## POSTWAR REVIVAL IN BANK LENDING

Postwar revival of bank lending activities proceeded at an accelerated pace during 1946. The volume of outstanding loans at all commercial banks increased by over 5 billion dol-lars-the largest shown in any twelve-month period since 1919-20, when a similar expansion occurred. Total loans outstanding at the end of 1946 amounted to nearly 32 billion dollars, which is the highest level since 1930 .
Growth in total loans occurred despite a substantial reduction in loans for purchasing and carrying securities. Most of this reduction represented liquidation of loans on Government securities, a segment of bank credit which had expanded rapidly in connection with financing the recent war. Outstanding bank loans to businesses, farm operators and owners, urban real estate owners, and consumers rose sharply, as is shown in the chart, and reached a total of nearly 28 billion dollars at the year end. Both the aggregate increase in these loans during 1946 and the amount outstanding at the year's close established new records in the history of American banking.
Owing to the broad base of credit demand created by the high level of economic activity and inflationary conditions, expansion of producer, ownership, and consumer credit was distributed throughout all areas of the country, among banks both large and small, and
among major types of business, real estate, and consumer loans. By class of bank the highest over-all percentage expansion was at country banks. Loans to commercial and industrial businesses, which is the largest single category, increased nearly 50 per cent.

Total loans and "other" loans are not shown. Latest figures are for Dec. 31, 1946.

Bank credit extended to consumers and loans to owners of urban real estate rose by about 60 per cent. Loans on farm real estate increased somewhat; only agricultural production loans failed to show marked growth. This reflected in part the high level of farm
income during the year and the unusually high proportion that farm income was of national income. From this it would appear that the expansion of bank lending was associated primarily with business and consumption activities in urban communities.
Expansion in bank loans in 1946 both contributed to the attainment of a high level of production of goods and services and, by expanding further deposits of businesses and individuals, added somewhat to existing inflationary pressures. Bank borrowers probably used loan proceeds to a certain extent in financing inventory speculation although there is no clear indication that such speculation was widespread. Restraint on total loan expansion was exerted by the Board's regulations affecting consumer and security loans and by moderate pressure on reserves as a result of Treasury debt retirement. Banks were able, however, to obtain reserve funds with which to support the additional deposits created by the increase in their loans by selling short-term Government securities to the Federal Reserve Banks.

## Trends in Bank Lending

Prior to the recent increase in bank lending activities, which began shortly before the end of the war, the volume of loans at banks had been maintained for about ten years at a level only slightly above that brought about by the severe liquidation of the great depression in the early thirties. In 1936 and the first half of 1937 increasing economic activity resulted in some growth in loans, reflecting primarily credit extended to business concerns but to some extent loans on securities. This increase was followed by a decline in 1938. Again in the 1940-41 defense period, an increase in loan volume occurred, reflecting growth in business, real estate, and con-
sumer loans. Again the increase was followed by a decline, in 1942 and early 1943. As shown in the chart, however, these increases did not raise the volume of loans outstanding to levels even close to the lowest level of the years 1920-31.
total loans at all commercial banks

June 30, 1919-22; June 30 and December 31 thereafter. Latest figure is for Dec. 31, 1946.

During the middle and late war period total loan volume was sustained primarily by a strong demand for loans for purchasing and carrying Government securities. These loans were made during war loan drives and, although substantially retired in interim months, they showed a gradual growth over the war period. The volume of bank loans outstanding during the war was further supported by war production loans guaranteed by the Armed Services through Federal Reserve Banks under Regulation V. These loans attained a peak of about 2 billion dollars in 1943 and 1944 and were almost entirely repaid by the early part of 1946.

The current upsurge in loan volume, which reflects lending to businesses, real estate owners, and consumers, began about the middle of 1945 with the initial revival occurring in business loans. All major cate-
gories of loans except those for agricultural production and for purchasing and carrying securities rose sharply, particularly in the second half of 1946.
Total loans at all commercial banks are now nearly 3 billion dollars larger than at the loan peak after World War I, reached about mid-1920. Current data on various types of loans, available for member banks of the Federal Reserve System, are not strictly comparable with figures available in 1920, partly because of changes in classification and partly because of an increase in the relative importance of member banks in the commercial banking structure. On the basis of available information, however, loans to commercial and industrial businesses appear to be larger at the present time than during the inflationary business boom that followed World War I. Bank loans on real estate are over five times larger than the amount estimated for 1920, and bank loans to consumers, which were of minor importance then, are currently in excess of 3.7 billion dollars. Of the major types of bank loans, loans for purchasing and carrying securities alone are smaller than at the apex of the inflation after World War I. This reflects to a considerable extent differences in the methods of financing the two wars.
The amount of bank credit originating in loans is not as important today in relation to the total national product as during the post-World War I inflation or the prosperity years of the middle and late 1920's. Total bank credit originating in loans and investments, however, and accordingly the volume of deposits and currency at the disposal of businesses and consumers, is considerably larger than in these earlier periods, even in relation to a much greater national product. Bank investments, consisting primarily of Government securities purchased in connec-
tion with the financing of the recent war, are now the major form of bank assets and account currently for about three-quarters of total commercial bank credit outstanding as compared with one-quarter in 1920. The strength of the current demand for bank credit is the more noteworthy in view of the exceptional volume of liquid assets already held by a large number of businesses and consumers.

## Loans to Businesses

Most striking of the recent developments in bank lending has been the widespread revival in demand for bank credit by commercial and industrial concerns. Expansion in bank loans to businesses began in mid-1945 and has continued almost uninterrupted. Growth was particularly rapid in the last half of 1946 when most of the year's increase of almost 5 billion dollars took place. Although bank loans to business ordinarily increase during this period of the year, only a small part of the rise in 1946 can be attributed to seasonal factors. At the end of

COMMERCIAL AND INDUSTRIAL LOANS at member banks

Latest figures are for Dec. 31, 1946.
the year outstanding loans to commercial and industrial businesses at all insured commercial banks, on the basis of preliminary estimates, reached a record high of approximately 14 billion dollars.

Revitalization of bank lending to business has occurred at large and small banks in all sections of the country, reflecting heightened demand for bank credit by virtually all kinds and sizes of enterprise. The general character of expanding business credit demand throughout the country is further indicated by the large increase in such loans in all Federal Reserve districts and at all classes of banks, as is shown in the chart and the table. Increases in commercial and industrial loans during 1946 ranged from 16 per cent at city banks in the Boston District to 86 per cent at country banks in the San Francisco District. City banks, which hold approximately four-fifths of the outstanding amount of such loans, accounted for the preponderance of the increase. At coun-

${ }^{1}$ Including open market paper.
try banks, however, business loans showed a percentage growth larger than that in financial centers. This increase at country banks illustrates the breadth of business loan demands since it involved credit extension to thousands of small firms in retail trade and service industries as well as in manufacturing.
Much of the expansion in business loans in the months immediately following the end of the war appears to have reflected an increase in outstanding loans maturing in over one year, principally at New York City banks. These banks do almost as much of this type of lending as all other banks combined, and consequently carry a larger proportion of term advances to businesses than do banks in other sections of the country. Although term-loan financing is becoming more popular among small- and medium-size enterprises, most of the dollar volume of such loans is outstanding to large concerns, and the increase in term loans during the last half of 1945 reflected especially financial adjustments of these companies in connection with expansion and reconversion to peacetime operations.
During 1946 term loans at city banks have not been as important a factor in bank loan expansion as in 1945. Data from banks reporting loans advanced in the first 15 days of the last month in each quarter indicate that there was considerable reduction last year in the volume of term loans extended at New York City banks. Some growth in term lending over 1945 came about, however, in banks outside New York City according to reports from banks in 18 cities outside New York. Despite the over-all reduction in the volume of term loans granted, they probably contributed substantially in 1946 to the increase in the amount of bank loans outstanding since repayments on term loans previ-
ously made appear to have been considerably less than the amount of such loans extended during the year.

## Reasons for Increased Business Borrowing

Revival of business demand for bank loans has resulted from a combination of factors many of which are manifestations of the current boom in private business activity. Increases in prices of materials and supplies and in wages have been sharp, and inasmuch as these affect business operating costs cash requirements have risen concurrently. Inventories have increased in physical volume as well as in value both at manufacturing concerns and at wholesale and retail trade establishments. In financing an expanded volume of sales, businesses also have advanced additional credit to customers, and in retail trade instalment sale and charge account credit to consumers has risen very rapidly. Programs for modernization and expansion of plant and equipment have been undertaken by many manufacturing, trade, and service businesses, and frequently at greater total cost than had been anticipated due to rising construction and equipment prices. Special drains on the cash balances of businesses have also resulted from strikes, material shortages, and transportation delays. All of these factors, however, are associated with inflationary expansion in economic activity, and as in other boom periods they have combined to bring about the current expansion in bank loans to business concerns.

The rise in bank loans, as stated earlier, has happened despite the relatively large volume of liquid assets held by many businesses. Such assets, however, are not evenly distributed among individual concerns and, while they have doubtless reduced the volume of business credit demands, they have not
obviated resort to bank financing. Funds held by some enterprises in excess of current operating needs are not ordinarily available to other units in the business population, which may be obliged to seek bank credit to implement their business plans. Moreover, many concerns desired to retain a liquid position even if it meant incurring additional indebtedness.

## Characteristics of Outstanding Bank Loans to Business

For some time there has been increasing recognition of the need of the banking community and the public for more comprehensive factual information on bank loans to commerce and industry and on banking practices in this field. The sharp revival in the commercial lending activities of banks during the postwar transition makes such information extremely timely.

Through the cooperation of its member banks the Federal Reserve System conducted a survey of member bank loans to commercial and industrial concerns outstanding on November 20, 1946, and a summary of some of the results is given in an article elsewhere in this Bulletin. Additional articles are scheduled to discuss the various aspects of bank lending covered by the survey and will appear in subsequent issues of the Bulletin.

The survey was carried out by sampling methods with participation of individual banks on a voluntary basis. The response of member banks included in the sample was extremely gratifying and the System is indebted to these banks for their generous cooperation in supplying the information requested.

Pervasiveness in business demand for bank credit and in bank lending to businesses is evidenced by information obtained in the
survey. An estimated 673 thousand loans were outstanding to commercial and industrial concerns as of November 20, 1946, or an average of one loan for every 4 to 5 business establishments. Loans were widely distributed in all areas of the country and among businesses engaged in all kinds of activities and of all sizes. Two-thirds of these business loans were to concerns with total assets of less than 50 thousand dollars and 90 per cent to concerns with less than 250 thousand in total assets, indicating the extent to which banks are financing small businesses primarily in trade and service industries. Of the dollar amount of outstanding business credit extended by banks, 55 per cent originated with enterprises with assets under 5 million dollars, a group that is comprised of medium-size and small concerns. Manufacturing and mining concerns were indebted for over 40 per cent of outstanding business loans, and wholesale trade, retail trade, and public utilities companies followed in importance as bank borrowers.

## Bank Loans to Consumers

A postwar development of considerable interest is the marked expansion in bank loans to consumers. This type of loan was relatively unimportant at banks until recent

${ }^{1}$ Includes industrial and Morris Plan Banks.
years, although for some time banks have helped to finance consumer borrowing by making loans to other lending agencies. Bank loans to consumers, after a moderate increase in 1945, rose by almost 1.5 billion dollars in 1946. Banks lend to consumers through both instalment loans and singlepayment loans. Some of the instalment loans are made directly to consumers while a part is represented by retail paper purchased from dealers or other lenders.

All types of consumer credit at commercial banks expanded sharply in 1946. Automobile paper increased by one and a half times and other retail paper showed gains almost as large. Repair and modernization loans doubled over the year and personal instalment cash loans increased by about 75 per cent. Much of the expansion, which was widely distributed throughout the country, reflects the growing volume of durable goods available to consumers and the marked increase in prices of such goods.

Most of the rise in bank credit to consumers has taken place in instalment type

paper, which more than doubled and at the year end was close to the record level of 1941. Recent growth in consumer instalment paper held by commercial banks has been considerably greater than at other lending institutions, and, as is shown in the table,
banks now hold about 43 per cent of such paper as compared with about one-third during the war period. Another article elsewhere in this Bulletin describes in some detail the scope of bank activities in consumer financing at the middle of last year.

## Real Estate Loans

Commercial bank lending to real estate owners, which had shown little change over the war period despite increasing activity in real estate markets, began to increase about mid-1945 and grew rapidly in 1946. Such loans increased by approximately 2.5 billion dollars during the year and are currently at a record high of over 7 billion, or approximately 50 per cent above the previous high of December 1941, which followed the private building boom in the defense period.
Expansion in bank mortgage loans reflected increased lending on both urban and farm real estate, but particularly lending on urban property. The amount of commercial bank recordings of nonfarm mortgages under $\$ 20,000$ this past year was about two and a half times as large as in 1945, according to estimates prepared by the Federal Home Loan Bank Administration. Over 25 per cent of the nonfarm mortgages recorded were made by commercial banks as compared with 19 per cent in the previous year, indicating that banks were handling an increasing share of the mortgage business that accompanied the sharp rise in real estate values. The increase in outstanding loans on urban real estate did not fully reflect the increased lending owing to the fact that repayments on mortgage loans were at an abnormally high level.
Commercial bank holdings of farm real estate mortgages also rose substantially during the year. The rise was general through-
out the country, with particularly large increases reported in the South and West. The growth in farm real estate loans at commercial banks in 1945 reflected chiefly an increase in the average size of loans, but in 1946 it was due largely to an increase in the number of farm mortgages. During the first half of 1946 the average size of farm real estate loans recorded by banks, according to estimates of the United States Department of Agriculture, advanced 10 per cent while the number of such loans increased by 53 per cent. As with urban mortgages, a growing proportion of farm mortgage lending is being done by commercial banks, reflecting particularly the decline in these loans at Federal lending agencies, but also more rapid growth at banks in farm real estate loans than for other private farm mortgage lenders. Banks currently hold a larger proportion of farm mortgage debt than at any time in the past 20 years.

## Decline in Securtty Loans

During 1946 a substantial repayment was made of the large volume of commercialbank loans for purchasing and carrying securities outstanding at the beginning of the year. Following the Victory Loan drive in December 1945 such loans amounted to about 7 billion dollars, of which approximately 5 billion represented loans on Government securities. About half of these loans were to brokers and dealers and the remainder to various other borrowers. Over the year a gradual liquidation has occurred in these loans both to brokers and to others, and at the end of 1946 they were considerably less than half as large as at the postdrive peak.
Bank loans for purchasing and carrying other securities also underwent a marked re-
duction during the year. This reflected in part the establishment in January of maximum margin requirements for buying and carrying listed securities under the Board's Regulations T and U , which in effect prohibited further extensions of credit in this area. The decline in stock prices, which began in June, also contributed to further gradual liquidation of stock market credit.

Inasmuch as economic conditions and prospects had altered materially by early 1947, the Board on January 17 amended its regulations on margin requirements, effective February 1, to permit credit on the basis of 75 per cent margins. This action was taken in view of an apparent abatement in the strength of general inflationary forces and some increase in the strength of antiinflationary forces, reflected in reduced intensity of the demand for goods.

Reduction in security loans affected primarily banks in the financial centers inasmuch as these banks handle the bulk of such loans. As a consequence of substantial repayments of these loans in 1946, total loans at New York City banks declined during the year. At banks in Chicago and some reserve cities total loans showed little change or increased only moderately. Thus growth in other loans at these banks was also offset at least in part by the decline in security loans.

## Bank Loans and General Credit Developments

Strength in the demand for bank credit stems largely from forces accompanying a high level of economic activity and rising prices. Many of the loans extended by banks in 1946 facilitated the expansion in production of goods and services during the year and in this way contributed to overcoming inflationary pressures. At the same time, how-
ever, the addition of new deposits from the increase in bank loans in itself was a further inflationary factor. In addition, some of the funds made available through bank loans were used by businesses to bid for scarce material and labor resources or by consumers to swell the demand for goods in short supply without resulting in any substantial addition to the national product. In other words, by borrowing from banks some producers were able to bid away productive resources from others who in turn were induced by active business conditions to seek additional credit with which to protect their own operations. Some businesses and individuals, moreover, were encouraged by inflationary price advances to seek loans for purposes of inventory speculation and these loans not only added nothing to production but tended to reduce total output. Similarly, for many consumer items, there appears to have been adequate demand to support a rising volume of sales at stable prices without the extension of additional consumer credit.

Restraint on the expansion of certain types of bank loans has been effected by the Board's Regulation W, which prescribes minimum down-payment and maximum repaymentperiod terms for particular kinds of consumer loans, and by Regulations T and U , which set margin requirements for loans for purchasing and carrying listed stocks. Some measure of restraint on the availability of bank credit to private borrowers may also have been exerted since the early Spring of 1946 by the Treasury's program of retiring public debt.

Retirement of debt out of the Treasury's excess cash balance has put the reserve position of banks under moderate pressure. Although debt retirement out of the accumulated Treasury cash balance increased further the deposits of businesses and individuals,
banks were able to expand their reserves with which to meet resulting added requirements by selling short-term Government securities to the Reserve Banks. The year's total expansion of deposits and currency held by the public amounted to nearly 13 billion dollars, or nearly two-thirds of the average annual increase during war years. About half of this expansion represented a shift of funds from Treasury balances to private accounts, while the remainder has reflected net expansion of loan portfolios of banks. Further debt retirement can be accomplished only out of a budget surplus and such retirement will reduce, rather than increase, deposit balances of the public.
In the first two months of 1947 there has been a budget surplus, partly for seasonal reasons, and Treasury deposits at commercial banks and the Reserve Banks have increased by almost 3 billion dollars despite further debt retirement. Accordingly, deposits of businesses and individuals have been drawn
down considerably. Total loans at commercial banks, which are usually reduced somewhat during January and February, have continued to increase slightly, reflecting primarily further growth in loans to businesses.
Except for the limitations placed by selec-tive-type credit controls on consumer credit and security loans and aside from the moderate reserve pressures resulting from Treasury debt retirement operations, banks as a whole have been largely free to expand their loan portfolios whenever there was suitable opportunity to do so. Additional reserves could be obtained as needed by selling short-term Government securities, which the Reserve Banks stood ready to purchase at prevailing rates. Bank holdings of such securities are still large, moreover, and these constitute a potential source of reserve funds on which banks may build additional deposits through further bank credit expansion should the conditions favorable to such expansion continue.

# VALUES AND LIMITATIONS OF CONSUMER FINANCIAL SURVEYS FOR ECONOMIC RESEARCH 

by<br>Ralph A. Young and Duncan McC. Holthausen*

Economic science has been singularly handicapped in its development by the absence of quantitative information on consumer spending-saving patterns. Four decades ago, Alvin Johnson wrote: ${ }^{1}$
. . . Most economists believe that the existing high average of material welfare would have been impossible but for the vast accumulations of the past, and that the future progress of the working class, as indeed of all classes of society, depends upon the continued increase of capital. Now if this is true the greatest importance attaches to the study of the forces governing the development of habits of saving in society at large. This seems so obvious that one would naturally expect to find numerous bulky volumes devoted to the psychology of thrift and to the economic and sociological conditions under which it flourishes.

As a fact, however, no such volumes are to be found. One aspect of the question-the effect upon savings of variations in the interest rate-has of late years received an immense amount of attention. Otherwise little progress has been made beyond the position taken by John Rae 70 years ago. One may summarize the accepted treatment of the subject as follows: different races, social classes, individuals, show varying degrees of thrift. Saving is conditioned, on the subjective side, by intelligence, education and regard for the welfare of one's dependents; on the objective side, by security of property and certainty of life, and by the reward for saving in the form of interest.
The decades since this passage was penned have not been without progress in the enlargement of our stock of conceptual and quantitative knowledge concerning consumption-saving patterns. Conceptually the progress has come by means of a clarification of the psychological elements comprising the time-preference or impatience theory of

[^1]savings and interest and the conversion of these elements by Keynes into the subjective factors affecting the propensity to consume. This development has contributed to a change in ideas as to the amount of liquid assets possible for an advanced and rich industrial society to assimilate without undue and unmanageable inflationary effects. Conceptual progress may also be recognized in a sharpening of the distinction and the relation between individual and aggregate social saving, and in the development of a more sophisticated framework for the accounting of social savings. ${ }^{2}$

Quantitatively, progress has been in three directions. First, we have developed time-series measures of aggregate social product and major components thereof, including output by types of goods, total income payments, disposable income, consumer expenditures, consumer and business saving, and changes in liquid asset holdings. We have further had some opportunity to examine the secular and cyclical interrelations between these magnitudes and to develop at least provisional generalizations concerning these interrelations.

Second, important benchmark observations of consumption-saving patterns have been developed through enumerative surveys of consumer budgets. Scientific workers have recently commenced to exploit systematically the insights that are afforded by relating the information that is available from various budget surveys over the past 50 years. There is thus beginning to emerge a quantitative image of longer-term shifts in consumption-saving patterns for urban consumers and of shorter-period shifts for both urban and farm consumers.

Third, a technique has been evolved for taking periodic observations, at reasonable cost, of con-sumption-saving patterns for small, representative samples of families and individuals. A recent development in such surveys has been the concurrent recording of attitudinal, motivational, and expectative considerations that influence consumer behavior. This supplement is designed to objec-

[^2]tivize the consumption factors that economic literature has heretofore described as subjective.

These developments sum up to an impressive stock of scientific progress. We know immensely more than was known only 40 years ago although we are far short of what we ought to know. But with the momentum that has been gathered there is every reason to anticipate that the achievement of the next four decades in studying the economic, sociological, and psychological aspects of saving will surpass that of the past four.

Surveys of consumer financial patterns (liquid asset holdings), such as the Federal Reserve Board of Governors sponsored last year and is again sponsoring this year, are examples of the small sample survey technique. They are directed to obtaining financial information on consumer income, saving, forms of saving, liquid asset holdings, and major expenditures by various economic, psychological, and sociological characteristics. In addition, they are assembling data on consumer attitudes, motives, and expectations related to and affecting consumer decisions as to saving, types of saving-liquid and nonliquid-incurrence of debt, and expenditure for durable goods.

The first survey of this type was conducted for the Board of Governors by the Division of Program Surveys in the United States Department of Agriculture; the second is being carried out by the Survey Research Center of the University of Michigan, using the same method and under the direction of personnel formerly associated with the Department of Agriculture. The survey technique employed, which is a blend of the enumerative-economic and the socio-psychological approach, was developed in the past several years in connection with various special phases of the Government's work during wartime. The data assembled relate to the crucial variables, constants, and coefficients of consumption analysis, in short, to the essentials with which to test strategic assumptions and propositions of accepted economic theory in this area. Moreover, they constitute a body of factual materials which may suggest new theories, e. g., a theory of the formation of consumer expectations. ${ }^{3}$ Taken together, the survey results represent an important and long-delayed step in rounding out our stock of fundamental information on consumer-saving

[^3]behavior, the need of which Alvin Johnson recognized 40 years ago.

## Survey Values for Descriptive Economics

Consumer surveys of financial patterns are difficult to appraise because their significance is manysided. From the viewpoint of descriptive-functional economic theory, their most general value is the specific information made available concerning the consumer-saving pattern by income class according to the particular definitions of saving and income that are employed. They provide a body of data with which to develop factual answers to quite basic but simple questions. Heretofore these questions have been answered, if at all, only from general observation or from hunch. Is it true, for example, that most consumers will usually respond to a change in income status during a given period by saving a part of the net increment or offsetting a net decrement by reducing saving?
The evidence from a single survey suggests that, at least in some circumstances, an increase in income, unless a significantly large increase, will not be reflected in increased saving for many consumers, but that more people will save less when income is reduced. If the fall in income is substantial, more than a majority of the consumers experiencing lower incomes may reduce their saving. This pattern, of course, may be unique and relate only to $1945-46$. Quite different patterns have probably characterized other periods. Nevertheless, the observation implies that, while aggregate individual saving may rise or fall with corresponding changes in aggregate income payments, in some situations the increase in saving may be less than proportional to an increase in income payments, and more nearly proportional to a decrease in income, especially to a large decline in income.
Again, consider the questions: Does the consump-tion-saving pattern vary significantly as between savers having similar incomes but different ages and education? Do the self-employed and professional workers tend to save a larger proportion of income than other workers with similar incomes? Do farmers and people in rural areas who set aside a "nest egg" for the future save more or less of their incomes than people having similar incomes who live in metropolitan areas? How important are habitual practices with respect to saving for savers whose current income is comparable?

Results of the Board's first survey indicate that people who have more education, who are self-employed (including farmers) or are professional or white collar workers, who live in rural communities, and who have regular savings plans tend to save more than other people with similar money income. By age group for people with similar incomes, in contrast, the variation shown in impatience as to present consumption was not as pronounced as might have been expected. These findings are in part consistent with and in part inconsistent with preconceptions of accepted descriptive theory. However, they need further testing to establish them firmly, particularly the observation relating to saving by age group.

As a third example, take the questions: Do some persons within the same income group save a smaller proportion of income than others in the same group? If persons have large holdings of liquid assets, do they typically save a smaller proportion of their incomes than others in their income class with small holdings of liquid assets? In other words, does equality of income combined with large holdings of liquid assets tend to be associated with a high propensity to consume, i.e., a low saving rate? Obviously, no conclusive tests of these primary questions can be designed on the basis of a single crosssection survey.

Analysis of information from the 1946 survey suggests, however, that among individuals with similar incomes and large liquid asset holdings, there are substantial differences in saving rates. This finding, although restricted to consumptionsaving patterns of 1945 when many goods were in short supply, may indicate that the sense of security contributed by large holdings of liquid assets alone does not necessarily bring about a higher propensity to consume. We may or may not have a higher propensity to consume in the years ahead, but if we do, the data for 1945 suggest that other factors as well as holdings of liquid assets will account for it. This matter obviously merits further consideration and analysis.

Other examples can be cited of simple questions relevant to descriptive economic theory which may be answered from surveys of consumer finances. For instance, what are the various motives that influence people to save and what is their relative importance? Do people save for security, save for posterity, save to spend, save what they do not
spend, save for interest, save to save, or what? How does size and composition of family affect saving and savings motives? Again, what considerations influence the saver's choice of alternative savings media? Which of his savings assets does he regard as being liquid and what considerations affect his holding of liquid assets? Who are the dissavers and what are their characteristics? How variable is thriftiness over time and what personal and ex. ternal factors infuence this variation?

If consumer financial surveys of the type under discussion could be repeated at regular intervals for a long enough period, an underpinning of observation would be developed for the questions raised. The potential contribution of such information for descriptive-functional economic theory seems selfevident. Certainly, were factual answers available, theorists would be compelled to be more critical in their formulations; there would be much less latitude for the ex cathedra generalization of a priori imagination.

For purposes of delimiting subject matter, the social science theorist has special responsibility as arbiter and guardian of fundamental terms and their definitions. The accepted canons of a good definition are: (1) that it should accord as far as possible with common understanding, and (2) that it should be helpful in the exploration or explanation of things. While economic literature in recent years reflects an especially active concern about the terms income, expenditure, and saving, it would appear that scientific usage has not yet succeeded in meeting effectively both of these standards of a good definition, particularly in the case of the term sauing.

Survey interviews with consumers (in 1946) indicate, for example, that few individuals regard mortgage or other debt repayments, payments of insurance premiums, or increases in checking accounts, as additions to savings, or new debts incurred as dissavings. Although there have also been some differences in scientific usage of the term saving, the above items, generally excluded from common usage of the term, are included as saving under the scientific definition of the term. Survey interviews show that most commonly saving means additions during a period to savings accounts and to holdings of building and loan shares, Government bonds, and other securities. The difference between the common and scientific understanding
of the term saving requires that inquiries and responses related to saving must be clearly understood by both interviewer and respondent and every care should be taken to maintain consistency of terms in successive surveys. It also suggests that analysis should explore differences in results that might be produced by variations in definition. In any case the desirability of further clarification of terms such as income, expenditure, and saving is indicated if the professional statement of the economics of saving and thrift is to be made generally intelligible to the public.

## Survey Values for Business Cycle Study

One of the important values of consumer financial surveys is the information they promise to yield for business cycle study. For example, because of the greater cyclical variation in consumer expenditure for durable than nondurable goods, we need to develop new information by income groups regarding time changes in expenditure for durable goods. Also, we need to know more about time changes in consumer debt for the groups that buy most heavily on credit because variations in such debt seem to exercise an amplifying effect in cyclical swings. Since initiating or amplifying impulses in cycles may apparently originate in changes in consumer saving and liquid asset holdings, another urgent need is for periodic data relating to them by income and other consumer characteristics. Finally, we need additional information by income groups about changes in consumer attitudes, plans, and expectations. Are the "rich" more "cycle conscious" than other groups with respect to spending and saving? Are skilled or unskilled workers generally given to light-hearted and improvident spending in time of prosperity and enforced frugality and debt retirement in time of depression? Or, is there a definable variation in the climate of public opinion that pervades the psychology and affects the behavior of a majority of consumers in all groups?

In dealing with the consumption phase of business cycles in his distinguished synthesis of modern business cycle theory, Gottfried Haberler raises the question as to how the proportion of income saved by various groups varies during different stages of cycles. "Unfortunately, for the lack of statistical data," he states, "there is no possibility of measur-

[^4]ing directly how savings behave during different phases of the cycle. We have to rely on very general considerations which cannot provide a precise answer to the above question(s)." In other words, the most that a business cycle scholar can hope to do today with this critical phase of business cycle processes, is to offer his best judgment on the "probability" of how various groups of consumers behave and what their plans and expectations are during successive cycle stages.

There are good reasons for believing that variations in consumption-saving-debt processes will play a larger role in future business instability than in the past. Consumer expenditures at postwar income levels will possibly involve a higher proportion of expenditure on durable goods than at prewar levels. Second, consumer credit facilities are more ample than in any former period. Third, more consumers than ever before have a backlog of liquid assets on which to draw for down payments and full cash payments on durable goods and houses and, therefore, a wider latitude of choice in timing their purchases of these goods. Finally, the servicing of our huge public war debt will withdraw purchasing power from some consumers and add to the purchasing power of others, affecting in uncertain ways the stability of production and employment.

If this interpretation of prospects is valid, there is urgency in expanding our knowledge of con-sumption-saving-debt patterns and expectations for business cycle study. The need is to understand these factors better not only for their own sake but also to gain insight into the instability of consumer expenditures for durables. In addition, their understanding will be essential to assessing the incidence on consumption and saving of servicing the public debt. The knowledge thus gained can definitely aid in shaping economic policies designed to counteract partially variations in expenditures for durables. Furthermore, data that will help to show who pays whom in servicing the public debt will be the elementary facts with which to evolve debt management policies that will be as little destabilizing as possible. The method of consumer financial surveys promises to be a practicable way of developing some of the specific information which future conditions will probably require that we possess for studying effectively the consumption phases of business cycles.

## Survey Values for Current Economic Analysis

The immediate occasion for the sponsorship of a consumer financial survey by the Federal Reserve Board of Governors was of course the insights that might be gained in connection with current economic developments. The commitment was made on an experimental basis and was prompted by the crucial intangibles in the current situation growing out of almost four years of war effort and finance. How "hot" were wartime accumulations of liquid assets in the hands of consumers? ${ }^{5}$ How impatient were consumers to fill their deferred and current demands for durable goods and housing? What was their willingness to incur debt? Did they plan to reduce their saving? What was the inflationary potential of postwar consumer spending?

The first survey showed a relatively high concentration of holdings of liquid assets but in all probability a lower concentration than characterized the prewar period. The wider distribution was apparently to be accounted for by the changing dispersion of income at rising income levels during wartime. At the same time, liquid asset holdings were widely distributed among income classes, consumers with annual incomes below $\$ 5,000$ holding nearly two-thirds of the liquid asset holdings, excluding currency, of individuals. The important finding with regard to liquid asset holdings was that most consumers regarded them as permanent or rainy-day reserves, not to be disposed of in capricious or improvident spending. In addition to these primary findings, there were a number of items of information foreshadowing developments of the year. For example:
(1) Consumer purchases in 1946 would be paid for mainly out of income.
(2) Expenditures, including those for durables, would be at such a level in relation to income for most groups that the volume of saving would decline.
(3) Anticipated rises in consumer prices at prevailing standards of living, in addition to a higher general propensity to consume because of a backlog of deferred demands and many urgent current needs, would contribute to the decline in saving.
(4) The use of instalment and mortgage credit during the year would be substantial, and would

[^5]add to funds available from income for expenditure on durable goods and housing.
(5) Use of liquid assets for down payments on durable goods and houses would add significantly to available funds from income for spending.
(6) Transfers of liquid assets to other forms of investment would exert some inflationary pressure in investment and realty markets.

All in all, the picture presented by the survey as of the first quarter of last year was one of strong inflationary developments in consumer goods and investment markets over the months then ahead. As matters have turned out, the composite indications of plans and expectations of various consumer groups as assembled in the survey proved a more accurate prognosis of consumer income, expenditure, saving, and debt developments in 1946 than was offered by many experts in forecasting. Whether other surveys, made under varying circumstances and conditions, would prove as sensitive in foreshadowing future consumer financial developments can only be determined by repeated experiment. It is obvious enough that the indications of such surveys can constitute only one body of reference data for analyzing the current economic drift, and that it would be foolhardy to rest shortterm projections on consumer interview evidence alone.

## Survey Values for Bank Credit, Monetary, and Fiscal Policy

A final important value of consumer financial surveys is in connection with bank credit, monetary, and fiscal policy. Under present conditions, effective regulation of the money supply by the Federal Reserve is no longer possible on the basis of the flexible application of its traditional instruments. Individuals and businesses hold approximately 140 billion dollars of liquid assets that can be used at will to increase current expenditures, and conversion of bond holdings into cash can serve to increase the money supply, both directly and indirectly. In addition, the commercial banks have large holdings of Governments which can be sold to the Reserve Banks, thus increasing bank reserves for purposes of increasing their holdings of higheryield assets, thereby expanding bank credit and the money supply.

With total liquid asset holdings of individuals amounting to 140 billion dollars, it is obvious
that the basis of central banking interest in current surveys of consumer finances is immediate and real. Furthermore, that interest is necessarily heightened by the consideration that sizable sums are held by middle- and lower-income groups whose possible spending inclinations are uncertain. It was a matter of not inconsiderable importance from the standpoint of monetary and fiscal policy to know the relative concentration of liquid asset holdings by income groups at the beginning of 1946 and to find that holders for the most part were not inclined to spend them. It was also reassuring to find that the inflationary threat of this potential money supply may not have been as serious, even though serious enough, as had been thought by many.

Current surveys of consumer finances also have direct usefulness for central bank policy in selective credit areas. The 1946 survey showed the possibility of a sizable conversion of liquid assets into investments, which confirmed the desirability of maintaining reasonably high margin requirements to prevent securities speculation from becoming an inflationary menace to the whole economy.

The 1946 survey was also useful in connection with consumer credit regulation. It made possible rough estimates of consumer demand during the year for durable goods and for instalment credit to finance purchases of such goods. It further showed what consumer groups were impatient to acquire durables and to incur debt to do so. This information indicated that strong inflationary pressures would be present during the year in the durable goods markets, which were characterized by short supplies, and pointed to a continuing need for restraining "deficit spending" by consumers, i.e., consumer credit expansion, so far as possible until conditions of short supplies were remedied.

From these illustrations, it is obvious that consumer financial surveys can serve a helpful function in framing current central bank and fiscal policy. Structural changes in the economy, referred to earlier, give the information assembled virtually a strategic importance. For instance, the size of the public debt makes it imperative that we develop a quantitative picture of interclass transfers of funds in servicing that debt. However, further surveys are necessary to test the validity of the methodology and also to provide an adequate retrospective basis for evaluating the significance of current results.

The full utility of survey information for bank credit, monetary, and fiscal policy will not be assessable critically until the results of several successive surveys, made under varying economic conditions, are available for comparative analysis.

## Do Consumers Plan?

While the value of surveys of consumer financial patterns may generally be recognized, it is true that some observers remain particularly skeptical about the value of surveying consumer attitudes and expectations with respect to spending and saving. The skeptics include economists, publicists, and businessmen. Fundamentally, their skepticism rests on a doubt whether consumers commonly plan, in any legitimate sense of that term, even though the skeptics might admit that they themselves engage in consumer planning. This part of the surveys sponsored by the Federal Reserve is their most experimental phase, and how much reliance can be placed upon the mass expectations reported by consumers is indeed a proper question to raise. ${ }^{6}$

The case against the concept of consumer planning as one meaningful enough to permit enumeration and statistical analysis of consumer plans may be summarized as follows. The concept of advance planning is without content except when a plan is directed to a given end, such as profit, and when possible deviations in plans because of unforeseen contingencies can be allowed for initially within a margin of tolerance that conforms to some standards of reasonableness. Even though the typical consumer is aware that he will have future wants, he does not know in detail what these wants will be. From this point of view he is largely a creature of habit, of impulse, of response to social background, standards and whims of fashion, of reaction to salesmanship and advertising. To put the case extremely, the consumer is a complex of wants, present and future, without any too fixed a priority of desires either in the present or in the future. While he might in the present indicate unsatisfied desires, his expectations in general would have little relation to later action, and therefore would be without value as an indication of future behavior. As a creature of unlimited desire, his array of future wants and the priority he would tend to put upon them in the present would be restricted only

[^6]by the scope of his imagination as to his future well-being.

The case that consumer plans are meaningful data and are appropriately recorded in interview surveys may be set forth as follows. Admittedly, the qualities of foresight and forbearance differ widely from one individual to another, and also the capacity to articulate plans. While individuals may not plan future expenditures as a whole in any detail, they are certainly aware that they will have continuing expenditures for major classes of wants. It is reasonable to think, furthermore, that future expenditure related to current consumption, or present expenditure related to future consumption, is more or less consciously and definitely planned. Cultural patterns and social standards are merely conditioning influences affecting such planning.
Purchases of items of high unit value are illustrations of the latter type of planning. They are infrequently repeated in a consumer's lifetime and are in the nature of events, to be thought about, talked about, and planned for some time in advance of expenditure. Experience from last year's survey indicates that consumers do plan certain major expenditures. Respondents' replies in regard to the possible purchase of consumer durable goods or houses were in most cases a very positive "no" or "yes" accompanied by a statement as to why purchases would not be made, or as to the type of purchase contemplated. A further example is the discipline which instalment and mortgage debt imposes on future expenditure and which makes necessary advance planning. Provision through saving for future personal or family contingency, for health, for education, for vacation and travel are other illustrations of consumer action that clearly have a large element of foresight or planning about them.
Survey interview experience shows that consumers, of course, state their plans with varying degrees of firmness. Plans for certain major expenditures often appear to represent very conscious and definite planning; in contrast, saving plans are not so frequently described in definite terms. Consumers also express differences in the likelihood of attainment of plans. A significant number of consumers are generally uncertain about plans for some items and respond "not sure" or "it depends." Despite the lack of finality about plans in these cases, the replies are still useful data; if surveys are
made for successive periods, the changes in the number of uncertain replies is a significant item of information.
For surveys of consumer plans and expectations to yield significant information, it is not essential that there be a high probability that the large majority of consumers will realize expectations based on present plans. What is essential is that people generally do plan some aspects of future expenditures, have expectations as to the realization of their plans, and are giving some account to these plans in present consumption. The patterns into which these plans and expectations fall is an empirical matter that we desire to know something about. We also want to know how sensitive these plans and expectations are to changing economic conditions. Beyond this, we want to find out whether the patterns have enough consistency at different times to indicate the prevalence of a generally optimistic or a generally pessimistic climate of opinion, and whether this climate changes systematically during the successive stages of business cycles.
A single survey of consumer plans and expectations has limited usefulness in testing the validity of the general concept of consumer planning. A number of annual surveys and their results assessed comparatively will be needed before a proper interpretation can be established. In addition, it would be helpful if direct evidence could be obtained by interim surveys to determine the frequency with which consumers realized their previously expressed plans. But in the meantime we must resolve the problem in terms of limited survey experience and general considerations. The weight both of survey experience and of general considerations is on the side of accepting the concept of consumer planning as a useful working hypothesis.

## Limitations of the Survey

An interview survey such as the national survey of liquid assets is subject to a number of limitations. These limitations may be classified as: (1) limitations of a technical nature, and (2) limitations for public understanding and for public relations.

## Technical Limitations

1. Small sample-In all, about 3,000 interviews are used in the Federal Reserve Board's survey of consumer financial patterns. The smallness of the samples precludes the derivation of any detailed
regional or State estimates. In addition, there are definite limits to the number and variety of tabulations that can be made for samples of this size. When finer breakdowns are made, the number of cases in any particular cell becomes too small for adequate representation, particularly when the range of the sample data is great, e.g., income and liquid asset holdings.
2. Coverage of the survey--To obtain information about a person's annual income, saving during the year, and volume of bank desposits and bonds held is a time-consuming process even when the minimum of information needed for technical accuracy is requested from the respondent. A survey designed to find out about certain consumer attitudes, motives, and expectations in relation to this financial information must necessarily use an interviewing procedure that maintains as well as possible the good-will and spontaneous cooperation of the respondent. To do this, interviews are designed so as not to average more than one hour. The variety of attitudinal questions and the detail of financial information on any particular questionnaire is therefore limited and much additional information that might be useful in the over-all analysis of results must be eliminated during the careful review and screening of the questionnaire form. This limitation can be remedied of course by special supplementary surveys, but such a procedure adds considerably to cost.
3. Basic unit--In the Board's surveys, the basic unit adopted for interviews is the spending unit. A spending unit may consist of a financially independent single individual, or of several related persons who live in the same household and who pool their major items of income and expense. The spending unit concept differs in one important respect from the family unit as used by the Census Bureau in that it tends to identify as individual spending units the married son or daughter living with parents as well as single sons or daughters who are financially independent. In a survey relating consumers' plans and attitudes to financial data, it is essential that each unit surveyed is responsible for and controls the allocation of its own income and the disposition of its assets.

As Simon Kuznets once indicated in discussing "The Why and How of Income Distribution," " different types of units may be needed to "establish the relation between income received and such of its
antecedents or consequences as are of primary interest." The spending unit was chosen as a basis for the Board's surveys in the belief that it best served the objectives of a study of consumer financial behavior. It may not be the best unit, however, for studying certain specific objectives of the surveys, for example, the demand for housing and certain related consumer durables. In addition, this unit presents some difficulties in making comparisons of the size distribution of income and saving with other surveys, especially those of earlier periods, which used a different or modified unit of survey enumeration.
4. Phrasing of questions-As in all attitudinal surveys, extreme care must be exercised in framing questions to insure a clear understanding of the questions by people of all socio-economic groups, and to prevent "putting answers into the mouths" of respondents. Perhaps one of the most difficult problems encountered in this respect relates to information on saving, whether attitudinal or financial. The average person has relatively little idea as to the meaning of saving as it has come to be used in modern economic literature. In the Board's survey, a complete itemization of the many components of saving in the previous year is requested in order to develop a meaningful aggregate from each interview. However, discussing motives for saving or the volume of saving anticipated makes for difficulties of interpretation when the term means different things to different people. The results of any such attitudinal or expectative inquiries must, therefore, be used with caution.
5. Analysis must be telescoped in time-Expectations of people regarding the future spending of liquid assets, future income and saving, and other variables are made in the light of a particular current situation at the date of the interview. Deviation from an individual's expectations of future income, prices, or other factors may change that individual's anticipated behavior as a consumer. Thus the survey data regarding future expectations and plans refer to attitudes as of one specific date-the time of interview-and changes in underlying conditions may affect the significance of a particular set of results.

[^7]
## Public Relations Limitations

1. Public incredulity concerning the reliability of results-The results of the first Federal Reserve survey, as based upon 3,000 interviews, have been the subject of wide-spread skepticism, and in some cases still are, both on the part of the public at large and also by many economists. The size of a sample is only one of several considerations that influence the accuracy of results. It has been pointed out many times that millions of cases did not prevent the Literary Digest from having a serious bias in its poll in the 1932 presidential election. This widespread skepticism as to the reliability of results from so small a sample stems in large part from the lack of familiarity with scientific sampling procedures. Every sample is subject to sampling error. But accurate results from small samples may be achieved for specific purposes through the elimination of bias by using area sampling, stratification of the universe, overinterviewing of units the variation of which may affect the results greatly, and other refinements of scientific sampling methods.
2. Interest of public groups in income and savings statistics.-The distribution of income, saving, and liquid assets by economic units is information that is in great demand by Government agencies, business establishments and associations, labor organizations, and many special interest groups. In the course of the past year the results of the Federal Reserve's first survey of consumer financial pat-
terns have been interpreted by some groups in a manner that has led to considerable misunderstanding of the basic data. As an example, the basic unit for presentation of the survey results was the spending unit. Nevertheless, the family unit was widely identified with the survey statistics in published statements based upon the Board's original reports. Since there were approximately 46 million spending units and 38 million family units at the beginning of 1946, income distributions as well as distributions of other financial statistics obviously can vary substantially depending upon whether the spending or family unit is used as a basis for results.

A further illustration is the emphasis placed upon the concentration of liquid asset holdings and the conclusions drawn therefrom. After the Board's first report, there was a widespread belief that because of the concentration of these assets the preconceived notion that they would be used to finance the backlog of demand for consumer durable goods was a myth. Data subsequently published showed that these accumulated savings were dispersed through all income groups; that many spending units with moderate incomes held substantial amounts; and that, in the aggregate, the spending by holders of liquid assets would be substantial. Greater precautions in presentation and explanation of survey results than were taken last year will be desirable to maximize the usefulness to the public of further surveys.

# BUSINESS LOANS OF MEMBER BANKS 

by
Albert R. Кoch

Near the end of 1946 the member banks of the Federal Reserve System had an estimated 673,000 loans outstanding to business concerns. These loans totaled over 13 billion dollars, or about one-third more than at mid-year. This was undoubtedly a greater number and dollar volume of loans to business enterprises than had ever before been on the books of commercial banks.

These new data about bank loans provide the basis for a better understanding of recent credit developments by supplying important material not otherwise available concerning outstanding loans in various industries. Taken alone, the statistics do not disclose whether the present large volume of loans is excessive, or whether the borrowing was incurred for speculative or other unsound purposes. Judgments on whether present bank credit to business is excessive must be based on the relationship of bankloan data to such relevant information as level of output, price situation, and character of credit demands. Specific purposes for which individual concerns borrowed bank funds are not revealed by the survey. These could only be ascertained through a study of the over-all financial record of borrowers, which would show the various sources of funds available to them and also the various uses to which these funds were applied.

Bank loans outstanding to commercial and industrial concerns late in 1946 were distributed among all types of industries. Loans to manufacturers of metal products, foods and related products, and petroleum, chemical, and rubber products, to wholesalers of foods, liquors, tobacco, and drugs and of apparel and other dry goods, and to sales finance companies were the heaviest in dollar volume; most of these amounts went to large corporations. The largest number of loans was to small retail stores and to service concerns.

These business loans of member banks were distributed among businesses of all sizes, as well as among corporations and unincorporated enterprises. Medium and small business units, defined as those with total assets of less than 5 million dollars each, accounted for the great bulk of the total number of loans and over half of the total amount. The
greater share of the number and dollar volume of loans to small concerns was to unincorporated enterprises, while corporations were the dominant legal form of business among larger borrowers.
The amount of bank credit employed in financing medium and small business is undoubtedly greater now than in prewar years. The proportion of business loans extended to this group of enterprises has probably declined, however, in view of the large volume of bank credit currently being extended to larger companies. The survey data, of course, provide no direct evidence as to whether or not all of the legitimate and proper credit needs of medium and small business are being adequately met by the commercial banking system. The positive survey finding on this subject is that as of late 1946 the accommodation of the credit needs of medium and small concerns was an important activity of the banking system, even though the proportion of small to total business borrowers was probably less than the proportion of small enterprises in the total business population.
Reflecting their greater size and loan capacity, large banks lent primarily to large business corporations and the dollar volume of these loans was a substantial portion of total loans. Since banks are generally prohibited by law from lending to any one borrower in excess of a specified proportion of capital, the medium- and small-size banks lent principally to medium and small business enterprises, and, in view of the large number of banks and enterprises in these groups, they were responsible for the preponderance of the number of loans. Loans to large borrowers by the large banks were concentrated in the heavy manufacturing industries, while a large proportion of the loans of small banks went to small retailers.

The importance of long-term business loans in contemporary bank lending is indicated by the fact that at the date of the survey more than one-third of the volume of total outstanding business notes in banks or almost 4.5 billion dollars, had an initial maturity of over one year. Moreover, these loans provided a significant source of funds for medium and small concerns as well as for large business
corporations. Indeed, as of the date of the survey, almost 30 per cent of the bank loans outstanding to very small enterprises, those with total assets of under $\$ 50,000$ each, was long-term.

There was little difference in the industrial character of bank borrowers in 1946, as compared with 1942, the date of an earlier Federal Reserve survey of business loans made on a somewhat different basis. Of the small differences, the most significant was the relative increase in importance of industries that had little or no direct connection with war production. Apparently such concerns are now engaged in carrying out needed expansion which had to be postponed during the war years.

These estimates are based on a nation-wide survey of loans as of November 20, 1946, conducted by the Board of Governors of the Federal Reserve System and the Federal Reserve Banks. ${ }^{1}$ The broad purpose of this survey was to collect a comprehensive body of information on the magnitude and characteristics of current bank lending to business enterprise and on the role commercial banks are playing in financing businesses of various sizes in different industries and regions during the first postwar expansion in economic activity.

The survey was made possible through the cooperation of almost 2,000 member banks that participated voluntarily in submitting survey schedules. These included all of the large banks, which were asked to report on all of their large loans and on a sample of their small loans, whereas the small banks were represented by a sample of reporting banks, which were requested to submit data on all loans outstanding to businesses. This sample of banks included 26 per cent of all Federal Reserve member banks and held 83 per cent of the total "commercial and industrial" loans outstanding at all member banks on June 29, 1946. From the sample data thus secured, estimates for all banks were made on the basis of well-established statistical procedures.

Several Federal Reserve Banks have already pub-

[^8]lished some district analyses of the survey data in their Monthly Reviews. This article, which is the first of a series to be published on the national aspects of the study, contains a brief discussion of several of the basic magnitudes developed in the course of the survey. Subsequent articles will deal more fully with additional phases of bank loans to commercial and industrial concerns, such as their regional distribution, the interest rates charged, loans to small businesses, term loans, and types of security for loans.

## Type of Business of Borrowers

Manufacturing and mining concerns were responsible for the largest proportion of the total dollar volume and the second largest proportion of the total number of loans outstanding to business concerns at Federal Reserve member banks as of November 20, 1946. The category accounting for the largest number of loans was retail trade. For the purpose of identifying the type of business of bank borrowers, all loans in the survey were classified, first, into eight broad industrial groups of borrowers, and, secondly, into sub-categories within certain of these broad groups.

As is shown in Table 1, manufacturing and mining companies had 116,000 , or 17 per cent of the total number of bank loans outstanding at the date of the survey; these loans amounted to 5.7 billion dollars, or 43 per cent of the aggregate dollar volume of all loans. Within manufacturing and mining, the loans were fairly evenly distributed among durable and nondurable goods industries. Such nondurable goods subgroups as food, liquor, and tobacco, and petroleum, coal, chemicals, and rubber, for example, were heavy borrowers. These large commodity-using industries required considerable outside financing during the last half of 1946 to finance increased purchases of inventory at a higher price level.

Durable goods industries such as automobile, automobile parts, and electrical and other machinery also accounted for a sizable amount of borrowings. Many concerns in these industries which in normal prewar years obtained little or no money from commercial banks found it necessary to borrow in 1946 to help finance the gap between the end of mass military sales and the beginning of mass sales to the postwar civilian market.

Retail trade concerns, which accounted for the
largest portion of the total number of business loans, 38 per cent, held only 11 per cent of the total dollar volume of such loans. This reflected the dominant role of such establishments in the total population of business establishments-almost one-half -as well as their characteristically small size and consequently small average financial requirements.

Within retail trade it was the small food, liquor,

tobacco, and drug stores which were responsible for the greatest share of the total number of retail trade loans. This group of concerns and the group of larger apparel, dry goods, and department stores
accounted for approximately equal amounts of the total dollar volume of retail trade loans. Trade concerns, particularly apparel, dry goods, and department stores, customarily borrow heavily in the late fall and early winter to finance the large inventory holdings and customer accounts receivable which accumulate prior to Christmas. Although large in absolute amount because of high-level inventories and accounts receivable, such borrowing was probably less than usual this year relative to sales because of the substantial profits made and resultant savings retained by these concerns.

Wholesale trade concerns, public utility companies, and sales finance companies were responsible for most of the remaining dollar volume of loans, while small service concerns accounted for a large number of small loans. Wholesale trade, the business area in which interest rate charges are assumed to have considerable effect on the volume of borrowing, accounted for the second largest share, 18 per cent of the total dollar volume but only 13 per cent of the total number of loans. The principal wholesale trade borrowers were dealers in nondurable and semidurable products such as food, liquor, tobacco, drugs, apparel, dry goods, and home furnishings.

## Stze of Business of Borrowers

Large concerns, that is those with total assets of 5 million dollars or more each, were responsible for the greatest part of the dollar volume of bank loans to commercial and industrial concerns outstanding near the year end 1946, but small concerns, those with total assets of under $\$ 250,000$ each, had by far the greatest number of loans outstanding at that date. For every loan outstanding to a large concern there were over 50 loans outstanding to small concerns as defined above. The dollar amount of the average loan to the large business, however, was over 90 times that of the loan to the smaller concern. To indicate the varying size of businesses that borrowed from banks, all borrowers were classified in one or another of five size groups and the survey data classified into these size groups. The results of this classification are summarized in Table 2.

The survey data indicate that, as of late 1946, 55 per cent of the total dollar volume of loans was to concerns with assets of under 5 million dollars each. There is some evidence that this percentage, although still large, is lower than it was before the
war. Ascording to a recent study of the National Bureau of Economic Research, some $70-80$ per cent of the total amount of bank credit to business around 1940 is estimated to have been used by companies with assets of less than 5 million dollars. ${ }^{2}$ Part of this decrease in the proportion of loan volume going to small- and medium-size enterprises may have been the result of an increase in the average size of concerns since 1940. However, it is not
population, it also indicates that financing of small business is an important activity of banks. The data collected in the survey do not show, however, whether there still remained a significant number of small businesses with legitimate and proper bank credit needs which were unsatisfied.
In all probability the proportion of small borrowers to total business borrowers at banks was less than the proportion of all small concerns to the

certain that such an increase did occur; although most concerns in operation during the war period grew considerably, many new, small enterprises have begun operating since V-J Day.

Almost 90 per cent of the number of loans was to concerns with assets of under $\$ 250,000$ each and two-thirds to those with assets of under $\$ 50,000$ each. Thus, at the end of 1946 commercial banks were making a large number of loans to small and very small enterprises. While this refects the preponderance of small firms in the total business

[^9]total business population. The National Bureau of Economic Research has estimated as of 1939, that 88.5 per cent of the manufacturing concerns and 99.5 per cent of the retail trade concerns had assets of under $\$ 250,000$ each. ${ }^{3}$ At the date of the loan survey 77.5 per cent of the number of loans to manufacturers and 96.8 per cent of the number of loans to retailers were to borrowers with assets of under $\$ 250,000$ each.

The proportions for 1946, however, may not be as far apart as indicated by these ratios, for two reasons. In the first place, the survey covered the

[^10]number of business loans outstanding rather than the number of individual business borrowers. Since some borrowers, particularly large ones, had more than one loan outstanding at the date of the survey, the distribution of loans by size of borrower underestimates the importance of the number of small, relative to large, borrowers. Secondly, as was noted above, the size distribution of the business population may have shifted upward since the prewar period.

## Size of Lending Bank

Large banks were responsible for the highest proportion of the dollar volume of loans outstanding. Smaller banks, on the other hand, accounted for the greatest number of loans, primarily to medium and small businesses. To examine the characteris-

[^11]tics of loans at different size banks, the data were grouped into five classes based on total deposits of the lending institution. The results of these groupings are presented in Tables 3 and 4.
The principal factor affecting the character of the business lending of banks of different sizes is
the size of business borrower. As would be expected, large banks tend to lend to large industrial companies while small banks lend to small concerns. This direct variation of size of bank with size of business results in part from the different economic and geographical characteristics of large and small lenders and borrowers. Large banks, located in metropolitan areas, are well equipped to service large industrial enterprises operating nation-wide businesses. Medium and small banks in the smaller communities are best able to handle the credit needs of local enterprises.

| All borrowers ${ }^{\text {a }}$. | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 |

[^12]This variation is also due in part to the statutory limitation on the size of loan that a bank may make to a single borrower. Subject to some exceptions, a member bank is not permitted by law to lend any one business concern an amount in excess of 10 per cent of the bank's unimpaired capital stock and surplus.

Whereas over three-fourths of the dollar volume of loans of banks with total deposits of 500 million dollars or more were to business concerns with total assets of 5 million dollars or more each, over 70 per cent of the dollar volume of loans of banks with total deposits of under 2 million dollars each went to business concerns with total assets of under $\$ 50,000$.

This size factor, moreover, affects the industrial distribution of the loans of different size banks; it is the industries dominated by large concerns which are usually serviced by large banks and those dominated by small concerns which are usually serviced by small banks. Thus, heavy borrowers from large banks included large manufacturers in the food, liquor, tobacco, petroleum, automobile, and machinery industries, large wholesalers, large public utilities, and large sales finance companies. Smaller banks service predominately small retailers, and especially those selling food, home furnishings, and electrical appliances; small manufacturers of food, metal, lumber, and paper products; small service establishments, including laundries, repair shops of all kinds, and places of amusement; and small building contractors.

## Long-term Bank Loans

It has been general knowledge that during the late thirties business loans with a maturity of over one year, often called "term loans," increased in importance relative to loans with a shorter maturity. Available evidence indicates, however, that although the dollar volume of term loans in late 1946 was much larger than in 1940, the ratio of term to total loans in 1946 was about the same as it was before the war. ${ }^{4}$ The survey data indicate that, near the peak of 1946 lending activity, member banks of the Federal Reserve System had long-term loans of 4.5 billion dollars outstanding. This amount was 34 per cent of their total business loan volume at that time. Since there is some evidence that long-term lending decreased relative to shortterm lending during the last half of 1946 and that many long-term loans were wholly or partly retired during this period, the relative importance of term loans at this time was probably less than it was six months earlier.

[^13]Manufacturing and mining, as Table 5 shows, is the broad industrial category in which most term lending occurs. As of the date of the survey over two-fifths of the total bank loans to concerns of this kind had a maturity of over a year, and these concerns were responsible for over half of the total

Table 5
Long-term Business Loans of Member Banks, November 20, 1946, by Size and Business of Borrower [Estimates of outstanding loans]

[^14]term loans of all member banks outstanding at that time. Within manufacturing and mining such loans were most common among concerns making metal and metal products, and petroleum companies. Among the other types of enterprise in which term loans were responsible for a substantial proportion of total loans were public utilities and service companies. Indeed, in the case of public utilities the dollar volume of loans outstanding at the date of the survey with a maturity of over a year was three and one-half times that of short-term loans. Wholesale trade, sales finance, and construction companies on the other hand were small users of long-term bank credit at the time of the survey.
One of the most striking findings of the survey
is the relatively large proportion of the term loans that was made to businesses with assets of under $\$ 50,000$ each. It was generally assumed prior to the survey that long-term loans were a much more important source of funds relative to short-term loans for large than for small concerns. Although it is true that the largest size group of business concerns, those with total assets of 5 million dollars or more each, had the largest proportion, over 50 per cent, of long-term to total loans, the smallest size group had the second largest proportion, almost 30 per cent. Businesses with total assets between $\$ 50,000$ and 5 million dollars each accounted for over one billion dollars, or one-fourth of the term loans outstanding at the time of the survey. Term loans amounted to 19 per cent of the total borrowing of these concerns.

It is also striking that term loans were an important part of the total loans of small businesses in most broad industrial groups. Three of the industrial groups in which term loans to small businesses were most prominent were public utilities, services, and retail trade. In retail trade such loans were resorted to most frequently by food and liquor stores, and automobile and auto parts dealers. A sizable portion of these long-term loans to small concerns was undoubtedly loans on or secured by real estate. In contrast, the long-term loans to large concerns were generally either unsecured or secured by plant and equipment.

The largest banks, those with demand deposits of 500 million dollars or more each, were not only responsible for the principal term loan volume but also had the largest proportion of their loans in longterm form. It was the middle-size banks, however, which were responsible for most of the long-term lending to small business.
Legal Form of Business of Bank Borrowers
The loan survey has also provided information for the first time on the legal form of business of bank borrowers, and thus permits a comparison of the proportions of total bank loans that are made to corporations and unincorporated enterprises respectively. From Table 6 it can be seen that, as of late 1946, 72 per cent of the dollar volume of all outstanding bank loans to business were to corporations and 28 per cent to unincorporated firms. That is to say, for every dollar borrowed from a bank by an unincorporated business there were $21 / 2$ dollars borrowed by a corporation.

The relative importance of corporate and noncorporate borrowing varied greatly from industry to industry, ranging from 86 per cent corporate and 14 per cent noncorporate for sales finance companies to 42 per cent corporate and 58 per cent noncorporate in construction. Even within broad industrial groups the range of variation was great. In apparel, dry goods, and department stores, for example, corporate torrowing was over twice as

large as noncorporate borrowing, while in the case of automobile dealers, auto accessory stores, and filling stations noncorporate borrowing was over two and one-half times corporate borrowing. The principal determinant of the industrial variation of this ratio was presumably the relative importance of different legal forms of enterprise in the total populations of firms within individual industries.

The relative importance of different legal forms of business borrowers also varied greatly with size of borrower and size of lending institution. Again, because of differences in the character of the business population, corporations were predominant among large borrowers and unincorporated enterprises more important among small borrowers. Corporate borrowers were also relatively more important among the customers of large banks than they were among those of small banks.

## Changes in the Type of Business of Bank Borrowers Since 1942

In the spring of 1942 the Board of Governors and the Federal Reserve Banks conducted a survey covering the commercial and industrial loans of member banks. Although the data gathered in that survey are not strictly comparable to those collected in the current survey, ${ }^{5}$ a rough comparison can be made between the two sets of data to indicate the differences that have occurred in the industrial character of business bank borrowers. ${ }^{6}$ The earlier survey was undertaken at the beginning of the participation of this country in the war, in part to ascertain the extent to which the banks were engaged in the early war financing of business enterprise, while the current survey was undertaken in part to determine the role banks were playing in business finance during the first postwar period of general economic expansion.

The most striking feature of the comparison is the lack of change in the industrial character of business bank borrowers from 1942 to 1946 . In both periods, manufacturing concerns contributed about two-fifths, the largest single industrial share, of the total loan volume. Trade concerns were the second most important group of borrowers and their relative importance was probably somewhat greater in late 1946 than in early 1942. This may very well have reflected the fact that the seasonal peak in trade borrowings occurs in the late fall.

The most significant change among the remaining broad industrial groups was the decrease in borrowing of construction concerns relative to that of other businesses. This decrease may have been in part the result of seasonal factors, but it was probably due in part to the sharp increase in, and large volume of, construction for war purposes in

[^15]early 1942, the date of the previous survey. In general, it appears that the greatest relative growth in bank indebtedness was in those industries that had little or no war connection, such as retail trade and nondurable goods manufacturing.

It should be remembered that loans with a maturity over one year were omitted from this comparison. Since the extent of such lending increased from 1942 to 1946 and since such loans are most common among public utility and durable goods manufacturers, the growth in the total bank indebtedness of these concerns relative to that of all other concerns is underestimated in a comparison that covers only short-term indebtedness.

## Coverage of the Survey

The sample banks selected for the survey, as is indicated in Table 7, varied in size from very small to very large institutions. Moreover, they were located in all sections of the nation.
These banks were selected in a stratified, random manner consistent with established sampling procedures. All member banks with deposits over 100 million dollars were included. The smaller banks were classified into three size groups and the samples in each size group were chosen so that the results for each group would possess approximately the same degree of reliability. In selecting the samples of the smaller banks, such individual characteristics as geographic and size-of-city location,

${ }^{2}$ As defined for Call Report purposes.
percentage of assets in business loans, and State or national bank status were taken into account. In some Federal Reserve districts the bank sample was increased somewhat to assure its adequacy for regional analyses.

The selection of the loan sample at the participating banks was also accomplished in a stratified, random fashion. Each bank with total deposits over 100 million dollars reported on all of its business loans over one million dollars and on every sixth smaller loan. Banks with total deposits from 10 to 100 million dollars reported on all of their loans over $\$ 100,000$ and on every sixth smaller loan. All other participating banks included data on their entire business loan portfolio.

Two steps were involved in deriving the over-all estimates of commercial loans from the sample data. First, the characteristics of the samples of business loans of the participating banks that reported on only a portion of their smaller loans were expanded to represent those of all business loans of that size at these banks. Secondly, the resulting estimates for the participating banks were raised to cover all member banks in each Federal Reserve district and bank-size group. For the par-
ticipating banks that sampled their smaller loans, the characteristics of the sample data were expanded to cover those of all business loans of that size at these banks on the basis of the relationship between the dollar amount of the sample loans to that of total business loans of that size outstanding in these banks at the date of the survey.
The sample bank estimates were in turn raised to the over-all estimates by Federal Reserve district and by bank-size group on the basis of the relationship between the outstanding "commercial and industrial" loans of the sample banks to those of all member banks on the last Call Report date, June 29, 1946.

The survey covered bank loans to all business concerns except agricultural enterprises. It therefore included not only the major portion of "commercial and industrial" loans as defined by bank regulatory agencies for regular reporting purposes ${ }^{7}$ but also real estate loans made for commercial and industrial purposes. The latter type of loan is included in another classification in the regular bank statistical reports.

[^16]
## REPORTING FORM AND INSTRUCTIONS

## SURVEY OF BANKING LOANS TO COMMERCIAL AND INDUSTRIAL CONCERNS

OUTSTANDING ON NOVEMBER 20, 1946

This survey provides for the analysis of your "commercial and industrial" loans (as defined for Schedule A, Item 1 of the Call Report) and real estate loans made to commercial and industrial concerns (including real estate loans made to individuals for business purposes), outstanding on November 20, 1946.

Please mail the completed worksheet forms to your Federal Reserve Bank on or before December 4, 1946.
A column is provided on the worksheet for entering the names of your borrowers. This column is for your convenience and should be detached and saved but not returned to the Federal Reserve Bank.
The information on individual loans supplied on this schedule will be treated as confidential by your Reserve Bank. The results of the survey will be published only in the form of aggregates for groups of banks. A copy of these results will be sent to you.
Loans to commercial and industrial concerns are defined herein to include real estate loans to commercial and industrial concerns (including real estate
loans made to individuals for business purposes), and all commercial and industrial loans as defined in Schedule A, Item 1, of the Call Report instructions. Such loans include all business loans to individuals, partnerships and corporations, whether secured or unsecured, or whether for the purpose of financing capital expenditures or current operations. Such loans do not, however, include loans which, according to information available at the reporting bank, represent money borrowed for the purpose of purchasing or carrying U. S. Government or other securities. In accordance with the Call Report instructions the types of business for which loan balances are to be reported should exclude financial institutions such as building and loan associations, insurance companies, and such other institutions as hospitals and educational organizations.
Loans made for business purposes in your G. I. loan and consumer credit departments, if any, should be included as commercial and industrial loans.
Please fill out the general questionnaire on page 4 of this form.

## INSTRUCTIONS

Column 1. List the dollar amount outstanding of each commercial and industrial loan drawn into your sample of loans. See enclosed sampling instructions. A series of notes covering one advance of funds to a borrower should be reported as one loan. ${ }^{1}$
Column 2. State the month, day and year the loan was made, or last renewed, if renewed.
Column 3. Enter the month, day and year the loan is due If a serial or instalment loan, insert date last payment is due Columns 4.7. Indicate by a check in the proper column whether the loan is to be repaid by a single payment, by payment of a series of notes, by approximately equal instalment payments, or by unequal instalments. (If the latter, please explain terms in column 20.)
Columns 8.9 . Indicate the rate charged on the loan in the appropriate column. If charge is on an interest basis, show the annual rate in percent in column 8; if note was discounted, insert the annual discount rate in column 9. If more than one rate was charged under a serial note or other arrangement, show the lowest and the bighest rate and give details in column 20.
Column 10. Refer to the table which follows and select the business classification of the borrower. Enter the number opposite the classification in column 10a. Include only one code number; use code referring to largest part of borrower's business. Indicate by a word or two the borrower's principal line or activity in column 10b.
Columns 11-15. Indicate the size of the borrower, as measured by approximate total assets as of some recent date, by a

# COMMERCIAL BANK ACTIVITY IN CONSUMER INSTALMENT FINANCING 

## by

Frieda Baird

Over the past two decades commercial banks have gradually enlarged their consumer instalment financing and during the past year have greatly accelerated the rate of expansion in this field. At the end of 1946 around 11,500 insured banks held about 1.7 billion dollars of consumer instalment paper or more than 40 per cent of the estimated total instalment credit outstanding.
In 1929 bank instalment financing was largely in the hands of industrial or Morris Plan banks. Participation by commercial banks was on a very minor scale, with probably fewer than 200 operating consumer credit departments. The total year-end instalment paper holdings of commercial banks amounted to less than 45 million dollars of loans plus an unknown but comparatively small amount of purchased retail paper. Commercial and industrial banks together probably held less than 200 million dollars of consumer instalment paper. ${ }^{1}$

Beginning in the mid-thirties, the number of commercial banks, apart from industrial banks, participating in consumer instalment financing increased rapidly. The National Bureau of Economic Research estimated that in 1938 about 1,500 banks had consumer or personal loan departments. That many other commercial banks were financing consumers as one of their various loan activities is evidenced by data covering all consumer instalment paper held by insured banks, first collected by the Federal bank supervisory authorities in 1940. At that time in the neighborhood of 11,500 insured commercial and industrial banks reported that they held some consumer instalment paper. ${ }^{2}$

[^17]When regulation of consumer credit was introduced in September 1941, approximately 12,750 insured and noninsured banks reported some holdings of consumer instalment paper. Total instalment paper held by banks amounted to about 1.9 billion dollars, roughly equivalent to 9 per cent of their total loans and discounts, and about 30 per cent of total instalment receivables reported at time of registration. ${ }^{3}$ During the wartime contraction of consumer credit, instalment receivables of banks declined along with those of other lending institutions. However, banks gradually gained in importance in comparison with other lending institutions, and by mid-1945 accounted for approximately 35 per cent of the consumer instalment credit outstanding. The banks' share of this type of lending has expanded rapidly in the postwar revival of consumer instalment financing and at the close of 1946 accounted for approximately 43 per cent of the total.

## Recent Developments in Bank Participation in Consumer Instalment Financing

A directory of banks actively engaged in consumer instalment lending was recently issued by the American Bankers Association. ${ }^{4}$ Some 8,800 banks, or somewhat less than two-thirds of all commercial banks in the country, are listed as participating in various types of consumer instalment financing. About 8,500 are insured banks and nearly 300 are noninsured institutions.
A substantially higher proportion of insured commercial banks are currently engaged in one or more types of instalment financing than is indicated by the listing in the A.B.A. directory. Tabulation of call report data for all insured banks reveals that nearly 11,400 banks held some consumer instalment paper on June 29, 1946, while less than 2,000 , or 15 per cent of the total number, reported none. These figures represent a moderate decline

[^18]from the end of 1941 in both the number and the percentage of insured banks reporting some personal instalment loans and retail instalment paper, and therefore probably do not include all insured banks that are prepared to engage in instalment financing when consumers' durable goods are readily available. In view of the fact that postwar expansion of instalment credit had not reached full momentum by the end of June 1946, a tabulation of condition reports as of six months later might show more insured banks engaged in the business. Consumer instalment loans held by banks increased by almost 900 million dollars during 1946, representing the most rapid rate of expansion in any period since banks have participated extensively in the financing of consumers.

Concentration of Commercial Bank Holdings of Consumer Instalment Paper

Consumer instalment paper held by banks is concentrated largely in the portfolios of about 900 institutions, each of which held $\$ 200,000$ or more in instalment paper. These banks accounted for about 75 per cent of the total amount held by insured commercial banks, although their total assets amounted to something less than 55 per cent of the aggregate for all insured banks.

Because consumer instalment financing involves routinized procedure of credit selection and collection, it is most effectively conducted through specialized consumer loan or personal loan departments. Whether departmentalization is economically justified, however, depends upon a wide variety of factors including size and location of bank, number of employees, type of instalment paper solicited, whether instalment paper is acquired principally from dealers or represents loans made directly to consumers, as well as the total amount of instalment business handled. Discussions in banking circles suggest that $\$ 200,000$ of instalment loans outstanding is close to the minimum necessary for a separate consumer loan department to break even at an annual charge of $\$ 6.00$ per $\$ 100$ advanced. It is reasonably safe to assume, therefore, that insured banks with $\$ 200,000$ of instalment paper on their books include a majority of those operating separate consumer instalment loan departments. If a minimum of say $\$ 100$,000 of instalment loans outstanding is judged adequate to warrant a specialized department, then
some 1,600 banks, or slightly more than the esti mated number in 1938, may be presumed to have had such departments at the end of June 1946. This number of banks accounted for almost 85 per cent of total instalment loans outstanding at insured banks at that time.
More than half of the consumer instalment loans of insured commercial banks in June 1946 was held by 195 institutions or about 2 per cent of the total number of banks participating in such financing. Most large banks and nearly all banks in urban and metropolitan centers, however, are engaged in the business today. Nearly all of the banks having deposits of over 25 million dollars held some consumer instalment paper at the end of June 1946, and in the aggregate these large banks accounted for nearly 60 per cent of the total held by all insured banks. About 95 per cent of the banks situated in population centers of 25,000 or more made consumer instalment loans and held around 75 per cent of the total amount outstanding.

While bank activity in consumer instalment financing is heavily concentrated in the hands of a comparatively small number of large banks situated in urban centers and especially equipped and departmentalized to conduct the business on a volume basis at low cost, many other banks effect additional diversification of their loan portfolios by doing some consumer instalment financing. Of about 9,700 insured banks having under $\$ 100,000$ in consumer instalment loans at mid-1946, nearly two-thirds held less than $\$ 20,000$. They were mainly small banks with less than 10 million dollars in deposits and situated in centers of less than 25,000 population.
Reflecting the fact that consumer instalment financing is essentially an urban phenomenon, a majority of the insured commercial banks not now engaged in instalment lending are situated in smaller communities. More than 90 per cent of those banks reporting no consumer instalment paper were in centers of less than 10,000 population, and in such centers nearly one-fifth of all insured banks had no consumer instalment loans.

## General Characteristics of Bank Instalment Loan Portfolios

The consumer instalment business of banks with small portfolios of instalment paper differs considerably from that of banks with substantial hold-
ings. Condition reports give a three-way classification of consumer instalment paper into retail automobile, other or diversified retail instalment including repair and modernization paper, and personal instalment loans. In June 1946 retail automobile instalment paper was the largest component in the instalment portfolios of banks having less than $\$ 20,000$ outstanding and made up nearly half of the total. At banks with as much as one million dollars invested in instalment loans, automobile paper was the smallest component, making up less than one-fourth of the total amount outstanding.

Retail automobile paper accounted for the major part of the instalment paper held by commercial banks in smaller population centers, a characteristic attributable in considerable part to the relatively high unit income such paper yields in relation to collection costs. In banks situated in centers of 500,000 population and over, automobile paper constituted only about one-fifth of the instalment credit outstanding. The ability of banks in large metropolitan areas to handle instalment paper of lower unit return on a volume basis partly explains their relatively larger holdings of diversified retail instalment paper and personal instalment loans. While this pattern of portfolio composition relates to a period when automobile paper was being generated in relatively small volume, it would generally characterize a situation in which automobile production and sales were at much higher levels. This would result partly from the active demand in urban areas for other types of consumer credit, and partly from the intense competition for automobile paper which commercial banks in urban centers meet from other financing institutions, particularly sales finance companies.

Among the banks having instalment portfolios in excess of one million dollars and also among banks in population centers of more than 500,000 people, diversified retail instalment paper accounted for about two-fifths of their consumer instalment paper. Repair and modernization paper was a larger element in the diversified financing of these banks than of banks with comparatively small instalment portfolios. Estimates based on a sample of commercial banks indicate that from 20 to 30 per cent of the instalment loan portfolios of banks having one million dollars or more outstanding consist of repair and modernization paper while the pro-
portion for banks having less than one million dollars outstanding probably ranges from 5 to 15 per cent.

Single-payment loans to individuals exceed the consumer instalment loan portfolio of most banks by a substantial margin. When banks were grouped by amount of consumer instalment paper held, instalment loans outstanding exceeded single-payment loans only at banks holding in excess of 5 million dollars of instalment paper. In the case of banks whose instalment paper amounted to less than $\$ 20,000$, there were $\$ 6.00$ of loans to individuals on a single-payment basis to every $\$ 1.00$ on instalment terms. For banks holding more than 5 million dollars of instalment paper, nearly $\$ 2.00$ out of every $\$ 3.00$ of total loans to individuals were represented by instalment notes.

Instalment loans, however, constitute a steadily increasing proportion of total loans to individuals as the size of the instalment portfolio increases. This shift reflects not only variation in loan practices among banks of differing size and operating situation, but also the amount of effort which some banks have made to put loans for consumption purposes on a scheduled repayment basis. A part of the recent growth in consumer instalment loans at commercial banks may represent a conversion of noninstalment credit to an instalment basis rather than a net addition to credit extended toindividuals. The relatively small rise in singlepayment loans of commercial banks, estimated at about 35 per cent during 1946 compared with an increase of more than 100 per cent in instalment loans outstanding at banks, tends to support this interpretation. Since mid-1942 it has been the policy of the bank supervisory agencies to encourage the regular amortization of loans to individuals.

Consumer instalment paper, on the average, represented a comparatively small percentage of total loans and discounts of commercial banks engaged in such lending in June 1946. Aside from banks in communities of less than 2,500 or more than 500,000 population, consumer instalment paper ranged on the average from around 7 to nearly 8 per cent of total loans and discounts of banks active in instalment financing. Similar percentages are found when banks are grouped by size of deposits, except that in the largest size classbanks with 100 million dollars or more of deposits
-consumer instalment paper averaged only 3 per cent of all loans. Inasmuch as banks of this size are located in the larger financial centers and are chiefly engaged in commercial and industrial lending, their consumer instalment business is bound to make up a small fraction of total loans even when it is large in dollar volume. For banks having instalment portfolios of $\$ 20,000$ or less, consumer instalment paper averaged less than 2 per cent of total loans, but for banks having more than this amount outstanding, the average ranged from 5 to 7 per cent of the total.

That these averages conceal wide variations in the percentage ratios for individual banks is evident from an analysis of the ratios for 373 banks having half a million dollars or more invested in instalment paper. Consumer instalment paper constituted less than 10 per cent of total loans at 167 of these banks, from 10 to 40 per cent at 165 banks, and ranged from 40 to around 95 per cent of total loans for the remaining 41 banks. The proportion of all insured banks having 40 per cent or more of total loans in consumer instalment paper is probably small. At the end of 1941, only 4 per cent of the total number of banks engaged in instalment lending had consumer instalment paper amounting to 40 per cent or more of total loans, while at approximately 60 per cent of these banks consumer instalment paper constituted less than 10 per cent of total loans and discounts.

Gross bank earnings on consumer instalment paper typically exceed gross returns from a comparable dollar volume of commercial and other paper. Consequently the importance of consumer instalment business to total bank earnings is significantly greater than the ratio of such paper to total loans indicates.

## Regional Variation in Bank Instalment Financing

Commercial bank activity in consumer instalment financing varies considerably by regions, as is shown by tabulation of June 29, 1946 call data by Federal Reserve districts. The proportion of banks reporting no consumer instalment loans was highest in those districts having a relatively large number of small independent unit banks situated in small towns and rural communities. In the San Francisco District, where branch banking largely prevails, only 33 banks, or about 7 per cent of the
total number, were not engaged to some extent in instalment financing.
The relative importance of consumer instalment paper in loan portfolios of commercial banks also differs widely among Federal Reserve districts. In the Richmond, Minneapolis, Philadelphia, and San Francisco Districts consumer instalment loans were a considerably higher-than-average percentage of total loans and discounts; and in the New York District, with its large banks in the country's principal financial center, they constituted a much lower-than-average percentage. The ratio of consumer instalment loans to total loans and discounts was 5 per cent for all insured commercial banks engaged in instalment business with a low of about 3 per cent for banks in the New York District and a high of nearly 8 per cent for those in the Richmond District. These regional differences reflect differences in banking practices and in the character of the bank credit market.

The composition of instalment loan portfolios varies considerably from one section of the country to another. In the Boston, New York, Philadelphia, and Richmond Districts, personal instalment loans predominate, constituting 50 per cent or more of all instalment loans outstanding. Retail automobile paper accounts for two-fifths or more of the instalment paper in three Western DistrictsKansas City, Dallas, and San Francisco. Diversified retail instalment financing, which is heavily weighted with repair and modernization loans, is about 40 per cent of all consumer instalment paper in the Chicago, Minneapolis, and New York Districts, but only around 20 per cent in the Richmond and Dallas Districts. To some extent these geographic differences reflect variations in consumers' demand for instalment financing. Large wage-earning and salaried groups account in part for the predominance of personal instalment loans in the portfolios of banks in the industrial areas of the East and South. Differences in demand likewise may account for the greater relative importance of retail automobile paper in the portfolios of banks in the West and Southwest. At present, however, regional differences in the type of paper held are largely due to the selective character of banks' instalment financing. Many banks, including some with large holdings of instalment paper, specialize in particular types of instalment business. Consequently, the lending
policies of a few institutions largely determine the composition of bank instalment portfolios in the area.

## Tabulation of Consumer Loans of Insured Banks

Consumer loans to individuals as reported by all insured commercial banks on June 29, 1946 condition reports are summarized in the following tables. Instalment loans outstanding as shown here represent gross amounts; that is, borrowers' instalment payments which are held in special de-
posit accounts and not immediately applied to reduce the face amount of the note have not been deducted. Consequently the amount due from consumers on instalment paper held by banks at the end of June 1946 is overstated by approximately 65 million dollars. Inasmuch as the monthly consumer credit estimates for commercial and industrial banks presented on pages $322-323$ of this Bulletin are on a net basis and include an allowance for instalment credit at noninsured banks, they are not entirely comparable with the data presented in the following tables.

## LAW DEPARTMENT

## Administrative interpretations of banking laws, new regulations issued by the Board of Governors, and other similar material.

## Consumer Credit

## Automobile License Taxes and Fees

Taxes and fees payable as a prerequisite to obtaining license plates in the name of the purchaser of a used automobile, when paid as part of the cash price, may be added in computing the appraisal guide value under Part 4 of the Supplement to Regulation W.

## Kitchen Cabinets

In view of recent developments in the type of kitchen cabinets currently being marketed in volume, the Board has reviewed its previous rulings ( 1941 Federal Reserve Bulletin, p. 848 and 1946 Federal Reserve Bulletin, p. 1240) and has concluded that kitchen cabinets should no longer be considered to be "furniture" for purposes of Regulation W.

## Sets and Groups of Articles

In reply to a recent request for its advice regarding the application of section $6(h)$ of Regulation W covering "Sets and Groups of Articles" the Board expressed the following views.

In determining whether several items are to be considered a single "article" for purposes of Regulation W, as a "set, group, or assembly," three basic requisites must be considered:

1. The items must be so related as to constitute a set, group, or assembly;
2. They must be commonly merchandised as a single unit; and
3. They must be sold or delivered at substantially the same time.

The first requisite is that the items shall be related. This is principally a matter of function. Examples which would be included are components of a sectional bookcase, dining-room table and extension leaves, lounge chair and matching ottoman, living-room, dining-room, and bedroom suites. On
the other hand, a refrigerator and a vacuum cleaner or a radio and a chair clearly would not be deemed sets even if offered in combination. Similarity of design would be a contributing factor, confirming the determination made on functional grounds and helping to decide doubtful cases. But some variation in design would be possible without necessarily excluding the items from being considered to be a set. In many instances, one or both of the items would have appreciably less utility or worth to the purchaser if acquired separately, as for example in the case of a rug-pad and rug but not in the case of a lamp-table and table lamp.
The second requisite is that the items shall be commonly merchandised as a single unit. This requisite refers to the merchandising practices of the particular seller, and practices in the particular trade would be significant in throwing light on the practices of the seller. The essential consideration is how the items are offered to customers. In this connection, such matters as the ways in which the items are advertised, ticketed, and priced would be important. When they are available at a price which is less than the total of the prices for the components if bought separately or when it is only seldom that the seller is willing to sell them separately, there would be a strong indication that the items are to be considered a set. In some cases, the same items will be offered both as sets and for individual purchase, as when a tank type vacuum cleaner and a motor-driven brush type vacuum cleaner are offered separately and also in combination at a reduced price.
The third requisite is self-explanatory.
In order for section 6(h) of Regulation W to be applicable to the items as a set, all three requisites must be present. For example, a sofa and matching lounge chair or bed-springs and mattress might meet fully the requirement that they be related, but the method of offering might be such that they are separately priced, without reduction when bought in combination, and the customer has a
free choice as to whether he will buy one or the other or both. In such cases, the items would not be considered to be a set even though bought at the same time.

## Status of Rulings Made Prior to Revision of Regulation

The revision of Regulation $W$ which became effective December 1, 1946 made obsolete a number of published rulings, and many rulings had already become obsolete before that date. Moreover, in revising the regulation, the questions involved in a number of other rulings were covered by the text of the revised regulation so that there would no longer be any need to refer to the rulings themselves. Of the rulings which continue to be applicable, the more important are summarized below. The summaries are arranged in approximately the same order as the provisions of the revised regulation to which they relate.

Isolated transaction_-Although an automobile salesman may sell his demonstrator as an isolated transaction on terms which do not comply with the regulation, the dealer-employer, if a Registrant, may not purchase the resulting obligation unless it complies with the requirements of the regulation. Of course, if the relation of the salesman and the dealer is such that the automobile is in effect the property of the dealer rather than of the salesman, the sale would be subject to the regulation.

Bank discounting obligation_A bank which discounts an obligation is nọt required to ascertain whether the lender is licensed under the regulation.

Excess down payment.-A purchaser who has made a down payment in excess of the amount required by the regulation may not later have the excess applied as part of the down payment on another listed article.

Add-on sale over $\$ 2,000$.-An add-on sale of a listed article having a cash price of $\$ 900$ which is consolidated with an existing obligation of $\$ 1,200$ resulting in a total credit of more than $\$ 2,000$, is not subject to the regulation, and therefore no down payment is required in connection with the add-on sale. However, if the total credit is less than $\$ 2,000$, the down payment is required.

Loan over $\$ 2,000$-A loan over $\$ 2,000$ is not subject to the regulation even if a part of it is to be used to pay off an indebtedness which was
subject to the regulation. The renewal or revision of a loan which was originally more than $\$ 2,000$ is not subject to the regulation even though the balance at the time of renewal or revision is less than $\$ 2,000$. If instead of renewing or revising such an obligation, the lender makes one instalment loan of less than $\$ 2,000$, part of the proceeds of which are to be used to pay off the old obligation, only the part of the loan representing new money is subject to the regulation. In such cases, however, it would ordinarily be better practice for the lending institution to keep the two credits separate.
Delay in delivery-If the article sold is not going to be delivered until a date subsequent to the date of the contract, the maximum maturity may be calculated from the date of delivery and the first instalment may fall due one month after the date of delivery with, of course, the usual option under section $6(b)$ of making the 15 -day adjustment permitted by that section with respect both to the maximum maturity and the date of the first instalment.

Record of instalment sale.-The "Record of Instalment Sale" described in section 6(c) need not be on a single sheet of paper and need not use the terminology used in that section. The cash price may be shown as a total without itemizing taxes and accessories, but the accessories must be identified.

Agreement to convert charge account.-The sale of a listed article in a charge account with an agreement or understanding that the credit will later be converted into an instalment contract violates sections 3(a) and 6(i).
Side loan to make down payment.-The words "any other extension of credit" in section $6(j)$ include but are not confined to other extensions of instalment credit.

Investment securities.-Savings pass books are not "investment securities" under section 7( $f$ ).

Loans to carry securities.-The word "carrying" in section $7(f)$ means the refinancing of any indebtedness originally incurred for the purpose of purchasing investment securities.
Section $7(f)$ would not exempt a loan made by a credit union secured by its shares to enable the borrower to purchase such shares if there were an agreement that the borrower would be permitted
to withdraw any portion of the share account at any time if the credit union felt that the loan was otherwise adequately secured, because such a loan would have a dual purpose and not the single purpose mentioned in section $7(f)$.
Single payment or instalment credit-An extension of credit, which upon its face is repayable in only one scheduled payment, is an extension of instalment credit if at the time it is made the lender and the borrower have an understanding that the borrower will be required to make only a partial payment at maturity and that the balance will be renewed. However, if a Registrant makes a sale on credit under an agreement which does not expressly provide for instalment payments by the customer, the transaction need not be treated as an "instalment sale" even though the customer has previously made partial, divided, or serial payments in his account, or, regardless of previous practice, indicates an intention to do so in this instance, provided there is no bilateral understanding between the customer and the seller that the customer is required to make payments in such manner. Likewise, an ordinary bank loan evidenced by a promissory note payable in full at maturity is not an "instalment" loan subject to the regulation even though the bank may anticipate that at the maturity of the note it may accept partial payment and a renewal note, provided the bank makes no commitment to do so and the transaction is entered into in good faith and not as a means of evading the regulation.

Lease with option to purchase.-A lease with an option to purchase is an "extension of credit" within the meaning of the regulation, and the lessor should obtain the down payment and periodic payments which would be required in the event of a sale. If the lessee decides not to exercise his option to purchase, the Registrant may return to him the difference between these payments and the amount of rental agreed upon. Of course, the regulation does not apply to a bona fide rental without an option to purchase.

Obligation payable to seller or financial institution. -If the seller of a listed article takes an instalment note in payment, the transaction is a sale subject to the regulation, whether the note is payable to the seller or to a bank or finance company. If the seller of an unlisted article takes a note payable to
himself, the transaction is exempt from the regulation because the regulation does not apply to the sale of an unlisted article. However, if the seller of an unlisted article takes an instalment note payable to a bank or finance company, the transaction (if for $\$ 2,000$ or less) is subject to the regulation as an instalment loan.
Notes payable to insurance agents for premiums are not subject to the regulation, because insurance is not a listed article. However, an instalment loan by a bank for the purpose of paying such premiums is subject to the regulation, except as provided in section 7(e).
"Principal amount" defined.-The phrase "principal amount" (of a loan) in section $8(h)(6)$ means the principal amount lent, excluding any interest, finance charges, service charges and insurance costs, whether or not deducted in advance. For example, if a borrower received $\$ 1,950$ and signs a note on a discount basis for $\$ 2,040$, the loan is in a principal amount of less than $\$ 2,000$.
The phrase "principal amount" (of a sale) in section $8(h)(5)$ has a similar meaning and refers to the deferred balance (that is, the difference between the down payment and the cash price).
Listed articles.-The classification "automobiles" includes station wagons and the "Jeep Station Wagon" (trade name). It does not include trailers, ambulances, hearses or jeeps.
The classification "mechanical refrigerators" does not include cabinets ta hold or display ice cream and other products for sale; nor coin operated machines for dispensing beverages; nor water coolers; nor milk coolers designed for household use. The classification "mechanical refrigerators" includes a system consisting of one or more cabinets, each of which has less than 12 cubic feet capacity and a separate mechanical refrigeration unit serving these cabinets, even though the total capacity of the system is more than 12 cubic feet.
The classification "air conditioners, room unit" includes portable units of 1 horse power or less.

Repair and replacement parts for automobiles, refrigerators and other listed articles are not themselves listed articles.

The classification "household furniture" includes mirrors, unpainted furniture, kitchen or breakfast room sets, and swings. It does not include pictures, chinaware, cooking utensils or silver-plated flat-
ware. A piece of furniture, such as a table, lamp or a bed having a radio built into it, is to be classified in accordance with the relative value of the component parts so that if the value of the radio is greater than the value of the lamp as a separate piece of furniture, the article should be classified as a radio. Furniture of the type used in households is subject to the regulation even though the particular piece may be sold for use in an office, hospital, store or other commercial building.

Calculating down payment on automobiles.-Taxes and fees payable as a prerequisite to obtaining license plates may be included in the "cash price" of the automobile.

The equity in a used car may be used as a down payment on another car, and for this purpose the dealer may accept the first car and pay off the contract on it. However, if the owner obtains a loan to pay off the contract on his old car, and in addition uses the car as a trade-in, the loan would violate section $6(j)$.

Calculating down payment on other articles.When an article is traded in on a listed article other than an automobile, Part 5 of the Supplement requires that the value of the article traded in (or the value of the purchaser's equity in it) be deducted in order to ascertain the net price to be used in calculating the down payment or loan value of the article being purchased. However, Part 5 of the Supplement does not prohibit the seller from taking back an article which is unsatisfactory to the purchaser if the seller allows the full purchase price as a credit against the price of the new article. Of course, if the price of the new article in such a case is inflated in order to offset depreciation in the original article, the transaction would violate Part 5 and section $6(i)$.

In addition to those summarized above, there are a number of published rulings which, although not obsolete, deal with special situations and are not of general interest. These rulings, which are arranged in the order in which the subjects are dealt with in the regulation, were published in the Federal Reserve Bulletin at the following pages:

## Foreign Funds Control

## Treasury Department Release

The following release relating to transactions in foreign exchange, etc., in addition to those heretofore published in the Federal Reserve Bulletin, has been issued by the Office of the Secretary of the Treasury under authority of the Executive

## LAW DEPARTMENT

Order of April 10, 1940, as amended, and the Regulations issued pursuant thereto:

Treasury Department
Foreign Funds Control
January 16, 1947
General License No. 87, as Amended
Under Executive Order No. 8389, As Amended, Executive Order No. 9193, As Amended, Section 5(b) of the Trading with the Enemy Act, As Amended by the First War Powers Act, 1941, Relating to Foreign Funds Control.*
General License No. 87 (31 CFR, 1943 Supp., 131.87) was amended on January 16, 1947, to read as follows:

EXEMPTIONS FROM SECTION 2A (2) OF THE ORDER AND FROM general ruling no. 5
(1) Transactions exempted from Section $2 A$ (2) of the Order. A general license is hereby granted exempting all transactions from the provisions of Section 2A (2) of the Order, except transactions with respect to any securities or evidences thereof which, whether in registered or bearer form, are transferable or assignable and which either

[^20](a) were issued or guaranteed prior to December 7, 1941, by the United States or any state, territory, district, possession, or other political subdivision, agency or instrumentality of or in the United States or by any partnership, association, corporation or other organization organized or having its principal place of business in the United States; or
(b) were issued prior to December 7, 1941, and are payable in the United States exclusively or alternatively in United States dollars, regardless of the nature or location of the issuer;
provided that this exception shall not be deemed to preclude transactions with respect to securities or evidences thereof which are physically situated in Great Britain, Canada, Newfoundland, or Bermuda, or to which Form TFEL-2 has been attached, or with respect to which a certification under paragraph (1) of General License No. 95 has been issued.
(2) Exemption of certain currencies and securities from General Ruling No. 5. The following currencies and securities are hereby exempted from the provisions of General Ruling No. 5:
(a) United States currency in denominations of $\$ 20$ or less and all foreign currencies; and
(b) All securities other than those to which the exception of paragraph (1) hereof applies.

John W. Snyder, Secretary of the Treasury.

## BANKING STUDIES

Copies of a paper-bound reprint of Banking Studies are now available for distribution. The 496-page volume, comprising seventeen papers on banking and monetary subjects written by members of the Board's staff, was published in August 1941. As stated in the preface, the purpose of the studies is "to present in brief form and simple language the substance of a large mass of information bearing on banking and monetary problems that the

Federal Reserve System has accumulated during its quarter century of operation, and particularly during the past decade." Copies may be purchased for $\$ 1.00$ each, or for 75 cents each in group orders of 10 or more for single shipment. Orders should be sent to the Division of Administrative Services, Board of Governors of the Federal Reserve System, Washington 25, D. C.

## CURRENT EVENTS

## Federal Reserve Meetings

A meeting of the Presidents of the Federal Reserve Banks was held in Washington on February 25 and 26, 1947, and on February 28 the Presidents met with the Board of Governors.

On February 27 and 28 and March 1 meetings of the Federal Open Market Committee were held. At the meeting on March 1, Marriner S. Eccles was re-elected as Chairman of the Committee and Allan Sproul as Vice Chairman. The representative members of the Committee elected by the Federal Reserve Banks for the period of one year, beginning March 1, 1947, are Laurence F. Whittemore, Allan Sproul, Ray M. Gidney, Chester C. Davis, and John N. Peyton, Presidents of the Federal Reserve Banks of Boston, New York, Cleveland, St. Louis, and Minneapolis, respectively. The members of the executive committee are Marriner S. Eccles, Chairman; Allan Sproul, Vice Chairman; Ernest G. Draper; James K. Vardaman, Jr.; and Chester C. Davis.

The Federal Advisory Council met in Washington on March 9-11. The annual organization meeting of the Council was held on March 9, at which Edward E. Brown, Chairman of the First National Bank of Chicago, was re-elected President, C. E. Spencer, Jr., President of the First National Bank of Boston, was re-elected Vice President, Walter Lichtenstein was reappointed Secretary, and Herbert V. Prochnow was appointed Acting Secretary. The Council met with the Board of Governors of the Federal Reserve System on March 11.

## Death of Director

Mr. D. P. Tillett, President, Union National Bank, Charlotte, North Carolina, who had served as a director of the Charlotte Branch of the Federal Reserve Bank of Richmond since January 1, 1947, died on February 27, 1947.

Appointment of Class C Director
and
Designation as Chairman and Federal Reserve Agent
The Board of Governors, on March 6, 1947, announced the appointment of Mr. Clarence W.

Avery of Detroit, Michigan, as a Class C director of the Federal Reserve Bank of Chicago for the remaining portion of the three year term ending December 31, 1948. He was also designated as Chairman and Federal Reserve Agent of the Bank for the remaining portion of the year 1947.
Mr. Avery is Chairman of the Board and President of the Murray Corporation of America. He has previously served as a director of the Detroit Branch of the Federal Reserve Bank of Chicago and subsequently as a Class B Director at Chicago.

## Appointment of Branch Director

The Board of Governors of the Federal Reserve System on March 12, 1947, announced the appointment of Mr. W. T. Bland of Lake Jem, Florida, as a director of the Jacksonville Branch of the Federal Reserve Bank of Atlanta for the unexpired portion of the term ending December 31, 1949. Mr. Bland is a citrus fruit grower and nurseryman.

## Admissions of State Banks to Membership in the Federal Reserve System

The following State banks were admitted to membership in the Federal Reserve System during the period January 16, 1947 to February 15, 1947:

> Georgia

Blackshear-The Blackshear Bank Colquitt-Citizens Bank

Louisiana
Bastrop-Bastrop Bank \& Trust Co.
New York
Dobbs Ferry-Dobbs Ferry Bank
Ohio
Niles-The Dollar Savings Bank Company
Oklahoma
Cleo Springs-Cleo State Bank, Cleo Springs
South Carolina
Darlington-Citizens Bank of Darlington
Texas
Houston-Hampton Oaks State Bank

## NATIONAL SUMMARY OF BUSINESS CONDITIONS

[Compiled February 25, and released for publication February 27]

Industrial output reached a new record peacetime level in January-one-sixth higher than at the beginning of last year. Dollar volume of retail sales during January and the early part of February was substantially larger than in the same period last year, reflecting mainly increased prices. Prices of agricultural commodities have risen in recent weeks, following earlier declines, and prices of building materials have shown further increases.

## Industrial Production

Total output at factories and mines in January was at a rate of 188 per cent of the 1935-39 average, according to the Board's seasonally adjusted index, as compared with 181 in December and with the previous peacetime peak of 183 in November. The large rise in January reflected chiefly sharp gains in output of coal, iron, and steel. Production of these materials had been curtailed in November and December owing to the bituminous coal work stoppage.

Production of iron and steel in January was in the largest volume since May 1945. Steel mill operations averaged 93 per cent of capacity and were at a slightly higher scheduled rate during the first three weeks of February. Output of build-

Federal Reserve indexes. Groups are expressed in terms of points in the total index. Monthly figures, latest shown are for January.
ing materials was maintained at an unusually high level for this season, and activity in the nonferrous metals, machinery, and transportation equipment industries was maintained close to the December rate.
Production of nondurable goods was at a rate of 177 per cent of the 1935-39 average in January as compared with 173 in November and December. Activity in the chemicals, foods, and paper and printing industries reached new postwar peak rates in January, while output of most textile and leather products was below earlier peak rates.
Output of bituminous coal, after being curtailed in November and December, increased in January to the highest level in twenty years and was 9 per cent above a year ago. Production of metals advanced somewhat, while output of anthracite and crude petroleum declined slightly.

## Employment

Employment in manufacturing and most other nonagricultural industries continued to show little change in January, after allowing for the usual seasonal variation. The number of persons unemployed increased further to a level of 2.4 million.

Bureau of Labor Statistics' indexes. Weekly figures, latest
shown are for week ending Feb. 22 .

## Construction

Value of construction contracts awarded, as reported by the F. W. Dodge Corporation, increased by one-fourth in January following a marked decline during the preceding seven months. About one-half of the increase was accounted for by public nonresidential construction, reflecting chiefly large awards for Veterans' hospitals. Residential contracts expanded by one-third due principally to awards for several large apartment projects.

## Distribution

Value of department store sales in January and the early part of February was maintained close to the level prevailing since last June, after allowance is made for the usual seasonal changes. Sales during the first seven weeks of this year were 17 per cent larger than the same period last year. Sales at other retail stores were at a relatively higher level compared with last year, reflecting mainly advanced prices for foods and increased supplies of such durable goods as automobiles and hardware. Unit sales of numerous nondurable goods apparently have declined somewhat from earlier advanced levels.

Freight carloadings increased somewhat further in January, reflecting chiefly increased shipments of coal, iron, steel, and lumber. Shipments of most manufactured products and agricultural commodities showed little change. Shortages of cars continued to limit the movement of some classes of freight.

Wednesday figures, latest shown are for Feb. 26.

## Commodity Prices

Prices of farm products and foods, which declined from the middle of December to the latter part of January, have risen since that time, reflecting partly severe weather conditions and increased Federal export allocations for grains. Wholesale prices of most industrial products have shown little change but building material prices have increased further.

## Bank Credit

Income tax collections greatly increased Treasury deposits at the Reserve Banks in January and the first half of February and placed member banks under moderate reserve pressure. A post-holiday return flow of currency of about 900 million dollars and an increase in monetary gold stock supplied some reserve funds to member banks and there was a decline in required reserves. To maintain their reserve positions, however, banks sold shortterm Government securities to the Reserve Banks.

Bank deposits were also reduced by tax collections, notwithstanding the return flow of currency. At member banks in leading cities demand deposits adjusted declined by 1.3 billion dollars in the four weeks ending February 19. Commercial and industrial loans continued to expand during January and early February; the rate of increase was more moderate than during last summer and fall. Government security holdings declined further, reflecting Treasury debt retirement and bank sales of bills and certificates.

Demand deposits (adjusted) exclude U. S. Government and interbank deposits and collection items. Government securities include direct and guaranteed issues. Wednesday figures, latest shown are for Feb. 26.

Tables on the following pages include the principal available statistics of current significance relating to financial and business developments in the United States. The data relating to the Federal Reserve Banks and the member banks of the Federal Reserve System are derived from regular reports made to the Board; index numbers of production are compiled by the Board on the basis of material collected by other agencies: figures for gold stock, money in circulation, Treasury finance, and operations of Government creart agencies are obtained principally from statements of the Treasury, or of the agencies concerned; data on money and security markets and commodity prices and other series on business activity are obtained largely from other sources. Back figures for banking and monetary tables, together with descriptive text, may be obtained from the Board's publication, Banking and Monetary Statistics; back figures for most other tables may be obtained from earlier Bulletins.

${ }^{1}$ Outside Treasury and Federal Reserve Banks. Includes any paper currency held outside the continental limits of the United States; totals for other end-of-month dates shown in table above, totals by weeks in table on p. 281, and seasonally adjusted figures in table on p. 290.
${ }^{2}$ Includes $\$ 1,800,000,000$ Exchange Stabilization Fund and $\$ 156,039,431$ held as reserve against United States notes and Treasury notes of 1890; the balance resulting from reduction in weight of the gold dollar, also included, is not shown in the circulation statement beginning July 31 1945.
i To avoid duplication, amount of silver dollars and bullion held as security against silver certificates and Treasury notes of 1890 outstanding is not included in total Treasury currency outstanding.

4 Because some of the types of money shown are held as collateral or reserves against other types, a grand total of all types has no special significance and is not shown. See note of explanation of these duplications. ${ }^{5}$ Less than $\$ 500,000$.

Note.-There are maintained in the Treasury-(i) as a reserve for United States notes and Treasury notes of $1890-\$ 156,039,431$ in gold bullion; (ii) as security for Treasury notes of 1890-an equal dollar amount in standard silver dollars (these notes are being canceled and retired on receipt); (iii) as security for outstanding silver certificates-silver in bullion and standard silver dollars of a monetary value equal to the face amount of such silver certificates; and (iv) as security for gold certificates-gold bullion of a value at the legal standard equal to the face amount of such gold certifcates. Federal Reserve notes are obligations of the United States and a first lien on all the assets of the issuing Federal Reserve Bank. Federal Reserve notes are secured by the deposit with Federal Reserve agents of a like amount of gold certificates or of gold States. Federal Reserve Banks must maintain a reserve in gold certificates of at least 25 per cent, including the redemption fund which must be deposited with the Treasurer of the United States, against Federal Reserve notes in actual circulation; gold certificates pledged as collateral may be counted as reserves. "Gold certificates" as herein used includes credits with the Treasurer of the United States payable in gold certificates. Federal Reserve Bank notes and national bank notes are in process of retirement.

MONEY IN CIRCULATION WITH ADJUSTMENT FOR SEASONAL VARIATION

| February | 28,300 | 28,300 | -158 |

${ }^{1}$ For end of year figures, represents change computed on absolute amounts in first column.
Note.-For discussion of seasonal adjustment factors and for back figures on comparable basis see September 1943 Bulletin, pp. 822-826. Because of an apparent recent change in the seasonal pattern around the year end, adjustment factors have been revised somewhat for dates affected, beginning with December 1942; seasonally adjusted figures for money in circulation, as shown in Banking and Monetary Statisfics, Table 111, p. 414, and described on p. 405, are based on an older series of adjustment factors.

ANALYSIS OF CHANGES IN GOLD STOCK OF UNITED STATES

Revised.
${ }_{1}^{1}$ National series for which bank debit figures are available beginning with 1919.
Annual figures for 1937-1942 (old series) include 133 centers; annual figures for 1942 (new series) and subsequent figures include 193 centers.
See page 717 of August 1943 Bulletin for description of revision beginning with May 1942; deposits and debits of new series for first four months of 1942 partly estimated.

Nore.-Debits to total deposit accounts, except interbank accounts, have been reported since 1942 for 334 reporting centers; the deposits from Which rates of turnover have been computed have likewise been reported by most banks and have been estimated for others. Debits to demand deposit accounts, except interbank and U. S. Government, and the deposits from which rates of turnover have been computed have been reported by member banks in 101 leading cities since 1935; yearly turnover rates in this series differ slightly from those shown in Banking and Monetary Statistics, Table 55, p. 254, due to differences in method of computation.

${ }_{2}^{1}$ Beginning with January 1947, figures are for the last Wednesday of each month. $p$ Preliminary.
${ }^{2}$ Includes demand deposits, other than interbank and U. S. Government, less cash items in process of collection.
${ }^{3}$ Beginning with December 1938, includes United States Treasurer's time deposits, open account.
${ }^{4}$ Excludes interbank time deposits and postal savings redeposited in banks.
${ }_{5}^{5}$ Beginning June 1941, the commercial bank figures exclude and mutual savings bank figures include three member mutual savings banks.
${ }^{6}$ Includes both amounts redeposited in banks and amounts not so redeposited; excludes amounts at banks in possessions.
Note.-Except on call dates, figures are rounded to nearest 100 million dollars. See Banking and Monetary Statistics, p. 11, for description and Table 9, pp. 34-35, for back figures.

* These figures do not include data for banks in possessions of the United States and therefore differ from those published by the Federal Deposit Insurance Corporation.
${ }^{1}$ During the period Dec. 31, 1942-June 30, 1945, agricultural loans included loans to dealers, processors, and farmers' cooperatives covered by purchase agreements of the Commodity Credit Corporation, which are now classified as commercial and industrial loans; consequently, beginning Dec. 31,1945 , these items may not be entirely comparable with prior figures
${ }^{2}$ During 1941 three mutual savings banks with total deposits of 8 million dollars became members of the Federal Reserve System. These banks are included in "member banks" but are not included in "all insured commercial banks."
: Central reserve city banks.

${ }^{1}$ Monthly figures are averages of weekly prevailing rates.
The average rate on 90-day stock exchange time loans was 1.50 per cent beginning Aug. 2,1946. Prior to that date it was 1.25 per cent.

Rate on new issues oflered within period
From Sept. 15 to Dec. 15, 1945, included Treasury noter of Sept 15, 1948, and Treasury bonds of Dec. 15, 1950; beginning Dec. 15 1945, includes only Treasury bonds of Dec. 15, 1950.

Back figures.-See Banking and Monetary Statistics, Tables 120-121 pp. 448-459, and the Bulletin for May 1945, pp. 483-490.

- Revised.
${ }^{1}$ Estimates of new issues sold for cash in the United States.
${ }^{2}$ Gross proceeds are derived by multiplying principal amounts or number of units by offering price.
${ }^{3}$ Estimated net proceeds are equal to estimated gross proceeds less cost of flotation, i.e., compensation to underwriters, agents, etc., and expenses. "Includes repayment of other debt and other purposes. publication of the Board of Governors.

[^38]$p$ Preliminary.
Nore.-Unadjusted data compiled by Bureau of Labor Statistics. Estimates for manufacturing have been adjusted to levels indicated by final 1944 data made available by the Bureau of Employment Security of the Federal Security Agency. Estimates include all full- and part-time wage and salary workers in nonagricultural establishments employed during the pay period ending nearest the 15th of the month. Proprietors self-employed persons, domestic servants, and personnel of the armed forces are excluder!. January 1947 figures are preliminary. For back seasonally adjusted estimates see Bulletin for June 1944, p. 600. Back unadjusted data are available from the Bureau of Labor Statistice.

*Less than $\$ 500,000$.
1 Mortgages insured under War Housing Title VI through April 1946; figures thereafter represent mainly mortgages insured under the Veterans' Housing Title VI (approved May 22, 1946) but include a few refinanced mortgages originally written under the War Housing Title V1.

Note.-Figures represent gross insurance written during the period and do not take account of principal repayments on previously insured loans. Figures include some reinsured mortgages, which are shown in the month in which they were reported by FHA. Reinsured mortgages on rental and group housing (Title II) are not necessarily shown in the month in which reinsurance took place.

1 The 1941 average of monthly sales for each department is used as a base in computing the sales index for that department. The stocks index is derived by applying to the sales index for each month the corresponding stock-sales ratio. For description and monthly indexes of sale were reversed
${ }^{2}$ The ratio of stocks to sales is obtained by dividing stocks at the end of the month by sales during the month and hence indicates the number of months supply on hand at the end of the month in terms of sales for that month.

For movements of total department store sales and stocks see the indexes for the United States on p. 319.

${ }^{p}$ Preliminary. ${ }^{1}$ Figures include only personal instalment cash loans and retail automobile direct loans shown on the following page, and a small amount of other retail direct loans not shown separately. Other retail direct loans outstanding at the end of January amounted to 67 million dollars, and loans made during January were 10 million.
: Figures include only personal instalment cash loans, retail automobile direct loans, and other retail direct loans. Direct retail instalment loans are obtained by deducting an estimate of paper purchased from total retail instalment paper.

Includes only loans insured by Federal Housing Administration.

1 Revised figures. Quarterly unadjusted data for all components, which have not yet been revised, and revised figures for the quarterly adjusted series appear in the Bulletin for July 1946, p. 806, and January 1947, p. 88, respectively,
${ }^{2}$ Revised figures. Quarterly unadjusted data have not yet been published
${ }^{3}$ Based on new sources and not precisely comparable with previous years.
4 Less than 50 million doliars.
Note.-Detail does not always add to totals because of rounding. For a general description of above series see the Survey of Current Business for May and August 1942 and March 1943.

Back figures: For annual totals 1929 through 1938, see the Survey of Current Business, May 1942 and April 1944. For quarterly estimates
1939 through 1944 see the Survey of Curvent Business for April 1944 and February 1946.

For footnotes see p. 329
March 1947

For footnotes see p, 329

CURRENT STATISTICS FOR FEDERAL RESERVE CHART BOOK—Continued

[^41] r Revised.
${ }^{1}$ Figures for other than Wednesday dates are shown under the Wednesday included in the weekly period.
${ }^{2}$ Less than $\$ 5,000,000$.
${ }^{3}$ Capacity base changed effective Jan. 8, 1947. Revised figures for earlier weeks are: Jan. 8, 90.3; Jan. 15, 91.8; and Jan. 22, 92.5. ${ }^{4}$ For charts on pages 20,23 , and 27, figures for a more recent period are available in the regular Bulletin tables that show those series. ${ }^{5}$ Adjusted for seasonal variation.
${ }_{7}^{6}$ Figures available for June and December dates only.
${ }^{7}$ As of July 1 and Nov. 1.

Tables on the following pages include the principal available statistics of current significance relating to gold, international capital transactions of the United States, and financial developments abroad. The data are compiled for the most part from regularly published sources such as central and commercial bank statements and official statistical bulletins, some data are reported to the Board directly, Figures on international capital transactions of the United States are collected by the Federal Reserve Banks from banks, bankers, brokers, and dealers in the United States in accordance with the Treasury Regulation of November 12, 1934. Back figures for all except price tables, together with descriptive text, may be obtained from the Board's publication, Banking and Monetary Statistics.

$$
\text { Figure for December } 1938 \text { is that officially reported on Apr. 30, } 1938
$$

6 Beginning December 1943, includes gold holdings of Swiss Government.
7 These countries are: Albania, Algeria, Australia, Austria through Mar. 7, 1938, Belgian Congo, Bolivia, Bulgaria, China, Costa Rica beginning July 1943, Danzig through Aug. 31, 1939. Ecuador, El Salvador, Estonia, Finland, Guatemala, Iceland, Ireland beginning February 1943, Latvia, Lithuania, Morocco, and Siam. Figures for certain of these countries have been carried forward from last previous official report.
${ }^{8}$ Gold holdings of Bank of England reduced to nominal amount by gold transfers to British Exchange Equalization Account during 1939.
Note.-For back figures, see Banking and Monetary Statistics, Tables 156-160, pp. 536-555,
and for a description of figures, including details regarding special internal gold transfers affect-

[^42]ing the reported data, see pD. 524-535 in the same publication.

Gold production in U.S.S. R.: No regular Government statistics on gold production in U. S. S. R. are available, but data of percentage changes irregularly given out by officials of the gold mining industry, together with certain direct figures for past years, afford a basis for estimating annua production as follows: 1934,135 million dollars; 1935,158 million; 1936,187 million; 1937,185 million; 1938 , 180 million.

1 Annual figures through 1940 are estimates of U. S. Mint; annual figure for 1941 based on monthly estimates of American Bureau of Metal Statistics.

Coast oniy.
Beginning May 1940, monthly figures no longer reported.
4 Includes Philippine Islands production received in United States. Annual figures are estimates of United States Mint. Monthly figuret represent estimates of American Bureau of Metal Statistics, those for 1945 having been revised by subtracting from each monthly figure $\$ 197,195$ so that aggregate for year is equal to annual estimate compiled by Bureau of the Mint.
${ }^{6}$ Figures for Canada beginning 1945 are subject to official revision. Beginning April 1942, monthly figures no longer reported.
Gold exports, reported by the Banco Nacional de Nicaragua, which states that they represent approximately 90 per cent of total production.
Beginning December 1941, figures are those reported by American Bureau of Metal Statistics. For the period December 1941-December 1943 they represent total Australia; beginning January 1944, Western Australia only.

Beginning May 1940, figures are those reported by American Bureau of Metal Statistics.
Note.-For explanation of table and sources, see Bulletn for February 1939, p. 151; July 1938, p. 621; June 1938, p. 540; April 1933, pp. 233-235; and Banking and Monetary Statistics, p. 524. For annual estimates compiled by the United States Mint for these and other countrie in the period 1910-1941, see Banking and Monelary Stolistics, pp. 542-543.

1 Prior to June 30, 1942, included under "Other Asia."
Country breakdown not available until June 30, 1942.
See footnote 4 below.

Footnotes tn table on p. 338.
${ }^{1}$ Country breakdown is for "Official and private."

- Prior to Jan. 3, 1940, the figures under Asia represent Far East only, the remaining Asiatic countries being included under "All other."
${ }^{2}$ Report dates for these years are as follows: 1934-Jan. 2, 1935; 1935-Jan. 1, 1936; 1938-Jan. 4, 1939; 1939-Jan. 3, 1940; and 1940Jan. 1, 1941
'These figures are not strictly comparable with the corresponding figures for preceding months due to inclusion for first time of the account of international institutions. The cumulative figures in Tables 1, 2, and 3 of "Net Capital Movement to United States" have been adjusted to exclude the unreal movement introduced by this change.
${ }_{5}$ These figures are not strictly comparable with the corresponding figures for preceding months due to exclusion of an account amounting to $\$ 4,322,000$, which should not have been reported as "foreign.". The cumulative figures in Tables 1, 2, and 3 of "Net Capital Movement to United States" have been adjusted to exclude the unreal movement introduced by this change.
- Prior to June 30, 1942, included under "All other."
'Prior to June 30, 1942, included under "Other Latin America."
8 Included "Canal Zone" prior to June 30, 1942
Note--Certain of the figures are not strictly comparable with the corresponding figures for preceding months owing to changes in reporting practice of various banks. The cumulative figures in Tables 1, 2, and 3 of "Net Capital Movement to United States" have been adjusted to exclude the unreal movements introduced by these changes. For further explanation see Banking and Monetary Statistics, pp. 578-584, and Bulle TIN for September 1945, pp. 967-970.

[^6]:    ${ }^{6}$ J. R. Hicks' consideration of consumer planning under dynamic conditions has been suggestive in weighing this question here. See his Value and Capital (Oxford, 1939), pp. 226-30.

[^7]:    ${ }^{7}$ Income Size Distributions in the United States, Pt. I, Vol. V of Studies in Income and Wealth (National Bureau of Economic Research, 1943).

[^8]:    ${ }^{1}$ The survey of bank loans to industrial and commercial businesses, on which this article is based, was planned by the Businesses, on which this article is based, was planned by the Board's Division of Research and Statistics in consuitation with
    the Federal Reserve Banks and other interested agencies. The the Federal Reserve Banks and other interested agencies. The
    information was collected and compiled into district totals at information was collected and compiled into district totals at
    the Reserve Banks and national totals were prepared at the the Reserve B.
    Board's offices.
    Supervision of the survey, analysis of results, and preparation of articles are under the general direction of Ralph A. Young, Assistant Director of the Division of Research and Statistics. Richard Youngdabl of the Division has been largely responsible for the supervision of the collection and tabulation of information.
    A copy of the forn used in the survey with accompanying instructions for its completion is appended to this article.

[^9]:    ${ }^{2}$ Neil H. Jacoby and Raymond J. Saulnier, Business Finance and Banking (National Bureau of Economic Research, 1947), p. 8 .

[^10]:    ${ }^{3}$ Ibid., p. 25.

[^11]:    1 Excludes a small amount of loans unclassified by size of bank and size of borrower.
    ${ }^{2}$ Less than $\$ 500,000$.
    ${ }^{3}$ Less than 0.05 per cent.
    Note.-Detailed figures may not add to totals because of rounding.

[^12]:    1 Excludes a small amount of loans unclassified by size of bank and business of borrower.

    Note.-Detailed figures may not add to totals because of rounding.

[^13]:    *See, for example, Neil H. Jacoby and Raymond J. Saulnier, Term Lending to Business (National Bureau of Economic Re: search, 1942).

[^14]:    ${ }^{1}$ Excludes a small amount of loans unclassified by size and business of borrower and maturity of loan.

[^15]:    5 The primary difference between the two surveys is that, whereas in the earlier survey data were collected on new loans and renewals made during a one-month period of time, in the current survey they were collected on all loans outstanding on a given date. A second difference is that the first survey was a given date. A second difference is that the first survey, was
    confined to loans classified as "commercial and industrial" for Confined to Report purposes while the current survey included (1) "commercial and industrial" loans other than open market paper and loans to, or loans covered directly or indirectly by purchase agreement of, the Commodity Credit Corporation, and (2) real estate loans made for commercial and industrial purposes. A third difference is that, whereas the earlier survey did not obtain information on loans of less than $\$ 5,000$ at very large banks, loans of less than $\$ 2,500$ at smaller banks in larger cities, and loans of less than $\$ 1,000$ at banks in cities of less than 100,000 population, the current survey obtained data on all large loans and on a sample of small loans as described in the last section of this article.
    ${ }^{\circ}$ The comparison here presented has been restricted to the dollar volume of short-term loans, since the inclusion of loans with a maturity of over one year would make any comparison of outstanding loans with new loans meaningless.

[^16]:    ${ }^{T}$ Open market paper and loans to, or loans covered directly or indirectly by purchase agreement of, the Commodity Credit indirectly by purchase agreement of, the Commodity Credit trial" loan classification, were excluded from this survey.

[^17]:    1 The 1929 estimate of instalment paper held by banks is a rongh approximation and is not entirely comparable with the 1946 figure since the latter relates only to insurable banks and 1946 figure since the latter relates only to insured banks and includes purchased retail instalment paper. Data on the amount
    of purchased paper held by banks at the end of 1929 are not of purchased paper held by banks at the end of 1929 are not
    available but the total was probably small. Moreover, 1929 data do not provide separate estimates for instalment paper held by industrial banks, as distinguished from industrial loan companies.
    2 The term "commercial banks," as used in the Federal Reserve Board summaries of banking statistics and in Federal Deposit Insurance Corporation tabulations of condition reports of insured banks, includes a considerable number of industrial and Morris Plan banks; mutual savings banks are excluded. This usage will be followed in the remainder of this article in order to give a more complete account of the role of "banks," as dis. tinguisbed from other lending institutions, in the consumer credit field. For the purpose of monthly consumer credit estimates separate series are maintained for industrial and commercial banks. See pp. 322-323 of this Bulletin.

[^18]:    ${ }^{3}$ The figures for instalment receivables held by banks at time of registration differ slightly from data published in the Federal Reserve Bulletin, May 1942, pp. 434-37, owing to reclassification of some registrants following first publication.
    ${ }^{4}$ Consumer Installment Lending Directory, 1946 Edition, published by Consumer Credit Department, The American Bankers Association. This directory includes a certain number of industrial and Morris Plan banks.

[^19]:    ${ }^{2}$ Figures relate only to banks reporting some consumer instalment ${ }^{\text {paper }}$
    ${ }^{2}{ }^{2}$ Excludes figures for five banks in possessions of the United States.

[^22]:    ${ }^{1}$ Rates shown also apply to advances secured by obligations of Federal intermediate credit banks maturing within 6 months.
    Note.-Maximum maturities for discounts and advances to member banks are: 15 days for advances secured by obligations of the Federal

[^23]:    ${ }^{1}$ Regulations $T$ and $U$ limit the amount of credit that may be ex-

[^24]:    ${ }^{1}$ After deducting $\$ 69,000$ participations of other Federal Reserve Banks on Jan. 29; Feb. 5; Feb. 12; Feb. 19; and Feb. 26.
    ${ }^{2}$ After deducting $\$ 433,136,000$ participations of other Federal Reserve Banks on Jan. 29; $\$ 393,178,000$ on Feb. $5 ; \$ 337,881,000$ on Feb. 12; $\$ 259$. 693,000 on Feb. 19; and $\$ 322,582,000$ on Feb. 26.

[^25]:    ${ }^{1}$ Represents banks which, during the periods shown, closed temporarily or permanently on account of financial difficulties; does not include banks whose deposit liabilities were assumed by other banks at the time of closing (in some instances with the aid of Federal Deposit Insurance Corporation loans).
    ${ }^{2}$ Deposits of member banks and insured nonmember banks suspended are as of dates of suspension, and deposits of noninsured nonmember banks are based on the latest data available at the time the suspensions were reported.

    Back figures.-See Banking and Monelary Statistics, pp. 283-292;
    for description, see pp. 281-282 in the same publication.

[^26]:    - Estimated. Figures have been rounded to nearest 50 million.
    * These figures do not include data for banks in possessions of the United States and therefore differ from those published by the Comptroller of the Currency and the Ferieral Deposit Insurance Cornoration for national banks and insured banks, respectively.

    1 Beginning, June 30,1942 , excludes reciprocal bank balances, which on Dec. 31,1942 , aggregated 513 million dollars at all member banks and 525 million at ati insured commercial banks.
    ${ }^{2}$ During 1941 three mutual savings banks, with total deposits of 8 million dollars, became members of the Federal Reserve System. These banks are included in both "member banks" and "insured mutual savings banks," are not included in "commercial banks," and are included only once in "all banks."
    ${ }^{8}$ Decreases in "noninsured nonmember commercial banks" figures reflect principally the admission to membership in the Federal Reserve ystem of one large bank with total loans and investments aggregating 554 million dollars on Dec. 31 , 1942 .
    "Beginning June 30, 1942, includes Bank of North Dakota, a nonmember bank not previously included in these statistics; on Dec. 31,1941, its deposits, excluding interbank deposits, were 33 million dollars, and its loans and investments 26 million,

    Back figures.-See Banking and Monetary Statistics, Tables 1-7, pp. 16-23; for description, see pp. $5-15$ in the same publication.

[^27]:    ${ }^{1}$ Direct and guaranteed.
    Back figures.-See Banking and Monetary Statistics, Dp. 127-227.

[^28]:    1 Demand deposits other than interbank and U. S. Government, less cash items reported as in process of collection.

[^29]:    ${ }^{1}$ Excluding balances with reporting firms (1) of member firms of New York Stock Exchange and other national securities exchanges and (2) of firms' own partners.

    2 Includes money borrowed from banks and also from other lenders (not including member firms of national securities exchanges).
    ${ }^{2}$ Includes money borrowed from banks and aiso from other to these reports, the part of total customers' debit balances represented by balances secured by U.S. Government securities was (in millions of dollars): November, 80 ; December, 74; January, 69.

    Note. -For explanation of these figures see "Statistics on Margin Accounts"' in Bulletin for September 1936., The article describes the method by which the figures are derived and reported, distinguishes the table from a "statement of financial condition," and explains that the last column is not to be taken as representing the actual net capital of the reporting firms.

    Back figures.-See Banking and Monetary Statistics, Table 143, pp. 501-502, for monthly figures prior to 1942, and Table 144, p. 503, for data in detail at semiannual dates prior to 1942.

[^30]:    ${ }^{1}$ Monthly and weekly data are averages of daily figures, except for municipal bonds, which are based on Wednesday figures.
    ${ }^{2}$ Standard and Poor's Corporation ${ }^{3}$ U. S. Treasury Department.
    4 Moody's Investors Service, week ending Friday. Because of limited number of suitable issues, the industrial Aaa, Aa, and A groups have been reduced from 10 to 5,6 , and 9 issues, respectively, and the railroad Aaa, Aa, and A groups from 10 to 6,6 , and 9 issues, respectively.

    5 Beginning Dec. 15, 1945, includes Treasury bonds of June 1952-54, June 1952-55, December 1952-54, and March 1956-58
    ${ }^{6}$ No partially tax-exempt bonds due or callable in 15 years and over.
    Back figures.-See Banking and Monetary Statistics, Tables 128-129, pp. 468-474, and the Bulletin for May 1945, pp. 483-490.

[^31]:    ${ }^{1}$ Includes publicly offered issues of Federal credit agencies, but excludes direct obligations of U. S. Treasury.
    ${ }^{2}$ Includes issues of noncontiguous U . S. Territories and Possessions.
    Source. -For domestic issues, Commercial and Financial Chronicle; for foreign issues, U. S. Department of Commerce. Monthly figures subject to revision.

    Back figures.-See Banking and Monetary Slatistics, Table 137, p. 487.

[^32]:    1 "Net profits" and "net income", refer to income after all charges and taxes and before dividends.
    2 Includes 29 companies engaged in wholesale and retail trade (largely department stores), 13 in the amusement industry, 21 in shipping and transportation other than railroads (largely airlines), and 11 companies furnishing scattered types of service.

    Partly estimated. Class I ine-haul railroads, covering about 95 per cent of all railroad operations.
    ${ }^{8}$ Class A and B electric utilities, covering about 95 per cent of all electric power operations. Figures include affiliated nonelectric operations.

    - Thirty large companies, covering about 85 per cent of all telephone operations. Series excludes American Telephone and Telegraph Company, the greater part of whose income consists of dividends received on stock holdings in the 30 companies.

    After all charges and taxes except Federal income and excess profits taxes.
    Sources.-Interstate Commerce Commission for railroads; Federal Power Commission ;or electric utilities (nonelectric operations and quarterly figures prior to 1942 are partly estimated); Federal Communications Commission for telephone companies (except dividends); published terly figures prior to 1942 are partly estimated); Federal Communications Commission for telephone companies (except dividends); published
    reports for industrial companies and for telephone dividends. Figures for the current and preceding year subject to revision. For description reports for industriagures, see pp. 214-217 of the March 1942 Bulletin.
    of data and back figures

[^33]:    * Figures include only holdings by institutions or agencies from which reports are received. Data for commercial banks, mutual savings banks and the residual other are not entirely comparable from month to month. Since June 1943 the coverage by the survey of commercial banks has been expanded. Figures in column headed other included holdings by nonreporting banks and insurance companies as well as by other investors. Estimates of total holdings by (including relatively small amounts of nonmarketable issues) by all banks and all insurance companies for certain dates are shown in the table above.
    ${ }^{\text {I }}$ Including stock savings banks. On Dec. 31, 1946, commercial banks reporting to the Treasury held 16,760 million dollars of U. S. Government securities due or callable within one year out of a total of 54,952 million outstanding.
    ${ }^{2}$ Including Postal Savings and prewar bonds and a small amount of Guaranteed securities, not shown separately below.
    ${ }^{5}$ Classification has been revised (1) to include notes and bonds and (2) to include callable issues as of their first call dates.

[^34]:    ${ }^{1}$ Assets are shown on a net basis, i.e., after reserves for losses. $\quad{ }^{2}$ Federal Surplus Commodities Corp. has been liquidated.
    ${ }^{3}$ Less than $\$ 500,000$ Includes U. S. Commercial Company and War Damage Corp.
    5 Figures are for Nov. 30, 1946, with the exception of those for lend-lease and UNRRA activities.

    - Figures for Inland Waterways Corp. and the Virgin Islands Co., which are included in this group, are for Nov. 30, 1946, and June 30 946, respectively.

    Note.-This table is based on the revised form of the Treasury Statement beginning Sept. 30, 1944, which is on a quarterly basis. Quarterly figures are not comparable with monthly figures previously published. Monthly figures on the old reporting basis for the months prior to Sept. 30,1944 , may be found in earlier issues of the Bulletin (see p. 1110 of the November 1944 Bulletin) and in Banking and Monetary Statistics, 30, 1944, may be
    Table 152 . D. 517 .

[^35]:    * Average per working day. $\quad$ P Preliminary. $\quad r$ Revised.

    1 Department of Commerce series on value of payments to individuals.
    ${ }^{2}$ For indexes by groups or industries, see pp. 310-313. For points in total index, by major groups, see p. 328.

    - Based on F. W. Dodge Corporation data; for description, see p. 358 of Bulletin for July 1931; by groups, see p. 317 of this Bulletin.
    - The unadjusted indexes of employment and pay rolls, wholesale commodity prices, and cost of living are compiled by or based on data of the B

    Bureau of Labor Statistics. Nonagricultural employment covers employees only and excludes personnel in the armed forces.
    Fark figures in Bulletin.-For industrial production, August 1940, pp. 825-882, September 1941, pp. 933-937, and October 1943, pp. 958-984; for factory employment, January and December 1943, pp. 14 and 1187, respectively, October 1945, p. 1055, and May 1946, p. 529; for department stores sales, June 1944, Dp. 549-561.

[^36]:    $p$ Preliminary. $\quad$ Revised. 1 Series included in total and group indexes but not available for publication separately
    2 This series is in process of revision.

[^37]:    Annual indexes for 1946 were computed by the Board of Governors and are preliminary.
    Note. - Indexes for major groups and totals have been adjusted to final 1944 data made available by the Bureau of Employment Security of the Federal Security Agency. Back data and data for industries not here shown are obtainable from the Bureau of Labor Statistics. Underlying figures are for pay roll period ending nearest middle of month and cover production workers only. Figures for January 1947 are preliminary.

[^38]:    * Includes Contract Construction and Federal Force Account Construction.

[^39]:    ${ }^{1}$ The RFC Mortgage Company, the Federal National Mortgage Association, the Federal Deposit Insurance Corporation, and the United States Housing Corporation.
    ${ }^{2}$ Including mortgage companies, finance companies, industrial banks, endowed institutions, private and State benefit funds, etc.

[^40]:    $p$ Preliminary.
    NoTe.-Descriptive material and back figures may be obtained from the Division of Research and Statistics. Basic data compiled by the Interstate Commerce Commission. Annual figures include revisions not available monthly.

[^41]:    ${ }^{\varepsilon}$ Estimated. $p$ Preliminary.

[^42]:    ${ }^{1}$ Reported at infrequent intervals or on delayed basis: U. S.-Exchange Stabilization Fund (Special A/c No. 1); U. K.-Exchange EqualiFund and Rentes Fund; Belgium-Treasury.
    ${ }^{2}$ Figure for end of September.

    - Reported figure for total British gold reservea on Aug. 31, 1939, less reported holdings of Bank of England on that date.

    4 Figure for Sept. 1, 1941.
    Note.-For available back figures and for details regarding special internal gold transfers affecting the British and French institu transfers Banking and Monetary Statistics, 526 and Bulletin for February 1945, p. 190.

[^43]:    Preliminary.
    1 Includes $\$ 28,097,000$ from China and Hong Kong. $\$ 15,719,000$ from Italy, $\$ 10,953,000$ from Norway, and $\$ 13,854,000$ from other countries.
    2 Includes $\$ 75,087,000$ from Portugal, $\$ 43,935,000$ from Italy, $\$ 33,405,000$ from Norway, $\$ 30,851,000$ from U. S. S. R., $\$ 26,178,000$ from Hong Kong, $\$ 20,583,000$ from Netherlands Indies, $\$ 16,310,000$ from Yugoslavia, $\$ 11,873,000$ from Hungary, $\$ 10,416,000$ from Spain, and $\$ 15,570,000$ from other countries.
    ${ }^{8}$ Includes $\$ 44,920,000$ from U. S. S. R. and $\$ 18,151,000$ from other countries.
    4 Includes $\$ 133,980,000$ to China and $\$ 509,000$ from other countries.
    5 Includes $\$ 27,567,000$ to China and $\$ 5,981,000$ from other countries.
    ${ }^{6}$ Includes impirts from U.S. S. R. as follow: April, $\$ 5,625,000 ; J$ June, $\$ 2,813,000 ; \mathrm{July}, \$ 2,813,000$; August, $\$ 2,821,000$; September, $\$ 3,372,000$; November, $\$ 11,793,000$; December, $\$ 4,492,000$.

    Includes $\$ 27,229,000$ to China and $\$ 75,000$ from other countries.
    Nore. - For back figures see Banking and Monetary Statistics, Table 158, pp. 539-54t, and for description of statistics, see p. 524 in the same publication.

[^44]:    r Revised
    1 This category made up as follows: through Sept. 21,1938 , funds held by foreign central banks at the Federal Reserve Bank of New York and"Philippine accounts held with the U. S. Treasury; beginning Sept. 28, 1938, also funds held at commercial banks in New York City by centra banksimaintaining accounts at the Federal Reserve Bank of New York; beginning July 17, 1940, also funds in accounts at the Federal Reserve Bank of New York which had been transferred from central bank to government names; beginning with the new series commencing with the month of July 1942, all funds held with banks and bankers in the United States by foreign central banks and by foreign central governments and their agencies (including official purchasing missions, trade and shipping missions, diplomatic and consular establishments, etc.) beginning Jan 31. 1946, accounts of international institutions; and beginning Feb. 28. 1946, Italian special deposit account held with the U. S. Treasury
     Since the old series overlapped the new by one day, the cumulative figures were adjusted to represent the movement through June 30 only. This adjustment, however, is incomplete since it takes into account only certain significant movements known to have occurred on July 1. Subsequent figures are based upon new monthly series. For further explanation, see BuLLETIN for January 1943, p. 98.

    Note--Statistics reported by banks, bankers, brokers, and dealers. For full description of statistics see Banking and Monetary Statistics, p. 558-560; for back figures through 1941 see Tables 161 and 162, pp. $574-637$, in the same publication, and for those gubsequent to 1941 gee Bulletin for September 1945, pp. 960-974.

[^45]:    $r$ Revised.
    Prior to Jan. 3, 1940, the figures under Asia represent Far East only, the remaining Asiatic countries being included under "All other."
    Inflow less than $\$ 50,000$.

[^46]:    ${ }^{1}$ Prior to Jan. 3, 1940, the figures under Asia represent Far East only, the remaining Asiatic countries being included under "All other." Note.- The figures in this table are not fully comparable throughout since certain changes or corrections took place in the reporting practice reporting practice was changed from a weekly to a monthly basis. For further information see Bulletin for September 1945, pp. 971-974.

[^47]:    Prior to June 30，1942，included under＂All other．
    Less than $\$ 50,000$
    Prior to June 30，1942，included under＂Other Latin America．＂
    Included＂Canal Zone＂prior to June 30， 1942.
    Prior to June 30，1942，included under＂Other Asia．＂
    －Country breakdown not available until June 30， 1942.

[^48]:    ${ }^{1}$ From September 1939 through November 1946, this table represents aggregates of figures reported by individual banks for days, varying from bank to bank, toward the end of the month. After November 1946, figures for all banks will be compiled on the third Wednesday of each month, except in June and December, when the statements will give end-of-month data.
    ${ }^{2}$ Represent six-month loans to the Treasury at $11 / 8$ per cent through Oct. 20, 1945, and at $5 / 8$ per cent thereafter.
    Note.-For back figures and figures on German commercial banks, see Banking and Monetary Statistics, Tables 168-171, pp. 648-655, and for description of statistics see pp. 566-571 in same publication.

[^49]:    p Preliminary.
    ${ }^{1}$ New weighted index of 400 articles. For detailed description of the articles included and of the weight coefficients used in the index, see Maandschrift for 1941, pp. 663-664. Yearly averages 1926-1938 are calculated from old index, 1926-30=100.

    2 Approximate figure, derived from old index $(1913=100)$.
    : Average based on figures for 5 months: no data available since May 1940, when figure was 919.
    Sources.-See Bulletin for January 1941, p. 84; April 1937, p. 372; March 1937, p. 276; and October 1935, p. 678.

[^50]:    ${ }^{1}$ Figures represent calculated prices of a 4 per cent 20 -year bond offering a yield equal to the monthly average yield for 15 high-grade corporate bonds. Source--Standard and Poor's Corporation; for compilations of back figures on prices of both bonds and common stocks in the United States see Banking and Monetary Statistics, Table 130, p. 475, and Table 133, p. 479.

    2 Published by the Ministry of National Economy with new base of $1938=100$. Figures are for the last Friday of each month. The number of bonds included in the new index was increased to 50 (formerly 36). The index for stocks was based on 300 issues until Dec. 6, 1945, when five banks were nationalized; on 295 issues until July 4, 1946, when 11 insurance companies were nationalized; and on 284 issues thereafter. For complete information on the composition of the bond and stock indexes see "Bulletin de la Statistique Générale"' for December 1942, pp. $511-$ 513, and July-August 1942, pp.,364-371, respectively. For back figures for both indexes from 1938 through 1941 on a monthly basis see "Buletin de la Statistique Générale" for October-December 1944, pp. 274-276.
    : Since Apr. 1, 1935, the 139 bonds included in the calculation of the average price have all borne interest at $4 \frac{1}{2}$ per cent. The series prior to that date is not comparable to the present series, principally because the 169 bonds then included in the calculation bore interest at 6 per cent. ${ }^{4}$ Indexes of reciprocals of average yields. For old index, 1929-1936, 1929 = 100 ; average yield in base year was 4.57 per cent. For new index beginning January 1937, January-March 1937 $=100$; average yield in base period was 3.39 per cent.

    6 This number, originally 329 , has declined as the number of securities eligible for the index.has diminished. In May 1941 it was down to 287.

    - Average based on figures for 5 months; no data available June-Dec. ${ }^{\text {I }}$ Average based on figures for 7 months; no data available May-Sept.
    
    ${ }^{8}$ Average based on figures for 9 months; no data available May-July.
    ${ }^{10}$ Average based on figures for 8 months; no data available Sept.-Dec
    Sources.-See Bulletin for November 1937, p. 1172; July 1937, p. 698; April 1937, p. 373; June 1935, p. 394; and February 1932, p. 121.
