# UNITED STATES DEPARTMENT OF COMMERCE bureau of foreign and domestic commerce WASHINGTON 

## PRESERVE THIS ISSUE

Owing to the lack of printing funds, it is not possible to publish the 1934 ANNUAL SUPPLEMENT TO THE SURVEY OF CURRENT BUSINESS.

Every effort has been made to complete the 1933 statistics with this issue, but, in a few instances, December data are still lacking. If you do not keep a complete file of the SURVEY, it is suggested that the missing figures be posted in this copy as soon as they are available. Thus, this number will afford a convenient source of reference for the year 1933, and, together with the March 1933 issue and the 1932 ANNUAL SUPPLEMENT, will afford a complete record of all series, excepting the new series that have been added and those that have been revised since the publication of the last annual supplement. For a complete file of the new and revised series, it is necessary to have the special tables which have been presented in the issues starting with September 1932.

WhOLESALE PRICES

## Business Situation Summarized

BUSINESS conditions improved moderately during January，and the weekly statistics reveal further gains in February．The expansion in industrial pro－ duction has been greater than the usual seasonal rise for this period，and the statistics of carloadings also show a favorable trend in primary distribution． Retail sales data indicate a decline in January of about the usual proportions，following the greater－than－ seasonal increase of December．Construction con－ tracts awarded have tended to lag since December， and the seasonally adjusted index has declined follow－ ing the rapid rise in the last 4 months of 1933. Foreign trade statistics reveal a decrease in exports in January and a rise in imports．

Increasing output in most of the major manufactur－ ing industries，and the larger production of coal， resulted in an advance of 3 points in the adjusted index of industrial production in January to 78 per－ cent of the 1923－25 average．Production was sub－ stantially higher than in 1933 and was 7 percent above 1932．Iron and steel output increased very slightly in January，but a fairly rapid rise in operations was reported in February．Textile mill activity improved following the December drop，although some branches of the industry were still working on curtailed sched－ ules．Despite the mechanical difficulties experienced in the industry，the adjusted index of automobile production moved sharply higher．Other relatively large increases were reported for food products， tobacco manufactures，and cement production．

Lumber production increased slightly，and the upward movement continued in February．

Employment and pay rolls declined between mid－ December and mid－January，mainly as a result of large seasonal declines in the nonmanufacturing industries． The change in factory employment was in accord with the seasonal trend，while the slight drop in factory pay rolls was less than the usual decline in this interval． Preliminary February data indicate an improvement in private employment and pay rolls in that month．

Commodity prices have tended upward in recent weeks，and the wholesale commodity price index was nearly 5 percent higher in the week ended February 17， than in the third week of December．Retail prices and the cost of living also advanced in January

Financial markets during February were featured by the heary inflow of gold from abroad following the official devaluation of the dollar to 59.06 percent of its former gold content．As a result of this movement， excess reserves of the member banks have exceeded a billion dollars，a record total．Government expendi－ tures during the month were very large，a considerable portion of the funds being devoted to direct relief，and to employment relief through the C．W．A．Bond prices have continued to move higher，while the move－ ment of stock prices was irregular with declines pre－ dominating in the latter part of February．The new capital market has continued inactive and flotations， aside from Government loans，have made an insig－ nificant total．

AUTOMOBILE PRODUCTION - (THOUSANDS OF CARS)

FREIGHT CAR LOADINGS - (MILLIONS OF CARS)

## Commodity Prices

$\mathbf{A}^{\mathrm{s}}$a result of the widespread advance in domestic prices since the latter part of December, the wholesale price index has advanced rather rapidly to the highest point in nearly 3 years. After moving steadily higher for 8 consecutive weeks, the Bureau of Labor Statistics' index during the week ending February 17 stood at 73.7 percent of the 1926 average, thus recording a gain of 3 percent since late September and 4.7 percent since the third week of December. During the latter period there was a gain of 13 percent in the price of farm products, a rise of 9.4 percent in food prices, and of 1.4 percent in other products. An advance of approximately 20 percent in livestock quotations featured the rise in the four-week period ending February 17. This group had been a weak spot in the final quarter of 1933, and livestock prices at the close of the year were approximately the same as at the end of 1932.

Retail prices have not advanced since December as rapidly as wholesale prices, according to the available data. After remaining unchanged during December, Fairchild's index of retail prices again moved higher in January, the gain for the month amounting to six tenths of 1 percent. This index, which is computed from prices of representative department store articles, has shown a gain of 28 percent since last April, or a larger relative increase than occurred in the wholesale price index. Retail food prices averaged slightly higher during January than in the preceding month.

Following declines during the 2 preceding months, the cost of living index computed by the National Industrial Conference Board increased slightly in January. Changes in this index have been moderate in recent months and while the January figure was 8.4 percent above the low of last April, this was the result of the marked rise in the 5 months ending in September. The retail price of food in January was 17 percent higher than the 1933 low, but the rise in this index covered only a 4 -month period ending in August. During the past 5 months there has been a slight decline.
As compared with the low point of 1933, the index of wholesale prices by the third week in February had advanced 24 percent. Farm products, which had declined to the greatest extent also recorded the largest gain in this period, the general average increasing 53 percent. Foods increased 26 percent and all other commodities advanced 19 percent. Among the group included in the last-named classification, the widest gain, amounting to 51 percent, was in textile products. Chemicals and drugs, which gained only 5.8 percent, showed the smallest increase.

According to the Bureau of Agricultural Economics, the prices paid by farmers for the commodities they purchased increased 17 percent from the middle of March 1933, to the end of January 1934. At the same time the prices received by farmers for their produce increased 42 percent, resulting so far as price changes are concerned, in an increase of 22 percent in the purchasing power of farm products.

## INDEXES OF COMMODITY PRICES

## Domestic Trade

RETAIL sales figures for the first month of 1934 show in most instances a recession from the December total approximating the usual seasonal novement for the month. The dollar volume of sales of department stores and grocery chain stores, decreased slightly more than usual for the month, while variety store sales fell off less than usual and the increase in passenger-automobile sales was slightly less than the normal seasonal rise. The unimpressive results in automobile sales was due to the inability of dealers to deliver cars and is not a reflection of current sales trends, as this industry has been one of the chief beneficiaries of increased purchasing power. February sales totals will show a substantial rise over the corresponding figures for January. Prelinninary data on February department store sales show little change in the total as compared with January. The indicated gain over last year amounts to 16 percent, on a daily average basis, or a slightly higher relative gain than was recorded in the preceding month.

Department store sales in January were 19 percent greater than for the same month of 1933. This increase is reduced to 15 percent when allowance is made for the extra trading day in January of this year. The increases in the 12 Federal Reserve districts, based on total sales comparisons, varied from 12 percent in the Philadelphia area and 13 percent in the New York and Minneapolis districts, to 33 percent in Cleveland and 36 percent in Dallas. The largest gains continue to be concentrated for the most part in
agricultural areas, although the Boston district reported an increase of 23 percent.

Estimates of general merchandise sales in small towns and rural areas for January indicate an increase of 45 percent in dollar volume over January 1933. Such sales were 40 percent lower in January than in December, as compared with a decline of 46 percent a year ago. Rural sales for the full year 1933, measured in dollar terms, were about 9 percent above 1932. The year 1932, on the other hand, registered a drop of 16 percent from 1931.

A new index of retail sales of variety stores, designed to measure the trend of consumers' purchases through these stores, is given on pages $17-20$, together with a complete description of the index and the method of construction.

Both the number of commercial failures and the aggregate of liabilities involved increased in January by approximately one fifth. The first month of the year is the seasonal high point for failures, and the totals continue to make a favorable comparison with the same month of other recent years.

Advertising linage in both magazines and newspapers fell off sharply in January, reflecting the usual decline from December. Autonotive and department store advertising in newspapers in January were above a year ago, whereas classified and financial advertising was lower. Advertising by radio, as shown by the data on the cost of facilities, has moved upward continuously in recent months.

Adjusted for seasonal variation.

## Employment

EMPLOYMENT and pay rolls in those industries for which current data are available declined between the middle of December and the corresponding period of January. The reduction resulted mainly from the seasonal losses in nonmanufacturing industries. These data do not include the workers employed on C.W.A. projects. The number so employed averaged higher in January than in December. Available preliminary statistics for February indicate a gain in private employment and pay rolls as compared with January.

The decline in factory employment during January was slight, and was in accord with the usual seasonal trend, terminating the greater-than-seasonal declines which characterized the final quarter of 1933. Factory pay rolls during the month receded by only four tenths of 1 percent which is considerably less than the average drop during this month for the past 10 years. In January, factory employment and pay rolls were each about 8 percent below the 1933 ligh reached in September. Compared with a year ago, employment and pay rolls were 21 percent and 35 percent higher, respectively.

Among manufacturing industries, the transportation equipment group revealed a 17 -percent gain in employment and a 21 -percent rise in pay rolls, due entirely to increases of 22 percent and 27 percent, respectively, in the automobile industry. As a result of the marked improvement in the boot and shoe industry, the leather group reported a 5.1-percent increase in the number employed accompanied by a 10 -percent increase in pay rolls in January as compared with December.

Large seasonal variations characterized the employment and pay-roll changes in many of the nonmanufacturing industries. Employment in retail trade declined nearly 20 percent, substantially the same proportionate drop as occurred between the months of December and January a year ago. Seasonal declines of over 10 percent in employment also were reported in the quarrying and nonmetallic mining, canning and preserving, and building construction industries. Increased activity in anthracite mining brought about an 18-percent rise in employment and a 65 -percent gain in pay rolls for the month.

It was reported that during the third week in January over 60 millions of dollars were disbursed in wages in connection with the Civil Works program. The number employed for the same week was slightly over $4,000,000$. As this amount was equivalent to approximately one half of the estimated weekly factory pay roll in January, its significance in terms of workers' income may be readily appreciated. The process of gradually decreasing the number employed on C.W.A. projects was begun around the middle of February and the program calls for more to be released each week. The 377,500 dropped as of March 2, reduced the total to $2,770,000$, including 160,000 engaged on Federal projects and under the emergency education program.

Employment increased from December to January in 10 of the 48 States, according to the data collected by the Department of Labor. Michigan reported the largest gain-an increase of 11 percent, due mostly to the greater activity in the automobile industry.

## Finance

OFFICLAL devaluation of the dollar on January 31, 1934, to 59.06 percent of its former gold content and the resultant large gold inflow and growth of member bank reserve balances have featured financial markets during February. Gold imports assumed for a time unprecedented proportions. In the week ending February 24, imports paid for by the assay office, as reported by the New York Reserve Bank, amounted to about $\$ 230,000,000$. From February 1 to February 24 the increase in the Treasury's gold stock amounted to $\$ 322,000,000$, most of which was obtained from gold imports. These imports have resulted in a large increase in the reserve balances of the member banks which recently have exceeded reserve requirements by approximately a billion dollars for the first time on record.
The Gold Reserve Act, approved on January 30, while permitting the free importation of gold, subjected the export of gold to control by the Treasury. The President's proclamation on dollar revaluation caused a swift realinement of values in the foreign exchange market. During the next 2 weeks, however, the dollar remained at a sufficiently high premium in terms of the franc and other gold currencies to make inward gold shipments profitable. In the latter part of February the dollar moved downward again, and toward the close of the month the French franc had appreciated to a point which made the profit on gold shipments very small.
As a result of the provision of the Gold Reserve Act, whereunder title to all monetary gold passed to the Government, the Federal Reserve statement was revised so as to substitute, for the formerly reported gold holdings, gold certificates given by the Treasury for the gold taken over before the dollar was devalued.

After devaluation became effective, those certificates represented the same number of dollars as before, but represented a weight of gold smaller by the extent of the decrease in the gold content of the dollar, the difference being retained, under the provisions of the act, by the Treasury.
Money in circulation showed a decrease of $\$ 142,000,-$ 000 in January, due largely to seasonal factors. Because of Treasury regulations prohibiting use of gold coin, such coin previously reported as in circulation was omitted on January 31 from the total of money in circulation, thus reducing the reported circulation figure by $\$ 287,000,000$, representing principally gold coins lost, destroyed, or exported without record. From January 31 to February 21, there was an increase of money in circulation of $\$ 52,000,000$.
Member bank loans declined during the period under review. Investments, on the other hand, showed appreciable gains due largely to the purchases of Government securities. Member bank borrowings at the Federal Reserve banks continued to decline and fell to a record low level of $\$ 68,000,000$ by the third week of February.
After a sharp rise in January, the movement of stock prices became irregular during February, and in the closing days of the month the trend was downward. Bond prices continued to move upward during the month. The activity in listed securities has had no counterpart in the new capital market which remains stagnant. The decision of the New York Central Railroad to offer to the public $\$ 60,000,000$ of convertible bonds was made known during the latter part of February. This represents the most important financing proposal since the passage of the Securities Act of 1933.

# Foreign Trade 

UNITED STATES export trade declined in both quantity and value during January, while import trade recorded a moderate increase. The value of exports of United States merchandise amounted to $\$ 170,000,000$ as compared with $\$ 190,000,000$ in December. Imports for consumption were valued at $\$ 129$,000,000 as against $\$ 124,300,000$ in December. The net balance of merchandise exports was $\$ 41,000,000$.

The decline of 11 percent in the value of exports was in excess of the usual seasonal decrease of about 4 percent, while the increase of 4 percent in the value of January imports for consumption compares with a normal seasonal increase of about 2 percent.

More than half of the decline in the value of domestic exports resulted from the decrease in shipments of unmanufactured tobacco; however, only two of the 11 major classifications of exports recorded larger total values than in December. Exports of inedible animals and animal products increased from a value of $\$ 5,300,000$ in December to $\$ 8,200,000$ in January, while exports of machinery and vehicles advanced $\$ 200,000$ to a value of $\$ 26,400,000$.

Exports of inedible vegetable products declined $\$ 13,300,000$ from December to a value of $\$ 10,200,000$ in January; shipments of textile fibers and manufactures decreased $\$ 3,000,000$, to $\$ 46,500,000$ in January; chemicals and related products declined $\$ 2,200,000$, to $\$ 6,600,000$; wood and paper products $\$ 1,500,000$, to $\$ 7,100,000$; vegetable food products and beverages $\$ 1,100,000$, to $\$ 15,600,000$; and nonmetallic minerals declined $\$ 900,000$, to $\$ 23,800,000$ in January. De-
clines in each of the other three major classifications amounted to a half million dollars or less.

Principal commodities, other than tobacco, which showed declines during January were unmanufactured cotton, electrical machinery and apparatus, petroleum and products, sawmill products, hops, and wheat. The decreases ranged from $\$ 2,800,000$ to $\$ 600,000$.

Eight of the commodity groups of imports increased in value in January as compared with December. Among the leading commodities, notable increases appeared in imports of cane sugar from the Philippine Islands, crude rubber, cocoa, vegetable oils, and undressed furs. Imports of wood and paper and of nonferrous metals declined in value. Spirits, liquors, and wines imported for consumption aggregated $\$ 4,998,000$ in January in comparison with $\$ 6,690,000$ in December.
It will be noted that the detailed import statistics for January represent imports for consumption, whereas previously the statistics were based on general imports. The January index is computed from the general import total as in the past. The reasons for the change will be set forth in an article to appear in the next issue. Those desiring an explanation more promptly may obtain a copy of the press release on the subject, dated February 27, upon request. It will not be possible to publish in the Survey detailed commodity data for earlier years representing imports for consumption. However, comparative totals for a period of years are being compiled and will be included with the article containing details concerning the change.

## Real Estate and Construction

CONSTRUCTION contracts awarded during January and the first half of February declined, after having risen rapidly in the latter months of 1933. The value of contracts awarded from February 1 to 15, amounting to $\$ 59,000,000$, according to the Dodge Corporation statistics, was larger than the total for the entire month of February 1933. Public-works construction continues as the major source of activity, projects classed under public works comprising nearly 60 percent of all awards in this period. Contracts let for residential building were slightly higher in the early part of February than in January, but the contracts in the other classes showed a large decline.

Reflecting the downward trend of awards since December, the Federal Reserve Board's adjusted index declined 12 percent, which compares with a decline of 22 percent at this time last year. Although the value of the January awards declined, the total was nearly as large as the aggregate amount of all contracts let in the first quarter of 1933, and more projects were contracted for than for any January since 1929.

Residential building in January declined by slightly more than usual for the month, but the adjusted index has shown no marked variation in more than 6 months. The value of these contracts, while exceeding the total for January 1933, continues extremely small in the aggregate. Nonresidential construction, including factories and other commercial buildings, hospitals and institutions, and educational, social, and recreational buildings, showed an increase of 17 percent in January,
which brought the value of these contracts to the highest level since May 1932. The value of public works projects was slightly higher than in December. Such contracts amounted to $\$ 103,000,000$ including unallocated C.W.A. projects amounting to $\$ 33,000,000$.
Employment among union members of the building trades improved slightly in January, when 41 percent of the membership was at work, compared with 38 percent in December and 30 percent in January, 1933. The statistics of employment and pay rolls compiled by the Bureau of Labor Statistics refiect a less favorable condition for the industry as a whole. Their data indicated a reduction of 13 percent in employment and of 9.3 percent in pay rolls from December to January.
The survey of the National Association of Real Estate Boards of the real estate situation recently released indicates some improvement since the middle of 1933. Some of the major conclusions, based on a survey of 273 cities were as follows: (1) An appreciable percentage of cities in all sections report a shortage of single-family dwellings-a condition not indicated on their mid-1933 survey; (2) shortages are reported in apartment space in cities under 100,000 ; (3) the downward tendency of rents has been checked and an upward movement started; (4) the decline in real estate selling prices has ceased, although prices continue around minimum levels; (5) an absolute dearth of mortgage money supplies is reported as prevailing in every section and every type of city; and (6) interest rates are rising in about two thirds of the cities of over 500,000 population.

# BUILDING MATERIALS, CONSTRUCTION, AND REAL ESTATE 

1 Based on 3-month moving average and adjusted for seasonal variation.
${ }^{2}$ First of month. Feb. 1, 1934, index 194.1.

## Transportation

FREIGHT traffic handled by the railroads in January and the first half of February expanded by more than the normal seasonal amount. Loadings in the first 7 weeks of this year were 14 percent greater than in the corresponding period of 1933, and were approximately the same as those in the like period of 1932. For the latest week reported, however, loadings were nearly 5 percent in excess of the comparable 1932 figure. Heavier coal loadings, partly the result of the severe weather conditions over a large area of the country, have been an important factor in the recent rise.

With the exception of forest products and miscellaneous freight, January loadings for all major groups were higher, after allowance for the usual seasonal trend. The movement of merchandise in less-thancarload lots picked up during the month, and the adjusted index advanced to the highest figure since last July. Despite this increase, l.c.l. loadings were no higher than in January 1933. Increases over a year ago for the other groups were as follows: Coal and coke, 21 percent; forest products, 32 percent; grain and products, 9.3 percent; livestock, 1.7 percent; and miscellaneous freight, 20 percent.

Gross revenue of the carriers turned upward in January following 2 months of decline from the fall peak. Net railway operating income, which increased slightly in December due to the rise in passenger revenues, showed the usual decline in January. The total was, however, more than twice as large as
in 1933, and represented the highest net income for the month since 1931, despite the fact that loadings were more than one fifth lower than in January 1931.

A number of important orders for railway equipment were placed early in February, and definite progress was made in starting work on the 7,000 -car undertaking by one of the eastern roads in its own shops when a $\$ 3,000,000$ order for the necessary steel was placed. This was said to be one of the largest steel purchases made by a railroad in recent years. While January business was in small volume, and employment and pay-roll disbursements remained extremely low during the month, the recent trend of new business promises increased employment and pay rolls for the equipment manufacturing business. The Railway Age reports orders for 20 locomotives, 12,725 freight cars, and 177 passenger cars placed early in February. In addition, one of the western roads ordered three additional streamlined passenger trains, and several important orders have been placed for air-conditioning equipment. These orders represent the first real stimulation to the railway-equipment business in many months, and in most instances have been made possible by loans previously allotted by the Public Works Administration.

Rail orders placed by the carriers have not been an important factor in the rise in steel operations. Nevertheless, some important orders have been placed recently.

RAIL AND WATER TRAFFIC

## Automobiles and Rubber

WITH the exception of a slight temporary recession around the middle of February, automobile production has continued an upward course since the turn of the year. In the week ended February 24 , output reached approximately 71,000 units, the highest weekly total since May 1931, and on the basis of available statistics, it is estimated that production for the month of February will total at least 260,000 units for the United States and Canada.

Delays resulting from the shift to new models were gradually overcome and January output of 161,000 units for the United States was almost twice the number reported in the preceding month. The gain in the Federal Reserve Board's adjusted index of production amounted to 23 percent. Dealers' stocks absorbed a large percentage of the output, and deliveries to consumers did not show the usual seasonal rise for the month. In February some progress was made in reducing the total of unfilled orders.

The number of wage earners employed in United States plants increased 22 percent over December, while the amount paid out in wages showed a gain of 27 percent. Employment and pay rolls were 41 percent and 52 percent, respectively, higher than a year ago.
More than one fourth the total number of cars produced in January were trucks. Not since June 1930 has any monthly showing been larger, and the total
( 44,729 units) was higher than the number reported for any corresponding month since 1929. Passenger-car output was more than double the relatively small showing in December, and the total also was higher than in the same month of 1933 or 1932.

Exports of automobiles showed a further increase during January. As in the preceding month, trucks far outnumbered the passenger cars exported. This may be explained in part by the delay encountered in new model passenger output during the latter months of 1933, which tended to retard shipments of passenger cars, whereas the movement of trucks was relatively free of this hampering influence. Excepting the month of October, total shipments of cars exceeded any monthly showing since the spring of 1931.

With the tire industry entering its active season, preliminary reports indicate that production of pneumatic tires advanced 26 percent in January. The increase in shipments was somewhat smaller and tire stocks at the end of the month showed an increase of approximately 8 percent over December 31 .

Domestic consumption of crude rubber increased 39 percent over the preceding month, while imports increased 20 percent and were at the highest level for any month since December 1931. The fifth consecutive monthly advance placed world stocks of crude rubber at the end of the month at a new high level.

${ }^{1}$ Adjusted for seasonal variations.

## Chemical Industries

CHEMICAL production continued at a relatively high level during January, although the increased demand from the rise in activity in chemical consuming industries was partially met by withdrawals of stocks on liand. Employment in the industry continued to expand, the increase in January being contrary to the usual seasonal trend. Pay-roll disbursements were larger than in any month of 1933. Prices showed a rising tendency, less pronounced in the heavy chemical branches. On February 10, a code of fair competition for the industry was approved by the President, establishing a 40 -hour work week, a 35 - and 40 -cent minimum wage, and appointing the newly organized Chemical Alliance as code authority.

While the rise in employment in the chemical industries during the past year has not been as large relatively as in some other industries, the chemical group is the only one in which the Federal Reserve Board's index has exceeded 100 percent of the 1923-25 average. The major part of the increase of one third in the number employed in the industry took place in the late summer and fall, with less important monthly gains being recorded toward the end of the year. In January, the fertilizer and paint and varnish sections of the industry recorded the greatest employment gains.

The gain of a sixth in the volume of chemical industry pay rolls which took place from May to October in 1933 was maintained in the last quarter of the year, and there was a further improvement in January.

The major increases in January were in the paint and varnish, explosives, and fertilizer divisions, while decreases were registered in the rayon and allied products, druggists' preparations, cottonseed oil, cake and meal, and soap branches.

Prices of chemicals and drugs as a group made a slight gain in January, due primarily to a sharp advance of quotations on drug and pharmaceutical products. Heavy chemical prices showed no important change in January and early February and remained at about the same level as in this period a year ago. Drug and pharmaceutical quotations advanced 10 percent from December to January.

Production of wood rosin and turpentine increased seasonally in January, increasing the stocks on hand, while receipts of gum rosin and turpentine at three ports fell off sharply and seasonally, accompanied by a curtailment of stocks. Naval stores prices showed a rising tendency after the close of 1933, with a pronounced upward movement in the early part of February.

Fertilizer consumption in the Southern States, which picked up more than seasonally in January, was 75 percent above January a year ago. A reorganization of the Chilean nitrate industry, which is meeting severe competition from synthetic nitrogen producers, was announced in January. A strict Government monopoly was established, with exports restricted to the Government or a controlled corporation.

## Forest Products

LUMBER production has been increasing since December, partly in response to the improvement in the rate of incoming business. Output during the first 7 weeks of 1934 was reported by the Code Authority as 45 percent above production in the same period of 1933, while new orders exceeded the cut by 4 percent. Shipments, however, were about 10 percent less than production and there was an increase in stocks which amounted on February 17, in the case of softwoods, to 123 average days' production. Some upbuilding of stocks was anticipated by the Code Authority, which allocated fairly high production quotas for the first quarter for the purpose of relieving. unemployment conditions in the industry.

Employment and pay rolls in the industry in the middle of January show a reduction as compared with a month earlier. Employment, after adjustment for the usual seasonal variation, declined more than 5 percent. Despite this drop the number engaged in January was 26 percent above the level of a year ago and was also slightly above January 1932. Pay rolls fell off 12 percent in January to a level 28 percent below the 1933 high, but were 48 percent above January a year ago.

Carloadings of forest products during January and the first half of February have tended upward. The increase in January shipments was, however, slightly less than the usual seasonal rise for the month.

Wholesale lumber prices declined fractionally during January, moving contrary to the trend in the general wholesale price level. Lumber prices, however, had moved up rapidly in 1933 and the current index excceded the corresponding figure of a year ago by 56 percent.

Activity in the Southern pine industry picked up sharply during January. New and unfilled orders, as well as production, showed marked gains. Production rose 10 percent to a volume that was a fourth greater than at this time a year ago, and 33 percent better than 2 years ago. Incoming orders in January were 41 percent above the volume received in December, and were sufficiently above production to permit a rise of 43 percent in unfilled orders.

Marketings of naval stores fell off seasonally in January to approximately the same quantity marketed at this time a year ago and over a fifth above the volume in this month in 1932. Increased activity, accompanied by rising prices of naval stores, was noted in the latter part of January and in early February.

Exports of all types of lumber continued in January at the high level reached in December. Foreign slipments in these 2 months were greater than in any similar period since the summer of 1931, and were 38 percent above exports at this time a year ago.

## Iron and Steel Industry

EXPANDING consistently throughout February, scheduled steel mill operations in the week ending March 3 reached 46 percent of capacity, the highest operating rate since last August. Demand for automotive steel, as well as for tin plate and miscellaneous products, continued relatively active, although structural steel requirements for Public Works projects and placements from the railroads have also shown a gradual increase. Current demand reflects in large part actual needs of consumers, rather than any wide anticipatory buying movement such as occurred on a large scale last summer, and more recently in December.

The failure of the industry to show the expected seasonal iucrease in activity during January was reflected in the 8 percent decline of the Federal Reserve Board's adjusted index of production. With activity at 56 percent of the 1923-25 average level, production was almost twice as large as in January 1933. Employment and pay rolls declined slightly frem December, and both indexes were the lowest since last July.

Following the contraseasonal rise in December, the expansion in steel-ingot production during January was slight. While an increase of about 15 percent usually occurs in Jonuary, output was little more than 3 percent above the December figure. Notwithstanding the small gain, the tonnage turned out was about 10 percent higher than average monthly output in the
last quarter of 1933. The increase in pig-iron output likewise was small but, as in the case of steel ingots, production was considerably higher than in the same month of 1932 or 1933. Twelve additional furnaces were placed in blast during the month.
Considering the negligible change in the production rate, the wide drop in January steel shipments of the United States Steel Corporation (from 601,000 tons to 332,000 tons) indicated an increase of stocks during the month. January shipments of the corporation were about the same as last April, although ingot production in the earlier month was about one third less than in January. This is in contrast to the movement in December when the rush to effect deliveries before the first of the year, according to contract requirements, brought about a considerable withdrawal from material on hand. In the immediately preceding years for which data are available, shipments in January have invariably shown an increase over the December level.

Recent production trends have been reflected in a renewed upturn in prices of steel scrap. The average prices for steel scrap at Chicago in January exceeded the lighest monthly figure of 1933. Continued advances in February brought quotations at the end of the month to the highest point since October 1930. At $\$ 32.42$ per long ton, composite iron and steel prices were back to the approximate level prevailing in the fall of 1930 .

## Textile Industry

BUSINESS in the textile industries was more active in January，and the declining trend of pro－ duction which extended over the latter half of 1933 has been reversed．New orders have picked up，and the statistical position of the industry has beenimproved by the recent general reduction of operations．Mill curtail－ ment，under the provisions of the codes，was effective in several branches of the industry during January， and tended to reduce output to an important extent

The improvement in operations in January was pronounced in the cotton textile industry．Cotton－ spinning operations showed a very marked rise，with mill takings increasing 46 percent over the December total，to the highest figure since last August．New orders for cotton goods increased sharply during Jan－ uary，and for the first 3 weeks of the year exceeded production by 60 percent．It was announced by the Code Authority that unfilled orders，as of January 20， amounting to $847,000,000$ yards－an increase of $175,-$ 000,000 yards since December 1－－were the largest since the code became effective last July．Stocks on hand，amounting to $523,000,000$ yards，or 8 percent less than in the middle of December，were thus sub－ stantially below the volume of unfilled orders and were equivalent to less than 5 weeks＇production at the January rate of output．The yardage of cotton cloth printed during January was about 9 percent greater than in December．Shipments were substantially
above output，and stocks of finished print goods were reduced by about one forth during the month．

The rise in raw－wool consumption，amounting to about 7 percent，brought the total above that for the opening month of 1934 ．The increase in spinning and weaving activity was greater than indicated by the statistics of wool consumption．
Production of silk goods in December was at a low level as machinery operations were curtailed in a con－ certed effort to reduce stocks．Hosiery mills also operated on drastically reduced schedules in the 5 －week period ended January 22 ，on which date normal schedules were resumed．Deliveries of raw silk to mills，however，were substantially larger than in December but were 11 percent less than a year ago． Cloth production was sharply curtailed as indicated by the machinery statistics for the final week of 1933， the first week in which the 30－day restriction of output was effective．In that week，broad looms were operated at 35 percent of the available hours permitted by the code，compared with 54 percent in the preceding week．The corresponding percentages for narrow looms were 16 and 31 ，respectively．The raw silk market improved slightly in January in response to greater buying interest at the prevailing low level of prices．January prices averaged higher than in December，the first increase since the rapid rise of last spring．

## Index of Variety Store Sales

IIN THIS issue is presented a new monthly index of chain variety store sales. ${ }^{1}$ This is the first of a series of indexes of retail sales planned by the Bureau at the request of the Executive Council, for the purpose of measuring changes in the volume of purchases by final consumers. Other index numbers, which are under construction at the present time, will cover dealers' sales of new automobiles, chain grocery store sales, and the sale of general merchandise in small towns and rural areas.
A measure for part of the general merchandise business already existed in the Federal Reserve Board's index of department store sales. But these stores are concentrated in the larger cities and represent a relatively high price range, and their sales do not provide an adequate reflection of general merchandise sales as a whole. Five- and ten-cent and to-a-dollar variety stores, on the other hand, reach into smaller towns as well as having a much lower price range. Because of the prominence of chains and their willingness to cooperate, the practical difficulties of collecting figures for this type of establishment are largely eliminated. An index for these stores was therefore constructed.

The Survey of Current Business has been publishing for several years an index of the sales of variety chains. However, the old index was based on the total sales of the chain organizations, and no adjustment was made

[^2]for changes in the number of their store units. The new series reflects the changes in the sales of anidentical group of retail units, thus eliminating the effect on sales totals of expansion in the number of units by companies within this field. Since this sample group of stores is large enough to be representative of the whole variety store trade, the index may be said to measure the sales of a typical limited-price variety store. ${ }^{2}$ It should thus indicate more accurately the month-to-month variations in the amount of con-sumer-buying. While it was constructed primarily for this purpose, it should also prove useful to the trade itself, for it furnishes each store operator with a standard against which to match his own sales volume.

This index does not measure the trend of the total variety store business over a period of years. Its application to that end would involve the assumption that the total number and aggregate size of all the retail stores in the business remained fairly constant. Whether this is true must await the results of the second Census of Retail Distribution now being compiled. However, it is well-known that the large chains have added to their number of stores during the period covered by the index. Part of this increase may constitute an increase in the total number of variety stores, in spite of the influence of depression, probably at the expense of other types of retail outlets. Insofar as this has taken place, the new index would be misleading

[^3]
as applied to long-term trends. On the other hand, for shorter periods this type of index shoald provide an accurate reflection of the volume of buying.

## Nature of Data Obtained

The problem to be solved was that of securing figures from the chains which would cover a constant number of stores and so provide a more reliable sample. The figures needed were obtained in two ways. The first was the submission by each reporting organization of the sales of a sample group of its stores which had operated continuously during the whole period covered and without any notable change in physical size or in policy. The alternative way was the submission by each company of two figures for each month, comparing the sales of stores at least 13 months old with the sales of the same stores in the corresponding month of the previous year. These two methods may be known respectively as the method of "identical samples" and of "same-store comparisons." They serve to eliminate the effects of expansion in either number or size of units.

## Character of Sample

The chain organizations which have cooperated in supplying data for the present sample are: W. T. Grant, H. L. Green, S. S. Kresge, S. H. Kress, G. C. Murphy, J. J. Newberry, and F. W. Woolworth. The total sales in 1929 of these seven firms or their predecessors amounted to $\$ 685,000,000$, of which about $\$ 665,000,000$ were in the United States, as compared with a total of $\$ 904,000,000$ for all variety stores, as shown by the Census Bureau. Since this group as a whole has expanded during the past 5 years, it probably represents a larger proportion of the field at the present time. For purposes of computation the total sales were not used, so that the actual sample includes only the older stores of these firms, whose sales aggregated $\$ 578,000,000$ in 1929.

The individual store units comprising the sample give representation to every section of the country and to every State, more or less in proportion to the distribution of all variety stores. In regard to location by size of city, the sample weights rather heavily those
cities between 10,000 and 100,000 and gives relatively low weight to towns of less than 10,000 population.
Variety Store Distribution by Geographic Divisions and by Size of Gity

${ }_{1}$ Figures as of 1933.
2 These figures are taken [rom the Census of Retail Distribution of 1929
Note.-lt was impossible to obtain a break-down of the sample's dollar sales by regions. Because of the character of the variation in sales per store in different areas, it is believed that such a break-down would have exhibited greater similarity to the distribution of all variety sales than is the case with the store-unit comparison.

## Reduction to Average Daily Sales

Although most of the contributing companies furnished figures in the form of calendar-month totals, the index has not been computed on this basis. The different months would not be comparable because of differences in the total number of days and in the number of Saturdays and Sundays. Moreover, some firms record their sales either by 4 - or 5 -week periods, only roughly coinciding with the calendar month or by 4 -week periods fitting into a 13 -month year. Therefore, it was decided to calculate a figure representing average daily sales for each month, resulting in a series which could be compared from month to month without any prior adjustment.
In computing the average daily sales from the monthly totals, weights were assigned to the several days of the week on the basis of the sales experience of some of the contributing firms, and were so arranged as to add to a total of six for each full working week. The number of working days in each month was then calculated by adding the weights of all the days in-

cluded, and the total sales for the month were divided by this figure to arrive at average daily sales. ${ }^{3}$

## Weighting of the Seven Contributing Firms

The general plan of assembly for the statistical material supplied by the seven different companies was to convert the figures of each one into the form of relatives, all on a comparable base. The several series of relatives were then weighted as desired and combined into a single series of index numbers.

The total sales of the several firms for the year 1932 were taken as the primary weights, and minor adjustment of these, either upward or downward, was made according to the bearing of other significant factors. The secondary factors to which consideration was given may be listed as follows: (1) The number of units maintained by the company; (2) whether it represented territory overweighted or underweighted by the group as a whole, or perhaps included stores located outside the United States; (3) whether the reliability of the reports as histories of consumer buying been had affected by changes in management or by the form in which figures were furnished.

## Handling of the Various Reports-Same-Store Comparisons

Three of the contributing companies provided reports on past sales in the form of same-store comparisons, two reported the sales of identical samples, while the other two reports were in hybrid form based on year-total figures for identical samples. The majority of the firms did not provide figures further back than 1929, so that this was the earliest year for which an index could be computed. Since September 1933 all firms have sent in monthly reports in the form of samestore comparisons.

Figures of the latter type state the sales of only those stores which have been in operation at least 13 months, and in addition give the sales of those same stores in the corresponding month of the previous year. ${ }^{4}$

[^4]| Month | 1929 | 1930 | 1931 | 1932 | 1933 | 1934 |

${ }^{4}$ The treatment of these figures was as follows: The sales of these stores in the current month were divided by their sales in the same month of the previous year. The resulting percentage ratio provided what is known as a "year-link relative." The sales of old stores were thus expressed as a relative with the same month of the preceding year as a base. All the link relatives which are obtained by this procedure are in effect a series of index numbers, but every one has a different base. It was now necessary to convert these links chain-fashion into an index with a

From these figures was constructed in each case a series of relatives, based on the sales of all the stores of the particular company in 1932.

The necessity of using the sales of all stores for the 1-year base period may cause a bias in the trend of the figures within each year because of chain expansion. For this reason the year 1932 was chosen as the year in which the least expansion occurred. The maximum increase in the number of stores of any of the three firms for which the same store comparison method was used, was only $1 \frac{112}{2}$ percent in 1932 . Therefore, it is not believed that much error was introduced from this source.

## Identical Samples

Two companies reported the histories of sample groups of stores. That provided by one organization included about one half of all its stores in 1933, all of those included having been open continuously since before 1929. The other firm's identical sample was composed only of stores open since 1927, and these amounted to well over one half of the total number open in $1933 .{ }^{5}$ In these two cases it was merely necessary to divide all the monthly values by the average month of the year 1932 in order to obtain a series of relatives with this period as base.

## Special Treatment of Two Cases

One of the firms supplied figures showing (1) the annual sales of an identical sample of about one third of those stores operating in 1933, (2) weekly sales of established stores and the sales of the same stores in the corresponding weeks of the previous year. These weekly totals were consolidated into 4- and 5 -week months, correction was made for cases where a holiday fell within the period 1 year but not within

[^5]the period compared, and year-change relatives were derived for each month. In converting these relative to index-form, the base-period chosen as that of greatest stability was August 1931 through July 1932. The average index number for each year was then compared with the index number derived from the sales of the identical sample. This showed a greater rate of decline for the sample than for the figures based on same-store comparisons. The difference in trend over a 2 -year interval was 8 percent. The only apparent explanation for so large a discrepancy is that the samestore comparisons, although excluding stores opened between the dates compared, nevertheless did include stores which might have been opened only a short time before the earlier of the two periods compared. As the sample was of good size, it was decided that the trend which it indicated was the more reliable. But the sample provided only year-totals. Consequently, the only course open was to graft the trend of the sample onto the monthly variations shown by the same-store comparisons. ${ }^{6}$

The case of the one remaining firm was somewhat similar to the one just described. The material reported consisted of (1) the annual sales of an identical sample including over half the units operating in 1933; (2) the total sales of all stores by months. Here it was necessary to combine the trend of the sample and the monthly variations provided by the total sales figures. ${ }^{\text {? }}$

[^6]It should be remarked that the weights of the last two firms in the final index are relatively small.

## Combination of the Different Firms

At this stage of the computation there were 5 individual series of relatives based on calendar months, namely, the 3 based on same-store comparisons, 1 of the 2 computed from identical samples, and 1 of the 2 special cases just described. These 5 were each multiplied by their respective weights and added together. They were then reduced to average daily sales. To these were now added the weighted relatives of the other 2 firms, which had already been placed on an average-daily-sales basis. ${ }^{8}$ This provided 1 final series combining the reports of the 7 contributing organizations.

## Selection of Base Period

The average sales per working day for the 3 -year period, 1929-31, were chosen as the base for the final index, i.e., the average for these 3 years equals 100 . The base period, 1923-25, used for so many existing indexes, was out of the question because the data available did not extend that far back. The base selected was found to have the advantage of approximate comparability with the Federal Reserve Board index of department store sales, as the average of the department store index for 1929-31 relative to 1923-25 is 101.7 .

## Seasonal Adjustment

Because of the wide seasonal fluctuations in the variety-store business, an index adjusted for this influence was computed in addition to the primary series. ${ }^{9}$ The adjustment factors used for this purpose were derived by a method similar to that used by the Federal Reserve Board for its department-store index. ${ }^{10}$ Special adjustment of the correction factors was made for March and April, since the changing date of Easter affects the period in which its full influence falls. This was also accomplished after the manner of the Federal Reserve Board. ${ }^{11}$

These indexes will be carried regularly under the section, "Domestic Trade", when the next revision of data are made in the June 1934 issue. The indexes for the latest month, meanwhile, will be shown among the footnotes on page 27.

WEEKLY BUSINESS STATISTICS

${ }^{n}$ Preliminary
§ Statistics cover 90 cities. Comparable figures not available prior to 1932 , but adjustments have been made in indexes in the preceding table.

## Monthly Business Statistics

The following summary shows the trend of industrial, commercial, and financial statistics for the past 13 months. Statistics through December 1931 for all series except those marked with an asterisk (*) will be found in the 1932 Annual Supplement to the Survey of Current Business, together with an explanation of the sources and basis of the figures quoted. Series so marked represent additions since the Annual was issued and similar information, if published, will be found in the places noted at the bottom of each page. Later data will be found in the Weekly Supplement to the Survey.

| Monthly statistics through December 1931, together with explanatory footnotes and references to the sources of the data, may be found in the 1932 Annual Supplement to the Survey | 1934 | 1933 |  |  |  |  |  |  |  |  |  |  |  |

[^9] gasoline for 1932). Data for coke revised for 1932. See p. 43 of the Deceniber 1933 issue.

ID Data revised for 1032 . For revisions of months January to A ugust, inclusive, see $p$. 56 of the November 1933 issue
ind of storace to another as a result of the nubsequent months (? (? are not comparable with these firures for earlier months because of revisions and transfers from one kind of storage to another as a result of the new form of report to the Petroleum Administrative Board. The Bureau of Mines has not found it possible to reconcile these figure and will report the figures henceforth to compare with the August data. The Aug. 3 ligures on the old basis are on p. 42 of the November 1933 issue.

- Beginning Aug. 31 figures reported on the new basis caused by transfer of 414,000 barrels from gas oil and fuel oil stocks.
- New basis as of Dec. 31 caused by 1,089000 barrels being classified as fuel oil
$\circ$ New basis as of Dec. 31 caused by $1,089,000$ barrels being classified as fuel oil.

Note. - The following applies to the exchange rate on the Argentine peso on p.31. Quotation on the gold peso was discontinued on Dec. 10 , and no quotations were issued on tha 11th and 12th. Bagianing with Dec. 13, the rate was quoted on the basis of the paper peso, equal to 44 percent of the gold peso. The December rate given above has bean adjusted to the basis of the gold paso. Beginning with January 1934 the rate will be given on the basis of the paper peso.

[^0]:    ${ }^{1}$ Adjusted for seasonal variation.

[^1]:    ${ }^{1}$ Adjusted for seasonal variation.

[^2]:    I This index was constructed by Walter Mitchell, Jr., and H. Haines Turner, assisted by Miss Reba Osborne, in the Domestic Commerce Division of the Bureau of Foreign and Domestic Commerce, under the general supervision of Dr. Willard L. Thorp, Director of the Bureau.

[^3]:    ${ }^{2}$ This should not be confused with "average sales per store", i.e., total sales divided by the total number of units operating, which includes all newly opened stores as well as the established and more typical ones.

[^4]:    ${ }^{3}$ The weights given the different days are as follows: Monday, 0.9; Tuesday, 0.7; Wednesday, 0.7 ; Thursday, 0.8 ; Friday, 0.8 ; Saturday, 2.1. The weights of those week days upon which holidays fall have been subtracted from the number of days in the months in which they occur. The six holidays on which variety stores are generally closed are: New Year's Day, Memorial Day, July Fourth, Labor Day, Thanksgiving, and Christmas. The following table shows the number of working days in each month, 1929 to 1934, used for calculating average daily sales:

[^5]:    In order to do this, it was necessary to use the total sales of all the particular company's stores over some selected period of 12 consecutive months; an ordinary index for 1 year was made from these, dividing each month's sales by the average for the 12 -month period. In this operation the year 1932 was usually employed, for reasons described below. Each of the 12 index numbers for 1932 was multiplied by the relative for the corresponding month of 1933 to secure an index for each month of 1933, and they were divided by the relatives of 1932 to obtain index numbers for the corresponding months of 1931. The index numbers for 1931, in turn, were divided by that year's relatives to extend the index back to 1930; and so on. The result of this process was an index based on the average month's sales in 1932.
    : There was a special problem presented by the first of these two firms. It reported not only the sales of the sample mentioned above for the complete period, 1929-33, but also the sales of a larger sample, including one third more stores, for the years 1931-33. It was decided to take advantage of this larger sample by splicing the two series together at the beginning of 1931. The sales of the smaller sample were reported by calendar months, but those of the larger by weeks. In order to make the two comparable, the weekly figures were grouped into 4 - and 5 -week periods, and then both these and the calendar-month totals were reduced to average daily sales. Both series were put into index form on a 1932 base, and since comparison of the two during 1931 and 1932 showed no noticeable difference in trend, but only some discrepancy in their month-to-month variations, the shift from the first to the second was made in January 1931, without any special adjustment.
    The second of these two firms used accounting periods of 4 weeks each, cutting across the traditional calendar. The sales figures of this firm had therefore to be converted to a ealendar-month basis. This was accomplished by first reducing the 4.week period totals to average daily sales, and then prorating these figures to the months across which each period cut. Thus, if 15 working days in June fell in the sixth period of the 13 -period calendar, and 11 fell in the seventh period, the total sales for June were calculated by adding 15 times average daily sales in the sixtb period plus 11 times average daily sales in the seventh period. The first 2 and last 2 months of the year generally came near enough to coinciding with the corresponding 4-week period, so that the average daily sales of the period could be used as that for the month also. The sales of this company were not put into relatives until after they bad been converted to calendar-month totals.

[^6]:    ${ }^{0}$ For this purpose an average multiplier was calculated for each year, representing the correction needed to make the average month of the same-store index equal the index number of the sample. The multiplier for 1 year, for example, was 1.0818 , and that for the next 1.0510 -a difference between the 2 years of 3 percent. If the average multiplier for 1 year were applied to every month of the year alike, and that for the next applied to every month of that, then an abrupt drop of 3 percent would occur between December and January. This was obviously incorrect, and it was decided that the size of the multiplier should be graduated from month to month so as to approximate a secular trend line, provided that the average of the 12 products in each year should equal the sample's index number for the year. Multipliers for the various months graduated in this manner were obtained by graphical methods, plotting the average multipliers at the middle of each year and drawing a smoothed curve through them.
    Resulting from this procedure was an index based on the period, August 1931, through July 1932, incorporating the trend of the identical sample. Since the indexes for the other firms were based on the year 1932, it was still necessary to convert this index to that base. This was done by dividing each month by the average for the 12 months of 1932 .
    However, no same-store comparison of 1930 with 1929 had been supplied by the company, so that this index extended back only to January 1930. In order to fill in the year 1929, it was decided to resort to the monthly sales of all the stores of this concern, as printed in the Survey of Current Business, and divide them by the number of stores in operation each month. These sales per store for 1929 were then divided by their average, converting them into relatives on a 1929 base. To place them on the 1932 base, the ratio of 1929 to 1932 for the identical sample was used as an average multiplier. This was applied to all months alike, on the assumption that the trend of these figures within the year was similar to the true trend, or that of the sample.
    There remained still another difference in the case of this firm's index. It was not developed from calendar-month totals. Each year-link relative represented a comparison between two periods containing an equal number of working days. However, by means of these relatives all the years were linked to the actual figures of total sales in the base period, and these total sales were recorded by calendar months. This meant that the index number for each month was based on the number of working days in the corresponding calendar month of the base period. Reduction to an average-daily-sales basis was accomplished by applying to every month the number of days in this corresponding base-month.
    ${ }^{7}$ This was done by deriving average multipliers from the differences between the trends (see footnote 6), and graduating these average multipliers by graphical methods before applying them to the monthly figures. After this adjustment of the trend of the total sales they were converted to index form on the 1932 base, and were ready for combination with the other indices computed from calendar-month totals.

[^7]:    s In these 2 cases reduction to average daily sales took place after the figures were converted to relatives based on 1932 as 100 , since this was the order of procedure in the case of the other 5 .
    ${ }^{9}$ The seasonal adjustment factors follow: January, 74.5; February, 83.5; March, 89; April, 97.5; May, 100; June, 95; July, 89; August, 88.5; September, 95.5; October, 101.5; November, 101.5; December, 184.5.
    ${ }^{10}$ A detailed description of the method used by the Federal Reserve Board will be found in the Federal Reserve Bulletin for April 1928. A minor change in method of calculation was necessitated in the present instance by the shortness of the period eovered by the data. This slight modification in the measurement of seasonal variation was designed to compensate in particular for "cyclical distortion", elimination of which is more or less automatically provided by the Reserve Board's "ratio" method of computing seasonal indexes in those cases where data are available for a period covering a considerable number of years.

    It The adjustment factors applied to March and April were moved up and down, depending on the position of Easter. These adjustments follow: For MarchBefore Apr. 1, +5 ; Apr. 1-4, +3 ; Apr. $5-8,-1$; Apr. $9-16,-3$; and after Apr. 16, -5. For April-Belore Apr. $1,-5$; Apr. $1-4,-3$; Apr. $5-8,+1$; Apr. $9-16,+3$; and after Apr. $16,+5$
