# The Business Situation 

DECEMBER is a month in which the income flow to individuals is increased very substantially by final dividend and interest payments for the year. Last month was no exception to the usual pattern of disbursement, and with economic activity generally well sustained, the absolute amount of total income paid out was no doubt a record, exceeding the highest previous monthly total.

In November, the latest month for which actual data are available, the index of income payments, adjusted for seasonal fluctuations, stood at 238 (1935$39=100$ ), equivalent to a 160 billion dollar annual rate. The index at the end of 1943 stood at 223 , so that the upward movement over the past year amounted to 6 or 7 percent.

The tendency for the seasonally corrected index of income payments to rise slightly in the final quarter is not significant in terms of any change in basic conditions which, on the whole, have remained substantially unaltered. Rather, it reflects the continued increase in military payments, and also the rise in salaries and wages and proprietors' income in the distributive trades, an indication that the advance in retail sales was even better than the seasonal expectation. In the commodity-producing industries, the flow of income, as of output, has continued stable

## Sales and Orders Continue High.

While figures are not available at present covering the complete Christmas trading, which this year extended over a somewhat longer period than usual because the early shopper generally had the wider choice, and overseas packages had to be mailed early, data through November show a more-than-seasonal rise. The increase was in the nondurable goods, as the supply of durable products has not been sufficient to support any enhanced seasonal purchases. Buying was in record dollar volume-probably averaging for the fourth quarter about 8 percent more than a year ago. Much of the increase over last year represents price advances.

The pressure for goods was reflected in the orders on manufacturers. New orders placed with manufacturers for nondurable goods during the final quarter of the year were running at a rate about 10 percent above the dollar volume in the third quarter, although the increase in shipments did not match this rate of increase.

Manufacturers' shipments in recent months have not fluctuated significantly, although somewhat higher in the fourth compared with the third quarter. Very little change also was recorded in comparison with the latter part of 1943 , the slight rise in dollar terms over a year ago being a reflection of some price rises and variations in output among industries, rather than any further rise in volume. Manufacturers' shipments, of

course, include the goods destined for the military forces as well as those ultimately disposed of through retail channels.

While the flow of output from the factories has remained stable, the vigorous drive to meet schedules for the critical munitions items showed up in accelerated advances in output of these products in the month of November, and a further upward increase is indicated by the partial data now available for December. The sharp upsurge in November stands out in Chart 1, the 10 percent increase in the aggregate output of munitions items with scheduled peaks ahead being relatively twice as large as the average of the earlier months of 1944 . The acceleration extended over all the major programs subject to special expediting effort.

Since June when the intensified drive was started on these programs, there has been an increase in output of 30 percent in the aggregate. The gains ranged upward to as high as several-fold for Navy rockets, a relatively new and urgent pro-

gram. Gains of between 40 and 50 percent were recorded for heavy artillery ammunition and for the heavy-heavy trucks.

While these accomplishments have in a number of rising programs resulted in their removal from the critical category, the remaining critical programs continue to require most determined efforts to meet the urgent military needs.

## Manpower Steps.

Added to current industrial manpower problems is the developing need of securing enough men in the 18 to 25 year group to fll the calls of the Army and Navy in 1945. Other than the men becoming 18 years of age, the only sizable remaining reservoir available in the age group preferred by the services is among those deferred because of their agricultural occupation. The 364,000 men in this category have been covered by the Tydings amendment to the Selective Service Act. A review of the occupational deferments in agriculture has been undertaken at the direction of the President in order to tap this source of inductees this year. It is not expected that this action will critically affect food supplies.

There are in addition only 35,000 to 40,000 of the 18 to 25 group with occupational exemptions in industry and science. These cases have been reviewed carefully under earlier directives to release such young men from industry to the armed forces, and the War Production Board has reported that further depletion would affect adversely critical programs. At any rate, the number that could be made available from this source is small.

The manpower problems that persist in the munitions industries continue to be limited to particular segments and to selected skills. Additional steps were taken in December, under the direction of the Office of War Mobilization and Reconversion, to aid in procuring the desired labor and to prevent losses of employment in critical plants.

With the heavy fighting continuing in both Europe and the Pacific, and the decisive battles yet to come, we are in no position to rest on our laurels or to relax our efforts to supply the military needs. These requirements must continue to have a high priority in the allocation of economic resources. Yet, in evaluating the present economic situation and the progress of recent years, it is important to keep in mind the cumulative magnitude of the supplies and equipment built up in 1944 and earlier years.

The results of the production effort are summed up in the statement in the December 30 report of the Director of War Mobilization and Reconversion: "The truth is that our soldiers at the front today are not short of ammunition and supplies as a result of any production
failures." He added that "* * * they must know that more, in abundance, is on the way." The economic situation was summarized in this sentence: "We have reached a rate of munitions production in excess of 64 billion doliars a year, while maintaining a standard of living higher than that which we enjoyed in 1929."

As we enter the year 1945, it is clear that the level of economic activity will remain high so long as the global war continues. Allocation of resources will continue to be necessary in order to secure the desired output, and to make certain that any facilities, materials, or manpower that are released from declining programs be used to the fullest extent possible in the expanding munitions programs and in war-supporting activities of the highest priority. At the same time, developments during the year are likely to bring about considerable change in the use of resources and the setting forth of definite plans and lines of action will be required to cope with these eventualities.

## Imporis and Supply of Material

The physical basis of the tremendous production accomplishments of the war years is found in the wealth of our natural and productive resources. As one of the most self-sufficient nations with respect to natural resources and a mass production system already well developed by the demands of a large internal market, the United States was able to avoid any disastrous consequences of the wartime dislocations of supply. To handle this situation did require, nevertheless, tremendous organizational and technical efforts and extensive cooperation by Allied and other countries.

Despite its very high degree of economic independence, the Nation nevertheless depended on imports of a number of vital materials in varying degrees.

Chart 2 sets forth the percentage of the total new supply of ten important commodities which was imported. The value of imports of materials there shown represent almost two-fifths of 1939 imports.

In addition to rubber, tin and silk shown in the chart as 100 percent imported, we depended on imports for practically all of our supplies of 40 -odd items listed as strategic or critical early in the war.
In such cases as newsprint, sugar, bauxite, and certain critical ferro-alloys, the contribution of outside sources ranged from 50 percent to 90 percent of total new supplies. While our dependency on foreign sources was not quite so cornplete for wool, hides, fats and oils, and wood-pulp, we nevertheless imported one-fifth or more of new supplies of these items in that year. Indeed within this latter group there were commodities such as goatskins, and tung oilvery important industrial materialsfor which we were entirely dependent upon foreign countries.
By restricting civilian consumption, developing substitutes, salvage drives, stimulating domestic production wherever possible, and developing new sources of supply especially in the Western Hemisphere, most of the import supply problems have been solved. Through these solutions it has been possible not only to meet military needs but to maintain in most instances an adequate flow of the end products to the civilian economy, (with some exceptions of which automobile tires is an outstanding example). Rationing has been necessary for some products, e. g., sugar, to distribute the supply equitably and to hold consumption below the amount which would otherwise be sought under prevailing conditions of high consumer incomes.
There follows a discussion of the current situation with respect to three of the materials shown in char 2 , which indi-

cates the nature of the problems faced and how they were met.

## Rubber and Rubber Products

Production of synthetic rubber is estimated for the fourth quarter of 1944 at an annual rate of about 840,000 long tons. It is significant to note that synthetic production in 1944 exceeded consumption of crude in any peace-time year and was considerably larger than prewar imports in any year, except for the stockpiling period of 1940 and 1941.

The following table gives the rated capacity of the Government owned synthetic plants, by principal types, as of the end of September 1944:

|  |  |  |  | Major use |
| :---: | :---: | :---: | :---: | :---: |
| Buna S.-- | 705,000 | 84.6 | 604 | Tires and tubes and general replacement for natural rubber. |
| Butyl....- | 68,000 | 8.2 | 53 | Inner tubes, gas masks, coating fabries. |
| Neoprene. | 60,000 | 7.2 | 43 | Tank linings, conveyor belts, mechanical goods, hose. ${ }^{2}$ |
| Total | 833, 000 | 100.0 | 700 |  |

Source: Rubber Reserve Company.
The actual capacity is considerably larger as indicated by the performance of the plants in operation. Private plants, in addition, have a capacity of about 55.000 long tons. Present synthetic rubber capacity is able to supply current requirements, including those for the tire manufacturing facilities added in 1944 and planned for 1945 , though natural rubber is still requisite for some manufactured products.

Total new supply and domestic consumption of new rubber in 1944 reached a wartime high, but still 17 and 10 percent respectively short of 1941 peaks. Direct military and export requirements absorbed the bulk of crude rubber made available in 1942 and again in 1943 when they accounted for approximately 69 percent of the total crude and synthetic rubber used. In 1944, with relatively larger supplies of synthetic available, the proportion declined to about 60 percent.

To insure the flow of the limited supplies of crude into military channels, severe restrictions were imposed early in 1942 on civilian use of rubber, including the prohibition of the manuîacture of nonessential civilian products containing rubber. As a result, domestic consumption in 1942 and 1943 fell substantially as compared with the record vear of 1941. However, in 1944 the availability of synthetic rubber permitted the resumption of production of many civilian items which, together with increased military requirements, resulted in a much higher domestic consumption of crude and synthetic.

Total stocks of rubber as of September 30. 1944 were slightly above the low point at the end of 1943. However, stocks of crude rubber, vitally needed in the war effort, have been declining rapidly and at the present time are below the 100,000
long tons considered by the Baruch Committee as a minimum.

## Rubber Uses.

There are over 30,000 industrial and consumer items that contain some form of rubber. Wartime conditions have, however, necessitated that the use of rubber be rigidly controlled with the result that many items can be manufactured only with reduced quantities of rubber, in restricted volume, or in many cases not at all. Tire production is far the largest end use of rubber as it was before the war. Approximately 70 percent of the domestic consumption of crude and synthetic and 25 percent of the reclaimed went into tire products in 1944 compared with 78 percent and 45 percent respectively in 1939.

Among the nontire products only the most essential civilian types are permitted to be produced and, with few exceptions, these must use synthetic and reclaimed rubber exclusively.

Products permitted to be produced include all rubber goods required for hospitals and other institutions, such items as are necessary to safeguard health standards, and those which are essential to the civilian economy. While the list has been expanded concurrently with the larger synthetic rubber supply, restrictions continue on many less essential products which normally consume relatively large quantities of rubber (mats and matting, flooring, sponge rubber for upholstery, etc.).

## Output of Tires.

In contrast to the success of the synthetic rubber program, the difficulties associated with the production of tires in numbers sufficient to satisfy both military and civilian demands have not yet been fully overcome. Though the quantity of crude and synthetic rubber consumed in tire manufacture in 1944 was about 110 percent of 1939 consumption, the number of tires produced was equivalent to only about 64 percent of 1939 output, indicative of the effect of wartime shift to the heavier tires.

Chart 3.- Production of Rubber Tires ${ }^{1}$

: Data for 1944 are preliminary estimates.
Sources: Rubber Manufacturers Association and War Production Board.

A comparison of the production of rubber tires during the last three years with the three years immediately preceding the war may be made from the accompanying chart. Production of passenger car tires was very small in 1942 and 1943. While output in 1944 was more than double that of 1943 , it represented only about 38 percent of 1939 production. Production of passenger tires for the three war years combined constituted only 20 percent of total production in the 1939-41 period. The bulk of the output went to the maintenance of commercial vehicles, and other essential transport.

Production of tires for civilian passenger cars in the first quarter of 1945 has been scheduled at 5 million- 5 percent higher than the average for 1944 -but less than the output of the fourth quarter of 1944. The arresting of the upward trend was predicated upon the schedules for military types which impinge upon the less essential types.

Military demands, coupled with the necessity of maintaining essential domestic transportation, resulted in a considerable expansion in the past three year's in the output of truck and bus tires. Production has trended sharply upward since 1939 , and in 1944 was nearly doubled 1939 production. For the three-year war period total output was 42 percent over the three years immediately preceding the war. Military demands have absored an increasing proportion of total output, with consequent absolute reduction in supplies for other uses.

Despite the greatly expanded output, the Production Urgency List now includes not only all truck and bus tires but also combat-vehicle and aircraft tires.

## Product Changes.

Basic to any analysis of the tire situation is the change in the character of the product produced since the war due to the increased output of truck and bus tires, especially for very heavy trucks and airplanes. The shift to heavy duty types weighing 65 pounds and more, compared with 22 pounds for the widely used $6.00-16$ passenger tires, and the increase in the use of tires with heavier tread explains the need for additional manpower, facilities, and rubber despite the reduced output of passenger car tires. The data in table 2 indicates strikingly the basis for increased manpower requirements per unit of output.

It is the need for expanded production of those tires with relatively large per unit labor requirement that causes

Table 2.-Productivity in Tire Manufacture ${ }^{1}$

Chart 4.-EEmployment and Hours in the Rubber Tire and Inner Tube Industry

${ }_{2}^{1}$ Data for 1944 are averages of 10 months.
${ }_{2}$ Data through 1943 represent average number of wage earners for the year; 1944, average of 10 months.
Source: U. S. Department of Labor.
the rise in the number of wage earners employed and in weekly hours shown in chart 4.

The number of wage earners in the tire industry increased from an average of 54,100 in 1939 to an average of 91,800 for the first 10 months of 1944. The stability in average employment in 1942 as compared with 1941 resulted from a drop in the early part of the year and a very sharp increase in later months as progress was made in reconversion to the newer types of tires.

It will be noted that the total labor employed in the tire industry is not large, being considerably less, for example, than the number employed in the two largest merchant shipyards. Man hours have doubled since 1939 because the average hours worked per week has increased from 35.0 to 46.4 in October. The later figure is still slightly less than average for the war industries.

## Facilities Still Expanding.

This increase in employment was used primarily to increase the output of truck tires in existing facilities and to staff the new tire building facilities which came into operation. Under the expansion program, authorized late in 1943, five new plants designed to produce heavy duty tires are expected to be in operation early in 1945. In addition, new tire building machinery is being installed in a number of existing plants.

These additional facilities for the output of truck and bus tires will aid in meeting military demand. However, until such new plants are in effective operation, the bulk of the immediate need for expanded truck tire production will be met by the existing facilities through improved utilization, including the recent establishment of a 7-day workweek as a temporary speed-up measure.

To provide for future contingencies, the War Production Board has recently ordered the immediate construction of additional plant and machinery with an annual capacity of six million truck tires.

## Civilian Supplies.

The distribution of tires, as compared with production, since rationing went into effect is set forth in table 3.
Very few passenger tire certificates were issued under the ration plan in 1942 when production was very small. Since that time there has been a substantial increase, particularly in 1944. Under the program, only about 32 million new passenger tires have been put on the road in the last three years as against 153 million tires (original equipment- $55 \mathrm{mil}-$ lion, and replacements- 98 million) in the three years preceding the war.
In addition to the new tires alloted, a total of 16.8 million used tires were made available to civilians. However, the supply of used tires has been substantially depleted. Re-caps were made available more freely in 1944, and considerable reliance will have to be placed on recap facilities in 1945 to keep private cars rolling.
The domestic heavy motor transportation system likewise has been operating on a greatly reduced supply of tires. Operators of commercial trucks and busses have received under ration certificates and in original equipment 14.5 million new tires in the last three years as compared with 26.0 million new tires (including original equipment and replacements) in the three years preceding the war. Replacements in the pre-war period represented approximately 58 percent of total shipments and in the war period they were 92 percent. The new tires have been supplemented by the distribution of approximately 400,000 used tires since May 1943.
Despite the present stringency which will continue indefinitely, the outlook for increased civilian tires can be regarded as improving. Just as other bottlenecks along the path of war production have been broken, so will the current bottleneck in heavy tire output be alleviated by direct action, such as that already taken in installing the 7-day week. The rubber for increased civilian output is available, the production of the lighter tires is comparatively simple, and the manpower requirements-as evident from the 1939 bars on charts 3 and 4are neither so large nor so exacting as in the case of the big tires.

## Leather and Shoes

The war period has seen a progressive tightening of raw material supplies for
leather production and, at the same time, a continuance of civilian purchases of footwear, including both leather and nonleather types, at approximately the peak levels reached in 1942.

On the supply side, the forces which necessitated shoe rationing early in 1943 are being intensified as the war continues. On the consumption side, sales to civilians have been sustained by withdrawals from inventories and by increased consumer takings of nonrationed fabric shoes.
Leather for the military programs and Lend-Lease absorbed about 25 percent of total production in 1944. The impact of this large diversion from civilian channels has been partly offset by increases in raw material supplies and leather output. Nevertheless, after allowances for exports and for purchases by government agencies and military personnel, the number of rationed-type shoes produced in 1944 is estimated to have declined to about $240,000,000$ pairs, as compared with a 1936-40 annual average of approximately $340,000,000$ pairs.

By pre-war standards, therefore, current production of leather shoes for civilian use is running considerably below the amounts normally purchased, even after taking account of the number of individuals in the armed forces. It is evident that current production is even more restricted relative to the consumer demand than would be forthcoming in the absence of rationing.

## Raw Materials Above Pre-War.

The problem of assuring that military and essential civilian needs for shoes and other leather products would be met during the war period has been essentially a problem of directing the flow of raw materials into the most essential channels. A monthly control plan has been in effect since July 1942, under which hides are allocated by grades among tanners and other processors according to the uses to which the hides will be put.
Contrary to the situation for most raw materials, the demand for leather products has very little influence on the supply of staple hides and skins. The value of meat from slaughtered animals, especially cattle and sheep, far exceeds the value of the hides and skins that are obtained. As by-products of the meat industry, domestic supplies of hides and skins are dependent on meat production. The exportable supplies of foreign countries are limited by this same condition

Table 3.-Production of Tires for Passenger Cars, Trucks and Busses and Ration Certificates Issued
[Thousands]

[^0]Source: Rubber Manufacturers Association, War Production Board, and Office of Price Administration.

Since then, however, imports of cattle hides have been dropping rapidly to 1935-39 levels, chiefly because of a decline in the exportable hide supply of foreign countries. Arrivals of calf skins and, more recently, of goat and kid skins, have also fallen off. In addition to those exporting areas which have been cut off by the war, various countries have expanded their own tanning industries and, therefore, have smaller supplies of raw materials for shipment abroad.

World supplies of sheep and lamb skins have increased during the war period, making it possible for the United States to import more. These larger supplies have served in part to satisfy the heavy military demands for sheep skins for garment purposes.

## Shoe Production Below Leather Tanning.

In the aggregate, wartime supplies of raw materials have been sufficient to permit leather tanners to produce more than

Chart 6.--Production of Leather and Leather Shoes

1 Estimated on the basis of data for 10 months.
Sources: Leather, tanning index of the Board of Governors of the Federal Reserve System recomputed with 1939 as base; shoes, U. S. Department of Commerce.
in 1939 and 1940. As shown in chart 6, the output of leather tanners reached a peak in 1942, reflecting the exceptionally heavy imports of hides in the preceding year and also some depletion of raw material inventories. Output declined in the succeeding 2 years. The record animal slaughter in 1944 has not yet been reflected fully in leather production as some part of the slaughter has served to increase tanners' stocks of hides and calf skins.

The chart contrasts changes in leather output with changes in the production of leather shoes, including all military and civilian-type shoes with leather uppers. The two indexes are plotted so as to highlight the significant spread which has developed between them during the war.

The index of shoe production, which is based on the number of pairs manufactured, has declined relative to the index of leather tanning. This is most noticeable in 1944. Preliminary figures show leather tanning in 1944 about 8 percent

${ }^{1}$ Estimated on the basis of data for 10 months.
Source: U. S. Department of Commerce.
above 1939, while the number of leather shoes manufactured is estimated at 11 percent below 1939.

This divergence between leather tanning and shoe production is one of the key factors in understanding the wartime restrictions on civilian shoes. It reflects the well-known fact that more leather is used on the average in military shoes than in civilian shoes.

This is illustrated by some rough estimates of leather consumption in shoe manufacture. Men's heavy oxfords require about two and one-half square feet of upper leather per pair. Shoes customarily worn by women and children use about one and one-half square feet. The army service shoe, on the other hand, takes four square feet of upper leather and a pair of combat boots takes almost twice that amount. The actual leather used in the approximately $50,-$ 000,000 pairs of military type shoes produced on Government contract in 1944 is equivalent to almost $150,000,000$ civilian pairs.

## Chart 8.-Production of Leather Shoes

[^1] Source: U. S. Department of Commerce.

Use of leather for purposes other than shoe manufacture has declined during the war. While such uses as industrial belting, harness, work gloves, and shoe repair have increased, leather for luggage, upholstery, pocketbooks, and other consumer items has been restricted. Various types of military equipment other than footwear require leather, but the amounts used remain small compared to the amounts going into military shoes. Whereas before the war approximately 85 percent of all leather produced was used in the manufacture of shoes, the ratio today is probably nearer 90 percent.

## Footwear Production Near 1941 Peak.

Charts 7, 8, 9 show the trends in annual production of the various types of footwear (other than rubber footwear) since 1940. The effects of pressing military demands, of civilian rationing, and of the shift to substitute materials are readily apparent.

## Chart 9.-Production of Footwear Other Than Leather Shoes and Rubber Footwear

${ }^{1}$ Includes shoes with all-fabric uppers, most of which
have nonleather soles.
2 Includes athletic shoes, beach sandals, harefoot sandals, theatrical footwear and other footwear not distributed as to kind.
${ }_{3}$ Estimated on the basis of data for 10 months.
Source: U. S. Department of Commerce.
Over-all production reached a peak of practically $500,000,000$ pairs in 1941 and has declined only moderately since then. Leather shoes, generally defined as shoes with leather uppers, also achieved a record production total in 1941, but have been reduced by one-fourth since then. This decline has been partly offset by the doubling of the output of other types of footwear, from $72,000,000$ pairs in 1940 to $150,000,000$ pairs in 1944 . Leather shoes continue to be the largest component of total footwear production, but they accounted for only 68 percent of the total in 1944 , compared with 82 percent in 1940.

Leather shoes for civilian wear were one-third lower in 1944 than in 1941
(chart 8). Military-type shoes, on the other hand, have been increasing steadily and amounted to about $50,000,000$ pairs, or 16 percent of total leather shoe production last year. Although these shoes were produced on Government contract, not all of them are for use by our own armed forces. Some are for lend-lease shipments, but part of the shoes for export are fabric shoes for civilian wear.

More detailed information on the composition of leather shoe production in 1939, 1941 and 1944 is contained in table 4. Roughly one-half of the 1939 production was in women's shoes, one-fourth in men's and the balance in shoes for youngsters and infants.

Comparing the first 10 months of 1944 with the corresponding period of 1941, the year of peak output, it is seen that men's shoes experienced the sharpest cut. This was to be expected in the light of the large numbers inducted into the armed forces. The reduction in women's leather shoes, however, was almost as large.

As noted below, this reduction has been compensated to some extent by the substantial rise in the production of fabric shoes, which are chiefly for ladies' wear. Misses', youth's and children's shoes declined less sharply, and infants' shoes were maintained at the high levels of 1941.

Leather for civilian footwear has been curtailed in other ways than by reducing the number of civilian-type leather shoes produced. There has been a marked trend toward greater use of nonleather soles on shoes. In 1942, 83 percent of all shoes manufactured for civilian wear had leather soles. This percentage dropped to 70 percent in 1943 and 53 percent in October 1944. In addition, larger production of the fabric-upper, leather-bottom shoe has served as a leather extender. Finally, there has been some savings in leather use because of the curtailment in the number of styles of civilian shoes manufactured.

Production of fabric shoes, which include shoes with fabric uppers and, in most cases, soles of various materials other than leather, increased sharply
during the past two years (chart 9), They accounted for 15 percent of total footwear in 1944, compared with less than 2 percent in 1940. Most of these shoes are unrationed and are for women's and misses' wear. Part-leather, part-fabric shoe production has increased somewhat even though most of these shoes are subject to rationing and must compete with leather shoes for the consumer's coupons. The style factor is important in sustaining the demand for part-leather, part-fabric shoes.

## Sales Trends.

Sales of footwear, including all types of shoes, sandals, and slippers, have followed a different pattern than production, chiefly because of the drawing down of inventories of rationed types. In spite of lower production after 1941 and of considerably larger takings by Government agencies, military personnel, and exports, total annual sales to domestic civilians appear to have been stabilized during the past three years at close to $460,000,000$ pairs, more than 5 percent higher than the 1941 total.
The types sold to civilians have undergone significant shifts because of the critical leather supply situation and because of the rationing program. Sales of nonrationed types of footwear, principally fabric shoes and house slippers, have increased while sales of ration-types have declined.

## Rationing Program.

When rationing was introduced, the per capita ration was set at approximately 3 shoe stamps a year. This rate compared with per capita consumer takings of leather shoes in 1942 estimated at 3.8 pairs for women, 3.1 pairs for misses, children, and infants, 2.1 pairs for men, and 1.4 pairs for boys and youths. In recognition of the large differences in per capita needs, transfer or stamps within families was permitted. Beginning in November 1943 the ration rate was cut to a stamp every 6 months.

Actual purchases for ration currency, however, have proceeded below these rates. A sizable ration stamp "float" has come into existence since stamps were

made valid for an indefinite period, reflecting the fact that the ration allotment is inadequate for some families and single individuals and excessive for others.
On the other hand, the number of shoes sold to consumers in exchange for ration coupons has been augmented by purchases from stocks released from rationing. Releases were authorized by the Office of Price Administration in order to aid dealers in clearing out merchandise for which the consumer was reluctant to spend ration stamps. The amounts involved were approximately $33,000,000$ pairs in 1943 and a somewhat lower total in 1944.

In the aggregate, it is estimated that releases offset the "float" accumulation, with total sales of rationed-type shoes approximating the rate permitted under the rationing program.

The program has not operated to reduce consumer purchases to the extent of the reduction in current production, as indicated by the spread in chart 10. Sales of rationed-type shoes to domestic civilian consumers, including shoes released from rationing, have exceeded new supply in each year since 1941. During this period consumers have been steadily drawing on the inventory backlog.

Dealers' shelves were exceptionally well-stocked when rationing began. Although inventory depletion has reduced the reserve by about 45 percent, over-all stocks continued to be adequate at the end of 1944 to honor all stamps then outstanding.

The estimated composition of trade inventories of rationed shoes on April 10,

# Classification of Consumer Expenditures by Income-Elasticity 

By Louis J. Paradiso

TT IS COMMON KNOWLEDGE that during the war period businessmen have been able to sell practically all of the goods and services they could offer. Indeed the problem of retailers and wholesalers was to get enough goods to satisfy the demands of consumers even though the supply was larger than in any peacetime year. These demands, stemming from record consumer incomes, constantly pressed upon a limited supply of consumer goods.
This war phenomenon, however, will come to an end soon after the close of hostilities. The forces of market supply and demand will once more assume more fully their economic function. Consumer purchases of goods and services in the post-war years will be determined by the volume of purchasing power and employment, and by considerations of prices, quality and variety of the goods offered.

In other words, consumer behavier will tend to conform with the patterns which prevailed in the pre-war years. This being the case it will be useful to have a knowledge of the structure of consumer demand and to have a measure, based on the historical experience, of the degree and direction of consumer spending as consumer incomes change.
A well known characteristic of the consumption pattern is that consumers do not dispose of their added incomes in the same proportion for all types of goods. A smaller proportion of an increase in the income is spent on food, for example, while a much larger proportion goes for the purchase of automobiles. In general, a large group of expenditures is relatively stable in relation to changes in incomes while at the other extreme many items of consumption are highly volatile.

Information on the degree of sensitivity of individual consumer expenditure items or groups of items to changes in consumer incomes is useful in that (1) It provides a yardstick for determining the probable change in demand for a product with the change in the business cycle; (2) it serves as a basis for estimating the probable maximum potential demand for consumer goods and thus throws light on policies relating to production, employment, and capital expansion, and (3) it meets the need for information to appraise changes in raw material requirements, import requirements and other problems related to supply and demand for consumption goods.

In this article some of the basic information relating to the structure of consumer purchases is presented by the

Note.-Mr. Paradiso is Chief of Business Statistics Unit, Bureau of Foreign and Domestic Commerce.
use of a classification of 174 consumer expenditure items according to their degree of sensitivity to changes in consumer incomes. ${ }^{1}$ That is, the presentation is made on the basis of the income elasticity as determined by the general relationship of consumption to consumer incomes in the years from 1929 to 1940.
It is clear that a study of the changes in expenditures in relation to changes in income in the very unstable period from 1929 to 1940 will reveal those items which have shown relatively little fluctuation in relation to the income change, those which have shown approximately similar proportionate changes and those which have responded more sharply.
A grouping of consumer expenditure items according to three categories of sensitivity to income change-those expenditures that are relatively insensitive to changes in income, those that are somewhat sensitive, and those that are most sensitive-provides a framework which is valuable in marketing analysis from the standpoint of the effect of business cycle changes on consumption.
From this point of view, such a classification has advantages over the cus-

[^3]tomary breakdown of consumer expenditures based on the concept of durability. ${ }^{2}$ The purpose of this latter classification is to group the items according to the length of time it takes to consume them. Most foods, for example, are classified as perishable while automobiles are classified as durable.

Since the purchase of durable commodities is usually postponable the aggregate expenditures for such goods tends to fluctuate more violently over the cycle. This classification has been used primarily for analyzing the response of the groups of expenditures to changes in business activity.
However, as is shown below, there are many items classified as nondurables and services which are as sensitive to business fluctuations as the durable goods, and conversely. The dispersion of the sensitive as well as the insensitive items throughout the entire range of the durability classification makes this latter classification less useful for the purpose of studying the effect of the business cycle on changes in consumer purchases.
By definition the groups classified by income elasticity provide a more ex-

tended basis for studying changes in consumer expenditures in relation to business fluctuations.

## Income-Elasticity Groups.

There are numerous ways of measuring the sensitivity of consumer expenditures to changes in business fluctuations. ${ }^{3}$ In this study the disposable income of individuals (income payments less personal and nonpersonal tax payments) was used as a measure of the broad changes in economic activity.
The indicator of demand or incomeelasticity is defined as the percentage increase in the consumer expenditure for a specifled commodity or service which is associated with a given percentage increase in disposable income, all other factors affecting the expenditure assumed to remain constant. The measure of income-elasticity was determined from the relationship between income and expenditure on the basis of a study of the changes in income and the corresponding changes in expenditures in the period of years from 1929 to 1940 .

Altogether 174 consumer expenditure items were analyzed in relation to changes in income. ${ }^{4}$ In arriving at the measures of income-elasticity it is necessary to consider the net effect of a change in income on the expenditures. The influence of secular trends or changes in expenditures resulting from the operation of specific factors other than income were abstracted from the changes in consumer expenditures. This was accomplished by the use of a correlation analysis between consumer expenditures for each of the 174 items of goods and services, disposable income, and a time factor.

[^5]The general form of the equation used in determining the elasticity constants is as follows: Consumer expenditures= A $\times$ (disposable income) $\alpha(1+r$ ), yenr where $A, \alpha$, and $r$ are constants and determined by the method of least squares from the data. The factor $(1+\mathrm{r})^{\text {ve.ir }}$ is the "catch-all" net trend which represents a combination of the effect of secular changes and the trends in factors other than disposable income affecting changes in consumer expenditures.

From this form of the regression, the coefficient $\alpha$ may be taken for the approximate measure of the income-elasticity. ${ }^{5}$ For example, in the case of consumer expenditures for jewelry and watches the coefficient $\alpha$ as determined from the regression is 1.7 . This may be interpreted as follows: Assuming all other factors equal, a change of 10 percent in disposable income is associated with a change of 17 percent in dollar expenditures for jewelry and watches. This obviously implies a marked degree of sensitivity of these expenditures to income changes.

On this basis it was possible to classify each of the consumer expenditure items into groups of income-elasticity. Table 1 shows the distribution of the items of consumer expenditures by income-elasticity. It may be noted that the aggregate of the consumer expenditures for goods and services has an income-elasticity of 0.8 , that is, a change of 10 per-
${ }^{5}$ That the result is only approximate may be seen from the following: Assume that the disposable income changes by k percent, all other factors remaining the same. Then the ratio of consumer expenditures under these conditions is given by

$$
\begin{gathered}
\frac{\mathrm{C}_{1}}{\mathrm{C}_{2}}=\frac{\mathrm{A} \mathrm{I}^{\alpha}(\mathbf{1}+\mathrm{k})^{\alpha}(1+\mathrm{r}) \text { year }}{\mathrm{AI} I^{\alpha}(1+\mathrm{r})^{\text {year }}}=(1+\mathrm{k})^{\alpha}= \\
1+\alpha \mathrm{k}+\alpha \frac{(\alpha-1)}{2} \mathrm{k}^{2}+\cdots
\end{gathered}
$$

where $\mathbf{C}$ is consumer expenditures and $I$ is the disposable income. If $\alpha<1$ and $k<1$ the other terms of the series are small and $\alpha \mathbf{k}$ is approximately equal to the percentage change in consumer expenditures. If $\alpha$ is much greater than 1 then $\alpha k$ is not a very close approximation unless $k$ is very small.
cent in disposable income is associated with a change of 8 percent in total consumer expenditures. This coefficient ot the total expenditure was used as the basis for grouping the various items of expenditures.

All those items whose income-elasticity was less than 0.8 , the coeffieient associated with the total expenditures, were classified in the insensitive group. In other words, the aggregate expenditures for all the items in this group would be reiatively insensitive to changes in the disposable income.

Tlose items that had a coefficient of 0.8 to 1.2 were classified as somewhat sensitive, since the coefficient was somewhat above that for the total expenditures.

Finaliy, the items whose coefficient of income-elasticity exceeded 1.2 were classified in a group called sensitive because a change of 10 percent in the disposable income in each of these cases was associated with a change of more than 12 percent in the consumer expenditure.

The expenditures for the items in each group were then aggregated for the years 1929-42. These are shown in chart 1 and in table 2.

## Behavior of Income-Elasticity Groups.

The chart reveals very clearly the difference in cyclical behavior of the three groups of expenditures. From 1929 to 1933 the aggregate expenditures of goods in the insensitive group declined by 28 percent whereas for the somewhat sensitive group the decline was 43 percent and for the sensitive group it was 63 percent. On the upswing from 1933 to 1940 the first group increased by 30 percent, the second by 64 percent, while the sensitive group more than doubled.

In general, for the period covered, the insensitive goods have constituted about two-fifths of total consumer expenditures. On the other hand, the sensitive group comprised less than one-fifth of the total.
The striking feature of the table is the breakdown of each group into commodities and services. As would be expected most of the services fall in the insensitive group. However, a sizable proportion of the total expenditures for serv-ices-in 1940, almost one-quarter-was sensitive to changes in disposable income.
Furthermore, while almost two-thirds of the total expenditures for commodities fall in the somewhat sensitive group, the remainder is almost equally divided between the other two groups. This table clearly indicates the wide dispersion in income-elasticity which exists among both commodities and services.
For example, over 70 percent of the items fall within the range of sensitivity from 0.4 to 1.6 .
Because of the wide dispersion of the various consumer expenditure categories among the sensitivity groups, the groups cannot be readily characterized by types of expenditures. As the listing below indicates, while most of the foods fall in the somewhat sensitive group, purchased meals and beverages at schools belong in the insensitive group and purchased meals, and beverages in dining cars and in institutions, clubs and indus-

trial lunch rooms are in the sensitive group. Similarly, the various items of clothing expenditures fall in each of the three groups.
Durable goods such as furniture, cooking equipment, and new cars go in the sensitive group but other durables such as refrigerators, washing machines and sewing machines are in the somewhat sensitive group. On the other hand, durables such as china, glassware, tableware and utensils appear in the insensitive group. The interest in table 3 lies in the fact that any of the items or groups of items can be characterized by the broad sensitivity range in which they are included.

## Uses of the Classification.

The grouping of consumer expenditure items by their response to changes in income has both a general and specific use. The classification shown in table 2 is useful for broad economic analysis relating to problems of the business cycle and full employment.

Expenditures for the items in the insensitive group will remain relatively stable regardless of the changes in income and employment. Indeed, the in-come-elasticity for the aggregate expenditures of this group is less than 0.6, which implies that a change of 10 percent in disposable income will very likely result in a change of only 6 percent in these expenditures.

As the economy approaches high levels of employment, however, consumption of goods most sensitive to changes in income will comprise an increasingly larger proportion of total consumption.

It must be reemphasized that the sensitivity indicators are based on cyclical changes in periods of relative instability. What the sensitivity of consumption to changes in disposable income would be in periods of a high and stable level of employment is not known and cannot be determined either from previous experience or from existing data. If practically all of the working population were certain of continued employment over a
long period of years, the consumption pattern might very well be altered, but there is no way of knowing to what extent and in what direction.

For many purposes, and particularly for those in which the businessman would be interested, the sensitivity information on the individual items of consumption is more useful. On the basis of table 3, it is possible to determine within broad limits the effect of a change of 10 percent, 20 percent or any other given percentage change in the disposable income on the relative increase of the expenditure for a given item.

For the items listed in the first group, the insensitive category, a change of 10 percent in the disposable income is likely to result in is change of less than 8 percent in the expenditure. In the case of the second group, the corresponding expenditure would be between 8 and 12 percent; and for the sensitive group the expenditure would change by more than 12 percent.

These broad ranges of sensitivity groupings are of especial interest in connection with the problem of possible shifts in demands in the post-war years as the income changes.
Indeed it is hoped that private firms will make income-elasticity analyses for sales of their own particular products which take into consideration not only disposable income but other factors as well. Such analyses would supplement or improve the present classification and would thus provide a more useful body of information as a guide for business policy.

## Necessary Qualifications.

The classification by income-elasticity has several important qualifications and for this reason it should be considered as a first approximation only. The two more important qualifications are described below.

First, the coefficients of elasticities were determined for a period in which the cyclical movement was by far the widest and had a greater amplitude than
any other in our history. The classification might be modified somewhat if it were possible to include some of the minor recessions of the twenties. It is not believed, however, that the change would have been significant if more years had been covered in the determination of the elasticities. One minor recession was covered in the 1929-40 period, namely that of 1938-and a classification based on that decline alone yields approximately the same groupings.

Using a longer period of time from which to determine the relationships has definite advantages when considering a number of items having a strong upward trend. In the case of such a relatively new product as refrigerators, for example, the expenditures are probably more sensitive to changes in income than is indicated by the experience from 1929 to 1940 alone. In this instance the basic upward trend in purchases which was evident in the twenties affected the amplitude of the cyclical movement in the thirties and the full effect of the trend could not be entirely eliminated by the analysis of the experience in the period 1929-40.
It may be noted that for a few items there apparently was no relation between the consumer expenditures and disposable income. In fact, as table 1 shows, the coefficient of income-elasticity for five items was negative and not significant. Expenditures for these items were very small and for the sake of completeness were included in the insensitive group.

The second qualification is more serious. The classification of necessity is based on the available break-down of consumer expenditures. More detailed information is available on consumer expenditures for services whereas a further break-down of certain commodity groups is lacking.

For example, data for expenditures on refrigerators are available only in combination with washing and sewing machines. If each of these items were available separately, their income-elasticities would probably differ from that of the combination. Similarly, clothing and accessories had to be treated as a group, whereas a break-down might show considerable dispersion in the incomeelasticities of the components of the group.

A further break-down of the existing commodity groups would add materially to the understanding of the shifts in the consumption pattern and to the sharpening of the sensitivity categories. Obviously, further intensive work is called for to develop additional data in the field of consumption.

As a final note on the classification, it must be borne in mind that the in-come-elasticities are determined from current dollar consumer expenditures and disposable income. If physical quantity data could be obtained for each of the items and related to the "real" disposable income (i. e., disposable income adjusted for price changes) the resulting classification might be different from the one presented in this article.

Table 3.-Consumer Expenditure Items Classified According to Sensitivity to Changes in the Disposable Ineome

## INSENSITIVE

I. Food and tobacco:

Purchased meals and beverages-schools.
Tobacco products and smoking supplies.
II. Clothing, accessories and jewelry:
hoes and other footwear
shoe cleaning and repair.
Laundering (in establisments).
Net purchases from second-hand clothing dealers.
III. Personal care:

Toilet articles and preparations.
Barber shop services.
V. Housing:

Owner-occupied nonfarm dwellings space-rental value
Tenant-occupied nonfarm dwellings (including lodging houses)-space rent
Rental value of farm houses.
Clubs, schools and institutions.
V. Household operation

Lighting supplies.
China, glassware, tableware, and utensils.
Net purchases from second-hand furniture and antique dealers.
Upholstery and furniture repair.
Fuel (except gas) and ice:
Purchased.
Produced and consumed on farms.
Household utilities: Electricity.
Clas.
Water.
Telephone.
Postage.
Moving expenses and warehousing.
Fire and theft insurance on personal property-net payments.
Miscellaneous household operation services.
Ophthalmic products and orthopedic appliances.
Ophysicians.
Chiropodists and podiatrists.
Private duty trained nurses.
Privately controlled hospitals and sanitariums.
Student fees for medical care.
Funeral and burial service.
Cemeteries and crematories.
VII. Personal business:

Theatrical employment agency fees.
Employees' dues and fees to professional associations.
Trust services of banks.
Bank service charges on deposit accounts.
Bank check collection and foreign exchange eharges.
Safety deposit box rental.
Money order fees.
Expense of handling life insurance.
Life insurance companies.
Fraternal and assessment associations.
VIII. Transportation:

User-operated transportation.
Gasoline and oil.
Bridge, tunnel, ferry, and road tolls.
Automobile insurance-net payments
Purchased local transportation.
Strect and electric railway and local bus.
Steam railways-commutation.
Ferries-foot passengers.
Purchased intercity transportation
Intercity bus.
Coastal and inland waterway.
IX. Recreation:

Admissions to specified spectator amusements:
Motion picture theaters.
Entertainment of nonprofit organizations (except athletics). Professional foothall.
College football.
Other amateur spectator sports.
Purchase of programs.
Specified commercial participant amusements:
Daily fee golf courses -greens fees.
Golf instruction, elub rental, and caddy fees.
Informal recreation:
Magazincs, newspapers, and sheet music.
Book rental and repair.
FIunting dog purchase and training, and sports guide service. Camp fees.
Clubs:
School fraternities-dues and fees.
Fratcrnal, patriotic and women's organizations (except school and insurance)-net payments.
Luncheon clubs
X. Private education and research

Higher education.
Other instry and secondary schools.
Foundation expenditures for education and research.
XI. Religious and welfare activities:

Religious bodies.
Social welfare and foreign reliel agencies.
Muscums and libraries.
Foundation expenditures (except education and research).
XII. Foreign travel and renittances:
Personal remittances to foreign countries.

## SOMEWHAT SENSITIVE

I. Food and tobacco:

Food purchased for off-prenaise consamption. Purchased meals and beverages: Retail, service and amusement establishments. Hotels.
Tips.
Food furnished commercial employees.
Food produced and consumed on farms.
II. Clothing, accessories and jewelry:

Clothing and accssories except footwear
Cleaning, dyeing, pressing, alteration, storage and repair of garments n. e. c. (in shops).
Miscellaneous personal services
III. Personal care:

Beanty shop services.
Baths and masseurs.
IV. Housine:

Transient hotels and tourist cabins.

1. Household operation

Reirigerators, and washing and sewing machines. Cleaning and polishing preparations.
Rug, drapery and mattress cleaning and repair. Care of electrical equipment (except radios) and stoves.
Stationery and writing supplies.
Miscellaneous household paper products.
Telegraph, cable and wireless.
Express charges.
Y1. Medical care and death expenses:
Drug preparations and sundries.
Dentists
Osteopathic physicians.
Miscepractors
Miscellaneous curative and bealing professions. A ceident and health insurance-net payments.
riI. Personal business:
Miners' expenditures for explosives, lamps and smithing.
Classified advertisements.
Net purchases from pawnbrokers and miscellaneous second-hand stores.
Personal business serviees.
VIII. Transportation:

User-operated transportation:
Tires and tubes.
Automobile repair, greasing, washing, parking, storage and rental.
Purchased intercity transportation-air line
IX. Recreation:

Admissions to speeified spectator amusements: Professional baseball.
Horse and dog race tracks.
specined commercial participant amusements Billiard parlors and bowling alleys. Dancing, riding, shooting, skating, and swimming places.
Amusement devices and parks. Sightseeing buses and guides.
Private flying operations.
Informal recreation:
Books and maps.
Nondurable toys and sports supplies. Boat and bicycle rental storage and repair Radio repair.
Photo developing and printing. Photographic studios.
Veterinary service and purchase of pets
Athletic and social-dues and fees.
Commercial amusements, n. e.c.
X. Private education and research Commercial, business and trade scbools-fees. Correspondence schools-lees.
XII. Foreign travel and remittances: Other foreign travel expenditures.

## SENSITIVE

I. Food and tobacco:

Purchased meals and beverages:
Dining cars.
Institutions, elubs and industrial lunehrooms.
II. Olothing, accessories and jewelry:

Fur storage and repair.
Dressmakers and seamstresses (not in shops)
Jewelry and watches.
Watch, clock and jewelry repair.
V. Houschold operation:

Furniture.
Floor coverings
Miscellaneous clectrical appliances (except radios). Cooking and portable heating equipment.
House furnishings and equipment, n, e. c.
Tools.
Writing equipment
Domestic service (excluding practical nurses): Cash payments.
Value of meals furnished,
VI. Medical care and death:

Practical nurses and midwives.
Net payments to group hospitalization and health
Mussociations. net payments.
VII. Personal business:

Nonthentrical employment agency fees.
paynents
Brokerage charges and interest, and investment counseling.
VIII. Transportation:

User-operated transportation: New cars.
Net purehases of used cars.
Parts and accessories.
Purchased local transportation:
Taxicab-fares and tips.
Purchased intercity transportation: Steam railway (excluding commutation). Sleeping and parlor car-fares and tips. Baggage transfer, carriage, storage, and excess charges
IX. Reereation:

Admissions to specified spectator amusements: Legitimate theaters and opera. Ticket broker's markup on admissions
Pari-inutuel net receipt
Nonvending coin machines-receipts minus payoff.
Wheel goods, durable toys, and sports equipment Boats.
Radios, phonographs, parts and records. Pianos, and other musical instruments.
Collectors' net acquisitions of stamps and coins.
Flowers, seeds, and potted ${ }_{\alpha}$ plants.
XI. Religious and welfare activities:

Political organizations.
XII. Foreign travel and remittances

Payments to United States vessels.

# Service Industries-Trends and Prospects 

IN CURRENT discussions of probable areas in which post-war employment expansion may be anticipated, the service industries are often given a prominent place. These industries-comprising domestic, commercial, professional and nonprofit services-had the equivalent of 6.3 million full-time proprietors and employees in $1943 .{ }^{1}$
The problem explored by this article is the extent to which the service industries may contribute to the solution of the post-war employment problem. If total employment should reach a satisfactory level in the post-war period, would the service industries contribute disproportionately to the increase from the prewar period?
The view that the service industries will play an important role in furnishing postwar jobs probably derives from the observation that during the twenties the service industries were characterized by sharp relative growth. However, this movement was contrary to the secular trend of employment and it ceased about 1930, when the position of the services stabilized.
Furthermore, in examining the wartime experience of these industries one finds an expansion of service employment only moderately smaller, except in domestic service, than would have been expected had total private employment risen to similar new record levels under peacetime conditions. Domestic service employment dropped sharply during the war, but is expected to make only a partial recovery if the total employment picture is satisfactory in the post-war period.
In consequence, the total number engaged in the service industries in the post-war period is not likely to increase
Note.-Mr. Denison is a member of the National Income Unit. Bureau of Foreign and Domestic Commerce.
${ }^{1}$ The definition of the service industries is that of the Standard Industrial Classification (Bureau of the Budget, 1942) except for the exclusion of Government-operated establishments and automobile repair services and garages; and the inclusion (in business services) of title abstract companies. The principal government activities excluded are public education and public hospitals. Automobile repair services and garages, which accounted for 167,000 full-time equivalent employees and proprietors in 1939, are excluded since they are closely akin to filling stations and automobile dealers, classified in Trade, and are better considered in an examination of that industry. Title abstract companies are of little importance.

All employment figures cited in this article for the services have been reduced to a fulltime equivalent basis as defined in table 5 unless otherwise noted. The term "employment" will refer in this article to wage and salary workers only. "Number engaged" or "personnel" will be used when inclusion of proprietors is intended.
greatly from either the 1941 or 1943 totals, even if employment generally is high, unless new developments not yet in sight occur. In fact, the relative importance of the industry, as measured by the number engaged, is apt to be less than in the pre-war period as a result of a decline in household employment and the mere maintenance of the relative position of the other service components combined. The service industries, therefore, cannot be expected to make a significant contribution to the solution of the post-war employment problem.

## Diversity of Service Industries.

Any analysis of the service industries is complicated by their diversity. These industries are a heterogeneous aggregate of establishments and individuals with little in common except a service as principal product-and exclusion from all other industries. For the following discussion, these establishments and individuals have been classified in the 17 major components listed in table 1.

The various components of the services vary radically in earnings levels. The following table shows one type of breakdown of service personnel by earnings in 1941 (a more representative year than 1943):

## Percent of number engaged in service industries in 1941

Proprietors of professional (including engineering and architectural). amusement, and business service en-terprises-average net income $\$ 3,577$ _ Proprietors of personal services, lodging places, and repair services and hand trades-average net income $\$ 836$
Employees in industries with average full-time equivalent earnings of:

```
        $1,258 to $1,608__-._--..------------
``` \$933 to 1,045 10.6 10.5 \(\$ 549\) to \(\$ 578\).................................

Total 25.5
32.0 100.0

Differences among components in ownership, clientele, earnings, and employment trends (table 1) as in other important characteristics, warn against easy generalizations about the service industry as a whole. Detailed examination of the components is required.

For analysis of employment trend, the 17 service industries have been grouped into three categories: commercially operated services, professional and nonprofit services, and domestic service. Even this three-way grouping, though helpful for analysis of employment trends, would be inappropriate for analysis of other characteristics.

\section*{Long.Term Employment Trend.}

Inadequate data render any detailed analysis of service employment prior to 1929, or at least 1919, impracticable. However, the Bureau of the Census has recently completed a reclassification of Census of Occupations data for all decennial censuses from 1870 to 1930 on as nearly comparable a basis as is possible from existing records. \({ }^{2}\) Data for those occupations whose members are typically employed in the service industries, as here defined, furnish a measure of the changing importance of service-industry employment in the economy over this long period.
From 1870 to 1930 the percentage of the gainful workers attached to these selected occupations increased from 10.6 to 11.6. This increase, however, has little meaning since it is solely the result of the declining importance of agriculture and the increasing importance of all other industries.
When agriculture is excluded from the comparison, as in chart 1 , a pronounced and steady drop in the importance of service employment in the total nonagricultural economy is revealed. This chart is especially interesting since it suggests that the sharp relative employment gains of the services in the twenties, so frequently noted by observers, may be interpreted as a return to a trend line from an abnormal position, rather than representing a new and different trend.
The year 1920 is out of line with the other years in the series. This may be explained as a result of the distortions introduced by the first World War, which had not been eliminated by 1920. Chart 1 cannot be carried beyond 1930 because of the basic differences between the 1930 and 1940 censuses, but other available
\({ }^{2}\) Comparative Occupation Statistics for the United States, \(1870-1940\). Bureau of the Census, tables 9 and 10.

Chart 1.-Percentage of all Nonagricultural Gainful Workers in Service Industry Occupations

Source: U. S. Department of Commerce.

\section*{Chart 2.-Employment in All Private Nonagricultural and Service Industries}

Source: U. S. Department of Commerce.
data show a slight decline in the importance of service employment over that decade.

Division of the selected service occupations into those consisting predominantly of domestic servants (household employees) and all other occupations, as in table 2, shows that the long-term drop in the importance of service employment is due chiefly if not exclusively to the former. These occupations included 17.2 percent of the nonfarm gainfully occupied in 1870 , and only 7.7 percent in 1930.
The variations in the percentage engaged in the other service occupations are too small to be granted any great sign:ficance, but the series shows no apparent tendency to increase during recent decades. As in the service total and in the domestic service occupations separately, 1920 appears as abnormal in the nondomestic service occupations, so that conclusions based on the 1920 to 1930 movement should be viewed with caution.

No further mention is made of these long-time trends in the analysis of the service industry components, but they underlie in part the writer's greater willingness to accept the thirties, which do not violate long-term trencs, than the twenties, which do, as a fruitful period for close analysis. \({ }^{3}\)

\section*{Commercial and Professional}

The 16 service industries (other than domestic service) have been divided for analysis into two groups, comprising
\({ }_{3}\) From 1910 to 1920 even the absolute number in the service occupations declined. The number in domestic service dropped 10 percent while the number in the other service occupation increased 1 percent. In every other decade the absolute number in each of the 2 service groups increased.
roughly commercial services, and professional and nonprofit services. It is desirable first, however, to examine briefly the behavior of employment in these two groups combined. In this examination domestic service is excluded.

The reputation of the services as a growing industry was earned in the twenties, not in the thirties. From 1919 to 1930 service employment increased very sharply, both absolutely and relative to total private nonagricultural employment. From 1930 to 1941, two years in which the proportions of the labor force employed were similar so that cycle influences are roughly eliminated, the ratio of service employment to total private nonagricultural employment remained unchanged. (See chart 3.)

Service employment fluctuated less than total private nonagricultural employment during the thirties, chiefly because several of the professional and nonprofit components are almost unaffected by the business cycle.

The war initiated a growth of service employment only slightly smaller than past relationships indicate would have occurred in a period of similar expansion of private employment when Government military and civilian employment were at peacetime size. In 1943, the index of service employment shown in chart 3 stood only 2.3 points, or 65,000 full-time equivalent employees, below the point indicated by the 1930-41 relationship with total private nonagricultural employment. More detailed analysis gives essentially the same answer for this deficiency in the number of employees.

The extent of this expansion in employment at a time when millions of workers were being drawn into war industries and the armed forces is remarkable. It is due in large measure to the successful abscrption by major service industries of persons previously not in
the labor force, and domestic servants. Aside from the unemployed, these were the only important sources of persons available for housekeeping work in hotels, hospitals, laundries and the like whose earnings were not already above the relatively low rates these industries could offer. Abnormal movements in other components were largely off setting.
Estimates of the number of proprietors in the services indicate a drop of about 110,000 from 1940 to 1943. Much of this decline resulted from the entrance of physicians and dentists into the armed forces.

At least part of the remainder is probably in accordance with expectations in a period of rising employment, since estimates of the number of proprietors in the services show a slight tendency toward contracyclical movement, at least during the period of the thirties. The net deficiency in the number of proprietors, by comparison with a period of peacetime prosperity, is probably something under 100,000 .

The total number engaged in the services in 1943 is thus in the neighborhood of 165,000 less than the number associated with a similar level of private nonagricultural employment in a peacetime year.
A shift from war to peace, in itself, will increase total employment in the service industries (except domestic service) only moderately, even if total private employment is as high as in 1943.

\section*{Commercially Operated Services}

Seven of the service components which are characterized by operation under commercial conditions similar to most other private industries have been grouped under the heading of "commercially operated services," in contrast to the professional services and the components dominated by nonprofit organizations.

As chart 4 shows, employment in these services as a group moves much like total private nonagricultural employment. Cyclical fluctuations are almost as large, relatively, as in the private economy as a whole, and employment is almost completely dependent on general business conditions. There is no evidence of upward trend, relative to total employment, since 1930. In 1943, despite the war, employment stood only 2.3 percent, or 50,000 persons, below the expected figure based on peacetime relationships. The seven commercial service components are discussed in the following paragraphs.

\section*{Personal Services.}

The personal service industry is the largest of the service industries, exceot domestic service. A detailed distribution of its near-million persons engaged in 1939 is shown in table 3. The distribution of employees differs considerably from that of proprietors. Power laundries and cleaning, dyeing and rug cleaning plants, for example, had 53 percent of the employees but only 4.5 percent of the proprietors. Barber shops, beauty parlors, cleaning, pressing and alteration shops and shoe repair shops together ac-

\({ }^{1}\) See table 5, footnote 1, for definition of components. \({ }^{2}\) Excludes unpaid family workers. \({ }^{3}\) The term "noncorporate" rcfers to individual proprietorships and partnerships. \({ }^{4}\) This column indicates trend from 1930 to 1941 relative to trend of total private nonagricultural employment. 0 indicates about the same trend as for all private nonagricultural employment, + a relative upward trend, ++ a strong relative upward trend, - a relative downward trend, and - - a strong relative downward trend. With minor modifications where 1930 or 1941 was abnormal, relative trend was measured by calculating the percentage change from 1930 to 1941 (two years in which about the same percentage of the labor force was employed) in the ratio of employment in the service component to total private nonagricultural employment and converting to a per-year basis.
; Full-time equivalent employment calculated on a school year, rather than calendar year, basis.
Source: U. S. Department of Commerce.
counted for 80 percent of the proprietors but only 34 percent of the employees.
Normal average earnings of both proprietors and employees are low, by allindustry standards, in almost every industrial component of the personal services. Funeral parlors and photographic studios are the only conspicuous exceptions.

Personal service employment expanded to a large degree from 1919 to 1930, but registered only a very slight growth relative to total private nonagricultural employment during the thirties (chart 5a). This record is a composite of trends for the various personal services.

Employment in power laundries and cleaning and dyeing plants increased sharply during the twenties-the former by 75 percent from 1919 to 1929, the latter by 207 percent. In the thirties, however, these components gained at only a very moderate rate, and only at the expense of corresponding declines in pressing

States, 1870 to 1940 , tables 9 and 10 .
shops and, to a minor extent, in hand laundries.

Employment in all types of laundries, linen supply, rug cleaning, and cleaning and dyeing plants and shops increased 19 percent from 1930 to 1941, compared to 20 percent for all private nonagricultural employment. The number of proprietors probably declined.

Beauty parlors, which had multiplied several fold during the twenties, grew rapidly during the thirties. Most of this recent growth was achieved at the expense of barber shops, which lost what remained in 1930 of their feminine clientele, but it was sufficient to indicate a moderate growth factor for the two industries combined.

The net effect of these movements, combined with relative stability of other components, was to advance the position of the combined personal services as a component of total private nonagricultural employment only very slightly from 1930 to 1941.
The war spiraled the personal services to new heights. Employment increased 10 percent from 1941 to 1943 , only slightly less than the relative increase in all private nonagricultural employment. This gain was notable in view of the labor supply difficulties of low-wage industries. Interpretation of this movement as a resumption, stimulated by high consumer incomes, of the sharp trends of the twenties is questionable because of the influence of women moving out of the homes to take jobs, the increase in the number of persons not in families, and the shortage of domestic servants. The laundries took both
the work and the people to perform it from the domestic service market. \({ }^{4}\)
That portion of this expansion which is a result of the shortage of domestic
\({ }^{4}\) From 1939 to 1942 total personal service employment increased 31.8 percent, compounded of an estimated 44.9 percent increase in cleaning and dyeing and rug cleaning in clants, and cleaning, pressing and alteration phops; a 35.6 percent increase in laundries and linen supply service; and a 22.0 percent increase in all other personal services combined.

servants may be maintained after the war. However, employment in the personal services cannot in the near future increase much above present levels under even the most favorable conditions.

\section*{Hotels and Other Lodging Places.}

About 80 percent of the 363,000 fulltime equivalent employees in this group in 1939 were in hotels. The remaining 12 percent were distributed among tourist homes, tourist courts, rooming and boarding houses, and recreational camps. The 150,000 proprietors, on the other hand, were concentrated in boarding and lodging houses and tourist facilities. Only 24,000 were hotel keepers.

Employment in the industry as a whole failed by a slight margin to maintain its relative position in the private nonagricultural economy from 1930 to 1941, despite the rapid growth of tourist camps.

The wartime increase in rail, plane and bus travel, and of travel by businessmen, and by servicemen and their relatives in particular, furnished the hotels with a major war boom. This boom was intensified by the sensational growth in eating out. Tourist camps were rather generally able to offset loss of tourist clientele with semipermanent residents, although the situation was spotty.

Employment in hotels and other lodging places responded only partially to the expansion in business. Had ample labor been available, full-time equivalent employment in 1943 might have been 45,000 to 70,000 above the actual figure of \(406,-\) 000. However, employment was only perhaps 25,000 below that which would have prevailed under conditions of equally full general employment in peacetime.

Because of the condition of labor shortage presently operative in the industry, a substantial reduction in hotel business may be incurred before contraction will be felt in employment.

\section*{Business Services.}

The business service industry has, apparently, the strongest upward trend of any of the commercially operated service industries. It is also the least adequately covered by detailed statistical information of any of the commercially operated services. It appears, however, that advertising, including advertising agencies, billboard advertising service, and miscellaneous advertising services, accounted for about 18 percent of the total employment in 1942, and no other single component was responsible for much more than half this amount.

Accounting and bookkeeping, adjustment and credit bureaus and collection agencies, duplicating and mailing serv-
ices, and services to buildings are the more important of the other components.

It is particularly unfortunate that inadequate data make impossible a really satisfactory analysis of this industry because, in addition to its record of strong past growth, average earnings of both its employees and proprietors are high, and employment has ben depressed by war conditions. Consequently, the business services appear to offer better opportunities, relative to their size, for postwar employment expansion at satisfactory earnings than any of the other service industries.

\section*{Commercial and Trade Schools.}

Commercial and trade schools, normally a minor employer, mushrcomed during the war. Holders of trade school certificates were able to secure war plant jobs as experienced workers and the schools benefited accordingly. Employment increased from 16,000 in 1940 to 53,000 in 1943 and payroll from \(\$ 25 \mathrm{mil}-\) lions to \(\$ 135\) millions. These figures include private employment agencies, a minor but volatile component. The wartime expansion of these industries is not likely to be maintained after the war.

\section*{Amusements.}

The amusement industries included in the services are divided into two groups: motion pictures, and amusement and recreational services except motion pictures. Of the 193,000 full-time equivalent employees in the motion picture industry in \(1942,142,000\) were employed in motion picture theaters, 45,000 in production and distribution, and 6,000 in motion picture service industries. Average full-time equivalent earnings in motion picture production and distribution were so high ( \(\$ 4,393\) ) that these industries accounted for \(\$ 197\) millions of the total motion picture pay roll of \(\$ 408\) millions in 1942.

The "other amusement" industry has had about the same number of employees

\section*{Chart 4.-Relationship of Employment in Commercially Operated Service Industries to Employment in All Private Nonagricultural Industries}

Source: U. S. Department of Commerce.
as motion pictures in recent years. It includes dczens of types of enterprise, of which only bowling alleys and pool parlors, with more than one-third of the total employment, and golf clubs are individually important.

For analytical purposes it is desirable to combine a communications indus-try-radio broadcasting-with motion pictures and other amusements classified as services, to obtain a series for employment in all direct amusement enterprises.

Over the period 1929-1941 employment in the direct amusement industries exhibited a fairly smooth linear relationship to total private nonagricultural employment. This relationship is marred only by a partial lag in the adjustment of amusement employment in years of sharp cyclical change (chart 5b). The relative importance of the direct amusements in the private nonagricultural economy appears to have remained unchanged or declined slightly during this period.

Amusement employment increased substantially during the war years, but less than might have been expected in a period of like expansion of private employment under peacetime conditions. The differential between actual 1943 employment and a figure based on the peace time regression is 33,000 , or 7.7 percent of 1943 employment. This probably overstates the war-induced distortion, however, because the amusements tend to lag in periods of expansion, and because
there is some indication of slight convexity in the regression at high levels.

If past relationships prevail after the war, and radio broadcasting continues to encroach on the amusement industries classified in the services, employment in the latter may rise about 20,000 above the 1943 level, in the immediate post-war period, provided the general employment situation is satisfactory.

Although the combined direct amusement industries show a fairly smooth relationship to total employment, movement: of the individual components appears erratic. Chart 6 illustrates the sharply differing movements of the components of amusement employment from 1929 to 1843. This behavior suggests that competition between them is so direct that if one increases, except in response to the business cycle, it is at the expense of the others.

The motion picture industry was invigorated by introduction of sound into a new period of expansion which continued through 1931. The industry scarcely felt the depression until 1932, and even in 1933 employment stood at 84 percent of 1929. During these same years employment in the "other amusement" industry dropped nearly one-half, the result of a downward trend for country clubs and stage performances and the sharp cyclical drops in other types of amusements.

From 1933 to 1937 motion picture employment increased 48 percent and other
amusements 35 percent. Each dropped slightly from 1937 to 1939 but motion pictures dipped much less in the 1938 recession. From 1939 to 1941 the encroachment of motion pictures on the other amusements was reversed, as the latter advanced 21 percent and motion pictures only 8 percent.

Further expansion of the "other" amusements was checked by the shifting of athletes into the armed forces (leading, for example, to suspension of most baseball minor leagues), by the inaccessibility of golf courses under gasoline rationing, shortage of pinboys and cessation of new construction in bowling alleys, and a combination of minor factors such as travel restrictions and the closing of California race tracks. After a minor rise in 1942 , employment in 1943 dropped back to the 1941 level. Motion pictures took up part of the slack with a 13 percent rise from 1941 to 1943.

Although past relationships may be a reasonable guide to the future for the direct amusement industries as a whole, employment levels in particular segments can be so affected by shifts among types of amusement that they are, by nature, unpredictable.
Engineering and Architectural Service.
Engineering and architectural service, which includes only consulting engineers and architects and their employees, is a prince or pauper industry. In peak years the average net income of proprietors is very high; in poor years earnings vir-

Chart 5.-Relationship of Employment in Selected Service Industries to Employment in All Private Nonagricultural Industries

Source: U. S. Department of Commerce.

Chart 6.-Employment in Direct Amusement Industries

Source: U. S . Department of Commerce.
tually vanish. Employment, which follows a similar though less extreme pattern, shared fully in the construction boom and relapse during the war. Fulltime equivalent employment rose from 28,000 in 1940 to 67,000 in 1942, then turned downward. If the expected postwar construction boom materializes the industry should enjoy a period of prosperity, but it can scarcely employ the 52,000 employees at work in 1943.

Repair Services and Hand Trades.
This industry includes all types of repair services except automobile and clothing repair, and so-called custom industries. It also includes as proprietors "own account" workers who are really manufacturers but who are excluded from the manufacturing classification because that is restricted to firms with a value of product in excess of a given amount ( \(\$ 5,000\) in most components).
Repair services (except automotive) are not of great quantitative importance in themselves. Those conducted in establishments accounted for 75,000 proprietors and 30,000 full-time equivalent employees in 1939. Among this group, the elite of the industry, gross receipts per proprietor averaged 2,311 dollars and net income well under 1,000 dollars, in that year. Employees, concentrated in larger firms, did somewhat better, with average full-time equivalent earnings of 1,145 dollars.
The remainder of the industry, covering 167,000 proprietors and 23,000 fulltime equivalent employees in 1939, was even less impressive financially than the repair services, since it excludes large firms by definition, except in a few of the custom industries.
The industry has apparently prospered during the war-in comparison, that is, with peacetime earnings-largely as a
result of repair and custom work induced by the shortage of new durable consumers' goods. There is little to suggest, however, that the industry is destined to play an important role in furnishing post-war employment.

\section*{Professional and Nonprofit Services}

The next principal category of service industries includes three groups composed principally of independent professional practitioners and their employees, and five components which are dominated by nonprofit organizations. The professional and nonprofit services are
characterized, as a group, by their relative independence of the business cycle (see chart 7). Although employment in this group of services increased steadily through the thirties, its percentage growth barely equalled the growth in total private employment between years in which the proportion of the labor force employed was similar. Hence, the relative importance of the professional and nonprofit services in the private economy is merely being maintained. \({ }^{5}\)

This stability is the composite result of the increasing importance of hospitals, a principal component, and the declining importance of the other professional and nonprofit services combined.

\section*{Private Hospitals.}

Private hospitals are the only large service component besides business service in which employment during the past decade and a half has shown a strong and persistent growth trend relative to total private employment. The only financial census covered the year 1935, but available data indicate an increase in fulltime equivalent employment from 278,000 in 1929 to 396,000 in 1941, and 442,000 in 1943. Transfer of the care of the sick from the home to the hospital has been the dominant factor in this impressive expansion. Growth of hospital insurance plans accelerated this trend in recent years.

Hospital expenditures during the war years, aside from Federal hospitals, were largely determined by the importance of income from patients as a source of funds. War prosperity greatly increased revenue from this source, while leaving

\footnotetext{
\({ }^{5}\) If one chooses to assume a secular increase in the percentage of the labor force unemployed, these services, because of their relative imperviousness to depression, are of increasing importance.
}

Chart 7.-Employment in All Private Nonagricultural Industries and in Professional and Nonprofit Service Industries

Source: U. S. Department of Commerce.

Chart 8.-Relationship of Domestic Service Employment to All Private Nonagricultural Employment and of Domestic Service Pay Roll to Disposable Income of Individuals

Source: U. S. Department of Commerce.
government support and endowment income relatively untouched.

From 1940 to 1942, for example, income of nonprofit and state and local government hospitals from patients increased 39 percent in 30 principal urban areas, while income from all other sources rose less than 8 percent. During the same period expenditures of nonprofit hospitals in these areas increased 29 percent, compared to 14 percent for state and local government hospitals, which are far less dependent on income from patients.

Expenditures of proprietary hospitals probably increased even more rapidly during the war expansion, since their income is almost entirely from patients.
Employment changes followed a similar pattern. Employment increased sharply in proprietary hospitals and moderately in nonprofit hospitals. But it declined in state and local hospitals, which were faced with the necessity of raising salaries substantially while budgets increased only slightly. Only proprietary and nonprofit hospitals are classified in the service industries.

Provided that general business activity is at a high level after the war, prospects for continued expansion of employment in private hospitals are excel-
lent. The basic growth trend is still operative. Plans have already been completed for construction of several hundred new private hospitals as soon as wartime restrictions on building are lifted. The projected Federal health program may further boost hospital employment.

\section*{The Independent Professions.}

The independent professions, including medical and health, legal, and professional services not elsewhere classified (but not hospitals, engineering and architectural service or accountants and auditors) engaged 659,000 proprietors and employees in 1943, as compared with 721,000 in 1940. Net income of the 372,000 proprietors is estimated at 1.9 billion dollars in 1943, and that of the 287,000 full-time equivalent employees at 0.4 billion dollars.

Until 1941 the number of both proprietors and employees in the independent professions showed a steady growth in absolute terms, scarcely touched by the business cycle. Influence of the cycle was reflected chiefly in variations in the net income of proprietors.

Primarily because of inductions of physicians and dentists into the armed services the total number of independent professional practitioners in these groups dropped from 440,000 in 1940 to an estimated 372,000 in 1943, a loss which will presumably be made good, with normal growth added, after the war. The number of employees dropped fractionally during the war. Most of the component professions have been discussed in detail in recent articles in this magazine.

\section*{Educational Services.}

Aside from commercial and trade schools, which have already been discussed, private education engaged 258,000 employees and 51,000 proprietors in 1943.

Parochial schools employed 97,000 . Apart from 6,600 lay teachers and some of the 13,000 employees other than teachers, parochial schools employ religious personnel, chiefly nuns, who are outside
the competitive economy. Employment is stable, unaffected by general business activity or wars and, at least in the short run, is largely independent even of enrollment.

 published in the April 1944 Survey of Current Business because radio broadcasting is exeluded from the present table and because slight modifications have been made in the

Higher education accounted for \(\mathbf{1 2 3 , 0 0 0}\) of the 161,000 employees in "Educational services, n. e. c.," elementary and secondary schools other than parochial for 23,000 , and other agencies for 15,000 . The Navy V-12, Army A. S. T. P. and similar programs forestalled what some feared would be a wholesale closing of private colleges at the outbreak of war, and employment in these groups of schools dropped only an estimated 18,000 or 10 percent, from 1941 to 1943.
Nearly all the proprietors in the educational services are unattached teachers of music, whose number has been stable for the past decade or more.

In the past, the educational services have exhibited an upward trend in employment sufficient to maintain approximately their relative position in the economy. Several factors will influence the post-war situation, including especially the possible effects of the educational provisions of the G. I. Bill and the backlog of students whose education was delayed by the war, the changing age distribution of the population, and any change in the relative importance of publicly and privately controlled institutions. There is sufficient fiexibility in the ratio of teachers to students in the short run, however, to suggest that no great variation from pre-war employment trends should be expected immediately after the war.

\section*{Nonprofir Membership Organizations.}

Nonproft membership organizations in 1943 employed 376,000 full-time equivalent employees of whom 190,000 , or about one-half, worked for religious organizations.
Employment in religious organizations increased moderately during the twenties, dropped slightly from 1930 to 1935 , and has remained substantially unchanged since that date, since clergymen account for 60 percent of employment in churches, there is only a limited degree of competition between church employees and the remainder of the labor force. Church income has never, up to 1943 , regained the level of the twenties, which probably explains the failure of employment to rise. Employment is so stable that there is no apparent reason to expect any marked change in the near future.

Full-time equivalent employment in other nonprofit membership organizations came to 186,000 in 1943. Welfare organizations contributed to this aggregate an estimated 66,000 employees, including Americans employed by American organizations stationed outside continental United States.

The remaining 120,000 full-time equivalent employees cannot be classified in detail, but an indication of the relative importance of different types of organization is furnished by Social Security Board data for employment covered by State unemployment compensation laws in 1942, shown in table 4. \({ }^{\circ}\) These employment figures are not reduced to full-time equivalence, and consequently are not comparable to those in other tables.

Most of the variation in employment occurs in labor and welfare organizations. Empleyment in labor organizations varies with the business cycle, but has of course risen markedly since 1933 as a result of expansion of union membership. Employment in charitable organizations also varies with the business cycle, but is subject to special influences.

\section*{Domestic Service}

Although there are a few well-paying positions in household employment, the vast majority of domestic service positions are generally regarded as among the less desirable jobs, characterized by long hours and low earnings. Nevertheless, domestic servants comprised more than five percent of the entire labor force as recently as 1940. Household employment is of overwhelming importance to Negro women. In 1940, 65 percent of Negro women in the labor force, other than unpaid family workers, were in domestic service. Fortythree percent of employed domestic servants, compared to 30.5 percent of all employed persons were located in the South.

In chart 8A an index of domestic service employment is related to an index of the total private nonagricultural em-

\footnotetext{
\({ }^{9}\) These figures exclude welfare organizations, 12,000 full-time and part-time employees of railroad labor and management associations, and 45,000 employees of establishsociations, and 45,000 employees of establish-
ments otherwise excluded from coverage in ments otherwise excluded from coverage in sions.
}
ployment. In 1910, domestic service employment accounted for 9 percent of total privacie nonagricultural employment (before reduction to full-time equivalence). Presumably because domestics took advantage of labor scarcity during World War I to obtain more desirable positions, household employment fell substantially from 1910 to 1920.
By 1920, domestic service employment represented only 6 percent of total private nonagricultural employment, about two-thirds as much as might have been expected on the basis of the pre-war relationship. Household employment partially recovered during the \(1921-22\) depression. At this time a new relationship between domestic service and total private nonagricultural employment was established about midway between the 1910 and 1920 levels which endured until 1932.

This partial recovery and its maintenance were the joint result of the 192122 depression which closed job opportunities elsewhere, and of the heavy immigration of the early twenties. From 1920 to 1924288,000 arriving immigrants reported their occupation as "servant" and this is certainly a minimum figure for the number actually entering domestic service. From 1925 to \(1929,149,-\) 000 so reported, and thereafter this source of supply for domestics almost vanished.

After 1932, domestic service employment dropped slightly relative to total private nonagricultural employment, stabilizing from 1935 to 1940 at a new relationship about 5 percent below that prevailing in the preceding period. This drop in the importance of domestic service appears in much more pronounced fashion in chart \(7 B\) which relates domestic service pay rolls (a type of direct consumption expenditure) to disposable income of individuals. It presumably resulted from demand rather than supply influences, since the number of unemployed domestics was high throughout the thirties.

With the beginning of the war boom in 1941, domestic service employment moved downward almost immediately. The rapidity of this response is especially striking in view of the large number of domestics unemployed in 1940. By 1943 (1944 was approximately the same) full time equivalent employment was 1.6 mil lion, compared to 2.1 million in 1940, 2.3 million in 1929, and a hypothetical 1943 figure, based on the \(1936-40\) relationship to total private nonagricultural employment, of 2.6 million.
From 1941 to 1943 average earnings in domestic service increased about as much as the average in other private nonagricultural industries, while in 1944 they increased much more. The effect was to narrow considerably but not to close the differential between average pay in domestic service and average pay in the labor-competitive personal services and hotels, in which pay increases were moderate. It is significant that consumers were not prepared to pay a price for domestic service sufficient to narrow, much less to eliminate, the differential in pay between domestic service and other industries except at the cost of a severe drop in domestic service employment.

Consideration of the future course of domestic service employment requires further examination of the supply of servants. The potential supply may be divided for this purpose into (1) Negro women, representing 40 percent of employed domestic servants in March 1940 and an estimated 54 percent in April 1944; and (2) all others (see table 6).

Aside from 50,000 teaching positions in Negro school and a limited number of housekeeping jobs in hotels, laundries and restaurants, employment of Negro women before the war was almost entirely in domestic service and southern agriculture. Annual earnings in southern agriculture were even lower than in southern domestic service. A major portion of Negro working women are likely to continue in the domestic service market, especially in the South where threefourths of the female Negro domestics were employed in 1940.

\section*{Post-War Employment Prospects}

In table 7 an attempt has been made to quantify the suggestions about postwar employment prospects contained in the preceding paragraphs. This table contains estimates of the number of fulltime equivalent employees and proprietors who would be engaged in each of the service industries if total private nonagricultural employment should be at the 1943 level in the year 1948, and if the war and immediate conversion to peacetime production have been completed by that time. The assumption about total employment is very favorable, but not a maximum one. It places private nonagricultural employment 10.7 percent above 1941, and implies a percentage of the labor force unemployed about the same as in 1941.

This is a convenient assumption because it facilitates comparison of the relative position of the services in the post-war year with that in the pre-war
year 1941. If a different point on the business cycle were assumed it would be necessary to allow for the greater cyclical stability of the services than of the private nonagricultural economy as a whole.

These figures are not forecasts, but estimates of the position of the service industry under favorable conditions.

The method followed in estimating employment in most components except domestic service was to apply to assumed 1948 total private nonagricultural employment, the 1941 ratio of employment in the particular service component to total private nonagricultural employment, and to adjust the resulting figures for differential trend. However, special adjustments were made where they appeared necessary.

The number of professional proprietors was based on past trends. The number of proprietors in each of the nonprofessional groups was piaced 5 percent above the 1940 level, an arbitrary procedure but one which, in the writer's opinion, is overgenerous if the possible effects of the "G. I. Bill of Rights" are overlooked.

The "G. I. Bill of Rights" providing Government-guaranteed loans and guaranteed profits for veteran-proprietors, has been ignored in construction of table 7. It may result in concealing partial unemployment in data for employed proprietors, especially in the personal services and repair and hand trades.

The domestic service employment figure is based on analysis suggested by the textual discussion of that industry.

The procedure assumes that the relationships and trends of the thirties will endure, rather than appear as a temporary interruption of the differential growth of the services relative to total employment which characterized the twenties. It also ignores the possible development of new industries which may be classified in the services. This is probabiy unimportant unless a host of new services are devised, since new industries require time to develop into importance, and few single service products ever become quantitatively important.

The improbability that the estimate for a major portion of this total, employees in all services other than domestic service, is too small is illustrated by the following consideration. Even the resumption of the sharp relative employment gains of the twenties would raise employment in these services only about 160,000 above the figure shown in table 7.
The employment gains suggested by table 7 are small in comparison with the magnitude of the post-war employment problem and not large in comparison with the number engaged in the service industries. Of course, this employment pattern would be affected by alteration of consumers' and business' spending patterns. There is little likelihood, however, that changes sufficient to alter substantially the projected service employment will take place in the first few years after the war. It follows, therefore, that under conditions of high-volume employment, the service industries will contribute not much more than one-half million jobs above the already large numbers averaged during the war.

\section*{Business Situation}
(Continued from p. 6)
1943, and July 31, 1944, is indicated in table 5. Excluding the "all other" category, the largest relative inventory reduction occurred in infants' rationed shoes (sizes \(41 / 2\) to 8 ), where the decline amounted to 46 percent. Least affected were stocks of men's work shoes, which dropped only 14 percent.

The sharp decline in infants' shoes occurred in spite of the fact that production of these shoes during the first 6 months of 1944 increased 6 percent over the same period of 1943. Similarly, inventories of misses' and children's shoes were reduced 33 percent despite a 16 percent increase in production during this same period.

2 Includes unclassified.
Source: Office of Price Administration.
Among the corrective steps taken by the War Production Board was the recent inclusion of infants' and children's shoes in sizes \(41 / 2\) to 8 and \(81 / 2\) to 12 in Group 1 (most urgent programs) of the Critical Products List.
The inflexibility of supplies of raw materials promises to be the chief problem which the leather and shoe industries will face in 1945. Despite a cattle and calf population which is down only slightly from the \(82,000,000\) peak estimated for January 1, 1944, domestic slaughter is not expected to exceed the record volume reached in 1944. Military and export programs will continue to have a high priority.
These factors, combined with reduced inventories in the hands of the trade, indicate that there is little prospect of an early easing of shoe rationing. While victory in Europe will result in military cut--backs freeing leather for other uses, it is uncertain how much of such leather will be made available for domestic civilian consumption. There will be heavy demands for leather, including both raw materials and finished products, for relief and rehabilitation purposes in liberated areas where the livestock population has been seriously depleted.
The ration rate during 1945 will depend not only on the magnitude of the drain for the military and export programs, but also on the ration stamp "float" which consumers choose to maintain. Some adjustments in the current program may be needed to bring consumption of rationed footwear into balance with new supply.

\section*{Monthly Business Statistics}

The data here are a continuation of the statistics published in the 1942 Supplement to the Survey of Current Business．That volume contains monthly data for the years 1938 to 1941，and monthly averages for earlier years back to 1913 insofar as available；it also provides a description of each series and references to sources of monthly figures prior to 1938．Series added or revised since publica－ tion of the 1942 Supplement are indicated by an asterisk（ \({ }^{*}\) ）and a dagger（ \(\dagger\) ），respectively，the accompanying footnote indicating where historical data and a descriptive note may be found．The terms＂unadjusted＂and＂adjusted＂used to designate index numbers refer to adjustment of monthly figures for seasonal variation．

Data subsequent to November for selected series will be found in the Weekly Supplement to the Survey．

\footnotetext{
: Preliminary. \(\quad r\) Revised
For data for 1939-42 for the Department of Commerce index of retail prices of all commodities and a description of the series, see p. 28 of the August 1943 Survey; revised figures for all months of 1943 are available on p.S. 4 of the August 944 issue. Dovatane includes other food uroups not shown senarately.
\(t\) Revised because of a revision of the basic index of prices received by farmers; for data for all months of 1943, see the April 1944 Survey; earlier data will he published later.

p Preliminary. Pevised. \& See note marked " \(\delta\) " on p. S-6 of the April 1943 Survey in regard to enlargement of the reporting sample in August 1942.
TRevised figures through September 1944 for drug stores are shown on \(p\). 16 of the November 1944 survey; in a later issue the new data will be incorporated in the table above. *New series. Comparable dollar figures for \(1939-42\) for the series on consumer expenditures are available on p. S-6 of the March 1943 and later issues of the Survey, and p. 7 of the April 1943 issue; these monthly series, first presented in the October 1942 Suryey ( P p. 8-14), were later adjusted to accord with annual estimates published in the Survey for March 1943 ( p .20 , table 9 ) and May 1942 (p. 12, table 3); revised annual estimates, incluc
vey; the monthly series will subsequently be adjusted to these revised annual estimates.
vey; the monthly series will subsequently be adjusted to these revised annual estimates.
\(\dagger\) Revised series. Data on sales of retail stores have been completely revised and are shown in greater detail than formerly; for figures for 1929, 1933, and 1935-42 and a description of the data, see pp. \(6-14,19\) and 20 of the November 1943 Sur vey. The 1943 figures were revised in the August 1944 issue, where necessary, to adjust the series to 1943 totals for the basic data; also the seasonal adjustment factors for some of the indexes on p. 8-8 have been revised; revisions for January-May 1943 are available on request.

\section*{DOMESTIC TRADE-Continued}

p Preliminary. 'Revised. § Minor revisions in the figures prior to November 1941 are available on request. I Sce note marked " \(\varphi\) " on p . S-7. the July 1944 Survey to adjust the estimates, where necessary, to 1943 totals for the basic data; also the seasonal adjustment factors for some series were revised to take account of shifts in Christmas buying: scattered revisions for January-March 1943, which bave not been published, are available on request. Data beginning 1939 for the new estimates of retail inventories will be published later.
\(\dagger\) Revised series. See note marked " \(\dagger\) " on p. S-7 regarding revision of the indexes of retail sales and the source of earlier data. The indexes of department store sales for the United States and the indicated districts have been revised for all years; the revisions reflect primarily enlargement of the samples, adjustment of indexes to 1929 and 1939 census data, where necessary, and a recalculation of seasonal factors; in addition, all series have been computed on a 1935-39 base. The Boston index is a new series from the Federal Reserve Bank.
Revised ata beginning 1919 or 1923 for the United states and two districts have been published as follows: United States, Decemher 1944 Survey, p. 17 ; Dallas, February 1944, p. 20; Richmond, June 1944, p. 22 . Complete data for other districts will be published later; indexes for Atlanta have been shown on the revised basis begianing in the February 1944 Sur

 \({ }^{*}\) New series. The new series on department store sales by type of credit have been substituted for the series relating to installment sales of New England stores shown in the Survey through tbe July 1944 issue; data beginning January 1941 will be published later. Collection ratios for furniture, jewelry, and household appliance stores represent ratio of collections to accounts receivable at beginning of month; data beginning February 1941 are on p. S-8 of the April 1942 Survey; data back to January 1940 are available on request; the amount of instalment accounts outstanding are shown on p. S-16 under consumer credit. Earlier data for the new estimates of wholesale sales will be published later; for estinates of whole-
salers' inventories for \(1938-42\), see p .7 of the June 1942 Survey and p . \(\mathrm{S-2}\) of the May 1943 issue. Estimates of civilian labor force, employment, and unemployment are shown on a salers' inventories for \(1938-42\), see \(p .7\) of the June 1942 Survey and p . \(\mathcal{S}-2\) of the May 1943 issue. Estimates of civilian labor force, employment, and unemployment are shown on a
revised hasis beginning in the May 1944 Survey; revisions beginning March 1940 will be published later. See note marked "\% on p. S-10 regarding the new series on wage earners in manufacturing industries.
\(\dagger\) Revised series. The index of department store stocks published on a 1923-25 base through the May 1944 Survey has been recomputed on a 1935-39 base. The estimates of employees in nonagricultural establishments bave been revised beginning 1939, by months, to adjust figures to levels indicated by final Unemployment Compensation data through the last quarter of 1942 and to other data collected by government agencies; annual data for \(1929-38\) have been revised to a comparable basis; monthly averages beginning 1939 and
nonthly figures for the unadjusted series beginning January 1943 are shown on p. 3 of the June 1944 Survey; all revisions will be published later.

\section*{EMPLOYMENT CONDITIONS AND WAGES-Continued}

\({ }^{*}\) Revised. \(\ddagger\) Total includes State engineering, supervisory, and administrative employees not shown separately.
TSee note marked " \(q\) "' on p. S-11 of the July 1944 Survey regarding changes in the data beginning June 1943 . The United States total beginning November 1943 reflects a further change in reporting resulting in an upward adjustment of 24,558 in that month. Data cover only paid employees. District of Columbia data for June-October 1943 are partly estimated. The December 1943 total includes about 22 , 000 excess temporary Post Office substitutes employed ouly at Christmas.
*New serics. Indexes beginuing 1939 for retail food establishments and beginning 1940 for water transportation are shown on \(p\). 31 of the June 1943 Survey. Data beginning March 1942 for all series on average hours, except for the telephone and telegraph industries, are available in the May 1943 Survey and data back to 1939 will be published later; data back to 1937 for the telephone industry, shown separately beginning in the December 1944 Surver, will also be published later; data for the telegraph industry are available only from June 1943 (1943 data not shown above: June, 47.1; July, 47.1; Aug., 46.5; Sept., 46.2; Oct., 45.6).
†Revised series. For data beginning 1939 for the Department of Laioor's revised indexes of employment in nonmanufacturing industries (except for the telephone and telegraph industries), see p. 31 of the June 1943 Survey. Separate data for the telephone and the telegraph industries have been computed beginning 1937; complete data will be published later For revision in the Department of Labor's series on average weekly hours in all manufacturing industries, see note marked " \(\dagger\) " on p ping sis of the July 1944 Survey. The indexes of Digitize \(\begin{gathered}\text { aillway emplogees have been shifted to a } 1935-39 \text { base and the method of seasonal adjustment revised; earlier data not shown in the May } 1943 \text { Survey will be published later. }\end{gathered}\)

\(r\) Revised. §Speeial issues to government agencies and trust funds. \(\otimes\) Figures are on the basis of Daily Treasury Statements (unrevised).
1 Partly estimated. 2 March and November data include prepayments on securities dated Feb. 1 and Dec. 1,1944 , respectively, sold in the Fourth and Sisth War Loan drives. In addition to data shown above, quarterly estimates of profits of all corporations are pablished in special tables in the survey as follows: 1940-43 and the first quarter of is44, p. 6 of the July 1944 issue of the Survey; 1939, June 1943 issue, p. 25 ; the latter includes also on p. 24, annual data back to 1929 and, on p. 28, a description of the data; it should be noted that these estimates are in line with profits compiled from income tax returns and thus inciude reserves not allowable as deductions in computing taxes.
\({ }^{\circ}\) Revised 3d quarter 1943 totals: Railways, class 1 , net income-249.7. Telephones, net operating income 63.3.
tFor 1941 revisions see \(p\). S- 17 of the November 1942 issue. Data for the agricultural adjustment program, shown scparately through the February 1944 issue, and unemployment relief, shown separately through the July 1944 issue, are included in the "all other" item. Debt retirements, which have becn comparatively small, are exeluded.
†Beginning September 1944 data are reported quarterly and for some items (notably farm mortgage and other agricultural loans, all otber loans, business property, property held for sale, all other assets) are not comparable with earlier data owing to changes in Treasury Department regulations governing reports from the agencies and to shifts between classiGeations
electric utilities. For data beginning 1929 for profits and dividends of 152 companies, see p. 21, table 10 , of the A pril 1942 Survey. Data for net income after taxes of class A and \(B\) electric utilities have heen substituted for data for 28 companies; they include affiliated nonelectric operations and cover 95 percent of all electric power operations. Data beginning
 duplication in the figures for R. F. C. and its subsidiaries has been eliminated beginning October 1943; see lootnote marked "*, on p. S-18 of the April 1944 issue. The series on war savings bonds is from the Treasury Department; amounts outstanding are at current redemption values except series \(G\) which is stated at par; this item and redemptions cover all savings bonds series, including pre-war issues; sales represent funds received during the month from sales of scries E, F, and G, the series issued since April 1941 (for sales beginning of their obligations and other net expenditures by the Reconstruction Finance Corporation, the Commodity Credit Corporation, and other lending agencies; transactions of these Digitat their obligations and other net expenditures by the Reconstruction Finance Corporation, the Commodity Credit Corporation, and othcr lending agencies; trans http://fratRequjsed seriest seegrote in the December 1943 Survey regarding changes in the classifications; the figures include payments unallocated, pending advices, at end of month.

 1944 Surveys; 1942 data on the old basis, comparable with figures for earlier years, are available in the March and April 1943 issues.
- Data for 3 companies operating outside of United States. Included in original reports for 1943 and 1944, are excluded to have all figures cover the same companies.

 of the November 1944 Survev; a more detailed description of the individual series and earlier data will be published later.
 inclnuded.

; Revised.
\({ }^{1}\) Data included in "total vegetable oils" but not available for publication separately.
8 See note marked " 8 ", on p. S-23 of the November 1944 Survey.
in the 1942 Supplement fipures for August 1937 to D, in the 1942 Supplement; figures for August 1937 to December 1941 are the same as published in the Supplement; for data for \(1935-36\) and all months of 1937 , see note marked "e" on \(p\). S-23 of the May 1943 Surver. Prices are quoted per ton and have been converted to price per bag
are minor and are azailable on request. Data for 1942 also revised; revisions are availahle upon recte marked " \(f\) " on p. S-22 of the April 1943 Survey: revisions for all other series *minor and are avallable on request. Data for 1942 also revised, revisions are avaliahle upon request.
\(\dagger\) New serics. For information regarding the new chemical series see note marked on on can be converted to a comparable basis with the current data by deducting 6 cents. Superphosphate is reported on a revised basis beginning September 1942 covering all known manufacturers of superphosphate, including Tennessee Valley Authority; the new series include all grades, normal, concentrated, and wet base, converted to a basis of 18 percent available phosphoric acid; sce note marked " \(t\) " on p. S-23 of the July 1944 Survey regarding data prior to September 1942 published in the Survey.

FOODSTUFFS AND TOBACCO

Revised. OTSee note marked "o"' on p. S 27.
\(t\) Reflects all types of wholesale trading for cash
\(\ddagger\) Reflects all types of wholesale trading for cash or short-term credit. Base ceiling price comparable with data prior to January 1943 shown in the Survey is \(\$ 0.4634\) through June 3 and \(\$ 0.4134\) effective June 4, 1943; these are maximum prices delivered market; sales in market proper are at permitted mark-ups over these prices.
qAugust and September 1944 production figures include whisky, run, gin, and brandy (whisky and gin included for September represent completion of beverage operations authorized during August); in addition, registered distilleries produced in August \(23,083,000\) tax gallons of high-proof spirits, approximately all of which were for beverago purposes, and 3,786,000 tax galons of unfinished spiris", part, of which may be so used; at industrial alcohol piants, an estimated 1 , 514,000 tax gallons were produced which were a a months represent rum and brandy, the only spirits authorized for beverage purposes since October 1942 except during August 1944 . Stock figures exclude data for bigh-proof and months represent rum and brandy, the only spirits authorized or beverage purposes since october 1942 except during
\(\dagger\) Data for manufactured and natural gas have been revised beginning 1929 and are not strictly comparable with figures shown in the October 1944 and earlier issues; all revisions are available on request. Revisions for consumption of distilled spirits for beverage purposes for January 1940-July 1943 are available on request. Revisions in the 1941 and 1942 monthly data for the other alcoholic beverage series not published in issues of the Survey through March 1944 are shown on \(p\). S- 25 of the April 1944 Survey. 1941 revisions for
 Apr., 361,154.) Data for the utilization of fluid milk in manufactured dairy products have been revised for 1920-42 (see note in October 1944 Survey); revisions are available on request.
\({ }^{*}\) Da'a for 1918-38 are publisned on p. 103 of the 1940 Supplement to the Survey; figures for 1939-41 are available on request; 1942 final figures are on p. S-26 of March 1944 Survey.

Prices si - No quotation. \(\ddagger\) Compiled by the U. S. Department of Labor; see note in A pril 1944 Survey.
tThe hog-corn ratio has been shown on a revised basis beginning in the March 1943 Survey; revised data beginning 1913 will be published later. The series for feeder shipments of cattle and calves and sheep and lambs have been revised beginning January 1941 to include data for Illinois; revisions are shown on pp. S-26 and S-27 of the Aurust 1943 Survey. "New series; represents production of dried whole eggs, albumen and yolks; annual figures beginning 1927 and monthly figures beginning 1941 will be shown later.
\(\oplus\) Miscellaneous meats includes only edible offal beginning June 1944; trimmings formerly included in "miscellaneous meats" are now distributed to tbe appropriate meat items. The total includes veal, shown as a new item beginning June 1944, as follows (thousands of pounds): June, 8,517; July, 7,525; August, 8,886; September, 6,587; October, 7,002; Novenber, 7,493; some of this veal formerly may have been included with trimmings in "miscellansous meats." The total also includes, beginning Septeinber 1944, the following data not re-
ported previously (thousands of pounds): Sausage and sausage products-September, 15,573 ; October, 14,718 ; November, 13,758 . Canned meats and meat products-September, 21,596 ; ported previously (thousands of pou

IData relate to regular flour only; in addition, data for granular flour have been reported beginning 1943; see note in previous Surveys for data through September 1944. Granular foar data for October 1944: Wheat grindings, 4,233,000 bushels; production, 921,000 barrels; offal, \(74,010,000\) pounds; percent of capacity, regular and granular flour combined, 77.7 . Digitizen ditbres

- Revised. \({ }^{1}\) December 1 estimate. \({ }^{2}\) Revised estimate. a Not available.
§For data for Decenber 1941-July 1942, see note marked " \(\S\) " on p. S-28 of the November 1943 Suryey.
\(\ddagger\) Data for June to December 1943 were revised in the August 1944 Survey; revisions for January-May 1943 are available on request
The new series on sugar are compiled by the U.S. Department of Agriculture and replace the series on meltings and stocks at 8 ports shown in the Survey through the July
1944 issue; data are compiled from reports by cane sugar refiners, beet sugar processors, importers of direct consumption sugar, and continental cane sugar mills. Data represent both raw and refined sugar in terms of raw sugar. Data beginning 1934 will be published later.
\(\dagger\) Revised series. The price series for sole oak leather is shown on a revised basis heqinning with the October 1942 Survey: revisions beginning July 1933 are available on request.

\section*{LUMBER AND MANUFACTURES}

: Revised. \({ }^{1}\) Includes Southern pine stocks at concentration yards not included prior to February; these stocks totaled 798 mil. bd. ft. Dec. 31, 1943. \({ }^{2}\) Not available.
". New series. The plywood and veneer series are from the Bureau of the Census and are practically complete. The unit of measurement for hardwood plywood is the "glue line" or total area of glue spread. The "glue line" measures the surface area of the veneer used in the manufacture of plywood but does not include the core. The hardwood veneer figures are in terms of surface measure with no account taken of thickness. For softwood plywood, als thickncsses are converted , itespectively, for hard wood plywood and veneer are published on p. 14 of the November 1944 issue
vencer are published on p. 14 of the November 1944 issue. indicated lumber series are on pp. 27 and 28 of the March 1943 Survey. Further revisions in data published prior to the December 1943 Survey have been made as follows: Total stocks and hardwood and softwood stocks beginning 1940 and all Series beginning January 1942 on the basis of data collected by the Bureau of the Census. Southern pine unfilled as previously published). All revisions will be published later (for revised 1942 monthly averages see May 1944 Survey). The 1942 Census included many mills in the Eastern States not previonsly can vassed; this affects the comparability of the statistics for 1942-43 with those for earlier years for Southern pine and for total lumber, total softwoods, and total hardwoods. The revised price series for Southern pine each represent a composite of 9 series; for comparable data beginning August 1942 see note at bottom of p. S-35 of the

\(r\) Revised. I Beginning 1943 data cover virtually the entire industry. ©Designated "tin plate" prior to the July 1944 Survey but included terneplate.
o beginning July 1944 the coverage of the industry is virtually complete; the coverage was about \(97-98\) percent for September 1942-June 1944 and 93 percent prior thereto.
 \(\ddagger\) Of the 99 manufacturers on the reporting list for Jan. 1, 1942,29 have discontinued shipments of these products for the duration of tho war.
 industry, as formerly. For 1942 data, except for April, see the October 1942 and July 1943 Survevs; for Aprii data see note at bottom of p. S-31 in the September 1943 issue.

\({ }^{5}\) Revised. tThe total and the detail cover 59 manufacturers; see March 1944 Survey for comparable data for 1942.
\(\sigma^{2}\) For data beginning January 1942 for the indicated copper, lead, and zinc series, see p. 24, table 6, of the June 1944 Survey
Revis in unmed 1942 are a
ners for the duration of the war; data currently cover 85 manufacturers.
for
*New series. For magnesium production begining January 1042 see \(p .24\) table 6 , of the June 1044 Survey The series on antomotive replacement batter
stimated industry totals compiled by Dun and Bradstreet data beginning 1937 are avalable on request. For 1940-41 and early 1942 data for machine tool shipments seapresents estimated industry totals compiled by Dun and Bradstreet; data beginning 1937 are avalable on request. For \(1940-41\) and early 1942 data for machine tool shipments see p. S-30 of tire industry through June 1944; thereafter, reports were no longer requested from 150 small companies which formerly accounted for about 4 percent of total shipments.
\(\dagger\) Rerised series. Indexes for electrical products have been shown on a revised basis beginning in the January 1943 Survey; the inder for motors and generators was furt her revised n the April 1944 Survey (see p. \(\mathrm{S}-31\) of that issue). Data beginning 1934 are available on request.

Unless otherwise stated, statistics through 1941 and descriptive notes may be found in the 1942 Supplement to the Survey

Revised. \(\ddagger\) For revisions for 1942 and the early months of 1943 , see note for paperboard at bottom of p. S- 35 of the July 1944 Survey
\&Computed by carrying forward March 1943 figures on the basis of percentage changes in data for 59 identical eompanies reporting to the National Paperboard Association. †Revised series. Revised wood pulp production data beginning 1940 and sulphite stocks for all months of 1943 are shown on page 20 of December 1944 Survey; revised 1942 stock figures for all series are on pp, 30 and S-31 of the June 1943 issue. The data exclude defibrated, exploded, and asplund fiber. The paper series from the American Pafer and Pulp
*New series. The new paper series from the Bureau of the Census cover production of all mills including producers of building paper and building boards; for comparable 1942 monthly averages and data for the early months of 1943 , see \(p\). S-32 of the August 1944 issue. For data beginning 1934 for shipping containers and a description of the series, see \(p\).

\end{tabular} \({ }^{-}\)Revised
§ These data based in general on returns made in accordance with gasoline tax or inspection laws are designed to relleet total consumption of gasoline in the United States. It is stated by the compilers that since the beginning of the war some gasoline has moved on government bill-of-lading and, as sueh, by-passes State inspection and is not included; on the other hand, some government purchases intrastate that finally find their way abroad are included. For revisions for \(1941-42\) see p. S-33 of the August 1943 Survey and p. S-34 of the July 1944 issue, respeetively.
\(\ddagger\) Includes production of natural gasoline, cycle products, and liquefied petroleum gases at natural gasolinc plants and, since the beginning of 1942 , benzol. Sales of liquefied petroleum gases for fuel purposes and transfers of cycle products are excluded from these figures before combining the data with production of straight run and cracked gasoline to obtain total motor fuel production. Separate figures through September 1944 for the items excluded are given in notes in previous issues of the Survey; October 1944 data are as follows: Sales of liquefied petroleum gases for fuel, \(1,053,000\) barrels; transfers of cycle products, 134,000 barrels.
products revised for 1941 añ 1942 ; for 1941 revisions, see notes marked " \(t\) " on p . S-33 of the March and ap. S- 32 of the April 1943 Survey. Data for the indicated series on petroleum products revised for 1941 ana 1942; for 1941 revisions, see notes marked " \(\dagger\) " on p. \(\mathrm{s}-33\) of the March and April 1943 issues, and for revised 1942 monthly averages, see note marked " \(\dagger\) " Digitized por \({ }^{33} \mathrm{~F}^{\circ}\) 解 the July 1944 issue; 1942 monthly revisions not shown in the December 1943 Survey are available on request.

\({ }_{i}\) Revised. \({ }^{\text {Revised }}\) Preliminary,
\(\dagger\) Revised series. The revision of the Canadian index of physical volume of business is due mainly to changes in the weighting and in the list of components, so as to present a picture of the expansion in industries engaged in war production. Revised data were first shown on \(p\). \(S-36\) of the December 1942 Survey; subsequently the construction index was further revised in the March 1943 Survey and the mining index was revised in the April 1944 issue. The revisions affected principally indexes for the period beginning January 1940; the agricultural marketings index and the distribution index were revised back to 1919 and minor revisions were also made in data prior to 1940 for other series. All series are New series. Th
New series. The new series on woolen and worsted goods are compiled by the Bureau of the Census from reports of manufacturers who account for 98 percent or more of total production; the statistics include estimates for a few manufacturers from whom reports were not received; yardage is reported on an equivalent 54-inch linear yard except blankets
which are on a 72 -inch linear yard. Data on trucks and tractors are from the War Production Board and cover the entire industry. Jeeps, military amhulances and wheel drive which are on a 72 -inch linear yard. Data on trucks and tractors are rrom the War Production board and cover the entire industry. Jeeps, military ambulances, and wheel drive
 Digitized for FRAshburd also be noted that the latter were "faetory sales." Earlier data for all new series will he published later.
