## Businessmen have a new Service Office in Washington It is in Room 1060 • Department of Commerce Building

#### Abstract

JESSE JONES, Secretary of Commerce, has established a Service and Information Office for your use. The next time you desire to come to Washington but do not have your own contacts or do not know to which Government office you should present yourself, get in touch with this Service and Information Office.

This new Service Office is staffed with men detailed from the Bureau of Foreign and Domestic Commerce and others with long experieace in Washington with Government affairs. Its primary objective is to put you in direct contact with the governmental official who can answer your questions or give you the needed information-if it is available. As a result, it will be possible for you to reduce the number of calls and eliminate unecessary delays in tronsacting official business in the city.

If you contemplate coming to Washington and would like to have your appointments arecnged in advance, write, wire, or telophone the Service and Information Oflice, Department of Commerce. If in Washington, call DIstrict 2200, Exiensica 576, or drop in at Roon 1060, Department of Commerce Building, which is to the right of the main lobby, entering from Fourteenth Streei.

ARRANGEMENTS CAN ALSO BE MADE THROUGH OUR OFRICES IR JHE FOLLOWING CITIES

## Monthly Business Indicators, 1936-41

## The Business Situation

UNDER the impetus of extremely heavy demand and record unfilled order backlogs, business again moved ahead at a substantial pace in February. Notwithstanding inadequate capacity as compared with demand in a number of industries, industrial production advanced more than the usual seasonal. Construction also gained strongly, larger defense awards for plant and rising private demand for housing contributing to heavier activity in this area. Trade remained in very good volume holding a pace surpassing that of 1940 by a substantial margin. Reflecting the industrial advance, electric power output and freight carloadings both increased more than is usual at this time of year, movement of industrial freight rising strongly at month's end.

Despite a larger industrial output, developments of the month clearly demonstrated that a new phase of the upswing under way since April 1940 has definitely been reached-a phase best symbolized by inauguration near the month's end of the first mandatory industrywide priorities.

In the first stage of the expansion, the availability of unutilized plant and labor made possible an exceptionally rapid increase in production in almost all lines. From April to February, aggregate output rose by 27 percent. As was to be expected, the pace was uneven in different industries, a fact illustrated in figure 2 showing the movement of production in a number of commodities. It was early apparent that the nature and magnitude of the demand made shortages in certain metal and cquipment producing industrics probable unless very rapid expansion of capacity in these lines could be achicved. Construction of additional capacity was begun, but to increasing civilian and military demand was added heavy purchasing for inventory. For several months the combined demand has exceeded production in a few cases, but availability of stocks and some informal control of forward buying made it possible to fill commitments.
During February the tight supply situation became acute in a number of instances, and the varying effects, heretofore only threatening under the surface of events, came to a head. In consequence, the Office of Production Management was confronted with the many problems raised by scarce supplies, even though unutilized facilities remained available in many industries. Furthermore, the labor force-the ultimate limiting factor to expansion-if not completely in possession of the needed skills, was still ample for further industrial growth.

## Priorities Inaugurated.

In the course of the month machine tools and aluminum were placed on a mandatory priority status, while producers of magnesium were requested to give defense orders complete preferential status. In the other cases,
including nickel, zinc, tungsten, and temporary tight supply situations such as that in structural steel, the Priorities Division continued its efforts to iron out all difficulties by informal and voluntary cooperation of producers and consumers. Meanwhile, arrangements for further expansion of metal producing capacity were under way; training programs preparing skilled workers for defense industries were enlarged and speeded up; commitments for the import of strategic and critical materials were increased, and producers of certain civilian goods were urged to develop the use of substitutes.

Under the priority arrangements adopted, responsibility for determining the relative importance of finished military goods, whether guns, tanks, airplanes, ammunition, or other products, rests with the Army and Navy Munitions Board. This Board issues preference ratings to contractors for these items, and if necessary, approves extension of the rating to the first subcontractor, indicating in each case the order of preference. For all items below the first subcontract, including all raw materials, preference ratings are determined by the Priorities Division of the Office of Production Managenent.

## High Scrap and Import Prices.

The situation prevailing in the metal trades is reflected in the continued advance of many scrap metal prices. In the case of two of the nonferrous metals, aluminum and zinc, scrap prices have risen above and continued to be higher than prices of the virgin metals. In the zinc and aluminum industries, producers in cooperation with the Defense Commission have been able to prevent price advances of the primary metal. However, a quite different situation existed in the scrap market. Late in February, for example, No. 12 alloy remelt aluminum sold as high as 28 cents a pound, 65 percent above the price of virgin ingot metal, while remelted zinc was quoted at 11 cents a pound, as contrasted with 7.25 cents for Prime Western zinc, East St. Louis. The Price Stabilization Division continued attempts to hold down prices in secondary markets, conferring with producers, requesting important interests not to sell in these markets, and indicating that continuation of disturbed conditions might result in commandeering and disposal of scrap metal by the Government.

As for stecl scrap, the price of No. 1 heavy melting scrap (Pittsburgh) was reduced from $\$ 23.75$ a ton in the first part of January to around $\$ 21$ in the last half of February. This was still somewhat above $\$ 20$, the objective set. In some cases where the supply situation was most serious, such as cast scrap, little or no reaction was obtained. Another development in secondary
markets was the establishment (effective March 1) of maximum prices for used machine tools. In certain instances, these had previously been priced at double their original cost.

Aside from the metals, the main advances of the month occurred in import prices. Possible difficulties in obtaining supplies and rising ocean freight rates contributed to the bidding up of quotations. Chiefly as a result of the increase for this subgroup, the index of 28 basic commodity prices rose by month's end to 123.8, from 119.8 on January 31. Notwithstanding this advance, the B. L. S. weelly "all commodity" index was fractionally lower at the close of February than at the beginning. Prices of semimanufactured goods strengthened a bit, but the index of the raw materials group, which is heavily weighted with agricultural items, declined.

## New Orders in Record Volume.

As mentioned above, business demand has been extraordinarily heavy, the flow of new orders to manufacturers having been the largest on record in January. Part of this new business, of course, did not constitute current demand, but represented efforts of customers to assure themselves a preferential position on supply lists some months ahead of expected deliveries. This was especially true in iron and steel, where a particularly large advance lifted unfilled order backlogs another 19 percent. A few other durables, including machinery, were ordered in somewhat smaller volume, but in no instance could January orders be characterized as being other than extremely large. Morcover, in the less volatile nondurable goods industries, new business increased almost 9 percent and stood more than onefourth above that a year ago.

Shipments in the aggregate declined slightly during January, giving further evidence of limited gains in output. The reduction was centered in the durable goods industries, alnost all of these showing a smaller movement. These reduced shipments along with the advance in new business, acted to inerease total order backlogs in the durable industries another 12 percent. For all durables (exclusive of aircraft and shipbuilding) unfilled orders had a value more than two and one-half times the amount at the end of Jenuary 1940.

## Smaller Inventory Accumulation.

Heavy forward buying over recent months, has contributed to a growth in manufacturers' inventories which increased nearly $\$ 200$ million monthly in the final quarter of last year. But under pressure of heavier consumption and a less rapid increase of production, this expansion appeared to be abating in January, when accumulation was limited to about $\$ 130$ million. The most substantial rise again occurred in the transportation component, including railroad equipment and aircraft, and in automobiles and equipment, all of which are expanding defense output.

Until February, forward buying did not interfere seriously with delivery of materials to defense industries, but rather served to utilize what otherwise would have been idle capacity. But as pointed out above, additional demand for larger inventories of certain materials has now helped to create some tight supply situations, and the introduction of priorities has been hastened because of it. However, accumulation of inventories still is not gencral, retail and wholesale stocks showing no undue expansion.

## Further Advance in Production.

Many industries achieved a further advance in productive activity during February, the aggregate increase being larger than has been usual in past years for this month. The Federal Reserve index of industrial production well surpassed the January mark of 139. However, as capacity operations proved a limiting factor in many lines, it was apparent that the pace of future advance would be more closely geared to the completion of new facilities, especially in the metals, machine tool, and finished armament industries.
Steel production expanded only slightly on a daily average basis, though order backlogs increased. Weekly output fluctuated between 97.1 and 94.6 percent of capacity, changing with the number of shutdowns necessary for repairs. In the important nonferrous metals, deliveries generally continued slightly in advance of production and imports, again reducing producers' stocks. Domestic output of refined copper remained virtually unchanged from the capacity lerel of the previous month, though rising imports, including the release of tomage meant for government stock piles, eased the supply problem. Lead production also showed little change from January, operations in this case being well under full capacity of the industry. Aluminum and zinc outputs were increased a small amount during the month, as further additions to capacity in each industry were scheduled for introduction over the next quarter.

Bituminous coal output rose again in February, daily average production increasing 4 percent as compared with January, but the gain was smaller than in past years. Cotton consumption, lumber, machincry. and chemical production all advanced, in most instances showing some rise on a seasonally adjusted basis. Electric power output averaged about 2.8 billion kilowatt hours a week, the same as in January, which made for a slight rise after adjustment for seasonal influences. Power output currently is rumning approximately 12 percent ahead of last year.

## Large Automobile Production and Sales.

Activity in the automobile industry continued to be sustained by heavy dealer stocking and exceptionally large sales for this time of year. Production of an estimated 510,000 units was the highest ever recorded for February and brought total assemblics for the first

Figure 2.-Production of Selected Commodities, 1937-41.

2 months slightly above 1 million units. This was 9 percent in advance of production in early 1940 and slightly above the record pace in the fourth quarter of last year, though the industry usually faces a marked seasonal decline at this time. The strength of current demand was evident in maintenance during February of the January sales volume, which amounted to 372,000 units. Here, too, the usual seasonal pattern is not being followed, high current sales representing in part consumers' attempts to avoid expected price advances, possible changes in construction as competing military needs divert scarce materials from automobile production, and possible curtailment of output duc to the necessities of defense. However, these factors are of secondary significance, the chief reason for expanded sales being the current high level of consumer income and favorable outlook for income over the next year. Providing the demand can be met, domestic automobile sales in 1941 should rise substantially above the $4,096,000$ units sold in 1940 .

Production since September has consistently exceeded sales by a substantial amount, dealers adding 75,000 to 100,000 units a month to new car stocks. From the beginning of the model year to the middle of February, inventories were expanded to about 600,000 units, one of the largest stocks in the history of the industry. Moreover, because of a possible shortage of metals, it was expected that this inventory accumulation would be extended over the near term.

## Heavy Loadings Stimulate Freight Car Purchases.

The advance in productive activity during February again increased carloadings more than seasonally. The aggregate change from January was not large, but the total remained well ahead of last year. Since December the weekly movement of goods has averaged nearly 700,000 cars, 11 percent above the corresponding period in 1940. More than 80 percent of the gain has been in the miscellaneous category, which includes most rail shipments of manufactured products. Coal loadings, a substantial component of the total, were lower this January than a year ago, when coal traffic had been unusually heavy. However, in February coal shipments, like those of coke, ore, forest products, and less than carloads moved in larger volume than a year ago.

To meet the present and prospective freight traffic, the railroads now have available or on order a larger number of cars than at any time since 1937. During last year, retirements almost offset the 66,000 new cars placed in service, but an intensive repair program reduced the inventory of "bad order" cars from 156,754 to 113,717 , the lowest in more than a decade. The net result was an increase of 51,000 in serviceable cars on line to a total of $1,753,495$ (including Class I switching and terminal companies, and private line cars). If one takes an efficiency of active car utilization (the average time consumed from carload to carload) and a minimum car surplus equal to the best records achieved
in recent years, the serviceable car supply at the end of the year could have supported a fortnight peak of about 882,000 carloadings a week. It may be possible, of course, to better the efficiency of utilization or to reduce the required surplus slightly.

During recent months the railroads have ordered new cars in large volume, and intensive repair work on "bad order" cars has been directed at reducing these still further. New cars on order at the end of January were 41,600 , of which $14,100 \mathrm{had}$ been ordered in January. Additional orders for 5,650 were placed in February.

Loadings may be expected to increase until the fall, with a seasonal peak in October. The Transportation Commissioner of the Defense Commission has tentatively forecast an increase of 9.4 percent for the year

Figure 3.-Index of Railroad Car Production, Adjusted for Seasonal Variations, 1936-41 (Board of Governors of the Federal Reserve System).
as a whole. This would mean a 2 -week peak well in excess of the 826,000 in October 1940, unless strong effort was devoted to realizing a more even distribution. Even with car production continuing at a ligh rate, it was the conclusion of Mr. Harriman of the Office of Production Management, that "the Railroads are unable to guarantee that there will not be a tight situation in the autumn of 1941 or the autumn of 1942."

## Large Volume of Defense Construction.

Like the record of production, construction activity continues to move ahead under the stimulus of heavy defense and private demand. Though contract awards in 37 States during January as reported by the F. W. Dodge Corporation declined from $\$ 456$ million to $\$ 305$ nillion (reports through February 22 showing a further small reduction), these monthly comparisons do not record the actual change in contracts. Because of difficulty in classification, defense awards in many instances are reported some time after being made. The high December figure included $\$ 124$ million of defense awards which had been let but not classified during the autumn months. The Defense Commission announced that contracts totaling $\$ 358$ million for plaut and equipment were let in January alone, which compared with a total in the previous 7 months of only $\$ 700$ million. It is evident that the plant contained in
many of these contracts is not yet reported by the Dodge Corporation, their defense component in January amounting to only $\$ 15$ million.

Some decline has taken place in the pace of defense contracts let for housing, but considerable more work in this field will be forthcoming. As of February 15, funds had been allocated for 68,632 dwelling units and contracts had been awarded for only 36,936 , with 1,932 units completed.

Insofar as private contracts are concerned, the general expansion in business counteracted the usual seasonal decline through January, although it appears that some decline occurred in February. These contracts in 37 States have remained close to $\$ 200$ million per month since last July. The current strength of private construction is evident in the fact that contracts of $\$ 194$ million in January were about equal to the total for both private and public contracts in January 1940.

Private residential construction has been especially heary, contracts in 37 States having increased contraseasonally from $\$ 89$ million in December to $\$ 100$ million in January. In addition, commercial and factory building continue markedly higher than a year ago, contract awards exceeding January 1940 by 69 percent and 335 percent, respectively. This construction is chiefly for private account, although in recent months publicly financed construction of defense plant has made a large contribution to the total.

## Less Than Seasonal Decline in Employment.

As activity in defense industries was expanding in January, the usual seasonal decline in employment during this month was sharply modified. The adjusted index of employment in firms producing durable manufactures advanced from 117.5 in December to 120.8, while that for nondurable employment declined only fractionally from 115.7 to 115.4 . The net result was an advance in the total index of factory employment from 116.6 to a new record of 118 . Particularly noteworthy gains appeared in foundries and machine shops, shipbuilding, electrical machinery, engines and turbincs, and aircraft.

Civil nonagricultural employment in January totaled 36,343 thousand workers compared with 37,299 thousand in December, the decline reflecting mainly the usual seasonal reduction of employment in retail trade establishments. These employed 650,000 fewer workers in January than in the preceding month. Despite this decline, employment was the highest for any January on record, being almost 2 million above January 1940 and more than a million larger than in January 1929. Largest employment increases over the year were in manufacturing and construction, employment in these two fields being respectively 781,000 and 606,000 above January 1940. Industries closely associated with the defense program such as steel, foundries, aircraft, shipbuilding, brass, bronze, and copper prod-
 http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis
more workers in January than in any other month on record.
The further expansion of business activity in January had its counterpart in rising income payments, the index advancing on a seasonally adjusted basis from 95.6 in December to 96.3 -the highest point since February 1930. The index of salaries and wages reached 97.3 and that for nonagricultural income 97.0 compared with identical figures of 96.6 in December.
In respect to farm income, the controlling factor is still increasing domestic demand. Crop income is somewhat lower than last year due to generally lower prices than at that time. However, grain, cotton, and tobacco prices, stabilized by commodity loans and ample supplics, have changed little in recent months. In contrast, income from marketings of livestock is materially ahead of a year ago, the consequence of advancing meat-animal priccs. Increasing demand for the latter has impinged on what in the short run is a relatively inelastic supply. On the whole, cash farm income (including Government payments) is expected to average higher in the first half of 1941 than in the similar period of 1940 .

## Consumer Buying High.

Consumer purchases remain very large, a natural sequence to the employment and income gains of recent months. The Federal Reserve adjusted index of department store sales in February remained above 100 ( $1923-25=100$ ) for the third consecutive month-the highest point reached by this index in more than a decade. Sales surpassed the corresponding period last year by more than 14 percent, with trade reports indieating strongly sustained demand for home furnishings and other consumer durables.
Current year data for variety store sales and sales in rural areas show little change from high December totals after the usual seasonal adjustments. The rural sales index for January was approximately equal to December's 146 (1929-31 = 100)-the highest on record. Variety store sales were down slightly, while the adjusted index of chain grocery store sales advanced to 122 from $117(1929-31=100)$ in the previous month.
Wholesale trade also continues to show considerable strength. January sales were 18 percent above last year and only 3 percent below those of December 1940. The December-January decline was the smallest in 5 years.

## Exports Little Changed.

Evidence of inability to expand production rapidly in a number of metals and machinery industries was afforded in the report on exports of United States merchandise in January. These totaled $\$ 318$ million as against $\$ 315$ million in December, with no significant shifts in trends established during recent months. A small drop in agricultural exports was counteracted by increased shipment of industrial products. The decline in agricultural exports from $\$ 25.9$ million
to $\$ 22.1$ million was almost entirely the result of smaller shipments of raw cotton, which had a value of $\$ 3.1$ million compared with $\$ 6.4$ million in December and $\$ 60$ million in January 1940 (when cotton exports were unusually large).

Nonagricultural exports rose to $\$ 295.8$ million from $\$ 289.5$ million in December, chiefly because of an increase in shipments of aireraft to a record total of $\$ 40.9$ million, 27 percent above the previous month. Shipments of other materials associated with the conduct of war continued in high volume, although there were some declines from December totals. Exports of iron and steel mill products declined $\$ 5$ million to $\$ 39.8$ million, firearms and ammunition were slightly lower at $\$ 6.8$ million, and metalworking machinery reversed its steady advance of recent months by declining to $\$ 25.4$ million from $\$ 29.6$ million in December. Shipments of nonferrous metals increased from $\$ 11.9$ million to $\$ 14 . \overline{5}$ million over the period.

Imports for consumption were $\$ 224$ million in January, falling from $\$ 238$ million in December. A wide range of commodities participated in the decline, record coffee receipts and larger imports of unmanufactured wool being major exceptions. Receipts of strategic and critical materials such as crude rubber, tin, and ferro-alloys were all smaller than in the previous month. December imports of crude rubber and tin, however, were unusually large. A very important development of February in respect to the defense program was the amouncement by the International Nickel Co. that imports of their product from Canada will be in smaller volume in future months,
demand on the part of the United Kingdom requiring a larger proportion of the capacity output.

## Finance.

The expansion of business and defense activity continues; to make heavier demands upon the banking system. From January 1 through February 26, business loans of weekly reporting Federal Reserve member banks rose $\$ 209$ million, bringing the total advance since August to $\$ 764$ million. In addition, member bank holdings of United States Government securities increased $\$ 638$ million in the 8 weeks through February 26, with $\$ 635$ million Treasury notes offered in late Jinuary. As a further supplement to private bank financing, the Reconstruction Finance Corporation increased its defense loans at the end of February to $\$ 80,912,000$, which compared with $\$ 38,000,000$ at the end of December.

The capital market failed to share substantially in the heaviar financing, issues for new capital declining sharply from $\$ 189$ million and $\$ 95$ million in December and January, respectively, to $\$ 77$ million in February. This represented one of the smallest monthly volumes in recent years. A contributing factor to the reduction was the weakness of the security markets. Bond prices reversed the trend of the previous month, the Dow-Jones 40-bond average dropping from 92.19 on January 28 to 90.19 at the close of February. The decline in stock prices, which began in January, was still under way in February. The Dow-Jones 65 -stock composite price fell to 41.30 from 44.92 on January 10 , with 30 industrial stocks off from 133.59 to 121.97.

# Capital Expenditures for Manufacturing Plant and Equipment-1915 to $1940^{\prime}$ 

By Lowell J. Chawner, Chief Industrial Economist

T${ }^{\top} H E$ production of manufacturing capital facilities in the form of plant and equipment, for both public and private ownership, in the United States during the first 3 months of 1941 will exceed that of any previous quarter year in our history. If no appreciable decline occurs from the present rate (a slight increase during the second and third quarters scems more likely in terms of the present outlook), the total production of new manufacturing facilities in 1941 may reach $\$ 3.5$ billion. The corresponding value is estimated to have been $\$ 2.3$ billion in $1940, \$ 2.7$ billion in $1929, \$ 3.2$ billion in 1920, and $\$ 2.5$ billion in 1918 at the peak of our productive effort during the first World War. These figures are in current prices of the year during which the expenditures were made, and hence exaggerate the fluctuations in the actual physical additions to productive capacity. After allowances for price changes, gross additions to manufacturing plant and equipment appear to have been approximately the same in the three peak years 1918, 1920, and 1929, but less than that in prospect for $1941 .{ }^{2}$

This article endeavors to summarize the broad general movements which have occurred during the past 25 years in the additions to manufacturing capital facilities. The record of these expenditures during the World War and subsequent years has a timely bearing upon the development of national policy, both by private enterprises and by the Government, with regard to the increases in capital facilitics required to attain the large, and for the most part highly specialized, production necessary in the present emergency. A carcful study of our experience over this period also will throw light upon the character and magnitude of the readjustment of productive facilities which may be expected following a decline in national defense expenditures.

Estimates of capital expenditures for manufacturing purposes for plant and equipment by quarters from 1915

[^0]to 1940 are shown in table $1 .^{3}$ The terms "capital expenditures" and "capital assets" as used here follow the usual definitions of business accounting rather than those of economic theory. They consequently refer for the most part to durable producers' goods, usually those having a useful life of 3 years or more, upon which annual depreciation charges are made, rather than to all commodities retained for multiple use in the production

Figure 4.-Percentages Which Plant and Equipment are of the Total New Manufacturing Capital Expenditures, 1915-40 (Based upon the Estimates Shown in Table 1).
of other goods and services. These estimates consequently do not include expenditures for small cutting tools and hand tools nor expenditures for the maintenance and minor repairs of structures or machinery. In calculating the estimates, allowances were made for the actual cost of plant and equipment to the manufacturing concerns using it, thus including distribution, transportation, and installation costs. They also include deductions for exports and allowances for imports at their final cost to the industrial user. ${ }^{4}$

[^1]
## Movement of Total Capital Expenditures

During the years of the first World War, capital expenditures for manufacturing facilities, both public and private, at current prices, increased from approximately $\$ 620$ million in 1915 to $\$ 2,466$ million in 1918 . These expenditures may be compared with an estimated net value of manufacturing plant and equipment assets of approximately $\$ 10$ billion at the beginning of this period.
The amounts of the Fedcral Government outlays for productive facilities, as distinguished from other expenditures, cannot be determined precisely. It appears, however, that manufacturing facilitios for public ownership by the War Department, the Navy Department, the Emergency Fleet Corporation, and other Federal agencies were constructed during the fiscal years 1917, 1918, and 1919 at a cost of approximately $\$ 500$ million. This amount does not include the privately owned plants which were built for the primary purpose of producing military supplies and which for all practical purposes were thus financed by the Government.

During the two immediate post-war years the gross additions to manufacturing facilities remained high; and the expenditures of $\$ 3.2$ billion upon plant and equipment in 1920 have not been equaled before or since that time. This large volume was due to the
rapid readjustment of manufacturing facilities to peacetime purposes, particularly in the metal-working and autonobile industries, and also reflected the sharply rising prices during these years.

Large physical additions to manufacturing plants, measured by floor space of new manufacturing buildings constructed, were made throughout the entire period from 1916 to 1920, as indicated in table 2. Annual equipment expenditures adjusted for price changes also were very large and did not change greatly during the entire 4 years 1917 to 1920 inclusive. Statistics on railroad shipments of machinery over this period tend to further substantiate this observation. Annual estimates of capital expenditures for manufacturing purposes from 1915 to 1940, adjusted for price changes, appear in table 3.

Several influences tended to sustain manufacturing plant and equipment expenditures at fairly high levels during all but two of the immediate post-war years. The need for readjustment of our wartime economy to meet peacetime requirements, together with the provisions of the Revenue Act of 1918, which made it possible for concerns to depreciate rapidly all wartime equipment, resulted in very substantial capital expenditures during 1919 and 1920, as already observed. A sharp decline in 1921 and little change in 1922 was followed by 8 years of substantial and usually slightly increasing expenditures upon replacements and expan-

[^2]sion in manufacturing facilitics of approximately 2 billion dollars annually. The rapid expansion in demand for several relatively new products such as automobiles, electrical household appliances, and synthetic chemicals, together with the large additions to generating and distribution facilities of electric light and power concerns, a residential building boom, and the construction of an extensive highway system throughout the United States, all contributed to this development. The migration of cotton textile mills to the South Atlantic States, and the exploitation of petroleum resources in the South Central States and in California and other Western States resulted in substantial expenditures for refining and other manufacturing facilities in these areas. Throughout this period, far-reaching improvements occurred in machines and in the technical organization of manufacturing processes. The post-war decade, with the exception of 1921, also was a period of well-sustained earnings of manufacturing concerns which provided both the means and incentive for further plant expansion.

Source: Based on F. W. Dodge Corporation reports and othor data. See description of estimates at end of this article.

In 1931, manufacturing capital expenditures declined sharply to an amount less than that of any year since the World War, and they remained low during the subsequent 4 years. Although the rate of new capital expenditures upon plant and equipment during the 1930 decade has been very low, considerably less than the attrition of capital measured by depreciation and obsolescence, the additions to facilities that have been made, particularly during the past few years, are in many cases technically more efficient per dollar value of capital investment than similar equipment was a decade or more ago. Also during this period actual retirements appear to have been less than the depreciation taken upon capital plant and equipment. Consequently, the physical productive capacity of many manufacturing industries has been maintained more adequately than is indicated by a comparison of capital expenditures with depreciation and obsolescencecharges.

The present emergency, which requires a greatly increased production of many commodities in the interest of national defense, comes at a time when a number of manufacturing concerns appeared to be
initiating plans for considerable plant expansion, improvement, and relocation to meet their normal requirements. Marked improvements have been effected in mechanical devices and in environmental conditions for efficient production by industrial workers such as those in plants built during the past 2 years for the Simonds Saw \& Steel Co. and the Allison Division of the General Motors Corporation. The relocation of many industrial establishments in areas more favorably situated than existing sites from the point of view of proximity to markets and raw materials, to electric power and other energy resources, and to more favorable living conditions for industrial workers, also appear to have been possible. Some expansion of this character may occur in plant additions to meet defense needs. In many cases, however, it appears that current additions to manufacturing facilities must be provided in the most expeditious manner to assure at the earliest possible moment the products required for the national defense rather than to expand the facilities entirely from the point of view of maximum cconomic efficiency. Many of the principal designers of manufacturing plants report that in recent months some of their clients have deferred plant expansion for other than defense purposes. Consequently, it is possible that

after the needs of the present emergency have been met, there may be a tendency toward the readjustment of our fundamental industrial facilities similar to that which occurred after the first World War. The extent to which such a readjustment may actually occur will be influenced not only by the then current demand for manufactured products but also by factors such as the movement of population, incentives or deterrents to technological change, and by tax and other public policies relating to capital investment.

## Capital Consumption

The attrition of capital assets in the form of plant and equipment may be accounted for by (a) deprecia-
tion and obsolescence charges, (b) capital losses through revaluation of assets arising from changes in earning power, and (c) capital losses through destruction of plant and equipment, partial or complete, by catastrophes such as fire, tornado, or flood.
By far the largest form of capital consumption in the aggregate is taken as depreciation and obsolescence charges. Charges to depreciation and similar accounts may be more or less than the actual loss of value or usefulness for productive purposes of capital assets. Some concerns not infrequently fail to provide adequate reserves against the loss of value of their capital assets, although their accounts may not indicate this to be true. Other concerns undoubtedly have fully depreciated certain capital assets that have not been retired and still possess substantial value in use. Notwithstanding these differcuces, depreciation charges do provide a rough measure of the ycar-to-year change in the principal element in the consumption of capital

Figure 5.-New Manufacturing Capital Expenditures for Plant and Equipment and Current Depreciation Charges on Manufacturing Capital Assets, 1915-40.
Note.--Both series refer to all manufacturing concerns, corporate and unincorporated. New manufacturing capital expenditures, U. S. Bureau of Foreign and Domestic Commerce (see table 1). Depreciation, including obsolescence charges of manufacturing concerns, years 1919 to 1935, from "Capital Consumption and Adjustment," National Bureau of Economic Research (Fabricant); years 1917, 1918, 1936, and 1937 derived from U. S. Bureau of Internal Revenue data; years 1938 and 1939 derived from the "Survey of American Listed Corporations," Securities and Exchange Commission. Data for 1915, 1916, and 1940 are not available. See accompanying text for a discussion of the limitations involved in the comparison of these two series.
${ }^{1}$ Data are from consolidated corporation returns and are comparable with those for prior years.
${ }^{2}$ Data are from unconsolidated corporation returns and are comparable with those for subsequent years.
assets corresponding to the increments in such assets measured by capital expenditures shown in table 1. Similarly, estimates of new plant and equipment produced may include some machinery which is not treated as capital by some manufacturing concerns but is charged as current operating expense during the year in which it is purchased.

The capital expenditures and depreciation charges slown in figure 5 provide the basis for an approximate comparison of the increases and decreases in useful capital facilities from year to year. The comparison is a rough one, and in its interpretation the following facts should be fully recognized. The expenditure figures in 1918, 1919, and 1940 include substantial amounts for facilities financed by the Federal Government. The corresponding depreciation charges refer only to privately owned plants. The depreciation charges during the first few years shown on the chart relate largely to capital assets which cost much less per comparable unit than the facilities that were added during the years 1917 through 1920. Moreover, since the figures for expenditures and for depreciation do not cover preciscly the same items, the relative heights of the two curves are not strictly comparable.
Notwithstanding these important differences, a comparison of the two curves since 1921 is believed to be an approximately valid one. In each year prior to 1930, there appears to have been a slight net addition to manufacturing capital. Since 1930, however, the attrition of capital in cach year, with the exception of 1936, 1937, 1939, and 1940, has been more than the current additions to capital facilities during these years.

## Economic Analysis of Manufacturing Capital Expenditures

In vicw of the marked differences which occur in the rate at which outlays are made for plant and equipment in particular industries, any adequate economic analysis of manufacturing capital expenditures must include an appraisal of these expenditures in different industries. Such an appraisal would be largely in terms of technological developments in new products and processes of manufacture, current production and its relation to productive capacity, the earnings of the leading concerns, and other similar factors in each industry.
However, it is also interesting to consider the fluctuations of manufacturing capital expenditures as a whole in terms of the more general factors related to these movements. The principal influences which might appear to be related to aggregate manufacturing capital expenditures are total manufacturing production, total profits of manufacturing enterprises, interest rates, factory construction costs, the attitude of business enterprisers with regard to the outlook for the future, broad general shifts in the markets for manufactured products and extensive changes in the demand for manufactured products such as those occurring in time of war.

From 1916 to 1920, and during the past few months, marked changes in the character of products of manufacturing industrics needed to meet military requirements have largely determined the character of plant expansion. From 1916 to 1920, surprisingly little change occurred in the total physical volume of manu-
facturing production. In those years, however, and again since last June, our requirements for the production of military airplanes, powder, guns, shells, and ships increased at a striking rate over the immediately preceding period.

On figure 6 are shown indexes of the new manufacturing capital expenditures for plant and equipment, the physical volume of manufacturing production, and the net profits, after all taxes, of manufacturing concerns having net earnings. There is general agreement, as logically would be expected, between the fluctuations in additions to manufacturing facilities and those in the physical volume of the manufacturing production. The movement in capital expenditures also appears to be quite similar to that in the net profits of manufacturing concerns having net earnings in a given period. This similarity does not mean that the concerns which are more profitable are necessarily the ones which are responsible for capital expenditures. A concern that is not relatively as profitable as its leading competitor
may add to or improve its facilities in order that it may compete more effectively.
The precise nature of the relationship between manufacturing capital expenditures and net profits is not well defined and cannot be determined using time series of aggregate data such as are shown in figure 6. Nevertheless, it is interesting to observe that there is a closer similarity in the movements of the two series during the past 18 years than between total manufacturing capital expenditures and any other related factor for which data are available. The sharp rise in additions to capital facilities during the last half of 1940 is an exception to this general observation because of the fact that possibly as much as 20 pereent of the expansion of facilities in this period, both publicly and privately owned, is required for defense-production purposes. At present this percentage is considerably higher.

It may also be observed that careful study indicates that changes in interestrates and in factory building costs over the past 25 years did not bear any simple or direct

Figure 6.-Indexes of Value of New Manufacturing Capital Expenditures for Plant and Equipment, Physical Volume of Manufacturing Production, and Net Profits (After All Taxes) of Manufacturing Concerns, by Quarters, 1915-40.

Note.-New manufacturing plant and equipment expenditures based upon table 1. Physical volume of manufacturing production from 1919 to 1940 , Board of Governors of the Federal Reserve System and from 1915 to 1918, "The Output of Manufacturing Industries," National Bureau of Econornic Research (Fabricant). Net profits of manufacturing concerns (after all taxes) derived by the U. S. Bureau of Foreign and Domestic Commerce from data compiled by the U. S. Bureau of Internal Revenue and the Federal Reserve Bank of New York. Estimates are based upon data showing the aggregate profits of concerns having net earnings. The estirnated net profits. include allowances for the trend in the relative contribution of corporate and unincorporated concerns and allowances for major breaks in the statistics of corporate incomes including the change from consolidated to unconsolidated returns in 1934.
relation to the movement of total capital expenditures for manufacturing purposes. In fact, quarterly time series for capital expenditures are positively correlated with similar series for interest rates and building costs. ${ }^{5}$ However, fluctuations in interest rates and building costs, particularly those that are sharp and abrupt, undoubtedly have substantial effects upon projected expenditures for plant expansion by individual concerns. As indicated above, economic analysis of manufacturing capital expenditures must be sought principally in terms of individual industries and enterprises rather than in terms of broad general movements for manufacturing as a whole.

## Productive Facilities for the National Defense

The total expenditures upon manufacturing facilities financed directly by the Federal Government under the present defense program are much larger than similar expenditures during the first World War. As has been indicated the expenditures for these purposes by the Army, the Navy, the Emergency Fleet Corporation and other Government agencies appear to have been approximately $\$ 500$ million during the fiscal years 1917 to 1919 , inclusive. ${ }^{6}$ Since June 1940 , the funds which have been made available for investment in productive facilities by the various agencies of the Federal Government total approximately $\$ 1,900$ million. This amount includes funds provided in specific appropriations to the Army, the Navy, and the Maritime Commission plus actual contracts which have been entered into by the Reconstruction Finance Corporation and the Defense Plant Corporation. In view of the large expansion possible in the allocation of the resources of these corporations for productive facilities under existing law, the total amounts which eventually may be allocated by them for manufacturing plant and equipment cannot be determined. Also, the enactment of appropriations now pending before the Congress including those to implement the Lease-Lend Act, very likely will add several hundred million dollars to the funds now available for investment in plant facilities by the Federal Government.

Of the total indicated above $\$ 1,574$ million were

[^3]under contract or letter of intent on March 1, 1941. Approximately two-thirds of these contracted expenditures are for facilities which are financed entirely, and presumably will be owned permanently by the Federal Government. The remainder are for facilities for which the various agencies of the Federal Government assume an obligation to pay their entire cost because of their immediate need for defense purposes, but which also are considered to be of possible commercial value later in fabricating goods for civilian use. The contracts for the construction of these plants contain an option for the purchase by the private operating agency of any equity which the Government may have in such a facility at the termination of the contract between the agency and the Federal Government.

A small part, possibly not more than 10 percent, of the total indicated as having been placed under contract represents actual purchases of machinery or construction of plants during the calendar year 1940. Also some of the contracts may not be fully executed during the present year. By far the largest part of these totals, however, represent expenditures to be made for plant and equipment during 1941.

In addition to these projects financed by the Federal Government a large number of plants have been built and financed entirely by private concerns for national defense purposes. Under the Second Revenue Act of 1940 concerns constructing facilities which are considered by the appropriate authorities to be necessary in the national defense may be permitted to depreciate them over a period of five years in the calculation of their taxable income. The Office of Production Management reports that "certificates of necessity" have been issued up to March 1, 1941, for the construction of plants which will cost $\$ 393$ million. It also reports that the British Government since June 1, 1940, has undertaken to finance the expansion of productive facilities in the United States at a cost of $\$ 171$ million.

The smooth working of a society dependent upon intricate and highly specialized industrial facilities requires not only great technical skill but also careful economic preparation for the introduction of such facilities many months in advance of their actual use. This fact is now realized in its relation to the present defense program. It is equally pertinent to the adjustment which appears likely to follow the curtailment of defense production and merits the most careful consideration by private and governmental agencies concerned with such problems.

## Description of Estimates of Manufacturing Capital Expenditures

## Equipment Expenditures.

The estimates of equipment expenditures include such items of specialized industrial machinery as leather-working, metal-working, rubber-working, textile, and similar machinery, and general-purpose equipment such as electric motors, steam, Diesel, and other prime movers, cranes, trueks, office fixtures, business machines and other movable equipment.
These estimates are based upon the value of production reported in every Census year from 1914 to 1939 for each of approximately 65 major groups of industrial machinery and related equipment used for manufacturing purposes. Prior to 1923, data are available for a somewhat smaller number of industrial-machinery products. A comparable series for all of the Census years during the entire period from 1914 to 1939 was secured by making allowazces derived for the few unreported items from a careful examination of the Census statistics for each machinery product in every Census year.
Nore than half of the industrial-machinery products for which biennial Census data are avalable (such as textile, shoe, rubber-working, and flour-mill machinery) are used eutirely in particular industries. Production of such special-purpose machinery constitutes approximately 60 percent of the total industrial machinery estimated to have been used for manufacturing capital purposes. A number of other capital equipment items, such, for example, as "steam engines and turbines (excluding marine)" and "electric motors, 1 horsepower and over (not including railway and automotive)," are used largely but not entirely for manufacturing purposes. The proportion of these products that was estimated to have been used for manufacturing capital yurposes was based on data obtained from trade associations and technical specialists in the various machinery industries.
For 1923 and subsequent years, quarterly estimates of industrial-machiucry production were interpolated between the data for Census years by using a quarterly index of pay rolls of industrial-machinery manufacturers derived from data compiled by the Bureau of Labor Statistics. This index of pay rolls was based upon the following five series: Electrical machinery; engines, turbines, etc.; machine tools; textile machinery: and foundry and machine-shop industries-weighted from yuar to year according to the proportion which the industrial-machinery production of these industries was of the totals of all industrial-machinery production in that year. The pay-roll index used from 1919 to 1922, inelusive, is that for all machinery iudustries (not tincluding transportation equipment) compiled by the Federal Reserve Board. (Federal Reserve Bulletin, Decenber 1923.)
Estimates for intercensual years between 1914 and 1919 were derived by using anuual reports from 5 States-Massachusetts, New York, New Jersey, Pennsylvania, and Missouri. The industrial-machinery products reported for these 5 States comprised approximately 40 percent of the United States totals for these products for the year 1919. The quarterly movement from 1914 to 1919, which approximates a straight line, is based upon an index of machinery-manufacturing pay rolls for New York State. In all cases throughout the entire period, the movement iu the quarterly series was adjusted to equal the movement in the production of industrial machinery between Ceusus years.
Deductions for exports were made from the quarterly estimates of the production of industrial machinery for manufacturing-capital purposes. These deductions were based upon a detailed compilation of the exports of commodities as nearly identical as possible with those used in deriviug the production data from Census statistics. Before applying the correction for exports, a reduction of 10 percent was nade in the deelared export value of industrial maehinery to allow for export erating and railroad transportation to the point of export.
An attempt was also inade to correct for changes in inventories from 1930 to date. Prior to 1930. data were not available for making a similar correction. This correction was small, with the exception of that during 1932 when shipments of industrial machinery were estimated to have been 7 percent more than its production (which was extremely low that year). In other years the correction, plus or minus, for inventory changes was less than 3 percent.

The net production of designated types of industrial machiuery at factory prices remaining for domestic consumption was next adjusted for the differences between Sactory cost and the cost to the industrial purchaser. Adjustments were also made at this point for durable products that are used by manufacturing concerns but for which no precise allocation could be made of the proportion of the total product that was devoted to manufacturing-capital purposes. These adjustments include the following additions: (a) For distribution, transportation, and installation costs17 percent; (b) for equipment used in the plant in which it was manufactured but which was not reported as a Census product-7 percent; (c) for other manufacturingcapital items, such as measuring instruments, mechanical power transmission equipment, industrial locomotives, power shovels, and brewery equipment, but for which complete detailed tabulations were not a a ailable in any but the most recent years13 percent. This last figure was derived from a detailed study of items of this charaeter for which specifie data are available in the 1937 Census of Manufactures. Thus, industrial-machinery production at factory prices was increased by a total of 37 percent to secure eapital expenditures by the industrial user. To this were added all imports of industrial machinery, with appropriate allowances for duty, transportation costs, insurance, and import commission. The resulting figure is an estimate of total capital expenditures for manufacturing equipment at the prices paid by the industrial user.

## Plant Expenditures.

The estimates of plant expenditures include such items as buildings (together with elevators, heating, plumbing, and similar accessory equipment), blast furnaces, docks, boilers, pipe, stills, tanks and vats, and similar fixed structures.

Factory building construction is approximately four-fifths of the total estimated plant expenditures in most years. The principal basis for the factory building activity estimates are the reports of contract awards which the F. W. Dodge Corporation have compiled for 37 Eastern States in 1925 and subsequent years, 36 States in 1923 and 1924, and 27 States in earlicr years. Allowances for the Pacific Coast and Roeky Mountain States not covered in any year by the Dodge reports, and for the Southeastern States not covered in the carlier years, were made through use of Engineering News-Record statistics of contracts awarded, together with data upon the relative rate of additions to facilitics such as cotton spindles, woolen and worsted looms, petroleum refinery capacity, and other measures that are available for the country as a whole.
In order to estimate factory building construction in the textile and petroleum refining industries in Southeastern and South Central States in earlier years (not covered by the Dodge Corporation's reports), a special examination was made of gross changes in their production facilities. From this examination, ratios were obtained of the relative expansion in the Southern States and in the Dodge reporting area. These ratios were used to estimate the volume of factory building contracts for the industries under question located in the South. Particular attention to the textile and petroleum refining industries was necessary, since they experienced a marked expansion in the Southern area during this period.
Estimates of factory building in the Western States over the period from 1919 to 1940 were based upon the industrial building contracts reported by the Engincering News-Reeord. The statisties for industrial building contracts compiled by that publication included electrie light and power buildings, railroad buildings, and some other structures not built by manufacturing concerns. Consequently a special tabulation of the contracts awarded in the Western States in each of 12 manufacturing industries, showing the largest projects separately, was made for this period. These special tabulations yielded data which were used to calculate quarterly estimates of factory building in the Western States.
A detailed examination of factory building projects of different industries in various States for selected years, using all available sources of information, indicated that the Dodge Corporation statistics include roughly 70 percent of all factory building construction in the areas covered by these reports. This percentage was consequently applied to the estimated contract totals for the United States in order to secure an cstimate of total factory building construction upon which work was started in a given period.
The data in table 1 are designed to measure, both for plant and equipment, the value of the capital facilities that are actually being fabricated for manufacturing capital purposes during the period indicated. An examination of the time period required for the construction of various types of factory buildings indicated that contracts could be translated into current activity for a given time period by use of a moving average consisting of two-thirds the contracts awarded in the previous quarter and one-third of the contracts in the given quarter. This final adjustment gave the estimates of dollar value of factory building construction activity in the Uuited States for each quarter during the period from 1915 to 1940.
Estimates of plant construction other than buildings were derived by allocating to manufaeturing capital certain percentages of the value of products reported by the Bureau of the Census, of such items as tanks, vats, pipe, industrial boilers, and similar plant facilities used in manulacturing plants. These estimates were determined in the same manner as those of machinery production, with similar allowances for exports and imports and for distribution, transportation, and installation costs. The estimates of plant expenditures shown in tahle 1, then, include both the measures of building construction and the measures of plant construction other than buildings.
Many collateral examinations were made in the calculation of these estimates to test their reliability and consistency with other measures. Also, each series was examined carefully and an attempt made to eliminate all fluctuations in the basic data, not representative of the country as a whole, and to correct for any changes in the coverage of a series from time to time.

Nevertheless, estimates such as these, which are built up from many primary sources rarying in coverage and quality and which in their calculation involve personal judgment, are subject to error and should be so recognized.
Consequently, persons who may care to make use of these estimates are advised not to attach too great significance to small fuctuations in the serics. In earlier years the fluctuations from quarter to quarter in total capital expenditures inay difler from those that actually oceurred by possibly 15 percent. Since 1923, it is believed that these fluctuations are likely to be in error cousiderably less than that amount.
The absolute magnitude of this series depends in an important degree upon allowances for mark-up for equipinent above factory prices and for installation and transportation costs, and allowances for under-reporting used in compiling the factory construction activity estimates. A preliminary examination of the statistics on plant and equipment expenditures of manufacturing eoncerns in a number of industries reporting to the Bureau of the Census in 1939 suggests that the data shown in table 1 may not differ greatly from the actual expenditures for manufacturing capital purposes in that year. Nevertheless, the estimates presented ahove should be regarded as preliminary and will be revised if nccessary as soon as the census enumeration for 1939 has been completed.

## NEW OR REVISED SERIES

Table 9.-STEEL PRODUGTION, INGOTS AND STEEL FOR GASTINGS ${ }^{1}$

1 Revised series. Steel production has been revised by the American Iron and Sieel Insfitute to include in addition to the ingot production by the open hearth and bessemer processes formerly shown, electric ingots and steel for castings (except steel for castings produced in foundries operated by conpanies which do not produce ingots). Monthly figures, which are not available from all companies, are calculated to 100 -percent production on the hasis of the ratios between the annual production of the reporting companies and the total production of all companies. In the latest vear, before the total annual production of all companies becomes available, the monthly figures of the reporting companies are calculated to 100 -percent production according to the ratio applicd in the preceding year; they are later revised when the final total production for the year is available. Data for 1940 are based on reports by companies which in 1939 made 98 porcent of the open hearth, 100 percent of the bessemer, and 78 percent of the electric ingots
and steel for castings produeed by the industry. The percentages were the same for companies reporting in 1941 cxeppt that they accounted for 84 percent of the electric ingots and steel for castings produced in 1939. Data heginning January 1940 are subject to revision when 1940 totals are available.
Percent of capacity shown here is the ratio of average weckly protuction in a given month to average weekly capacity calculated on annual capacity as of the end of the preceding year (with the exeeption of July-December 1937 which are based on the July 1,1937 , capacity, no allowance being made for Sundays or holidays. The percent of capacity shown in the 1940 Supplement and in monthly issues of the survey through F buruary 1941 was based on daily average production and capacity with allowance for
 $1934,78,440,080 ; 1935,78,152,450 ; 1936,78,136,524$ (July 1, 1937, $78,464,124$ ); 1937, $80,176,028 ; 1938,81,823$, 644 ; 1939, $81,614,142 ;$ and 1940, 84,148,350 (used in computing percentage of capacity for 1941 shown on p. 49 of this issue).

[^4]Table 11.-ESTIMATES OF NONAGRICULTURAL EMPLOYMENT ${ }^{1}$

# Table 11.-ESTIMATES OF NONAGRICULTURAL EMPLOYMENT--Continued 

[Thousands of employees]

1 New series. Compiled by the U. S. Department of Labor, Burean of Labor Statistics. Data represent the estimated number of persons working at any time during the tisties and to other Government ageneies, as well as employers monthly reports in connection with ancmployment compensation and quarterly reports in connection with "old age and survivor's insurance." The data have been adjusted to conform to the figures shown by the 1930 Census of Occupations for the number of nonagricultural gainful workers less the number shown to have been unemployed for one weck or more at the time of the Ccnsus. Jotal nonagricultural employment shows the estimated total number of persons engaged in gainful work in the United States in nonagricultural industries, including proprietors and firm members, selfemployed persons, casual workers and domestic servants. The series on employees in nonagricultural estainlishments is limited to cmployees only and does not inelnde self-employed persons, domestic ser vants. casual workers, persons employed on W.P.A. and N. Y. A. projects. or cmrollees in C. C. C. camps. Data for the nilitary and naval forces, which are evcluded from the other employment estimates, include persons inducted into the Federal service by Act of Congress, as well as the regular military and naval forces.

## Monthly Business Statistics

The data here are a continuation of the statistics published in the 1940 Supplement to the Surver of Current Business. That volume contains monthly data for the years 1936 to 1939 , and monthly averages for carlier years back to 1913 insofar as a vailable; it also provides a description of each series and references to sources of monthly figures prior to 1936 . Series added or revised since publication of the 1940 Supplement are indicated by an asterisk (*) and a dagger ( $\dagger$ ), respectively, the accompanying footnote indicating where historical data and a descriptive note may be found. The terms "unadjusted" and "adjusted" used to designate index numbers refer to adjustment of monthly figures for seasonal variations.

Data subsequent to January for selected series will be found in the Weekly Supplement to the Survey.

| Monthly statistics through December 1939, together with explanatory notes and references to the sources of the data, may be found in the 1940 Supplement to the Survey | 1941 | 1940 |  |  |  |  |  |  |  |  |  |  |  |

-Revised. $\quad$ Preliminary. $\ddagger$ Designation changed from "quit" as separations such as deaths, permanent disabilitics, retirements on pensions, ete., are included.
§Data are a weekly average of the number receiving benefits, based on an average of the weeks of unemployment compensated during weeks ended within the month.
I Compilation of separate figures for private placements shown in previous issues of the Survey through February 1941, has been discontinued by the reporting source.
$\dagger$ Revised series. Telephone and telegraph employment indexes revised beginning 1932, other indicated employment series heginning 1929; see table 19 , p . 17 of the April 1940 Survey; subsequent revisions in indexes for street railways and busses heginning 1932, superseding those shown in the April Survey, appear in table 27, , 17 of the May 1940 issue. For revisions in pay-roll indexes for all manufacturing and durable goods for 1938 and 1939, see table 12 , p , 18 of this issuc. For revisions in tllinois and Chicago indexes, sce note marked with a " $\dagger$ " on D. 29 of the January 1941 Survey. Index for Wisconsin revised beginning 1925 ; data not shown on p. 26 of the February 1941 Survey
will appear in an carly issuc.

| Monthly statistics through December 1939, together with explanatory notes and references to the sources of the data, may be found in the 1940 Supplement to the Survey | 1941 | 1940 |  |  |  |  |  |  |  |  |  |  |  |

${ }^{r}$ lievised. ${ }^{*}$ Preliminary. Deffit. Number of companies varies slightly. at shown separately. © djusted to preliminary 1940 annual estimate of the U . S. Mint in cooperation with the Bureau of Mines debentures of certain agencies f. A merger during the scoond quarter of 1940 reduced the number of corporations in the miscellaneous group to 54 and the total to 167. $\otimes$ Excludes collections from national defense taxes under Revenue Act of 1940.
Data reported by the Canadian Government have been substituted beginning 1940 for data previously reported directly by producers to the American Bureau of Metal Statistics, as the later data have been temporarily discontinued. Annual totals from the 2 sources have been in fainly close agreement but the monthly movement in the
past has been quite different.
rent reports are available at the time of compilation, the last reported figure is carricd forward. The comparability of the data has been affected by these substitutions. flievised series. Data on total expenditures and transfers to trust accounts revised beginning 1937, and on income taxes beginning September, 1936 ; see table 50 , p. 18 of the November 1940 Survey.

| Monthly statistics through December 1939，to－ gether with explanatory notes and references to the sources of the data．may be found in the 1940 Supplement to the Survey | 1941 | 1940 |  |  |  |  |  |  |  |  |  |  |  |

rRevised. o'Includes consumption in reporting company plants. $\ddagger$ Excludes consumption in reporting company plants.
$\dagger$ Revised series. Data on manufactured gas revised beginning January 1938 and natural gas beginning January 1937; see tables 24 and 25 , pp. 16 and 17 of the May 1940 Survey. Electric power sales and revenues from sales will be revised beginning 1937. At present, revised data comparable with the 1940 figures shown above are available
nly y or January to November 1939

- For monthly data beginning January 1920 corresponding to averages shown on p. 97 of the 1940 Supplement, see table 58, pp. 17 and 18 of the December 1940 Survey.

## * Revised.

*New series. Data on wholesale price of fuel oil beginning January 1918 appear in table 46, p. 14 of the November 1940 Survey. Data beginning 1920 for the new series on retail service-station price of gasoline, which replaces a similar series previously shown, appear in table 10 , $p$. 16 of this issue.
$\dagger$ Exports of motor fuel revised; for data beginning January 1913, see table 54, p. 16 of the December 1940 Survey. Date beginning January 1941 include mineral spirits. The comparability of the series is effected to a very slight extent, mineral spirits representing less than one percent of the total exports. For revised series on wholesale tank wagon (N. Y.), price of gasoline, see table 6, p. 18 of the January 1941 Survey.
$\ddagger$ Revised data for 1939 appear on table 1, p. 17 of the January 1941 Survey.

| Monthly statistics through December 1939, together with explanatory notes and references to the sources of the data, may be found in the 1940 Supplement to the Survey | 1941 | 1940 |  |  |  |  |  |  |  |  |  |  |  |

## METALS AND MANUFACTURES-Continued

T Revised. ${ }^{1}$ Quarterly data; monthly reports initiated April 1940. - Data are for 6 manufacturers beginning January 1940 .
$\pm$ Monthly data begimning 1929, correspondine to the inonthly averages on p. 132 of the 1940 Supplement, appear on p. 18 of the April 1940 Survey.
$\dagger$ Revised series. Steel products, production for sale, have been converted to a short tonnage basis; see table 45 , p. 14 of the November 1940 issue. Steel production and percent of capacity revised completely; see table 9, p. 16 , of this issue. Porcelain enameled products revised beginning 1939 to include data for 99 manufacturers; 1939 data percent of capacity revised completely; see table 9, p. 16, of this issue. Porcelain enameled products revisca beginning 1939 to include data or

$r$ Revised.
I Discontinued by reporting source.
$\dagger$ Revised series. For revised data for fine and wrapping papers beginning 1934, see table 43, pp. 12 and 13 , of the November 1940 Survey.
$\ddagger$ For monthly data beginning 1913 corresponding to the monthly averages on p .148 of the 1940 Supplement, see table 28 , p . 18 , of the May 1940 Survey.
or In recent months, the number of companies reporting has fluctuated to such an extent that tonnage figures are not comparable from month to month.
earlier data from this source have been in close agreement with data compiled by the Bureau of Foreicnand Domestic Commerce shown in previous issues of the Simitec;

| Monthly statistics through December 1939, together with explanatory notes and references to the sources of the data, may be found in the 1940 Supplement to the Survey | 1941 | 1940 |  |  |  |  |  |  |  |  |  |  |  |

: Temporarily discontinued by reporting source.
§Desigation changed from "commercial licensed" or "ciri" aircraft" (1944) Supplement).
§Designation changed frem "commercial licensed" or "ciri" aircraft" (194) Supplement).
$\ddagger$ Includes straight electric types only (trolley or third-rail and storage battery); data for 1939 and earlier years, published in the Survey, include some units of only partial
United states manufacture and are not comparable with data here shown.
*New series. Comparable data on total shipments are qvailable only beginning January 1940. "Other" includes Diesel-electric, Diesel-mechanical, and gasoline or steam
Incomotives; data for 1939, the earliest available, are as follows: first quarter, 21; second, 20; third, 26; fourth, 52 . These are largely industrial.

| Monthly statistics through December 1939, together with explanatory notes and references to the sources of the data, may be found in the 1940 Supplement to the Survey | 1941 | 1940 |  |  |  |  |  |  |  |  |  |  |  |

## ${ }^{1}$ TViscontinued by reporting source.

$\sigma^{2}$ Prior to 1940, the Canadian foreign trade year ended in Narch and the period for closing returns for this month was extended beyond the normal period in an attempt to include wind-up items in the figures, naking March figures high and April figures low. This practice was discontinued in 1940 . when a foreign trade year coinciding with the calendar year was adopted; therefore, March 1940 trade figures show a considerable artificial re luction and April figures a considerable artificial increase as compared with previous years. The business indexes to which this note is appended are similarly affected since exports and imports of certain connoodities are component factors.
tData on life-insurance sales revised beginning September 1936 . For revisions, see p. 56 of the September 1440 Survey. Indexes of cost of living and stock prices revised and computed on a $1935-39$ base; earlier 1 evised data will be shown in a subsequent issue. Revisions of new bond issues for 1939 are as follows (in thousands of dollars! i A prit,

# International Reference Service 

U. S. DEPARTMENT OF COMNERCE, JESSE H. JONES, Secretary BUREAU OF FOREIGN AND DOMESTIC COMMERCE, CARROLL L. WILSON, Director

# This loose-leaf reference service contains data on economic and commercial conditions in foreign countries, data that have a permanent or semipermanent value, as exemplified by the annual reviews issued by the Bureau for a number of years. All reports are issued in $81 / 2$ - by 11 inch size, printed on substantial white paper, two columns, and punched for a standard 3-ring binder. 

## THE SERVICE [NCLUDES:

Surveys of foreign market areas, Appraisai of transportation problems, Foreign industrial development data, Analyses of international shifts of capital, Foreign trade reports, Basic data relating to ocean and foreign land shipping, Basic export and import data, Monetary, financial, and budgetary developments in foreign countries, Analyses of foreign commercial laws affecting the interests of Americans, Studies of foreign tariff changes including information on quotas, documentation, restrictions, and regulation, and much other material of equal value.

## RECENT REIEASES <br> VOLUME I

No. 1. Marketing Areas in Brazil, 5 cents.
No. 2. Preparing Shipments to Colombia, 5 cents.
No. 3. Bankruptcy Law in Australia, 5 cents.
No. 4. Education for the U.S.S. R.'s New Trained Labor Reserve, 5 cents.
No. 5. Preparing Shipments to Venezuela, 5 cents.

No. 6. Impact of the War Upon the Trade Policies of Foreign Countries, 5 cents.

No. 7. Trade of the U. S. S. R. With the United States in 1940, 5 cents.

No. 8. Eritish Financial Agreements With Foreign Countries, 5 cents.

NOTE: Although most businessmen will wish to subscribe th the whole service, thes receiving all reports as rapidly as they are issued, arrongements hove been mada to make available single copies of individual reports. These single copies will be available through the Superinitendent of Documents and the Bureau's offices at varying prices, such prices depending upon the number of pages in the individual report. Announcement of the availability of the single copies will ke made in Foreign Commerce Weekly.

The International Reference Service may be obicined from the Superintendent of Documents at the Government Printing Office, Washington, D. C., or through any office of the Bureau of Foreign and Domestic Commerce listed at right. The annual subscription price is $\$ 6$ per year, in advance, and full remittance should accompany all orders.

[^0]:    ${ }^{1}$ The material in this issue includes a new series of quarterly estimates of capital expenditures of manufacturing concerns for plant and equipment from 1915 to 1940 and a discussion of the principal influences related to such expenditures. A discussiom of capital expenditures in individual industries and geographic regions will appear in a subsequent issuc. Dorothy S . Coleman assisted greatly in the statistical research and direction of the calculations involved in the preparation of these estimates.
    2 These comparisons of capital expenditures over a number of years should be contrasted with the growth in population and output of manufactured products over the same period. Between 1915 and 1940, population in the continental United States increased slightly more than 32 percent, while the tread of manufacturing output rose at approximately twice this rate.

[^1]:    ${ }^{3}$ The separate classifications of plant and equipment are similar to those used in the enumeration of such expenditures recently made by the Bureau of the Census for all active manufacturing establishments in 1939. When tabulated, this enumeration will provide the first direct measure of such expenditures by manufacturing concerns in the United States.
    ${ }^{4}$ Annual estimates of the production of all types of durabic goods for producers and consumers for 1919 and subsequent years have been made by George Terborgh (Federal Reserve Bulletin, September 1939 and February 1941) and by Simon Kuznets (Commodity Flow and Capital Formation). However, separate estimates for manufacturing capital expenditures apart from those for mining and other industries have not been compiled by them. Using sample data secured from manufacturers responsible for 1.3 percent of the total manufacturers' sales in 1936, Dun and Bradstreet Incorporated have estimated that the total expenditures for improverments and enlargements by manufacturing concerns were $\$ 1.5$ billion in 1936 and $\$ 1.8$ billion in ${ }^{\circ}$ 1937 (Dun's Review, July 1938).

[^2]:    Source: Compiled by U.S. Bureau of Foreign and Domestic Commerce. See description of estimates at end of this article.

[^3]:    ${ }^{5}$ Fluctuations in interest rates and building costs exercise a greater influence on outlays for types of improvements and construction such as houses and office buildings in which the capital cost is a large part of the total cost of ownership and operation.
    ${ }^{6}$ Many of the facilities required to meet our war nceds were constructed and substantially written off out of the profits of the business for the Allies prior to the cntrance of the United States into the War in April 1917. See "The Costs of the World War to the American Pcople," by John Maurice Clark.

[^4]:    ${ }^{1}$ Reported by the American Petroleum Institute, as compiled by the Texas Co. The prices are simple averages of service-station prices for regular-grade gasoline, exclusice
     The prices for the lst of the month are shown here as of the end of the preceding month. This series replaces 1 he one previously published, eompiled by the Oil and Gas Journal, for which monthly data were available only every 6 months
