# Economic Highlights 

## Local Transit at Peak

The Nation's local transit system, devoted largely to carrying people to and from their places of work, has made a contribution of the greatest significance to the war production program. The demand for intensive utilizatiton of manpower required that vastly increased numbers of people be transported. At the same time less and less dependence could be placed upon the privately owned passenger automobile.

The result was that in 1943 local transit systems carried 22 billion passengers, an all-time record number. This peak load represented a 22 percent increase above 1942 and a 71 percent rise above 1939.

Restriction upon use of passenger cars and the location of many new war plants on the outskirts of cities have placed a heavy burden on local passenger carriers. The average number of rides per civilian nonagricultural employee jumped 50 percent from about 350 in 1941 to 525 in 1943.

While some of this increase was due to the increase in employment and in the number of working days, a curtailed use of passenger automobiles in commuting to work has been the most important factor.

The most significant development within the industry has been the phenomenal rise in the use of busses. (See chart.) These carriers handled 16 percent of the passenger load in 1929. Since that time they have steadily increased their share and by 1943 accounted for over 46 percent of the traffic. Indeed, by 1942, the motor busses and trolley coaches together carried more passengers than street cars. There appears littie likelihood that this trend will be reversed.

An examination of the 1939 and 1943 distribution of passengers among the various types of carrying equipment clearly reflects several trends in our war economy. The volume of business of elec-trically-operated railways and trolley

Retail Prices of Electricity and Coal.

The Weekly Supplement to the Survey of Current Business is prepared as a service to readers of the Survey to make available selected statistical series which are prepared on a weekly basis and to present in advance of publication in the Survey such monthly series as are of sufficient general interest as to justify publication as quickly as possible after release.

Included in the Weekly Supplement are such series as income payments, industrial production, cost of living, prices, employment, pay rolls and wages. All series carried are published in monthly form in the Survey.

The Weekly Supplement, formerly issued as a printed leaflet, is now being processed in identical form and is available to Survey readers upon written request which should be made to the Publications Unit, Bureau of Foreign and Domestic Commerce.
busses which carried 70 percent of all local transit passengers in 1939, declined to 59 percent in 1943 . This indicates that the increase in war employment and activity was relatively greater in less densely populated areas.

Rapid transit systems experienced a loss in the proportion of total passengers carried in this period, their share declining from 18 to 12 percent. Since New York City predominates in this form of local transit passenger traffic, the decline in the share of rapid transit traffic may be interpreted as illustrative of that city's failure to participate fully in the war boom.

## Coal and Electric Power Prices

An index is an average of prices of a composite group of selected commodities. As such the price movements of the individual items included are obscured. The fact that some prices may have gone down disappears in a general upward trend.

The Bureau of Labor Statistics combined index of prices of fuel, electricity. and ice has increased steadily since 1940. Examination of the components of the index reveals that the increase is due almost entirely to the increase in coal prices.

The chart calls attention to the fact that prices of retail domestic power have continued during the war period the consistent reduction of prices which had prevailed before. The electric power price series used is based on monthly consumption of 100 kilowatt-hours which is believed to be most generally representative. Prices are collected quarterly by the Bureau of Labor Statistics for 51 cities.

The chart illustrates clearly the effect of wage increases upon prices in an industry such as coal mining where labor costs are a large proportion of total costs. In contrast, though wages have increased in the electric power industry, that. industry has been able to absorb them by reason of the fact that labor costs are a relatively smaller part of its production costs and because economies in per unit costs have followed from operations approaching close to capacity. The trend of electric power prices is the more interesting in that coal is a major raw material in its manufacture. Increases in coal prices must necessarily exert an upward pressure on production costs.

## The Business Situation

THE major tasks of 1943 were those of completing the planning, organizing, and building of the Nation's production plant to the character required by the war program and of bringing that plant to peak production activity.

The tasks of 1944 are likewise twofold: (1) maintaining the production activity of the war plant at highest levels required by military needs, and (2) preparing for the adjustments in our economic structure that will be required when the needs for vast quantities of war materials decline. At the close of the first two months of 1944 , it can be said that progress is being made in both respects though the experience has not been such as to justify national selfsatisfaction.

Industrial production continued at high wartime levels, displaying in the aggregate some tendency to stabilize short of the peaks reached in October and November 1943. Production in February as reflected by the Federal Reserve seasonally adjusted index was maintained near the January levels of 242 $(1935-39=100)$. This compares with a figure of 241 for December. The wartime high of 247 was achieved in October and November.

Iron and steel production increased significantly in the first two months from the December level when the index stood at 200 . The outlook for continued near capacity operation in the iron and steel industries appears bright for the near future. The decline in steel production in December was one important factor in the decline of the over-all production index. Offsetting the gain in the steel index, however, was the extension of the declines in the important war producing industries, such as machinery, transportation and chemicals, the latter industry having experienced a downward trend since the peak was reached in August.

## Chart 1.-Production of Nondurable Manufactures

The movement of munitions production dominated the trend of business activity and present schedules suggest the levels to be expected in future months. Production of munitions climbed each month in 1943, though only very slightly from November to December.

Output in January 1944, however, was below the previous month if by only a small percentage. Though a similar decline occurred in January 1943 as compared with December 1942 there was at that time no question that higher levels

## Chart 2.-Production of Durable Manufactures

ratio scale

Source: Roand of (awornors of the Frederal Reserve system.
would be reached. Hence, the decline may be viewed as possessing greater significance.

Aircraft production, measured in terms of airframe-weight, reached its highest and most satisfactory levels since the beginning of the war program. In January it was up 6 percent above the previous month. The output of landing craft-No. 1 item in the munitions program-increased by 20 percent. Communication and electric equipment production advanced by 4 percent. An important factor in the decline in total munitions production was the drop of 7 percent in ship construction, a decline reflecting program rescheduling in large part.
Another program which fell short of schedule because of production difficulties was that of heavy trucks. Important categories within the munitions group which declined in the month in accordance with reduced schedules included gun and fire control equipment, ammunition and certain types of vehicles.

The decline in munitions production in January 1944 as compared with December 1943, while not unexpected, was still somewhat greater than was anticipated and did not recover as a result of the slight reaction in February. Clearly, the lower level of the first two months of 1944 is not to be interpreted as forecasting a new trend based on changes in over-all production requirements, since production must actually be increased if announced schedules are to be met. Schedule changes in the munitions programs were largely responsible. Also important was the decline in hours worked and in employment while reports have been numerous of heavy absenteeism due to illness. Also worthy of note are premature evidences of cutback jitters which have resulted in tendencies for employees to seek jobs in industries which appear to offer more attractive post-war prospects than some of the war industries.

Among the developments of the month relating to the problems of industrial demobilization by far the most important were two reports accompanied by recommendations regarding the termination of war contracts and the sale of Government-owned surplus materials, equipment and properties. The policies enunciated in the report to Congress by the George-Murray groups and in the Baruch-Hancock report to the President were basically similar. For the most part, they differed only on matters of administration.

Some of the Baruch-Hancock recommendations have been acted upon by means of Presidential Executive order. Government policy on certain phases of the demobilization problems have thus been crystallized, subject to such changes as Congress may determine.

Among the more important recommendations made by the George-Murray and the Baruch-Hancock reports are: (1) coordination between government agencies in mapping contract terminations before they occur, (2) assistance to business to speed reconversion and reemployment as soon as possible after contracts are terminated thru assuring prompt payment of settlement claims, and extension of $T$ and VT loans. (3) removal of Government-owned materials not purchased by the contractor. (4) continuation of commodity price and material controls, (5) disposition at a fair price of surplus materials without either undue delay or glutting the market in selling them, (6) reduction of taxes from war to peacetime levels as quickly as possible, (7) preparation of a backlog of public works plans to be ready if needed to provide employment. Throughout the reports stress is laid upon the primacy of the requirements of the war program.

The Baruch-Hancock report recommends that the Joint Contract Termination Bjard, which now operates within
the six major procurement agencies, be reorganized as a general supervisory and coordinating body within the Office of War Mobilization. This Board, plus the Surplus War Property Administration and the staff of the Retraining and Reemployment Director, are the only new organizations recommended since existing agencies, among them the War Production Board, will perform most of the operating tasks as logical extensions of their wartime functions.

The experience of the first two months of the year suggests strongly that public optimism regarding the early conclusion of the war has had an unfavorable influence upon war production. A further deterrent upon our all-out war effort appears to be a confusion between the planning and the effectuation stages of postwar demobilization.

Preparing for post-war adjustments must continue to be carried on and progress has been satisfactory so far. However, it is apparent that the true role of post-war planning at this time must continue to be stressed. Such plans cannot be permitted to serve as obstacles in gaining the economy's present paramount objective: quickest achievement of the maximum goals of the war program.

Though the anti-inflation front continues to hold, largely as the result of successful administrative devices, the pressures against it continue unabated. Most serious of these pressures at the present time is the demand of organized labor for higher wage rates. Spearhead of labor's campaign is the demand of the steelworkers before the National War Labor Board for a 17-cent per hour increase.

Wage increases approved by the Na tional War Labor Board since the establishment of the stabilization program have resulted in very few upward adjustments of commodity prices. Nearcapacity operations are no doubt largely responsible in many cases for the ability of industry to absorb increased labor costs. It is very doubtful, however, that industry can absorb any large addition to its labor costs such as would follow from further increases in general wage rates.

Thus, general increases in wage rates would have a doubly adverse effect upon price levels. Present OPA ceilings would be broken in numerous cases because of the advance in costs. Larger spendable incomes in the hands of consumers which would follow from higher wage rates, would, on the other hand, increase effective market demand. With no immediate prospect of a larger volume of production of consumer goods, even greater pressure upon prices and pricecontrol machinery would consequently follow.

## The Wartime Workweek

Under the pressure of wartime demands upon the Nation's increasingly stringent supply of manpower available for the production of manufactured commodities, the average number of hours worked per week has increased
consistently since the middle of 1940 . Though there have been minor interruptions, the trend in the length of the workweek has been consistently upward since that date until the second quarter of 1943.

For all manufacturing industries, hours worked per week have increased from an annual average of 37.7 in 1939 to 38.1 in $1940,40.6$ in 1941, 42.9 in 1942 , and 44.9 in 1943.

In the second quarter of 1943 the manufacturing workweek reached a level at which it has since been maintained, the slight variation month to month ranging from a low of 44.4 to a high of 45.5 hours. The wartime high of 45.5 was reached in November 1943 and was followed by a decline to 44.9 in December a workweek which represents the approximate average level for the year.

Wide differences in the length of the workweek continue to persist as between industries and industry groups. Industries producing durable goods averaged a workweek of 46.6 hours in 1943 which compares with the 42.5 -hour week in the nondurable goods group.

## Chart 3.—Average Hours Worked Per Week in Manufacturing Industries

Source: [. S. Itepartment of Labor.
Among the durable group the machine tool industry since the beginning of the war program has maintained the longest average workweek. The experience of the industry illustrates the fact that the tooling-up period in the war effort is approaching completion inasmuch as the length of the workweek in the industry has been declining slowly since the middle of 1942 and was in the last quarter of 1943 very slightly higher than in the last quarter of 1940 .

Hours in transportation equipment were maintained virtually at the 1942 levels, declining very slightly from 47.6 to 47.1. All other durable goods industries maintained or increased hours in 1943 over 1942.

The nondurable industries divide clearly into two groups; those which are generally scheduling a 48-hour workweek for the bulk of their employees and as a consequence experience an average effective workweek exceeding 44 hours, and those which appear to be maintain-
ing a 40-hour scheduled workweek. The first group includes petroleum and coal products, paper, chemicals, rubber and food products. Hours in these industries increased during 1943 more rapidly than was the case among the durable goods classification although a trend toward levelling off was evident in the last quarter.

The hours worked per week in the second group of nondurable industries averaged significantly fewer and indicated a much smaller increase during the year. Included beside tobacco, printing and publishing, are the very large clothing groups-the textile mill, apparel and other finished textile, and the leather and leather products industries.

It is apparent from the average hours worked in these industries that most firms are continuing to schedule a 40hour workweek in their operations. In view of the shortage of manpower and the tight supply situation in the textile fields, generally, the explanation for the relatively short workweek in these industries appears to be employer resistance to the payment of penalty overtime for hours beyond 40 per week.

On February 9, 1943, the President by Executive order empowered the Chairman of the War Manpower Commission with authority to establish a wartime workweek of scheduled 48 hours in such areas or industries as he might determine. The order was initially applied to those labor market areas designated as group I areas, areas of critical labor shortages of which there were at the time 35.

The order has since been slowly extended. As of March 30, 1944, the 43hour scheduled workweek will be mandatory in 135 of the labor market areas classified by the War Manpower Commission, including beside group I, numerous areas designated as group II and a few listed in group III. The list of areas covered includes 18 of the 30 cities in the nation reporting populations in 1940 exceeding 300,000 . Among the important cities to which the order has not been applied are New York Philadelphia, St. Louis, Pittsburgh, and New Orleans.

Marked unevenness in the application of the order is apparently a result of the fact that the powers granted by the Executive order have been delegated to the War Manpower Commission Regional Directors. More than two-thirds of the labor market areas to which the 48-hour workweek has been applied are located in the states of Wisconsin, Illinois, Indiana, Ohio, and Michigan.

Beside application to designated areas, the order can be applied also to industries and initial application was made to the lumber industry and the mining and smelting of nonferrous metals. Extension of the order since has been largely on an area basis, the only addition to the two industries mentioned being steel to which the order was applied effective as of August 1, 1943.

It is a difficult matter to measure the effect of the 48 -hour order upon the industries to which it has been applied. In the case of lumber, hours averaged 41.9 per week in February 1943 and 42.8 in December, after the order had been in effect 8 months. The small change in average weekly hours is not indicative of noncompliance but largely of the difficulty of securing a 48-hour week in woods work where bad weather inevitably interrupts efforts to secure realization of a fully scheduled workweek.

In lumber mills the shortage of log inventories and the inadequate supplies coming from the woods have likewise prevented realization of scheduled 48-hour weeks.

In the case of the steel industry the increase in hours following the application of the order was also slight since the workweek increased from 46.4 in June to 46.6 in December with a high of 47.1 in November.

In these industries the order had the effect of significantly reducing the unfilled labor requirements of the industry, stabilizing employment and equalizing competitive conditions.

Adoption of a 48 -hour workweek by an industry adequately supplied with manpower working a 40 -hour scheduled workweek would tend to release manpower for transfer to industries suffering from shortages. This objective has apparently not been sought in the application of the order. Rather, it appears that the 48 -hour week has been required only after a worker shortage has developed to a degree that an increase in the workweek will merely reduce unfilled labor requirements. Though instances of the release of workers as a result of the area-wide adoption of the order have occurred, the total number of workers made available in this way for employment elsewhere has doubtless been very small.

## Food Rationing Experience

On March 1, the Nation had acquired a year of experience with consumer rationing of food supplies. The mass and variety of operating problems encountered have been such as to rank this program among the most difficult of wartime commodity apportionment operations, illustrated by the issuance of $128,760,419$ copies of War Ration Book Four up to February 24.

Nevertheless, rationing has been carried out with exceptional smoothness. The principal task has proven to be that of shifting the pattern of consumption from scarce to more plentiful items rather than a net reduction of food consumption.

The experience of the program in substituting ration points in the place of money as a controlling medium of exchange and distribution for certain foods is among the more interesting phases of the Nation's wartime economy.

Food rationing involves the evaluation of the relationship of available supplies to all sources of demand, commodity by
commodity. This process of allocating the supply begins with submission by the various claimant agencies of their com-modity-by-commodity estimates of requirements. It ends when these requirements have been reconciled with the expected supply of each commodity involved.

Needless to say, the allocations can be only as firm as the supply estimates are correct. In the aggregate, the allocations for 1944 apportion 75 percent of the total food supply to United States civilians, $13^{1 / 2}$ percent to United States armed forces, 4 percent to Great Britain, $3^{1 / 2}$ percent to Russia, and 4 percent to all other exports and special purposes such as supplying Liberated Areas and maintenance of contingency reserves.

Allocations for 1944 provide an adequate diet for civilians but leave to the rationing machinery the problem of assuring equitable distribution of scarce foods and of shifting the consumption pattern so as to substitute more plentiful for the scarcer foods.

The only important changes in civilian food supplies from 1943 to 1944 will be slight reductions in red meats and dairy products, and probably in canned fruits also unless the 1944 crops are exceptionally good. Compared to average 193539 per capita consumption, civilians will have in 1944 roughly one-fourth less butter, cheese, mutton, and dried fruits; onethird less canned fruits and fruit juices; one-half less apples and canned fish and from 10 to 20 percent less evaporated milk, vegetable shortening and cocoa beans.

To compensate for these shortages, however, per capita civilian supplies of allocated foods in 1944 will be greater than average 1935-39 consumption by 14 to 17 percent for pork, eggs and coffee; 25 percent for citrus fruits; 37 percent for canned vegetables, and more than 200 percent for dry edible peas.

Supplies of frozen vegetables will be 158 million pounds or 28 million more than in 1943. There will be much larger supplies of certain unallocated items such as peanuts and soybeans. as well as the substantial production expected from home gardens.

Another aspect of the rationing task is the statistical controls required to keep the ration price and volume of ration currency for each commodity in line with the supply available for civilians. They must be devised so that supplies will move through distribution channels in a manner satisfactory to producers, processors, retailers, industrial, institutional, and civilian consumers without an overwhelming amount of statistical reporting and other paper work.

To maintain the necessary information on the stocks and movements of all supplies involved in OPA's 13 rationing programs, a central inventory and control unit tabulates, audits, and analyzes reports received from local boards, field offices and industry. The food mailing list compiled by this unit includes more than 500,000 names of processors, wholesalers. retailers, and industrial consumers.

Numerous sample surveys are made to
determine the effects of different ration point values, and the relative adequacy of supplies in the various geographic areas. Monthly adjustments in ration point values, and the issuance of special ration credits to distributors and industrial users for crop moving purposes, are made partly on the basis of these surveys.

An example of these adjustments in point values occurred when larger farm marketing of hogs in the last quarter of 1943 permitted lowering the point values of pork enough to induce consumers to buy about 23 percent more than in the rrevious quarter.

More than a million "ration bank accounts" are maintained by food distributors in nearly 15,000 commercial banks. The OPA requires all large and medium size distributors to use these bank accounts, and OPA pays the banks for rendering the service. Payments are made in accordance with a schedule of uniform charges developed by OPA in collaboration with the American Bankers Association. Into these accounts flow about 44 billion food ration stamps per year, deposited by distributors who receive them from food purchasers and write checks against their ration deposits in replenishing their stocks from suppliers.

These stamps are usually weighed rather than counted. Vulcanized fiber tokens are now being introduced to serve as "small change ration currency", thus permitting assignment of higher values to ration stamps. They will reduce the number to be handled by 60 percent, and decrease the labor required to sort them by denomination. It is estimated that the token plan will stretch the life of War Ration Book Four through 1945, and cut stamp handling time in the trade by 80 percent.

An analogous improvement in largedenomination ration currency used only at trade or institutional levels was the introduction of ration coupons in value denominations ranging up to 1,000 points. These are to be substituted for the point certificates formerly issued to the trade when additional ration points had to be created.

Practically all ration currency, deposits, checks, and so on, are now negotiable and do not expire at trade levels if initially deposited within specified time limits after they expire for consumers. But negotiability at consumer levels is restricted to tokens and intrafamily stamps, and expiration dates must be observed for all consumer ration currency except tokens and shoe stamps.

Persistent upturns in consumer purchases of rationed articles just before the expiration dates of stamps is causing observers to explore the idea of lengthening the validity period of some stamps, or perhaps making them valid for an indefinite period as is now the case with shoes. The aim, of course, would be to either reduce aggregate purchases of rationed goods, or ascertain the amount by which the individual ration allowance could be raised.

Perhaps the most surprising aspect of food rationing is its small cost to OPA. Data on the food programs alone are not available, but for all 13 consumer ration
programs only 64 million dollars was spent in the fiscal year ending June 30, 1943. This is only about 50 cents per capita, less than 4 cents per ration program per civilian.

## Passenger Transportation

Passenger transportation in 1943 again reached unprecendented heights but towards the close of the year a tendency to level off was apparent. The Commerce index of passenger transportation, which includes air, rail, bus and local transit, rose 47 percent in 1942 as compared with 1941. Although there was evidence that this rate of increase was slackening off somewhat during the latter part of 1943 , the rise of 39 percent in the index in 1943 from 1942 was nevertheless almost as great as the gain made over the two years preceding 1943.

Exclusive of local transit passenger transportation, which in 1943 increased about one-fifth from 1942 (see the Economic Highlight in this Survey), the record is even more remarkable. The index of intercity passenger-miles increased 51 percent in 1943 over 1942 , reaching in 1943 the peak level of 357 ( $1935-39=100$ ) .
The data as analyzed above and as displayed in chart 4 clearly indicate that the increase in intercity passenger-miles has been leveling off in the recent period. Thus, the increase in December 1943 over December a year ago was only 26 percent as compared with the 51 percent increase for the full year and a 78 percent increase in the first quarter of 1943 over the first quarter of 1942.

This leveling off is to be expected as the economy reaches maximum production and as the Armed Services effectuate the declared policy of transferring personnel from continental United States to bases nearer the actual theaters of war.

The year 1944 will see a continuance of this trend. The Office of Defense Transportation is expecting an increase of 15 percent over 1943 in rail passen-ger-miles and an increase of less than 15 percent in intercity bus passenger-miles.

Passenger-miles by air in 1944 should differ little from those for 1943 unless the Army makes additional equipment available. On this basis an over-all increase of from 10 percent to 15 percent in the Commerce intercity passenger traffic index seems likely in 1944.

A comparison of intercity passenger travel by rail and by bus, as measured by revenue passenger miles, indicates that rail travel has increased much more rapidly than travel by bus. From 1941 to 1943 intercity bus passenger-miles rose by 96 percent, compared with a concurrent increase of 200 percent in intercity rail travel.

These unequal rates of increase resulted from the effect of wartime conditions upon the average length of journey per passenger, the length of journey for rail travelers showing a striking increase while the average length of journey by bus suffered a decline. These changes in comparative length of journeys are reflected in the figures for number of revenue passengers carried. The number carried by rail showing an increase of 128 percent and by bus, 156 percent.

In contrast to the large gains in passenger travel by rail and by bus, the domestic airlines showed a loss of 15 percent in passengers carried between 1941 and 1943. When consideration is given to the loss of approximately 50 percent in flying equipment in May 1942, as a result of Army action, this modest decline in traffic represents a remarkable achievement.

More intensive hourly utilization of each airplane, combined with much larged load factors has been responsible for the excellent level of performance.

Chart 4.-Intercity Passenger Traffic ${ }^{3}$

${ }^{1}$ Indexes are based mpon passenger-miles.
Source: L.S. Iepartment of Commerce.

During 1943 the airlines more than regained the ground lost in 1942, measured in terms of passenger-miles performed.

The impact of war has affected differently the various carriers of passengers. In general, shortages of manpower and equipment have been the principal factors necessitating adjustments since United States participation in World War II.

The shortage of manpower has been met principally by overtime, employment of women and high school students, and to a limited extent by draft deferments. The consequences of shortages of equipment have ranged from overcrowding, as in rail and bus operations, to the physical curtailment of service as in the case of air carriers.

The increase of 128 percent in passengers carried by rail since 1941 , and the 200 percent increase in rail passengermiles in the same period has severely taxed the rail carriers, particularly in certain areas. Since the promulgation of WPB Limitation Order 97a on April 4, 1942, fewer than 270 new passenger cars have been delivered to class I railroads, all of these being cars under construction on the date the order was issued.

This can be compared with an average of 385 new passenger cars delivered annually in the 5 -year period prior to 1942. Despite this freeze in the production of new cars the total number of serviceable passenger cars has remained about constant, the decrease in total cars being roughiy compensated by a decrease in the percent of cars classed as unserviceable.

Intercity bus operators have fared somewhat better than rail passenger carriers in the receipt of new equipment. In 1942, 3,800 new units were delivered to intercity bus carriers, as compared with an average of only 2,200 during the preceding 5 years. In 1943 no new units were authorized by the War Production Board. For 1944, however, 1,880 are now scheduled with delivery of most of these quite likely.

Thus, the entire fleet of intercity busses, estimated by the National Association of Motor Bus Operators at 21.480, has been steadily increasing throughout the war period though by no means as rapidly as the demands made upon the fleet by the traveling public.

The acute shortage of equipment on the airlines is being slowly but steadily relieved. By degrees the air carriers are getting back from the Army a part of their commandeered fleet. Correspondingly they are extending their daily scheduled mileage.

The immediate future, depending as it does upon the release of more planes or new production, is most uncertain. But the index of air passenger transportation will probably rise in direct ratio to expansion of the domestic air fleet. In June 1943 alone, according to the 1943 Annual Report of the Civil Aeronautics Board "nearly 28,000 passengers and more than a million pounds of mail and a like volume of express" were displaced by higher priority traffic.

## Farm Real Estate Situation

Farm real estate values moved upward at a rapid pace last year. In the twelve months ending November 1, 1943, farm land prices rose 13 percent, an increase greater than that which occurred in the 44 months from March 1939 to November 1942.

The average rise of more than 1 percent a month represented a rate of increase greater than that which took place in any of the farm years (March to March) from 1914 to 1918, and was surpassed only during the 1919-20 period of high inflation, when the Department of Agriculture's index rose from 169 to 205.

The Pacific States region was in the vanguard of the general advance of farm values in 1943 with a jump of 18 percent over 1942. On the other side of the Nation, land prices in the East South Central section were also moving ahead of the national average with a 15 percent rise. Lagging far behind towards the end of 1943, New England farms were selling at prices but 6 percent above November 1942 levels, about 4 percentage points lower than for any of the other: major geographical regions.

For the entire interval which roughly covers the period of the world conflictfrom March 1939 to November 1943the East South Central, Mountain, and Pacific divisions showed the greatest relative increase in farm estate prices. with advances varying from 32 to 35 percent, in contrast to an average change of +25 percent for the Nation as a whole.

Instances of upward pressure on farm land values are even more striking for local areas than for the larger geographical regions.

During the farm year of 1942-43 purchases at "boom" prices occurred in Imperial County, Calif. ; in the winter wheat areas of western Kansas, western Nebraska and eastern Colorado; in the western corn belt and the central parts of Kansas and Nebraska; and in the better grade land areas of the South, particularly the Missisisippi Delta and the citrus and truck crop sections of Florida.

Considerably increased activity in the farm real estate market has been coupled with rising land values in 1943. Preliminary estimates for the first three quarters of this last year indicate that the volume of voluntary farm sales and trades is at a level about 75 percent above such transfers in the corresponding period of 1942.

If this increased rate of activity continued throughout the winter of 1943-44, the volume of voluntary transters for the farm year 1943-44 would be significantly in excess of even the record total during the boom year of 1919-20.

This more active market appears to have been general throughout the country. The increase is all the more impressive when it is recalled that it is superimposed on a volume of transfers which had been steadily growing since 1939. In the year ending March 15, 1943. voluntary sales and trades amounted to 44.4 per 1,000 farms, 6 percent higher than in the preceding year, and 50 per-

Map 1.-Percentage Change in Estimated Average Value Per Acre of Farm Real Estate, November 1943 from 1935-39 Average

source: V. S. Bepartment of Igriculture.
cent in excess of voluntary changes in ownership in 1939.

The latest year for which complete information is available on the regional distribution of the volume of voluntary transfers is the farm year 1942-43. In that year the Mountain States region, which experienced only a slow increase in activity from 1939-42, led all major geographic regions with a 20 percent rise in the frequency of voluntary sales. The actual number of transfers per 1,000 farms rose from 32.7 in 1941-42 to 39.3 for the year ending March 1943.

In all other sections, however, with the exception of the East South Central and Pacific regions, where the frequency of transfers rose 14 percent and 11 percent respectively, the increase in activity was below that of the nation as a whole.
If the entire war interval is taken into account, voluntary sales and trades in the West North Central region exhibited the strongest upward trend. In the 4 years ending March 1, 1943, the number of farms voluntarily changing hands rose 90 percent from 27.8 to 52.9 per 1,000 farms. While North Dakota, with a frequency of voluntary transfers in 1943 about 300 percent above the 1939 level, was most prominent in this respect, substantial increases of over 100 percent were also recorded in Nebraska, South Dakota, and Kansas.

Wisconsin in the hay and dairying region and Maryland in the South Atlantic division also experienced farm real estate activity in 1943 which was more than double the level of four years before.

Analysis of the character of purchasers and sellers invoived in the increasingly heavy turnover of farm lands reveals for the nation as a whole no startling changes in 1943 as compared
with preceding war years. It appears that the proportion of 1943 buyers who are farmers underwent little change or increased but slightly in all but the North Central region.
In this section. however. a Department of Agriculture survey indicated that tarmers were but 55 percent of all buyers in the third quarter of 1943 in contrast to the 63 percent proportion in the corresponding period of 1942 . This 63 percent ratio was about the level applicable to the whole country in 1942-43.

In recent years, the volume of sales by active farmers has grown in importance relative to the total. Dealers cooperating with the Department of Agriculture reported active farmers as sellers in about 38 percent of the voluntary sales in 1942-43 as compared with the 32 percent reported in the previous year. This change for the most part reflects reduced selling by former creditors. Financial institutions have by now disposed of the bulk of their real estate investments acquired through mortgage foreclosure or assignment.

Though the overall national picture did not indicate any great recent inflix of nonfarmer speculators into the farm real estate market in 1942-43 as compared with preceding war years, land market developments in local areas do appear to have attracted "outside" interests. In many instances a boom psychology seems definitely at hand. Likewise if the proportion of total sales represented by resales of property recently purchased was in the early part of 1943 still comparatively low, such resales had increased materially over the preceding year.

All-cash purchases of farm lands have increased slightly in recent months in both relative and absolute importance.

Cash payments in full represented 55 percent of all voluntary sales in the third quarter of 1943 as compared with 53 percent in the sccond quarter and 45 percent in the first quarter of the year.

It appears moreover that even where mortgage financing was involved, the average down payment continued to rise in 1943. In cases where data are available this represented 42 percent of the total consideration in the third quarter of 1943 in contrast to 35 percent in 1942.

In spite of the larger down payments being made, indications are that the average size of farm mortgage loans used to finance purchases is increasing. This is a result of the considerably higher values placed on the farm real estate transferred.

While farm transfers on the whole appear to continue to be conservatively financed, signs of less conservative trends are evident in local areas. A Department of Agriculture Survey found, for instance, that in a sample of new mortgage lending in the North Central region, 62 percent of these mortgages were made for five years or less, while the general average term was seven years. Fifty-three percent of these mortgages had no amortization feature, and only 15 percent provided for full amortization.

For the country as a whole new mortgage recordings in 1943 were materially in excess of the levels in recent years. After rising from a 729 million dollar total for all lenders in 1939 to 834 million in 1941, mortgage recordings fell to 763 million in 1942. In the first three quarters of 1943, however, new mortgage lending amounted to 683 million dollars, 15 percent above the corresponding 1942 total.

If fourth quarter 1943 lending was above the level for the same period of 1942, the volume of new mortgage loans would be materially above the 1941 total, the high point for this type of loan activity in the last 8 years.

An analysis of new mortgage loans by type of lender reveals the steadily growing role played by individuals. The amount lent by this group was 31 percent of all mortgage lending in 1939, 33 percent in 1942 , and 37 percent for the first 9 months of 1943. Commercial banks lending also represented a slightly greater relative share of the total in the past year.

Since a large portion of new mortgages recorded are simply renewals and refinancing of existing mortgages, the significance of these recordings lies principally in the fact that they are a measure of the volume of new credit currently available to mortgagors. These recordings do not reflect the trends in the level of mortgage debt outstanding.

Full data on the outstanding level of farm mortgage debt in 1943 are not yet available. Whether the downward trend in evidence since the late twenties continued throughout 1943 depends almost entirely on the trend of holdings by individual lenders since the major institutional lenders, with the exception of the Farm Credit Administration, continued to reduce their holdings in 1943.

This result was achieved in spite of the high level of new loans made and
was, therefore, primarily the result of large scale repayment of existing loans. Some idea of the influence and trends of this liquidation of debt may be derived by examination of the relevant credit data for the farm land banks and the Land Bank Commissioner.

The combined holdings of mortgages by these agencies at the beginning of 1943 amounted to 2,115 million dollars, or 33 percent of the total then outstanding, These institutions reported a net reduction of outstanding farm mortgage loans of 350 million dollars in 1943, as compared with a reduction of 250 million dollars in 1942.

While new mortgage lending by these agencies rose approximately 9 million from 1942 to 1943 . liquidation of existing loans was much heavier, amounting to 443 million dollars in 1943 , 115 million more than in 1942. The 1943 liquidation of credit extended by these agencies was the highest on record.
Interest rates on new mortgage loans remained on relatively easy terms in 1943, as Congress ruled that the reduced rates of $3 \frac{1}{2}$ percent for most land bank and Land Bank Commissioner loans and 4 percent for direct borrowing should continue until July 1944.

The presence and extent of inflationary developments in the present farm real estate situation can be gauged in the last analysis only in the light of the current and prospective farm income trends. It is however instructive, particularly as an aid in acquiring perspective, to compare the trend of farm values in this and the previous World War.
In the years prior to World War I, there existed a slightly more pronounced buoyancy in farm land prices than in the comparable years before World War II. The period $1935-39$ has been characterized as one of the most stable periods in the history of the United States farming and in farm real estate.

It is also to be noted that land values were materially higher before the start

## Chart 5.-Estimated Average Value Per Acre of Farm Real Estate ${ }^{1}$

${ }^{1}$ Includes all farm land with intirovements. Souree: I. S. Department of Agrienture.
of the first World War. The Department of Agriculture's index, based on $1935-39$ values was 124 in 1914 as compared with 101 in 1939.

During the four years ending March 1, 1918, farm real estate values rose 25 percent to 155 , while for the four years ending March 1, 1943 the rise approximated 18 percent.

There is a remarkable correspondence of over-all movements from year to year within the two periods. In 1914-15 and in 1939-40, land values showed little or no tendency to rise. However, in the second year of both war periods, values in World War I rose 5 percent while price expansion in the second World War was less than 1 percent.

In the last two years of each war advances were much more substantial and at an increasing rate. In 1916-17, and 1917-18, real estate prices jumped 8 percent and 10 percent respectively. The 1941-42 and 1942-43 rises were 7 percent and 9 percent respectively.

The force behind the upward movement in both cases was the rapid expansion of farm incomes resulting from favorable production, demand and pricecost relations. A major difference in the two periods lies in the fact that whereas land prices advanced at a somewhat more rapid pace in 1914-18, farm incomes in that period expanded at a materially lower rate than in 1939-43.

If the years immediately prior to the two wars be used as bases (1912-14 in World War I and 1937-39 in World War II) the percentage increase in cash farm income per acre amounted to 70 percent in the first period as compared with an expansion of 86 percent in the second.

It would be far better to compare land incomes with values in the two periods. Attempts to calculate such incomes are so beset with thorny theoretical and practical problems that only very rough estimates of land rents are possible. The evidence derived from even these rough measures is apparently conclusive that in the present world conflict, land values have responded much more slowly to changes in land income than in the first World War.

The major influences affecting the trend of agricultural land values are generally well understood. As was stated above and as the February Survey of Current Business indicated, production and price trends have been, generally speaking, quite favorable to farmers. Under the stimulus of war demands, farm marketings are at record levels, and the relation of prices received to prices paid has continued to be advantageous to farmers.

Analysis and evaluation of present levels and trends in farm land values are much more intricate. However, some general comments are possible.
(1) If one is inclined to regard the values of farm lands during the period before the last war as representative of normal, present land values in the nation as a whole will not appear to be out of line.

But it must be pointed out that so many changes in production, technology, demand, and prices have occurred in the
(Continued on p. 20)

# Trends in the Business Population 

By Howard R. Bowen, Business Structure Unit

TTHE number of business firms operating in the United States has declined since 1941 by more than half a million. This represents a reduction of about one-sixth in total number of enterprises.

Also since 1941, partly as a result of this decline in number and partly because of the great expansion of heavy industry incident to the war, the proportion of the American economy in the hands of small business has diminished significantly. The fear has frequently been expressed that these wartime shifts in the structure of American business may outlast the war-that they may result in a permanent impairment of small business.
In interpreting the future significance of these recent developments, it is useful to examine long-term trends and tendencies. In this way, the effects of immediate and perhaps transitory changes are placed in perspective with reference to the more fundamental and enduring causal factors.

Analysis of long-term trends in the business population strongly suggests that small business will be able to recover, at least in part, from wartime reverses. In the long view, small business appears to be a persistent and hardy American institution. Although the several million small independent enterprises constitute perhaps less than a major part of the economy, yet they have shown clear evidence of sustained vitality.
During the entire period 1900-1941, except for temporary setbacks, the increase in number of business firms was more rapid than the growth of population. In the nine years immediately preceding the war, the rate of growth in number of business enterprises was greater than in any period since 1900 , and at the outbreak of the war the number of firms per capita was probably at an all-time high. In the same period, small business was maintaining-or even slightly strengthening-its relative position in the economy.
It is against the background of such facts that the future of small business must be appraised. The purpose of this article is to present a broad view of both recent and long-term trends in the business population in order to place recent changes in perspective.

An attempt is made, so far as available facts permit, to answer two questions with reference to the past several decades: (1) Has the small business sector of the economy been declining in relative importance? (2) Have the opportunities for individual private enterprise been narrowing?

Data will be presented on trends in (a) the number of operating business firms, (b) the size distribution of the business population, and (c) the industrial composition of the business population.

This article is one of a series of publications on the business population The Department of Commerce has recently undertaken to compile comprehensive statistics on the subject.

It is planned to release quarterly data on number of operating firms. number of new businesses established. number of new businesses established. with detailed classifications by kind of business. by size, and. to some extent, by geographic area.

The detailed statistics covering the period 1939 through 1943 will be published in an early issue of the Surver of Current Business. and data for subsequent pertods will appear at intervals thereafter.
The reader is referred to three prior studies: Small Retailers Face the War, Senate special Committee to Study Problems of American Small Business Print No. 13, pp. 39-53: Small Retail Store Mortality, Bulletin No. 22, Economic Series. Bureau of Foreign and Domestic Commerce; "Business Discontinuances. 1940-1942," Survey of Current Business. November 1943, pp. 1520.

Trends in Total Number of Firms.
An indication of long-term trends in the over-all position of small businessand of trends in extent of opportunities for individual enterprise-is provided by data on changes in the total number of operating business firms. It should be noted that these data refer to firms-not establishments.
In table 1, several statistical series covering various periods between 1900 and 1943 are presented indicating trends in number of business firms or in number of persons in the entrepreneurial class. In chart 1, these data are presented as indexes $(1929=100)$.
For purposes of comparison, an index of total human population is also shown in chart 1.

Though the several series of data vary considerably in scope and, perhaps, in degree of accuracy, certain general conclusions may be derived from them.

During the period from 1900 to 1929. the total number of firms apparently increased more rapidly than the total human population. During the recession period of 1929-33, the number of firms declined sharply.

Subsequently, during the long recovery period, the number increased steadily until a new peak was reached in 1941. Following 1941, the number of firms again declined abruptly.
The principal question which remains, and it is perhaps the most crucial of all, is whether the number of firms in the period immediately preceding the war was as large, relative to the population, as before 1929. That the ratio between number of firms and the human population was higher in 1939-41 than at any time before 1929 is indicated in three of the series presented: proprietors-mana-gers-officials, corporate and partnership
income tax returns, and the estimated total number of firms.

The Dun and Bradstreet series, on the other hand, shows that the ratio between firms and population was markedly less in the immediate pre-war period than at any time before 1929. This discrepancy is easily explained. The great increase in number of firms during the period 1933 to 1941 occurred largely as a result of the sharp increase in number of filling stations, eating and drinking places, truckers, and service concerns. These are the very lines of business for which Dun and Bradstreet coverage is relatively restricted.

It may reasonably be inferred, therefore, that the ratio between number of firms and total population was perhaps as great at the outbreak of World War II as at any other time since 1900. This suggests, at least in terms of numbers,

Table 1.-Number of Business Firms, as Indicated by Various Data, I nited Stales, 1900-43

Preliminary extimates based on data deived from Burean of the Census, Bureau of Internal Revenut varions state governmental agencies, trade associations and other sources. The estimates refer to firms- no establishments. Wherever the basic data used were presented on an establishment basis, adjustmenis were made to convert them to a firm basis: Excludes farms and professional firms.

Sontres: Sere Trble 1, pates.
that the opportunities for individual enterprise had not declined perceptibly during the 40 years preceding the warexcept during the great depression-and that the entrepreneurial class was at least as numerous in 1941, relatively, as in 1900, 1920, or 1929.

This is a very significant conclusion from the point of view of appraising the post-war future of individual enterprise. In interpreting this conclusion, the fact must be considered that the relative number of independent farmers has decreased during the same period and the number of independent professional men increased.

It is apparent from table 1 and chart 1 that the number of firms has declined precipitously since Pearl Harbor. The number of firms operating in 1943 represented about 14.0 percent less than the number in 1939 or 16.5 percent less than the number in the peak year of 1941. This decline in the business population was the result of a sharp increase in business discontinuances combined with a rapid reduction in the rate of entry of new firms.
Business discontinuances occurred at a very high rate during the latter part of 1941 and all of 1942 . In the same period, the rate of business entries steadily diminished. During the first half of 1943 , however, the discontinuance rate declined sharply and the entry rate leveled off. By the latter half of 1943, the business population had approximately stabilized, with the rates of entry and discontinuance about equal. There is even some evidence that the number of firms has recently been increasing slightly.

The wartime decline in number of firms has given rise to the view that thousands of firms have been forced out of business. In fact, the decline can be explained oniy in part by the increase in number of business discontinuances. A $573606-44-\quad 2$
substantial part of it must be ascribed to the decline in number of business births. Moreover, it is probably not justifiable to assume, because of the wartime increase in discontinuances, that firms are being forced out of business in unusual numbers.
Many recent business deaths have been mere suspensions with definite plans for resumption after the war. Other businesses have been closed by their owners, who have found alternative opportunities more attractive or have been called into the armed forces. Indeed, the number of business failures has declined, during the war, to a new all-time low.'

## Trends in Business Size

In order to determine whether the relative position of small business has been growing or declining, it is necessary to show trends not only in number of firms but also in the size distribution of these firms. It is entirely possible for the number of firms to be growing and at the same time for the relative proportion of the economy in control of small firms to be decreasing. In fact,

[^0]as will be shown in this section, that is generally what has been happening in the United States over the past several decades-especially in the period before 1929.

Information on trends in size structure is limited. Such data as are available are subject to weaknesses. Nevertheless, by drawing on a variety of sources, it is possible to construct a reasonably adequate picture of the distribution of firms by size, covering a fairly long period.

The most useful available statistics are those derived from the corporate tax returns as reported by the Bureau of Internal Revenue for the years 1918-39. These data are obviously limited in scope, since they exclude unincorporated firms. ${ }^{2}$ This limitation can partially be overcome, however, by making separate comparisons of the corporate and noncorporate sectors of the economy.

The Bureau of Internal Revenue has tabulated corporate returns by industry and size of corporation for each year, 1918-39. For the period from 1918 to 1930, the size classification is based on net income, and for subsequent years on assets. However, an unbroken series with size measured in terms of net income is available for all industries combined for the entire period 1918-39.

For the purposes of this study, the corporate size data for each year were converted to cumulative percentage distributions. On the basis of these distributions the percentage of total assets and percentage of net income attributable to each of the following three groups of corporations were computed: the smallest 75 percent of all corporations, the next 20 percent, ${ }^{3}$ and the largest 5 percent.

Figures are presented for all industries combined and, where possible, for

[^1]all industries excluding the finance group, and for manufacturing. The data, presented in tables 2,3 , and 4 , and in chart 2. clearly reveal that the proportion of corporate net income earned by the smaller corporations declined steadily and rapidly during the period from 1918 to 1932.

Calling attention to this trend, Gardiner C. Means wrote in 1930:
"* * * the large corporations are already so important and are so rapidly increasing in importance that if this growth continues at its present rate. most of the industrial wealth and activity of the country will soon be in the hands of a few huge units." "

However, this rapid decline in the relative position of small corporations was apparently arrested in 1932. Between 1932 and 1939 , the share of the smallest 75 percent of the corporations in total corporate income varied without a pronounced trend either upward or downward. The share of the next larger 20 percent, however, increased slightly so that the percentage assignable to the largest 5 percent decreased somewhat.

The proportion of corporate assets held by the smaller corporations declined perceptibly during the period 1931-39. However, when the finance group is excluded no significant trend in the proportion of assets belonging to the smaller companies is observable. It
${ }^{4}$ The exclusion of the finance group, which comprises banks, investment compawhich insurance companies, holding companies, insurance companies, hoding compa nies, real estate firms, etc., was designed to
avoid duplication of assets and income arising from the fact that such concerns are large owners of companies in other industries.
${ }^{5}$ These conclusions may be compared with those of Gardiner C. Means, who combined data on the assets of the 200 largest nonfinancial corporations and all nonfinancial corporations for the period 1909-29. According to his estimates, the annual rate of growth of the assets of the 200 largest and of all nonfinancial corporations was as follows:

Mr. Means also estimated the percentage relation between net income of the 200 largest and all nonfinancial corporations as follows:

| year | Percent | Year | Percent |
| :---: | :---: | :---: | :---: |
| 1920 | - 33.4 | 1925 | 37. |
| 1921 | - 37.6 | 1926. | 40. |
| 1922 | 32.2 | 1927 | 38. |
| 1923 | - 32.8 | 1928 | 40. |
| 1924 | 36.0 | 19 | - 43.2 |

See A. A. Berle, Jr., and G. C. Means, The Modern Corporation and Private Property, 1932, pp. 36-7. A later study revealed the following relationship between the assets of the 200 largest and of all nonfinancial corporations:

| year | Percent | Year | Percent |
| :---: | :---: | :---: | :---: |
| 1929 | - 49.4 | 1932 | - 55.5 |
| 1930 | --54.0 | 1933 | -57.0 |
| 1931. | 57.0 |  |  |

See National Resources Planning Board, Structure of the American Economy, p. 107.
" "The Growth in Relative Importance of the Large Corporation in American Economic Life," American Economic Review, March 1931, pp. 10-11.
may reasonably be concluded, on the basis of available corporate data, that the relative position of the smaller corporations was not materially weakened during the period 1932-39.

These conclusions refer. of course, only to the corporate sector of the economy. They reveal nothing about the progress of unincorporated business. The question remains as to whether the entire corporate group, representing chiefly the relatively large firms, gained or lost in importance as compared with the numerous group of unincorporated firms, consisting chiefly of very small businesses.

Unfortunately, the comparison is made difficult by the paucity of data on the latter group and by the tendency-especially prior to 1930 -for an increasing proportion of businesses to assume the corporate form. An examination of available information indicates, however, that the corporate sector of the economy rapidly increased in relative importance during the period prior to 1929 . It has maintained a relatively constant position since that time.
${ }^{7}$ The Bureau of the Census compiles separate data for corporate and noncorporate establishments in manufacturing, wholesale trade, and retail trade.

For manufacturing, the data are available over a long period, but for wholesale and retail trade they are available only for the period 1929-39. Moreover, because of changes in census classifications and coverage, the data are not strictly comparable through time. According to these statistics, the proportion of total value of manufactures produced in corporate establishments was 88 percent in 1919, 92 percent in 1929 , and 93 percent in 1939.

For wholesale trade, the percent of sales accounted for by corporate establishments was 73 in 1929 and 74 in 1939. and for retail trade the corresponding percentage was 47 in both 1929 and 1939.

These conclusions agree with those derived from the analysis of corporate statistics, namely, that the relative position of smaller firms was declining during the period prior to the Great Depression but that this downward trend was thereafter halted.

Another approach to the determination of trends in the relative position of small business involves an analysis of census data relating to size of establishments. These figures cover both corporate and noncorporate business, but are reported on the basis of establishments rather than firms.

Table 5 , derived from these figures, shows the proportion of wage earners or sales in large and small establishments i in manufacturing, wholesale trade, and retail trade) for various years, 1914-39.

In manufacturing, the relative importance of the large plants increased significantly between 1914 and 1929 , but decreased between 1929 and 1939.

In wholesale and retail trade the proportion of sales accounted for by the largest 5 percent of stores increased between 1929 and 1939, but at the expense of the next largest 20 percent. The proportion of sales in the hands of the smallest 75 percent of firms remained almost constant.

The net conclusions to be drawn from all the evidence presented in this section are: (1) that the relative importance of the small business sector of the economy generally declined during the period between World War I and the Great Depression, and (2) that between 1932 and 1939 little change in the relative position of small and large firms occurred.

In the next section, evidence to show wartime changes in the size structure of the business population will be presented.

Chart 2.—Percentage of Total Corporate Net Income Received by the Smallest 95 Percent of Corporations ${ }^{1}$

## War Changes in Business Size

The most comprehensive available information on recent changes in the relative position of small and large firms is that derived from the employer records of the Bureau of Old Age and Survivors Insurance. These records include all firms having one or more employees within covered industries.

In table 6, the percentage of total employment reported by employees of various size classes is shown for the years 1938-42. A steady decline is indicated in the percentage of employment accounted for by the smallest 75 percent of employers and also by the next 20 percent. A corresponding increase is shown by the largest 5 percent of employers. Particularly noticeable is the large shift that occurred between 1940 and 1942.

Other information, though somewhat fragmentary in character and difficult of interpretation, reinforces the conclusion

Table 2.-Percent of Total Corporate Net Income Reported by Small and Large Corporations, Size Measured in Terms of Net Income, 1918-39

that the relative importance of small firms has declined during the war period. A recent study of the wartime operations of small manufacturing firms makes possible a comparison of the employment and output of small and large manufacturing firms."

From this study, it appears that the output of small concerns, defined as sin-gle-establishment firms having fewer than 125 wage-earners in October 1942, remained approximately constant during the two-year period from January 1941 to January 1943. For this group, the increase in employment was 1 percent and the increase in value of product, largely attributable to price increases, was 16 percent.

On the other hand, data from other sources indicate that the output of larger firms increased very considerably during the same period. The increase of employment within larger firms was approximately 62 percent and the increase in value of product about 96 percent. The difference in trend of output between small and large firms was particularly evident in the metals industries. (See table 7.)
" "Impact of the War Upon Smaller Manufacturing Plants," Survey of Current Business, July 1943, pp. 19-24, and September 1943, pp. 19-24.

Similar results were obtained from a study of employment in June 1942 and June 1943 for a large sample of identical manufacturing establishments. Since these statistics are on the basis of establishments, not firms, they are here relevant only to the extent that size of establishment is related to size of firm. During this period, the percentage of employment within the largest 25 per-

cent of the establishments in the sample increased from 83.4 to 85.0. Similarly the percentage of employment accounted for by establishments having more than 500 wage earners increased from 67.6 in June 1942 to 72.0 in June 1943. ${ }^{\text {™ }}$

Both of these studies suggest, though the statistics are not sufficiently comprehensive to prove, that the proportion of manufacturing production in the hands of smaller firms has declined during recent years-largely as a result of the increased importance in wartime of largescale heavy industry. This conclusion is supported, it may be added, by other miscellaneous evidence.

In retail trade, there are indications of some increase since 1939 in the relative importance of larger firms. The differences are not striking. however, and there is reason to believe that more recently the smaller firms have been regaining their former position.
Table 8 presents indexes derived from a sample survey of the Bureau of the Census on the sales and inventories of independent retail stores in 1942 as compared with 1939 for all stores and for stores with sales of $\$ 100,000$ and more.
In most lines of retail trade the sales of larger stores show a greater increase than those of smaller stores during the

[^2]period since 1939. Moreover, in the same period the inventories of the larger stores also have increased more rapidly than those of the smaller concerns.

Another test of the relative progress of small and large retail firms is provided by a comparison of the sales of independent and of chain and mailorder stores. A recent comprehensive study of the subject indicates that the relative proportion of total sales accounted for by the two groups has remained approximately constant since 1939.

The chains enjoyed a large relative gain in 1942, but in 1943 the pre-war relation between chains and independents was approximately restored. ${ }^{11}$
The recent trend of sales of large retail firms, represented by chain and mail-order firms and by department stores, and of small retail firms as represented by independent stores, is shown by the following indexes, each expressing 1943 sales as a percent of 1939 sales:

All retail stores.

## Trends in Indusirial Population.

An adequate study of changes in the business population must take into account the rapidly shifting industrial composition of American business firms. This is particularly important in studying the role of small business.

For example, it is easy to conclude that the opportunities for small business are narrowing from the observation that production is becoming more concentrated within the larger firms of one or more particular industries. Such a conclusion may be unwarranted if other industries technically suited to small business are emerging to provide new outlets for small-scale enterprise.

In fact, it would be logically possible for increasing concentration to be occurring in every single industry taken separately without disturbing the relative position of small and large business in the economy as a whole. For this

Source: Bureau of the Census. The original data on ales and inventories were arailable for a large mumber of dentical stores for each of the following 2 -sear periods: 939-40, 1940-41, and 1941-2. The percentage change for each class of stores was computed for each 2 -year period. nd these petcentages were linked to derive the percent ge change for the entire period 1939-42. The resulting indexes show the general trend of sales and inventories for stores of each class, but not for identical stores through the whole period 1939-42
to happen, it is only necessary that sufficient expansion occur in industries suited to small-scale enterprise. Therefore, a recognition of the rapidity with which the industrial composition of the business population changes is most important.
The history of American business reveals a steady shifting in the relative number of firms in various lines of business. In many lines of business the number of firms has declined either because of increasing concentration of production in large firms or because of reduction in demand. In other lines, the numbers have increased in mushroom fashion, and totally new kinds of business have emerged which were almost unknown a few decades ago.

Indeed, had it not been for the rapid development of "small-business" industries (e. g., eating and drinking establishments, filling stations, radio repair shops, beauty shops, etc.) the trend toward concentration for the economy as a whole would have been much more rapid than it has been in fact.
The fluidity of the business population with respect to industrial composition is illustrated by data on estimated changes between 1929 and 1939 in the number of
firms operating within the various major industrial groups. In finance, mining, manufacturing, and construction, the combined net decrease in number of firms was about 82,000 or 3 percent of the total business population. On the other hand, a combined increase amounting to more than 350,000 firms, or 12 percent of the total business population, occurred in transportation, wholesaling and retailing and the service trades.

Similar variations in the make-up of the business population are evident from an analysis of the various kinds of business within each of the several major industrial groups. For example, during the period 1914-37, out of 204 manufacturing industries, 109 showed declines in number of establishments totaling 28,916-whereas 95 showed increases aggregating 20,386 . $^{12}$

Similarly, of the 67 industries classified within the service trades 24 registered a decline in number of establishments during the period 1935-39 amounting altogether to about $\$ 3,000$, and 43 registered an increase totaling about 47,000 establishments. Similarly, of 21 lines of retail trade, ${ }^{13} 12$ showed a decline in number of stores totaling 134,994 , and 9 showed an increase amounting to 428,984.

In each of the three industrial groups studied-manufacturing, service trades and retail trade-there were 27 business classifications in which the increase in number of establishments exceeded 100 percent within the periods studied. On the other hand, there were 67 kinds of business in which the number of establishments decreased by 25 percent or more.

## The Role of Small Business

Statistical evidence presented suggests the existence of four clearly defined periods in the history of the business population:
(1) From 1900 to 1918 , the number of business firms apparently increased more rapidly than the human population. No comprehensive data on the size structure are available for this period.
(2) From 1918-29, the relative increase in number of business firms continued, but the proportion of the economy in the hands of very large firms increased rapidly.
(3) During the period 1929-41, the number of firms declined abruptly up to 1933 and then increased very rapidly until, in 1941, the ratio between business firms and human population was greater than in 1929. The relative portion of the economy in the hands of small and large firms fluctuated during this period, with a probably slight gain for small business.
(4) Since 1941, the number of firms has declined sharply. This decline

[^4]ceased in the middle of 1943 , however, and since then the number has remained about stationary. During the war period the growth of large business has been such that the proportion of the economy accounted for by small firms has apparently declined. These conclusions are subject to two important qualifications.

First, it must be noted that the changes in the distribution of American business firms by size classes have not been violent. Throughout the entire period under study, the general pattern of size distribution has remained remarkably constant.

Indeed, when the firms or establishments of the United States are classified by size on the basis of assets, net income, sales, or employment, the percentage of firms within each class remains approximately the same even over long periods of time. This is true because the changes referred to in earlier sections have occurred among the very large firms, which percentagewise, are few.

Second, from the fact that the relative position in the economy of small business apparently declined during the periods before 1929 and since 1939, it must not be concluded that the absolute importance of small business also declined. In fact, during both periods, small business at least maintained its absolute level of activity.

Third, the conclusions presented ignore possible increases in the economic power of large firms through various informal controls over smaller firms, e. g., financial control, price leadership, and control of dealer franchises.

On the basis of the statistical analysis presented in this article, certain conclusions may be drawn concerning the probable future of small business. In the first place, there is abundant evidence that small business is an institution of great vitality, as indicated by the continued growth in numbers of enterprises and by the fact that the relative position of small firms was gaining slightly during the years preceding the war.

Against this background, it seems highly probable that a post-war resurgence of small business will occur with the removal of the obvious wartime obstacles to the opening of new firms, with the return of potential business men from the armed forces and war jobs, and with the restoration of the civilian economy.

Even with a sizable post-war increase in number of firms, however, it does not necessarily follow that the relative importance of small firms will be as great as before the war. That depends in part on the extent of growth among large firms.

In appraising the effect of the war upon the size structure of American business firms, it must be noted that conversion of the American economy to a war basis has meant, above all, a great increase in the relative importance of manufacturing. This has been particularly true within the heavy industries in which large-scale operations are customary.

The great expansion in output of aircraft, ships, guns, tanks, trucks and other war materials, and the develop-
ment of auxiliary industries, have inevitably tended to increase the relative proportion of output produced by large firms. This is in itself sufficient to explain much of the relative gain in the output of larger firms during the war period.

With the return to a peacetime structure of production placing less emphasis upon heavy industries and with a larger portion of the economy devoted to consumer goods, it may be expected that the relative position of small and large firms will be restored, at least in part. ${ }^{1}$

When these and the other factors of wartime change in the relative status of small and large firms are viewed against the remarkable persistence of small business, it may reasonably be doubted that the wartime dislocations will drastically affect the future size structure of American business. It seems probable that, given a continuation of pre-war conditions, old relationships will tend to be reestablished.

The war may have speeded up trends favoring larger firms in certain industries but, on the other hand, the war has probably also been accompanied by the development of new opportunities for small business. In the past, small business has held its position, not by maintaining its status within each kind of business, but rather by ceaselessly developing opportunities in new fields. There seems to be no valid reason for assuming that this process has been brought to an end by the present war.

# Retail Inventories in the War Period 

By Louis J. Paradison Current Business Analysis Unit

BUSINESS firms have always been vitally concerned with the size and nature of their inventory holdings. In periods of prosperity as well as of depression, the profit position of a firm is invariably affected by the decisions made with respect to accumulation or liquidation of inventories. In a war period inventory policy is not only of great importance to business itself but it influences government price, rationing and production policies.
Three major factors have influenced the movement of retail inventories during the war period: (1) fear of price rises and of shortages of goods which led to unusually large accumulations from the end of 1939 to the middle of 1942, (2) curtailed or complete stoppage of production of many goods, particularly the metallic consumer goods, which resulted in severe inventory declines in these lines, after the middle of 1942 , and (3) the tremendous increase in consumer incomes relative to consumer goods output which induced widespread curtailment of wholesale and retail inventories during the past year and a half.

An examination of retail inventory data during the war period reveals that the dollar value of all retail inventories at the end of 1943 was about 10 percent above that at the end of 1939. a few months after the outbreak of war in Europe. In detail the value of inventories of each major group of nondurable goods stores gained over the 4 -year period, while with few exceptions, each major group of durable goods stores suffered significant inventory declines. The latter trend, of course, reflected the stoppage of the flow to retail outlets of such durable goods as passenger automobiles. radios and household appliances.

It would be erroneous, however, to conclude from the fact that the value of inventories of nondurable goods stores increased in the four years since 1939, that the quantity of goods on retailers' shelves was necessarily greater. Because of price increases, which in many lines of goods such as foods, wearing apparel and certain jewelry items were very substantial, inventories were constantly revalued upward as replacements were made at higher cost.

Consequently, after adjusting for the price rises, the physical stocks in many nondurable goods stores at the end of 1943 were substantially below the quantities held at the end of 1939 . Since the peak levels of these inventories were reached in the third quarter of 1942, it is clear that the inventory liquidation in

Note.-The author wishes to acknowledge the contributions of Hugh J. May who prepared most of the statistical material and of Christopher C. Frishe who assisted in the early stages of the study.
the past 15 months was very considerable in most lines of retail trade.

The significance of this development lies in the fact that the record volume of retail sales during the past year and a half was achieved in part by substantial inventory reductions in practically all lines of trade, although the bulk of the sales came, of course, from current production.

The indicated trends in retail irventories and the kinds of stocks held by retailers have important implications for the postwar period. Numerous retailers now have greatly reduced or entirely liquidated stocks of many types of goods. Others possess inventories of "victory" goods made of substitute materials or of wartime design which may prove difficuit to sell when peacetime quality products are again available.

Thus, it is clear that after the end of the war retailers will find it necessary to accumulate not only a stockpile of the wartime scarce goods but also to replace their stocks of many types of goods with better quality products. This demand by retailers for goods will necessitate considerable outlays for inventory purposes.

An accurate estimate of the magnitude of the inventory investment obviously cannot be made at this time. The present stock position of retailers suggests, however, that these firms might have to invest as much as 5 billion dollars in additions to stocks during the transition period in order to supply the quantity and types of goods sold in 1941 at present price levels.

For the purpose of providing current information on retailers' inventories, not only for use in the war period but also in evaluating the inventory problems of the postwar years, the Bureau of Foreign and Domestic Commerce has prepared monthly estimates of the value of inventories in retail stores from 1933 to 1943. Inventory data are presented for all retail stores, for six major groups of nondurable goods stores and for six major groups of durable goods outlets.

The 1939 Census of Business has been used as the basis for the inventory levels at the beginning and end of 1939. Numerous series and a variety of techniques were utilized in projecting the census figures by months since 1939. These are described in detail in the statistical notes to this article.

It cannot be emphasized too strongly that because of the lack of data in many areas, the present estimates are subject to revision as additional information becomes available. In many lines of trade, such as food, apparel, shoe, general merchandise, and drug stores, fairly reliable data are available. But in other categories, such as eating and drinking places, furniture stores and liquor stores, the data are not as complete and the
monthly movements may contain significant errors.

The Bureau has been publishing total retail inventory data for some time. In view of the greater reliability of these revised estimates and the need for detailed information by kinds of business it is believed desirable to present them at this time even though it is recognized that some of the series may subsequently require revision.

## Importance of Wartime Inventories.

During the war period retail inventories have undergone tremendous changes ranging from an accumulation of 2 billion dollars during the 12 months ending June 1942 to a liquidation of the same magnitude in the subsequent $12-$ month period. Thus, changes in retail inventories together with retail sales records have reflected not only the ability of retailers to acquire new supplies of goods but have also thrown light on the volume and direction of the wartime consumer demands.

As severe shortages of many goods developed, consumers "made runs" on stores which often resulted in severe depletions or the complete disappearance of stocks of many goods. In some lines, however, retailers were still able to replace stocks after such buying waves. This was the case for many nondurable goods, particularly for items of wearing apparel.

The size of inventory holdings in periods of scare buying and the ability of retailers to quickly replace stocks are of utmost importance from the standpoint of judging consumer behavior. Maldistribution of stocks may result in such severe depletions of holdings in some areas or in some lines as to lead consumers to intensify their efforts to accumulate additional goods merely from fear that none will be available in the future. When this state of mind becomes sufficiently widespread it inevitably leads to the rationing of the items upon which attention is focussed.

That rationing of goods has not as yet been required for this reason is to be credited to an unexpected development in consumer preference in the war period. Available information suggests that the increase in consumer purchases of many relatively plentiful commodities during the war period, particularly nondurable goods, has been proportional to the increase in their buying power and that the proportion has been about the same as in the pre-war years.

In other words, there has been apparently no significant transference of the increased purchasing power of consumers from commodities which were no longer available or were relatively scarce to the more plentiful goods. Since many nondurable goods have been produced in relatively plentiful quantities throughout the war period, retailers

sourer: V. S. Departiment of Commere
in general have been able to satisfy nearly all of the increased demands without at the same time seriously impairing their inventory position.

The fact that consumers voluntarily have saved a large proportion of their incomes in the form of war bonds and that there has been some resistance to price rises and to quality deterioration explains in part this pattern of wartime spending.

In addition to the importance of inventories to business firms and consumers, the size and distribution of stocks are of concern to the Government in connection with its various control programs, especially those involving the flow of goods to consumers. Chief among these are the interrelated programs of rationing, price control and inventory control. As certain goods become increasingly scarce in relation to demand, the available supplies are parceled out to consumers to ensure that everyone is entitled to an equitable share.

Both the size of inventory and the flow of new supplies are necessary considerations in determining the value of ration points in exchange for the controlled commodities. The importance of the size of inventories in rationing techniques is illustrated by the fact that before a commodity is subject to rationed sales, stocks at retail outlets are "frozen" for the time required to take inventory and to ascertain the quantities of existing supplies.

Furthermore, the distribution of inventories by firms and by regions has been a deciding factor in formulating policies regarding the need and the char-

acter of inventory control. As previously indicated, a maldistribution of inventories of scarce goods by regions and by firms would work hardships on some firms and on consumers.

The inventory control program for consumer goods operating through WPB Order L-219 aims to redistribute inventories and to prevent an unusual accumulation in the hands of a few firms or in particular locales. The size and distribution of inventories are important types of information used in the operation of this program.

In view of the important role that inventories play in the economy, it is surprising that current retail inventory data are so scant. Reliable data are available from reports of the Federal Reserve Board on department store stocks and from reports of the Bureau of Foreign and Domestic Commerce on chain store stocks in a number of important retail business groups. Yearend figures are also available from the Bureau of the Census based on a sample of independent stores in 34 States.

Aside from these sources, the other available information is fragmentary and spotty. The lack of current information regarding independent store outlets where most of retail inventories are concentrated is particularly noteworthy. It is true that many private agencies and firms have developed reliable stock data for their own uses but this information is in most cases not available for public use.

The data presented herewith has been compiled for the purpose of filling part of the gap in inventory information.

## The Size of Retail Inventories.

Inventories held by retail stores at the end of 1939, according to the Bureau of the Census, amounted to a cost value of 5.1 billion dollars. This represented over 26 percent of the total value of business inventories in the possession of manufacturers, wholesalers, and retailers at that time.

Since 1939 manufacturers' inventories have increased at a very rapid rate corresponding to the rapid expansion of output. Although retail inventories increased substantially in the $21 / 2$ years following the outbreak of war in Europe they did not keep pace with the rise in manufacturers' stocks.

Since the middle of 1942 the value of retail stocks has tended downward, whereas manufacturers' inventories which consisted increasingly of war goods or goods destined for war purposes, continued on an upward trend. As a consequence the proportion of retail inventories to total business inventories declined to about 20 percent at the end of 1943.

Inventories of retail stores have never been large in relation to the aggregate sales. In terms of average monthly sales, average inventory holdings in 1939 represented only about $2 \frac{1}{4}$ months' sales. ${ }^{1}$

[^5]This is an average figure, of course, and for individual trade lines the variation would range, for example, from an inventory equivalent of a few days' sales for some food items to in excess of a year's sales for certain types of furniture.
The rapid increase in sales from 1939 to 1942 resulted in a slight reduction in the number of months' equivalent of inventory holdings. In the period covering the latter part of 1941 and the first half of 1942 . retailers accumulated an unusually large volume of goods and in relation to the average sales of that year, inventories were again equivalent to about $21 / 4$ months' sales. The record sales of 1943 together with the considerable inventory liquidation brought the stocks-sales ratio for that year to the lowest level of the war period-stocks representing about 13/4 months' sales.
Table 3.-Relation Between Year-End Inventories of Chain and Independent Stores

Source: [: S. Department of Commerce.
Slightly more than one-fifth of all retail inventories at the end of 1943 were in the hands of chain organizations. Because chain stores are concentrated primarily in the soft goods lines, which suffered relatively less from war scarcities, chain firms have been better able to maintain their stock positions than independents. This is shown by the fact that the chain proportion of total retail inventory holdings increased from 17 percent at the end of 1939 to 20.5 percent at the end of 1943 , whereas the independent portion declined from 83 percent to 79.5 percent.

During 1941, for example, chains increased their value of inventories by 30 percent, whereas independents increased their inventory value by only 16 percent. On the other hand, during 1943 inventories of chain organizations declined by only 3 percent compared with a liquidation of 12 percent for independents.

It is to be noted that despite this more rapid decline in inventories of independcnts from 1942 to 1943 , their proportion of total retail sales increased over these two years, indicating a faster turn-over of stock. Chain stores, in contrast, lost husiness to the independents throughout 1943.

Very little information is available on inventory holdings by size of firm or on
a regional basis. Data collected by the Bureau of the Census from approximately 15,000 firms comprising independent stores in 34 States suggest that the larger independents have been better able to accumulate additional stocks or replace stocks during the war period than the smaller outlets.

As shown in table 4, during 1941 stores with annual sales of less than $\$ 50,000$ increased their inventories by an average of about 10 percent, whereas those with annual sales of $\$ 50,000$ or more increased their inventory values by over 25 percent.

Table 4.-Inventory Changes During the War Period for Independent Retail Stores

Source: Bureau of the Census, Department of Commerec; based on a sample covering 3: States. Data for 1:43 are preliminary.

During 1942 the smaller stores reduced their inventories from 3 to 8 percent, but the larger stores with annual sales of $\$ 100,000$ or more added 3 percent to the value of their inventories. This trend continued into 1943 when the small stores further reduced their inventories by about 7 or 8 percent while the larger firms reduced them by 6 percent.

Several reasons account for the more advantageous inventory position of the larger firms relative to the smaller, the most important of which is that the larger firms, through their wider contacts and because they handle a variety of goods, are in a better position to quickly substitute less scarce goods for those no longer available. The larger firms, in general, also possess better credit facilities and are able to buy in large quantities at times when goods are available.

## Chart 1.-Inventories of Retail Stores, End of Month

Source: T. S. Department of Commerce.

## Inventories at Record High in May 1942.

As a result of increasing consumer purchasing power, sales of retail stores reached new records in each year since 1939. At the same time, so long as goods were plentiful, retailers increased their inventories partly to support the higher sales volume and partly as a protective measure against higher prices and anticipated shortages of goods.

Retailers steadily added to their inventories from 1939 through May 1942, at which time they reached an all-time high of 7.9 billion dollars. The significance of this figure may be emphasized by pointing out that it represents a gain of 46 percent over May 1939.

Since the average price increase over this period was considerably less, the change in the dollar volume of inventories reflects a substantial addition to the physical stocks in retail stores.

As chart 1 shows the value of retail inventories began to decline in June 1942 and the downward trend continued during the ensuing 12 months, the total liquidation from the end of June 1942 to the end of June 1943 amounting to al-

## Chart 2.-Inventories of General

 Merchandise Stores, End of Year

Source: U. S. Department of Commerce.
most 2 billion dollars. Despite the increase of 700 million dollars in the next 4 months, an accumulation which occurred because of anticipated early and record high holiday sales, the value of retail inventories at the end of December 1943 was almost 700 million dollars below a year before. Withdrawals consequent upon the record December retail sales and inability to replace many goods accounted for a decline of 1 billion dollars in inventories during that month.
Because of drastic cuts in the production of many durable goods, retail stores handling principally durable commodities experienced the sharpest fluctuations in inventories. These stores include the automotive, furniture, household appliance and radio, lumber and building materials, hardware, jewelry, and other miscellaneous durable goods stores.

At the end of 1939 the value of inventories at these stores amounted to 1.8 billion dollars, or about 35 percent of all

retail inventories. In the second quarter of 1942 , shortly after the stoppage of production of automobiles and other me-tallic durables, stocks of the durable goods stores reached a record high of 2.7 billion dollars.

Because these stocks were largely irreplaceable they declined steadily since the early part of 1942. At the end of December they amounted to 1.5 billion dollars and constituted only slightly more than one-fifth of all retail inventories.
The value of inventories of nondurable goods stores increased steadily during the war years until the end of September 1942 when they reached a peak of 5.3 billion dollars. This represented an increase of almost 50 percent from the level at the end of September 1939.

However, only a part of this increase represented additions of physical stocks since prices of nondurable goods, particularly food and clothing, increased substantially over this period. A sizable liquidation of nondurable goods stores' stocks took place from September 1942 to June 1943. But from the middle of 1943 to November, these stores were able to increase their inventory holdings by almost 800 million dollars.

Thus, despite the unusually large liquidation of about 900 million dollars made during December, the value of inventories of the nondurable goods stores at the end of 1943 were only about 100 million dollars below the level of a year before.

## Inventories by Kinds of Business.

An analysis of the movement of inventories of particular kinds of business shows some very interesting contrasts. A detailed breakdown of the value of inventories by major kinds of retail business for the end of each year from 1938 to 1943 is shown in table 5. Monthly figures for this same period are given in table 6.

Of the groups shown in the tables, general merchandise stores held the largest proportion of total retail inventoriesat the end of 1943 they accounted for almost one-quarter of the value of all retail inventories. Furthermore, department stores, including catalog business of mail-order houses, held over half of the stocks of the general merchandise group.

' Inchodes stocks of mail order houses (catalog activitios only).

The relative proportions and movements of the value of inventories for the three major components of the general merchandise group are clearly seen in chart 2. In each group of stores there was a significant inventory accumulation during the war period up until about
the middle of 1942 when peak levels were reached. Since then the trend in these inventories has been downward.

In fact the inventory level in each month of 1943 for each of the three groups of general merchandise stores was below that of the corresponding month

## Chart 4.-Inventories of Apparel Stores at End of Month, by Type of Store

27: $1306+14 \cdots-3$

Chart 5.-Inventories of Department Stores, End of Year

of 1942 , with the exception of the value of department store stocks at the end of November 1943 which was slightly above the level of a year before.
While the inventory decline in each of the three general merchandise groups was substantial during 1943 it is to be observed from chart 3 that the value of inventories of the independent department stores, which account for well over half of all department store stocks. shows practically no change from the end of 1942 to the end of 1943. The combined stocks of chain department stores and mail-order houses, on the other hand, declined by more than 10 percent during 1943.
In view of the increasing shortages of many goods and the record sales made by these stores during 1943 it is indeed remarkable that inventories were so well maintained. Apparently the inability to get many consumer durables was obviated by the substitution of less scarce goods and by adding higher priced lines in the place of unavailable cheaper goods.

The next most important group of stores from the standpoint of inventory holdings is the apparel group. At the end of 1943 the value of their inventories accounted for about 15 percent of all retail stocks.

As chart 4 shows. stocks of apparel stores, excluding shoes, at the end of last year were only slightly below the level of the year before. Obvionsly these stores did not have serious difficulties in getting replacements despite the fact that in certain lines, particularly women's wear, they had the highest sales in their history.

It is to be noted from chart 5 that inventories of chain men's and boys' wear stores during the last half of 1943 were considerably below the levels of the corresponding periods of 1941 and 1942. indicating that producition of many lines of apparel sold by these stores had declined appreciably.

With the single exception of jewelry. every major group of durable goods stores had substantially lower inventories at the end of 1943 than in the early

part of 1942. Despite the fact that the production of many jewelry items was either curtailed or stopped altogether, the value of inventories in these stores continued to increase throughout the war period, on the basis of year-to-year comparisons.

Three factors account for the favorable dollar inventory position of jewelry stores. namely, the shift to substitute goods, such as chinaware and glassware, the fact that the jewelry items that were still produced consisted of higher priced merchandise, and the stocking up of diamonds, the demands for which increased substantially in the war period.

Due to increasing scarcities of most
durables. inventories of these goods at the other durable goods stores shown in table 5, were at rock bottom levels. That the value of inventories did not fall even below the levels shown is due to the fact that many of these stores turned to selling soft goods and other commodities which were relatively less scare.

## Sources and Methorls of Estimating

The data on inventories by kinds of business given in this article represent the value of stocks on hand at cost value as of the end of the reporting period. The monthly estimates of retailers' in-
ventories cover 12 majo: types of retail business: 6 types are primarily nondurable goods groups of stores and 6 are durable goods groups 'see table 5 ).
The data published by the Census of Business were used in arriving at the figures for beginning and end of 1939. The 1939 Census was also used both for definitions and classifications of the kinds of business shown.

A retail store or establishment is, for Census purposes, a readily recognizable place of business with more than onehalf of its sales at retail. The classification of stores by kind of business in the Census is based primarily on the commodities sold.
by Kind of Business, 1938-43
of dollars)

This study corresponds to Census groupings throughout with the single exception that stocks of "general stores 'with food"" have been included in the total dry goods and general merchandise component of the combined general merchandise group. This was done so that the general merchandise group in this study would correspond to the same group in the Bureau's retail sales series.

From the beginning of 1939 to the present the data were estimated by a combination of direct measurements and indirect estimates. Since 1935 the Bureau of Foreign and Domestic Commerce and the Census Bureau have maintained a sample coverage of inventories
held by retailers. This sample ranged in size from 14,177 stores in the 1939 report to 60,704 stores in the major sample report of 1937-38 which furnished data on year-end stocks of 1935,1936 , and 1937.

By linking the indicated percentage changes for each year it was possible to determine the amount and direction of bias between the sample and the actual figures given in the 1935 and 1939 Census of Business. Each group was then adjusted to correct for the bias discovered.

Although the "identical" store sample approach contains certain inherent defects, the Census data on independent retailers' stocks give a reasonably accurate basis on which to establish final year-end
totals for independent outlets
Direct measurements are now available on a much broader segment of retailers' inventories than has previously been the case. The Bureau of Foreign and Domestic Commerce has recently extended its coverage of the chain field to include several trades in addition to variety stores, chain drug stores, men's wear and shoe stores which have long been incorporated in Commerce estimates of retail inventories. To these trades has now been added inventory data on chain auto accessories, chain food stores, chain women's wear, chain department stores, chain hardware, and chain lumber and building materials.

The present sample is based on reports from about 275 chain firms operating over 33,000 stores in trades representing approximately 70 percent of the dollar volume of total chain inventories as reported in the 1939 Census of Business. The cooperating firms in these 10 major retail businesses report monthly data regularly for the current month, for the previcus month, and for the corresponding month of the previous year.

Data on furniture store inventory changes are obtained monthly from reports to the Board of Governors of the Federal Reserve System. Additional data received from the Board which are included in this study are the index of independent department store stocks and the monthly report on department store stocks showing a breakdown by individual departments. This latter report covers more than 120 separate items and is especially helpful in giving some indication of the trend in inventory position of a number of items on which other data are very meager.

The Office of Price Administration furnishes data on the number of certificates of necessity issued each month. These certificates are issued to prospective buyers by automobile ration boards and sanction the purchase of new cars from the total stockpile 'which was frozen in February 1942.

For a few trades indirect estimates are necessitated and in most of these instances the inventory movement has been based on the usual relationship to sales in that field. Retail inventories at the end of a given month are very closely associated with retail sales (lagged by an appropriate moving average based on average inventory turnover in each respective kind of business).

Thus, using the relevant monthly sales data published by the Bureau of Foreign and Domestic Commerce. it was possible to estimate the level of inventories for the retail establishments on which direct measurements were unavailable. This method was used for filling stations, eating and drinking places. and independent food stores.

The results were checked with changes obtained for the Bureau of Census sample for independent stores in 34 States at year-end periods and ad.justments were then made in the monthly data for the year in question.

The few series on which no direct measurements were available to inclicate monthly movements present a difficult problem in interpolation. Normaliy, the relationship between sales and stocks in these fields eatine and drinking places filling stations, and independent focd stores-conforms to a simpie straightline trend.

With the complications of the wartime emergency this complementary movement of sales and stocks has been sharply disrupted. Correction is made by adjusting the monthly data by means of a smooth curve to arrive at the final result reported in the independent retailers' inventory sample taken by the Bureau of the Census each year.

Mail-order house inventories likewise were difficult to estimate. The only published data on stocks held by the catalog divisions of these concerns, which is the portion reported under the Census classification "mail - order houses." were for the end of 1939 . The remaining data have been interpolated by using a stock-sales relationship for the catalog division as a proportion of total mail-order sales and inventories.

Total sales and inventories for these concerns in turn was derived by moving the grand total with a representative sample as reported on annual earnings statements published by Moody's Industrials.

It is also perhaps in order to point out that the year-end figures should be given more stress than the individual intervening monthly data since it has been possible to adjust these figures to the results obtained in the much broader sample prepared by the Bureau of the Census. An additional word of caution can be given against attempting to use this series as an exact measurement of stocks on hand. The prime purpose of these, as well as other Commerce Department estimates, is to indicate direction and approximate amplitude of movements within the business economy for aid in trend analysis.

Despite the shortcomings described above, it is believed that fundamentally the estimates of inventories presented in this article give a reasonably accurate representation of the movement of retailers' stocks over the period covered. It is planned, however, to further develop the sample coverage in those lines of trade which were not sampled in the latest chain survey, and to supplement this series with additional material as it becomes available.

The 6 independent nondurable goods groups that are measured individually represent more than 86 percent of the total nondurable stocks held by retailers as shown in the 1939 Census of Business. Likewise, the 6 independent durable goods groups cover approximately 88 percent of the total durable stocks reported by the 1939 Census.
Therefore additional research on retailers' inventories will be largely directed toward improving the present independent groups rather than adding further segments which could contribute little toward providing a more representative indicator of trends in inventory holdings for the total retail neld.

## Business Situation

## (Continued from p. 7)

aguicultural situation since 1310-14 that such a period provides at best questionable foundation for appraising current talues and estimating future trends.

On the whole in spite of the iactor of Government support in the 1935-33 interval. the general stability of values evidenced in that period would seem to make it a preferable reference point in evaluating the soundness of current levels and trends of farm land values.
(2) In view of the tremendous expan-
sion of farm incomes since 1935-39, the rise which has already occurred in farm real estate values over the country generally does not seem excessive. Nevertheless, the sharp increases which have occurred in the last 2 years and in particular in 1943 should instill a healthy fear of the inflationary potentialities of the current situation. This fear is supported by the evidence of inflationary developments in particular localities.

Indeed, these instances serve to highlight the volatile nature of the present farm land situation, a situation which would seem to require little more than a spark of additional inflationary developments to give rise to a speculative boom comparable with that of the year 1919-20.
(3) Attention may well be called to a few of the circumstances which could contribute to an unhealthy farm land boom.

In the first place, the "overhang" of institutionally held real estate has in large part disappeared, and with it has gone a damper which served to keep farm land prices from expanding too rapidly.

Secondly, while the relative slowness of the response of land values to land income points to a conservative element pervading the existing situation, the very slowness of response might well be a consideration which would lead the unwary investor of surplus savings into the false conclusion that current land values are too low.

In this connection, it should be pointed out that even if one could predict normal farm incomes in the post-war period, the estimation of a warranted price for farm land at the present time rests heavily on the calculation of the length of time over which currently high wartime levels of land incomes may be expected to continue.

Thirdly, it seems probable that there are a large number of investors who regard investment in land as a suitable hedge against inflation. Any intimation of impending general inflation would probably cause these individuals to enter the land market in large numbers with resultant bidding up of land prices-in all probability with little regard to the long-term considerations. Indeed, it is conceivable that this group would be willing to accept a very low rate of return if the capital gain from inflation-engendered increase in the value of land appeared sufficiently large.

A fourth consideration is that there is a large volume of cash currently being held by all groups in the nation. The presence of these funds would serve to make diffcult any attempts at credit control of the increase in farm land values. since stiff down-payment requirements can be met by the prospective buyer.

## Monthly Business Statistics

The data here are a continuation of the statistics published in the 1942 Supplement to the Survey of Current Business. That volume contains monthly data for the years 1938 to 1941 , and monthly averages for earlier years back to 1913 insofar as available; it also provides a description of each series and references to sources of monthly figures prior to 1938 . Series added or revised since publication of the 1942 Supplement are indicated by an asterisk (*) and a dagger ( $\dagger$ ), respectively, the accompanying footnote indicating where historical data and a descriptive note may be found. The terms "unadjusted" and "adjusted" used to designate index numbers refer to adjustment of monthly figures for seasonal variation.

Data subsequent to Jamumy for selected series will be found in the Weekly Supplement to the Survey.

- Revised. - Preliminary.
* New series. The dollar figures for consumer expenditures have been shown on a revised basis beginning in the March 1943 Survey and the indexes beginning in the July 1943 issue. Dollar figures for years prior to 1942 are available as follows: $1939-41$, p. 7, of the A pril 1943 Survey; annual figures for years prior to 1939 for the total only, p. 12 , table 2 , of the May 1942 issue. All revisions will he published later. A detailed description of the series, as originally compiled, appears on pp. $8-14$ of the October 1942 Survey and a subsequent change in the concepts is outlined in the descriptive notes for table 10 , lines 16 to 19 , included on $p$. 24 of the March 1943 issue. Data for 1929, 1933 , and $1935-42$ for the new series under sates of all retail stores are shownon p. 7 , and m. $11-14$, of the November 1943 Survey and for the new series on chainstores and mail-order houses, on pp. 15 and 16 of the February 1944 surver; see also note marked "** on p. S-8 in regard to the chain-store data.
1943 Survey. 1943 Survey.

r Revised．${ }^{\circ}$ Preliminary
Minor revisions in the figures prior to November 1941，which have not been published，are available on request
The index on a 1935－39 base shown in the 1942 Supplement is in process of revision；pending completion of the revision，the index on a $1923-25$ base is being continued．
＊New series．Collection ratios for furniture，jewelry，and household appliance stores represent ratio of collections to accounts receivable at beginning of month；data beginning

 ores operated by the reporing compantes．
$\dagger$ Revised series．Indexes of department store sales for the indicated districis have been cornpletely revised．Revised data beginning lgag for the Cleveland and Dallas districts

| Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey | 1944 | 1942 |  |  |  |  |  |  |  |  |  |  |  |  |

Revised.
$\dagger$ Revised series. The estimates of employees in nonagricultural establishments and in each of the component groups, with the exception of the trade group and the financial, service, and miscellaneous group, have been revised beginning 1939 and revisions of the earlier data are in progress; the revised data will be published when revisions are completed (data beginning August 1941 are in the October 1942 survey). The indexes of wage-earner employment and of wage-earner pay rols (p. S-12) in manufacturng industries have goen
 1941; data for 1941 are shown on p. 28 , table 3, of the March 1943 issue.
*New series. Data beginning 1939 for the new series on wage earners in manufacturing industries will be shown in a later issue; data beginning October 1941 for the individual industries, except machine tools, newspapers and periodicals and printing, book and job, are available on pp. S-8 and S-9 of the December 1942 suryey; the figures for all manufacturing, durable goods, nondurable goods, and the industry groups are shown on a revised basis beginning with the March 1943 Survey and figures previously published for these series
 estimates published in the Survey prior to the February 1944 issue will also be revised; data for agricultural and nonagricultural employment are not available at present.

| Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey | 1944 | 1942 |  |  |  |  |  |  |  |  |  |  |  |  |

${ }_{2}$ Revised. ${ }_{2}$ Decmber 1942 figures include about 80,000 and December 1943 about 220,000 excess temporary Post Office substitutes employed only at Christ inas. ${ }^{2}$ Including two industry-wide coal strikes, with most of the workers involved counted twice. The net number of workers involved was about 575,000 .
IData beginning June 1943 are not comparable with earlier figures as a result of differences in coverage under a new reporting system. Beginning that month, data include persons serving without compensation and $\$ 1$ a year emplovees, previously unreported, and exclude employees on terminal loave who were formerly included. Data beginning June 1943 incude only personnel in 48 states and the District of Columbia; earlier data incude some of continent employees, The estimated united states total for June 1943
$\sigma^{*}$ The 1943 figures for individual months should not be added to obtain an annual total as this would result in substantial duplication due to the counting of striking coal miners ach time they were involved. The net total for 1943 is $1,900,000$.
$\dagger$ Revised series. For data beginning 1039 for the Department of Labor's revised indexes of employment in nonmanufacturing industries, see p. 31 of the June 1943 Survey. For
ision in the Department of Labor's series on average weekly hours in all manufacturing industries, see note marked " $\dagger$ " on p. S-13. The indexes of railway employees have been revision in the Department of Labor's series on average weekly hours in all manufacturing industries, see note marked "p on p. S-13. The indexes of railway employees have been shifted to a $1935-39$ base and the method of seasonal adjustment revised; earlier data not shown in the May 1943 Survey will be published later.
$*$ New series. Indexes beginning 1939 for retail food establishments and beginning 1940 for water transportation are shown on
*New series. Indexes beginning 1939 for retail food establishments and beginning 1940 for water transportation are shown on p. 31 of the June 1943 Survey. Data beginning 1939 or all series on average hours for fhe manufacturing and nonmanufacturing industries shown above will be published in a later issue.

| Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey | 1944 | 1942 | 1943 |  |  |  |  |  |  |  |  |  |  |  |

## EMPLOYMENT CONDITIONS AND WAGES--Continued

FRevised. SRevisions in 1942 monthly averages shown in the A pril 1943 Surrey: Weekly earnings, $\$ 25.58$; hourly earnings, $\$ 0.635$. . Index is beiny revised.
Weata hegiming November 1942 are not stricty comparable with figures for prior months because of a change in the reporting sample. Figure for November 1942 comparable with
$\dagger$ Revised series. For revised data beginning 1939 for the indexes of pay rolls in nonmanufacturing industries, see p. 31 of the June 1943 Survey. The Department of Labot's series on hourly earnings and hours per week (p. S-11) in manufacturing industries have becn revised and differ from those published prior to the March 1943 Survey owing to the which are used for weighting purposes. The series of covered and extensire corrections, on the basis of consus and social security data, in the empioyment cstionates of the Rureau computed by taking the product of the averages of hourly earnings and hours worked per week. The industry classifications have been revised for all series to agree with definitions of the 1939 Census of Manufactures and the Standard Industrial Classification Manual; there were no changes, however, in the cata for the industries which do not carry a reference
to this note. Data for years prior to 1942 for all series will be published in a subsequent issue; figures for the early months of 1942 are in the March 1943 Survey.
*New series. Indexes beginning 1939 for retail food establishments and beginning 1940 for water transportation are shown on p. 31 of the June 1933 Survey. Earlier data for a verage weekly earnings in the newspapers and periodicals and printing, book and job, industries will be published later.

## CHEMICALS AND ALLIED PRODUCTS

$r$ Revised. ${ }_{1}$ D Deficit.
1 Owing to changes in the accounting system, 1943 figures are not comparable with earlier data above; available data on the new basis for January-October 1942 are shown in foot notes in the September 1943 to January 1944 Surveys; November 1942 figures on the new basis are as follows: Operating revenues--total, 14,504; telegraph carriers, total, 13,390; Western Union cable operations, 863; cable carriers, 1,114; operating expenses-no comparable data; net operating revenues-1,909; 1942 data shown above for the latter item are "operating income."
-Data for 3 companies operating outside of United States, included in original reports for 1943 , are excluded to have all figures cover the same companies.
in the 1942 Supplement; figures for August 1937 to December 1941 are the same as published in port warehouses. This series has been substituted beginning 1935 for the series shown p. S-23 of the May 1943 Survey. Prices are quoted per ton and have been converted to price per bag.
$\ddagger$ Data for the indicated series on oils and fats revised for 1941; revisions for fish oils are shown in note marked " $t$ " on $p$. S- 22 of the April 1943 Survey; revisions for all other series were minor and are available on request.
$\dagger$ Revised series. The turpentine price shown beginning with the April 1943 Survey is the bulk price; data shown in earlier issues represent price for turpentine in barrels and can be converted to a comparable basis with the current data by deducting 6 cents. Superpbosphate is reported on a revised basis beginning september 1942, covering all known manufacturers of superphosphate, including Tennessee Valley Authority; the new series include all grades, normal, concentrated, and wet base, converted to a basis of 18 percent available phosphoric acid. Earlier data include normal and concentrated superphosphate as reported by concerns which for 1939 and earlier years accounted for about 95 percent of the value of superphosphate produced, exclusive of T. V. A. production, according to Biemial Census data; it is estimated that this earlier series represented approximately 94 percent
 comparisons with the new data. Data are shown on an 18 -percent A. P. A. basis; data in the Survey prior to the June 1943 issue are on a 16 -percent basis and can be converted to
18 percent by multiplying by 0.8889 .

| Monthly statistics through December 1941, together with explanatory notes and references to the sources of the data, may be found in the 1942 Supplement to the Survey | 1944 | 1942 | 1943 |  |  |  |  |  |  |  |  |  |  |  |

 - Revised.

1 Reffects all types of wholesale trading for cash or short-term credit. Base ceiling price comparable with data prior to January 1943 is $\$ 0.463 / 4$ through June 3 and $\$ 0.4134$ effective June 4, 1043 ; these are maximum prices delivered market; sales in market proper are at permitted markups over these prices.

INot including data for unfinished and high-proof spirits, which are not available for publication. For rovised data for 1941 , see p. S-24 of the February 1943 Survey.
$\dagger$ Minor revisions have been made in data for manufactured and natural gas beginning 1929; revised figures beginning June 1942 are in the Angust 1943 Sur vey; earlier revisions are

$r$ Revised. - No quotation. "For domestic consumption only, excluding grindings for export. ${ }^{1}$ Dec. 1 estimate. ${ }^{2}$ Revised estimate.
${ }^{3}$ Includes old crop only; new corn not reported in stock figures until crop year begins tn October and new oats until the crop year begins in July.
$\dagger$ Revised series. Data for the utilization of fuid milk in manufactured dairy products have been revised for all years: revisions resulted from the inclusion of data for dried whole milk and condensed bulk goods and changes in factors used to compute milk equivalent of the manulactured products; revisions are availahle on request. For 1941 revisions for the other indicated dairy products series, see notes marked "f on $5-24$ and $5-25$ of the darch 1943 survey. 1942 revisions are given at the hotom or p. S-35. The indicated grain series 1934; corn, oat, and wheat stocks on farms and total siocks of United states domestic whear hegiming 1926. Revised 1941 crop estimates and l)ecember 1941 stock figures are on pp.
 in notes marked " $\uparrow$ ". All revisions are avalable on request.

 average, $25,102$.

Revised. 1 No quotation.
$\dagger$ Revised series. The price series for sole oak leather is shown on a revised basis beginning with the October 1942 Survey; revisions beginning July 1933 are availa ble on reauest. The shoe price series for plain, black, kid blucher has been substituted beginning in the June 1943 issue for the colored, elk blucher series formerly shown; data beginning 1940 are shown in footnote marked " t "' on p , S-28 of that issue. Revised 1937-39 figures for total lumber stocks, hardwood stocks and softwood stocks, and revisions for 1941 and, in some instances earlier years for the other indicated lumber series are on pp. 27 and 28 of the March 1943 Survey. Total stocks and hardwood and softwood stocks were further revised beginning
January 1940 on the basis of data collected by the Bureau of the Census and all series have been revised beginning January 1942 to the 1942 Census of Forest Products data; all reviJanuary 1940 on the basis of data collected by the Bureau of the Census and all series have been revised beginning January 1942 to the 1942 Census of Forest Products data; all revi.
sions will be published later; the 1942 Census included many mills in the Eastern States not previously canvassed; this affects the comparability of the statistics for 1942 -43 with those sions will be published later; the 1942 Census included many mills in the eastern states not pre
for eatiot years for Southern pine and for total lumber, total softwoods, and total hardwoods.

* Revised. §Beginning Sentember 1942, 3 companies, formerly accounting for about 7 percent of the total, discontinued reporting. National Paperboard Association.

Computed by carrying torward the March figure on the basis of percentage changes in data for 59 identical companies reporting to the National Paperboard Association.
tWood pulp production statistics have been revised beginning January 1940 and stocks beginning January 1942; for revisions through March 1942, see p. 30 , table 8 , of the June 1943 Survey.

| Monthly statistics through December 1941，together with explanatory notes and references to the sources of the data，may be found in the 1942 Sup－ plement to the Survey | 1944 | 1942 | 1943 |  |  |  |  |  |  |  |  |  |  |  |

－Revised．
$\ddagger$ Figures for the product ion of natural pasoline include total sales of liquefied petroleum gas as follows（thous，of barrels）：1942－TVecember，832．1943－January， $824 ;$ Fubruary， 829 ；
 furf；similarly，sales of liquefied petroleum gas are included in the total production of natural gasoline but excluded from total motor fuel production in the revised 194$]$ figures referred to in the note marked＂f＂．Production of straight－run gasoline includes transfers of cycle products as follows：1943－January，108；February，104；Mareh，109；April．145； Aay，145：June，137；July，108：August，114；September，133；October，164；November，148；December，159；these data are not included in the total for motor fuel．
RRevisions for 942 not shown above，January 1， 882 ；February， 1,$530 ;$ March， 1,$300 ;$ April， 1,$008 ;$ ，May， $942 ;$ June， $926 ;$ July，1，216；August， $1.349 ;$ September， 1,$425 ;$ October， $1,326$. jroducts revised for 1941 and 1942 ；for 1941 revisions，see notes marked＂$t$＂on p．S－33 of the March and April 1943 issues． 1942 revisions not shown above are available on request． Ser also note marked＂$\ddagger$＂above．

${ }_{-}$Revised. ${ }^{1}$ Excludes Colorado and Oklaboma; comparable figure for October 1943 is 1,056 .
${ }^{2}$ Coverage changed beginning September 1943. Data computed on percentage changes as indicated by new data.
$\sigma^{\prime}$ Collection of data temporarily discontinued. Production from October 1942 to August 1943 is partly estimated.
§ For revisions for 1941, see p. S-33 of the August 1943 Survey.
$\oplus$ Beginning September 1042 includes laminated board reported as component board; this is a new product not produced prior to that month.

| Monthly statistics through December 1941, together with explanatory notes and references to the nources of the data, may be found in the 1942 Supplement to the Survey | 1944 | 1942 | 1943 |  |  |  |  |  |  |  |  |  |  |  |

PRevised. Preliminary.
$\dagger$ Revised series. Wool stocks are compiled on a retised basis beginning 1942 and cover all known stocks of wool in commercial channels, including stocks in the hands of country dealers and in country warehouses; figures exclude stocks afloat Which are no longer available for publication. Stocks of foreign wool held by the Defense supplies Corporation are Survey. The indexes of retail automobile financing shown above on a January 1942 base may be linked to the indexes on a 1939 base shown in the 1942 Supplement by applying the current series to the January 1942 index on a 1939 base given in footnote 5 to p .170 of the 1942 Supplement. 'Tbe revision of the Canadian index of physical volume of business is due mainly to changes in the weighting and in the list of components, so as to present a picture of the expansion in industries engaged in war production. Revised data mere first shown on p . S-36 of the December 1942 Survey; subsequently the construction index was further revised in the March 1943 Survey. The revised inder or grain marketings is based shown on p. S- 30 of the December 1942 survey; subsequentyy the construction index was " $\dagger$ " on perised in the March of the April 1943 Survey. Revisions for agricultural marketings beginning 1919 and for other series beginning January 1940 are arailable on request.

[^0]:    ' In a recent study of the Department of Commerce, it was shown that in 62 out of 149 cases of wartime mortality among retail dealers the decision to discontinue was based in part upon alternative opportunities. "Twenty-four had attractive opportunities in war plants, and four were commissioned in war plants, and four were commissioned in drafted, and 5 others were deferred by their Selective Service Boards when they closed their stores and transferred to war work On the other hand. 13 dealers decided to try their luck in other businesses not connected with the war and 11, chiefly hardware retailers, gave as an important reason a desire to retire. .-Willian T. Hicks and Walter $F$. retire. - Willian T Hicks and Walter F .
    Crowder, Small Retail Store Mortality, Bureau of Foreign and Domestic Commerce, June 1943, p. 22.

[^1]:    ${ }^{2}$ Corporate income tax data are subject, also, to several other limitations: (1) Subsidiary corporations are reported separately from their parent companies. This tends toward understatement of the degree of concentration among very large firms. However, since the subsidiaries of very large companies are also generally large, this does not significantly alter the general character of the size distribution.
    frior to 1934 , consolidated returns were permissible only for common carriers by railroad. The number of consolidated returns in 1933 was 7.101 , and in 1934 was 445 .
    (2) To the extent that corporate securities are held by other corporations, assets and income tend to be duplicative. Dividends from domestic corporations were included in net income beginning in 1936.
    (3) In the size distributions by assets, only those corporations submitting balance sheets were included
    (4) Since large corporations tend to pay out a larger proportion of their earnings as interest on bonded indebtedness, the income on the total investment tends to be understated as compared with that of smaller firms.
    ${ }^{3}$ The absolute size, in terms of net income or assets, of the corporations within these several classes varies from year to year. In general, the smallest 75 percent consists of companies with annual net income of less than 10 thousand dollars and assets of less than 250 thousand dollars. The largest 5 percent comprises companies with annual percent comprises companies with andual lars and assets in excess of 2 or 3 million dollars.

[^2]:    '"Similar results were obtained from a study of employment between 1939 and 1943. The number of workers in plants having more than 500 wage earners increased by about 175 percent, whereas the number in plants having fewer than 500 wage earners increased by only 25 percent.

[^3]:    "See Reba L. Osborne, "Retail Sales of Chain and Mail Order Firms,' Survey of Current Business, February 1944, p. 13.

[^4]:    ${ }^{12}$ Only those industries were included in this comparison for which comparable data for the years 1914 and 1937 were available. Data are in terms of establishments-not firms.
    1"Separate classifications within each of the following groups were combined: Food, hardware, apparel, general merchandise. furniture, and automotive.

[^5]:    ${ }^{1}$ In making this comparison it was necessary to convert the estimated book value of inventories into the retail selling value and for this purpose a mark-up of 50 percent was used on the book value figures.

[^6]:    Revised. $\quad$ Dec. 1 estimate. $\quad 2$ Reviscd estimate. $\quad$ For 1941 revisions see note marked " $\dagger$ " on p. S-23 of the February 1943 Survey.

[^7]:    - Revised. \& Revisions in unfilled orders and shipments for April-July 1942 are available on request; data cover 8 companies beginning March 1943.
    tof the 99 manufacturers on the reporting list for Jan. 1, 1942, 24 have discontimued shipments of these products for the duration of the war.
    - For earlier 1942 data except for April, see the October 1942 and July 1943 Surveys; for April data see note at bottom of p. S-31 in the September 1943 issue.
    
    
     Tof the 101 firms on the reporting list in 1941, 20 have discontinued the manufacture of stokers; some manufacture stokers only occasionally. The manufacture of class 1 stokers was discontinued Sept. 30 , 1942, by order of the War Production Board; this accounts for the large reduction after that month in figures for classes 1 , 2 and 3 .
    t Revised series. Indexes for clectrical produets thave been published on a revised hasis beginning in the January 1943 surwey; carlier data are available on request. The index for transportation and distribution equipmem shown in the Survey through the Fobruary 1944 issur has been tmporarily discontinued by the compiling aqency
    *New series. For 1940-41 data for machine tool shipments, see p. S-30 of the November 1942 issue. The series on number of automotive replacement batteries shipped represents estimated industry totals compiled by Dun \& Bradstreet; it has been substituted for the indexes formerly shown; data begioning 1937 will be published later.
