# The Business Situation 

By Office of Business Economics

Further progress toward full reconversion was made in April despite the retarding influence of the shutdown in the bituminous coal industry throughout the month and the accompanying reduction in steel output. The flow of finished goods from reconverted manufacturing plants was accelerated and retail sales continued to score new gains.

TTHE basic indicators of industrial production and distribution (see chart 1) did not reflect any extension of the effects of the coal stoppage beyond the steel industry during April. At present, however, the stoppage has completed its fifth week and its effects are starting to spread over the economy. Electric power consumption is being curtailed in many areas and the Office of Defense Transportation has ordered an embargo on all but essential freight shipments on coal-burning railroads, and also a sharp reduction in passenger service, effective May 10.

## Lower Steel Output in April

The output of steel ingots, which rose sharply following the settlement of the steel strike at the end of February, continued at a relatively high rate throughout March and up until the second week of April, when output turned downward because of dwindling coal supplies. Between the first and the last weeks of the month, the steel operating rate fell from 87 per cent of capacity to 68 percent. The number of furnaces shut down because of the lack of coal was increasing rapidly in early May.

On a daily average basis, the output of steel ingots in April was 7 percent below the preceding month. This decline will necessitate the further postponement of delivery dates in an industry where orders are already booked for deliveries far into the future. It will also make it more difficult for small firms and new firms to obtain positions on mill order boards.
The drop in total freight carloadings in April was due chiefly to sharply reduced coal movements. Miscellaneous carloadings-representing the movement of manufactured goods for the most part-showed the usual seasonal gain. Miscellaneous loadings in March and April averaged only about 8 percent kelow a year ago.

## Gains Recorded

While the over-all indicators of production will show a moderate decline in April because of the reductions in coal and steel, it is likely that the detailed figures will reveal many industries with larger output. On the basis of preliminary data, gains were recorded in the automobile and machinery industries, where the full effect of the earlier strike settlements had not yet been felt in March.
The most notable increase in production in April, however, occurred in construction activity, as described under that heading.

## Gross Product Increasing

In last month's review of the business situation it was noted that the gross national product had begun to increase during the first quarter of 1946, despite the large decline in Government expenditures during that period. Developments in April gave further indication that the moderate uptrend in the gross national product was continuing. If the coal strike is not prolonged, the dynamic segments in the gross national product will continue to outweigh the further decline in Government spending.

The continued decline in Government war expenditures deserves greater

[^0]Sources of data: American Iron and Steel Institute; U. S. Bureau of Mines; Edison Electric Institute; and Association of American Railroads.
weight than is usually given it in analyses of current business trends. As indicated in chart 2 these war expenditures did not disappear overnight. They dropped from 85 billion dollars in the second quarter of 1945 to 43 billion dollars in the fourth quarter and 27 billion dollars in the first quarter of 1846. They are continuing to decline.

At the peak of the war effort the combined Federal, State, and local Government expenditures for goods and services exceeded net Government receipts by over 50 billion dollars per year. This deficit spending necessitated the severe restriction of both private capital outlays and consumer expenditures. Added to the business earnings and consumer income from current production it created an inflationary pressure of demand far in excess of the supply of goods to be bought.

## Reduction in Government Deficit

$\mathrm{B}_{\mathrm{y}}$ the fourth quarter of 1945 this excess of Government expenditures over net receipts had declined substantially but it was still at the rate of 20 billion dollars per year. Government spending served to maintain a relatively high rate of business and consumer income at the same time thet it limited the quantity of goods bought with that income.

The concentration of income tax collections in the first quarter of 1943 brought expenditures and receipts approximately in balance. On a seasonally adiusted basis, however, the excess of expenditures was still over 10 billion dollars which is enough to be a major infuence affecting the total demand for goods.

The further decline in Government spending in recent months has been largely offset by the rapid increase in private capital formation and by the willingness of consumers to spend on a liberal scale. As a result, total demand in the market place has continued exseptionally strong with little indication of any lessening of the pressure during the remainder of this year. The prospect of increased production and elimination of the Government defioit, however, points to a more balanced situation for the future.

## Further Increases in Employment

Following the settlement of major industrial disputes in the steel, automobile, and electrical industries the upward trend in total nonagricultural employment was resumed in March and continued into April. Expanding industrial production together with continued gains in construction activity and trade contributed to the net addition of $1,660,000$ persons engaged in nonagricultural activities between the Census survey weeks of February 3-9 and April 7-13.

Most of the major industry groups participated in the upturn reported by Labor Department between mid-March and mid-April. The reported gain of 360,00 ) production workers was concentrated, however, in the durable goods industries and reflected primarily the resumption
of operations following the settlement of labor-management disputes.

The expansion in nonagricultural employment in April occurred despite the declines in those sectors directly affected by the coal stoppage. Since most industries have scheduled production considerably in excess of current output, further gradual increases in employment are in prospect for some months ahead.

Chart 2.-Goverument Expenditures for Goods and Services

## Veterans Augment Labor Force

The civilian labor force continues to be augmented by the return of veterans to the labor market together with the reentry of some of the women who withdrew from labor-force participation in the months following the end of hostilities. With new entrants and re-entrants more than offsetting withdrawals, the total civilian labor force increased in recent months and in mid-April exceeded last August (immediately before VJ-day) by $1,600,000$ persons.

Unemployment in mid-April was reported at $2,350,000$-a decline of 360,00 ) from March and the first reversal of the upward trend since the end of the war. An additional $1,100,000$ veterans, not yet returned to the labor force, were expected to enter the ranks of job seekers in the near future.

## Marked Upswing in Construction

The marked upswing in construction activity which started soon after VJ-day continued at an accelerated pace through the first 4 months of 1946 . New construction in the first quarter (in terms of value of work put in place) amounted
to 1,600 million dollars, compared with 1,355 million dollars in the last quarter of 1945 and a total of 4,700 million dollars for that year. April construction is estimated at 710 million dollars-betier than twice the rate of a year ago.

Residential construction is one of the fastest moving components of total construction. The April volume of $260 \mathrm{mil}-$ lion dollars represents an increase of approximately two-thirds over the January figure, whereas the gain for all other construction was 28 percent in the same period. Total residential construction for the first 4 months is estimated at about 815 million dollars.

## Program for 1946

Hypothetical distributions of the dollar activity required to produce all the houses set up in the Housing Expediter's program, together with auxiliary accommodations, such as schools, shopping centers, roads, and public utilities, as well as necessary commercial and industrial building, indicate that new construction will have to proceed at the rates of 1.7 billion, 2 billion, 2.6 billion, and 25 billion dollars during the four quarters of this year. ${ }^{\text {? }}$

Residential is to account for $560 \mathrm{mil}-$ lion and 700 million dollars of the total program for the first two quariers of the year. Actual first-quarter performance just about equaled this schedule and, if activity continues at the April rate, the implied quota for the residential segment for the second quarter will undoubtedly be exceeded.

Construction of all types other than residential construction is also proceeding at a rate which will apparently achieve the quotas set for the second quarter. The critical test of whether the program will or will not be met will be the industry's performance in the latter half of the year. The dollar goals set for total new construction are 25 percent higher for the third and fourth quarters than for the second.

In terms of number of residential units started, achievement of the Wyatt Program calls for 150,000 and 290,000 units in the first and second quarters of this year and an upward spurt to 400,030 and 360,000 units in the last two quarters, Of these, 700,000 will be conventional units, including 50,000 conversions of existing space, and 250,000 will be units in prefabricated structures, with the balance consisting of trailers and reassembled barracks and other temporary buildings. At the end of April, preliminary figures available showed that starts for both conventional types and re-use housing were ahead of the timetable mentioned above.

## Increased Output of Materials Needed

Achievement of the above goals is dependent on increasing the output of most kinds of building materials. Numbered among the most essential products which

[^1]are in short supply are lumber, structural clay products, cast-iron soil pipe, and clay sewer pipe. These products deserve special mention because of the peculiar and involved types of industrial difficulties which must be resolved in order to increase their production and because of the large scale of operations which are the object of the all-out effort to expedite the flow of materials.

The principal means by which the Housing Expediter hopes to stimulate production without unnecessary inflation of costs to veterans and consumers are provided for in pending legislation which cannot now be enacted before the middle of May. Other major actions already taken to implement the program include the issuance of Veterans Housing Program Order No. 1, which limits nonresidential construction, and Priorities Regulation No. 33, which makes priorities available for obtaining materials for use in housing costing $\$ 10,000$ or less, or renting for less than 880 a month, in which veterans will be given preference. The National Housing Agency has also issued General Order No. 13-1, effective April 18, 1946, which is designed to increase the proportion of rental housing and the proportion of lower-priced and lower-rent units built with priority assistance.

## Prices Continue to Increase

Changes in prices have attracted more attention in recent months because of the further advances that have occurred and because of the uncertainty regarding renewal of the basic price-control legislation. The implications of the expanded money supply for future price developments are examined in a feature article in this issue.

The official price indexes have risen appreciably since VJ-day, particularly since the begining of this year. The upward pressure on prices reflects both the heavy volume of business buying and the increases in consumer spending as a result of backlog demands and the requirements of veterans returning to civilian life. The liberalized policy of approving price increases under the revised wageprice policy has been an important contributing factor.

## Prices in Uncontrolled Areas

The strong tendency for prices to move upward is particularly apparent in those areas not subject to controls. The wholesale price of rye, for example, advanced from $\$ 1.442$ per bushel last August to $\$ 2359$ in March-an increase of 64 percent. Cotton prices at wholesale advanced sharply-close to 20 percentduring the same period. In the realestate field, where the pressure on prices is particularly severe, the National Housing Administration reports an average Nation-wide rise of 23 percent in costs of lots for home sites and over 17 percent in costs of lower-priced homes between September 1945 and February 1946.

These increases, of course, are far greater than the advances in price-controlled areas. They provide some indication of the inflation which would be in
store if price ceilings were removed from any large number of commodities while they are still in short supply.

## Approved Increases

Significant price rises have also occurred in the major fields subject to administrative control. Under the many pressures existing in recent months, extensive adjustments have been granted by the OPA. In the 9 months ending April 1, the agency approved a total of 528 industry-wide price increases which affected a varied list of industrial and consumer goods. These advances have been reflected in the wholesale price indexes and, derpite the influence of tims lags and seasonal factors, have also appeared in retail prices, although there has been some absorption along the line.

The combined index of wholesale prices compiled by the Labor Department advanced 3 percent between last August and March of this year, compared with less than 1.4 percent for the same period a year ago. All major groups of commodities showed accelerated increases some of which are summarized in the following table

| Wholesale brieeseries | Perentage inerenses |  |  |
| :---: | :---: | :---: | :---: |
|  | $\begin{gathered} \text { December } \\ \text { Math } \\ \text { Maret } 1046 \end{gathered}$ | $\begin{gathered} \text { August } \\ \text { 164.5- } \\ \text { Mareh } 1946 \end{gathered}$ | $\begin{gathered} \text { Hugust } \\ 1044- \\ \text { March } 104! \end{gathered}$ |
| Farm products. | 1.4 | 5.1 | 3.8 |
| Dairy products. | 2.0 | 5.0 |  |
| Cottongrods | 5.9 | 11.0 | 3.5 |
| Housi Gurnis'inges | 2.1 | 2.3 | . 1 |
| Building materials | 5.5 | 8 |  |
| Fromandster! | 5.9 | 8.0 | 1.0 |

## Consumers' Price Index

After showing relatively little change in the period since mid-August, the index of consumers' prices advanced 0.5 percent between mid-February and mid-March-a sharp jump in contrast to the small changes since the middle of last year. The greatest increase- 1.7 per-cent-occurred in clothing costs. The rise of 0.4 percent in the combined food price index includes the effects of a 5 percent increase in the average price of sugar and higher prices for fresh fruits and vegetables and cheese, which were partly offiset by the seasonal decline in the price of eggs.

The available price series may be particularly weak in a period such as the present, because of changes in the composition of products available to consumers and because of additional factors that stimulate up-trading and blackmarket operations

## Food Exports Behind Schedule

A further development which assumed new importance in April was the action taken to increase the flow of foodstuffs to the people of the world threatened with starvation. The necessity for drastic steps was clearly evident in the picture of wheat and flour shipments during the first 4 months of the year. In the first quarter, wheat exports totaled slightly less than 2.7 million long tons
against a goal of 3 million. In April, exports dropped more sharply behind schedule, totaling 576 thousand tons, or less than 60 percent of the goal.

## Efforts to Speed Wheat Exports

The most important of the recent actions to conserve stocks and expedite shipments for relief purposes were aimed at getting wheat off the farms. Early in the month the Government announced a plan to eliminate the financial incentive to hold wheat on the farm for use as feed. Farmers making early deliveries were promised payment at the price that prevails on any date before March 31, 1947, that they wished to specify. As an additional incentive, on April 19 a bonus of 30 cents a bushel was offered to farmers for wheat delivered before May 25 These offors are intended to make possible the meeting of the 6 -million-ton goal for wheat and flour exports in the first half of this year.

To insure the fulfillment of our commitment, the Department of Agriculture also ordered a reduction of wheat processed for the domestic market. Millers and other wheat users are limited in April, May, and June to 75 percent of the amount of wheat used in the corresponding period of 1945 .

## Over-All Domestic Food Supplies Large

Emphasis on the relatively large flow of foods to help meet relief requirements may tend to distort the interpretation of the domestic food picture. While in the next few months per capita civilian supplies of some items, notably some cereal products, potatoes, fats and oils, and sugar, will be lower than before the war record or near-record supplies of other goods, such as vegetables, poultry, eggs, fresh and frozen fish, milk, and ice cream, will be available.

For the year as a whole, it now appears that per capita supplies of food will be at record levels, somewhat larger than in 1945 and about 14 percent above the 1935-39 average. With consumer demand for many food items substantially in excess of prospective supplies, it appears probable that consumers' spending for food will likewise be at record levels this year, even assuming the maintenance of present food prices.

## Mixed Changes in Industrial Production

As already noted, industrial activity in April declined moderately from March primarily as a result of the virtual stoppage of soft-coal production coupled with its depressing effect on steel operations. Most of the durable and consumers' goods industries, however, which for the most part had not yet felt the impact of the coal dispute, continued to register gains.

A prolongation of the coal strike into all or a part of May will inevitably result in a further drop, perhaps of substantial proportions, in over-all industrial activity. This will be reflected particularly in lower steel operations as well as in reduced output in those industries which depend to a great extent on steel
and coal or both as raw materials for the fabrication of finished goods.

## Recovery in March Production

The recovery in manufacturing activity in March was due in large part to the settlement of important labor disputes. The value of goods shipped by manufacturers in March increased by approximately 8 percent from February on a daily average basis.
Deliveries of the durable goods industries attained a peak in the months just prior to VE-day but declined consistently thereafter with the result that by February of this year they were reduced to less than one-half of the war volume. However, these industries recorded a substantial gain-18 percent-in March. The most rapid rise was registered in the iron and steel group as volume in the preceding month was adversely affected by the shut-down in the steel mills. Other but less important gains occurred in the machinery and transportation equipment industries.
The value of deliveries of the nondurable goods industries was up by 5 percent from the February level, with gains recorded by practically all of the major industries in the group, with the exception of foods.

## Consumer Goods Supplies Increasing

The gain in industrial activity reported for March resulted in an expansion in the flow of many consumer goods into distributive markets. In many cases, however, the flow continued considerably below prewar volume. Of 18 important consumer items listed in table 1 , only 5 were above the indicated prewar shipments.
The base-period output shown in the table represents either the peak or nearpeak prewar rate of production with the exception of a few items for which the appropriate base-period data are not available. It should be pointed out that the base period selected is not intended to represent actual or potential postwar demand but simply a measure of gaging the progress of production during the transitional period.

The data in the table illustrate the diverse trends in the flow of consumer durable goods since last October, when practically all of the restrictive production controls were removed. For example, vacuum cleaners and radios were the only items to show successive monthly gains, while shipments of refrigerators and electric irons, to name only two of the more important ones, were higher in December than in any of the succeeding months shown. This diversity was in general due to the degree to which the industry was affected by labor disputes and shortages of materials and parts.
On balance, however, the general trend of shipments has been upward, with radios, alarm clocks, vacuum cleaners, washing machines, and electric irons close to or approaching the base-period output. In contrast, refrigerators, electric ranges, sewing machines, and watches are still at a rate considerably less than one-half of their prewar volume of shipments.

## Auto Production Gaining Slowly

Largely reflecting settlement of the General Motors strike, assemblies of passenger cars nearly doubled in March, reaching 90,000 units, compared with 48,000 in February. Although this represented a new postwar high, it was still less than one-third of the base-period production.
Output of automobile accessories, such as tires and batteries, and of gasoline has continued considerably above prewar levels. The production performance of the passenger tire industry is particularly impressive, with March volume almost one-third above 1940.

## Apparel Goods in Short Supply

The shortages in men's wearing apparel have been especially acute in the lower-priced lines. A basic difficulty apparently stems from the shortage of staple cotton fabrics, which have not been flowing in sufficient volume to manufacturers of the most vitally needed civilian apparel and work clothing, partly because of the tendency to use the scarce materials in the production of higherpriced garments.
To alleviate this condition, the OPA and CPA, in cooperation with representatives of the industry, adopted a pro-duction-incentive program through price
adjustments. Under this program, CPA issued an order effective in April designed to increase the production of staple fabrics and to establish percentage setasides for specific end uses, including essential items in the lower-priced lines.
The seriousness of the shortage in men's suits is indicated in the production figures for January and February, which were about one-seventh below the 1939 rate of production. Output during the first 2 months was at an annual rate of 21.6 million suits, compared with actual production of 24.7 million in 1939, on the basis of Census of Manufactures data. It is expected, however, that some improvement in the monthly rate will be achieved as a result of the recently adopted CPA program. The demand for men's suits, swelled by returning veterans, far exceeds the supply, and shortages are likely to continue for many more months.
As in men's suits, the supply of women's hosiery continues well under the prewar level. Nylon-hosiery production in February totaled 27 million pairs and output currently is running at the rate of $30 \mathrm{mil}-$ lion pairs. No increase over the latter figure is expected for the rest of 1946 owing to the lack of nylon yarn.
In the case of shoes, on the other hand, the level of current production is substantially in excess of 1940 . This also is true of cigarettes.

## Output of Processed Foods

The processed-food industry appears to be one of the more important segments of manufacturing which was little affected by the cessation of hostilities. Likewise, it is one of the few major industries which, on the whole, maintained its wartime production gains. Little or no reconversion problems were invoived, except perhaps for minor changes in packaging design and order specifications.

Although military and lend-lease purchases were drastically curtailed in the final months of 1945 , production generally continued close to the high wartime rates. Consequently, civilian supplies of most processed foods increased markedly and in the aggregate are now in greater volume than ever before. However, both domestic demand and foreign relief requirements are very large, with the result that continued pressure will be exerted to maintain a high volume of production.

## Production Continues High

Chart 3 traces the production of six major processed foods since January 1945 with the monthly average figure for 1940 included for comparison. The monthly data have been adjusted for seasonal variation.

It will be seen that, with the exception of butter and condensed and evaporated milk, there was no appreciable decline from the high war level of production in the period following VJ-day. The drastic decline in federally inspected meat production in March partly reflected the diversion of cattle slaughterings to other than federally inspected plants. Although the year-to-year gain in canned fruits and vegetables appears moderate in the chart, last year's pack represented a new all-time high and continued the slow but steady growth which began prior to the war. The high level of flour production reflects the 1945 record-breaking wheat crop. The slightly lower level in fluid milk is due to the decline in the number of milk cows on farms which, on January 1, 1946, was down about 3 percent from the year before.

## Chart 3.—Production of Selected Food Products, Seasonally Adjusted

I inta remesent dressel weight of livestork slaughtored under Federal inspection.
2 Iata are for total lack: ans of all sizes are converted to the equivalent standard case of 24 No. $\because 1 / 2$ cans for fruits and No. 2 cans for juices and vegetables.
Soures of data: V. S. bepartments of Agriculture and Commerce: basic data were adjusted for seasonal rariation by the latter agency.

A notable exception to the general trend was butter. Although output in the first 7 months of 1945 was down by 22 percent from 1940, the sharp drop in the period following VJ-day reduced the production rate for the first quarter of 1946 to a volume 47 percent below that
of the prewar year. The diversion of milk from butter manufacture to more profitable dairy production following the removal of wartime restrictions on the sale of fluid milk and cream was the chief reason for the post-VJ-day decline.

## Income, Consumption, and Savings

A significant development since VJ-day has been the maintenance of income payments at a level not far below the wartime peaks and the continued increase in consumer expenditures for goods and services. The sharp rise in expenditures resulted in a rapid fall in net savings of individuals. By the first quarter of 1946 , net savings returned to their prewar relationship to income after being considerably above this relationship since 1941.

March income payments to individuals, after allowance for seasonal influences, Digitized for FRASER
remained at about the February annual rate of 156 billion dollars. This high rate of income payments was only 3 percent below the record full-year total of 161 billion dollars for 1945 and 5 percent below the wartime peak reached in the first quarter of 1945 .

## Recent Trends in Income Payments

With the settlement of major labormanagement disputes, factory pay rolls turned sharply upward in March. Also there was a large increase in unemployment benefits to discharged servicemen. Continued military demobilization, however, resulted in a further reduction of total military payments, including pay of the armed forces, mustering-out pay-
ments, and family allowance disbursements to dependents of enlisted personnel. A drop in agricultural income, reflecting mainly a smaller volume of cash income from crop and livestock marketings, also was an important factor offsetting the increases in other components.

The course of monthly income payments during 1945 and the first quarter of 1946 is shown in chart 4 . In addition to changes in total income, the chart shows changes in the major volatile components of the total and in the significant private and Government categories.

Income payments rose to the peak annual rate of nearly 165 billion dollars
in February 1945 and then drifted downward for several months. This receding movement was accelerated in August and September by the immediate curtailment of factory pay rolls after the surrender of Japan. Income payments declined 6 percent from July to Septem-ber-from a rate exceeding 164 billion dollars to a rate of almost 154 billionbut turned upward to a slightly higher level in the past quarter of 1945 and the first quarter of this year.

During these two recent quarters the dominant elements in sustaining the flow of income to individuals included (1) the spurt in income paid out by trade and service establishments; (2) the greatly expanded volume of "transfer payments" (payments by Government to individuals for which no services are rendered currently, such as unemployment benefits and mustering-out payments) ; and (3) the general stability of total factory pay rolls, after the immediate VJ-day drop, despite changes in composition due to problems of reconversion and the dampening effects of major work stoppages in durable goods manufactures. The steady drop in total pay of the armed forces resulting from rapid demobilization was the major influence in the opposite direction.

## Chart 4.-Income Payments to Individuals

I Represents pay of Federal, State, and local government emplosees, pay of the armed forces in this country and abroad, qovermment interest puyments. and miscellaneous items.
". Major items included are social insurance benefits, the Government's contribution to family allowances paid to dependents of enlisted military personnel, mustering-ont payments to discharged servicemen, and vetemans pensions,
compensation, ami readiustment allowances. compensation, and readjustment ullowames. ${ }^{3}$ Major items included are net income of farm and nonfarm progrietors, rents and rozalties, and dividends and interest.

## Chart 5.-Consumer Expenditures and Consumers' Price Index ${ }^{1}$

${ }^{1}$ Index for consamer. expenditures is based upon current dollars: data are annual totals for 1989-43

Sources of data $L$. S. Departments of Commerce ami Labor,

The essential elements of strength and weakness, of "permanence" and instability, in the current income situation can be noted from the foregoing summary and from analysis of the extensive shifts in the composition of income payments since VJ-day as revealed by the chart.

Of primary significance is that income payments by private industry, at the near-record annual rate of 120 billion dollars, were as high in March as they were last July before the end of the Japanese war. Expansion of trade, service, and construction offset the reduction of pay rolls in war manufactures.

Continuation of the upward movement in manufacturing employment that began last October, but was checked by work stoppages, is in prospect. Although wage increases probably will be a generally less important factor in bolstering pay rolls in months to come than they have been since V.J-day, any further reduction in manufacturing pay rolls because of shorter hours of work and shift of workers from higher-paying to lowerpaying industries most likely will be of minor order.

Further basis for a favorable outlook on the trend of income payments in private industry is found in the projected emergency expansion of housing construction, the world-wide need and high domestic demand for farm products, and the probable continued growth of employment in trade and other distributive and service industries. Barring the possible serious effects of prolongation of
the work stoppage in bituminous coal, therefore, income payments by private industry may be expected to rise throughout the rest of the year.

## Changes in Transfer Payments

In contrast, income payments by Government currently reflect only partial transition to the probable level and composition that will obtain after demobilization of the armed forces has been completed and the jobless situation has improved and stabilized. "Transfer payments" reached a peak rate of 13 billion dollars in January and then declined to 12 billion by March. Such payments will continue to fall for several months as military demobilization curtails muster-ing-out payments and family allowances, and as veterans and others receiving unemployment benefits are absorbed into the employed labor force. It is expected, however, that declines in these types of transfers will begin, about mid-year, to be matched by increases in the flow of veterans' pensions and schooling payments, so that total transfer payments probably will level off during the rest of the year at a rate of roughly 8 billion dollars under present legislation. Passage of the bill now before Congress providing for retroactive payments of terminal leave to enlisted men wculd bring a substantial increase in this amount.

Military pay, which has dominated the movement of "other Government payments" in the chart, dropped from a peak of 17 billion dollars in the third quarter of 1945 to less than 8 billion in

March. Under present pay scales a further drop to less than half this amount is expected by the end of this year. The decline in Federal civilian pay rolls has been less spectacular and will be interrupted only temporarily by pay raises already approved for most War and Navy Department and Post Office workers and the pending increase for white-collar workers.

## Disposable Income Rises

Out of total income payments for the first quarter of 156 billion dollars (seasonally adjusted at an annual rate), personal tax payments took more than 17 billion dollars. This left almost 140 billion as the annual rate of disposable income, an increase from the fourthquarter rate of 137 billion dollars and only 1 percent lower than the first and second quarters of 1945 . In comparison with prewar years, the present volume of disposable income is exceedingly high, being more than double the 1939 total, for example. The decline in disposable income from the first half of 1945 to the first quarter of 1946 was much less than the actual drop in income payments as a result of the reduction in Federal individual income-tax rates this year.

## Consumer Expenditures at Record Volume

The high level of disposable income, augmented by special demand factors and a large volume of accumulated savings, has resulted in record retail sales and consumer expenditures so far this year. Sparked by increased expenditures for nondurable goods, total consumer expenditures for goods and services during the first quarter of 1946 rose to a seasonally adjusted rate of about 120 billion dollars, double that of 1939. This rate represents a 20 -percent increase since VJ-day. Indications point to a continued rise in expenditures during the second quarter. Sales of retail stores in April exceeded those of a year ago by one-third to one-half. Part of this increase is attributable to Easter buying, most of which occurred in April this year in contrast to last year when it took place in March. Nevertheless, retail sales in April registered a substantial rise from April of last year on a seasonally adjusted basis.

Although food, clothing, and other nondurable goods were not in sufficient supply to meet all consumer demands, which were bolstered not only by the high volume of consumer incomes but also by the requirements of veterans returned to civilian life, the flow of these goods to civilian markets increased markedly in the past 6 months. However, increased supplies only in part accounted for the rise in expenditures for nondurable goods. Further price increases, continued trading-up, and purchases made above ceiling prices were important factors contributing to the boost in these expenditures.

Chart 5 compares the trend of consumer expenditures with that of prices as measured by the Bureau of Labor Statistics consumers' price index since 1939. Price increases since VJ-day as recorded
by this index have been small in totalless than 1 percent from the second quarter of 1,45 to the first quarter of 1946 . Consumer expenditures, however, increased by 20 percent. Available information on the quantity of goods flowing to consumers does not indicate an overall increase of the amount implied by these expenditure and price comparisons. Although it is not possible to obtain a quantitative estimate, it appears that part of the dollar expenditure increase resulted from further trading-up and hidden price rises.

## Composition of Consumer Expenditures

Chart 6 shows the breakdown of consumer expenditures by three major groups. Expenditures for services, which constituted 28 percent of total expenditures in the first quarter of 1946 , have shown practically no change since VJ-day. Included in these figures are expenditures of military personnel abroad which have been declining over this period. Excluding this item, all the major components of services showed small continued rises since VJ-day and total services increased $b^{--}$, about 4 percent since the second quarter of 1945.

Total expenditures for durable goods were at an annual rate of 10 billion dollars in the first quarter of 1946. The wartime low in this category of expenditures occurred soon after producers of these goods were converted to war pro-duction-in the second quarter of 1942 when they were at an annual rate of 6 billion dollars. The first-quarter rate was already above the 1941 total despite the fact that production of many important durables, such as refrigerators, washing machines, and automobiles, was still far below the 1941 output.

The current high rate of expenditures for durables as compared to prewar is cue to higher prices and to greatly increased purchases of jewelry and automobile parts and accessories. The 10 -billiondollar rate, however, is far below the amount that consumers wcuid have purchased in relation to their current incomes had more durable goods been available. This category of expenditures will rise rapidly in the coming months as supplies of home appliances and equipment and automobiles increase.

## Savings of Individuals Decline Sharply

Net savings of individuals declined in the first quarter of this year to a seasonally adjusted annual rate of 19 billion dollars. This is a lower rate of savings than at any time during the war and is only half of the peak rate attained during 1944 and the first half of 1945. Nevertheless, it is still higher in dollar volume than in any prewar year.
In relation to disposable income, firstquarter savings were in line with the experience of the 1929-40 period. This can be seen clearly in chart 7. During this 12-year prewar period containing years of prosperity and of depression, the chart shows that the relationship between disposable income and savings was remarkably close. During the war period, however, inability to get goods and the channeling of a large proportion of the income into war bonds resulted in the savings "hump" shown in the chart.

If the relationship " which held for the
${ }^{2}$ The regression for the period 1929-4) is: Savings (billions of dollars) $=-5.6+0.174 \times$ disposable income (billions of dollars).

# The Expanded Money Supply and Economic Activity 

By Haskell P. Wald

$\mathbf{A}^{\text {s }}$S AN AFTERMATH of the huge deficits incurred in financing the war, the amount of currency, bank deposits, and Government secutties held by individuals and busmeses or far wrater today than over before in hicory. This accumulation of money men near-money assets is ef roo. immedte interest in relation to the pob:cm of preventing a repelition of the betray infationary boom that occurred aner ino firt World War. but it ha cqually imporiont implicalion: for cther problems of the postwar cocnomy.

Some monetary expansion was not only inevitable during the wer period. when the gross national product more than doubled, but was in itself a wholly desirable development which operated in the interest of a smoothly functioning war economy. A primary responsibility of our modern monetary and banking system is to provide for the expansion of the money supply in periods of rising business volume and income.

II is not an indictment of the war finance program-which has to its credit the borrowing of over 200 billion dollars at low and declining rates of interest-to say that it Was shaped by other considerations in addition to decisions as to the actual monetary requirements of the economy. Thus the end of the war found the economy in an excentionally high licuid asset condition, with currency, bank deposits, and Govermment securities far in excess of any conceivable "normal" requirements surgested by past experience, and with iittle likelihood of any sizable reduction in the volume of these assets over the near future. Coupled with this situation is a set of circumstances which make it extremely difficult to appiy the traditional instruments of monetary control.

## Expansion of Liquid Assets

At the present time, individuals and businesses hold about 55 cents in currency and demand deposils for cvery dollar of annual gross national product. This compares with money holdings per dollar of gross national product of about 40 cents in 1940. By the latter ycar, however, the money supply had already been considerably expanded. In 1929,

[^3]
## Summary

The public-individuals and businesses-now hold about 250 billion dollars in currency, bank deposits, and Government securities. This amount is much larger than ever before in history, even in relation to the high level of economic activity at present. Coupled with the existence of heavy backlog demands-for consumer durable goods, inventories, plant and equipment, and exports- and with stimuli to increased spending because of other factors in the current situation, the huge accumulation of money and near-money assets indicates a tremendous inflationary potential should the price situation get out of hand.

Reductions in the volume of liquid asset holding will come about chiefly through an excess of Federal tax collections over expenditures. At best, this will be a slow process. This does not mean, however, that inflationary pressures will linger on indefinitely.

Given the protection of a firm price-control policy, the Nation's productive capacity will rise to meet the heavy postwar demands. Once production and demand are brought into balance, the expanded money supply will no longer represent a threat to the stability of the economy.

The present article demonstates that it is possible for the postwar economy to become adjusted to a high volume of liquid assets without any sharp and disruptive boost in prices. It suggests that the process of adjustment may be accompanied by further downward pressure on long-term interest rates in the post-transition period.
for example, the comparable figure was only slightly more than 25 cents.

These figures by no means tell the full story. In addition to demand deposits and currency-which now exceed 100 billion dollars-individuals and businesses have at their disposal 50 billion
dollars in the form of time or savings deposits and close to 100 billion dollars in Government securities (see chart 1). All of these securities are convertible into cash virtually on demand and without loss, either by terms of the contract or by virtue of the announced policy of supporting the Government bond market in continuance of the wartime policy of maintaining low interest rates. The combined volume of liquid assets-currency, deposits, and Government secur-ities-exceeds the current annual rate of gross product by well over a third.

## Traditional Controls Difficult to Apply

There is yet a third element in the current monetary situation which has the effect of further enhancing the volume of cash assets at the public's disposal. Under the existing circumstances of large commercial bank holdings of Government securities and a guaranteed bond market, banks have virtually uncurbed access to reserve funds and, therefore, virtually uncurbed ability to expand bank credit and add to the volume of currency and deposits. In a sense, the 90 billion dollars of Government securities in commercial bank portfolios today are "excess reserves."
The futility of attempting to arrest an expansion in the money supply via the control of bank reserves, while at the same time the Federal Reserve banks are committed to purchase all Government securities offered for sale and not absorbed by private investors at guaranteed prices, illustrates the limitations on the effectiveness of the traditional instruments of monetary control. In this situation, changes in the money supply will continue to be determined by the preferences of the public for cash and bank deposits more than by decisions of the central banking authorities.

## "Latent Inflation"

What these several factors add up to is by no means self-evident. On the one hand, it can be argued that the wartime monetary expansion represents, to a considerable extent, "latent inflation," or accumulated buying power. This will continue to be reflected in breaks in the price line and will become much more of a reality should price controls be relaxed before production is sufficiently large to
meet the increased spending which will automatically be generated by these funds.

Support for this view rests upon analyses of past relationships between business volume and money holdings, which depict the existing money supply as being far out of line with prewar trends. It also rests upon an appraisal of the special incentives which impelled individuals and businesses to accumulate large liquid asset holdings during the war period and which are no longer operative now that the war is over. In addition, it is emphasized that the spending of "excess" cash or deposit holdings does not reduce the money supply, but merely shifts funds from the purchaser to the seller who, in turn, is a purchaser in relation to other sellers. Thus the funds become available for a second round of spending and, in the absence of effective price controls, a self-generating inflationary spiral is initiated. Since production cannot possibly keep pace with demand in such a situation, prices will continue to increase until the inevitable collapse.

## Money as a Motivating Force

On the other hand, past experience, particularly during the thirties, indicates that the availability of money is not necessarily a motivating force in the economy. The use actually made of money is the crucial factor. While the volume of spending by consumers and businesses may be influenced by the mere size of their money holdings, it is determined to a much greater extent by the flow of current income, expectations regarding changes in demand and prices in the period ahead, the condition of existing stocks of goods, changes in living standards, technological developments, and a multiplicity of less important factors.

Once the assumption of a "normal" relationship between the quantity of money and the volume of transactions is abandoned, it is apparent that the quantity of money in exisence can provide no more than an indication of the inflation potential at any given time. If there were no price controls at present, it is obvious that this potential would be tremendous. The key to the actual course of prices and production in the future, however, will be found not in the volume of funds available but in the motives which might impel businesses and consumers to activate the funds in their possession.

Of necessity, there is considerable uncertainty regarding the actual effects of the war-expanded stock of money on future developments. This article attempts to provide a basis for narrowing the area of uncertainty by analyzing long-term relationships between the quantity of money, gross national product, and interest rates, and by comparing the changes during the recent war with the previous experience. The analysis is focused on the role of price control in the existing situation and on the implications of the expanded money supply for the post-transition period.

## Chart 1.-Deposits of all Banks, Currency Outside Banks, and Private Nonbank Holdings of U. S. Government Securities

${ }^{1}$ Represents interest-bearing securities, direct and fully guaranteed. Small amounts held by State and local governments are included; holdings of insurance conipanies are excluded beginning with 1932.
${ }_{2}$ Includos time deposits in commercial and mutual sarings banks, and lostal savings System.
${ }^{3}$ Indudes demand deposits, other than interbank and C . S. Government, less cash items in process of collection.
Source of data: Board of Goveruors of the Federal Reserve System.

## Wartime Changes in Money Supply

It is apparent from chart 1 that the volume of money and near-money assets experienced large up-and-down movements during the $1916-40$ period, but that these fluctuations are dwarfed by the tremendous expansion that occurred during the recent war. In terms of absolute magnitudes, Government security holdings experienced the largest growth, rising from about 14 billion dollars in the middle of 1941 to its present total of approximately 100 billion dollars, including almost 50 billion dollars in savings bonds. (If the holdings of commercial and savings banks and insurance companies are counted, the total of privately held Federal securities approaches 225 billion dollars.)

Notwithstanding this huge investment, the public was able to accumulate almost as large an amount in the form of deposits and currency. Thus demand deposits (other than interbank and U. S. Government deposits) rose from 37 billion dollars at the end of June 1941 to about 75 billion dollars this year (with deposits in the Government's accounts amounting to an additional 21 billion dollars), time deposits from 28 to 50
billion dollars, and currency outside banks from 8 to 26 billion dollars.

## Relation to Federal Deficit

The aggregate magnitude of these increases is essentially a reflection of the size of the deficits incurred in financing the war. Had there been heavier taxation and less borrowing, business and individual savings would have been correspondingly lower. In that event, there would then have been a smaller accumulation of liquid assets.

Once the decisions as to war tax policy were made, the respective increases in currency, deposits, and security holdings were determined largely by the needs. and preferences of businesses and individuals. Despite the concerted efforts of the Government to raise as much funds as possible from nonbanking sources, businesses and individuals preferred to hold a substantial portion of their current savings in the form of currency and deposits, rather than in the form of Government securities. As a result, it was necessary to borrow about 95 billion dollars-almost half the total amount of Treasury borrowings-from commercial banks and Federal Reserve
banks during the years 1941-45. The increases in the currency and deposit holdings of businesses and individuals roughly correspond with the amount of bank borrowings.

## Definition of Money Supply

For the purpose of the following analysis, the total of currency in circulation and demand or checking deposits will be referred to as the "money supply." Because of their ready liquidity, time or savings deposits and Government securities have the essential qualities of "money," with one important excep-tion-they are not generally accepted media of exchange. Savings deposits and Government securities must ordinarily be converted into currency or demand deposits before being used for current payments.
By defining money in the above manner, it is not intended to identify the stock of money that would become available, or the total that would be spent, should there be a sharp change in the public's preferences for holding cash or securities. Today, more than ever before, the supply of money is responsive to changes in the preferences of individuals and businesses. Holders of liquid assets can readily shift from Government securities to deposits and currency or they can move in the opposite direction. The net effect is a money supply which is extremely elastic.
Nevertheless, the distinction between money and what may be called money substitutes can serve a useful end. The adequacy of a given stock of money is generally evaluated by comparison with the volume of transactions in goods and services or with some similar measure. The purpose of such a comparison is to obtain an indication of the amount of money that is being used for income transactions and the amount that is being used for other purposes, such as financial or speculative dealings, or is being hoarded. The ultimate objective of the comparison is to throw light upon factors which might influence the future course of prices and production.
The concept of adequacy of the money supply can have little meaning other than in relation to some measure of transactions. As already noted, the size of the existing stock of money is simply the result of the combined decisions of individuals and businesses regarding the composition of their liquid asset holdings. Consequently, if the public's requirements for currency and deposits are used as the standard for evaluating the adequacy of the money supply, it would necessarily follow that the supply was adequate, and no more than adequate, to satisfy these requirements. In relation to the public's requirements for transactions purposes, however, it can be shown that the existing supply is much more than adequate.

## Relation to Gross National Product

The relationship between the money supply and the gross national product over the past 38 years is illustrated in
the form of a scatter diagram in chart $2 .{ }^{1}$ Each point in the chart represents a pair of values for the year indicated: (1) the annual gross national product (measured along the horizontal axis) and (2) the quantity of money (measured along the vertical axis) as of the middle of the year. The money supply includes currency outside banks and demand deposits other than interbank and United States Government deposits. (Government deposits are excluded because the present analysis is concerned with funds available for private spending.)
The distribution of the points in chart 2 illustrates the general similarity in movement between the money supply and the gross national product that originally suggested the hypothesis of the quantity theory of money. On close examination, however, it becomes evident
${ }^{1}$ The gross national product-which may be defined as the market value of all goods and services produced-is used in the above analysis in the place of a measure of the gross volume of transactions. There are no satisfactory estimates of the volume of transactions, but it is known that this volume is several times the value of the gross national product.
that the similarity in direction of movement is much more pronounced than the similarity in magnitude.

It is evident from the chart that a straight-line relation between the money supply and gross national product would not explain all of the variation in the money supply between 1909 and 1940. For reasons described below, the moneyproduct relation experienced a sizable shift in level and in slope during the thirties. It is apparent that the average line of relationship shown in the chart falls in between the years after 1930 and the earlier period.

## Transactions Requirements

If money were used exclusively for in-come-transactions purposes, the various points on the chart would conform much more closely to a readily definable pattern. There are reasons for believing that the amount of money needed to support a given volume of transactions in goods and services is relatively stable, being determined by the average interval between the receipt of income and its disbursement. This interval is fixed by

Chart 2.-Money Supply Related to Gross National Product ${ }^{1}$

- Money supply represents demand deposits adjusted plus currency outside banks. Money supply for 1946 is for Mareh 31 : gross national product for 1946 is a preliminary estimate for the first half of the year (unadjusted for seasomal rariation) raised to the annual rate.

Sources of basic data: Board of Governors of the Federal Reserve System and D. S. Department of Commerce.
the structure of the economy and by institutional factors, such as the payment habits of businesses and consumers.

The shifts in the money-product relationship indicated by the scatter of points in the chart are not a reflection upon the correctness of the above view, but are simply an indication of the wellknown fact that money is not always used to purchase goods and services but may be held for other purposes. The shifts may be due to changes in the amounts being used in financial trans-actions-in purchasing stocks, bonds, or real estate. In most cases, however, they simply reflect fluctuations in idle balances, that is, in the volume of currency and deposits being held as savings.

## Growth of Idle Balances

The higher level of money relative to gross national product in the thirties, already noted above, can be explained in just this way. The large inflow of foreign capital brought with it gold imports, which increased bank reserves and enabled the banks to more than double their holdings of Government securities. Much of the resulting expansion of deposits evidently fell into the hands of businesses and individuals who were not stimulated to invest in new plant and equipment or to increase their spendings in other ways as a result of the increase in their balances.

## Relation to Interest Rates

Among the several factors which were associated with the growth of idle balances during the thirties, the sharp reduction in interest rates (see chart 3) is of particular significance because of its bearing upon the over-all economic situation. Theoretical considerations suggest that over a long-run period the amount of money in excess of transactions requirements is likely to vary inversely with the rate of interest. The structure of interest rates is highly sensitive to changes in liquidity preferences (i. e., the decisions of individuals and businesses as to the amount of their resources they will hold in the form of currency and deposits) and to changes in the demand for borrowed funds. Therefore, it cannot be expected that the inverse relationship between money supply and interest will apply in every year in systematic fashion. Nevertheless, over any extended time period a sizable growth in the quantity of money relative to the gross national product will tend to be reflected in increased availability of funds for investment. Competition for investment outlets will then result in a lowering of interest rates, unless there are simultaneous increases in the demand for borrowed funds which have counterbalancing effects.

The relationship of idle balances to changes in the interest rate may be illustrated in another manner. A decline in the rate of interest increases the incentive for individuals and businesses to borrow funds and at the same time reduces the incentive to sacrifice liquidity and purchase securities. Thus, increases in idle balances tend to be associated with a lowering of interest rates. Such

Chart 3.—Basic Yields of Corporate Bonds for Selected Maturities

Source of data: "Basic Yields of Corporate Bonds, 1900-1942," by David Durand, Natiomal Burtau of Economic Research. Data for $1943-46$ are preliminary estimates by Mr. Durand and have not been published.
balances may be thought of as supporting the lower structure of interest rates, since they are a major factor in the market for new or existing securities.

It is possible, of course, for idle balances to accumulate without having any effect on interest rates, simply because the holders of these funds have a very high preference for liquidity and have no desire to lend their funds at interest. For this reason, some of the variation in the money supply will be found to be independent of changes in the gross national product and in interest rates. In the following analysis, this factor takes the form of a secular trend.

## Equation of Relationship

The preceding hypothesis, which attempts to explain some fundamental relationships between the money supply, value of goods and services produced, and interest rates, may be expressed in the form of an equation derived by multiple correlation analysis. ${ }^{2}$ It can be

[^4]shown that such an equation can explain variations in the money supply during the 32 -year period ending in 1940 with only a small margin of error.

A word of explanation is needed regarding the selection of an appropriate interest-rate series for the statistical calculations. The decision was made to use the series entitled, "Basic Yields of Corporate Bonds," because the standard series on bond yields and interest rates are influenced by various extraneous factors, such as call dates, convertibility, tax status, and trading activity. The basic yield series are defined by the author as the yields of highest-grade corporate bonds free from extraneous influences. They are available by different maturities ranging from zero to 60 years. ${ }^{3}$ Series for both 5 -year and 30year maturities, shown in chart 3, were used in the present analysis and it was found that either series gave about as good results in terms of the closeness of fit between actual and calculated values.

## Divergence From Past Relationships

If average relationships between money supply, gross national product. interest rates, and a time trend during the $1909-40$ period are used as a standard of reference, the wartime divergence from past relationships was first

[^5]noticeable in 1940. This can be explained largely by the outbreak of war in 1939 which had the effect of retarding the down trend in interest rates which had been under way since 1932.
Following 1942, however, the departure from past relationships was magnified very considerably. This is quite evident from the position of the plotted points for the years 1943-46 in chart 2.

What has happened over the past 3 years is that the money supply continued to expand at a very rapid pace while the gross national product made only minor gains after 1943, and while interest rates declined very slowly. It was not until early $1946-6$ months after the end of the war-that the expansion in the money supply tapered off. The gross national product in the first half of this year appears to be running at an annual rate somewhat below that for 1943, yet the volume of currency and demand deposits held by individuals and businesses is higher by some 30 billion dollars, or by more than 40 percent.

## Importance of Price Controls

This striking development can be explained in terms of the special factors associated with the war economy. The imposition of price controls, together with rationing and priorities, undeniably had a powerful effect in holding down increases in business and consumer expenditures-increases which, because of the heavy war requirements and the tight supply situation, would have been reflected in price advances rather than in more production. Had there been no such restraints, the dollar value of the gross national product would have been substantially higher and, while the money supply would also have gained, the net result would have been to bring money and gross product more closely in line with past relationships-at the cost, however, of a substantial price inflation.

Because of the wartime controls and the disappearance of many goods from the market, a much larger proportion of current income was saved than would otherwise have been the case. Individuals and business invested heavily in Government securities but at the same time they accumulated large balances in the form of currency and deposits. Some reasons for this behavior are considered in the following section in connection with the analysis of the distribution of currency and deposit holdings among corporations, unincorporated businesses, and individuals.

## Money Supply Related to Bond Yields

The fact that the structure of interest rates was so little disturbed during the war is noteworthy. While there was a sharp increase in loanable funds over this period, there was at the same time a relatively larger increase in borrowing requirements. As already noted, the willingness of businesses and individuals to convert their currency and deposit holdings into Government securities fell considerably short of the volume of Treasury borrowing. The low interest rates which were maintained during the

Chart 4.—Basic Yields of Corporate Bonds (30-Year Maturities) Related to Money Supply ${ }^{1}$

1 Money supply represents demand deposits aljusted plus currency outside hanks: the 1946 figure is for March 31 .

Sources of basic data : National Bureau of Economic Research (see chart 3), and Board of Governors of the Federal Reserve System.
war did not result from the interaction of the usual supply and demand factors, but was the direct result of the management of the money market by the Treasury and Federal Reserve authorities.

The long-term relationship between the money supply and the rate of interest is of special interest at this time because of the announced policy of the Treasury to continue into the postwar period its low interest rate policy in the belief that it "will make an important contribution to the achievement of full production in the economy."

Chart 4 has been prepared more as an illustration of the basic economic forces which are at work than as a presentation of the actual statistical relationship between money, gross national product, and interest rates. Interest rates are sensitive to a variety of outside influences. Moreover, because only a relatively small part of the variation in the money supply over the $1909-40$ period is associated with changes in the interest rate, the percentage errors in any equation relating interest rates to money and gross product can be expected to be relatively large. Of course, the statistical
significance of any partial regressions such as those shown in the chart, is reduced because of the high intercorrelation between money supply and gross product.

The fact that the relationship between the money supply and the rate of interest (represented by the basic yield of corporate bonds maturing in 30 years) is heavily dependent upon the level of gross national product is brought out very clearly in chart 4 . Each of the downward sloping lines in the chart represents the calculated average relationship between money supply and interest rates at a constant level of gross national product, and at a fixed point in time. As the gross national product is increased, the lines shift to the right.

## Sensitivity to Changes in Money Supply

The steepness of the slope of these lines suggests that, at any given level of gross national product, the interest rate is highly sensitive to changes in the money supply. This generalization, of course, refers to the average relationship for the $1909-40$ period and would not necessarily apply in particular years, such as 1921, 1929, or 1932, when there
were important disturbing influences. It should also be noted that the past experience does not provide any evidence as to whether this generalization is applicable in the range of interest rates falling below $21 / 2$ percent. For reasons already described, the large increase in the money supply during the war period was accompanied by only a negligible decline in the rate of interest.

There is a more important reason why it would be very risky to generalize about changes in interest rates in the low ranges. Theoretical considerations suggest that the lines of relationship shown in the chart for the indicated levels of gross national product should not be straight lines but, instead, declining curves which flatten out as low rates of interest are reached. From the income which lenders earn by purchasing securities must be deducted allowances for risk and uncertainty, income taxes, and any investment costs that might have been incurred. Increases in the volume of funds available for investment cannot be expected to reduce interest rates below levels which are actually needed to compensate lenders for these factors.

The sharp departure of the years following 1942 from the average relationship for the prior period merely mirrors the situation already brought out in chart 2. The explanation lies in the special factors which prevented the gross national product from keeping pace with
the increases in the money supply, as well as in the factors which helped to sustain the rate of interest.

## Downward Pressure on Interest Rates

The fact that the existing relationship between the quantity of money, gross national product, and interest rates is so far out of line with past experience suggests that the trend toward lower long-term interest rates may continue in the post-transition period, provided the gross national product is not inflated by a large increase in the price level. How soon this pressure will assert itself is uncertain because of the existence of speculative factors in the current situation which tend to exert a disturbing influence. How much lower long-term interest rates will fall is even more uncertain, because divergent views as to what rate of interest is required as a minimum compensation for the factors mentioned above.

## Distribution of Money Holdings

The preceding analysis of the money holdings accumulated during the war must be supplemented by the available information regarding the distribution of currency and deposit holdings among different classes of holders. Distributional considerations have an important bearing on how the holdings will be used in the period ahead. Unfortunately,
little information is available concerning the distribution of money holdings by income classes. However, the results of a comprehensive field survey on the distribution of ownership and probable use of liquid assets are scheduled to be published by the Board of Governors of the Federal Reserve System by the middle of the year.

While all classes of holders shared in the wartime expansion of the money supply, it is possible to detect significant contrasts in their relative participation. These contrasts are illustrated in the three panels of chart 5 , which relate movements in currency and deposit holdings to changes in gross national product.

Because the estimates of the distribution of money holdings shown in the chart do not extend over a sufficiently long period, it is not possible to derive any "normal" or average peacetime relationships between money holdings and gross product for the separate classes of holders. The dashed lines plotted in the chart merely represent extensions of the 1940 money-product proportions. In other words, if the amounts of currency and deposits held in 1940 had increased proportionately with gross national product, the points for the subsequent years would have fallen on the dashed lines. While these lines are useful as standards for gaging the wartime changes in money holdings, it should be stressed that they are based entirely on the situation as it existed in

Chart 5.-Personal and Business Holdings of Currency and Demand Deposits Related to Gross National Product ${ }^{1}$

${ }^{1}$ Business holdings include holdings of corporate and noncorporate businesses other than banks, insurance companies, building and loan associations,

 are unadjusted for seasonal variation.

Sources of basic data: Board of Governors of the Federal Reserve System and U. S. Department of Cohmerce

1940 and do not necessarily reflect a "normal" relationship.

## Large Personal Holdings of Currency

The first panel in chart 5 indicates that the bulk of the large currency outflow since 1940 ended up as personal holdings. However, the break-down shown in the chart does not reflect a strict separation into "personal money" and "business money," since personal holdings include the balances of farmers, who are important users of currency, and professional persons. The balances of other individuals for business purposes, however, are included in business holdings. It is also likely that currency used in gambling and in black-market and other illegal operations is included in the personal rather than the business totals.

A separation of business holdings of currency by type of holder indicates that the holdings of corporations increased proportionately with gross national product, so that the explanation for the increase in aggregate business holdings of currency above the proportion which existed in 1940, as shown in the chart, lies in the expansion of the amount of currency in the tills of unincorporated businesses.

## Special Factors in Currency Demand

Several reasons can be cited to explain why the amount of coin and paper money in the hands of individuals has increased so much more rapidly than the gains in income payments or consumer spending. Of prime importance is the fact that a large portion of the increases in income has gone to wage earners and farmers, who make limited use of banking facilities, and, therefore, are accustomed to holding large amounts of currency as pocket money and as savings in periods of high earnings. These same persons are not used to purchasing securities and may have been somewhat reluctant to place a large proportion of their savings in war bonds. The disruption of established banking and credit connections because of changes in residence also had the effect of increasing the demand for currency.

There is no doubt that an unusually large proportion of currency in circulation represents idle balances. To some extent this may reflect the fact that memories of widespread bank failures of the early thirties are still fresh in the minds of some people. However, there is no real evidence of any general "scare hoarding" of currency.

Finally, it should be noted that blackmarket dealings, gambling, tax evasion, and similar activities have created a special demand for currency during the last few years.

## Growth of Personal Deposits

The two remaining panels in chart 5 illustrate the wartime changes in de-

[^6]mand deposit holdings. The largest share of the deposit accumulations went into personal accounts. In terms of relative changes, however, deposits of unincorporated businesses show the largest gain.

In contrast, deposits held by corporations at the end of last year were only slightly greater, relative to gross national product, than in 1940 . This reflects the fact that corporations invested a larger proportion of their current assets in Government securities than did unincorporated businesses.

The reduction in corporate deposit holdings during the second half of last year was concentrated among manufacturing and mining concerns and was partly due to heavy cash outlays relative to income while plants were being reconverted. The deposits of other corporations, as well as those of unincorporated businesses and personal deposits, recorded sizable gains between mid-1945 and the end of the year, even though deposits were lower at the year-end than a month earlier because of heavy security purchases during the Victory Loan which ended in December.

## Implications for Future

Public concern over the expansion of currency and deposits would be eased substantially if there were some prospect of a sizable shrinkage in the near future. For the last 4 years the inflationary pressures inherent in the war economy have been successfully restrained by price control. There is no doubt that, if the basic price-control legislation is renewed without restrictive amendments, this record of achievement could be substantially continued.

It is highly improbable that a sizable contraction in the money supply over the next year or two, or even over a longer period, will be effected merely by a change in the public's preferences for holding cash. Moreover, it would be extremely difficult to effect a contraction in the money supply via official action of the banking authorities.

As already noted, the relative liquidity of the public's asset holdings is largely a function of private decisions. With almost 50 billion dollars of demand obligations in the form of savings bonds outstanding and with nonbank holdings of other Government securities equally as large and virtually as liquid because of official support of the bond market, it is theoretically possible to have a doubling of the money supply merely by the public shifting from securities to cash. In addition, the public can draw upon 50 billion dollars in time deposits. Therefore, any steps taken to reduce the money supply directly cannot be assured of real and lasting success unless they operate through a reduction in the total supply of liquid assets.

## Effect of Federal Debt Retirement

Unlike the money supply, the combined volume of currency, deposits, and Government securities is subject to determination by public policy, although there are very definite limits on the exercise of such policy. The chief in-
strument of policy, of course, is debt retirement financed by budget surpluses.

If an excess of Federal tax receipts is used to retire securities held by nonbank investors, there is a net reduction in security holdings, without any change in the money supply. On the other hand, if the excess is used to retire securities held by commercial banks, there is a net reduction in deposit and currency holdings. Should the banks turn around and purchase securities from the public to replace those retired, the money supply, including the volume of time deposits, would be restored but the volume of nonbank security holdings would be lower. Thus, debt retirement financed by an excess of tax receipts must necessarily be reflected in a smaller aggregate volume of liquid asset holdings, although not necessarily in a reduction in the money supply.

## Reduction in Treasury Balance

Some progress in debt retirementamounting to about 6 billion dollarshas already been made this year, and larger reductions appear to be in the offing. These reductions, however, will be financed by drawing on the more than 20 billion dollars in the Treasury's cash balance rather than by using tax receipts in excess of expenditures. Therefore, they will not accomplish the results described above. If the Treasury's balance is used to retire nonbank holdings, the net effect will be to convert securities into deposits or currency-money supply will expand and security holdings will be reduced. If bank holdings are retired, the public's liquid assets will remain unchanged.

Until the time when Federal debt retirement is made through an excess of tax receipts, there is small chance of any appreciable reduction in the aggregate liquid asset holdings of the nonbanking public.

## Revised Budget Estimates

Budget surpluses do not lie as far into the future as the official estimates of last January indicated. Revised budget estimates for the fiscal year 1946 were issued in April which forecasted a deficit of 3.6 billion dollars for the first 6 months of this calendar year. This compares with a deficit of 10.5 billion dollars for the same period, indicated in the January Budget Message.

The estimates for the fiscal year 1947 have not been officially revised since they were issued in January, so that the official estimate of a deficit of 4.3 billion dollars still stands. However, the President has stated that it is the Government's aim to balance the budget for 1947. In view of the improved business prospects, it would not be unreasonable even to expect a small budget surplus in the next fiscal year.

The conclusion seems inevitable, however, that for several years ahead the whittling away of the public debt through budget surpluses will make only a small impression on the aggregate amount of currency, deposits, and security holdings, which now total about

250 billion dollars. ${ }^{5}$ Any further reductions in tax rates would, of course, strengthen this conclusion.

## Larger Security Sales to Public

In view of these dim prospects for reducing materially the over-all volume of liquid assets, the question arises as to whether it would be feasible and desirable to influence the composition of the public's asset holdings by inducing a shift from deposits and currency into securities. The most effective means of accomplishing such a shift are not at all clear, since the individuals and businesses holding large amounts of currency and deposits do so because they have a distinct preference for cash over securities. The public may be reluctant to change its preferences in this regard, despite special inducements by the authorities. Not only are patriotic appeals likely to be less effective at present, but in view of the changed economic situation, it is probable that holders of idle balances will be able to think up even stronger reasons for holding cash than during the war.

In the final analysis, there is no assurance that the stimulus to spend can be diminished appreciably merely by converting cash holdings into Government securities which are only one short step removed from cash. The attitude of an individual toward his savings undoubtedly affects the form which his savings take. Whether the reverse is true-that is, whether attitudes toward savings can be changed merely by shifting the composition of savings-is highly conjectural, particularly when the change in question would merely be a shift from deposits or currency to Government securities.

## Expansion of Bank Credit

A further expansion of bank credit would, of course, have the opposite effect of measures aimed at converting cash balances into Government securities. Such a credit expansion might come about either through bank purchases of additional Government securities or through increases in commercial loans.

The Federal Reserve System recently moved to discourage further bank-credit expansion by discontinuing the preferential rate previously granted to member banks on loans secured by short-term Government securities. This move was intended to curtail a particular type of speculation in Government securities.

Proposals for a more general tightening of the availability of bank credit, however, must by examined in terms of their effects on the low interest rate policy established by the Treasury. The

[^7]difficulties of applying the traditional instruments of monetary control at present have already been described.

## Inflation Potential

There is no denying that, in the absence of price control, the existing situ-ation-the greatly expanded money supply, the large holdings of near-cash assets in the form of time deposits and Government securities, and the weakened resitance of the central banking authorities to further credit expansion-would contain explosive possibilities from the standpoint of its inflation potential. If controls were released and consumers and businesses decided to go on an inflationary spending spree, they would have ample means at their disposal. Their ability to spend seems well protected against the effects of a tightening of the money market.

Even if it were assumed that spending decisions were determined primarily by the volume of liquid assets available, it would not necessarily follow that the inflation peril would persist as long as the liquid asset supply were not reduced or brought under control in some way or other. Rising production, of course, can be an effective answer to increased spending, provided the increases in spending are not of the type that occurs when there is a general flight from money to goods. Given the protection of a firm and vigorously enforced price-control policy, the Nation's productive capacity could be expanded to meet increases in consumer and business demands which were assumed to be implicit in the money supply.

## Pressures for Increased Spending

But spending decisions are not determined by any mechanical relationship to the liquid asset supply. The force of money as a motivating influence on spending decisions is seriously weakened when the money accumulation is associated with prior, rather than current, savings.

The inflationary danger in the present situation is largely associated with the existence of large backlog demands-for consumer durable goods, inventories, industrial plant and equipment, and exports. If price controls were abandoned, these demands could come onto the market as an addition to the usual volume of spending generated out of current income. Demand would press even tighter against the limitations of available resources and supplies and competition among buyers would bid up prices.

The temper of the buying public would also give impetus to increased spending if there were no price controls. This might come about simply as a temporary reaction to the restraints imposed by the war. It would be more likely, however, that the increased spending would result from widespread expectations of higher prices-among both the business community and the consuming public-and the irresistible urge to buy now rather than pay more later.

The ready availability of large liquid asset holdings would encourage the strong pressures already present for in-
creased spending and would add fuel to the fire should an inflationary spiral get started. Yet to view the asset holdings as the primary initiating influence would be to exaggerate their importance. Once sufficient goods are available to satisfy the backlog demands, the public will not encounter any serious difficulty in becoming inured to large currency, deposit, and security holdings.

## Price Control: An Effective Defense

In summary, the pressure for rising prices during the postwar transition stems from the co-existence of two sets of conditions: (1) The swollen demands of consumers and businesses which are considerably in excess of the available supplies of goods, even though these supplies are in most cases larger than in prewar years; and (2) the expanded supply of money and near-money assets, which provide the public with the means to increase their spending and which cannot be contracted except slowly through debt retirement financed by budget surpluses.

It is not possible to increase output immediately to the full extent required in the period ahead; the economy must be given time. In the interim, the economy must be protected by a firm price control policy-the most effective weapon at present for preventing inflationary price increases from choking off the expansion in production. The pressure on prices will be eliminated gradually as production and demand are brought into balance.

Because the Nation's productive potential is so great, there is no need to turn to drastic monetary measures to contract the money supply. In this respect, this country is in a different position than certain foreign countries which find it necessary to adopt extreme measures to reduce the quantity of money available partly because of the limited ability of their economies to increase production.

## Long-Run Salutary Effects

From the standpoint of the posttransition period-after production and demand are brought into balance-the enlarged money supply may well have salutary effects on the volume of production and employment. For example, the liquid asset holdings may be drawn upon in periods of unemployment or in other emergencies. Whether such use would be important as a sustaining influence would depend upon the distribution of the holdings among the lower income groups.

The existence of large liquid savings would make a major contribution toward the achievement of a full-employment, full-production economy if it raised the general level of consumption relative to income. Again, the distribution of the asset holdings would provide an important clue as to the likelihood of such a shift. Finally, if the expanded money supply should induce further reductions in long-term interest rates, it would have a stimulating effect on investment expenditures and would indirectly bolster consumption.

# Recent Trends in the Business Population 

By Donald W. Paden and Alice Nielsen

DURING the past 2 years almost three-fourths of the wartime loss in number of business concerns has been recovered. As early as the first quarter of 1944 prospective entrepreneurs began to show a renewed interest in business ownership, and since that time the number of entrants has consistently exceeded the number of discontinued businesses. By the first of the year there were 400,000 more firms than 2 years earlier, the net result of 695,000 new businesses and 295,000 discontinuances.

To a considerable extent, the increase in the number of firms has been due to a reversal of the factors which made for the decline during the war-to the release of men from the armed forces and the return of war workers to their home communities and former occupations. Of equal importance, perhaps, have been the optimism which prevails with respect to business conditions, the gradually increasing supplies of goods, and the desire for security on the part of individuals, many of whom for the first time possess sufficient savings to acquire a business of their own. A substantial number have also been attracted by the possibilities of quick profits in lines of business where a large backlog of demand promises easy sales, as in the case of automobiles and household appliances.

## New Businesses To Be Numerous

Of the roughly 700,000 persons who entered business during the past 2 years, some made the venture for the first time; others returned to businesses which were closed early in the war. In the months ahead the number of entrants should remain high, particularly as problems of supply become less troublesome, as new opportunities open up, and as it becomes easier to build, remodel, and equip new places of business.

Chart 1 shows the recent trend in number of firms in the business population. In spite of the rapid rise in number of concerns, it should be noted that there were still 160,000 fewer businesses operating at the beginning of 1946 than during the peak year 1941. However, the trend in the past few months has

Note.-Mr. Paden and Miss Nielsen are members of the Business Structure Division, Office of Business Economics. Much of the preliminary statistical work for the article was done under the direction of Genevieve B. Wimsatt, also a member of the Business Structure Division.

#### Abstract

Summary At the first of 1946 there were 400,000 more business firms in the United States than at the end of 1943. This rapid recovery of the greater part of the wartime loss of 560,000 firms results from the opening of 695,000 new businesses offset by only 295,000 discontinuances.

The high rate of business turnover will undoubtedly continue. During the past two years roughly 15 out of every 100 concerns were either closed or transferred to new owners. Indeed, it seems probable that the rapid expansion of the business population will ultimately be checked more by a rise in the rate of discontinuance than by a fall in the number of entrants. Business opportunities still remain, however, at our present high level of industrial activity.

The present article continues the studies on the business population which have appeared in the Survey of Current Business during the past two years. The Department of Commerce in these studies has undertaken to present current quarterly statistics on the number of operating business firms together with the number of new, discontinued, and transferred businesses.

These basic statistics for the period 1944-45 are presented at the end of the article in table 6, classified by kind of business. Table 6 also includes a summary of previously published figures together with revised estimates of business turn-over for some industry groups for the period 1940-43.

continued upward. New products, shifts in population, and the operation of the economy at higher than prewar levels are current factors favoring the further expansion of the business population. Indeed, it seems probable that the number of firms may exceed the prewar high by as many as from 300,000 to 500,000 concerns. ${ }^{1}$
${ }^{1}$ The larger figure is an estimate (for conditions of full employment) appearing in the Twentieth Bimonthly Report of the Smaller War Plants Corporation, p. 3. The lower figure will be reached in 1946 if new businesses exceed discontinuances by approximately the same amount as in 1945.

## Discontinuances at Low Level

The rise in number of firms during the past 2 years was due as much to the low level of discontinuances, shown in chart 2 , as to the high rate of entry. Only 295,000 firms discontinued business during the 2 years 1944 and 1945. This is less than half the prewar rate and less than one-third of the total number that closed their doors during 1942 and 1943.

Needless to say, it is unlikely that such a low rate of discontinuance will persist. The increasingly large number of new concerns makes it almost inevitable that over-all mortality rates should rise within the next few years. Even in 1944 , 15 percent of the firms established during that year discontinued business within the first 12 months of operation-a percentage which will probably rise rather than fall as the wartime deficit in number of firms is fully recovered.

## Sales of Businesses Increasing

The desire to enter business has also led to a rise in the number of business transfers from 280,000 in 1944 to 346,000 in 1945. These transactions are quite apart from the figures on new and discontinued businesses and represent firms which have been sold, reorganized, or otherwise transferred to new owners. As in the case of real estate, many of these sales have undoubtedly been made at inflated values which in the future may be an important factor influencing the long-run stability of these enterprises.

Although the sale and purchase of going concerns do not influence the total number of firms, nevertheless they are of considerable importance in judging the magnitude of business turn-over. Prospective businessmen should reccgnize the fact that roughly one out of every six or seven firms in business was either closed or sold to a new owner during each of the last 2 years-a period in which the rate of discontinuance (although not the rate of transfer) was at an abnormally low level.

The large and continuous turn-over in the business population noted above characteristically takes place among the smallest firms. This is not surprising in view of the fact that these firms account for an overwhelmingly large proportion of the business population and that the rates of entry, exit, and transfer normally vary inversely with the size of firm as measured by number of employees. During 1945 concerns with fewer than four employees were responsible for 83 percent of all discontinuances, 88 per-
cent of all new firms, and 75 percent of all transfers.

The following definitions should serve to clarify the discussion on business turn-over:

A new business is defined as one which is newly organized and is not the successor of a pre-existing going concern.

A discontinued business is defined as one which has been liquidated, i. e., one which does not continue as a going concern under new ownership. The concept includes closures which occur for reasons other than financial loss, as well as business failures.

A business transfer is defined as a change in ownership of a going concern. It covers (1) ordinary purchase and sale of a business including cases where the transaction involves persons within the same family, (2) reorganization of a business, e. g., incorporation, admission of a partner or dropping of a partner, and (3) transfer of a business to a trustee, receiver, or executor.

The number of business transfers does not affect the total number of firms, inasmuch as they represent both a purchase and a sale in which the business continues as a going concern. The number of new and discontinued businesses, on the other hand, represents additions to and subtractions from the business population and the numerical difference between the two in any period is equal to the net change in the total number of firms.

It should also be made clear that the estimates are expressed in terms of number of firms-not establishments. Since a single firm may be composed of several establishments, the statistics presented on the number of firms are generally smaller than comparable figures for establishments in the 1939 Census of Business.

## Number of Operating Firms

The number of firms has risen steadily from the wartime low of $2,836,000$ at the

end of 1943 to within about 160,000 of the prewar peak. The summary tabulation at the end of the article presents estimates of changes in the number of operating business concerns in the United States by quarters for 1944 and 1945 with summary statistics by years back to 1939 .
Except for the negligible 1-percent rise in mining and quarrying, all of the major groups showed substantial increases during the past 2 years-ranging from 7 percent in the finance-insurance-real estate group to 29 percent in construction. The exceptional case-mining and quarrying-was, however, an industry which did not follow the pattern of wartime loss and recovery; the number of mines and quarries in operation rose 8 percent in the 2 years 1942 and 1943 and then began to level off.
In general, the gains made in 1944 and 1945 in the major industry groups are in inverse proportion to the degree of loss during the preceding 2 years. In table 1 the eight major industries are ranked by the relative decline in number of firms during the first 2 years of the wara ranking which, except for manufacturing, is identical with their rank by relative increase in the next 2 years. Manufacturing was unusual in that a very slight loss in number of firms in the first three quarters of 1942 was followed by an increase in 1943 and an even more marked increase in 1944 and 1945.
Several of the major groups, including the transportation-communication-public utilities group, wholesale trade, and the finance-insurance-real estate group, are now close to or above the 1941 levels as a result of steady increases throughout 1944 and 1945. The number of firms in the construction industry has also made a sharp climb and is approaching 1939 levels. The industry, however, is still far from the 1941 and early 1942 peak.

## Recovery in Retail Trade

The number of retail stores followed the same general pattern of other indus-tries-a prewar peak, a rapid decline to the end of 1943, and a marked upward
trend through 1944 and 1945. This upward movement in the last 2 years amounted to 14 percent and resulted in nearly every retail group recovering at least a substantial proportion of the earlier wartime loss. A few lines-liquor stores, other automotive dealers, hardware and farm implements, home furnishings, and appliances and radiosnow exceed prewar peaks. General stores constitute the only group which continues to decline.

As can be seen from chart 3, changes in the total number of retail firms have not been closely related to the volume of sales since 1939. Although the total retail population fell through 1942 and 1943, sales have risen steadily and in 1945 stood at 175 percent of the 1939 level.

The failure of the number of firms to follow a rise in sales is particularly marked in eating and drinking places, apparel, shoes, other food stores (including meat and seafood), grocery stores, and general stores. In all these lines of business, average sales per store in 1945 were more than 200 percent of 1939 average sales; yet the number of stores ranged from only 76 percent to 101 percent of the 1939 number.

In the case of automobile dealers, on the other hand, total sales in 1945 as shown in chart 3 amounted to only 46 percent of 1939 sales; yet the number of dealers in operation was 4 percent higher. Here the increase in number of dealers is obviously in anticipation of future business.

In the field of household appliances and radios, the wartime divergence between sales and number of firms has almost been overcome; total sales in 1945 were 111 percent of sales in 1939, and number of firms 109 percent.

## Recovery by Line of Business

For specific lines in retail trade, the extent of the 1944-45 increase is indi-

cated in table 2. This table shows the percentage increase in number of firms over December 1943 as well as the absolute amount of the wartime decline and subsequent recovery.
The groups with the highest percentage increases in number of firms from 1943 to 1945 (shown at the top of table 2) are appliance and radio stores, "other automotive" dealers, liquor stores, automobile dealers, and home furnishings. All of these groups except automobile dealers are now above 1941 levels. The large groups-filling stations and eating and drinking places-have shown a substantial increase ( 17 and 18 percent, respectively), but are still a long way from their prewar numbers, both in the absolute and on a percentage basis. If 1941 levels are considered a norm, these two groups, along with grocery stores and other food stores, seem to afford the bulk of the remaining opportunities in the retail field.
Of the five lines of business which
have passed their prewar high in terms of number of concerns, all except liquor stores had a lower percentage increase in sales per store than had retail stores in general. It seems likely, however, that for some of these groups a heavy demand is awaiting the supply and that, as in the case of automobile dealers, the increase in numbers is in anticipation of future sales.

## The Service Industries

The number of firms in the service trades as a whole increased almost as rapidly in the last 2 years as the number in the retail field. Automobile repair shops, especially, made a notable rise24 percent-a recovery of nearly all of their previous loss in number. This increase is no doubt related to the increased average age of automobiles. The number of barber and beauty shops has risen less sharply while amusements and motion pictures have gone up only slightly.

## Business Turn-Over, 1944-45

The rapidity with which business concerns disappear, change hands, and reappear has always been of considerable interest to the business community. During the war, the closing of almost a million firms within a 2 -year period, offset by only 480,000 openings, caused a good deal of concern, particularly among the champions of small busi-ness-since it was here that the wartime casualties were most numerous.

Today, however, interest has shifted to the rising number of new enterprises and fear is being expressed that many may be ill-advised. As has been indicated, in some lines there are now more firms than before the war, with no apparent slackening in the number of entrants. While it is true that a continued high rate of entry may presage failures in the future, it should be remembered that for all industries combined, and for most industry groups, the present number of businesses is not out of line with prewar standards.

Indeed, numerous difficulties stand in the way of a too-rapid rise in the number of new enterprises. Merchandise is appearing more slowly than many had anticipated. Skilled labor and materials remain scarce and new concerns especially find them difficult to acquire. Thus, despite a high level of income and an extraordinary backlog of demand in

consumers' durable goods, it may be several years before the enthusiasm for entering business has spent its force. In the meantime, the rate of business entry is likely to remain relatively high.

Since 1939 well over one-third of all business births and deaths (shown in the summary table at the end of the article) were in retail trade-a reflection of the fact that this segment of the business population accounts for a correspondingly large proportion of all business ventures. Turn-over in other lines of business was similarly closely related to the size of the parent population.

New businesses in 1945 were twice as numerous as discontinuances, resulting in a substantial increase in the total number of firms. As yet, the number of new enterprises has not been materially affected by the loan guarantee provisions of the GI Bill of Rights. Last year little more than 3,500 out of a total of more than 400,000 new firms were financed with the aid of the veteran legislation. At the present time, however, as more and more servicemen are returning to their home communities, the number of these loans is rising rapidly.

## Birth and Death Rates

The rates of entry and withdrawal in the business population for 1944 and 1945 are shown in table 3. These statistics
were computed by dividing the number of new, discontinued, and transferred businesses, exclusive of concerns without employees, by the number of employing firms operating at the first of each year.

The exclusion of the nonemploying enterprises lowered somewhat the level of the rates, since it is among the smallest firms that the highest rates of turn-over occur. The greater accuracy which was obtained by using only that portion of the business population for which data were most definitive was thought to overbalance the gain in comprehensiveness which might have been obtained by using the whole population.

Roughly 5 percent of the total number of firms with employees operating at the beginning of 1944 discontinued business during the course of the year, a rate which was duplicated the following year. Business mortality in these 2 years appears unusually low, particularly in light of prewar rates which were almost double the 1944 and 1945 over-all figures. On the other hand, the rates of entry, especially in 1945 , were close to prewar levels and represented an addition of 7 and 10 percent, respectively, to the total number of firms in business at the first of each year.

Table 3 is of interest chiefly because it indicates that the rates of entry and

Chart 4.-New and Transferred Businesses, and Discontinued and Transferred Businesses as Percentages of Number of Firms Operating at Beginning of Year ${ }^{1}$

[^8]Source of data : U. S. Department of Commerce. Digitized for FRASER
exit are quite high regardless of the kind of business considered. For example, the commonly held belief that manufacturing is a comparatively stable segment of the economy is not supported by the data on new and discontinued business. Birth and death rates in this field are as high as in retail trade.

Since business transfers in most cases represent a simultaneous entry and exit to and from business, a somewhat more

comprehensive picture of business turn－ over is obtained by adding the transfer rates to the rates for both new and dis－ continued concerns．These estimates of total turn－over for the various lines of business are shown in chart 4 ranked for the major industries and in general are more in line with what is commonly be－ lieved about business mortality than the figures on either new or discontinued firms alone．
In manufacturing，for example，a low transfer rate when added to a high rate of entry and exit brings the totals below that for retail trade．In this latter field concerns are apparently more frequently sold than liquidated．

## First－Year Mortality High

The typical new business is particu－ larly susceptible to failure early in life． Difficulties in securing trade and bank credit，lack of experience in meeting even the ordinary problems of business operation，uncertainty with respect to employees and suppliers，the absence of an established clientele，all are particu－ larly acute during the first year of a firm＇s existence．

Even with the favorable business con－ ditions which prevailed during 1944， roughly 16 percent of all new businesses with employees which opened during that year closed within the first 12 months．${ }^{2}$ Variations in first－year mor－ tality rates ranged from 24 percent in mining and quarrying to 6 percent in wholesale trade．In retail trade， 22 per－ cent of the firms were casualties in the first year，with rates for manufacturing and the service industries at 12 and 16 percent，respectively．
Needless to say，these first－year mor－ tality rates are considerably higher than comparable discontinuance rates in table 4 for firms of all ages．The difference is indicative of the difficulties which new firms encounter in their struggle for survival．

${ }^{1}$ Data represent voluntary and involuntary bankruptcy cases referred during the fiscal years ending June 30 to the U．S．District Courts． The base period for the inder is an average of the fiscal years 1940 and 1941 ；basic data for subsequent fiscal vears also were averaged before computing the index．The number of bankrupt－ cies for the calendar year 1943 shown in the chart includes an estimate by the U．S．Depart－ ment of Commerce for the fiscal year ending June 30， 1946
Sources of data：U．S．Department of Com－ merce，Dun and Bradstreet，Inc．，and Adminis－ trative Office of the U．S．Courts．

## Turn－Over Involves Small Firms

Table 4 presents data on new，discon－ tinued，and transferred firms for 1944 and 1945 for six size groups classified in terms of number of paid employees． The distributions by size are essentially similar for new，discontinued，and trans－ ferred businesses，with the greatest number of firms in each case in the smallest size groups．In table 5 these figures are shown as percentages of the total number of firms in each of the various size categories．

## Discontinuances Not Necessarily Failures

The different trends followed by dis－ continuances，failures，and bankrupt－ cies are shown in chart 5 ．In spite of wartime difficulties，all categories have fallen to extremely low levels in recent years．

The very high rate of discontinuance in 1941 was undoubtedly a reflection of the large number of men inducted into the Army and the rapid expansion of employment in war industries．Con－ versely，the sharp drop in inductions in 1944 was accompanied by a decline in business discontinuances．

Differences between the figures on commercial failures，business bankrupt－ cies，and business discontinuances em－ phasize the fact that discontinuances are not necessarily failures．Thus，in 1945，there were approximately 150,000 discontinuances， 800 commercial fail－ ures，and 1,300 business bankruptcies．

Obviously，the figures are not compara－ ble；the data on commercial failures，for example，do not include many very small concerns．Allowing for these differ－ ences，however，it is clear that only a small number of all closed businesses result in known loss to creditors－－the criterion used in the failure figures．

Aside from any such technical defini－ tion of failure，a firm which does not pro－ vide the owner with a reasonable in－ come－and hence closes－must be counted as having fallen short of its pur－ pose，regardless of the solvency of its accounts．A large number of business discontinuances undoubtedly fall in this category．

## Appendix

Data on the total number of businesses and on the number of new，discontinued， and transferred firms classified by line of business are shown in table 6．The figures for 1944 and 1945 are being pub－ lished for the first time．Much of the data for earlier years，however，has been revised．

Increasing reliance has been placed upon tabulations from the Bureau of Old－Age and Survivors Insurance which show the number of new，discontinued， and transferred businesses subject to the social security program．Except for the absolute level of the figures，previously published data on business turn－over for the period 1940－43 were based largely upon material furnished by State unem－ ployment security agencies．

The present revision of the data on business turn－over for the years 1940－43 allows for an overlap of a complete year between the two series mentioned above－in comparison to the one quarter overlap which was possible at the time the earlier material was published．The consequent improvement in the linking of the two series has resulted in signifi－ cant changes in the level of business births and deaths for some industries in the period prior to 1944．The data for retail and service trades，however，were not sufficiently altered to warrant re－ vision of the published figures．

${ }^{1}$ Preliminary．
Source：U．S．Department of Commerce．

In general, the sources of the material, the methods used, and the limitations of the data which were discussed in previously published articles remain unchanged. ${ }^{3}$ It must again be emphasized,
${ }^{3}$ See The Business Population in Wartime
and New and Discontinued Businesses, 1940-
43, SURVEY OF CURRENT BUSINEss, May and 43, Survex
July 1944.
however, that the statistics on new, discontinued, and transferred businesses are to be regarded as estimates rather than actual enumerations. These estimates are based upon reliable but not exhaustive sources of data. Because of technical difficulties, some of which were due to inadequacies of basic sources and some of which were inherent in the nature of
the subject itself, the results are by no means to be accepted as definitive.

The reliability of the data is greater for totals than for components, for annual than for quarterly figures, for later years than for earlier, and for industrial classifications than for size classifications.

## Business Situation

(Continued from page 7)
prewar period is applied to a disposable income of 140 billion dollars, which is the annual rate for the first quarter of 1946, the computed savings figure is 19 bill-ion-or the same as the actual annual rate for the quarter.

## Possilility of Further Reduction

It must not be concluded from this analysis that savings of individuals, having returned to the prewar line of relationship in the first quarter, will remain on this line for the remaining quarters of 1946 . On the contrary, there are indications that savings may be cut still
more and fall below the prewar relationship.

First, it should be pointed out that the line of relationship referred to above is a cyclical line, not a long-term line; that is to say, it represents experience over the period of a business cycle. Years of low income, such as 1933, were years of heavy unemployment, and many individ-

${ }^{1}$ Preliminary.
${ }_{3}^{2}$ Wess than the excention of the retail and service industries, changes in the number of firms after 1943 are based upon social security data. Specific industries for retail and service trades are also based upon these data alter 1943, accounting in some cases for changes in their seasonal pattern.

Note: Due to rounding, totals do not necessarily equal sum of components. For quarterly data on number of firms prior to Sept. 30, 1943, see "The Business Population in Wartime," Survey of Current Business, May 1944.

Source: U.S. Department of Commerce.
uals spent beyond their incomes with consequent negative savings. It is probable that the long-term line of relationship is not as steep as the cyclical line.
A second consideration which may lead to a reduction of savings below the prewar relation to disposable income is
the high level of liquid assets held by individuals. The Board of Governors of the Federal Reserve System estimates liquid asset holdings of individuals, including unincorporated businesses, at 173 billion dollars at the end of 1945, compared with 64 billion at the close of
1941. Liquid assets include currency, demand deposits, time deposits, and United States Government securities. Individuals may choose to spend some of these assets this year for consumer goods and services, particularly for durables. Even if in the aggregate indi-
viduals decide not to draw down their liquid assets, they still may save less out of their current incomes than prewar experience would indicate because of the ownership of this ready cash.

## "Bunching" of Demand

A third consideration is the readily observed need of consumers for many types of goods. It is difficult to measure this element quantitatively. Consumer expenditures have increased sharply not only for goods whose demand is partly postponable, such as furniture and clothing, but also for food, gasoline, and tobacco and, in fact, for every item where supplies have increased.

This general desire for goods stems not only from a backlog of demand for warscarce items, but also from demands associated with high incomes and the needs of returned veterans. Consequently, part of the demand represents a "bunching" over a relatively short period of time. Once a family buys a washing machine or refrigerator, for example, it is no longer in the market for that commodity for many years. Once a veteran has outfitted himself completely his demand for clothing falls to a replacement basis. This temporary nature of part of the current and near-future demand must be kept in mind in appraising the trends of consumer expenditures.

## Monthly Business Statistics

The data here are a continuation of the statistics published in the 1942 Supplement to the Survey of Current Business. That volume contains monthly data for the years 1938 to 1941, and monthly averages for earlier years back to 1913 insofar as available; it also provides a description of each series and references to sources of monthly figures prior to 1938 . Series added or revised since publication of the 1942 Supplement are indicated by an asterisk (*) and a dagger ( $\dagger$ ), respectively, the accompanying footnote indicating where historical data and a descriptive note may be found. The terms "unadjusted" and "adjusted" used to designate index numbers refer to adjustment of monthly figures for seasonal variation.

Data subsequent to March for selected series will be found in the Weekly Supplement to the Survey.

$r$ Revised. Preliminary.
*New series. Data for inventories of nonferrous metals and their products were included in the "other durable goods" index as shown in the Survey prior to May 1943 issue, revised figures for the latter series and the index for nonferrous metals beginning December 1938 are available on request. For the estimated values of manuacturers inventories $21-23$ for data prior to 1945 .
tRevised series. The indexes of shipments were revised in the February and March 1945 issues; data beginning 1939 are available on request. The indexes of prices received by farmers are shown on a revised basis beginning in the March 1944 Survey: Data back to 1913 will be published later. Data for A pril 15, 1946, are as follows: Total 212; crops, 220;

p Preliminary. $\quad$ Revised. § Data for March, May, August, and November 1945 and January 1946 are for 5 weeks; other months, 4 weeks.
$\ddagger$ Data published currently and in earlier issues of the Survey cover 4- and 5 -week periods, except that December figures include awards through Dec. 31 and January figures begin Jan. 1; beginning 1939 the weekly data are combined on the basis of weeks ended on saturday within the months unless a week ends on the ist and 2 d of the month when it is included ing Revised $1942-43$ dat for urban dwelling wnits are available on weeks ended Apr. 3 , pu4, and Feb.3, 1945, which were included in he prece is is
included in the 1 -family classification; they have not been reported by type of dwelling since April 1943 but have been almost entirely 1 -family since that date.
*New series. For revised annual estimates of new construction for $1929-43$, see $\mathbf{p}$. 24 of the November 1945 Survey and for quarterly or monthly data for $1939-43, p$. 21 of the of the U.S. Departments of Commerce and Labor (data for military and naval and public industrial construction through October 1945 were supplied by the War Production Board). Estimates of total nonfarm dwelling units include data for urban dwelling units given above and data for rural nonfarm dwelling units which are not shown separately; monthly estimates are now available corresponding to the quarterly estimates shown in the November 1942 to October 1945 issues of the Survey; the monthly figures beginning January 1939 and annual totals for $1920-38$ will be published later.
tRevised series. The index of purchasing power of the dollar based on prices received by farmers has been shown on a revised basis beginning in the April 1944 Survey. The indexes of building construction have been revised for 1940-43 to October 1944; revisions are available on request.

[^9] quarterly totals) and have been adjusted to accord with the annual totals shown as a component of the October 1942 Survey (pp. . 14 ), are now compiled quarterly only (data are of the April 1944 Survey and for 1941-44, p. 8, table 6, of February 1946 issue; data in the latter table and those above arr on a revised basis; they differ from Egures published in the January 1946 Survey and earlier issues owing to the inclusion of expenditures of military personnel abroad in the total and services (dollar figures for this item are gived in the footnote to the table on p .8 of the February 1946 Survey); indexes beginning 1939, both including and excluding expenditures of military personnel abroad, are available on request.
tRevised series. For revised data (dollar figures and indexes) on sales of retail stores for January 1943 to June 1944, and earlier revisions for a number of series, see table on pp.
9 and 20 of the September 1945 Survey (corrections for p. 19 : March 1944 indexes-building materials and hardware stores, 143.6 ; jewelry stores 460.7 ; 1940 dollar figures, all retail
 beginning July 1944 were revised in the September 1945 Survey.

## DOMESTIC TRADE-Continued

- Revised. §Minor revisions in the figures prior to Norember 1941 are available on request.

New Series. Revised 1940-43 dollar figures and indexes for total chain store sales and furniture and house furnishings, $1942-43$ indexes for all series in the general merchandise group
 data shown in the Survey beginning with the June 1944 issue are comparable with estimates published currently.
†Revised series. See note marked " $\dagger$ " on p. S-7 for sources of data through June 1944 for sales of all retail stores. The indexes of department store sales for the United States

 be published later (see also note in April 1946 issue regarding recent revisions in the New York and St. Louis indexes).

\& Revised. 8 data for shipbuilding see p. 19 of December 1944 Survey; 1939-44 data for aircraft and aircraft engines are on p. 20 of the August 1945 issue. For data for December 1941-July 1942 for machine tools, see note marked " $\dagger$ " on p. S-10 of the November 1943 Survey.

* New series. Data begin ning 1939 or the estimates or production workers for ndivith finanufacturing industries will be shown later; data published in the Survey beginning with the December 1942 issue, except as indicated in note marked " 8 ", are comparable with figures published currently. Data for 1929 -43 for all manufacturing, total durable goods and total nondurable goods industries, and the industry groups are shown on p. 22 of the December 1945 Survey; estimates beginning January 1944 for these series have been further revised to adjust the series to Fed eral Security Agency data for 1944; revisions through February 1945 will be published later.
t Revised series. The indexes of production-worker emp"yment and of production-worker pay rolls fop. individual industries (except as indicated in note marked " 8 ") and 1939-40 data for the unadjusted series for all manufacturing, total durable goods and total nondurable goods in20 of the October 1945 issue; data beginning January 1944 for the totals and the industry groups have been further revised to levels indicated by 1944 data from the Federal Security Agency; revisions for January 1944 -February 1945 for the unadjusted series and all revisions through February 1945 for the adjusted totals (p. S-11) will be shown later.

Revised. P Preliminary. 1 See note marked "" Data beginning August 1942 are available in the November 1943 Survey; earlier data will be published later Total includes state engineering, supervisory and administrative employees not shown separately.
I United States totais beginning August 1945 include approximately 53,000 clerks at third-class post offices and substitute rural carriors not reported previously; see also note in July 1944 Survey regarding changes in the data beginning in 1943. December figures do not include excess temporary post offce substitutes employed only at Ciristmas. *New series. Indexes beginning 1939 for employment in retail food establishments and beginning 1940 for water transportation are shown on p. 31 of the June 1943 Survey. Data beginning 1939 for all series on average hours will be published later; data beginning March 1944 for the aircraft engines industry and beginning March 1942 for other series are available in previous issues of the Survey.
trevised series. See note marked " T " on p . S-10 regarding revisions in the indexes of employment in manufacturing industries and sources of revised data. Data for $1037-43$ for the index of employment and pay rolls in the telephone industiy are onp. 20 of the May 1945 Survey and data beginning 1937 for the telegraph industry will be published later; data for $1939-41$ for the other Department of Labor series on nonmanufacturing employment and pay rolls are on p . 31 of the June 1943 Survey. The index of railway employees' bas been

## EMPLOYMENT CONDITIONS AND WAGES-Continued

' Revised. ${ }^{1}$ Partly estimated. $\ddagger$ See note marked " $\S$ " on p. S-10. ©Small revisions in the data for January 1940 to May 1944 are available on request.
TData beginning April 1945 are not comparable with earlier data. See note for hours and earnings in telephone industry at bottom of p. S-13 of April 1946 Survey.
$\sigma^{\prime}$ Rates refer to all employes rather than to wage earners and are therefore not strictly comparable with data prior to 1943 published in che survey.
${ }^{\circ}$ "New series. Data on average hours for the telephone industry for $1937-43$ are shown on p. 20 of the May 1945 Survey (see also note " $\%$ "above) and data for the telegraph industry beginning June 1943 (the earliest available) are given in note on p. S-11 of the January 1945 jssue; data beginning March 1942 for all other series on average hours are available in the May 1943 Survey and data back to 1939 will be published later. The new series on veterans' nnemployment allowances relate to readjustment allowances payable under the Service men's Readjustment Act of 1944; data beginning September 1944 will be shown later. Indexes of pay rolls for the printing and publishing subgroups beginning 'Angust 1942 are on p. S-12 of the November 1943 Survey; data back to 1939 will be published later. Data beginning 1939 for the series on initial unemployment compensation claims will be shown later (see note in April 1946 Survey for definition of initial claims).
$\dagger$ Revised series. Data beginning June 1942 for nonagricultural placements are available in the August 1943 Survey; earlier data will be published later. For information regarding

$\sigma^{*}$ Excludes loans to other Farm Credit Administration agencies.
$\ddagger$ Rate on all loans; see note on item in April 1946 Survey.
\& Effective Jupe 12, 1945, only gold certificates are eligible as reserves; for total reserves through May 1945, see April 1946 Survey and earlier issues.

- A rate of 0.50 became effective Oct. 30, 1942, on advances to member banks secured by Government obligations maturing or callable in 1 year or less.
*New series. Data beginning December 940 for the series on taxable Treasury notes are available on p. S-14 of the April 1942 and later issues of the Survey. For information regarding the sexies on consumer credit see note marked "*"' on p. S-16.
$\dagger$ Bank debits have been revised beginning May 1942 to include additional banks; see note in the A pril 1946 Survey for source of 1942 data.

|  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| in that issue: data for various components have subsequently been revised from time to time; revisions that have not been published are indicated in the note marked "*" on p. S-15 |  |  |  |  |  |  |  |  |  |  |  |  |  |
| of the April 1946 Survey. Data for industrial banks and industrial loan companies were formerly shown combined as industrial banking companies. The series on payments to policyholders and beneficiaries represents estimated total payments in the United States, including payments by Canadian companies (see also note marked "** on p. S-16 of the April |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 1946 Survey). <br> t Revised series. All series for insurance written are estimated industry totals and, with the exception of data for ordinary insurance, are revised series not comparable with data published in the Survey prior to the March 1946 issue (sce note in that issue for the basis of the estimates). The data for ordinary insurance continue the data from the life Insuran ce Sales Research Bureau which have been published regularly in the Survey; revised data for 1940-44 for industrial, group, and the total will be published later. |  |  |  |  |  |  |  |  |  |  |  |  |  |

PRevised. $p$ Preliminary. ${ }^{\text {P Deficit. } \& \text { Special issues to Government agencies and trust funds. } \otimes \text { Data are on basis cf Daily Treasury Statement (unrevised). }}$ Partly estimated. ${ }^{2}$ Includes prepayments on securities sold during loan drive beginning in the month but issued after the close of the month. for Canada and the total are available on request; see also note in April 1946 Survey regarding revisions for 1944.

A Publication of data suspended during the war period; data for November 1941 to February 1945 will be published later
$\sigma^{2}$ The totals for 629 companies, the miscellaneous group, and net profits of 152 companies have been revised beginning 1941 , transportation equipment beginning 1942, and other series for some quarters of 1943; revisions through the second quarter of 1944 have not been published and are available on request.
$\ddagger$ For 1941 revisions see p. 17 of the November 1942 Survey; debt retirements which have been comparatively small in recent years are excluded.
*New series. For data far $1929-40$ for profits and dividends of 152 companies see $p .21$, table 10 , of the April 1942 Survey (see note marked " $\sigma^{\prime \prime}$ " above regarding $1940-44$ revisions).

 the data on net expenditures of Government corporations and credit agencies

## FOREIGN TRADE-Continued

Revised. Less than $\$ 500$.
§ The publication of practically all series on foreign trade included in the 1942 Supplement but suspended during the war period is resumed in this issue. Export statistics include lend-lease exports shown separately on p. S-20 (see note, marked "*'' on that page), shipments by UNRRA and private relief agencies, and since June 1945 comparatively small shipand total imports are shown on p. 22 of the June 1944 Survey; revised figures for 1941 and later data through February 1945 for other series will be shown later.

r Revised. d Deficit. IData for March, June, September, and December 1945 and March 1946 are for 5 weeks; other months, 4 weeks.
whew series. For data beginning 1929 for the transportation indexes, see pp. 26 and 27 of the May 1943 Survey (scattered revisions have been made in the series marked " $\dagger$ " as published prior to the December 1943 Survey; revisions are available on request). Comparable data beginning January 1943 for freight-car shortages and surpluses and an explanation
tSee note marked "*" regarding revisions in the transportation indeyes and car sur
October 1943 Survey, have been revised beginning 1939 or 1940; all revisions are available on The indicated spasonally adjusted series for freight carloadings, as published prior to the common carrier bus lines except long-distance interstate motor carriers; similarly, data for passengers carried, beginning in the May 1945 issue, represent estimated total revenue pasengers carried by all local transit lines; revised data beginning 1936 will be published later.

## r Revised. 1 Excludes data for Mississippi which has discontinued monthly reports: March 1945 figure excluding this State $1,255,000$, February $1946,1,272,000$.

$\bigcirc$ For a brief description of this series see note in April 1946 Survey. $\ddagger$ See note marked " $\ddagger$ " on $p$. S-25.
Includes production for beverage purposes, reported separately through October, as follows (thous. of proof gallons): Mar. 4,367 ; Apr., $412 ;$ May, $96 ;$ June, 112 ; July, 14,685 ug., 6,042 ; Sept., 4,414; Oct. 6,954 . These amounts and total production shown above after October are included also in data for production of distilled spirits shown on p. S-26.

8 See note in the April 1946 Survey with regard to differences between these series and similar data published in the 1942 Supplement to the Survey.
Data for ethyl alcohol, except stocks at denaturing plants, continue data published in the 1942 supplement to the survey but suspended during the war period; stocks at denatur-

 total tax-paid withdrawals of distilled spirits shown on p. S-26.
$\sigma^{2}$ Data for gelatin cover all known manufacturers; the series for edible gelatin continue data published in the 1942 Supplement; the totals include technical, pharmaceutical and photographic in addition to edible gelatin; data prior to February 1945 will be shown later.
$\otimes$ Data continue series published in the 1942 Supplement but suspended during the war period; data for October 1941 -February 1945 will be published later.

Revised. For revisions for the indicated series, see note at bottom of p. S-23 of the May 1945 Survey
1 Original estimates adjusted to agree with quarterly totals based on more complete reports. 19.5 survey ${ }_{2}$, Total for quarter
$\ddagger$ Data for some items are not comparable with data prior to 1945 ; see note for calcimines, plastics and cold-water paints at bottom of p. S-23 of the December i945 Survey.
§ Data for sheets, rods and tubes cover all known manufacturers and are comparable with the combined figures for consumption and shipments of these products shown in the 1942
 are comparatively small; this series includes, beginning June, data for one additional company which accounted for 7 percent of the total in that month and 4 percent for July.

See p. 24 of January 1945 Survey for 1943 revisions for total olectric power production and June 1945 Survey regarding a slight change in the data made in that issue
Data continue series published in the 1942 supplement but suspended during the war period; data for October $1941-F$ ebruary 1945 will be published later.
$\dagger$ See note marked " $\dagger$ " on p. S-25 of the April 1946 Survey regarding revisions in the data on natural and manufactured gas and the basis of the monthly estimates of gas sales.

 http://fraser.stlouisfed.orgits unfinished spirits are not included in the stock figures above but are shown on p. S-24.

| Revised. For domestic consumption only; excludes grindings for export. <br> : No quotation. <br> 2 Dec. 1, estimate. <br> ${ }^{3}$ Includes old crop only; new corn not reported in stock figures until crop year begins in October and new oats and wheat until crop year begins in July. <br> O'Data continue series published in the 1942 Supplement which were suspended during the war period; data for October $1941-$ February 1945 will be published later. <br> $\ddagger$ Data relate to regular four only; in addition data for granular four have been reported beginning 1943; see notes in previous Surveys for data through January 1946. Granular flour data for February 1946; Wheat grindings, 423,000 bushels; production, 98,000 barrels: offal. $6,193,000$ pounds. <br> § Prices since May 1943 have been quoted for sacks of 100 pounds and have been con verted to price per barrel to have figures comparable with earlier data. <br> The total includes wheat owned by the Commodity Credit Corporation stored off farms in its own steel and wooden bins not included in the breakdown of stocks. <br> - Revised series. The indicated grain series have been revised as follows: All crop estimates, 1929-41; domest c disappearance of wheat and stocks of wheat in country mills ani elevators, 1934-41; corn, oat and wheat stocks on farms and total United States stocks of domestic wheat, 1926-41; see note marked " "on p. S-26 of the April 1946 Survey for sources of revisions for 1941; all revisions are available on request. The series for feeder shipments of cattle and calves has been revised beginning January 1941 to include data for illinois; revisions are shown on p. S-26 of the August 1943 Survey. |  |  |  |  |  |  |  |  |  |  |  |  |  |

; Revised. \&For data for December 1941-July 1942, see note in November 1943 Survey.
$\ddagger$ Compiled by the U.S. Department of Labor; see note in April 1944 Survey.
$\sigma^{7}$ Cold storage stocks of dairy products, meats, pontry and eggs include stocks owned by the D. P. M. A., P. M. A., and other Government agencies; stocks held for the Armed
Forces stored in warehouse space not owned or operated by them, and commercial stocks; stocks held in space owned or leased by the Armed Forees are not included.
§ Data continne series published in the 1942 Supplement but suspended during the war period; data for October 1941-February 1945 will be published later.
$\oplus$ Data for edible offal are comparable with figures beginning June 1944 shown as "miscellaneous meats" through the April 1946 Survey (sce note in that issue) "Misecilaneous meats and meat products' shown above include sausage and sausage room products and canned meats and meat products which were not reported pricr to June 1944 . Stocks shown under bef and veal are combined figures for beef and veal: the latter also has been reported only beginning June 1944. Data for Jume 1944 to February 1946 for veal and for the items now shown as miscellaneous meats and meat productsare given in notes in the August 1944 to $\dot{A}_{\mathrm{p}}$ pill 1946 issues of the Survey. Stocks for the several meats include trimmings, which were included as "miscellaneous meats" prior to June 1944.
 April 1 ges survey).
gecorn ratio has been shown on a revised basis beginning in the March 1943 surver: revisions beginning 1913 will be shown later. The series for feeder shipmente of sheor and lambs has becn revised beginning 1941 to inelude date for Ilingis; revisions gre shown on p. S-2 - of the Augut 1943 Survey.

${ }^{r}$ Revised. aLess than 500 pieces.
1 Data reflect a change in the sample of reporting stores and in the method of summarizing reports; January 1946 figure comparable with carlier data is $\$ 0.064$.
TTax-paid withdrawals include requirements for consumption in the Thited states for both civilians and military services; withrawals for export and for consumption outside the United States are tax-free

Data continue series published in the 1942 Supplement but suspended during the war period (it should be noted that data for sugar are shown in long tons in that volume);
der 1041 Foblary win be pabished later.
Revised series. The pice or sole oak leather is shown on a reviset basis heqinning in the October 1042 surres revisions beginning Juty 933 are available on request

## LUMBER AND MANUFACTURES

${ }^{r}$ Revised
§ Data continue series published in the 1942 Supplement but suspended during the war period; data for October 1941 February 1945 will be published later
 $t$ Revised serics. The following lumber series have been recently revised to adjust the monthly figures to 1044 totals for

 fications given above apply to data collected beginning February 1945 ; earlier data were computed by linking slightly different series to the current data.

| Unless otherwise stated, statistics through 1941 and descriptive notes may be found in the 1942 Supplement to the Survey | 1946 | 1945 |  |  |  |  |  |  |  |  |  | 1946 |  |

$r$ Revised.
Cancellations exceeded new orders by the amount shown above.
 ata for October 1941-February 1945 will be pubished later.

Data beginning October are shipments and the coverage is more than that attained previously; however, it is believed that the comparability is not seriously affected.

 orders which has been discontinued; earlier data for this series and for unfilled orders will be shown later.

 1944 for shipments for sale and unfilled orders, not heretofore shown in the survey. will be published later.

5 Revised. 1 Total for January and February. $\otimes$ Beginning 1943 data have covercd the entire industry.
$\$$ For 1946 percent of capacity is calculated on annual capacity as of Jan. 1, I946, or $91,890,540$ tons of open-hearth, Bessemer, and electric steel ingots and steel for castings; 1945 data
$\ddagger$ based on capacity as of Jan. 1,1945 ( $95,501,580$ tons).

- See March 1944 Survey for comparable data for 1942 ; the series now covers 57 manufacturers itwo formerly reporting diseontinued production of bearing inetal).
$\odot$ Total shipments less shipments to members of the industry for further conversion; data prior to 1944 were net production for sale.
I Data continue ceries published in the 1942 Supplement but suspended during the war period: data for October 1941 -February 1945 will be published later.
FTor data for Jantuary 1942-April 1944 for the indicated copper, fead and zine series, see p. 24 of the June 1944 survey.
*New series. Data for almmimm fabricated products cover total shipments of castings, forgings, shect, strip, phate, rods, bars, and other wrought products, exclusive of products

 comparability of the totals is not seriously affected.

$r$ Revised. or See note in April 1946 Survey.
 or the other series will be pablished later
 transfers of eycle products, shown separately above, are deducted before conbining the data with strieht run and cracked rasoline to obtain total motor fuel production
QData are from the Civilian Production Administration and continue similar series from the Rubler Manufacturers Association published in the 1942 Supplement; the coverage is complete. Data for November 1941 -February 1945 will be nublished later.
Marel 1945 will be shown ater
thee not narked " $\dagger$ " on P. S-36 regarding revisions in the indicated series for petroleum products. Data for asphalt roofing have been published on a revised basis beginning iu Digitixpedrifiligat sumey; see note in that issue.

${ }^{r}$ Revised. ${ }^{1}$ See note marked " ${ }^{-1 "}$ ". 9 Data for April, July, and October 1945 and January 1946 are for 5 weeks; other months 4 wecks. ${ }^{2}$ Less than 1,000 pounds.
§Data continue series published in the 1942 Supplement but suspended during the war period; data for October 1941-February 1945 will be published later
tinut aring theng October are for $64 \times 60$ cloth and continue the series for which prices through June 1943 were shown in the October 1943 Survey (this construction was discon--This series was substituted in the November 1943 Surver for the $\$ 0.096$ fober 1945 -Fchruary 1946 and $\$ 0.107$ for March 1946

- This series was substituted in the November 1943 survey for the price of $56 \times 60$ sheeting, production of which was discontinued during the war period.

DRata through August 1945 exclude activity of carbet and rug looms onerating on blankets and cotton fabrics
1 Reviscd series. For 1941 data for the yarn price series, see p. $\mathrm{S}-35$ of the November 1942 issue. Wool stocks have been publisned on a revised basis heginning 1942 (see p. S- 35 *New scries. For data becinning 1943 for production of cotton cloth and a brief descrintion of the data wool held by the Defense Supplies Corporation.
The new series for cotton and rayon goods finishing, rayon broad woven goods production, and wool yarn production are from the Burean of the Census and represent virtually com-
plete coverage; earlier data will be shown later. Data beginning 1939 for the price of raw territory wool are shown on p. 24 of the February 1945 Survey. Data beginning 1936 for the
orice series for Australian wool, which is from the Department of Agriculture, will be shown later; prices are before payment of duty. For available data for $1937-43$ for woolen and

$r$ Revised.
$\ddagger$ Data for October 1945-January 1946 include converted tronp kitchens and troop sleepers.
\$ Data for several additional companies are included beginning July or Ausust: see note in the April 1946 Survey for July and August figures excluding these companics and information regarding an earlier revision in the series.

The export series, except data for total locomotives and other locomotives, continue data formerly published in the Survey but suspended during the war period; "other locomotives" has been revised to include internal combustion, carburetor type. Diesel-electric and Diesel in addition to electric locomotives and the total revised accordingly, The series include railway, mining and industrial locomotives. Data through February 1945 for the revised series and for October 1941 - February 1945 for other series will be published later.
*New series. See note in Septernber 1945 Survey for a description of the scries on production of trucks and tractors; data begianing 1936 will be published later. Data on passenger car production are from the Civilian Production Administration and cover the entire industry; there was no production April 1942-June 1945 . Data for unfilled orders of "other
locomotives" are for class I railroads and include electric, Diesel-electric. and Diestl; data becinning 1939 will be shown later. locomotives" are for class 1 rallroads and include electic, biesel-electric. and piesel, data becinning 1939 , in be shown later. and the otner indicated indexes beginning in the December 1942 issue: see note in April 1946 Survey for the periods affected.

[^0]:    ${ }^{1}$ Includes steel ingots and steel for castings.

[^1]:    ${ }^{1}$ See Industry Report on "Construction and Construction Materials," Department of Commerce, April 1946, p. 4.

[^2]:    1 Not available
    ${ }^{2}$ Represents factory sales.
    ${ }^{3}$ Negligible

[^3]:    Note-Mr. WaId is a member of the Current Business Analysis Division, Office of rent Business Analy
    Business Economics.

[^4]:    ${ }^{2}$ The calculated equation is: Money supply (in billions of dollars) $=13.50+0.291$ (year - 1925) $\perp 0.228$ gross national product (in billions of dollars)-1.92 basic bond yields (for bonds maturing in 30 years). The average error for the period is 4.4 percent, with errors of 10 percent or more in 1921, 1929, and 1940. It should be noted that while the multiple correlation is statistically significant, this may not be true of the partial regressions on time and interest rates, since there is a high degree of intercorrelation between these two independent variables. Consequently, an analysis based on the partial regressions should be properly qualified.

[^5]:    ${ }^{3}$ See "Basic Yields of Corporate Bonds, 1900-1942" by David Durand, National Bureau of Economic Research, Technical Paper 3: June 1942.

[^6]:    ${ }^{4}$ The assumption of a proportional relationship between money and gross product is not consistent with the slope of the partial nine of regression in chart 2 , which suggests that the relationship is less than proportionate.

[^7]:    ${ }^{5}$ Total liquid asset holdings of individuals and businesses at the end of 1945 are estimated by the Board of Governors of the Federal Reserve System at approximately 225 billion dollars. This figure is lower than the figure cited above largely because of the exclusion of holdings of nonprofit associations, foreign businesses and individuals, and State and local governments, and because of an adjustment by the Federal Reserve for the mail float between demand deposit holders.

[^8]:    ${ }^{1}$ Figures do not include firms without employees.

[^9]:    PPreliminary. "Revised. \& See note marked "f" on p. S-6 of the April 1943 Survey in regard to enlargement of the reporting sample to August 1942 .
