THE

Business SITUATION

By the Office of Business Economics

Total Gross National Product is down 3% from the peak in the 4th quarter, but is higher than a year ago.

BILLIONS OF DOLLARS

The decline in private expenditures in the 1st quarter reflects both lower prices and reduced output.

BILLIONS OF DOLLARS

* INCLUDES GOODS AND SERVICES.

U.S. DEPARTMENT OF COMMERCE, OFFICE OF BUSINESS ECONOMICS.

49-165

PRODUCTION and prices continued their gradual adjustment to the reduced level of total demand as the second quarter opened. Consumer buying, which accounts for the largest segment of demand for the Nation's output, has in the aggregate remained relatively steady at the level to which it had dropped in the early part of the year, though with considerable variation by commodity groups. Business buying, however, has been characterized by shortened commitments. The Government continues as the major segment showing a rising trend.

Total civilian employment rose from March to April and the number of unemployed fell slightly to approximately 3 million. All of the April increase was in agriculture where spring work got off to an early start; nonagricultural employment declined by one-quarter million, and the hours worked per week were reduced.

Decline in national product and income

The underlying trends in the current economic situation during the current year are reviewed in a succeeding section within the framework of the national product and national income statistics. The principal changes in the major components of gross national product are shown in the chart on the left. The decline in gross national product in the first quarter of 1949 resulted from a drop in personal consumption expenditures and in private investment, the latter due chiefly to a reduction in the rate of inventory accumulation. Government purchases plus net foreign investment constituted a partial offset, so that when stated at annual rates the total at \$256 billion was \$9 billion less than in the fourth quarter but \$11 higher than a year ago.

Personal income in March was at an annual rate of \$214.3 billion, which was \$2 billion less than in February and \$7 billion lower than the peak reached last December. Wages and salaries in private industry and proprietors' income have continued downward, but these declines have been partially offset by a rise in transfer payments, chiefly unemployment insurance benefits. Total personal income was still 4 percent above March 1948.

Little change in total retail trade

The changes taking place in the various types of consumer spending in March represented a continuation of recent trends with little change in total retail trade since the turn of the year. Thus, spending at automobile stores rose 8 percent above February and 14 percent above a year earlier. Food stores sales were about the same as in February on a seasonally adjusted basis and a little lower than in the final quarter of 1948. Spending at all other types of retail stores has been declining in recent months, and was generally lower again in March. Sales at apparel stores and general mer-

chandise including department stores continued to decline on a seasonally adjusted basis. However, preliminary reports for April show that department store sales made about the usual seasonal rise.

Order backlogs reduced

Manufacturers' sales in March continued the previous month's partial recovery from their January setback. Sales of nondurable goods showed a little better than seasonal rise. Durable-goods sales, supported in some cases by sizable backlogs of consumer and business deferred demands, picked up somewhat more than is normal for March. Transportation equipment—particularly aircraft—advanced substantially. The largest decline was in the nonferrous-metals industry, partly as a result of important price decreases. Among the nondurables, textile and apparel sales were up less than is usual for March; food products, however, rose more than seasonally.

New orders placed with manufacturers in March continued generally at the reduced level prevailing in February. Inasmuch as shipments held up, a further reduction in backlogs was the result. Unfilled orders for railroad equipment, lumber and furniture showed the largest declines.

Steps taken by manufacturers to reduce commitments in the face of weakening prices and declining backlogs were reflected in the drop of \$300 million in the book value of their inventories in March. Stocks of purchased materials and goods-in-process were reduced more than \$500 million although this contraction was partly offset by a \$200 million increase in finished-goods inventories. The decrease in total stocks was due in part to seasonal factors, and to lower costs reflected in book values.

As pointed out last month, inventories of consumer goods in completely fabricated form—trade stocks and manufacturers' finished goods—appear, on the basis of prewar relationships, to be low relative to final demand. It is quite possible, moreover, that the declining backlog of orders—by reason of its influence on manufacturers' expectations—may have the effect of causing manufactures to move to reduce this ratio still more by cutting production.

Business working capital loans reduced

The decline in sales and the virtual cessation of the rise in value of inventories has reduced business requirements for working capital and has made possible substantial net reduction of commercial loans since the first of the year. In 1948 commercial loans by Federal Reserve member banks increased relatively little—less than \$750 million for the entire year as compared with \$3.8 billion in 1947 and \$4.2 billion in 1946. Banks in large cities reporting weekly to the Federal Reserve have shown a decline of \$1.5 billion in total loans of all types between the end of December 1948 and the end of April 1949. The bulk of this decline has centered in the commercial and industrial category.

Business borrowing from banks generally declines in the first quarter of the year, but this year the drop in commercial loans was much more pronounced than during the same period a year ago. For example, member bank commercial loans in leading cities declined about \$250 million in the first quarter of 1948 but fell by \$675 million in the first three months of this year. Moreover, during the month of April the decline was accelerated—outstanding loans of this type at reporting member banks fell \$700 million from the preceding month.

The drop in lending has not been confined to working capital loans. Although real estate loans at the end of April were fractionally higher than they were at the end of

1948, they have not increased since mid-January. Last year, real estate loans of reporting member banks showed a moderate but steady upward trend during the first four months as construction and real estate activity moved upward.

Easing of restrictions

As the utilization of bank credit receded, the Federal Reserve relaxed reserve requirements for all member banks, effective early in May. Reserve ratios for demand deposits were reduced from 26 to 24 percent for New York and Chicago banks; from 22 to 21 percent for reserve city banks, and from 16 to 15 percent for country banks. Reserve ratios against time deposits for all classes of banks were reduced from 7½ to 7 percent. This action has freed some \$1.2 billion of reserves and thereby increased banklending power.

The reduction in reserve requirements was only one of a number of actions taken by the government agencies to ease credit restrictions which had been adopted when inflationary pressures were still strong. Late in March, the Federal Reserve reduced margin requirements on stocks from 75 to 50 percent, and at the end of April there was a further easing in consumer credit requirements under Regulation W. Maximum contract maturities on automobiles, appliances, and furniture were increased from 21 to 24 months and down payments on furniture and appliances were reduced from 15 to 10 percent—the usual down-payment requirement in the prewar period. Moreover, purchases of furniture and appliances at \$100 or less are now exempt from Regulation W; previously the cut-off price had been \$50.

Finally, the Federal Housing Administration has now permitted insured repair and modernization loans under \$2,500 to be made without any down payment, whereas previously payment of 10 percent was required.

The waning of shortages was also reflected in the relaxation of both the voluntary steel allocation program and the export controls administered by the Department of Commerce. The amount of steel allocated for essential industries for July was reduced 40 percent from the allocations made for the preceding month. Export allocations were increased for some important products, while for a long list of other commodities, exports were authorized in unlimited quantities to most destinations.

Price declines extended

The widening area of economic adjustment is reflected by the extension of price declines in recent weeks over broader sectors of the market for industrial commodities. Sizable decreases have now occurred in all major groups of industrial products. During the month of April wholesale nonfarm and nonfood prices declined 2 percent, which was about equal to the entire previous decrease from the November 1948 peak to the end of March. Farm and food prices in wholesale and primary markets also declined about 2 percent between the beginning of April and the beginning of May. This followed two months' relative stability of these indexes beginning in February of this year.

The expanding incidence of price declines is evident from an analysis of the principal price groups. Up until the end of 1948, the sharpest price declines occurred in cotton textiles, foods, hides and leather, chemicals, and fats and oils. Although price adjustments to lessened demand pressure in these segments have continued to be made into 1949, the rate of decline slackened, as in the case of cotton textiles and hides and leather.

Adjustment in metal prices

In recent weeks the previous sharp upward trend in the prices of materials used in durable goods has been reversed. The sharp decline of scrap metal prices foreshadowed price adjustment in nonferrous primary metals. Substantial reductions in primary copper, lead and zinc prices in March and April have erased a large part of the postwar rise in the prices of these metals.

In general, quoted prices of iron and steel have not been changed substantially from their 1948 peaks, though there has undoubtedly been some reduction in effective costs of such products. Aluminum and tin prices have maintained peak levels attained last year.

Price reductions in the primary metals have made possible further substantial downward revision of prices in the fabricating industries, as in copper wire and brass products, galvanized products, and paints, and in a broad range of lead and zinc products.

Reductions in manufacturers' prices of consumers durable goods have become more general. As indicated in the analysis of production in a subsequent section, reduced demand for a number of heavy consumer-durable goods resulted in production cutbacks at the end of 1948 and in the first quarter of 1949. Formerly a similar adjustment process had resulted in price reductions for small durable-goods items, such as toasters, table radios and electric irons which, because the plants making them were easily converted to peacetime needs, had reached peak production rates early in the postwar period.

Consumers' price decline interrupted

The 5-month decline in the over-all consumers' price index was arrested in March, mainly because of an advance in retail food prices. The rise of the consumers' price index to 169.5 (1935-39=100) was slight, but it served to focus attention on the trend of food prices, which in the spring and summer of 1948 were largely responsible for the advance in retail prices. As shown in chart 2, retail food prices rose 7 percent from March 1948 to August 1948, when the consumer price index reached a postwar peak of 175. At that time, the grain shortage of the previous year had resulted in reduced marketings of livestock and record meat prices.

Improvement in 1949 food supplies

A part of the easing in food prices since last summer is attributable to increased output, both actual and prospective. The Department of Agriculture indicates that total food production in 1949 is expected to be 3 percent higher than in 1948, and nearly as much as in 1947 (see table 1). Output of food crops will be approximately the same as in 1948, with declines in vegetable (except truck) crops offsetting increases in food grain output. An increase of 4 percent in meat, dairy and poultry products accounts for nearly all of the advance in total food production.

In view of the sharp rise in meat prices last spring and summer, improved production of meat is of special significance. The bumper harvest of 1948 has made possible an increase in both beef cattle and pig production. During the first quarter of 1949, Federally inspected pork slaughter was 10 percent higher than in the same quarter a year earlier. Based on December 1948 farrowing plans of farmers, indica-

Chart 2.—Consumers' Prices

Source of data: U. S. Department of Labor, Bureau of Labor Statistics.

tions are that the 1949 spring pig crop will be 10 percent higher than in the spring of 1948.

Beef production is also increasing, although in this instance the principal effect in 1949 will be an improvement in the quality of beef rather than any substantial rise in marketings, because of the long period required for cattle to reach marketing age. The movement of stocker and feeder cattle to feed lots has been of record proportions in the winter months.

Despite a substantial rise in pork output and an increase in corn-fed beef, total meat available for consumption in 1949 is now estimated by the Department of Agriculture to be only 2 percent higher than in 1948. The small size of this gain reflects an expected decline in the slaughter of grass-fed

cattle and dairy cows—which groups are both important in the total beef supply—and of lambs and sheep. Production of poultry, however, is expected to be substantially higher; the number of chickens hatched in the first quarter indicates that farmers are going to exceed the 7 percent rise over 1948 in chickens raised, which was reported in the February survey of farmers' intentions for 1949. Dairy production will also rise by 3 percent over the preceding year, although this amount will still be short of output during 1945-47.

National Income and Product in the First Quarter of 1949

THE market value of the Nation's output of goods and services, as measured by the gross national product, declined from \$265 billion in the fourth quarter of 1948 to 256 billion in the first quarter of 1949 (see chart on p. 1). National income, which measures the Nation's output in terms of the incomes accruing in production, shrank in about the same proportion, but complete estimates are not available at this time, because of the lack of sufficient data on corporate profits.

The fall in personal income, which consists of the current income receipts of persons from all sources, was considerably smaller—from \$220 billion at annual rates to 217 billion. This was due mainly to the fact that disbursements of property income were maintained, and that the stream of production incomes was supplemented by transfer payments in the form of unemployment insurance.

Decline in output moderate

The decline in the dollar value of national output had been foreshadowed by the easing of inflationary tendencies in the latter part of 1948. It was the first sizable drop since the beginning of 1946, when the immediate postwar contraction gave way to the upward phase of the postwar boom.

To put recent developments into perspective it should be noted that the decline which occurred to date has been small. In current dollar terms, national product still exceeds every past quarter with the exception of the third and fourth quarters of 1948. Although measures of the physical volume of the national product are not available at the present time, it appears that the recent drop reflected lower prices as well as a somewhat smaller volume of output.

Spreading decline in industrial prices

The progressive shift in the basic supply and demand factors which determine the level and character of economic activity continued to be reflected in the movement of prices in the first quarter of 1949.

As will be recalled from the discussion in the February SURVEY, the general upward movement of prices had virtually ceased by the end of the third quarter of 1948. During the remainder of the year wholesale prices in general showed little change. The only significant exceptions to this generalization were livestock and meat and textile products, which declined. Under the influence of falling food prices the average of prices paid by consumers receded moderately from the postwar top reached at the end of the third quarter.

During the first quarter of 1949 price declines that reflected wholly or largely the changes which had occurred in the agricultural supply situation slowed down and were, at least temporarily, reversed from February to March, when both wholesale prices of livestock and products, and retail prices of meat increased. While prices linked to the agricultural sector of the economy showed greater firmness, price declines were spreading in the markets for industrial commodities. In general they were small or moderate, but they affected the wholesale prices of all major commodity groups, including those durables that had shown no weakness even in the closing months of 1948. Retail prices of a widening range of industrial commodities—durables as well as nondurables—were also affected.

Weakening of private demand

These price declines in the markets for industrial commodities are significant. They indicate more clearly than was evident in 1948 that the shift from inflation is not primarily due to improved agricultural supplies—an essentially erratic factor over which producers have only incomplete control. They show that it is caused also by increases in industrial capacity to produce planned by the business community; as well as by a less intensive demand than the one that had obtained in the expanding phases of the postwar boom.

Both supply and demand factors contributed to the easing of inflation in the latter part of 1948. The importance of the demand element stands out with increased clarity in the economic developments of the first quarter.

Consumer demand lower

In the first place, changes in consumer income, expenditure, and saving indicate clearly that a genuine weakening in consumer demand has occurred—in the sense that consumers are less willing to spend out of given levels of disposable income. This condition could be inferred only indirectly from the data available for the year 1948. Consumer purchases and saving both kept rising throughout 1948, and the only indication that a weakening of consumer demand (in the sense specified) was occurring lay in the fact that relative to the increase in disposable income, the increase in purchases appeared small and the increase in saving large.

In the first quarter of 1949, however, there occurred a small decline in the disposable income, a larger decline in consumer purchases, and a consequent increase in personal saving. Although the figures are subject to a margin of statistical error, particularly in view of the difficulties involved in their seasonal adjustment, this divergent movement of saving suggests strongly a weakening in aggregate consumer demand.

Inventory accumulation reduced

Domestic investment demand for gross national product also was less insistent in the first quarter of 1949, especially in business inventories. Net additions to these inventories were halved as compared with the fourth quarter. Reduced accumulation reflected the carrying out of more cautious buying policies adopted by the business community in view of the uncertainties of the price and demand situation.

Government demand increases

Government demand for gross national product (including, as explained below, foreign purchases financed with United States Government aid) increased further in the first quarter, continuing the upward trend which had become increasingly important in shaping the course of economic developments during the year 1948. Currently government demand is the only major expansionary factor in the economy, but its rate of increase, so far at least, has not been sufficient to offset the decline in demand emanating from the private sectors of the economy.

A more detailed account of these broad developments and of their reflection in the various components of the product and income flow is given in the following review.

The Flow of Income

Personal income declined by 3 billion from an annual rate of \$220 billion in the fourth quarter of 1948 to \$217 billion in the first quarter. The decline from the December peak to March was larger—3 percent or 7 billion, from a \$221 billion to a \$214 billion rate. Despite this decline, total personal income in March still exceeded the levels prevailing in the first half of 1948.

It has already been noted that the decline in personal income has been less than that in gross national product. In part this is due to the fact that incomes paid out by the business system have declined less than the value of business production, as witnessed by the maintenance of dividend disbursements. It also stems from the fact that an increase in government transfer payments in the form of unemployment insurance has worked as an offset to the decline of production incomes. Accordingly, the declines in personal income have been in wages and salaries and in proprietors' and rental income.

Wage and salary receipts drop

Total wage and salary receipts as measured in personal income dropped from the 138 billion annual rate in the fourth quarter of 1948 to a rate of 134½ billion in the first quarter of 1949. As in the case of total personal income this quarterly change somewhat understates the decline which had occurred by the end of the quarter, wages and salaries having dropped to 132 billion by March. This rate corresponds to the one which they had reached in the middle of 1948.

The decline was concentrated in manufacturing. On a seasonally adjusted basis pay rolls in other commodity-producing industries and in the distributive industries showed a smaller change, and pay rolls in the service industries and in government were maintained. Lower employment was the major factor in the decline of manufacturing pay rolls. It was reinforced by a decrease in the number of hours worked. Somewhat higher average wage rates acted as a small offset.

Drop in farm income

The net income of farm proprietors dropped from an annual rate of 18½ billion in the fourth quarter of 1948 to 17½ billion in the first quarter, roughly the level which had prevailed a year earlier. Farm income has shown a tendency to decline since the middle of 1948 and the quarterly comparison accordingly understates somewhat the fall which had occurred by March from the postwar peak.

The first quarter drop in agricultural income reflected smaller receipts from marketings—prices were lower while the volume of marketing was broadly maintained—as well as smaller net additions to farm inventories. As in the latter part of 1948, Commodity Credit Corporation outlays for price support continued to be an important element in receipts and served to maintain the income and purchasing power of farmers. In the absence of these supports the fall in prices, and the decline in the current dollar measures of national income and production that can be traced to the price element, would undoubtedly have been much larger.

The influence of agricultural support operations on the physical volume of national output produced is harder to assess. But it is probable that the psychological effects of larger price declines would have had a depressing influence on the physical volume of output also. A more detailed review of the farm situation appeared in the April SURVEY.

The drop in the income of non-farm proprietors was more moderate than in farm income and reflected mainly developments in retail trade and to a lesser extent in manufacturing and construction.

¹ Detail will not necessarily add to totals because of rounding.

² Data for the fourth quarter of 1948 are the same as those in the February issue of the SURVEY, with the exception that an actual estimate of fourth-quarter corporate profits has been substituted for the arbitrary figure previously assumed. Revisions of the national income and product estimates for 1948 to incorporate recent information will be made in the July issue of the SURVEY. It should be noted that in the interim national product data will not agree fully with revised information already published for certain components of national product, notably new private construction.

Private Domestic Demand for Gross National Product

Decline in consumer purchases

The \$1 billion decline in disposable income from \$199 billion at annual rates to \$198 billion was associated with a 4 billion decline in consumer purchases—from \$181 to \$177 billion—and personal saving over the same period increased accordingly from 18 to 21 billion. It has already been noted that these developments indicate a weakening of consumer demand. The basic causes of this weakening were discussed in some detail in the review of national income and product in the February SURVEY.

Such information as is available indicates that the reduction in consumer expenditures reflected largely lower prices, and that the physical volume of consumption was more nearly maintained.

It may also be noted that, as shown by retail sales data, the drop in the dollar value of consumer purchases of commodities occurred from December to January and that during the remainder of the quarter total purchases were stable, even though personal income continued to drop. Thus there is some evidence in these totals of a firming of consumer demand. It should be observed, however, that both for theoretical and statistical reasons this evidence is highly tentative. Moreover, it is relevant that the constancy in the totals was due mainly to a continued increase in automotive expenditures and to the stability of food purchases for off-premise consumption; and that many other major types of purchases showed continuing declines in successive months of the first quarter.

A review of recent developments in the consumer durables field, published in the April SURVEY, indicates a substantial easing in the demand for most types of durables other than automobiles, mainly as a consequence of the satisfaction of war-induced backlogs.

Domestic investment demand weakens

Gross private domestic investment purchases fell \$5 billion from the fourth quarter of 1948 to the first quarter of 1949—from an annual rate of \$43 billion to \$38 billion. There were, however, marked differences among the various types of investment.

Business purchases of plant and equipment were only slightly lower. Declines in the demand of manufacturing industries, whose postwar conversion and expansion programs had been carried out more rapidly, were offset by larger purchases by electric and gas utilities and railroads. Capital expenditures by these industries are still increasing, because of such factors as a relatively late start on some of the expansion projects, initial shortages of essential raw materials, and long construction periods required for the completion of the programs.

As appears from the survey of plant and equipment programs which was discussed in the April SURVEY, some decline from the present high level of plant and equipment purchases has been programmed by business for later parts of this year. These programs were based on sales expectations whose fulfillment is contingent upon the maintenance of a high level of business activity.

Private residential construction at \$6 billion made a less favorable showing. The first quarter rate represented roughly a 20 percent decline from the peak level of activity which, according to revised estimates of construction activity, was reached in the third quarter of 1948. It now appears more clearly than it did in 1948, when current developments in construction activity were first foreshadowed by a drop in residential building starts, that the decline in residential construction reflects such basic forces as a gradual saturation

of demand for many types of housing at existing prices and construction costs, accelerated by a less favorable credit and liquid fund position of potential buyers. The recent level of residential starts implies a further moderate reduction in construction activity in the coming months.

Most of the reduction in domestic investment is attributable to substantially smaller additions to business inventories in the current quarter than in the fourth quarter of 1948—\$2 billion as compared with 5 billions at annual rates. Net additions to farm inventories were somewhat smaller, but the largest part of the change reflects the inventory position of non-farm business.

More cautious inventory buying policies appear to have been adopted already in 1948 as uncertainty with respect to prices and sales developed in many lines of business. However, partly owing to some involuntary accumulation of stocks in the hands of sellers, these restrictive buying policies were not reflected in the actual movement of inventories until the first quarter of the current year when smaller demand for inventories served to reduce the scale of productive operations. Current inventory developments were reviewed in the April SURVEY.

Foreign Demand and the Role of Government

Net foreign investment and government purchases of goods and services, which in combination measure net foreign and government purchases of American production, increased slightly from the fourth quarter of 1948 to the first quarter of 1949—from \$41 billion to \$41½ billion, at annual rates. As will become apparent from the subsequent discussion, their continued uptrend reflected the increasing impact of Federal Government demand, including export demand financed by U. S. Government aid. State and local government demand was an additional influence. Net export demand financed from sources other than U. S. Government aid has continued to contract, reflecting the earlier depletion of the gold and dollar resources of foreign countries, as well as the increased availability of U. S. Government aid.

Break-downs of foreign and Government demand

In a discussion of the impact of foreign and government demand upon the economy the conventional break-down of this demand into net foreign investment and government purchases of goods and services is insufficient at the present time. This break-down is influenced by shifts in the financing of the international transactions of the United States in a manner which obscures more basic economic relationships.

Specifically, exports financed by U. S. Government loans are included in net foreign investment, whereas U. S. Government grants are counted as a part of government purchases. The reason for this distinction is, of course, that the former type of transaction gives rise to U. S. claims on foreign countries and is therefore properly classified under net foreign investment, whereas the latter type of transaction does not, being essentially in the nature of a gift. Hence a shift from grants to loans, for instance, causes an increase in net foreign investment and a corresponding decline in government purchases, whether or not a change in total net exports or in total U. S. Government aid to foreign countries has occurred. The decline of Federal Government purchases in the first quarter and the increase in net foreign investment is the result of such a shift (see first panel of chart 3).

It is true that shifts in the form of United States foreign aid are not without significance, and—for reasons which cannot be detailed in this brief review—it is questionable whether a more significant general purpose break-down of the gross national product than the present one can be devised. It is also apparent, however, that for the purpose of discussing

many economic problems, such shifts are immaterial. Supplementary break-downs of government and foreign purchases, necessary for an adequate review of foreign and government transactions, are given in the second and third panels of chart 3.

The second panel of this chart breaks down the total of net foreign and government purchases into total net exports, irrespective of the manner of their financing, and Federal Government purchases exclusive of all foreign aid—an item which might be termed Federal purchases for domestic purposes. It appears from the chart that the total of net exports has been relatively stable since the beginning of 1948, whereas Federal purchases for domestic purposes have been expanding rapidly.

Chart 3.—Break-downs of Federal Government Purchases of Goods and Services, and Net Foreign Investment

NOTE.—U. S. Government foreign aid excludes United States subscriptions to capital of International Bank and Monetary Fund, but includes dollar disbursements by these organizations.

Source of data: U. S. Department of Commerce, Office of Business Economics.

While this break-down is of some usefulness in discussing the actual international movement of goods and services and the amount of production available for domestic use, it would appear upon further reflection that its significance is subject to many qualifications. For instance—to take a hypothetical case—armaments transferred to foreign nations would appear under net exports in the above classification, whereas armaments used by the U. S. Government would be

classified as Federal purchases for domestic use. Yet from the standpoint of national security these two uses of armament production would be very similar, and the distinction between export and domestic use implied by the break-down would be of little significance. Moreover, this break-down does not yield a complete measure of the demand for national production that is attributable to the U. S. Government.

Such a measure, which is of more immediate interest, is given in the third panel of chart 3. Here all foreign aid outlays—loans as well as grants—have been included in government purchases, and exports are measured net of all exports financed by U. S. Government aid. Although this break-down is a superior measure of Federal total demand, it, too, has limitations that must be noted.

Net loans and cash grants are not necessarily an exact indication of the Government's contribution to the financing of exports, owing to the possibility that proceeds may be used temporarily or permanently to replenish dollar balances or gold stocks, or to repay obligations previously incurred. Nor can it be deduced that in the absence of Government loans and grants to foreign nations there would have been a corresponding reduction in the total demand for American production. It is highly probable that the net reduction would have been smaller, since to some extent alternative means of financing—say a reduction in gold and dollar resources below levels considered as safe and adequate—would have been found.

Federal purchases increase

With due regard for these qualifications, it appears from the third panel of the chart that Federal purchases (including all foreign aid) have increased sharply during 1948 and that the increase has continued in the current quarter. Over the same period net exports, other than those financed by the U. S. Government, have contracted.

Expenditures for foreign aid were the largest single element in the growth of Federal expenditures in the latter part of 1948, and their increase continued through the first quarter. It represented a recovery from a temporary dip in foreign aid outlays which followed the exhaustion of the British loan early in 1948. Agricultural price support activities also contributed heavily to the expansion of Government expenditures during 1948, and remained at a high level in the initial quarter of this year. Other factors in the 1948 expansion were the mid-year wage raise for Government employees, enlarged construction expenditures, and an increased national defense program. Purchases for national defense, which had not risen significantly until late last year, increased again in the first quarter.

Recent rise of transfer payments

In assessing the impact of the Federal Government with the aid of national income statistics, it is possible to go somewhat further than in the third panel of chart 3 by taking account of other Federal expenditures—mainly transfer and interest payments, subsidies, and grants-in-aid to State and local governments—as well as of Federal receipts. Summary information showing total Federal expenditures and receipts and the resulting surplus and deficit is presented in chart 4, which thus provides a more comprehensive picture of Federal Government operations.

Needless to say the activities of the Federal Government that are summarized in this chart do not reflect all Federal operations that impinge upon the flow of income and production. To give only one example, monetary and credit conditions are of great importance in determining the course of economic activity. Yet they cannot be discussed precisely within the framework of the national income accounts.

Chart 4.—Federal Government Receipts and Expenditures¹

¹ Receipts consist of personal tax and nontax receipts, corporate profits tax accruals, indirect business tax and nontax accruals, and contributions for social insurance. Expenditures consist of purchases of goods and services, net foreign loans, transfer payments, grants-in-aid to State and local governments, net interest paid, and subsidies less current surplus of government enterprises.

Source of data: U. S. Department of Commerce, Office of Business Economics.

because, as presently constructed, these accounts do not include comprehensive information on changes in the financial assets and liabilities of the various sectors of the economy. Nevertheless, the series on Federal receipts and expenditures that are depicted in chart 4 do focus attention on those Federal operations that have recently had the most powerful single impact on the economy.

As can be seen from the chart the recent course of total Federal expenditures did not differ greatly from that of Federal purchases of goods and services. The former was dominated by the movement of the latter, and expenditures other than for goods and services in general did not show large changes. A significant exception to this statement are transfer payments in the form of unemployment insurance which rose sharply in the first quarter.

Federal receipts decline

Chart 4 also shows that Federal receipts have declined from their peak in the first quarter of 1948. This decline reflected the reduction of income tax rates in the spring of 1948. The aggregate of other taxes was higher.

The effects of income-tax reduction have been felt only in a staggered fashion, in a period beginning with the second quarter of 1948 and ending in the first quarter of the current year. Reduced rates of individual income tax became effective May 1, 1948, with respect to current withholdings, and were applicable to quarterly declaration payments filed in June. Most of the decrease in current payments was thus reflected in the second quarter of last year, but a full 3 months of withholding at the new rates brought about a further decline in the third quarter. It was not until this year, however, that the reduction became applicable to most nonwithheld income taxes. Payment of both final settlements and January quarterly installments at rates

much below those effective for last year introduced an additional sharp drop in seasonally adjusted Federal revenues for the first quarter. Moreover, this retarded impact of the tax cut was materially reinforced by an abnormally high volume of tax refunds attributable to overwithholding in the first 4 months of 1948.

Change in fiscal position of Federal Government

As a result of the divergent movement of receipts and expenditures, the Federal surplus, which had been increasing in 1946 and 1947, showed a rapid contraction during 1948 and (according to the definitions of receipts and expenditures adopted in this review) was converted into a small deficit in the current quarter.

The change in Federal surplus and deficit as depicted in chart 4 illustrates the restrictive influence of Federal Government in the earlier phases of the postwar boom, when the character of economic activity was dominated by inflationary pressures emanating from the private sectors of the economy. It also shows the expansionary influence of Federal Government fiscal operations during 1948 and the first quarter of 1949. It may be noted that even though the shift in the Federal fiscal position compared with a year ago has been quite drastic, it was accompanied by the passing of postwar inflation and has not prevented a moderate decline in prices and also in the volume of total economic activity.

The Federal revenue and expenditure program for the fiscal year 1950 is now under discussion by Congress, and is subject also to other uncertainties, such as developments on the international scene. It is impossible therefore at this stage to make a definite statement about the future course of Federal expenditures. It is apparent, however, that Federal expenditures are still on the upgrade.

The outstanding element in the prospective expansion is military purchases whose current level is still substantially below the one envisaged by the national defense program. The scope of this program will probably increase further in view of the commitments implied in the Atlantic Pact. Purchases of goods and services under other programs are also likely to increase, although the net increase on this score will be much more moderate. In addition, there is scheduled for the coming fiscal year a substantial though non-recurring increase in transfer payments in the form of dividends on national life insurance policies. An extension and liberalization of social security benefits has also been proposed.

Taking into account all these factors it is apparent that the uptrend of Federal expenditures will continue to be a powerful expansionary force although their increase will probably be smaller than that witnessed over the past year. The net effect on the economic situation cannot be predicted, in view of the uncertainty surrounding the various Federal expenditure programs, as well as the supply and demand developments in the private sectors of the economy. Enactment of increased taxes and social security contributions would, of course, serve as an offset to the expansionary effect of increased expenditures.

In considering the role of government in the present economic situation account should also be taken of government operations that in themselves do not cause changes in economic activity, but tend to cushion declines that emanate from other sectors. On the expenditure side an automatic increase in unemployment insurance benefits and certain other types of transfer payments results from declines in

economic activity. The working of agricultural price support programs is similar in many respects. The effects of these forms of expenditure, which were absent or of smaller size in earlier periods, have already been traceable in recent economic developments. On the revenue side the automatic contraction of taxes which accompanies declines of economic

activity has a similar cushioning effect. As compared with previous business cycles this effect is also more substantial, because of the increased proportion of national income that is currently absorbed by taxes, as well as the increase in the proportion of taxes that are collected on a current rather than a delayed basis.

Trend of Manufactures

INDUSTRIAL production continues to taper off from the peak rates attained in the fall months of 1948. This easing in total output reflects the successive readjustments of various industries from the high operating rates achieved during the period when backlogs were large. As these adjustments continue, a diminishing number of industries remain in the group reporting gains in output. However, there are still some important industries—in particular, automobiles and steel—where activity is either still moving up or is sustained at or close to capacity rates.

The downward adjustments which have taken place so far have on the whole been widely spaced, moving from one product to another and then from industry to industry. The industries which reached peak operations relatively early in the postwar period have with few exceptions continued to show declining trends in output (see table 3).

Production edges lower

Total industrial output for the first quarter of 1949, as measured by the Federal Reserve seasonally adjusted production index, was about 3 percent below the postwar peak rate attained in the fourth quarter of 1948 and it was under the corresponding quarter a year earlier. The larger part of the decline in production from the fourth quarter of 1948 to the first quarter of 1949 occurred in nondurable manufacturing. However, lower activity was reported for all major industries except iron and steel and transportation equipment which includes the important automobile industry.

In March, the decline in the Federal Reserve production

index was sharpened by the curtailment in minerals production as a result of the two weeks' work stoppage in coal production and the reduced output of crude petroleum.

Divergent movements in manufacturing

Chart 5 presents the trends of production for 23 commodities which represent a broad cross section of total manufacturing. The basic data for all of the individual products included in the chart represent physical volume of output—with the exception of aircraft and clay products which are based on man-hours—adjusted for seasonal variation where seasonal factors are available.

The chart facilitates comparisons of the current position of these industries relative to their best postwar performance as well as to the prewar year of 1940, when the economy was in an expanding phase and when output was only moderately influenced by developing defense programs.

The divergent movements among individual products and industries in the past two years is strikingly featured in the charts. Of the 23 manufactured products included, only 9 have shown a generally consistent upward trend throughout the period covered. Included among these are some major durable manufactures—metals, automobiles, tractors, railroad equipment—where backlogs have been large, and a non-durable-goods industry—refined petroleum products—where demand has continued strong. For some of these products, the current rate of output is more than one-half again as large as in 1940.

On the other hand, a somewhat larger group of com-

834381°—49—2

Chart 5.—Output of Selected Semifinished and Finished Manufactured Products

¹ Basic data represent production or shipments. Data for truck trailers and apparel wool consumption for the first quarter of 1949 are an average of January and February.

² Include wheel and tracklaying types, but exclude garden type.

³ Include brick, tile, pottery and related products.

⁴ Include radio-phonograph combinations, but exclude television receivers.

Sources of data: Indexes (1940=100) were computed by U. S. Department of Commerce, Office of Business Economics, from indexes (1935-39=100) published by the Board of Governors of the Federal Reserve System and from basic data reported by various private agencies.

modities—textiles, shoes, tires, paper, certain household appliances—have passed their best postwar marks and have receded to lower rates of output, although output generally has remained substantially above prewar volume.

Through the fourth quarter of 1948, the rising industries, as represented by those in the upper panel, were more important in terms of aggregate output than the declining industries as represented by those in the lower panel. But during the first quarter of 1949, the balance shifted to the declining group.

Steel rate slightly below March peak

Steel mills turned out a record volume in the first quarter of 1949 although operations in the month of April declined about 4 percent below the March rate. Although the decline is moderate, it suggests some easing of the abnormal demand for steel products and a trend away from the unusual methods of obtaining steel through conversion and other arrangements which generally added to costs. However, the extent of the decline is limited by the high and, in some instances, expanding demand from important steel consuming industries.

Automobile output expanding

The automobile industry, with first quarter model changes over, assembled about 540,000 units in April—topping the half-million mark for the second consecutive month. The

April performance was not only the best in the postwar period but the highest since June 1929. The increase in activity in aircraft manufacturing reflects to a large extent the stepped-up program for military procurement.

In the case of freight cars, the current high volume of deliveries, with new orders continuing relatively small, has reduced the backlog of orders from 13 months' shipments in April 1948 to 6 months' shipments at the April 1949 rate. New orders averaged 600 cars per month in the January-April period of this year as compared with an average of nearly 7,000 units per month in the last half of 1948.

Supplies of many building materials have improved considerably in the last year. The cement and clay products industries, where demand has remained strong, continue to operate at postwar peak rates. In the case of lumber, where prices have declined somewhat as a result of a general easing in over-all demand, output in the first quarter of 1949 was 15 percent below the October-December 1948 period and almost 20 percent below the comparable quarter a year ago. Part of the first quarter decline, however, was attributable to unfavorable weather conditions, particularly in the Pacific Northwest. A sharp decline in unfilled orders for lumber has been accompanied by a moderate rebuilding of stocks.

Readjustment in consumer durables

The trends in output among the consumer durables other

(Continued on p. 24)

Electric Power Output and Investment

● The current secular growth in power consumption is about 5 to 6 percent per year. The actual increase since 1946 has been much more than this secular growth because of the cyclical rise in industrial production, the extraordinarily high rate of acquisition of electrical equipment of all sorts, and other adjustments peculiar to the postwar period.

The more than 4 million kilowatts of new capacity installed in 1948, well above any previous year, were just about enough to take care of normal secular growth. To meet the total increase in demand for power it has been necessary to operate existing capacity well above the optimum rate, leaving a margin of reserve capacity that is too small. How much additional capacity is required to relieve this situation is a matter of business judgment and therefore not subject to precise calculation. It is clear, however, that this requirement is large, amply justifying the industry's plans to add around 6 million kilowatts per year over the next 3 years.

The sluggish reaction of important elements of electric power demand to changes in business activity means that the growth trend will not be entirely offset except by a recession of major proportions and duration. Thus, the demand for this additional capacity is relatively firm.

THE electric power industry is undergoing a sharp expansion in facilities and in output to meet postwar demands—demands which have been reinforced in this industry by the basic, strong upward trend in the consumption of power. The recent surveys of the capital expansion plans of business for 1949² revealed that, “while some industries were showing signs that the new facilities were catching up with the deferred demands arising from the war so that a tapering off is occurring, the trend in the power industry is still strongly upward.”

The basic factors underlying this expansion are analyzed in this article which consists of two parts: (1) an analysis of the growth trend in electric power consumption and of its limited sensitivity to cyclical fluctuations; and (2) the extent of capital investment and growth of capacity in relation to current economic trends for the purpose of evaluating the strength of the demand for electric power plant and equipment as a factor in the current economic situation.

The Consumption of Electric Power

This analysis of power consumption covers the years 1922 through 1948—a period for which relatively reliable statistics are available. During this span of a quarter century, which

includes all phases of the business cycle, total generating capacity grew from less than 21 million kilowatts to more than 69 million kilowatts. The war years 1942 through 1945, except as they are included in the secular growth trend, have been excluded because war production, consumer purchases, and general living conditions characterizing these years produced a pattern of power demand that is not typical of a peacetime economy.

Since the various uses of power have different growth trends and differing responses to cyclical variations in economic activity, it is helpful to break the total consumption, which according to preliminary data amounted to 294 billion kilowatt hours in 1948, into four categories. They are:

1. Large light and power consumption
2. Domestic consumption
3. Small light and power consumption
4. Public service consumption

These four classes represent the most workable division for our purposes. Data for each are presented for the years 1922 through 1948 in table 1. As will be more explicitly stated in the following sections, the data within the classifications are not entirely homogeneous, a fact which, while it does not significantly alter the conclusions of this report concerning the aggregate consumption of power, does make the analysis of the various types of consumption less exact than would be desirable.

Table 1.—Consumption of Electric Power

[Millions of kilowatts-hours]

Year	Large light and power ¹	Domestic	Small light and power	Public service	Total
1948 ^p	177,697	57,050	43,125	16,050	293,922

² SURVEY, April 1949, p. 9.

Industrial consumers take three-fifths of total

The first category, consisting primarily of electricity consumed for industrial purposes,³ is by far the largest amount of the four. It consists of the sales of power by utility companies to the large light and power users, to which has been added the production of electric power by the various user-owned plants. In 1948, the 124 billion kilowatt-hours of utility sales plus 54 billion kilowatt-hours of nonutility power production amounted to over 60 percent of the entire United States power consumption.

The consumption of electrical energy by the large light and power users is, as is the case with all other segments of power consumption, determined by a growth trend modified by cyclical fluctuations in the level of economic activity. The growth trend which seems best to fit this period is depicted in the top panel of chart 1 by a dotted line. The level

Chart 1.—Large Light and Power Consumption

¹ Includes production of user-owned plants, published by the Federal Power Commission.
² Ratio of the Federal Reserve Board Index of Industrial Production for each year to the level for that year determined by a constant rate of increase between the years 1923 and 1947.

Sources of data: Actual consumption, Edison Electric Institute, except for 1922-27 and 1948 which are from *Electrical World Magazine*; calculated consumption, U. S. Department of Commerce, Office of Business Economics.

of the line represents consumption at full employment levels. Since this is a straight line plotted on a semilogarithmic chart, it depicts a constant percentage increase amounting to a little over 5 percent annually. In absolute quantities, this secular growth is, of course, considerably larger now than it was in the early twenties, amounting currently to over 9 billion kilowatt-hours per year.⁴

³ Large light and power consumers are those with a consumption usually in excess of 50 kilowatts. While primarily industrial, they include some large nonindustrial business establishments and even a few large residential developments. Also a few of the user-owned plants belong to nonindustrial users.

⁴ The fact that the data to which the trend is fitted are in terms of actual energy consumption rather than demand, and therefore may understate slightly the amount of energy which would be consumed currently if it were freely available, should not affect significantly the estimate of the secular growth in demand.

The growth in the use of industrial power has been more rapid than the corresponding secular growth in the physical volume of total national output, which has been estimated at less than 3 percent per year, or the growth in industrial production as measured by the Federal Reserve Board index, which over the same time was less than 4 percent per year.

Probably the most important single factor in the strong growth has been the trend toward increased mechanical power per worker, with most of the increase as well as part of the existing mechanization being electrified. A further influence contributing to increased use of electric energy for many purposes has been the development of low cost power, particularly in areas rich in resources but previously deficient in power capacity.

The importance of these influences is indicated in the increased power consumption per unit of output in the three industries which are the largest consumers of power. In the short space of time between 1939 and 1946, the iron and steel industry increased its kilowatt-hour consumption per point in the Federal Reserve Board index for iron and steel by 20 percent. The chemical and paper-making industries increased their power usage by about 5 percent per index point. The increased use of power in producing the light metals is particularly striking. The kilowatt-hour consumption by the combined nonferrous metals industries expanded 43 percent per index point.

Cyclical fluctuations important

The difference between the estimated growth trend and the quantity actually consumed by industry can be seen in chart 1. The depression of the early 1930's caused a large discrepancy between the trend line and actual consumption during those years. The relation between changes in demand for power and changes in the level of economic activity is pictured in the middle of chart 1. More specifically, the country's actual industrial consumption of power, expressed as a percentage of the level determined by the secular trend, is compared with industrial production expressed as a percent of its secular trend.

The fluctuations in power consumption associated with the cyclical fluctuations in production, while sharp and immediate, are not proportionate to changes in the latter. This is particularly noticeable in 1932 when the drop in production to approximately 50 percent of what could have been expected from a full employment economy was accompanied by a drop in industrial power demand to a point equal to about 65 percent of the full employment secular trend.

This is not surprising, since certain overhead uses of power are relatively fixed even though the quantities used directly for production are not. Any reduction in the output of factories would immediately be reflected in less power used for machinery and equipment but would have much less effect upon that part used for lighting and other essential services within the plants. Furthermore, the large light and power category includes some nonindustrial consumption.

In the bottom panel of chart 1, the secular and cyclical factors affecting consumption are combined, resulting in calculated quantities which have been reasonably close to actual power consumption over the period covered. The relationship is necessarily approximate. The Federal Reserve Board Index of Industrial Production used in the cyclical factor encounters various practical difficulties which make it a less than precise measure for this purpose. In particular, the components are not weighted according to power usage.

The increase in large light and power consumption from 1946 through 1948 exceeded the secular growth as depicted in chart 1. The difference is not entirely accounted for by the cyclical improvement in industrial production shown in the second section of chart 1. It seems reasonable to assume,

however, that the 8-percent increase from 1947 to 1948 is due in part to the additional demands associated with the further adjustment of the economy to a high peacetime level of operations and that it does not at this stage warrant the conclusion that the 5-percent growth trend evident in prewar years has been increased substantially.

Seven percent growth trend in domestic power

The domestic use of power consists chiefly of urban and rural residential consumption although a small amount, not believed to exceed 5 percent of the total at present, is also used for rural nonresidential purposes. On the other hand other categories include some residential power consumption through the use of master-metering arrangements. The aggregate consumption in the domestic category in 1948 was 57 billion kilowatt-hours or about 19 percent of the total for all categories.

The secular growth in domestic power consumption is shown by the dotted line in the first section of chart 3. This is a curved line from 1922 through 1941, indicating that until recently the percentage rate of growth was declining (although the absolute annual increments were becoming larger). For reasons given below it is assumed that this decline did not continue after 1941. At the present time this secular growth is estimated at a little less than 4 billion kilowatt-hours per year, or a little over 7 percent. In the early 1920's it was almost 20 percent per year but less than 1 billion kilowatt-hours.

This growth in domestic power consumption is a combination of three separate growth trends: (1) The number of occupied dwelling units, (2) the proportion of those homes wired for electricity, and (3) the average consumption per wired home. These three elements are shown in chart 2, without, however, attempting to separate cyclical from secular influences. The historical estimates are not entirely satisfactory but serve to indicate the approximate trends.

Chart 2.—Occupied and Wired Dwelling Units, July 1, and Consumption per Occupied Wired Unit

Sources of data: Estimates by U. S. Department of Commerce, Office of Business Economics, based upon data of Edison Electric Institute and U. S. Bureau of the Census.

The secular growth in the total number of occupied dwelling units has been, and remains, between 1 and 2 percent per year.

These homes were being electrified at a rapid rate in the 1920's. It is apparent that this could not continue indefinitely, as saturation was approached, and that it was

Chart 3.—Domestic Power Consumption

¹ Includes rural consumption.

² Ratio of a 4-year moving average of the current and preceding three years' disposable personal income, roughly adjusted for price changes, to a 4-year moving average of the levels for the same years determined by a constant rate of increase between the years 1923 and 1947.

Sources of data: Actual consumption, Edison Electric Institute, except for 1922-27 and 1948 which are from *Electrical World Magazine*; calculated consumption, U. S. Department of Commerce, Office of Business Economics.

primarily responsible for the percentage rate of increase in domestic power consumption before the war. At the beginning of 1947 over 90 percent of the country's occupied dwelling units were wired for electric power. This includes a higher degree of electrification for urban homes, and about 65 percent electrification for the farm homes.

On the other hand the average use per wired home has continued to grow at about the same percentage rate although the trend has been interrupted by cyclical fluctuations. Furthermore, there is every reason to expect this growth to continue. The market is still far from saturated.

Of the more commonly used appliances, those in use by at least one-fifth of the wired homes, only the refrigerator is a large consumer of electricity. In contrast, the heaviest consumers of power are those which are not now commonly used, and which have been growing most rapidly during recent years.

This continuing growth in average use per wired home between 1929 and 1948 averaged over 5 percent per year. In addition, there is the continuing growth in the number of families as between 1 and 2 percent per year. Thus, there is little reason to expect any further flattening out of the secular trend in total domestic power consumption below the rate of over 7 percent per year shown in chart 3 even though the further increase in the proportion of wired homes will be comparatively small.

Domestic consumption cyclically insensitive

Chart 3 indicates the relative stability of consumption in this category in spite of economic declines. For example, the predepression peak year in domestic power consumption was not 1929 but 1931. The subsequent decline to the low point in 1933 was very slight.

This tendency of domestic power consumption to level off rather than decline in the face of even a drastic shrinkage in consumer buying power is explained in part by the strong growth trend discussed previously and in part by the fact that the domestic use of electricity is closely related to the family's ownership of electric appliances and lighting equipment. When incomes decline consumers reduce their purchases of additional equipment but typically they continue to use the equipment already owned. This is possible because the cost of operating most of these appliances is small relative to their purchase price, and relative to other elements of the family budget. Furthermore, once a household service, such as refrigeration, has been converted to electricity a reconversion to nonelectric equipment is usually not a practical means of economizing.

Since the purchase of additional electric equipment is closely related to consumer buying power it seems reasonable to expect that the consumer inventory of such equipment, and therefore the domestic use of electricity will be related to incomes in the preceding years. To express this relationship the middle panel of chart 3 shows a moving average of disposable personal income including the current and the three previous years, and roughly corrected for price changes, as a percent of the moving average of the secular trend of income. The deviations from the secular trend of this average and of domestic power consumption were comparatively mild in 1930 and 1931 and did not reach their greatest deviation until 1935.

The 4-year moving average used in chart 3 for the postwar period excludes the wartime incomes and includes the immediate prewar incomes. This is necessary because the high wartime incomes could not be used at the time to buy additional equipment. It results, however, in some understatement of the abnormal postwar purchases of such equipment. The inability to spend even the normal amount of abnormally high wartime incomes for appliances during those years has caused, at least in part, the tremendous purchases of these goods during the past two years. As a consequence, the increase in power consumption by households during the immediate postwar period has been more rapid than would be expected from the historical relationship.

The combined effect of the growth trend and the cyclical factor is charted in the last panel of chart 3. The practical result of the mild cyclical sensitivity exhibited by domestic power consumption is to mitigate to some extent the risk of installing new generating and distribution facilities.

Small light and power growth also important

The sales of energy in the small light and power category are chiefly to commercial and institutional consumers.⁵

⁵ This is generally true, although the classification is not determined by the nature of the demand, but by its size. As a result there are included in these sales some quantities to small industrialists whose demand is less than 50 kilowatts and to residential developments falling in this category. Similarly, certain large commercial users such as the larger department stores whose consumption is recorded in the large light and power group are not included.

During 1948 these users took 43 billion kilowatts or about 15 percent of the entire United States consumption.

The growth trend in this category, as depicted in the top of chart 4, in the past was marked by a decreasing percentage increase but increasing absolute consumption. This chart assumes that the percentage increase has not declined further since 1941. This assumption and the underlying reasons are similar to those followed for domestic consumption. The present annual growth is between 5 and 6 percent per year in contrast with an annual rate of 12 to 13 percent during the 1922-24 period. It has increased in absolute terms, however, from less than one billion kilowatt-hours to over 2 billion kilowatt-hours.

This growth at a decreasing percentage rate was due to the leveling off of the growth in the number of commercial users

Chart 4.—Small Light and Power Consumption

¹ Ratio of a 3-year moving average of the current and preceding two years' gross national product, roughly adjusted for price changes, to a 3-year moving average of the levels for the same years determined by a constant rate of increase between the years 1923 and 1947.

Sources of data: Actual consumption, Edison Electric Institute, except for 1922-27 and 1948 which are from *Electrical World Magazine*; calculated consumption, U. S. Department of Commerce, Office of Business Economics.

as these establishments became fully electrified. It seems reasonable to assume that additional commercial customers are already restricted to new business units, since almost all business establishments in areas served by power companies are undoubtedly electrified. The per customer use is not easily reconciled with any concept of saturation in view of the additional new uses and the extension of existing uses of

power for commercial purposes. Thus there is reason to expect a continuation of about the present percentage trend rate of growth.

Moderate cyclical fluctuations

The deviations between actual consumption and the growth trend also show similarities to those of domestic consumption. The predepression peak in consumption lagged the business cycle turning-point of 1929 but not by so long a period as domestic consumption, occurring in 1930 rather than in 1931. The depression low was recorded in 1933 for both series although the cylindrical downturn was more pronounced in the sale of commercial power.

The relative cyclical stability of these sales, like that of domestic power, is based upon the continued operation of lights and appliances already owned despite economic declines, as well as the existence of the growth trend. Commercial power is used primarily for lighting and certain other overhead purposes such as air-conditioning and for office equipment whose use does not vary proportionately with the level of business activity. Hence, curtailed activity is not immediately reflected in reduced demand as in the case of industrial power consumption. Continued adverse economic conditions do eventually force some reduction in commercial power consumption, largely because of a decrease in the business population.

This cyclical behavior is shown more clearly in chart 4 which shows the percentage deviations of commercial power consumption from the secular trend line in the top panel. These deviations are compared with a 3-year moving average of the gross national product, roughly adjusted for price changes, and expressed as a percent of its secular trend.

It is also apparent that a shrinkage in the gross national product which is insufficient to bring about a decline in the average of the current and the two preceding years is not likely to reduce the small light and power consumption below current levels. Thus the recession of 1937-38 postponed the further cyclical recovery of consumption in this category but did not offset the normal secular growth.

This characteristic again has practical implications with respect to the risk involved in the expenditures for new plant and equipment. The combined effect of both the secular trend and the cyclical influences as measured by the ratio is indicated in the third panel of chart 4.

Public service sales

The sale of power for public service use constitutes the smallest and most heterogeneous category of the four groups under consideration. It accounted for about 16 billion kilowatt-hours in 1948, or about 5 percent of total power consumption. It includes sales by utility companies for purposes of street and highway lighting, other public functions such as government office buildings, and street and inter-urban railways—these comprising about 85 percent of the total category—plus some other miscellaneous uses.

This category suffers even more than do the others from the lack of hard and fast definitions of sales. This deficiency, and the possibility that the classification may not be consistent over the years, make any analysis open to considerably more chance of error than the preceding categories. Over the past 26 years the secular growth seems to have been at the rate of about 3½ percent per year. This is indicated in the top of chart 5. The increase from 1946 to 1948, however, did not keep up with this trend. Fortunately the category is too small to make the question thus raised of any great significance.

The same limitations apply to the analysis of the cyclical fluctuations in chart 5. The chart also shows the average

of the gross national product for the current and the preceding year, roughly adjusted for price changes, and expressed as a percent of the secular trend.

Aggregate annual growth 5-6 percent

To recapitulate, that part of the current increase in demand which is the result of the normal long-term growth currently

Chart 5.—Public Service Consumption

¹ Ratio of a 2-year moving average of the current and preceding years' gross national product, roughly adjusted for price changes, to a 2-year moving average of the levels for the same years determined by a constant rate of increase between the years 1923 and 1947.

Sources of data: Actual consumption, Edison Electric Institute, except for 1922-27 and 1948 which is from *Electrical World Magazine*; calculated consumption, U. S. Department of Commerce, Office of Business Economics.

amounts to around 16 billion kilowatt-hours or 5 to 6 percent per year distributed as follows:

	Secular growth, 1948 over 1947	
	Billions of kw.-hrs.	Percent
Large light and power.....	9.0	5.4
Domestic.....	4.0	7.4
Small light and power.....	2.3	5.5
Public service.....	.6	3.7
Total.....	15.9	5.7

The growth trend of 5-6 percent per year would result in almost 17 billion kilowatt-hours of additional consumption during 1949, or about one billion more than in 1948. Adjusting for losses between the production and consumption of electric power, this consumption would require almost 20 billion kilowatt-hours of additional production.⁶

⁶ The difference is chiefly due to the power lost in the process of transmission and distribution, but it arises also from consumption by the utility systems during their own productive processes, which is excluded from the consumption data. The total of these losses is currently about 15 percent of utility production. Imports from Canada by the utility companies are excluded from production requirements.

Production by the user-owned plants is assumed to be net of self-use losses, while their transmission losses are probably quite small since they commonly do not include extensive transmission and distribution systems. The adjustment for losses is applied against the entire secular increase in consumption because it is anticipated that the utility systems will be obliged to meet most of the additional demand for power.

Analysis of recent changes in consumption

The actual increase in power consumption from 1947 to 1948 was 25 billion kilowatt-hours of which, as just indicated, 16 billion can be accounted for by trend growth. This leaves about 9 billion kilowatt-hours of the increase to be explained by the cyclical and other changes in economic activity and in the ownership of electrical devices. By deducting secular growth from the actual change in consumption (as shown in table 1) the following estimate of cyclical changes from 1947 to 1948 are obtained.

	Cyclical and other changes, 1948 over 1947 (billions of kilowatt-hours)
Large light and power.....	3.5
Domestic.....	3.3
Small light and power.....	2.5
Public service.....	— .5
Total.....	8.8

Only the cyclical increase can be accounted for by the historical relationship to the several indices discussed. The remainder must be explained by the adjustments peculiar to the postwar period. While it is possible that the 1949 increase may also exceed the calculated growth trend, this part of the expansion of power demand is essentially non-recurring.

Demand for Additional Generating Capacity

Table 2 shows the total generating capacity at year-end by class of ownership for 1948 and previous years. The data indicate the very slight increase in capacity in user-owned plants since 1946 as well as the slow but significant increase in the proportion of total capacity owned by public authorities since 1922.

Table 2.—Installed Generating Capacity by Class of Ownership
Dec. 31, 1922–48

Translating the annual increases in production into the required additions to capacity is hazardous, not only because there is considerable latitude for business judgment in this

respect, but also because of uncertainties as to the ultimate effect of technical developments tending to change the capacity required to meet a given demand. Among these developments are the grid systems of interconnecting power lines, which tend to reduce the reserve capacity required to levels below that believed necessary prior to World War II.

The combination of these developments, and some voluntary rescheduling of power loads for certain industrial and commercial purposes, enabled the industry to reach a combined plant factor, including user-owned facilities, of 57 percent in 1948. In other words, the actual output was 57 percent of the potential output if all of the installed capacity had been operated continuously throughout the year, without

Table 3.—Annual Plant Factors by Type of Prime Mover

regard for the daily and seasonal fluctuations in demand or the adequacy of water for hydro-power or any necessary shut-downs for repairs. This plant factor compares with 55 percent in 1947 when the margin of reserve capacity was already considered to be critically low. It compares with a prewar average of 38 percent for the years 1937 to 1940, inclusive, and a peak of only 52 percent during the war. Data for other years are shown in table 3.

Since most of the anticipated future additions to capacity will be in the utility segment, the utility plant factor, shown in table 3, is also significant. This reached an all-time record of 59 in 1948 compared to 57 in 1947 and an average of 36 for the years 1935–39.

Normal growth in capacity

The present utility plant factor of 59 percent is too high. The prewar ratio of less than 40 percent is unnecessarily low. Using the 1946 plant factor of less than 51 percent, which represents approximately the mid-point, the additional average capacity required each year to take care of the normal secular growth in demand would range from a little over 4 million kilowatts in 1948 to almost 5 million kilowatts in 1951. Any reasonable deviation from the 1946 factor would not greatly affect this estimate.

Replacements small

Replacement of existing capacity has been and is likely to be small. While the implied retirements in table 4 are derived from two sets of data which are not necessarily consistent, they suggest that replacements are around 200 to 300 thousand kilowatts per year. This seems reasonable since a major portion of the capacity in this industry is relatively new. Furthermore, the need to meet peak-load demand for short periods requires that the older capacity, although inefficient for continued operation, be kept in standby status.

Backlog of demand

The backlog in the sense of an unsatisfied current demand for power is probably small. It is, however, one more element strengthening the demand for additional capacity. More important is the deferred or backlog demand for the additional capacity required to reduce the combined plant factor from 57 percent to a more adequate ratio.

It is clear that this backlog is large. About 10 million kilowatts additional capacity would be required, for example, to reduce the plant factor to slightly above the 1946 level.⁷

Table 4.—Utility Generating Capacity, 1933–48

[1,000 kilowatts]

NOTE.—Detail does not necessarily add to totals because of rounding.

Sources: Federal Power Commission, utility capacity and 1948 additions; *Electrical World Magazine*, additions.

There is considerable latitude for business judgment, however, as to what is the optimum plant factor. Hence no precise estimate of the backlog is possible.

Net additions to generating capacity in 1948 were over 4 million kilowatts, more than in any previous year. They were barely sufficient, however, to take care of the present secular growth in use of electricity. They were far short of proportional to the total increase in power consumption last year. The actual increase in output to meet the additional demand was achieved by the further increase in the plant factor described above. The "required" additions to capacity in the following table are in terms of total production for the year and average generating capacity. Thus the comparison with the additions during the year understates the increase

			Millions of kilowatts	
			1947	1948
Additional average generating capacity required if combined plant factor had remained at 1946 ratio of 48.9 percent (utility factor=50.7; user-owned factor=41.7):				
To provide for normal growth in consumption of power			4.0	4.3
To provide for the cyclical and other postwar increases in consumption of power			4.7	2.4
Total			8.7	6.7
Gross additions to electric utility capacity during the year				
Utility retirements			.3	.1
Net additions to electric utility capacity			2.0	4.1
Net additions to user-owned capacity			.1	.3
Net additions to combined capacity			2.1	4.4

⁷ The seasonally adjusted 1948 year-end annual rate of power production, including user-owned plants, was about 350 billion kilowatt-hours. To reach the 1946 combined plant factor of 49 percent would have required almost 82 million kilowatts of capacity as compared with the actual 69.5 million installed. Using a plant factor of 50 percent, the additional required capacity would be a little over 10 million kilowatts. While the difference between 49 and 50 percent is important in the backlog calculation, it makes only a negligible difference in the calculation of the required annual increase in capacity.

in the backlog during the year. It does serve to illustrate, however, that the increase in capacity did not keep up with the increase in consumption.

Capacity and peak-load demand

An alternative method of appraising the backlog utilizes the concepts of utility peak-load demand and net dependable capacity as calculated by the Federal Power Commission for the seasonal peak month of December together with the reserve margin of 15 percent over peak-load which is generally accepted as desirable.

Year	U. S. peak-load demand plus 15 percent	[Millions of kilowatts]	
		U. S. net dependable capacity	Calculated deficiency
1948	62.20	54.9	7.1

Source: Calculated by U. S. Department of Commerce, Office of Business Economics from data of Federal Power Commission.

The peak-load represents only the aggregate of actual deliveries. It excludes that portion of demand both voluntarily curtailed as the result of contract provisions and that involuntarily curtailed during the peak period in order to bring demand in line with supply.

Furthermore, this calculated deficiency is for utilities only and does not allow for any inadequacy of user-owned capacity. A rough adjustment for these two factors would raise the 7 million to nearer the 10 million kilowatts calculated above. It must be recognized, however, that no precise estimate of the backlog is possible.

Source: Federal Power Commission.

That the requirement for new capacity is large is confirmed by the expansion plans of the industry. According to the compilation in the 1949 Annual Statistical number of the *Electrical World*, the electric utilities expect to add roughly 6 million kilowatts of new capacity in each of the next 3 years. This does not necessarily conflict with Federal Power Commission statistics cited in table 6, which indicate lesser quantities for the years 1950 and 1951. The latter cover only firm expansion plans officially reported to the Commission, and reflect the incompleteness of plans for the later years.

(Continued on p. 23)

Foreign Transactions of the U. S. Government in 1948

THE European Recovery Program in the first 9 months of operation furnished \$1.9 billion of goods, services, and funds to foreign areas on a grant or long-term credit basis, or about one-third of the aggregate amount of foreign assistance provided by the U. S. Government in calendar year 1948. However, by the last quarter of the year this program, which is replacing several of the earlier government aid programs, provided two-thirds of the aid total.

The aid extended through other grants and credits authorized by Congress to provide relief and to assist in the rehabilitation of foreign countries reached \$3.6 billion in 1948. An additional amount of about \$1.6 billion was expended abroad for goods and services. Although the latter outlays were not grants or credits, but were similar to private purchases of goods and services, they also provided an important source of dollars to areas abroad.

U. S. Government receipts from foreign areas were also significant. Even with the exclusion of certain items netted against outlays for the purpose of summarization, receipts in this year aggregated \$1.2 billion. Summary data covering the various types of foreign transactions by program for calendar years 1948 and 1947 are made available in table 1.

Foreign Aid Totaled \$5.5 Billion

Foreign aid amounted to \$5.5 billion in 1948, a decline of \$.9 billion from the total provided in the previous year. During the first 3 months of 1948, aid was sustained at about the average quarterly rate prevailing in 1947 (\$1.6 billion), but, in the second quarter, assistance decline to \$1 billion. However, the uptrend of aid as the European Recovery Program accelerated brought the third quarter to \$1.3 billion and the final quarter again to \$1.6 billion. Chart 1 illustrates the fluctuation in the amounts and types of aid provided during the period.

The European countries and their dependent areas now participating in the European Recovery Program received \$4,229 million of aid in 1948, and \$4,861 million in 1947, a little over three-fourths of the aid provided to all foreign areas in each year. Other European countries received only \$52 million in 1948 as compared with \$328 million in 1947.

The United Kingdom, which benefited by \$1,017 million of U. S. Government foreign grants and credits in 1948, ranked first among recipients in both years. However, the share of this country in the total aid rendered declined from 45 percent in 1947 to 18 percent in 1948. The western zones of Germany ranked second in 1948 with \$990 million. Table 2 provides data on the utilization of U. S. foreign grants and credits by ERP and other major countries.

Grants Are the Principal Aid Medium

Aid rendered on the basis of gifts and other grants where repayment is not required or is left for future determination

NOTE.—Mrs. Shepler is a member of the staff of the Clearing Office for Foreign Transactions, Office of Business Economics. This article is based upon a summarization of data compiled and published in detail each quarter by that office.

totaled \$3.9 billion in 1948, almost double the amount provided on this basis in 1947. The utilization of loans and other credits with specified terms of repayment declined to \$1.6 billion from the 1947 total of \$4.2 billion.

Chart 1.—U. S. Government Foreign Aid: Grants and Credits Utilized

Source of data: U. S. Department of Commerce, Office of Business Economics.

This change resulted largely from the appraisal accorded during the last half of 1947 to the foreign economic situation and to repayment prospects for further U. S. foreign aid. Another result of this appraisal was the shift from programs intended to assist individual countries to a coordinated plan based, in the case of Europe, upon the self-help and mutual-aid measures of recipient nations.

In the early postwar period it was believed that emergency reconstruction aid sufficient to rehabilitate war-damaged areas of Europe and Asia could be provided largely through foreign credits. With the exception of certain post-VJ-day lend-lease shipments, grant aid prior to 1948 was extended through programs primarily of a relief nature such as the United Nations Relief and Rehabilitation Administration program and the so-called post-UNRRA and civilian-supply programs of the U. S. Government.

However, several of the earlier grant programs, in particular the Philippine rehabilitation program authorized in March 1946 and the Greek-Turkish assistance program established in May 1947, included provisions for economic aid. Such provisions constituted an approach to the measures for recovery and financial stability incorporated into the economic-cooperation programs for European recovery and Chinese aid authorized by Congress in April 1948. During the period immediately preceding the inauguration of the latter programs, additional grants, primarily of a relief nature, were extended under an interim-aid program established in December 1947.

ERP emphasizes economic cooperation

On April 16, 1948, 16 European nations and the military governments of the Anglo-American bizon and French zone of Germany signed an agreement establishing the Organization for European Economic Cooperation for the purpose of guiding recovery efforts within the framework of the European Recovery Program and recommending the division of U. S. aid among member countries. Although the zones of Trieste administered by the United States and the United Kingdom were eligible for aid under the program, these zones were not admitted to membership in the organization until October.

Bilateral agreements between the United States and each member country receiving aid provide, in general, that ERP countries balance their national budgets as soon as practicable, stabilize currencies, establish and maintain valid rates of exchange, lower trade barriers, discourage cartels, and make strategic materials available to this country on reasonable terms. Each country is committed to a sustained effort, in common with other participating countries, to accomplish the recovery-program objective of making itself independent of extraordinary dollar assistance within the 4-year span of the program.

An appropriation of \$4 billion was approved for the program for the provision of grants or credits in the 15-month period ending June 30, 1949. However, Congress stipulated that, under certain conditions, the entire amount might be utilized in 12 months. In October 1948, the Economic Cooperation Administration, which administers the program, recommended that appropriated funds be used in the shorter period and the President so authorized. Subsequently this entire amount was allocated for grant aid. An additional \$1 billion, to be provided by the sale of notes to the Treasury Department, was authorized for the extension of loans and for certain guaranties to U. S. private investors in participating countries.

By December 31, ECA had authorized the procurement of over \$4 billion of goods and services for participating countries and their dependent areas. Thus four-fifths of the amount made available for grants and loans was obligated

by the end of the calendar year. Food and agricultural commodities comprised 49 percent of the \$3.7 billion authorized for commodity procurement. Authorizations for procurement from the United States comprised 62 percent of this total, from Canada 16 percent, from Latin America 9 percent, from ERP countries 7 percent, and from all other countries 6 percent.

Chart 2.—European Recovery Program: Procurement Authorized and Aid Extended on a Grant and Credit Basis From April 3 Through December 31, 1948, by Countries

¹ Includes Eire (Ireland), Sweden, Trieste, Iceland, and Turkey; data also include administrative costs and other aid for which procurement authorizations are not required.

Source of data: U. S. Department of Commerce, Office of Business Economics.

Aid has been extended by ECA primarily in the form of shipments of commodities procured by U. S. Government agencies against funds allocated by ECA, reimbursements to participating governments for procurement made by such governments and their agents, and reimbursements to U. S. banks for payments made on letters of credit authorized by ECA. ECA also pays for the ocean transport charges on relief parcels mailed by private citizens or shipped by voluntary relief agencies.

With the inclusion of administrative expenses, the total aid rendered through these various methods reached \$1,871 million by December 31. Assistance was generally furnished on an indeterminate basis through this date, since, with only one exception, no bilateral loan agreements were concluded prior to the last quarter of the year. However, it has since been determined that \$486 million of the above total represents aid extended under the terms of the loan agreements and such aid is considered as having been provided on a credit basis.

An estimated \$300 million of additional shipments through December 31 were financed by participating countries from their dollar balances or through letters of credit. These shipments were subsequently recorded as aid when ECA

reimbursed the foreign governments or U. S. banks for expenditures made for such shipments.

Chart 2 compares the total procurement authorized by ECA for each major recipient country with the aid rendered in 1948 on a grant and credit basis as a result of such authorizations.

Counterpart funds aid recovery

ERP countries are required to deposit in special accounts the local-currency equivalent of aid received on a direct grant basis. However, certain countries have received additional grant aid on the condition that they provide commensurate grants to other countries participating in the program. In the latter case the counterpart amount must be deposited by the ultimate beneficiary.

Not less than 5 percent of all counterpart funds must be made available for local-currency expenditures of the U. S. Government and for purchases of materials for U. S. stock piles. The balance, including the unencumbered portions of similar deposits made under the post-UNRRA and interim-aid programs, may be withdrawn only for purposes agreed upon between the United States and the participating country.

By December 31 counterpart-fund deposits totaled the equivalent of \$1,152 million, including \$58 million reserved for the use of the United States. Over three-fifths of the amounts available for use by ERP countries had been withdrawn for authorized purposes, including debt retirement, the promotion of production, the development of strategic material sources, and other projects. The use of such funds constitutes a very important segment of the program and a recovery measure second only in importance to the actual dollar aid provided by the United States.

Economic aid to China is handicapped

ECA also administers a \$275-million aid program for China, which was authorized at the same time as the European Recovery Program and resembles it in some aspects. However, as a result of the civil war, the aid provided through the end of the year was largely of a relief nature. In December, because of the uncertain military situation, ECA suspended, except for certain engineering surveys, a reconstruction and replacement program for which \$70 million had been set aside.

As measured on the same basis used for recording ERP aid, the assistance reported for this program totaled \$96 million in 1948. However, authorizations issued by ECA for procurement aggregated more than twice this amount.

Civilian-supply program is maintained for occupied areas

Over one-fifth of the total foreign aid provided by the Government in 1948 was in the form of civilian supplies furnished by military agencies to occupied areas. This program, initiated in the war period for the purpose of preventing civilian disease and unrest prejudicial to our forces abroad, has been maintained at an average yearly rate of \$953 million in the three postwar calendar years.

The value of supplies provided through the program increased from \$1,063 million in 1947 to \$1,180 million in 1948. Recipients in the later year were limited to the bizon of Germany, Japan, Korea (southern), the Ryukyu Islands, and Austria.

Authority to extend recovery assistance as well as relief supplies to Japan and Korea was provided in the appropriation to the Army Department for government and relief in occupied areas for fiscal year 1949. The German bizon, as a participant in the European Recovery Program, has been provided with recovery aid by ECA.

Relief programs are terminating

The major postwar foreign relief programs were largely completed or in the process of termination by December 31, 1948. These programs furnished less than one-seventh of the 1948 aid total. Although the assistance rendered aggregated \$730 million in 1948, it declined by \$186 million from the 1947 total.

UNRRA received the last U. S. contribution in July 1947. Over \$640 million was contributed in that year, almost one-fourth of the total U. S. contribution. In May 1947 Congress authorized a post-UNRRA program for Austria, Greece, Italy, Trieste, and China to enable these countries to maintain their recovery progress. The program was largely completed by the end of 1947. No more than \$68 million of relief was extended through this medium in 1948, as compared with \$230 million in 1947.

By the last quarter of 1947 it became evident that further assistance was necessary for Austria and Italy to prevent the deterioration of their economies prior to the initiation of the European Recovery Program. In December, Congress established an interim-aid program for these countries and for France. Over \$12 million of aid was provided by the end of the month and an additional \$546 million in 1948. The latter was furnished largely in the first 6 months of the year.

Although the above relief programs are being supplanted by the economic-cooperation programs for Europe and China, the U. S. Government continues to provide relief assistance on a smaller scale through contributions to two international agencies, namely, the International Refugee Organization and the International Children's Emergency Fund. IRO, together with other refugee organizations, received a total of \$89 million of contributions in 1948 as compared with \$19 million in 1947. Contributions to ICEF totaled \$27 million in 1948 and \$15 million in 1947.

Philippines and American Republics receive economic aid

The United States is rendering assistance of vital economic importance to the Philippines under a 4-year program authorized in 1946. Through the payment of claims for compensation of war damage to public and private property, the transfer of U. S. surplus property, and other services and training furnished the Philippines, this Government extended \$249 million of aid to the new Republic through December 31, 1948. Over one-half of this amount (\$130 million) was furnished in 1948.

Aid totaling \$6 million in 1948 and \$7 million in 1947 was furnished to the American Republics under cultural and economic programs currently administered by the Institute of Inter-American Affairs. These grants are provided under agreements signed with the republics.

Other grants include military aid

The Greek-Turkish assistance program, which has been in operation since May 1947, has become an important element in the maintenance of the military security of these countries. In addition to military aid provided under the program, Greece received civilian and reconstruction assistance under the initial appropriation of \$400 million. The \$225 million appropriated for the fiscal year ending June 30, 1949, is limited entirely to military aid since these countries are eligible for economic aid under the European Recovery Program. Over \$348 million of grants were provided under the Greek-Turkish program in 1948 as compared with \$74 million in 1947.

Military assistance of \$125 million was authorized for China at the same time the Chinese economic-cooperation program was established. As a result, \$72 million of military aid was reported for China from April through December 1948.

Credit Utilizations Decline

As previously indicated, the utilization of foreign loans and other long-term credits of the U. S. Government fell from \$4,241 million in 1947, when credit use reached a postwar high, to \$1,563 million in 1948. In the first quarter of 1948 only \$725 million of credits was used as compared with an average quarterly rate of \$1,060 million in 1947. Utilizations continued to decline abruptly during the second and third quarters, totaling \$222 million and \$68 million respectively. However, as reflected in chart 1, a sharp upward trend took place in the final quarter when \$547 million of credit aid was provided, largely as a result of the ERP loans. Nevertheless, credit utilizations for the entire year comprised only 28 percent of the aid extended.

Two factors were mainly responsible for this decline. The first was the unexpectedly rapid exhaustion of the \$3,750-million special British loan authorized by Congress in July 1946. Although disbursements were originally expected to continue over a period of 3 years, the final \$300 million of this loan was withdrawn by the United Kingdom in March 1948. The second factor was the allocation for loans of not more than one-fifth of the funds available for ERP.

Although loan disbursements of the Export-Import Bank (including agent bank funds guaranteed by the Export-Import Bank) totaled \$429 million in 1948, this sum represented a decline of \$396 million from the 1947 total. These loans have played a major part in foreign aid since July 1945 when Congress increased the lending authority of this agency from \$700 million to \$3,500 million.

Another important contribution to foreign postwar recovery has been made through property credits extended by the Office of the Foreign Liquidation Commissioner, the War Assets Administration, and the Maritime Commission in the liquidation of U. S. surplus property. Utilization of such credits increased from \$234 million in 1947 to \$311 million in 1948. This increase was more than offset, however, by a decline of \$148 million in the utilization of credits extended during the postwar period for goods furnished through lend-lease channels. The latter totaled less than \$29 million in 1948. Raw cotton and other materials provided to occupied areas as a result of commodity credits extended to these areas in connection with certain rehabilitation programs accounted for \$7 million of the credits used in 1948 as against \$86 million in 1947.

Countries participating in the European Recovery Program received 79 percent of the credit aid rendered in 1948 and 90 percent of the 1947 total. However, the amount provided to these areas in 1948 was less than one-third of the prior year's aggregate. Utilizations declined by \$2,570 million to \$1,231 million. Other European countries received \$52 million of aid in 1948, all on a credit basis (see table 2).

Although credit utilizations declined, net credit commitments and authorizations increased by \$1,285 million from the 1947 total to reach \$1,665 million in 1948. Cancellations, expirations, and downward adjustments during the latter year amounted to \$515 million.

Gross loan commitments and authorizations in 1948 totaled \$1,670 million including the \$1,000 million authorized by Congress for ERP loans and guaranties. Under this authorization the U. S. Government had concluded agreements with ERP countries covering \$837 million of loans by December 31. The Congress also authorized in 1948 an interest-free loan of \$65 million for the construction of the United Nations Headquarters in New York City.

New loan commitments of the Export-Import Bank amounted to only \$135 million in 1948. Since repayments and cancellations were in excess of new loan commitments, the uncommitted lending authority of this agency increased by \$470 million from December 31, 1947, to the same date a year later.

Gross commitments and authorizations for property credits totaled \$510 million in 1948. The only new congressional

authorization for property credits during the year was for a \$150-million revolving fund for the purchase of cotton and other textile fibers for the occupied areas.

Unutilized credits totaled \$2 billion

On December 31, 1948, the amounts available for the provision of credits aggregated \$2,347 million, with the inclusion of \$1,302 million of funds unallocated by country. Unutilized loan funds comprised 84 percent of the total credit availabilities.

Over one-third of the unutilized credit total was available exclusively to ERP areas. As shown in table 3, unused credits were quite widely dispersed among the participating countries. The \$182 million of funds not allocated by country for this area included \$163 million representing the balance of the fund authorized for ECA loans and guaranties. Such guaranties cover the convertibility of profits, or the return of principal, up to the extent of the paid-in investment of U. S. private investors. As of December 31, less than \$2 million had been earmarked to cover approved guaranties. Also included is \$19 million representing the unallocated balance available to ERP countries of a credit line of \$100 million set up by the Export-Import Bank in 1945 for the purpose of financing exports of raw cotton.

¹ Less than \$500,000.

Source: U. S. Department of Commerce, Office of Business Economics.

The uncommitted lending authority of the Export-Import Bank as of December 31, 1948 (\$967 million), comprised 86 percent of the \$1,120 million of unused credits not allocable to any area. The latter also includes the \$150 million occupied area revolving fund mentioned previously.

Outstanding credits reach \$9 billion

During the 12 months ended December 31, 1948, outstanding credits increased by \$1,108 million as the result of a net increase of utilizations over principal repayments, to reach a peak of \$9,331 million. However, this increase was only a little over one-fourth of the increase during the prior year.

The indebtedness of countries participating in the European Recovery Program accounted for 87 percent, or \$8,108 million, of the amount outstanding at the end of 1948, with the United Kingdom (\$4,735 million) and France (\$2,042 million) in leading positions (see table 3).

Payments on credits in 1948 amounted to \$556 million, with the inclusion of \$100 million of interest payments. However, over one-fourth of this total represents a \$141-million payment received from Canada for amounts utilized under a \$300-million loan authorized in November 1947 and disbursed in the first 6 months of 1948. Repayment was effected in August through a \$150-million loan placed with three U. S. insurance companies. The unutilized balance of this loan was canceled in October 1948 at the request of Canada.

Cash Transactions Reviewed

The foreign grant and credit transactions of the U. S. Government, which have been discussed previously, frequently take the form of cash disbursements and receipts. Thus the gross cash-transaction data provided by country in table 4 for 1948 and 1947 are included in other tables of this article when they apply to grants and credits. Table 1 provides a consolidated statement of net foreign transactions.

Gross cash disbursements and receipts of the U. S. Govern-

ment abroad in 1948 declined to 48 and 56 percent, respectively, of the comparable amounts in 1947. Disbursements fell by \$5 billion to a total of \$4.6 billion, and receipts by \$1.1 billion to \$1.4 billion.

The decrease in disbursements is attributable primarily to the decline in loan disbursements previously discussed and to a still greater decline in cash contributions to international agencies. The disbursement in 1947 of \$2,745 million to the International Monetary Fund and \$318 million to International Bank for Reconstruction and Development completed U. S. contributions of \$2,750 million and \$635 million to the Fund and the Bank. However, such decreases were partially offset by the sizable increase in direct financial aid resulting from ECA cash grants. Financial aid payments comprise one-third, disbursements on loans one-fourth, and disbursements for supplies and materials almost one-eighth of the total amount expended abroad in 1948.

The decline in cash receipts in 1948 was caused primarily by a sharp decrease in the cash sales of surplus and other property abroad. Cash repayments on foreign credits and receipts from cash sales each comprised about 40 percent of total 1948 receipts.

All cash-transaction data are exclusive of special currencies used in occupied areas, but include military payment certificates issued by the armed forces for use only within the U. S. military economy in foreign areas.

Cash-transaction data also exclude the U. S. Government's purchases and sales of gold which totaled \$1,687 million and \$182 million, respectively, in 1948. The excess of gold purchases over sales resulted principally from the high level of foreign demand for U. S. goods and the dollar shortage abroad relative to that demand.

Net purchases of gold from the United Kingdom (\$734 million) and the Union of South Africa (\$495 million) comprise 82 percent of total net purchases. ERP countries, excluding the United Kingdom, comprised 14 percent of the total net. Sales to Venezuela were about 60 percent of all sales.

Electric Power Output and Investment

(Continued from p. 17)

An expansion of the magnitude of 6 million kilowatts per year for the next 3 years would be almost 50 percent more than in 1948 and would be much more than enough to take care of the normal secular growth in the demand for electricity. It would not suffice to eliminate the backlog. If the growth in the use of power is not affected by a substantial cyclical downturn, the combined plant factor at the end of the 3 years (1951) would still be well above any year prior to 1947.

Shipping schedule for generating equipment

Further confirmation of the strength of demand can be gained from table 5 which shows, as of October 1948, the unfilled orders for generating equipment by date of scheduled shipment.

This is based on reports by manufacturers to an industry committee set up by the National Security Resources Board.

These totals do not coincide with the quantities indicated in table 6, or the previously cited *Electrical World* data. This is due in part to the fact that they represent shipping dates, whereas the Federal Power Commission and *Electrical World* statistics are based on in-service dates. The difference arises from the time required to install the equipment and make the necessary adjustments prior to "putting it on the

line." Again the lower figure for 1951 indicates that the orders have not yet been placed rather than the existence of any present intentions to curtail outlays in that year.

At that time (October 1948) the utilities were already committed to take virtually the full output of the larger

Table 7.—Expenditures by Private Utility Companies Compared to Total Private Plant and Equipment Expenditures

¹ Federal Power Commission data adjusted by Department of Commerce. These are only crude estimates of all new private utility capital expenditures, except land purchases, and are subject to revision by the Department of Commerce. They represent value of property put in place, not of that put in service. Totals for 1948 and 1949 are based on the movement in the total expected plant and equipment expenditures as compiled by the *Electrical World Magazine* for the utility industry including municipal and State-owned systems, excluding Rural Electrification Administration cooperatives, and Federal projects.

² Includes all private producers' durable and construction expenditures less all private residential construction.

Sources: U. S. Department of Commerce, Office of Business Economics; Federal Power Commission, *Electrical World Magazine*.

generators for the next 2 years. Deliveries of a few more large generator units (over 10,000 kilowatts) could be accomplished in 1950 but substantial open capacity existed for only 1951 and later. The smaller units, not typically bought by utilities, were represented as being capable of substantial deliveries during the last quarter of 1949. The user-owned capacity is not scheduled to receive any significant quantity of the equipment, supporting the thesis that the utility companies will have the primary responsibility for meeting the increased demand for power.

Private Utility Outlays

The total demand for power, and the requisite capacity necessary to satisfy this demand, have thus far been discussed in terms of aggregates which, because of the size of government operations in this field, are inappropriate for an appraisal of the magnitude of investment in the privately owned segment alone. To evaluate the size and relative importance of further private utility capital formation proposed, publicly owned installations must be distinguished from those proposed by the private companies.

In table 6, this distinction has been made for the years 1949-51. The table also distinguishes between the types of prime movers for both the government and private sectors. It can be seen that the planned hydro-generating capacity is in large part for government installation, whereas the great preponderance of the planned fuel driven generators are privately owned.

From table 6, it will be noted that the privately owned utilities have reported about 5 million kilowatts of additional capacity to be installed and placed in operation during 1949. This represents an investment outlay of roughly \$1 billion and is less than one-half of the estimated total value of all installations, including the related transmission, distribution and general construction facilities.

The 5 million kilowatts capacity installation by the private utilities is almost half again as much as was installed by them during 1948. This does not mean a corresponding increase in total outlays for plant and equipment. The 1949 increase over 1948 in the dollar value of the installed units will be greater than the increase in construction and equipment put in place because much of the expenditure for the 1949 installations occurred in 1948. Further, there is no fixed short-term relationship between outlays for additional capacity investment and outlays for additional transmission and distribution facilities. Thus there is no reason to suppose that the total of capital goods put-in-place, estimated in table 7 at slightly more than \$2 billion, should increase proportionately with the value of installed capacity.

The increase in outlays for 1949 brings the total to about four times the annual utility expenditures during the prewar period. The present level as a percent of total business capital expenditures is not out of line with the prewar experience.

Trend of Manufacturers

(Continued from p. 10)

than automobiles provide numerous examples of adjustments to easier supply-demand relationships. The downward adjustment in a few appliance lines have been quite severe and have been followed by lower factory employment and prices. The status of backlog demands for two of these—washing machines and vacuum cleaners—as well as refrigerators and automobiles, was reviewed in some detail in the April 1949 issue of the SURVEY.

In contrast with refrigerators, where sales have shown consistent gains, manufacturers' shipments for other appliances began to decline in some instances as early as 1947 with volume in the most recent period generally at the lowest rate since the downturn began. The drop, although from a very high rate, ranged from one-third for vacuum cleaners to about one-half for washing machines and radios.

In the radio and television industry as a whole, however, activity has declined only moderately. The sharp drop in the number of radios produced has been partially offset by a substantial expansion in the output of television receivers—from an annual rate of less than 500,000 in the first quarter of 1948 to 1.7 million sets in the quarter just ended. Despite the downtrend in most of these products, output in the first quarter of 1949 remained substantially above prewar tops.

Textile manufacturing lower

In the textile industries, total activity was maintained at a high rate throughout 1947 and 1948 owing chiefly to the continued uptrend in the rate of deliveries of rayon and nylon synthetic fibers. But the downward adjustment which has been underway for more than a year in cotton and wool, has now commenced in rayon. In the first quarter of 1949 textile manufacturing fell over 5 percent below the fourth quarter rate and almost 15 percent below the postwar peak.

Cotton consumption in the first quarter of 1949 was back

close to the prewar level, dropping about one-fourth from the postwar peak. Mills consumed an average of about 680,000 bales during this period, which was about the same as the two previous quarters, but about 20 percent less than in the corresponding period of 1948. The decline in wool consumption from its postwar peak was even more pronounced, although demand was still somewhat above prewar years.

Rayon producers curtailed output in the first quarter of 1949 following 2 years of rapid expansion of productive facilities and of output. Deliveries to domestic consumers dropped to 231 million pounds, 18 percent below the previous quarter and 13 percent below the corresponding period in 1948. The bulk of the decline in producers' shipments occurred in staple yarn which in 1948 accounted for about one-fourth of total rayon consumption, and where plant expansion since prewar has been especially large. In mid-March, plants producing staple yarn operated at 70 percent of the November 1948 capacity as compared with 91 percent in the fourth quarter of 1948. In mid-April, the rate of operations in these same plants was further reduced to 50 percent.

Rayon manufacturers have built up their inventories from about 16 million pounds at the end of 1948 to a total of 48 million pounds at the end of March 1949. Stocks held by producers at that time were the highest on record and represented about three-fourths of the March rate of shipments, whereas in 1940 the ratio was somewhat less than one-half.

The shoe industry, which was the earliest of the industries shown in table 3 to reach its postwar high, curtailed output about a fourth from that level. The 5 percent increase in production in the first quarter of 1949 was compared with the previous period was somewhat less than usual on the basis of the seasonal pattern of prewar years. It will be noted that production has shown a gradually declining trend—aside from seasonal influences—over the past two years, with output in the first quarter of 1949 about 7 percent below the corresponding period a year ago, and only moderately above the prewar year.

Monthly BUSINESS STATISTICS

THE DATA here are a continuation of the statistics published in the 1947 Statistical Supplement to the SURVEY OF CURRENT BUSINESS. That volume contains monthly data for the years 1941 to 1946, and monthly averages for earlier years back to 1935 insofar as available; it also provides a description of each series and references to sources of monthly figures prior to 1941. Series added or revised since publication of the 1947 Supplement are indicated by an asterisk (*) and a dagger (†), respectively, the accompanying footnote indicating where historical data and a descriptive note may be found. The terms "unadjusted" and "adjusted" used to designate index numbers refer to adjustment of monthly figures for seasonal variation.

Data subsequent to March for selected series will be found in the Weekly Supplement to the Survey.

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey	1948										1949

* Revised. † Preliminary. ‡ Seasonal factors for a number of industries were fixed at 100 during 1939-42; data for these industries are shown only in the unadjusted series.

† Data have been revised beginning January 1946 to incorporate revisions in reports on production and sales of farm products; revised figures for January 1946-June 1947 will be published later. Annual indexes of volume of farm marketings for 1941 and 1945-46, which supersede monthly averages for these years shown in the 1947 Supplement, are published in the table on the back cover of the February 1949 Survey. These annual indexes include revisions in marketings data, and also for 1945 adjustments to 1945 Census data, which have not been incorporated in the monthly indexes for these years; data for 1940-44 for all series, and also monthly indexes of volume of farm marketings for 1945, are subject to further revisions to adjust the series to Census data.

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey	1948										1949

† Revised. p Preliminary. † See note marked "†" on p. S-2.

‡ The new orders indexes are being revised.

§ Data for 1946-47 published in the May to September 1948 issues have been revised; revisions for January 1946-July 1947 are available upon request.

† Revised series. The series for manufacturers' and wholesalers' sales and inventories, retail inventories, and total sales and inventories have been revised for all years and estimates of retail sales beginning 1942. For monthly figures for January 1946-March 1947 and earlier annual figures for manufacturers' sales and inventories (except as indicated in note marked "†") and an explanation of the revision, see pp. 8, 9, 23, and 24 of the May 1948 Survey. Monthly data for value of manufacturers' sales and inventories for 1938-45 are on pp. 15 and 20 of the January and March 1949 issues of the Survey, respectively. For reference to revised data for the retail series and a break-down of sales and inventories by durable goods and nondurable goods stores, see p. 8-8 of this issue. Annual data for 1929-47 and data for all months of 1947 for wholesale sales and year-end figures for 1938-47 for wholesale inventories are on pp. 23 and 24 of the August 1948 Survey; revised data for 1941 for total wholesale sales, durable and nondurable, are on the back cover of the February 1949 Survey. Monthly data 1941-46 for sales and 1942-47 for inventories are on pp. 23 and 24 of the September 1948 Survey. Sales and inventories of service and limited-function wholesalers only are published currently on p. S-6.

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey	1948										1949

* Revised. * Preliminary. † Designation changed from "fuel, electricity, and ice"; there has been no change in the items included.

§ April 1949 indexes: All farm products, 260; crops, 236; food grain, 227; feed grain and hay, 178; tobacco, 410; cotton, 241; fruit, 207; truck crops, 236; oil-bearing crops, 238; livestock and products, 282; meat animals, 333; dairy products, 240; poultry and eggs, 221.

* New series. The subgroup "other fuels and ice" shown in the January 1949 Survey and earlier issues has been discontinued by the compiling agency and a separate index is now computed for "other fuels" (shown above) and for "ice" which is not shown here. Data for ice are included, however, in the group total.

NOTE FOR WHOLESALE PRICE INDEXES, p. S-5.—The Department of Labor is currently reviewing and revising the samples of commodities and of reporters for the indexes, subgroup by subgroup, to reflect postwar changes in production and distribution. As subgroup revisions are completed, the revisions are incorporated in the pertinent group indexes and the all-commodity index and the subgroup indexes are revised retroactively for the entire period covered by the revision; however, to avoid repeated revisions of the group indexes and the all-commodity index, these are not revised retroactively more than 2 months. If introduction of a revised subgroup into the calculations changes significantly the levels of the group indexes and the all-commodity index, the latter indexes computed with the original sample for the first month of the revision will be provided in a footnote. In some instances, it is necessary to correct previously published indexes because of late reports, incorrect reports, or other errors in prices previously used. Indexes for the latest 2 months are preliminary and are currently revised to incorporate corrections received in the 2 months following. Any additional corrections received are incorporated in final annual summaries issued in the middle of the year. Indexes for July-December 1947 were corrected in the September 1948 Survey. Corrected indexes for January-June 1947 are available upon request.

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey

*Revised. * Preliminary. † Data include some contracts awarded in prior months but not reported. * Data now reported quarterly.

§ Data for April, July, September, and December 1948 and March 1949 are for 5 weeks; other months, 4 weeks.

¶ Data for March, June, September, and December 1948 and March 1949 are for 5 weeks; other months, 4 weeks.

¶ The series under building authorized were formerly shown as "urban dwelling units scheduled to be started" and "indexes of building construction based on building permits;" see also note in July 1948 Survey. Minor revisions in figures for number of dwelling units beginning January 1946 are available upon request.

* New series. The new series for new permanent nonfarm dwelling units started has been substituted beginning January 1941 for the series on "total nonfarm dwelling units scheduled to be started" shown in the 1947 Supplement; see note marked "¶" on p. S-5 of the July 1948 Survey for a brief description of the series; data for January 1941–April 1947 are available upon request; data prior to 1941 shown in the 1947 Supplement are comparable with the current series. The new 20-city averages of construction costs from E. H. Boeckh and Associates have been substituted for the series for selected cities shown in the Survey through the August 1948 issue; monthly figures beginning 1934 and earlier annual data will be published later. See note marked "¶" on p. S-6 of the September 1948 Survey for brief descriptions of the index of highway construction costs and the index of production of selected construction materials and source of data through 1946 for the latter series.

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey	1948										1949

† Revised.

† Data beginning January 1948 for magazine advertising include advertising in farm magazines and some other magazines which is not included in earlier data and there have been changes effective January 1948 in the classifications of electric household equipment, housefurnishings, etc., soap, cleaners, etc., and toilet goods in both the radio and magazine series. Inclusion of advertising in farm magazines in the 1948 data for magazines materially affected the comparability of the figures for automobiles and accessories and, to a lesser extent, the comparability of data for other classifications. Adjustments of earlier data are under consideration by the compiling agency and more complete information on the changes will be published later.

† Revised series. The index of nonfarm foreclosures has been revised beginning 1938 because of discovery of certain errors in reporting; revisions through April 1947 will be shown later. There have been minor revisions in Printers' Ink index of magazine advertising beginning 1947 to include advertising in farm magazines formerly shown as one of the five major components of the advertising index; annual data for this index and the combined index have been further revised beginning 1935. These revisions are incorporated in monthly data beginning February 1948 (data for February 1948—combined index, 286; magazines, 317). The Tide advertising index has been completely revised and is now based on dollar costs for all media—newspapers, magazines, farm-papers, business papers, radio (network and spot), and outdoor advertising; revised data beginning 1936 will be shown later. Estimates of personal consumption expenditures have been revised beginning 1944; revised figures for the grand total and for total durable and nondurable goods and services are shown as a component of gross national product on p. 28 of the July 1948 Survey; revised figures through the first quarter of 1947 for the subgroups will be shown later.

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey	1948										1949

† Revised. § There have been revisions beginning 1947 in the chain-store series and some earlier revisions; see note marked "†" on p. S-9.

† Estimates of retail sales and indexes of sales, with the exception of data for jewelry stores, filling stations, general stores, including general merchandise with food, and dry goods and other general merchandise stores, have been revised beginning 1947 and there have been earlier revisions in the series marked with a "†" as follows: Total, durable goods and nondurable goods stores, motor vehicles, and the automotive group, grocery and combination and the food group, beginning 1942; farm implements and the building materials and hardware group, beginning 1943; variety and the general merchandise group, beginning 1944; furniture and house furnishings and the home furnishings group, beginning 1945. Revised annual figures through 1947 and an explanation of the revisions are published on p. 22 of the September 1948 Survey. All revisions through June 1947 will be shown later.

† Revised series. See note marked "†" above regarding revisions in the indicated series under sales of all types of retail stores, and note marked "†" on p. S-9 regarding revisions in data for sales of chain-stores and mail-order houses. Estimates of retail inventories have been revised for all years and data by kinds of business have been added; year-end figures for 1929, 1933, and 1935-46 are on p. 23 of the June 1948 Survey; monthly averages for 1939 and 1940 and monthly data for 1941-47 are on p. 31 of the July 1948 Survey.

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey	1948										1949

† Revised. ‡ Preliminary. § The adjusted index has been revised beginning 1942. Revised data will be published later.

† There have been revisions beginning 1947 in the series for chain stores and mail-order houses and additional revisions back through 1942 for the total and back through 1944 for variety and the general merchandise group; revisions through June 1947 will be shown later.

* New series. Monthly figures for 1942-47 and year-end figures or monthly averages for 1938-41 are on p. 24 of the September 1948 Survey. § There have been minor revisions in department store stocks beginning 1924. Revisions through August 1947 are available upon request.

† Revised series. For revised figures for 1919-40 for the index of department store sales for the San Francisco district, see p. 23 of the April 1948 Survey; there have been further minor revisions in the indexes beginning October 1940 as published on that page and in the May-July 1948 issues. The adjusted index of department store sales for the Boston, Philadelphia, Kansas City, and Richmond districts have been revised beginning April 1940, February 1940, August 1941, and January 1944, respectively; there have been minor revisions in the indexes for the United States as published prior to the September 1948 issue to incorporate revisions in the district indexes; revised figures through February 1947 for Kansas City, March 1947 for Philadelphia, June 1947 for Boston and the United States, and September 1947 for Richmond are available upon request. For sales of service and limited-function wholesalers for 1939-46, see p. 23 of the September 1948 Survey; earlier annual totals and figures for early months of 1947 are on pp. 23 and 24 of the August 1948 issue; revisions for 1941 are as follows (mil. of dol.): Total, 34,300; total nondurable, 22,077. Data for all wholesalers are published currently on p. S-3. See note marked "†" regarding revisions in chain-store series.

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey	1948										1949

* Revised. † Preliminary.

† The unadjusted estimates of employment in nonagricultural establishments have been revised beginning January 1946 for manufacturing, mining, and government and 1945 for construction, trade, finance and the total, to adjust the series to Federal Security Agency data for 1946; revisions affected the data for transportation and public utilities only beginning January 1947; data for service were not affected. Revisions through April 1947 will be shown later. See note marked "†" on p. S-11 with regard to revisions in the indicated series for production workers.

† Revised series. The adjusted estimates of employees in nonagricultural establishments have been revised to incorporate revisions in the unadjusted series referred to in note marked "†" above and there have been revisions in seasonal adjustments affecting the figures in most cases back to 1939; revisions through April 1947 will be shown later. Estimates of production workers in the machinery and machine-shop products industry have been revised beginning January 1939 to adjust the series to Federal Security Agency data through 1946; revisions through 1947 are shown on p. 16 of the January 1949 Survey.

* See note marked "S" on page S-11.

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey	1948											1949

* Revised. * Preliminary. † Data reflect work stoppages.

† Data beginning May 1947 are not comparable with earlier data; comparable April 1947 figures and April 1947 figures comparable with earlier data are shown on p. 8-12 of the June 1948 Survey.

‡ Beginning January 1948, the building construction series has been revised to combine publicly financed construction with the privately financed construction performed by private contractors. Revised data for January and February 1948: Weekly hours, 37.1, 36.4; hourly earnings, \$1.766, \$1.791.

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey	1948										1949

* Revised. * Preliminary.

† Data reflect work stoppages. ‡ Beginning July 1, 1948, farm mortgage loan data are reported quarterly. § Rate as of April 1.

¶ Reported quarterly after July 1947 for the week ended nearest the 15th of the indicated month.

|| Rate as of May 1, 1949: Common labor, \$1.424; skilled labor, \$2.38.

* New series. The "farm wage rate per month without board" series has been discontinued. Data for the present series are based on improvements in the interview surveys, to bring the wage-rate series into better agreement with current practices; comparable data prior to January 1948 are not available.

o See note marked "o" on S-13.

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey	1948											1949

† Revised. * Preliminary. † For bond yields see p. S-20.

§ June 1948 figures include \$3,000,000,000 transferred to the "Foreign Economic Cooperation Trust Fund" and considered expended during the fiscal year 1948, as required by the Economic Cooperation Act of 1948; the effect of this transfer is to charge the budget in the fiscal year 1948 for expenditures to be made in the fiscal year 1949. Figures beginning July 1, 1948, therefore exclude expenditures from this fund, totaling \$2,237,719,000 for July 1948-March 1949.

§ Beginning June 30, 1948, individual loan items are reported gross, i. e., before deduction of valuation reserves, instead of net as previously; data reported on a gross basis for March 31, 1948, for items against which reserves are held, are as follows (millions of dollars): Commercial, industrial, and agricultural loans, 14,510; "other loans for purchasing or carrying securities," 762; real estate loans, 3,628; "other loans," 3,595. Data for April and May 1948 will not be available until figures are reported for the corresponding months of 1949. Total loans are shown on a net basis for all months.

† Revised series. Credit unions have been revised to exclude real estate mortgage loans beginning 1929, and further revised on basis of year-end figures from Federal Deposit Insurance Corp. for Federal credit unions and BLS statistics for state-chartered credit unions. Other revisions are as follows: Insured repair and modernization loans, beginning 1934; components of sale credit (furniture stores, household appliance stores, jewelry stores, and all other retail stores), beginning 1942; single payment loans and loans by small loan companies and miscellaneous lenders beginning 1946. The related totals have been correspondingly revised. Revisions are available upon request.

• Beginning July 1948 figures exclude interagency transactions involving payments to the Treasury, principally by wholly owned corporations, for retirement of stock and disposition of earnings. Effective January 1949, amounts refunded by the Government, principally for the overpayment of taxes, are reported as deductions from total receipts rather than as expenditures. Earlier figures are similarly adjusted for comparative purposes.

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey	1948										1949

* Revised. [†]Surrender values include premium notes and liens voided by lapse.

[‡]Excluding accident and health premiums which were not reported prior to January 1948; these premiums totaled \$324,035,000 for 1948 and \$91,269,000 for January-March 1949. The reporting companies accounted for 78 percent of total premium income of all U. S. legal reserve life insurance companies in 1947. Minor revisions for total collections and industrial for 1946-June 1947 are available upon request.

*New series. The new data measuring assets of all life insurance companies are estimated totals for all legal reserve companies based on reports from about 130 companies accounting for 92 to 95 percent of the total. Annual data back to 1916 and monthly data back to January 1945 are available upon request. The data for 49 companies, based on actual reports, replace the data formerly shown for 36 companies; the 49 companies accounted for about 90 percent of the total assets of all legal reserve companies at the end of 1946; monthly data back to January 1947 are available upon request. Assets for the accident and health business of life insurance companies are included in the total assets of all companies and of the 49 companies but are only partially included in the security and mortgage data; accident and health assets amounted to less than 1 percent of total assets of life insurance companies in 1947.

[†]Revised series. Beginning in the September 1948 Survey, data for RFC are shown on a revised basis as follows: Investment in capital stock of the RFC Mortgage Company and the Federal National Mortgage Association has been eliminated and, in lieu thereof, loans and purchases of the subsidiary corporations are included; loans made by the Smaller War Plants Corporation prior to its transfer to RFC for liquidation, formerly included in figures for business enterprises beginning March 1946, and loans to U. S. Commercial Company, an RFC subsidiary, and to the Defense Homes Corporation, formerly included under "national defense," have been omitted; loans to railroads and to States, etc., and loans to the United Kingdom and the Philippines were formerly included in figures for "other loans"; "mortgages purchased" includes mortgages partially guaranteed by the Veterans' Administration and mortgages insured by FHA; RFC equity in mortgage loans of the Defense Homes Corporation, which was transferred to RFC in July 1948 for liquidation, is included in "other loans" beginning July 1948. Data on the revised basis are available only beginning May 1947.

[‡]Data for 1947 and 1948 have been revised in accordance with year-end adjustments; 1947 figures are available upon request.

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey	1948										1949

* Revised. * Preliminary.

¹ June average is based on quotations through June 22, July average on quotations beginning July 15; beginning the latter month, rates are those for "regular" products; earlier data are shown as official rate.

² Rate for foreign "bank notes" account, based on quotations beginning March 22, is \$0.0201.

³ Excludes Pakistan. ⁴ Quotations not available July 22-October 12. ⁵ Partly estimated.

⁶ Quotations not available after June 10.

⁷ Less than \$500,000. ⁸ Official rate since July 4, 1946, is \$1.000.

⁹ Free rates are as follows: February 10-August 1948, \$0.0033; September-December 1948, \$0.0032; and January-March 1949, \$0.0031. • Or increase in earmarked gold (—).

¹⁰ Revisions for January-August 1947 are available upon request.

¹¹ Revised series. Beginning in the July 1948 Survey figures for Africa and the total include production in Belgian Congo and the total includes also production in Mexico and revised figures for Australia. Data for Belgian Congo and Mexico were not available currently from May 1940 and March 1942, respectively, until July 1948 and figures reported through May 1940 for Belgian Congo represented only about 50 percent of production while those previously included for Australia after December 1943 covered Western Australia only. Revised annual figures for 1938-46 and monthly figures for January 1946-April 1947 for the total and Africa are available upon request.

¹² Revisions for January-November 1947 are shown in the February 1949 Survey.

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey	1948										1949

* Revised.

† Less than \$500,000.

‡ Revisions for January–August 1947 are available upon request.

§ Sales figures include bonds of the International Bank for Reconstruction and Development not shown separately; these bonds are included also in computing average price of all listed bonds.

¶ Revised series. The price series for high grade bonds is based on average yield of 12 bonds through August 1948 and 11 bonds thereafter, converted to a price basis by assuming a 2½ percent bond with 30 years to maturity. The series for medium grade bonds is converted from yields of 14 bonds through August 1948 and 12 bonds thereafter (number of industrial and railroad bonds each reduced to 4 in September 1948), assuming a 3-percent coupon with 30 years to maturity; this series replaces the series for medium and lower grade bonds shown in the Survey through the August 1948 issue. Both series are averages of daily figures.

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey	1948										1949

* Revised. † Preliminary. ‡ Data based on 14 stocks. § Data based on 11 stocks.

§ Total includes bonds of the International Bank for Reconstruction and Development not shown separately.

¶ Number of stocks represents number currently used; the change in the number does not affect the continuity of the series.

§ New series. The new series on dividend rates for 200 common stocks, which replace similar data formerly shown for 600 stocks, price per share, and earnings and the revised series for yields of 200 common stocks are for an identical list of companies. Dividends are at annual rates and are determined at the end of the month on the basis of the most recent declarations. Yields are obtained by dividing per share dividends by per share prices. Earnings are net after taxes and contingencies less preferred dividend requirements (whether actually paid or not) and are quarterly earnings (partly estimated) at annual rate; for utilities only they are for the 12 months ended each quarter. The number of shares used to obtain per share figures represents number outstanding per companies' balance sheets adjusted for stock splits, etc., so as to be comparable with number outstanding December 31, 1946. A more complete description of the series and data beginning 1929 will be published later.

† Revised series. The yield series for utility stocks has been revised to include only operating utilities beginning 1946 and earlier data have been revised back through 1942. There have been minor revisions in the yield series for industrial and insurance stocks and revisions in the railroad series beginning in 1946. Revisions through April 1947 will be shown later.

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey	1948										1949

* Revised. † Deficit.

§ Data have been revised beginning July 1947 to exclude covered hoppers; prior to that month covered hoppers were not shown separately from other hoppers and are included in the figures for total coal cars.

† Data relate to Continental United States. ‡ Revised data for February 1948, \$18,246,000.

§ Beginning January 1949, data are compiled from reports of carriers having annual operating revenues of \$250,000 or more; however, the one company excluded on the new basis accounted for only 0.3 percent of total revenues in December 1948.

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey	1948											1949

¹ Revised. ² Beginning January 1949, data include for animal fats, 45 plants and for greases, 23 plants not previously reporting; operations at these plants in January (thousands of pounds): Animal fats—production, 3,290; stocks, 3,804; greases—production, 953; stocks, 1,949. ³ Beginning January 1949, data on original reports show further details on certain refined oils which are believed to have been included formerly in the crude oil figures. January 1949 figures for the items excluded beginning in this month are as follows (thousands of pounds): Sesame—consumption, 29; stocks, 142; rapeseed—consumption, 550; stocks, 2,763; linseed oil—production, 8,900; consumption, 15,062; stocks, 45,560; other vegetable oils—production, 955; consumption, 1,503; stocks, 1,604. ⁴ Beginning January 1949, data include oleomargarine of vegetable or animal origin; exports of oleomargarine for this month amounted to 159,000 lbs.

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey	1948											1949

* Revised. ¹ December 1 estimate.

† Beginning in the April 1948 Survey, export figures include Army civilian supply shipments; see note marked "†" on p. S-21.

* New series. The new price series for cheese has been substituted for the price of twins on the Wisconsin Cheese Exchange; data for 1928 to June 1947 will be shown later. The price of U. S. No. 1 potatoes covers both new and old crops; the former series (incorrectly described as Long Island No. 1) covered U. S. No. 1, old crop only until new crop became plentiful; the new series is available beginning March 1947 and figures for March-June 1947 are shown on p. S-27 of the September 1948 Survey. Prices through September 1948 are based on quotations as of Tuesday; subsequently as of Monday.

† Consumption of distilled spirits for beverage purposes revised for 1944; revisions are shown on p. S-27 of the November 1948 Survey. Revisions for fluid milk utilization in manufactured dairy products for 1946 are shown on p. S-27 of the September 1948 Survey; final revisions for 1947 are shown at the bottom of p. S-35 of the February 1949 issue.

‡ Revisions for 1947 are shown in the note for dairy products at the bottom of p. S-35 of the February 1949 issue.

† Revised. 1 December 1 estimate.

‡ Includes old crop only; new grain not reported in stock figures until crop year begins in July for barley, oats, and wheat and October for corn. * No quotation.

§ The total includes wheat owned by the Commodity Credit Corporation and stored off farms in its own steel and wooden bins; such data are not included in the break-down of stocks.

|| Beginning in the April 1948 Survey, export figures include Army civilian supply exports; see note marked "†" on p. S-21.

¶ Data are partly estimated; see note marked "†" on p. S-28 of the October 1948 Survey.

|| Revised series. Data included for wheat flour, corn meal, malt, and oatmeal have been revised using new conversion factors supplied by the U. S. Department of Agriculture, which take into account changes in milling practices. The revisions have been carried back in each case to the earliest year for which the new information is available as follows: Exports of principal grains and oat exports, 1943; wheat and barley exports, 1944; corn exports, 1946. The new conversion factors are given in the note for grain exports at the bottom of S-29. Revised figures for 1944-46 for barley and through August 1947 for other series will be published later. The new factor for malt has been used in data for barley exports beginning January 1947 published in previous issues.

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey

* Revised. † No quotation. ‡ Revisions for January 1946 to June 1947 are shown on p. S-29 of the September 1948 Survey.

§ Beginning in the April 1948 Survey, export figures include Army civilian supply shipments; see note marked "†" on p. S-21.

¶ This series continues data in the 1942 Supplement to the Survey; it was omitted from the 1947 Supplement because of discovery of inconsistencies in the data. See note on corresponding item in the January 1949 Survey.

* New series. The new price series for calves, vealers (Chicago) is essentially a continuation of that published in the March 1949 Survey and earlier issues but is taken from a different source and reflects a slight change in specifications; data beginning January 1946 will be published later. The series for beef, fresh, steer carcasses, good (600-700 pounds) New York, has been substituted for beef, fresh, native steers (500-600 pounds) shown in the February and March 1949 issues of the Survey (see note marked "¶" on p. S-29) of these issues.

NOTE FOR GRAIN EXPORTS, P. S-28.—The new factors for converting grain products to grain, referred to in note marked "†" on p. S-28, are as follows: Wheat flour—beginning July 1947, an average factor is computed each month, weighting the milling rate for the types of flour exported by the quantities shipped; the factor for the period beginning September 1947 ranged from 2.234 to 2.276 bushels of wheat per 100 pounds of flour; malt—1 bushel of barley per bushel of malt; cornmeal—3.16 bushels of corn per 100 pounds of meal; oatmeal—7.6 bushels of oats per 100 pounds of oatmeal.

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey	1948										1949

* Revised. ^a Preliminary. ¹ December 1 estimate.

* January-April 1948 total, including corrections for months prior to April, 248,372 tons; corrected monthly figures not available.

† Not strictly comparable with data prior to September 1947; see note in November 1948 issue.

‡ Beginning in the April 1948 Survey, export figures include Army civilian supply shipments; see note marked "†" on p. S-21.

* New series.

Data on entries of raw and refined sugar (raw basis) from Puerto Rico and Hawaii, compiled by the U. S. Department of Agriculture, have been substituted for receipts of raw and refined sugar from these areas compiled by the U. S. Department of Commerce; collection of data for Hawaii has been discontinued by the latter agency.

§ Data for January-June 1947 are shown on p. S-30 of the January 1949 Survey.

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey	1948										1949

* Revised.

† Not strictly comparable with data prior to 1949 because of changes in commodity classification; excludes exports of box shooks which averaged 1,244,000 board feet per month in 1948.

† Revised series. Beginning in the July 1948 Survey data for 1948 for orders, production, shipments, and stocks of Western pine and west coast woods have been revised because of changes in the regions covered. The revised figures for Western pine include all production in Wyoming, Utah and Colorado (formerly only parts of these States were included) and only pine production, instead of total production as formerly, in two counties of Oregon which now produce largely Douglas fir; data for west coast woods have been revised to include fir in these two counties.

‡ The figures include a comparatively small number of "other footwear" which is not shown separately from shoes, sandals, etc., in the distribution by type of uppers; there are further small differences between the sum of the figures and the totals for shoes, sandals, and play shoes, because the latter, and also the distribution by type of uppers, include (except for the latest month), small revisions not available by type of uppers.

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey

¹ Revised.

² See note marked "O".

³ Data for January 1947-August 1948 for total exports of iron and steel products shown in the November 1948 and earlier Surveys should be corrected by subtracting the amount for scrap exports; the data for scrap exports were incorrectly included twice in the figures for total exports.

⁴ For 1949, percent of capacity is calculated on annual capacity as of January 1, 1949, of 96,120,930 tons of steel; 1948 data are based on capacity as of January 1, 1948, 94,233,460 tons.

⁵ The basis of price quotations for pig iron and steel was changed from basing point to f. o. b. mill or shipping point effective July 13, 1948. Specifications for the structural steel price series were revised in February 1948; however, the January price on both the new and old basis was \$0.0280.

⁶ January-June 1947 data for steel scrap prices are shown on p. S-32 of the November 1948 Survey.

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey	1948											1949

* Revised. † Preliminary. ‡ Series discontinued by compiling agency.

§ The number of companies reporting beginning 1947 is as follows: Direct current—first quarter 1947, 28; second and third quarters 1947, 30; thereafter, 29; polyphase induction—first quarter 1947, 34; second and third quarters 1947, 36; fourth quarter 1947, 35; thereafter, 33.

Ⓢ Data revised to exclude figures for water heating units; comparable data for January to August 1947 are shown on p. S-34 of the November 1948 Survey. Revised figures for 1945 and 1946 will be shown later; previous to 1945 water heating units were not called for on the schedule but were largely reported in data for residential burners shipped separately. Collection of data on new orders has been discontinued.

• Data for January-June 1947 for refrigerators sales index are shown on p. S-34 of the November 1948 Survey.

• New series. Data on shipments of cooking stoves and ranges, heating stoves, range boilers, and water heaters have been substituted for production data, collection of which has been discontinued. It should be noted that for range boilers and water heaters, shipments data have been shown beginning with the March 1947 issue of the Survey; however, production data were substituted in the 1947 Supplement because available for a longer period than shipments. Monthly shipments for September 1943-June 1947 for stoves and ranges and September-December 1945 for range boilers and water heaters are available upon request. The index of machine tool shipments, computed by the National Machine Tool Builders Association beginning January 1937, has been substituted for estimates of total shipments which have been discontinued by the association; the index is based on reports estimated to account for about 90 percent of industry shipments.

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey	1948										1949

* Revised.

¹ The comparability of the data for both anthracite and bituminous coal is slightly affected beginning March 1948 by a substitution for one of the reporting companies; February 1948 figures strictly comparable with March for anthracite and bituminous coal, prepared sizes, are \$15.011 and \$8.122, respectively; for bituminous coal, mine run, there was no change in price between February and March on the basis of comparable reports; April and September 1948 figures for bituminous coal, prepared sizes and November 1948 figure for bituminous coal, mine run, strictly comparable in each case with data shown above for the following month are \$8.154, \$9.196, and \$8.744, respectively; December 1948 figure for anthracite strictly comparable with January 1949, \$15.844.

² Data for coal mine fuel are included in "other industrial." ³ Beginning January 1949 stocks of heavy crude in California are included in gasoline-bearing figures.

⁴ Beginning January 1949 cracking stocks, formerly included in finished stocks in California figures, are excluded and stocks held in distributors' tanks in California which were formerly included in bulk terminal stocks are excluded; comparable figures on new basis for December 1948 (thous. of barrels): Distillate and residual fuel oil, 71,381 and 63,993, respectively.

⁵ Beginning in the April 1948 Survey, export figures include Army civilian supply shipments (see note marked "4" on p. S-21).

⁶ The comparability of the series has been affected from time to time by a reduction in the number of cities or by a change in the sample. Beginning August 1947 data cover 10 cities for anthracite and 21 cities for bituminous coal; see note on item in the April 1948 and September 1947 issues regarding the effect on the comparability of the data of changes made in that month and in February 1947.

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey	1948										1949

* Revised.

¹ Beginning January 1949, stocks held by distributors in California, which were formerly included in bulk terminal stocks, are excluded; comparable figure for December 1948, 23,895,000 barrels.

² Beginning January 1949, data exclude unfinished aviation gasoline stocks; comparable figures for December 1948 (thous. of bbl.)—total, 5,915; 100 octane, 2,504.

³ Beginning July 1947, data are reported stocks available to industry. ⁴ Beginning July 1947, data are reported stocks.

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey	1948										1949

* Revised. † Preliminary. ‡ Beginning in the April 1948 Survey, export figures include Army civilian supply shipments; see note marked "†" on p. S-21.

† Data beginning August 1948 are for wool sold on the open market instead of the Commodity Credit Corporation selling price; August price for the territory wool comparable with earlier series, \$1.480 per pound; for the bright fleece series, the Commodity Credit Corporation and the open market price were the same in August and September.

‡ Quotations beginning January 1949 are for a substituted series of the same description, but represent a composite price; the December 1948 price for the new series is \$2.57 per pound.

• Included in data for broad and narrow looms prior to April 1947. † Data for March, June, September, and December 1948 are for 5 weeks; other months, 4 weeks.

* New series. The new series for cotton spindle activity and the revised series for operations as a percent of capacity relate to all cotton system spindles, including data for spindles spinning synthetic and blended fibers as well as those consuming 100 percent cotton. The series designated "100 percent cotton" continue the data on active spindles and spindle hours shown in the 1947 Supplement and in previous issues of the monthly Survey. The figures for average spindle hours per spindle in place and operations as a percent of capacity for cotton consuming spindles for August 1945-January 1948, as shown in the Supplement and in previous issues of the monthly Survey, are not strictly comparable with earlier data because the figures for spindles in place collected beginning August 1945 and used in the computations include all cotton system spindles while the "in place" figures used in earlier computations related to spindles used exclusively for spinning cotton. Data for August 1945-June 1947 for the revised series on operations as a percent of capacity and for the new series on spindles and spindle hours are available in the May and August 1948 issues, p. S-39, and the note for cotton spindle activity at the bottom of p. S-34 in each of those issues. Beginning with the March 1949 Survey, the new price series for worsted yarn (Bradford weaving system) 2/32s, 64s (white) replaces the former price which has been discontinued; monthly data beginning 1947 will be shown later.

† Revised series. See note marked "•".

Unless otherwise stated, statistics through 1946 and descriptive notes may be found in the 1947 Supplement to the Survey	1948											1949

* Revised. 1 Not available for publication.

*New series. See note marked "a" on p. S-40 of the September 1948 Survey for January-June 1947 figures for passenger car shipments. The series for flannel dress goods, 8 ounce, 54-56 inch, f. o. b. mill, which is compiled by the U. S. Department of Labor, has been substituted for the 7-7½-ounce series shown in the September 1948 Survey and earlier issues which has been discontinued by the compiling agency; comparable figures beginning April 1938 will be published later.

*Revised series. See note on woolen and worsted apparel fabrics in the May 1948 Survey or in the 1947 Supplement to the Survey for explanation of changes in the classifications in the second quarter of 1947. A further change was made in the last quarter of 1947. Beginning that quarter the unclassified item consists entirely of fabrics containing 25 percent or more wool reported by cotton and rayon weavers, and all apparel fabrics produced by woolen and worsted manufacturers are distributed to the separate classifications for men's and boys' and women's and children's fabrics; for the second and third quarters of 1947, the unclassified item includes also 3,340,000 and 1,489,000 linear yards, respectively, which were reported by woolen and worsted manufacturers as "all other apparel fabrics." Apparel fabrics produced for Government orders were combined with other production prior to 1947. Blankets produced for Government orders are not available separately.
