## Chart I. - FEDERAL FINANCE

FISCAL YEAR 1947 HAS ENDED WITH A CASH SURPLUS

AND WITH SOME REDUCTION IN THE FEDERAL DEBT.

EXPENDITURES ARE DOWN FOR WAR AND DEFENSE - AND UP FOR VETERANS AND INTERNATIONAL FINANCE.

# The <br> Business Situation 

By the<br>Office of Business Economics

BUSINESS CONTINUED active on a high plateau in June as the year reached the halfway mark. Exports were in the forefront as the most dynamic factor in the situation. Inventory accumulation remained an important influence but the rate diminished in the second quarter.

In the securities market there was a small but steady recovery from the lows of late May. In wholesale commodity markets a somewhat firmer tone was manifested by small price increases.

None of the month's developments, however, has carried suffcient weight to result in a decisive change in the monthly indicators of over-all economic activity, with aggregate production and distribution continuing to move within a narrow range. Seasonal deviations slowed operations in a few lines, while production slow-downs stemming from conservation of coal supplies affected a portion of durable goods manufacturing. The rate of consumer buying has changed only slightly for several months, after allowance for the usual seasonal rise.

## Further Rise in Foreign Balance

A feature of the second quarter has been the further rise in exports which has had its impact upon a wide range of industries. Taking all transactions into account-both goods and servicesthe net export surplus for the second quarter will be even higher than the 3 billion dollar excess in the first quarter. This has made it necessary for foreign countries to draw down their gold and dollars assets and their credit allowances to a greater extent than in the first quarter when they liquidated 1.2 billion dollars of gold and other dollar assets and drew upon Government credit allowances in the amount of 1 billion dollars.

## Reduced Inventories at Distributive Level

Inventory accumulation in terms of book value declined in the second quarter, mainly by reason of the reduced accumulation by distributors. With prices tending to stabilize, the accumulation in terms of physical volume shows less of a slowdown from the first quarter rate than is indicated by the book value change. The effects of the reduced inventory buying are discernible in such developments as the lower volume of new orders and the selective declines in manufacturing production and employment.

Expenditures for plant and equipment recovered in the second quarter from the decline in the first quarter of 1947, and the expectations reported by business (reviewed in a subsequent section) indicate a third quarter 1947 total about in line with the rate reached at the end of last year.

Government expenditures for goods and services were higher in recent months than in the first quarter of the year. The rise occurred in Federal as well as State and local government outlays, even though the tendency over the past year, as indicated below, was for Federal operations to shift from a deficit to a surplus position.

## Cash Surplus for Fiscal Year

The results of the Federal Government's financial operations for the fiscal year just ended indicate a fundamental change that has taken place among the basic forces operating on the economy (See chart 1). The budget surplus of about $3 / 4$ billion dollars which has been reported by the Treasury is increased to approximately $71 / 2$ billion dollars when the accounts are restated on a cash basis. As described later, the divergence between the budget and the cash accounts was unusually large during the past fiscal year, partly because of sizable noncash transfers for armed forces leave bonds. In the 2 preceding fiscal years, there was an excess of cash outgo amounting to 45 and 18 billion dollars, respectively.

## Personal Income Series

Beginning with the current issue, the monthly series showing income payments to individuals is being replaced by a new series, "personal income." In general, the income breakdown which will appear each month on page S-1 is comparable with the detail which has been available in the past for income payments. The new series is part of the general revision of the national product and income series being published as a supplement to this month's Survey. A summary description of the changes will be found in a subsequent section. ${ }^{1}$

Personal income in May, on a seasonally adjusted basis, increased over April, rising approximately to the March figure. The source of the increase in May was primarily in wages and salaries, which rose in all major categories, the largest advance occurring in manufacturing. Here, a decline in employment was more

than offset by a rise in both hours and earnings, as the impact of the wage increases negotiated in the basic massproduction industries earlier in the spring made itself felt. Increases were also registered in trade, mining and communications, in part a result of the cessation of the work stoppages which had taken place in the previous month.

Proprietors' and rental income declined during the month because of a drop in agricultural income, while transfer payments also fell.

## Wholesale Prices Unchanged

Since mid-April, average prices in wholesale markets, as measured by the BLS weekly index of wholesale prices, have remained virtually steady and only fractionally below the high point established in March of this year (see chart 2). The difference in the combined index between the low and high values during the past four months has not exceeded 2 percent.

Most of the group indexes averaged slightly higher in June than in May. Some new highs were made in fuel and lighting products, metal and metal products, and household goods, but small decreases were registered for the building materials and chemicals and allied products groups. Prices of farm products and foods increased slightly from their end-of-May levels, but even here the
pattern of changes was not uniform, with meat prices advancing about 2 percent while prices of cereal and dairy products moved lower, the latter seasonally. Meat prices dropped in the last week of June, after a generally rising trend since the latter part of April.
.The first noticeable drop in lumber prices since the prewar period and lower prices for paint and paint products brought a decline in the building materials group. At 53 percent above the level of last June, lumber has shown a greater price rise than any other subgroup except meats and hides and skins. Drugs and pharmaceuticals recorded a sharp price drop of about 10 percent in comparison with the end-of-May level, while prices of fats and oils were also lower than in the previous month. Crude rubber prices continued to fall, standing 32 percent below a year ago.

## Retail Prices Steady

Essentially stable wholesale prices were reflected in steadiness at the retail level. Between April and May the BLS Consumers' Price Index declined by less than 1 percent and stood at 156 (1935-39= 100) in the latter month. The index has deviated only fractionally from this figure since March 1947.

In May, for the first time since the end of the war, all of the major components in the index, except rent, decreased. For clothing and housefurnishings, the decreases were the first since VJ-day.

## Seasonal Upturn in Construction

The 4 business indicators illustrated in charts 3 and 4 present a summary picture of the current business situation. For the first month this year, the value of new construction put in place has exceeded a billion dollars. Preliminary estimates place June construction activity at 1,060 million dollars. The increase over May was about 100 million dollars, or approximately 11 percent. The cumulative total of work put in place for the first half of the year is estimated at 5.4 billion dollars, which compares with a total of 3.8 billion dollars for the first half of 1946. This represents a gain of 40 percent, although in terms of physical volume the increase is estimated at about 10 percent.

The year-to-year increases improved somewhat in June for both the total and the private sector, after a steady narrowing of the gains had taken place during the first five months of 1947. The proportion of total work put in place accounted for by private construction in the first half of this year was 77 percent, as against 82 percent in the same period a year ago.

## Housing Starts at Peak

New permanent housing starts in May are estimated at 72,500 units, higher by 5,000 units than the May 1946 figure, which was the peak for last year. The number started during the first 5 months of 1947 also was slightly greater than in the like period of 1946, according to revised estimates of the Bureau of Labor Statistics. The recent modifications of the estimating technique employed by the Bureau of Labor Statistics reflect the incidence of a larger proportion of home construction in rural nonfarm areas and a larger rate of attrition in the conversion of permits to starts. These changes did not affect the estimate of completions in 1947 which, in the first 5 months, totaled 300,000 new permanent dwelling units. Completions in May were almost 60,000 and compare with 30,000 units completed in May 1946. Only 118,000 units were completed in the first 5 months of 1946 .

## New Rent Control Legislation

Many tenants will experience the first sizable increase in rents since 1941 as a result of the new rent control legislation

## National Income Supplement

During recent years the Office of Business Economics has been engaged in revising the official data on the national income and gross national product of the United States. Revised data for the years 1929 through 1946 are now available in published form in the national Income Supplement to the Survey of Current Business. Its contents are briefly described in this issue.

The Supplement is not included in the regular Survey subscription, and should be ordered direct from the Superintendent of Documents, U. S. Government Printing Office, Washington 25, D. C.
which became effective on July 1, 1947. The new law makes it possible for landlord and tenant to agree voluntarily before the end of 1947 to an increase in rents not exceeding 15 percent, provided the tenant secures in return a lease assuring him against further increase through December 31, 1948. If no agreement is reached, the tenant is afforded the protection of the new act through February 29, 1948.

The act specifies grounds for eviction of tenants, which are slightly more restrictive than those established through administrative rulings under the old law, and requires local regulations to govern eviction practices. In addition, local advisory boards are created by the act to operate in areas still under rent control. These boards may recommend decontrol of an entire defense-rental area or a portion of it, the recommendation becoming law unless disapproved by the Rent Administrator within 30 days.
In repealing most of the provisions of the Veterans' Emergency Housing Act of 1946, the newly enacted law eliminates the allocation and priority powers exercised by the Housing Expediter, retains the requirement that new housing be offered first to veterans, and abolishes the power of the Housing Expediter to limit nonresidential construction, except for the construction of amusement facilities and places of recreation.

## Export Gap Widened

The lower panel of chart 3 illustrates the trends in foreign trade. The value of exports rose to 1,430 million dollars in May, as compared with 1,300 in April and 1,330 in March. Imports, in contrast, declined to 470 million dollars, as
compared with 510 and 440, respectively, in the 2 preceding months.
Total merchandise exports in the first 5 months of 1947 aggregated almost 6.3 billion dollars, which is higher than in any previous 5 -month period, including the period of the preinvasion export bulge in 1944. The increase over shipments in the comparable months of 1946 was more than 2 billion dollars. While imports have also increased from last year, the gain has been less than $1 / 2$ billion dollars. Thus, the gap between exports and imports has widened substantially in 1947, reaching almost 1 billion dollars in May. For the first 5 months combined, the excess approximated 4 billion dollars.

## Finished Manufactures Exports Double

The greatest expansion in our exports for the first four months of this year in comparison with the comparable period in 1946 has taken place in the finished manufactures category, which has more than doubled its total of a year ago. Of the 1.9 -billion-dollar increase in United

Source of data: Office of Business Economics.

States merchandise exports over the year, approximately 1.5 billion dollars, or 80 percent, has occurred in this category, which now makes up 60 percent of United States merchandise exports. Among the more important groups showing the largest gains are autos, accessories and parts, up 197 percent; textile manufactures, up 106 percent; rubber manufactures, up 98 percent; iron and steel mill products, up 84 percent; and machinery up 81 percent. Sales of merchant vessels abroad rose from $\mathbf{1 0}$ million dollars to 300 million in the period.

The dollar value of foodstuffs exports, crude and manufactured combined, has remained unchanged over the year, the crude-food category having increased while the manufactured-food group decreased. Markedly depleted stocks of wheat resulted in some curtailment this year from the extremely heavy shipments of wheat which were made a year ago. This decrease was made up in part by a large increase in corn shipments and in part by increased exports of wheat as flour.

While an ever-growing foreign demand for American goods serves to sustain current income and employment levels in this country, the persistence of a large export surplus intensifies the drain upon the dollar resources at the disposal of foreign countries. Imports into this country continue to be limited by the slow recovery of most European and Asiatic nations and by the necessity of these countries to use such a large
portion of their current production for domestic consumption.

## Declines in Manufacturers' Shipments

The value of manufacturers' shipments receded fractionally in April and May, the two latest months shown in chart 4. Shipments of nondurablegoods industries declined, on a daily average basis, in both of these months, but shipments of the durable-goods group rose in April and declined in May.

The changes in shipments in the nondurable group over the past few months of this year are in contrast with those in the same period a year ago when small but steady increases took place between February and May. The index of daily average shipments of textile mill products, in particular, has dropped almost 15 percent since February of this year, whereas in the same period a year ago the index for this group rose by 11 percent. The decline in the food shipments index of 9 percent, however, was only slightly greater than the decrease which occurred between February and May 1946.

## Lower New Order Volume

There were indications in some major durable goods industries that the ratio of shipments to new orders was not only increasing-a development which set in during the fall of 1946-but that new orders had actually fallen off (see chart 5).

As the chart indicates, from January through September 1946 the index of the dollar value of orders exceeded the index of shipments for durable-goods industries other than the transportation equipment groups. Such a development was to be expected as order taking during the reconversion period far outstripped the rate at which such orders could be filled. By the last quarter of 1946, however, the reconversion process had reached a point where more orders were being flled than were coming in, even though new business was still increasing.

With the decline in new orders during the spring months of this year and the general rise in shipments for the industry groups in question, the amount of new orders received per dollar of goods shipped has been steadily declining. Unfilled orders are higher than they were a year ago, and these industries still have heavy backlogs to work against.

## Areas of Adjustment

A continuous feature of the business situation over the past year has been that downward adjustments have been underway in particular industries at the same time that the over-all trend in
business activity has generally been rising or has remained stable. The explanation is threefold: (1) The catching up of supply with demand has been a gradual process which has not yet affected some broad areas of the economy; (2) the demand for certain commodities has shown above-average sensitivity to the generally rising prices and the tightening of consumer purchasing power, and (3) some liquidation of war industries still was going on during 1946.

In chart 6 an attempt is made to place the industries where declines of 10 percent or more have occurred from last year's peaks in perspective relative to the industrial economy as a whole. The size of the lower shaded area in the chart indicates that the industries which have experienced a decline of this magnitude have accounted for less than 15 percent of total industrial production in recent months, as measured by the Federal Reserve index. The individual production series included in the group showing declines are 5 series for various nonferrous metals, 3 for textiles, 3 for meat packing, 3 for alcoholic beverages, 2 each for tobacco products and shipbuilding (Government and private), and one series each for processed fruits and vegetables, leather tanning, shoes, rubber products, anthracite coal, locomotives, industrial alcohol, and Government manufacturing. These series have been combined by applying the base weights used in the Federal Reserve index.
It is of considerable interest that the lower area of the chart rises during part

## Chart 6.-Industrial Production, Seasonally Adjusted

${ }^{1}$ Data for April and May 1947 are preliminary.
Sources: Basic data, Board of Governors of the Federal Reserve System; computations, Office of Business Economics.
of 1946 and shows a gradual decline thereafter, even though each of the series making up the group has declined 10 percent or more. This result is derived from the fact that the declines in the individual series have not occurred simultaneously. During a large part of 1946 the most important areas of declining activity were in Government shipbuilding and manufacturing arsenals. During this same period some of the other series included in the lower portion of the chart were still in a rising phase. The declines in these latter series came late in 1946 or in the early months of this year. Such differences in timing tend to cancel each other out when the various industries are combined into a composite series.

It may be noted that declining trends were somewhat more prevalent in April and May than in the preceding months, even though the industries involved did not bulk large in the total industrial production index. Between March and May declines ranging from approximately 5 to 10 percent (after seasonal adjustment) occurred in these series having relatively heavy weights in the index: cotton consumption, shoes, processed fruits and vegetables, and rubber products.

## Production Divergences Illustrated

Chart 7 illustrates the divergent production trends in a different manner. The individual bars compare results for the first half of 1947 with production in the last 6 months of 1946. The series have been adjusted for seasonal influences whenever necessary.
The explanation for the declines shown in the chart varies among the different products. In the case of shoes, wool consumption and alcoholic beverages, the lower level of consumer demand and the filling up of distributive pipe lines might be cited. The decline in denatured alcohol production is associated with a shift to lower-cost alcohol from petroleum in the manufacture of synthetic rubber.

## Retail Sales Firm

The evenness in the flow of personal income can explain much of the firmness exhibited in retail sales in recent months. Mention should also be made of the improved selection of goods available by quality and price lines.

Total retail sales, after adjustment for the number of trading days and normal seasonal movements, are plotted in chart 4. Recent tendencies in relation to income are reviewed in a subsequent section.
Nondurable goods store sales rose fractionally between April and May, seasonDigitized for FRASER

Chart 7.-Percentage Change in Output of Selected Products, First Half of 1947 from Second Half of 1946

Sources: Basic data, Board of Governors of the Federal Reserve System, except for the following: Washing machines, American Washer and Ironer Manufacturers' Association; passenger cars and trucks, Civilian Production Administra tion and Automobile Manufacturers Association; tires, Rubber Manufacturers Association; cigarettes and alcohol, U.S. Treasury Department; steel, American Iron and Steel Institute; radios, Radio Manufacturers' Association; copper, Copper Institute; aluminum products, Bureau of the Census. Computations and estimates for recent months, Office of Business Economics.
ally adjusted, paced by a 5 -percent increase in department store sales. The latter are expected to remain substartially unchanged in June, on the basis of preliminary figures. Adjusted sales in durable goods stores were down between April and May, chiefly because of a falling off in sales by automotive dealers. Apparently, the decline in automobile production stemming from short steel supplies was felt at the retail level with a minimum time lag.

## Inventory Growth Slackens

Businesses in the aggregate added about 50 million dollars to the value of their stock of goods on hand in May. The total dollar increase was substantially less than that of April. As in April, the increase was confined to manufacturers; in the earlier months of the year, accumulation at the distributive level accounted for the major share of the inventory advance.

Wholesale inventories declined in May, both on an adjusted and unadjusted basis-the first decline since early 1946. Retailers' stocks, including department store stocks, declined in May, the latter for the third successive month, after allowance for seasonality.
Among manufacturing industries, the bulk of the inventory gain occurred in the durable goods group. The advance in the nondurable goods field in May was considerably lower than in the first 4 months of 1947.

## Finished Goods Stocks Replenished

An analysis of the nature of the inventory changes in the nondurable goods manufacturing field, which is more closely related to consumer goods than the durable goods field, may help shed some light on the extent to which retailers may be following a more cautious buying policy since the first of the year. In the first 4 months of 1946 shipments

${ }^{1}$ Receipts equal sales plus inventories at end of month less inventories at beginning of month.
2 Net new orders equal orders outstanding at end of month less orders outstanding at beginning of month, plus receipts. Sources: Basic data, Board of Governors of the Federal Reserve System; computations, Office of Businest Economics
of finished goods by the soft goods industries exceeded production so that there was a net decline in finished goods inventories over the period, which was almost as great as the increase in stocks of raw materials and goods-in-process. The first 4 months of this year, however, witnessed an increase in shipping stocks which, dollarwise, was more than 60 percent in excess of the increase in inventories of other than finished goods. The article in the May Survey indicated that finished goods stocks at the end of March 1947 were below the prewar level, in terms of physical quantities.

## Department Stores Shorten Commitments

Recent experience in the departmentstore field is indicative of the cautious buying policies being carried out in some segments of the economy. During the latter part of 1946, while economic activity as a whole was still expanding, department stores began to make adjustments in inventories and in outstanding commitments in order to bring them in line with a no-longer-expanding market. A leveling off in department-store sales, evident as early as the summer of 1946, followed a year of expansion in trade during which time stocks were inadequate and deliveries slow and uncertain. At the time the sales rise was tapering off outstanding orders of department stores had risen to a level 10 times higher than in prewar years, as purchasers often had placed duplicate orders and had made commitments farther and farther in advance in an effort to overcome persistent shortages and rebuild stocks.

The first reaction of department stores to the leveling off in sales was a curtailment in commitments. The peak in commitments was reached in July 1946. After this date a decline, beginning gradually, was accelerated, bringing a fall of 50 percent in outstanding orders by the year-end, and a further drop between the latter date and the end of May (see chart 8). Although ordering was more selective and cancellation options more widely used, receipts of merchandise remained at a high rate-higher than sales-and stocks continued to rise on a seasonally adjusted basis until March of this year.

## Stock-Sales Ratio Reduced

After the turn of the year, however, receipts were curtailed and soon began to fall below sales. This is shown by the data presented in table 1 which applies to a group of 296 relatively large department stores reporting sales, stocks, and outstanding commitments monthly to the Federal Reserve banks. While it is likely that these bigger stores, which have larger purchasing departments and are in closer touch with market developments, took the lead in culling orders and shortening outstanding commitments, related information suggests that other retailers soon followed suit. As already noted, the slowdown in inventory buying is now rather general at the retail level.
The scatter diagram (chart 9) showing estimated seasonally adjusted stocks and sales for all department stores also highlights the reversal which has occurred over the past few months. May sales
registered a rise but at the same time stocks, which were down in March and April, were further reduced. As a result of these developments the stock-sales ratio currently stands substantially below the ratio earlier in the year.

## Buying Shift Felt by Manufacturers

Meanwhile, however, the shift in purchasing by department stores and other classes of retailers during the past several months has been reflected at the manufacturing level, chiefly in the textile and apparel fields. Output of women's, misses', and children's apparel has been substantially lower in recent months than a year ago. In addition, both cotton and woolen mills have reduced the rate of operations in recent months, but the rate remains higher than a year earlier.

## Lower Manufacturing Employment

Employment in manufacturing plants declined during May for the second successive month, with approximately 150,000 fewer persons at work in this group than in April and 250,000 fewer than in March, according to data from the Bureau of Labor Statistics. The decline was somewhat greater than could be accounted for by seasonal factors. Manufacturing employment had risen steadily for 13 months up to March 1947, after allowing for seasonal influences, although the month-to-month increases just prior to March were smaller than those in the first part of 1946.

Chart 8.-Department Store Orders Outstanding, End of Month (296 Stores)

Source of data: Board of Governors of the Federal Reserve System.

Chart 9.-Relationship Between Department Store Stocks and Sales ${ }^{1}$

1 Data for stocks are as of end of period, and for sales are monthly average for year and monthly total. Monthly data are adjusted for seasonal variation.
Sources: Basic indexes, Board of Governors of the Federal Reserve System; computation of dollar figures, Office of Business Economics.

Employment in durables goods lines was off slightly less than in nondurables, although all the major durable groups except lumber and transportation equipment showed drops in May. A shortage of materials was chiefly responsible for a falling off of 40,000 in automobile employment. Employment in the textiles, leather, and apparel industries continued the seasonal decline from March.

The total number of employees in all nonfarm establishments, however, rose by some 200,000 in May, according to the BLS estimates, and stood close to the March figure, as the decline in manufacturing was more than offset by the increase in contract construction and the return of workers in the telephone and bituminous coal industries which were affected by stoppages in April. The seasonally adjusted construction employment estimate for May is just under the postwar high reached in December 1946. Seasonally adjusted employment in nonagricultural firms has shown remarkable stability varying by less than 1 percent between the low and the high since Noxember of last year.

Recent reports also indicate larger employment in domestic service and a rise in the number of self-employed. To some extent both of these increases reflect the continued filling of vacancies which have been carried over from the war and early postwar periods when better-paying job opportunities were available in other areas.

## Decline in Unemployment

The decline in unemployment from 2.4 million in April to just under 2 million in May was traceable, in part, to the return of miners who were out of the coal pits in April because of the safety stoppage and, in part, to seasonal influences which saw more construction and agricultural workers on the job in the later month. A further labor market development was the rise from April to May in average hours worked per week.

## Federal Finance

The financial results for the Federal fiscal year which ended June 30, 1947, indicate the extent to which the Govern-
ment's financial position has been reversed over the past 12 months. The budget surplus of approximately 750 million dollars was the first in 17 years. At the wartime peak, the fiscal year deficit amounted to 57 billion dollars, and in the period which ended June 30 a year ago it was 21 billions.

## Budget vs. Cash Accounts

The reversal of the Government's position is more striking in terms of the actual cash receipts from and payments to the public, because the excess of cash income in the fiscal year 1947 exceeded 7 billion dollars. The change from an 18 billion dollar cash deficit in the fiscal year 1946 to a 7.5 billion dollar cash surplus in 1947 was almost as great as the cut in the deficit between the last war year and the fiscal period which ended June 30, 1946. Somewhat more than half the cash surplus of the past fiscal year accrued in the January-to-June period when tax receipts increase seasonally.

For purposes of analyzing the impact of the Treasury's financial operations, the cash income and outgo statement is more meaningful than the budget statement since the cash surplus or deficit more closely reflects withdrawals from or additions to the spending flow in the private economy.

The sizable difference between the budget and cash accounts is explainable by the fact that some of the Treasury's cash receipts are not classed as "budget" income and, on the other hand, a number of expenditure items in the budget accounts do not represent actual cash payments to the public. For example, most of the cash receipts of the Social Security trust funds are not counted in calculating the budget surplus. On the expenditures side, such an item as the bonds distributed to veterans in payment of accumulated wartime furloughs was classified as budget expenditure in 1947 but did not constitute current cash payments. The differences between the budget and cash positions of the Federal Government are shown in table 2 for some recent years.

Table 2.-Net Budget and Cash Positions of the Federal Government

Source: U.S. Treasury Department, except 1947 cash 1947 by the Office of Business Economies.

## Receipts Essentially Unchanged

The improvement in the Federal financial position was accomplished by cutting expenditures while holding receipts close to the wartime levels. Total net budget receipts amounted to 43.3 billion dollars in the fiscal year 1947 as compared with 43.0 billion dollars in the preceding twelve months and 46.5 billion in 1945 just prior to the postwar changes in the revenue laws. The only major classes of revenue which were lower than in the fiscal year 1946 were corporate income taxes and miscellaneous receipts. The drop in the former category was due to the elimination of the excess profits tax and the cut in tax rates, and also to lower corporation profits before taxes. The drop in "other" receipts shown in table 3 was due to lower recoveries on renegotiation of war contracts.

Individual income tax payments in the past fiscal year were up slightly as the larger income base more than offset the lowered tax rates. Budget receipts from sales of surplus property accounted for almost 3 billion dollars last year, but these receipts are expected to decline substantially in the current fiscal year, as the surplus sales program tapers off.

All other principal groups of receipts showed increases from 1946 to 1947 either as the result of increased consumer buying, which raised excise tax revenues, or higher civilian wage and salary payments, which boosted receipts from employment taxes.

## Defense Outlays at 17 Billion

The principal factor in the reduction of Federal expenditures has been the further cut made in defense outlays. These outlays amounted to 17.3 billion dollars in the 1947 fiscal year, as compared with 48.9 billion in the preceding year and 90.5 billion in 1945, the peak fiscal year. Included in this category of expenditures last year was the payment of almost 2 billion dollars in bonds or cash to veterans for furlough time accumulated in military service. Payments to UNRRA, also included in defense outlays, amounted to 1.5 billion dollars, as compared with less than 700 million dollars in the fiscal year 1946. Other classes of defense outlays remained relatively steady over the course of the fiscal year.

Changes in Federal civilian pay rolls over the last two fiscal years reflected the effects of reduced numbers of personnel, higher salary scales, and a shortened work week. The drop in civilian employment in the executive branch more than offset the 14 percent

average pay raise which became effective in July 1946, with the result that total pay rolls in this branch were substantially lower in the fiscal year 1947 than in the preceding fiscal period.

## Aftermath Outlays Bulk Large

The aftermath-of-war categories advanced sharply in the year just ended as international inancial requirements and Veterans' Administration expenditures showed a combined rise of almost 6 billion dollars (see budget summary in table 3). When interest and tax refunds are included, the aftermath-of-war category accounted for about 19 billion dollars out of the 42.5 billion expenditure total.

Increased benefit payments under the provisions of the $G$ I Bill of Rights largely were responsible for the increase in veterans' outlays. The 3 billion dollar increase in payments to meet international commitments is chiefly accounted for by the drawing down of the Treasury loan to Great Britain, the completion of our payment to the International Monetary Fund, and our basic cash subscription to the International Bank.
Among the remaining categories in which expenditures rose from 1946 to 1947, the most important items of increase were connected with agricultural aid resource development, veterans' housing, and various public works deferred from the war period.

Interest charges, which had advanced at a rate in excess of a billion dollars a year in the 1943-46 period, totaled slightly under 5 billion dollars in the fiscal year just ended, a rise of 236 million dollars for the 12 -month period. This rise is largely attributable to the larger proportion of higher interest-paying bonds in the debt structure.

## 22 Billion Dollar Debt Reduction

With financial requirements receding rapidly from the wartime volume, the United States Treasury initiated a debt reduction program early in 1946. By the end of June 1947 the gross Federal debt of 257 billion was down 22 billion dollars from the peak reached in February 1946. The bulk of this reduction was achieved by drawing on the large cash balance of the Treasury. As this balance approached a working minimum, the paying of the debt was slowed to a pace approximating the surplus from current operations.

As is illustrated in the middle panel of chart 1 , a substantial and steadily growing share of the total Federal debt is held by Federal agencies and trust accounts. Hence, the postwar decline in general public holdings has been somewhat sharper than the total debt reduction. Throughout the period of largescale debt redemption, the Treasury's policy has aimed at reducing security issues held largely by the banking system.

# Major Revisions in National Income and Product Data 

The concepts and statistical procedures involved in the national income and gross national product statistics regularly published in the SURvey of Current Business have for the past 5 years been subjected to careful reexamination. The growing volume of dependable economic data made possible not only the improvement of estimates, but the development of new techniques for the establishment of aggregates. The resulting enhancement of basic materials and methodology, coupled with clarification of definitions and concepts, offered an opportunity for a comprehensive revision of the entire series.

War service activities of the Office of Business Economics claimed first priority during most of the 5 years spent on this project, and its progress was further slowed by the departure of staff members for military service. After VJ-day, however, increasing resources were devoted to the task, and it is an index of the size of the undertaking that only recently has the work been completed in all its detail.

The result is the National Income Supplement to this issue of the Survey. This report presents data on the fluctuations since 1929 of more than a thousand key elements of the country's economic life. It shows the reaction of each to prosperity and depression, to war and reconversion. Finally, it presents each sector of the economy in cross-section, to bring out the basic quantitative facts about its relation to the other sectors.

The National Income Supplement is not included in the regular subscription to the Survey of Current Business, but should be ordered direct from the Superintendent of Documents. Further particulars on procurement are indicated on the back cover of this issue.
The extensive revisions embodied in the Supplement have been made in the light of carefully formulated definitions of the most important aggregates and their
components. These definitions, differing in several important respects from those used previously, were evolved after extensive consultations-in which specialists of other countries participatedand reflect a consensus of expert judgment.
The process of revision involved in some instances a clarification of detail, and in at least one outstanding case, a change in nomenclature. The monthly Income Payments series hereafter will be entitled Personal Income-on the ground that it includes income in kind, and income of proprietors, as well as actual cash payments. It should be noted that this change has been effected in the present issue, the Statistical Section of which contains the revised data under the new heading. Those readers who regularly use the Personal Income series should refer to the Supplement for comparable data on earlier periods.

Subsequent issues of the Survey of Current Business will present national income and gross national product exclusively on the revised basis. In the next issue-for August 1947-statistics for the first two quarters of 1947 will be published. With one exception, therefore, the Supplement now supersedes all previous publications of the Department as the source of official national income and product statistics.

The State Income Payments series constitutes the sole exception. Because of the tremendous amount of detail involved, revision of the state income data will not be completed until next year. Hence the 1946 State Income Payments data to be published shortly in the Survey will be issued on the basis of former definitions.
The new tools of analysis introduced in the Supplement provide answers to economic questions of wide business importance and public interest. How did the war affect consumer expenditure patterns with reference to the 250 -odd
classes of goods and services? How is public expenditure at each level of Government distributed among domestic business, foreign suppliers, employees, creditors, and other groups? How much of the nation's foreign spending is done by business firms, and how much by consumers directly, and by Government, in peace and war? How does corporate business compare with noncorporate business, with Government, with private households, as a source of income to Americans? What role do the modern multi-billion-dollar social insurance funds play, year by year, in the absorption and release of purchasing power? What effect did war have on the relative importance of the country's 60 major industries? How did corporation inventories in specific industries respond to wartime and reconversion pressures?

The series regularly published in the standard income and product tables familiar to readers of the Survey have been improved in degree of statistical reliability, in the amount of supporting detail shown, and in appropriateness for their most common uses. Each of the underlying component series from which the totals are built up has been reexamined, and revised to make all possible use of newly available source data and improved methods of estimation. By this means it has been possible to improve a number of underlying seriessuch as those for noncorporate in-dustry-so that they can be shown separately for the first time.

The lengthy introduction which appears in the National Income Supple-ment-preceding the presentation of more than 50 tables of new and revised data-will furnish to SURVEY readers a description of all important changes in the data. The explanation it contains is strictly factual, with no attempt to analyze the myriad economic forces whose workings are measured by the statistics.

## Retail Sales and Consumer Income

The pattern of retail trade in the initial postwar period was reviewed in the October 1946 issue of the Survey. ${ }^{2}$ This article described the extent of the shifts which had occurred during this period

[^1]and indicated the position of various lines of business in terms of prewar relationships of sales to disposable income.

Toward the end of the war, total retail sales in current prices were about 20 percent below the amount indicated by the relationship with consumer incomes over the period prior to 1942. As is known,
this reflected a variety of circumstances of which rationing, price controls, and war savings campaigns were paramount.

Changes in both sales and income closed the gap by the first half of 1946. Thereafter, the trend of retail sales continued generally upward relative to income, but in recent months modification
of this trend has been discernible. ${ }^{\text {s }}$ Durable goods store sales, retarded by supply deficiencies in some lines, have been moving upward toward the prewar relationship to income. Nondurable goods store sales which, partly as a consequence of the lack of durables, had moved far above the line of relationship after the war, continued well above through the first half of 1947.

There was a moderate tendency during this period for the excess to be reduced. Only in the food group has the excess of the actual sales over sales calculated on the basis of the prewar relationship to income widened during 1947, and even here the upward trend has been definitely slowed. ${ }^{4}$

## Nondurable Goods: Sharp Sales Rise

What happened to the two broad groups of retail stores-the nondurable and durable goods stores-is shown in chart 10. After VJ-day, sales at nondurable goods stores, which throughout the war were only slightly below the line of relationship, moved sharply upward. By the first half of 1946, sales at these stores were 20 percent above the amount suggested by the prewar relationship to income. In the first half of 1947 the excess of actual sales at nondurable goods stores over sales calculated on the basis of the prewar sales-income relationship had been increased by about 2 billion dollars (annual rate).

## Durable Goods: Sales Gap Persists

The sharp rise in sales of durable goods stores with increasing quantities of goods and rising prices is also shown in the chart. Notwithstanding this rapid advance from an annual rate of 11 billion dollars in mid-1945 to a rate of about 23 billion in the first half of 1947 , these sales were still about 30 percent below the level indicated by the prewar relationship to income.

## Contrast by Sales Lines

Although total expenditures in retail stores have continued at a high level, there have been very considerable shifts

[^2]
## Chart 10.-Relationship Between Sales of Retail Stores and Disposable Income of Individuals ${ }^{1}$

1 Data for first half of 1947 are preliminary estimates. Source of data: Office of Business Economics.
in buying in recent months which have registered a selective impact by lines of business. The contrasting movements shown in sales by individual lines of trade bring out more clearly the changes from past relationships and afford a better basis for an appraisal of the prospects for retail trade in the months ahead. Table 4 indicates the kinds of business in
which sales are in excess of the amount calculated on the basis of prewar salesincome relationships, those in which deficiencies still exist, and the changes that have occurred since the beginning of 1946. While these percentages cannot be regarded as precise measures they illustrate both the current situation and recent tendencies.

## Largest Deficiency for Auto Sales

The largest deficiency in sales relative to income appears in the sales of motor vehicle dealers. Despite the sharp rise in sales at such establishments from an annual rate of 2 billion dollars in mid1945 to nearly 8 billion in the first half of 1947, the deficiency of the actual from calculated values was still about 50 percent. While sales at such dealers rose steadily to a peak in April, a slight decline followed thereafter, reflecting in large part the drop in shipments of automobiles in May.

## Most Other Deficits Eliminated

In contrast to sales of automobile dealers, sales at other durable goods stores are, for the most part, close to the level based on prewar relationships to income.
Sales at parts and accessories stores rose rapidly after VJ-day, and early in 1946 exceeded the volume required to maintain the prewar sales-income relationship. This sharp rise, however, was not continued through 1946; by the first quarter of 1947, sales had dropped slightly below the calculated level. The slight slackening of demand came after the exceptional increase in car repairs that followed the removal of gasoline rationing.
Sales of household appliance and radio stores and of hardware stores increased continuously through 1946 and exceeded the calculated values for these groups in the first half of 1947. Building material dealer sales and sales of furniture and housefurnishing stores still show a deficit of about 10 percent. In most of these groups the problem of supply has not been entirely resolved.

Table 4.-Percent Deviation of Actual from Calculated Sales ${ }^{1}$

| Class of retail store | 1946 |  | 1947 |
| :---: | :---: | :---: | :---: |
|  | First | Sec- ond half | First half |

1 Calculated sales refer to sales that could have been expected on the basis of the prewar relationship between sales and the disposable income of individuals.
${ }_{2}$ Less than $1 / 2$ of 1 percent.
Source: Office of Business Economics.
For jewelry stores, sales throughout the war tended to follow the prewar relationship to income. Since early in 1946, however, when the peak in jewelry store sales was reached, the sales trend has been slightly downward.

## Food Sales Dominate Nondurables

Among the nondurable goods groups, however, somewhat different sales-income patterns are shown. For the most part sales in the first half of this year in these groups exceed the values calculated on prewar relationships. Also, sales in these groups, with the notable exception of food, generally give some indication of moving downward toward the line of relationship with income. Sales of all food stores and of eating and drinking places account for the major
part of the total excess in sales of nondurables relative to the prewar relationship to income.

After following the prewar relationship to income very closely throughout the war years, dollar sales of food stores recorded a sharp rise relative to income in the period immediately following VJ day. This sharp upward trend has continued, although at a slackening rate, so that the excess in sales ${ }^{*}$ compared to the figure based on the prewar relationship to income has risen almost to 40 percent in the first half of 1947 from about 20 percent in the first half of 1946.

With few exceptions, sales at the remaining nondurable goods stores exhibited a similarity of behavior after VJday. Immediately after the war's end, sales in these groups rose considerably above the values indicated by the relationship to income developed in peacetime years. During the past year, however, these excesses have been reduced to some degree.

Only a few nondurable goods groups showed sales in the first half of 1947 which were less than the values calculated on the basis of the prewar salesincome relationship. Sales of variety stores reached the line of relationship early in 1946 and have stayed close to it ever since. Liquor store sales were only 7 percent above the calculated values in the first half of 1946 and have dropped to 7 percent below in the first half of 1947. The only nondurable goods group in which sales have continued to remain considerably below the calculated values is filling stations. Sales of these outlets have stayed about 30 percent below the level calculated on the basis of the prewar relationship to income since the beginning of 1946 .

# Plant and Equipment Survey 

Expenditures by American business for new plant and equipment in the first quarter of 1947 were about 3.2 billion dollars, a decline from the fourth quarter of 1946 and below the amount which was estimated by business in the survey made several months ago. However, the anticipated expenditures for the second and third quarters approximate the peak annual rate of nearly 15 billion dollars per year, with the third quarter estimated at almost 3.8 billion dollars. (See chart 11.)

Business concerns cooperating in the Digijointosulfvey http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis
the Office of Business Economics and the Securities and Exchange Commission had anticipated several months in advance that new plant and equipment outlays of 3.6 billion dollars would be made in the first quarter of 1947. Throughout 1946, which was a period of steadily increasing activity in business new capital development-and generally advancing prices-quarterly advance anticipations of the new capital program were generally revised upward, with the final figures above the first estimates. In the first quarter both estimates proved high, possibly through inadequate allow-
ance for unpredictable seasonal factors. Only the electric and gas utility group reported a final total above the original anticipation.

The current survey reveals a moderate upward revision of the previously anticipated outlays on new plant and equipment in the second quarter of 1947. The third quarter of 1947 is given as 3,770 million dollars, considerably above the low first quarter and about in line with the peak in the closing quarter of 1946.

The tendency revealed by the anticipations is for new plant and equipment expenditures to level off on a high pla-

Chart 11.-Expenditures for New Plant and Equipment, All Private Nonagricultural Businesses

Sources of data: Securities and Exchange Commission and Office of Business Economics.
teau sustained mainly by net additions to new productive capital, or the replacement of serviceable but obsolescent equipment. The chemical and allied industries are perhaps an outstanding illustration of the former, and the railroads of the latter, with the utilities encompassing both features.

## Changes by Major Groups

The several business classifications shown in table 5 reveal different trends in their quarterly new plant and equipment expenditure anticipations. Manufacturing industries have a tendency to slack away from their 1.8 billion dollar expenditure peak in the fourth quarter of 1946. Even so, the anticipated expenditures for the second and third quarters continue on a relatively high scale.

Both actual and anticipated new capital outlays for mining and the commercial and miscellaneous group of business also display a tendency to level off below their quarterly peaks at the close of 1946. On the other hand, the railroads, electric and gas utilities, and to a smaller extent the other group of transportation industries, anticipate continuing growth in the second and third quarters of 1947. This tends to offset declines elsewhere in the estimates and to hold up the aggregate new capital total for all business in the immediate future.

Progress of capital expansion plans of the railroads reflects the problem of ob-
taining equipment which has been common in some degree to all of the business categories. The railroads originally planned to make capital outlays, in large part for new rolling stock, of 240 million dollars in the first quarter of 1947, but the actual realization was no greater than 160 million dollars. Moreover, the second quarter anticipation by the railroads has been reduced from 280 to 240 million dollars, although the anticipation for the third quarter is placed at the record high of 300 million dollars. For the entire year 1946, the new plant and equipment expenditures by the railroads were only 570 million dollars.

## Equipment Expenditures

In the first three quarters of 1947, it is anticipated that somewhat more than two-thirds of total new capital outlay will be for machinery and various kinds of equipment which accounted for 71 percent or 2,250 million dollars of the total actual plant and equipment expenditures of 3,160 million dollars for all business in the first quarter. Manufacturing indutries accounted for about one-half, or 1,140 million dollars, of the total machinery and equipment figure for the first quarter.

For the year 1946 new machinery and equipment purchases were 67 percent of total new capital outlays by all business; the ratio was 66 percent in the fourth quarter alone. Although there may be some reason to believe that as new plants are completed the machinery and equipment expenditures may for a time assume a larger proportion relative to total capital outlays, the increased percentage of machinery and equipment to the total for the first quarter of 1947 may reflect mainly seasonal factors, particularly in manufacturing industry.

## Used Plant and Equipment

Acquisitions of used plant and equipment by business were significant in 1946, when the annual total of such purchases reached an estimated 1.5 billion dollars. The current survey further substantiates earlier indications of the diminishing importance of purchases of used plant and equipment, as might be expected with the completion of the major transitions from the wartime economy. Although all business acquired possibly more than 300 million dollars of used plants and machinery in the last quarter of 1946, present anticipations point to a steady decline of such purchases to a figure approximating 100 million dollars or less in the third quarter of 1947.

${ }^{3}$ Includes trade, service. finance, and communications
In reporting actual figures for each quarter business concerns also give estimates of similar outlays planned for the 2 quarters following. The second estimate is thus a revision of the firstestimate.
Note.-Figures are rounded and will not necessarily add to totals.
Source: U. S. Department of Commerce and Sncurities and Exchange Commission

Food production for this year is expected by the Department of Agriculture to be about as large as in 1946 and to remain substantially above prewar volume. Although 1947 production depends partly upon weather conditions during the remainder of the growing season, information to date on plantings and moisture conditions and on livestock inventories makes possible approximate estimates for the year. Then, too, supplies for consumption during the current year are in considerable part drawn from production in the previous year, and for this reason can now be estimated fairly accurately.
Domestic civilian food consumption in 1947 will be slightly lower than last year on a per-capita basis, however, according to the latest estimates. In addition to the population growth, the number of persons in the armed forces will average lower this year than last. Imports of food will be a little larger although still below the prewar average, and total exports and noncivilian takings are expected to be substantially unchanged from 1946-a decline in military and other Government purchases is approximately counterbalanced by a rise in commercial exports.

## More Fats and Oils, Sugar

Although per-capita food consumption is expected to fall fractionally below the 1946 average, several important foods will be in increased supply, as shown in the upper panel of chart 13. Improvement in the Cuban sugar crop has made available an increase in supplies for United States consumption sufficiently large to permit the abandonment of rationing for household use. Reduced exports and increased production of edible fats and oils in 1947 will make available a larger supply for civilian consumption than in 1946. Also, more beef and more butter will be available, but these gains are offset by lower pork supplies and by reduced fluid milk and cream consumption.

## Curtailed Buying a Factor

Some of the anticipated decreases in food consumption in 1947, such as in eggs, potatoes, lamb, and pork, are attributable to reduced supplies available for consumption-in most of these cases, because of reduced production. Other declines, however, such as in canned fruit, juices, and vegetables, and fluid milk and cream, are attributable primarily to curtailed consumption because Digitofchigherpprices rather than to a reduchttp://fraser.stlouisfed.org/
tion in available supplies. In fact, most of these products are now available in larger supplies than a year ago. Because of the larger carry-over, the 1947 pack of canned vegetables and juices is expected to be below last year's pack.

## More Beef, Less Pork

Meat consumption in 1947 is expected to be between 150 and 15.5 pounds per capita, the same as in 1946. Prospects are for considerably larger supplies of beef per capita than in any recent year and for an increase in veal. On the other hand, lamb will be less plentiful, and pork output will remain lower than a year ago until the final quarter of the year when the larger 1947 spring pig crop will begin moving to market.

The recent flood damage to the corn crop will tend to reduce feed supplies and has raised feed prices but will not affect 1947 pork supplies to any great extent. Higher corn prices may be followed by some stepping up of the rate of marketing of hogs later in the year but, on the other hand, the weight of these animals may be somewhat reduced. The more serious impact of tighter feed supplies would be felt through reduced farrowings this fall and through lower marketings of lighter weight animals next spring.

Chart 12.-Total U. S. Food Disappearance

I Estimates for 1947 are forecasts as of April 1947. Source of data: U. S. Department of Agriculture.

## Large Gain in Butter Output

Total milk production in 1947 may be about the same as in 1946, but large shifts will take place in utilization because of reduced exports of manufactured dairy products and declining domestic consumption of fluid milk and cream. As a result of both of these influences, increasing supplies of milk and cream are being diverted into the usual surplus channel-butter manufacture. Output of butter in the first quarter of 1947 was 40 percent higher than in the same months a year earlier.

Increased lard yieid per hog in 1947 and reduced exports are making available larger lard supplies per capita than in 1946. Margarine, shortening, and other edible oils were consumed at more rapid rates during the early months of 1947 than a year earlier, but stocks of these oils and of the oil seeds from which they are extracted have been drawn down so rapidly that curtailed consumption will be required for the next several months until the new crushing season begins in the fall.

## Canned Goods Stocks Nearer Normal

Fresh fruit consumption per capita in 1947 is now estimated to be about as large as in 1946. The citrus fruit cropharvesting of which began last Octoberis larger than the previous year, and other fruit crop prospects appear favorable. Stocks of canned fruits are now about twice as large as a year ago, although the prospective carry-over is lower than the prewar average. Canned fruit juice and frozen fruit stocks are also considerably larger than a year ago.

Fresh vegetable supplies have been smaller this spring than in the spring of 1946, and summer output may also show a decline. Despite a record pack of canned vegetables last year, consumption may be reduced in 1947 because of higher prices, and the pack this year is: expected to be smaller. Stocks of frozen vegetables are at record levels.

Production of new-crop potatoes this season has been lower than in 1946 and March intentions to plant were also lower than last year's acreage in the interme-diate- and late-crop states. Such a reduction in planting-if followed by normal yield-would tend to reduce the support activity needed to maintain prices at 90 percent of parity during the 1947 season.

## Income High

Cash farm income in the first 6 months: of 1947 was about one-fourth higher
than in the same period a year earlier, but the year-to-year gain will be narrowed during the second half. This record level of farm income is swelled by temporary conditions arising out of the end-of-war food crisis abroad, but the temporary factors have not yet spent their force.

## Food Expenditures Sustained

During the past year food prices have paced the record advance in the general level of retail prices. This rise in prices has been accompanied by a slower increase in disposable income. In adjusting personal budgets to the decline in purchasing power-as well as to the increased availability of much-desired durable goods-consumers have made changes in their spending which are discussed in another section of this review.

Food expenditures have been sustained at a high level despite the shifting pattern of spending. Curtailments in expenditures have shown up in other lines such as women's apparel and in some socalled luxury items, many of which have shown a smaller price advance than food.

## Supporting Influence of Exports

On the basis of an analysis of farm income as affected by disposable income and by exports, a relationship based on observations for the interwar period indicates that each 1 billion dollars of exports of farm products is associated with an increase in cash farm income of 1.6 billion dollars." If this relationship holds in 1947, projected exports of approximately 4 billion dollars of farm products will contribute more than 6 billion dollars to farm income this year as compared with about 5 billion dollars in 1946 and 1.3 billion in 1935-39 on the basis of the same calculation. In addition, the volume of other noncivilian takings of farm products is expected to be large during 1947 and to exert a significant influence upon farm income.

The direct influence of export demand will be important in the following areas: grains (especially food grains), cotton, tobacco, manufactured dairy products, and lard. In addition, purchasing of eggs for export has reduced the amount of support activity that has been required to maintain egg prices.

From the standpoint of the contribution to cash farm income, exports of farm products have a major influence in products accounting for 15 percent of farm income (wheat, tobacco, and cotton) and an important although declining influence in products making up an-

[^4]other 20 percent of farm income (eggs, manufactured dairy products, and lard). Although the proportion exported of the two major products-cotton and to-bacco-is not unusually large in relation to prewar years, the value contribution of these exports to farm income is large because of the high prices at which
these products are being sold. In this connection reference might be made to the article, "Farm Price Supports and the General Price Level," appearing in this issue, which assays the implications of existing support legislation for the course of agricultural prices and income in the period ahead.

## Business Population and Turn-over

The sharp rise in the business population which began as the war neared its close continued through the first quarter of 1947. By the end of 1946, however, it was clear that the number of firms in operation was approaching a point of balance with the general level of business activity and that the pace of the advance had slackened appreciably.

## Postwar Rise in Business Population

The wartime decline in number of firms and the subsequent rise is indicated by the solid line in chart 14. From the prewar high of about 3.4 million firms in September 1941 the business population declined to almost 2.8 million in December 1943 and then rose steadily to 3.6 million as of December 1946. These changes may be compared with those shown by the dotted line in this chart, which indicates the hypothetical level of the business population calculated on the basis of its average prewar (1929-40) relationship with the general level of business activity. During the $1929-40 \mathrm{dec}-$ ade, the chart shows that agreement of calculated with actual values was generally close. As the war program progressed, however, the two lines departed temporarily, for the number of firms actually in operation declined even though the level of business activity increased enormously.

The special wartime conditions which accounted for this departure are by this time well known to readers of the Surver. ${ }^{\top}$ It is sufficient to note here that with the end of the war these same factors worked in reverse. As the economy reconverted and business resumed its peacetime pattern, the number of firms in operation was very substantially expanded and the gap between the actual and calculated levels of the business population narrowed swiftly. As of December 1946 the actual number of firms in operation was within 65,000 , or 2 percent, of the number expected on the basis of the prewar relationship with the general level of business activity.

[^5]The magnitude of the recent retardation in rate of increase of the business population is shown in table 6. During the first 6 months of 1946 the annual rate of increase in number of firms reached a high of 18 percent but dropped to 9 percent in the last 6 months. The decline was especially pronounced for contract construction, but the slowdown affected to some extent every industry group. Least affected was mining and quarrying, an industry group which expanded less than any of the others since December 1943.

## Gap Between Births and Deaths Narrows

Chiefly responsible for the reduced rate of increase in the business population has been the decline in number of new businesses started, illustrated in chart 15. In the first quarter of 1946 the number of new businesses reached the record high of 188,000 , but dropped steadily to 104,000 in the last quarter of the year.
The gap between new and discontinued businesses, representing the net increment in the business population, was also narrowed, however, by the rise in discon-
tinuances, though the effects of this trend thus far have been relatively moderate. From 32,000 in the fourth quarter of 1944 discontinuances advanced gradually to 54,000 in the last quarter of 1946 , with the pace of the rise increasing in the second half of the year. Although in chart 15 the recent advances in the number of discontinuances appear dwarfed by the larger fluctuations in new business, it is apparent from chart 17 that on a relative basis these increases were substantial, amounting to 45 percent between the last quarter of 1945 and the last quarter of 1946.

The factors underlying the recent trends in business entries and discontinuances were touched upon in part in the earlier article cited in the footnote. With the end of the war opportunities for new enterprises loomed in virtually every sector of the economy. In response, approximately one million new concerns were started in the 2 years preceding December 31, 1946, filling the gaps in the economy opened by the war and reinforcing facilities in areas deemed most likely to prosper in the immediate postwar period. By the end of 1946 it

## Chart 14.-Number of Firms in Operation

1 Calculated from a linear least squares regression equation for the years $1929-40, y=24.41+.1004 x+.061 t$, where $y=$ number of frms (hundreds of thousands), $x=$ gross national product, excluding Government and agriculture (billions
of 1940 dollars), and $t=$ time in 6 -month intervals centered at December 31, 1934.
${ }^{2}$ Data for the fourth quarter of 1946 are preliminary.
Source of data: Office of Business Economics.

## Chart 15.-New and Discontinued Businesses

${ }^{1}$ Data for fourth quarter of 1946 are preliminary. Source of data: Officear Business Economics.
appeared that at least the more obvious of such opportunities had been taken, and indeed, as shown in chart 14, the size of the business population as a whole appeared nearly in line with the prevailing level of business activity.

On the other hand, the generally favorable market and the rising trend of prices resulted in an abnormally low level of discontinuances. Only in the last 6 months of 1946 did the number of liquidations increase materially, and the level, even at the end of the year, was still low in the light of prewar experience and the number of casualties normally to be expected among the many thousands of firms recently started in business.

## Trends in First Half of 1947

Although basic data from which the business population series are compiled are not yet available for the first half of 1947, related series throw some light on the trends to be expected in this period. Thus, in chart 16 it may be noted that the decline in the number of business incorporations continued through the first half of 1947 and that the direction of change in this series roughly corresponds in previous quarters with that of new businesses. It should be noted that the data plotted in chart 16 are index numbers and therefore in-
dicate relative changes in the number of new businesses and of incorporations rather than the absolute levels of these series.
Similarly, the index of corporate dissolutions shown in chart 17 has advanced materially during the first half of 1947, continuing the upward trend in immediately previous quarters. The rise in dissolutions between the last quarter of 1946 and the second quarter of 1947 amounted to 13 percent. It should be borne in mind, however, that the magnitude of quarter-to-quarter changes in corporate dissolutions and in discontinuances sometimes differs materially.

## Failures Rise

The series on "discontinuances" shown in charts 15 and 17 refer to business closures of all kinds, including those attributable to the retirement or illness of the owners, to business failure, or to other reasons. In chart 18 business failures, as legally defined, are shown separately. These failures consist primarily of bankruptcies but include generally business enterprises which have discontinued with known loss to creditors. They, of course, do not include the many firms which discontinue because of inability to make a profit or in order to avoid financial loss when such firms are not involved in court settlements with creditors or other settlements which become a matter of public record.

It is, in any case, significant that the commercial failures shown in chart 18 have advanced sharply from about 800 in the year 1945 to an annual rate of 2,800 in the first quarter of 1947 and to more than 4,000 at an annual rate in the second quarter of the year. Nevertheless, although rising, the level of failures during the first half of 1947 was still far below that prevailing in prewar years. In 1940 there were 14,000 failures and in 1939, 15,000.

new businesses, and for 1947 for incorporations. and other nonprofit organizations are excluded.
Source of data: Office of Business Economics.

## Implications

An analysis of related series, therefore, suggests that both the decline in number of new businesses and the rise in discontinuances have continued over the first 6 months of 1947, a conclusion which agrees with the analysis of underlying factors previously given. It is by no means certain, however, that the magnitude of these changes during the firs: half of the year was sufficient to resul: in a net decline in the business popula.tion, for at the end of 1946 the number of firms in operation was still increasing at a rate of 50,000 per quarter. Nevertheless, it is clear that the substantial leveling off in the rate of increase since the latter part of 1946 was to be expected in the light of the current relationship between the growing business population
(Continued on p. 22)

# Farm Price Supports and the General Price Level 

By H. I. Liebling

INTEREST in farm product prices has been heightened in recent months because of the current high level of agricultural prices, which has been promoted by strong demands both at home and abroad, and because of the bellwether characteristic of agricultural price movements in the cyclical behavior of commodity prices. Prices received by farmers in June 1947 were almost a fourth higher than in June 1946 and nearly double the 1939 average. Reflecting to some extent the expansion of agricultural production but, for the most part the increase of agricultural prices, cash farm income in 1946 was more than three times as large as in 1939, and in 1947 is expected to be at least 10 percent higher than the record income of 1946.

Typically, however, changes in economic activity and the volume of underlying demand in the past have been reflected in wide changes in the level of these characteristically sensitive prices. Such wide fluctuations occurred during the post-World-War-I deflation, during 1929-33, and again during 1937-39. The farm price support program developed under existing legislation was designed to lessen downward fluctuations of this nature.

As long as supply-demand conditions are such as to maintain farm prices on the average far above support levels, as is the case at present, the farm price support program is operative only in very limited areas. For the time when a reverse situation is true, the support machinery can have an important effect upon marketing and consumer spend-ing-not only on the commodities directly affected but on others as well. Consequently, the present period of high farm prices and high farm income presents a favorable opportunity to review the support program and to examine

[^6]
#### Abstract

\section*{Summary}

Although the farm price support program is now largely inoperative because of the high level of agricultural commodity prices, the program will serve to bolster the prices of not only supported but also of nonsupported commodities in a period of downward price adjustments. Thus, fully effective price support operations under existing legislation-which continues in its present form until the end of 1948-will tend to modify the characteristically volatile behavior of agricultural prices and income during cyclical swings in business activity. The calculations here presented suggest that a decline of all the supported commodities to the price support level, together with the associated decline in nonsupported commodities, would result in a drop of about one-fourth from the June 1947 level in the index of prices received by farmers. The magnitude of the calculated decline would be gradually extended through the operation of the parity mechanism, particularly if a concurrent decline in industrial prices occurred.

how it would affect the general economic situation under conditions of a declining trend.

## Operative Area of Supports

The gradual extension of the farm price support program during the thirties and the early war period has introduced a new element designed to modify the characteristic behavior of farm prices during cyclical swings in business activity. On the one hand, it is evident that
the existence of the support programwhich establishes a price floor for major agricultural commodities for stated time periods-would retard a downward adjustment of prices should serious market weaknesses develop. On the other hand, with current prices considerably above existing or prospective support levels, there is room for sizable price declines before the supports would become operative on a broad scale. Thus, the existence of legal price supports will not prevent farm prices from declining-and possibly again taking the lead should a general move toward lower commodity prices be initiated-but it does provide farmers through 1948 with some insurance against the violent swings in prices and income that have occurred in the past.

## Price Floor Tied to Parity

The present article focuses upon the problem of determining the significance of the Government's farm price support program with relation to both supported and unsupported farm prices and to industrial prices. This problem involves the nature of the support machinery. As is well known, the support levels are linked to the "parity index," which is a compound of prices paid by farmers for production materials and family maintenance. The effect of this procedure is to inject an element of circularity in the evaluation, since both farm and nonfarm prices enter into the parity computation.

Although parity prices are computed monthly, the support levels generally are tied to parity prices at the beginning of the marketing season for each commodity. Thus, there is a delay-the length of which varies with the duration of the marketing season-in the adjustment of support prices to changes in prices paid by farmers. While the supports are operative, they serve to bolster the prices of agricultural commodities and of industrial commodities utilizing agricultural raw materials.

Sources of data: U. S. Department of Labor, except that June 1947 is estimated by Office of Business Economics on basis of weekly indexes through June 21.

In view of the interaction between farm prices, nonfarm prices and parity, calculations of farm prices under assumed conditions regarding the general level of economic activity cannot be made with a high degree of precision. However, the existence of the legal price support provisions makes it possible to delimit the area of price decline for farm products for a given marketing period under assumptions of a fall in demand and price. Furthermore, price adjustments in the subsequent marketing period stemming from declines in nonfarm prices can be approximated. In brief, this is the procedure to be followed in the ensuing discussion, although it will be shown that other variables must be taken into account.

## Volatility of Farm Prices

The wholesale price series plotted in chart 1 illustrate the typically volatile behavior of farm prices in comparison with the movement of industrial prices. After World War I, the farm price index fell 53 percent from peak to troughand in this period agricultural prices led the downtrend of the industrial price level by some 7 months. Industrial prices declined 44 percent over the 1920 21 period. In the second major downsweep of prices, which occurred after 1929, farm prices fell nearly two-thirds from November 1929 to the trough in 1933, while nonfarm nonfood prices sagged less than one-third.

Price supports through Government programs were present to a limited extent in the price downturn of 1937-39. Nevertheless, the fall in farm prices again was larger than in nonfarm prices and the anticipatory behavior of farm prices again was evident.

The wider fluctuations of farm price movements spring from the essentially different methods of production and distribution in agricultural as compared with nonagricultural industries. The farm production and marketing processes are conducted by some $6,000,000$ operators under almost completely competitive conditions, wherein control over total production by any individual is usually absent. In many nonagricultural industries like conditions prevail, but in others where large scale operations predominate, the price mechanism operates on a more inflexible basis. ${ }^{1}$ When general demand falls,- agricultural production tends to remain stable and almost the entire effect of the change in demand is expressed in lower prices. By contrast, industrial production is curtailed under such circumstances and industrial prices show relatively smaller declines.

## Origin of Farm Supports

Because of the wide fluctuations of farm prices and income, the Government beginning with the Agricultural Marketing Act in 1929, has attempted to reduce

[^7]the fluctuations in farm prices by various price and production control measures. The governing legislation before the war was the Agricultural Adjustment Act of 1938, which has as its purpose the stabilization of farm prices at the parity level, the latter being defined as that "level which will give agricultural commodities a purchasing power with respect to articles that farmers buy equivalent to the purchasing power of agricultural commodities in the base period," usually 1910-14 for the major commodities.

The parity price for a commodity is calculated by multiplying the base period of a commodity by an index of prices paid by farmers for items of production, family living, mortgage interest, and land taxes. Parity is reached for a given commodity when the actual price received by farmers equals the parity price; parity for all farm commodities exists when the index of prices received by farmers equals the index of prices paid by farmers, both indexes being expressed on a 1910-14 base.

Until 1941, farm price support operations were applied mainly to corn, wheat, cotton, tobacco, and a few minor commodities. Mandatory supports were fixed at percentages of parity varying from 52 to 75 percent.

As a means of stimulating production of essential commodities during the war, coverage was extended to a larger number of farm products-the so-called "Steagall commodities"-with supports being established at a minimum level of 90 percent of parity for these commodities. Supports for the basic commodities were subsequently raised to 90 percent, except that cotton is supported at 92.5 percent of parity and wool is covered under separate legislation-the extension of which is currently under consideration. Under present legislation, supports for the Steagall commodities will be terminated at the end of 1948 , but supports for the basic commodities are to be continued indefinitely beyond that date at percentages of parity ranging from 50 to 75 percent of parity.

Table 1 lists the commodities for which price supports are required under present legislation. The Secretary of Agriculture has also established supports for some additional commodities under discretionary powers.

## Current Prices Above Supports

Although price support provisions now extend to commodities representing three-fifths of the value of farm production for sale, the relatively high level of farm prices now prevailing is virtually independent of the Government's price support program. Except for potatoes, eggs, and dry milk, prevailing market prices are generally far above the Government support levels. This is shown in table 2 which compares the support prices for major commodities with the most recent market prices.
The average of prices received for all farm commodities in June 1947 was 271 and the average of prices paid was 230 (both indexes being based on 1910-14= 100). Thus, the parity ratio was 118 percent which signifies that farm prices were 18 percent above parity, on the average. For individual commodities the ratio of actual prices to parity prices in June ranged from 156 percent in the case of beef cattle and lambs, and 140 percent in the case of hogs down to less than 50 percent for the citrus fruits. Since 1943, the parity ratio has been higher than in any other previous period with the exception of 1917-18 (see chart $2)$.

The reason for the present high parity ratio, of course, is the relatively larger war and postwar increases in prices received by farmers than in prices paid. While the prices-paid index has increased 85 percent since 1939 , the index of prices received in June was 185 per-
cent above the 1939 level, when farm prices were depressed.
The parity ratio will vary in the future according to changes in prices received relative to prices paid. The chart indicates that in 1921 the parity ratio averaged 75 and at the depth of the depression of the thirties the ratio fell to a considerably lower point. As long as the existing support legislation remains in effect, it can be concluded that disparate changes in farm and nonfarm prices of such magnitudes will not occur.
In many instances-such as in the case of most basic crops-prices for the 1946-47 crop year were established in the summer and early fall of 1946 on the basis of the parity index then prevailing and have remained unchanged since then, although the parity index has risen considerably. The result is that most of the official support prices are currently below 90 percent of parity, taking into account the most recent estimate for the prices-paid index.

## New Supports To Be Higher

The parity index has advanced 22 percent since June 1946 and 15 percent since September. It was during the JuneSeptember period of last year that most of the existing supports were fixed. Since supported prices are tied to the parity index, the level of supports which can be expected to prevail for the 1947-48 marketing period will generally be higher
than those applicable during the marketing season now coming to a closebarring, of course, a very early and unexpectedly sharp drop in the index of price paid by farmers.

Should the parity index remain close to the present level until September 1947, the prospective support prices can be determined for most of the supported commodities. For the basic commodities given in the table below, as well as for most Steagall commodities, the computed support level will be higher than the old level but still far below the current price. Wheat prices in June were 19 percent above the computed support price, cotton prices 29 percent above and corn prices 39 percent above, while many of the Steagall commodities were in excess of the computed price by even wider margins. These excesses are high-lighted in chart 3.

| Item | $\begin{gathered} 1946-47 \\ \text { support } \end{gathered}$ |  | June 1947 price |
| :---: | :---: | :---: | :---: |
| Corn, per bushel | \$1.15 | \$1.33 | \$1.85 |
| Wheat, per bushel | 1. 49 | 11.83 | 2.18 |

cent. Should all supported commodities fall to computed price levels, the decline from June prices would amount to 20 percent.
If a decline of this magnitude eventuates for the supported commodities, it can be expected that the prices of nonsupported farm commodities would also decline. This is the next factor to be considered.

## Relation to Nonsupported Prices

Although the primary intent of the Steagall Amendment was to give support only to those farm commodities which required an expansion of production for wartime needs, the effect of supporting "Steagall" as well as the basic commodities is to establish a floor-somewhat adjustable-under the general level of farm prices. As already noted, approximately three-fifths of the value of farm production for sale is covered by support programs.

The reason for the close interdependence between the prices of supported and unsupported commodities is simply that farm commodities are generally in competitive and substitutive relations with each other. The price of corn, for example, is closely linked with the prices of feed grains so that, at a given level of corn prices, the competitive feed grain price index may be reliably estimated.

A similar relationship exists between hog prices-which are supported while other meat animal prices are not-and the meat animal price index. Because of the substitutability among pork, beef, veal, mutton and lamb at retail meat counters, the fixing of support price for hogs has the effect of propping prices for the entire range of meat products. Further interdependencies exist in the cases of supported wheat and unsupported rye, supported soybeans and unsupported cottonseed, and in a number of other commodities. Except for fruits and truck crops, where substitutability is not expressed in significant price relationships with other segments of the farm price level, there exists a degree of substitutability for nearly all of the unsupported commodities with a supported commodity.

As an approximation it can be stated that 85 percent of the sales value of farm products is given price support, either directly because of the legal provisions or indirectly because of competitive and substitutive relationships between supported and unsupported prices. Thus, an over-all level of farm prices for the coming support season may be calculated on the basis of the computed supported prices described above with allowance for the interdependence among farm prices as indicated by past price behavior. This allowance would raise the 20 percent decline previously cited for supported commodities to nearly 25 percent. This may be considered a first approximation-if the prices which farmers pay for purchased commodities are held constant.

## Interaction on Parity Index

The above calculation which holds the prices-paid index constant while farm products decline, does not allow for the interaction of lower farm prices on the parity index. The principal determinants of the index are the prices which farmers pay for production items, which generally move in direct relation to prices of industrial goods, and for family maintenance which includes food, clothing, and housefurnishings. Because of the inclusion of food, feed, seed, clothing and housefurnishings-for which farm products are used as raw materials to a greater or less extent-changes in farm prices quite evidently affect the parity index. The food and feed components of the parity index would react rather quickly to a fall in farm prices.

Based on long-term relationships, a reduction to support levels of prices received by farmers for food would reduce prices paid by farmers for food by nearly 25 percent and lower the parity index by about 4 percent. Similarly, a reduction of feed prices at the farm level
would imply a one-fourth reduction in prices paid by farmers for feed and would lower the parity index by 2 percent. Thus, a decline of 6 percent in the parity index, operating through the food and feed components only, would result from the decline of farm prices to support levels. In those few cases where supports are fixed monthly-eggs and dairy products are the chief commodities of this type-the lowered parity price would be quickly reflected in revised support prices. In most cases, the downward revision of supports could be delayed anywhere from 1 to 12 months.

After the full effect of the lowered parity index on the price supports and on the prices of unsupported commodities had worked itself out, the calculation of the decline of the index of prices received would be extended to roughly 30 percent, as compared with the $25-$ percent cited as the first approximation of the margin between current prices and the calculated price floor implicit in the support program. This 30 percent approximation covers only the decline stemming from the movement of farm prices.

In terms of the index of prices received by farmers, hypothetical declines of these magnitudes would reduce the index from the June 1947 figure of 271 ( $1910-14=100$ ) to 207 before interaction on the parity index, and to 194 after such interaction. It should be noted that the interaction has included only the effects

of lower farm prices on the food and feed components of the parity index.

## Allowance for Lower Nonfarm Prices

To the extent that general economic factors contribute to price weaknesses in the farm area, these would likewise react upon nonfarm prices. The latter are represented in the parity index, and together with farm-product prices comprise the two major determinants of changes in prices paid by farmers. Hence, the indexes of prices received by farmers and of wholesale prices other than farm and food are used here to express the effect of changes in industrial prices on the parity index. Past relationships between the parity index and its two major determinants indicate that for every 10 -point change in wholesale prices other than farm and food, the parity index changes by somewhat less than 4 points, on the average.

This statistical relationship provides a basis for illustrating the interaction of changes in industrial prices on the index of prices paid by farmers, and, consequently, on the calculated supports. Because May 1947 was the last month for which data was available for industrial prices, all of the computations in the table were calculated in terms of May, although the estimates previously cited were based upon farm-product prices and the parity index for June. Certain hypothetical computations, which illustrate varying declines in industrial prices, are shown in table 3. The significance of the table relates, in part, to the fact that an allowance for the effects of declines in industrial prices on the parity index would reduce support prices and, therefore, would extend the magnitude of the calculated permissible decline in farm-product prices. As shown in the table, a 10 -percent decline in industrial prices, combined with the effects of lower farm prices on the parity index, would result in an extension of the calculated decline in agricultural prices from 29 percent to 32 percent. The effect of a decline of 20 percent in industrial prices-operating through the parity mechanism-is also illustrated. Here again, a time period extending generally from 1 to 12 months would be required for effects of this nature to work themselves out.

## Relation to General Price Level

The effects of declines in agricultural prices to support levels and postulated declines in industrial prices also are expressed in table 3 in terms of the Bureau of Labor Statistics Wholesale Price Index. A drop of farm product prices to support levels, with no change in indus-

| 20 percent..----- | 179 | 124 | 112 | 106 | 111 | 34 | 30 | 30 | 20 | 24 |

Source: Indexes of actual prices from U. S. Department of Labor and U. S. Department of Agriculture; computation by Office of Business Economics.
trial prices, would imply a reduction of about a fifth for the BLS wholesale farm and food indexes, while the total index would fall 10 percent. After allowing for the interaction of lower farm prices on the parity index, the farm and food indexes would be reduced further. Example $C$ in the table illustrates the combined effects of this interaction and of hypothetical declines in industrial prices. The over-all BLS index would be reduced 18 percent from present levels, and the farm product and food indexes would fall more than one-fourth, assuming a 10-percent decline in nonfarm and nonfood prices. A price decline under the assumption of a 20 percent fall in industrial prices is also illustrated.

The basic links in the chain of price reactions illustrated in the table are the parity index and the price support provisions under existing legislation. All the hypothetical index values shown in the table represent the lower limits under the assumed conditions. Because of the complexity of the relationship between farm prices and industrial prices, the computations in the table do not allow for the effects of changes in the former on the latter, although they do take into account interaction in the reverse direction, that is, the effects of changes in industrial prices on farm prices.

Despite the statistical difficulties involved in estimating the various price effects, the nature of these effects can be illustrated very readily. A reduced farm price for cotton, for example, would affect the cost of cotton textile goods used for clothing, housefurnishings and industrial products. Similarly, a fall in the prices of soybeans, cottonseed, and flaxseed would be reflected in changes in the cost of production of paints, soaps,
lacquers, and many chemicals. While these effects often would be minor, in competitive markets they would in turn be reflected in price declines.

## Significance of Farm Price Floor

The analysis to this point has shown that the immediate prospect with respect to the agricultural price support program is for a rise in the level of supports for the 1947-48 season, assuming that the increase in prices paid by farmers since last summer will not be wiped out over the next 2 or 3 months. Nevertheless, even the higher level of supports in prospect will be substantially below current prices (see charts 3 and 4) and, therefore, will play only a nominal role unless a major change occurs in the supplydemand relationships for agricultural products during the coming months.
The calculations already presented indicate that the hypothetical decline-on the basis of farm prices and parity prevailing in May-would be about onefourth in terms of the index of prices received by farmers, with the decline being extended to nearly one-third after changes in the parity index are finally expressed in lower support prices. Translated into retail food prices, a decline of one-fourth in farm prices would imply a reduction of 15 to 20 percent in the food component of the BLS Consumers' Price Index for May 1947 and 6 to 8 percent in the total index. These latter effects, however, would be evident only after a time lag.
With the passage of time, the price floor would tend to be lowered as a result of the interaction of lower farm prices on the parity index and of concurrent reductions which would normally occur in industrial prices. This lowering would come about slowly because of the
time lag in revising support prices. A possible consequence is that many support prices will remain above 90 percent of parity, and even above the full parity price, pending downward adjustment of support levels. The point to be stressed, however, is that existing legislation, if made fully effective, would guarantee a minimum farm price level of 90 percent of parity for the supported commodities (which provide about six-tenths of farm income) with levels for unsupported farm products depending on the strength of the substitutive relationships between them and the supported commodities. Hence, the probability of a disparate fall in farm prices relative to nonfarm prices, to the extent that has frequently occurred in previous deflationary periods, is ruled out. The actual limit to a potential decline in farm prices would thus be determined more by the behavior of nonsupported farm and industrial prices than by the support machinery itself.

## Prop to Farm Income

Once farm supports become effective, not only would they tend to bolster costs in those industries heavily dependent upon agricultural raw materials, but they would also serve to sustain farm income at a higher point than would otherwise be possible. The decline of farm product prices to support levels, without allowing for any decline in industrial prices that would affect the parity index, would hold cash farm income at more than 20 billion dollars. The latter figure would represent a decline of more than 4 billion dollars from the 1946 level, and somewhat more from the prospective higher income in 1947. But even at 20 billions, cash farm income would still be as high as during the relatively prosperous years of 1943 and 1944. A concomitant price decline in the industrial segment would, of course, tend to reduce this income. Since farmers comprise an important market for consumers' and producers' goods, a continuing high level of cash farm income would operate as a deterrent to falling nonagricultural product prices.

## Prospective Support Operations

With farm prices currently in a strong position because of the heavy volume of exports and high consumer income, only a few commodities have required support
in the past few years. Should these conditions change, however, supports may be required for a broad range of commodities during the steagall period ending December 31, 1948. Price declines occurring among all the commodities that now require support by existing legislation will present many new problems to the price-supporting agency in terms of the volume of funds necessary to make the price floors effective, with respect to maintaining supports at the exact support levels, and in connection with the disposal of agricultural supplies acquired by the Government in its loan and purchase support operations.

Beyond the expiration of the Steagall period at the end of 1948 , supports under existing legislation will be required only for some of the basic commodities, at levels ranging from 50 to 75 percent of parity. Unless the support legislation is revised to extend over a wider area of commodities, operations to support such a limited number of products would have a considerably smaller effect on the average of farm prices and on farm income than is possible under the legislation now in force.

## The Business Situation

(Continued from p. 16)
and the relatively stable level of business activity.

This retardation in the growth of the business population is not without some implication for the general business outlook. Since VJ-day the demand for inventories of raw materials and finished goods, for credit and capital, for industrial and other business equipment, and for manpower has been subject to the constant pressure of a steadily expanding influx of new buyers. The excess of business births over business deaths between mid-1945 and December 1946 amounted to nearly 600,000 firms, although it is noteworthy that most of these new concerns were small. Thus, while the high level of demand spurred the establishment of new businesses, the growing business population itself provided some further stimulus to the high

level of demand. While it is difficult to assess the extent of this stimulus, it is apparent that if current trends persist this element of buoyancy in the nation's major markets will occupy a role of diminishing importance in the immediate future, when compared with experience in the 2 years immediately following the end of the war.

## Monthly Business Statistics

The data here are a continuation of the statistics published in the 1942 Supplement to the Survey of Current Business That volume contains monthly data for the years 1938 to 1941, and monthly averages for earlier years back to 1913 insofar as available it also provides a description of each series and references to sources of monthly figures prior to 1938. Series added or revised since publication of the 1942 Supplement are indicated by an asterik (*) and a dagger ( $\dagger$ ), respectively, the accompanying footnote indicating where historical data and a descriptive note may be found. The terms "unadjusted" and "adjusted" used to designate index numbers refer to adjustment of monthly figures for seasonal variation.

Data subsequent to May for selected series will be found in the Weekly Supplement to the Survey.

## BUSINESS INDEXES-Continued

${ }^{2}$ Revised. ${ }^{\text {P }}$ Preliminary. $\ddagger$ Index is in process of revision. ventories for nonferrous metals and their products see $p$. 22 of the August 1946 Survey
$\dagger$ Revised series. For revisions for the indirated unadjusted indexes and all seasonally adjusted indexes shown above for the industrial production series, see pp. $18-20$ of the December 1943 survey. Seasonal adjostment factors for a numher of industries included in the industrial production series shown in the survey were fixed at 100 beginning various months from January 1939 to July 1942; data for these industries are shown only in the unadjusted series as the "adjusted" indexes are the same as the unadjusted. Data for $1939-44$ these series and for inventories for 1938 - 45 are on p. 22 of the August 1946 issue; revised figures through August 1945 for inventories of "other durable goods industries," superseding fgures in the August 1946 Survey, willbe published later.

## COMMODITY PRICES

- Revised. Preliminary.
 series on operating businesses and business turnover, see pp. $21-23$ of the May 1946 Survey and $p .10$ of the May 1944 issue. The series on new plant and equipment expenditures are compiled by the Securities and Exchange Commission and the U.S. Department of Commerce and are estimated quarterly totals for all private industry, excluding agriculture, based on reports from a sample including most of the corporations registered with the Commission and a large sample of unregistered manufacturing companies; data are reported actual expenditures. The series on prices paid by farmers and the parity ratio are from the U. S. Department of Agriculture: the latter is the ratio of prices received by farmers to prices paid, interest and taxes; data for 1913-45 will be shown later.
$\dagger$ Revised series. Revised figures for $1938-A u g u s t$ i 945 for inventories of "other nondurable goods industries" will be shown later. Indexes of prices received by farmers for $1913-$ 45 are shown on pp. 17-19 of the April 1947 Survey; data for June 15, 1947, are as follows: Total 271; crops, 262; food grain, 253; feed grain and hay, 240; tobacco, 390 cotton, 275;

## COMMODITY PRICES-Continued

## "Revised. 1 Not available. §Formerly designated "cost of living index." $\ddagger$ For revised 1943 data see p. 20 , of April 1946 Survey.

- In May, June, September and October 1946, it was impossible to obtain adequate samples for some meats in a number of cities; in such cases, the latest available prices were car
ed forward in the index; July index reflects full price change from mid-A pril and November index, full price change from mid-August.

 and $1935-44$, p. 31 of February 1946 Survey. Data for 1923-45 for the indexes of retail prices of the food sub-gr
1985 for the indexes of retail prices of "gas and electricity" and "other fuels and ice" will be published later.

- Revised. p Preliminary. \$ Data for May, August, and October 1946 and January 1947 are for 5 weeks; other months, 4 weeks.
$\ddagger$ Rased on weekly data combined into 4-and 5 -week periods except that a week faling in December and January is prorated; see note in February 1947 Survey, * New series. Estimates of total nonfarm dwelling units for $1910-44$ are shown on p. 15 of the November 1946 Survey. The data on new construction activity since the beginning monthly data for $1939-45$ and annual estimates for $1915-46$ are slown on pp. 23 and 24 .
+ The index of purchasing power of the dollar based on prices received by farmers has
of hiding of building construction for January 1940-Necember 1945 are available on request. Data ior $1920-44$ for the number of new dwelling units are shown on $p$. 15 of the November 1946
Survey (see note in February 1947 Survey with regard to January and February 1945 figures). Since early 1945 data for new dwelling units and the indexes of building construction ahove should be considered volume of construction for which permits were issued or contracts awarded rather than volume started, as in normal years, since shortages of building materials and limiting orders have caused considerable delays in the start of construction or, in some cases, abandonment of the work.

- Revised. $p$ Preliminary.
*New series. Annual estimates of total wholesale sales beginning 1939 are available on p. 32 of the February 1946 Survey and the table on the back cover of the February 1947 lssue and monthly figures beginning June 1943 for all series are on $p$. S-9 of the August 1944 apd later issues. For estimates of wholesalers' inventories for $1938-42$, see $p$. 7 of the June 1912 Survey and p. S-2 of the May 1943 issue. Estimates of the labor force bave been revised beginning July 1945 (see explanation in the February 1947 Survey) and revision of the ea-lier data is in progress: all revisions for these series and data prior to 1946 for the series on noninstitutional population and persons not in the labor force will be published when revisions are completed. See note marked "*" on P. S-10 regarding the estimates of production workers in manufacturing industries.
† Revised series. See note marked "t" on p. S-8 regarding revisions in the indexes of department store sales. Revised data for $1919-45$ for the index of department store stocks
are shewn on p. 24 of the August 1946 Survey. Revised estimates of employees in nonarricultural establishments for January 1939 February 1946 are shown on pp. 22 and 23 of the are shewn on p. 24 of the August 1946 Survey. Revised estimates of employees in nonarricultural establishments for January 1939 -February 1946 are shown on pp. 22 and 23 of the
May 1947 Survey; earlier data back to 1929 for several series are availabie in the July 1945 Survey as indicated in the fontnote on 23 of the Mav 1947 Survey.
$\S$ Revisions for 1946 not shown above: Total-Jan., 4,131; Feb., 3,807; Mar., 4,031; Apr., 4,151; nondurable goods establishments-Jan., 3,144; Feb., 2,841; Mar., 2,955; Apr., 2,971.

$r$ Revised, ${ }^{p}$ Preliminary. $\ddagger$ See note marked "§" on p. S-10. © Small revisions in the data for January 1940 to May 1944 are available on request. 1 Partly estimated.
§Week ended the last saturday of the month. those eontinning from orevious months: data for 1944-45 are shown on $n .23$ of Decomber 1946 Survey

R Rates refer to all employes rather than to wage earners and are therfore not strictly comparable with data prior to 1943 published in the Survey.

 for these serics and begimning 1939 for initial unemployment compensation claims will he shown later (see note in April 1946 Survey for definition of initial claims).
$\dagger$ Revised series. Data beginning June 1942 for nonagricultural placements are available in the August 1943 Survey; earlier data will be published later. For information regarding the revised indexes of production-worker pay rolls in manufacturing industries. see note marked "i"' on p. S-10.

| Unless otherwise stated, statistics through 1941 and descriptive notes may be found in the 1942 Supplement to the Survey | 1947 | 1946 |  |  |  |  |  |  |  | 1947 |  |  |  |

## EMPLOYMENT CONDITIONS AND WAGES-Continued

$r$ Revised. $\quad$ Preliminary
${ }^{1}$ Data for October 1946 relate to the end of the preceding month. Data for the week ending September 15 th are not available. The index has been temporarily discontunued. tSample was changed in November 1942; data are not strictly comparable with figures prior to that month.
§Sample was changed in July 1942; data are not strictly comparable with figures prior to that month.
New series. Indexes of pay rolls beginning $1 \subset 39$ for retail food establishments and 1940 for water transportation are shown on $p$. 31 of the June 1943 Survey. Data beginning
1932 for the newspapers and printing, book and job, industries will be published later; see November 1943 Survey for data beginning August 1942 . Data for the aircraft engine industry beginning 1939 will also be published later
$\dagger$ Revised series. See note marked " $\dagger$ " on p. S-10 regarding revisions in the indexes of pay rolls in manufacturing industries and reference to revised data and note marked " $\dagger$ " on
p. S-11 for reference to revised data for pay rolls in nonmanufacturing industries. The indicated series on average weekly earnings and average hourly earnings (p. S-14) have been
shown on a revised basis beginning in the March 1943 Survey (see note in that issue for an explanation of the revision); data prior to 1942 have not been published in the Survey Digitizedand priH Aestepwn in a later issue; there were no revisions in the data for industries that do not carry a reference to this note.

: Revised. p Preliminary. § Sample was changed in November 1942; data are not strictly comparable with figures prior to that month.

- The comparability of the series was affected by a change in the data in July 1945; see January 1946 Survey for June 1945 figures on both the old and the new basis.
$\ddagger$ Data beginning April 1945 are not comparable with earlier data; see note for hours and earnings in telephone industry at the bottom of p. S-13 of the April 1946 Survey.
\& Rates as of June 1. 1947: Construction-common labor, \$1.189: skilled labor, \$2.01.
$\sigma^{2}$ Data beginning February 1947 include increases amounting to approximately ten cents per hour set aside by the Western Union Telegraph Company as a result of awards or recommendations of Governmental boards but not yet distributed pending completion of job classification structure; approximately 6 cents of this increase has been aceruing since December 1945 and the remainder since June 1946.
data in A pril 1945) and diourly earnings for 1937 -43 for the telephone industry are shown 00 p. 20 or the May 1945 Survey (see also note marked - above rezarding a hange in the nonmanufacturing industries and beginning August 1942 for the printing and publishing subgroups are available, respectively, in the May 1943 and November 1943 issues, and dat
$\dagger$ Revised series. See note marked " $\dagger$ " on p. S-13.

$\rightarrow$ Revised. ${ }^{\circ}$ Preliminary. § Includes open-market paper. IFor bond yields see p. S-19.
1 Includes time deposits of foreign banks, not shown separately, which amounted to 22 million dollars in February 1917
$\oplus$ Effective Nov. 1, 1946, jurisdiction over the emergency crop and drought relief loans included above was transferred to the Farmers Home Administration.
$\ddagger$ Excludes loans to other Farm Credit Administration agencies.
on Rate cn all loans: see note on item in April 1946 Survey.
*New series. Data beginning December 1940 for the series on taxable Treasury notes are available on p. S-14 of the April 1942 and later issues of the Survey; since Dec. 15, 1045 ,
this series represents price of Treasury bonds of Dee. 15,1950 . For information regarding the series on consumer credit see note marked "*", on p. S-16.
$\dagger$ Bank debits were revised in the September 1943 Survey to include additional banks; see p . S-15 of that issue for revised figures for May-December 1942 .

Revised. p Preliminary
Revised. ${ }^{p}$ Preliminary. ${ }^{2}$ Deficit. ${ }^{1}$ A verage for July 11-31. ${ }^{2}$ Partly estimated.
1 A verage for July 11-31
Q Data are on the basis of Daily Treasury Statements (unrevised)

- Data contain series published in the 1942 Supplement but suspended during the war period; data for November 1941 -February 1945 will be published later.

Quotations are for foreign silver through July 1946; thereafter they apply also to domestic and Treasury silver if such silver enters into New York market transaetions.
${ }^{6}$ - For $1941-44$ data for 629 companies sind the industrial groups, see p. 31 of the October 1946 Survey.
$\ddagger$ For 1941 revisions see p . S-17 of the November 1942 Survey.

§ The publication of practically all series on foreign trade included in the 1942 Supplement but suspended during the war was resumed in May 1946 Survey. Export statistics nclude lend-lease exports shown separately above, shipments by UNRRA and private relief agencies, and since June 1945 comparatively small shipments consigned to United States Government agencies abroad; shipments to U.S.armed forces abroad are excluded. Revised 1941 figures for total exports of U . S . merchandise and total imports are shown on p. 22 of the June 1944 surrey; revised figures for 1942-43 for the totals and revised figures for 1941 and later data through February 1945 for other series will be shown later.
chandise series. Daya on shipping weight of exports and impoits are compiled by the C . Department or commerce, Bureau of the Census; they represent gross weight of mer
 exports although, since the program officially ceased to operate at the end of the war, the recipient nations have, with few exceptions, arranged to finance them prior to the exportation of the merchandise. Monthly data prior to February 1945 for Colombia and Venezuela will be shown later.

| Unless otherwise stated, statistics through 1941 and descriptive notes may be found in the 1942 Supplement to the Survey | 1947 | 1946 |  |  |  |  |  |  |  | 1947 |  |  |  |

r Revised. or Data have been shown on a revised basis beginning in the March 1945 Survey.

- Data were revised in the September 1945 Survey; see note in that issue. © For a rief description of this series see note in April 1946 Surves.
$\otimes$ Data for nitric acid and ammonia include 2 additional plants heginning June 1946 and for the latter 1 additional plant beginning August 1946; see note in February 1947 Survey. $\oplus$ Excludes data for Mississippi, which bas discontinued monthy r rports, wegiving in the October 1946 Survey
$\ddagger$ The indicated series, except data for alcohol stocks in denaturing plants (available only beginning 1942 ). continue series published in the 1942 Supplement; unpublished data
 of the February $194^{-}$Survey for further information on the series for ethyl alcohol and production of spirits at registered distilleries for industrial purposes.

 ruary 1945 for the new series on gelatin, whil be shown later. fata for $1940-43$ for sulphur arf shown on p. 24 of the Nar 1946 surve.

was producing in 1945 but whose activities were not included in figures for that year; however, this change does not appreciably affect the comparability of the data.

## - Revised. ${ }^{1}$ December 1 estimate. "No quotation. $\ddagger$ See note in June 1945 Survey for explanation of this price series. or" See note marked " $\sigma^{\prime \prime}$ " on p. S-28.

© Distiling materials produced at wineries, shown separately above, were combined with production of still wincs as shown in the survey through the February 1947 issue.
\& Data continue series published in the 1942 supplement but suspended during the war period; data for October 1941 -February 1945 will be published later

- Revised 1943 data are on p. 13 of the March 1945 Survey; see note on item in February 1945 issue regarding earlier data: $1944-45$ revision are on p. 16 of April 1947 Survey
$\dagger$ Revisions for consumption of distiled spirits for beverage purposes are shown on p .22 of the July 1946 survey. See note marked "t" on p . $\mathrm{S}-25$ of the A priil 1946 Survey io reference to $1941-44$ revisions for other alcoholic beverage series and p . S - 27 of the May 1946 issue for revisions for fiscal year 1945 ; revisions for all mont hs of the fiscal year 1946 are shown on p. S-26 of the March 1947 Survey. Stocks for distilled spirits include products branded "spirits" which were shown in the May-October 1946 issues of the Survey with data for ethyl alcohol (see note in November 1946 Survey); production figures are net excluding spirits used in redistillation; tax-paid withdrawals of ethyl alcohol, which are lstgely for beverage purposes, are not included here but are shown on p . $\mathrm{S}-23$. See notes marked " + " on pp. $\mathrm{S}-25$ and $\mathrm{S}-26$ of the April 946 Survey for references to $1941-43$ revisions for the indicated

$r$ Revised. 1 No quotation. 1 Dec. 1 estimate.
Includes old crop only; new corn not reported in stock figures until crop year begins in October and new oats and wheat until crop year begins in July.
Data continue series published in the 1942 supnement but suspended during the war period; data for Octoter 1941-Febmary 1945 will be published later
f Data relate to regular flour only; in addition data for granular flour, collected for January 1943 to February 1946, are given in notes in the May 1946 and previous issues of the
8 Prices since May 1943 have been quoted for sacks of 100 nounds and have been converted to price per barrel to have figures comparable with earlier data. For March-August
6 quotations are for flour of 80 percent extraction; beginning feptem ber 1946, quotations were resumed for four of normal extraction (72 nercent).
$\dagger$ Revised series. The indicated grain series have been revised as follows: Crop estimate for oats, 1932-44, and rice, 1937-44; other crop estimates, $1929-44 ;$ domestic disappearance of wheat and stocks of wheat in country mills and elevators, 1934-44; corn, oat and wheat stocks on farms and total United States stocks of domestic wheat, 1926-44; all revisions are

- Revised. ${ }^{1}$ No quotation. ${ }^{2}$ Prices beginning December not strictly comparable with earlier data; comparable figure for November 1946, 0.545.
§Data continue series shown in the 1942 Supplement but suspended during the war period; data for October 1941 -February 1945 will be published later.
$\sigma^{7}$ Cold storage stocks of dairy products ( p . S-26) meats, poultry, and eggs include stocks owned by the U. S. Dept. of Agriculture and other Government agencies, stocks held or Armed Forces stored in warehouse space not owned or operated by them and commercial stocks; stocks held in space owned or leased by the Armed Forces are not included.

QSee note in May 1946 regarding ehanges in the indicated series made in that issue and an earier change beginning June 1944.
俍 of datar
IFor data for December 1941-July 1942 see note in November 1943 Survey.
New series. Data for 1927-43 for dried eggs are shown on p. 20 of the March 1945 Survey.
ments of cattle and ments of cattle and calves and sheep and lambs were revised beginning 1941 to include data for Illinois; revisions for 1941-42 are shown on p. S-27 of the August 1943 Survey. Data for egg production have been revised for 1940-45; revisions are shown on p. 24 of the June 1947 Survey.

I Data beginning January 1946 reflect a change in the sample and in the method of summarizing reports; January 1946 figure comparable with earlier data is $\$ 0.064$.
No quotation. December 1, estimate. Revised.
§Data continue series published in the 1942 Supplement but suspended during the war period (it should be noted that data for sugar are shown in long tons in that volume); data for October 1941-February 1945 will be published later.

俍 retes is from the Treasury Department, Bureau of Internal Revenue, and includes witbdrawals of smali cigarettes for export and for consumption outside the United States; tax ree withdrawals were comparatively small priot to the war nerion. Monthly data beginning Julv 1943 are shown on p. S- 29 of the March 1947 Survey.
$\ddagger$ Revisions for 1946 not shown above are as follows: January, 2,508; February, 2,552; March, 2,008; April, 2,488.

## $r$ Revised

No quotation.
${ }^{3}$ Data not collected separately; included with data for civilian shoes. ${ }^{3}$ Data not available
Data continue series published in the 1942 Supplement but suspended during the war period; data for October 1941-February 1945 will be published later
tBeginning August 1946, stocks in tanners' hands only are reported; all data were therefore revised beginning in the November 1946 Survey to cover only tanners' stocks; the
figures for total stocks for May 1946 include small revisions that are not arailable for the break-down between leather and raw hides.
SSee note for boots and shoes at the bottom of p. S-23 of the July 1945 survey regarding cbanges in several classifications and note marked " $\ddagger$ " on p. S- 28 of that issue regarding other revisions; revisions for January-May 1943 and 1945 and January-A pril 1944, which have not been published, will be shown later
*New series. The series for gloves and mittens were first included in the May 1946 Survey; sce note in that issue.
$\dagger$ Revised series. The price for sole oak leather has been shown on a revised basis beginning in the October 1942 Survey; revisions beginning July 1933 are available on request. There have been unpublished revisions in the January 1944 -April 1946 data for the lumber serics and also earlier revisions which have been published only in part (see note in the April 1946 Survey); all revisions through April 1946 will be shown later; reeent revisions resulted from adjustment of the monthly series to 1945 production data compiled by the Bureau of the Census.

- Revised.
${ }^{\circ}{ }^{\prime}$ Since May 1944 the coverage of the malleable iron castings industry has been virtually complete; see note in the February 1947 Survey for further information.
§ota continue series shown in the 1942 Supplement but suspended during the war period (it should be noted that data for iron and steel are shown in long tons in that rolume); data for October 1941-February 1945 will be pablished later.
data, New series. For data beginning September 1941 for softrood plywood see p. 16 of the September 1944 Survey. For description of the series on scrap iron and steel and $1939-40$ data, see note marked "*" on p. S-29 of the November 1942 Survey. The series for iron ore, all districts, are from the Department of the Interior, Bureau of Mines, and cover the entire industry, monthly data beginning 1943 and earlier annual totals will be shown later. Data for $1943-45$ for gray iron castings are shown on p. 24 of the January 1947 Survey. $\dagger$ Revised series. See notes marked " $\dagger$ " on $p$. S-31 of the February 1947 Survey and $p$. S- 29 of the A pril 1946 issue regarding unpublished revisions in data priar to 1945 for the
indicated scrics on lumber production, shipments, orders, and stocks; new orders, production and shipments have been further revised beginning 1945 to conform with Bureau of the Census production data for that year; all revisions through April 1946 will be published later. The Southern pine price series are shown on a revised basis begimning in the February 1946 Survey; see note in that issue.

r Revised. © Beginning 1943, data have covered the entire industry.
$\ddagger$ Based on information recently available it is believed that data beginning 1945 represent substantially the entire industry; in prewar years the coverage was about 90 percent $\odot$ Total shipments less shipments to members of the industry for further conversion; data prior to 1944 were production for sale.
Data continue series puhlished in the 1942 Supplement but suspended during the war period; data for October 1941 -February 1945 will be published later
§For 1947, percent of capacity is calculated on annual capacity as of January 1, 1947 , of $91,241,000$ tons of steel; 1946 data are based on capacity as of January $1,1946,91,891,000$ tons. *New series. For pig iron consumption and stocks for $1939-40$ and a description of the series see note marked "*" on p. S-29 of the November 1942 Survey. The series on pig iron production is approximately comparahle with data in the 1942 supplement data in that volume are in short tons instead of long tons as indicated see p. S-3. of the May 1943 sarve $\mathrm{S}-33$ of the February 1947 Survey for a brief description of the data on aluminum fabricated products and reference to 1945 figures for the total; separate data prior to 1946 for the detail will be nublished later. The series for closures including plastic closures, crowns, and metal cans are compiled by the Bureau of the Census and cover all producers: data prior to 1946 will be shown later. For a brief description of the series for steel forgings, which are also compiled by the Bureau of the Census, and available data for 1945 , see note on $p$. S-32 of the March 1947 Survey
$\dagger$ Revised scries. Data for steel castings are estimated industry totals ;see note on p. S-32 of the July 1946 Survey for comparable figures beginning January 1945.

## , Revised. Tata continue series published in the 1942 Supplement but suspended durivg the war period: data for October 1941-February 1945 will be published later.

1 Not comparable with data prior to A pril 1947 ; includes production from foreign copper and stocks of foreign copper; earlier data relate to domestie copper. Comparable stock figure for April 1, 1947, 81,741 short tons; no comparable production figure for Mareh.

2 Cancelations exceeded new orders. $\ddagger$ Data cover 9 companies since September 1944 ; earlier data back to March 1943 covered 8 companies.
o'For data for January 1942-April 1944 for the indicated copper, lead, and zine series, see p. 24 of the June 1944 Sur vey. Total shipments
 shipments for Government account in addition to shipments to domestic consumer and export and drawback shipments.
$\$$ eee p. 24 of the January 1947 Survey for available data for $1942-45$ for cast-iron boilers and radiation; these series continue data in the 1942 Supplement.
$\oplus$ Data are based on reports of 150 companies for 1946 and around 160 for 1947 , covering almost the entireindustry; it is believed that concerns added after
 duction in that year and data for 1945 were practically complete; in prewar years reports covered about 90 percent of the industry.

 ranges. For source of data on machine tool shipments and reference for 1940-42 data, see note on p. S-34 of February 1947 Survey.

 Data cover almost the entire industry; in prewar years the reporting concerns represented over 95 percent of the total.
tData continue series published in the 1942 Supplement but suspended during the war period; data for October $1941-$ February 1945 will be published later.
§The monthly index of orders received of motors and generators will be released quarterly beginning with the first quarter 1947

 include rebuilt cleaners and are therefore not entirely comparable with figures shown above (comparable monthly average for 1941, 139,177).

 data prior to 1946 will be shown later. Data beginning 1941 for production of defibrated, exploded, etc., wood pulp also will be shown later.

年筑d atal production of wood pulp include defibrated, exploded, ete., pulp, shown sep

 of estimates.
${ }_{1}$ The comparahility of the data is affected by a gradual reduction in the number of cittes, or changes in the number of dealers, or the number of quotations included in the averages from August 1946 to date; averages for August, September, November, and December 1946 and January 1947 comparable in each case with data shown above for the following month are s10.54, $10.80, \$ 10.02, \$ 6.06$, and $\$ 0.85$,
$\oplus$ Publication of anthracite stocks has been discontinued and collection of data for consumption of bituminous coal has been indefnitely discontinued.
$\dagger$ For revisions for January 1942-March 1943, see note for paperboard at bottom of P. S-35 of July 1944 Survey; small revisions for January 1944 -A pril 1946 are available on request. trevised series. The series from the American Paperand Pulp Association beginning in the August 1944 Survey are estimated industry totals and are not comparable with data n earlier issues; there have been further small revisions in the 1943-44 data as published prior to the June 1945 issue; these revisions and earlier data will be published later.
New series. The new paper series are from the Bureau of the Census and cover production of all mills including producers of building paper and building boards; for 1942 monthly sverages and data for the early months of 1943 , see $p$. S-32 of the August 1944 issue. For data beginning 1934 for shipping containers, see $p$. 20 of the September 1944 Survey. Digitizefordatafoepgnipg June 1943 for folding paper boxes, see p. S-32 of the August 1944 Survey; earlier dat
folding paper boxes and January 1943-May 1944 data for shipping containers are a vailable on request.

$\dagger$ Revised series. For source of $1939-41$ revisions for bituminous coal production, see note marked " $\dagger$ " on p. S- 32 of the April 1943 Survey; revisions for $1942-43$ are shown on
 " $\dagger$ " on $n$. S-33 of the March and A pril 1943 issups (correction for crude petroleum production January 1941, 110.446); 1942-43 rovicions are available upon request.
tIncludes natural gasoline, cycle products, liquefied petroleum gases at natural gasoline plants, and benzol: sales of liquefied petroleum gas for fuels and for chemicals and trans fers of cycle products are deducted before combining the data with gasoline and naphtha to obtain total motor fuel production.

## NEW AND REVISED ESTIMATES OF THE

## National Income and Gross National Product of the U. S.

Beginning with the July 1947 issue, the SURVEY OF CURRENT BUSINESS will show revised national income and gross national products statistics differing in many respects from those previously published.

All data prior to July 1947 are subject to ** this revision, which extends back to the beginning of the series in 1929.

The completely revised 1929-46 series, with detail for all component segments, have been published in a separate NATIONAL INCOME SUPPLEMENT to the Survey of c. Current Business. Thus, this publication furnishes to business managers and analysts,
economists, and students the new basic data to which all subsequently published national income and gross national product figures will be related.

The SUPPLEMENT contains, in addition to extensive statistical tables incorporating the revisions, an explanation of important changes in fundamental concepts and procedures underlying the data. It has been prepared by the National Income Division, Office of Business Economics which compiles the official national income and gross national product data for the United States.

## Now Available in the NATIONAL INCOME SUPPLEMENT to the SURVEY OF CURRENT BUSINESS

## JULY 1947

For sale by the Superintendent of Documents: Price 25 cents. Order direct from the Superintendent of Documents, U. S. Government Printing Office, Washington 25, D. C.

[^0]:    ${ }^{1}$ For those who wish to bring their records up to date through May 1947 on the old

[^1]:    2 "Retail Sales and Consumer Income since VJ-day," Survey, October 1946.

[^2]:    ${ }^{3}$ The revised income series introduced in this issue were not available in time to be incorporated in the present analysis. The relationships shown in the chart and discussed in the text are, in general, not disturbed by the use of the new personal disposable income series, although the absolute values of the excesses and deficiencies based on the relationships will be somewhat different.
    ${ }^{4}$ It should be pointed out that the relationships which were based on the period 1929 to 1941 have been extrapolated beyond the range of peacetime observations. The time period that has elapsed since the war is still not sufficient to determine the extent to which any of the relationships may have

[^3]:    1 Excluding agriculture.

[^4]:    ${ }^{5}$ Survex, December 1946, p. 5.

[^5]:    ${ }^{6}$ The form of this relationship and its implications were discussed at greater length in "The Postwar Business Population," Survey of Current Business, January 1947.
    ${ }^{7}$ Numerous factors combined to concentrate activity in the big business sectors of the economy and to curtail activity in small business sectors. Thus, for example, the wartime controls over materials and manpower had the effect of limiting or reducing activity in the least essential segments of the economy, such as construction, some lines of retailing, wholesaling and the service industries, all fields in which small business units are predominant.

[^6]:    Note.-Mr. Liebling is a member of the Current Business Analysis Division, Office of Business Economics.

[^7]:    ${ }^{1}$ See "The Current Structure of Prices," Survey, March 1947, pp. 5-6.

[^8]:    Revised．PPreliminary，$\ddagger 36$ companies which had 81 percent of the total admitted assets of all United States legal reserve companies at end of 1945

[^9]:    Revised d Deficit Q Data for May August and November 1946 March and May 1947 are for 5 weeks; other months, 4 week

[^10]:    Revised. ${ }^{1}$ No quotation. ' December 1 estimate. 'Less than 500 pounds. ' No sales.

[^11]:    - Revised. ${ }^{1}$ No quotation. $\ddagger$ Minor revisions for 1941-43 are available on request. §For July 1941-June 1942 revisions see February 1943 Survey, p. S-23; revisions for July 1942-June 1944 are on $p$. 23 of the November 1945 issue; revisions for July 1944 -June 1945 on p. S-25 of the August 1946 issue; revisions for July 1945-June 1946 are on p. S-25 of the March 1947 Survey. - Data for some items are not comparable with data prior to 1945 ; see note for calcimines, plastics and cold water paints at bottom of p. S-23 of the December 1945 Survey. I For $1943-44$ revisions for the indicated series see notes at bottom of pp. S-23 and S-24 of the May 1945 Survey.
    $\otimes$ Data for sbeets, rods and tubes are comparable with similar data in the 1942 Supplement; see note in September 1946 Survey regarding change in data for molding, etc. materials. $\dagger$ Revised series. Gas statistics are shown on a revised basis beginning in the December 1946 Survey; see note in that issue For P .
    $\dagger$ Revised series. Gas statistics are shown on a revised basis beginning in the December 1946 Survey; see note in that issue. For revised figures for the indicated series on electric power production, except the series for "other producers," see p. 32 of the February 1947 Survey; revised figures for 1920 -July 1945 for "other producers" will be shown later.
