# The Business Situation 

By Division of Research and Statistics, Bureau of Foreign and Domestic Commerce

READJUSTMENTS incident to reconversion characterized the first full month of peace. The marked changes associated with reconversion were, however, largely confined to those economic segments most intimately related to war production. In other areas, these signiñcant events either had little effect, or were accepted as evidence of an easing in the supply factors which would permit expansion from now on in the volume of production and sales.
The month then was one of falling national income and decreasing employment, with a sharp rise in claims for unemployment benefits, but withal a strong tendency in retail sales. A heavy flow of new business to manufacturers was occurring at the same time that much of their unfilled orders were being wiped from the books through war cancellations.

## Manufacturing Down

Elimination of most of the war orders was the determining influence on manufacturers' operations and put them on a sharply descending curve. This descent will not be arrested until reconversion of the durable goods industries is in an advanced stage. It has naturally been accompanied by a large decline in employment in the manufacturing industries, a decline which also has some considerable distance to go, and which will result in a reduction in the number so employed as compared with the wartime experience, even when reconversion is complete, since a disproportionately high percentage of the civilian working force was required in manufacturing during the war to serve the needs of mechanized armed forces.

## Retail Sales Steady

Such income reductions as have occurred to date have not slowed the pace of retail sales. Volume continued to hold up during September, and the vast change in the economic outlook which occurred in mid-August is not reflected in the quarterly figures. Sales, as have been pointed out numerous times in these reviews, have been low relative to income because of the unavailability of some types of commodities, and sales increases for many lines will not now be inconsistent with declining incomes.

## Prices Hold

The slump in output of manufactures is not accompanied by the price weakness usually associated with such a marked decrease in business on the books as is now occurring. This is because the disappearing customer-the Government-took, in the main, special-

Source: U. S. Department of Commerce.
ized products. The demand for other products-the ordinary market warescontinues, and is reinforced by the demands for the durable goods which will Government-took, in the main, specialness can be expected, however, in areas such as agriculture influenced by the easing off of demands that have been of such tremendous size under conditions of world-wide strife.
The cost-of-living has not been altered significantly by the current decline in total national product which, as was stated in last month's issue of the Survey, is expected to reduce the 206 billion dollar annual rate (seasonally adjusted) of the first half of 1945 to about 180 billion dollars in the second half. With the cost of living unchanged, the reduction of wage earners' income through the decline in hours of work and the shift
to lower-paying jobs-aside from unem-ployment-has meant an almost equivalent reduction in purchasing power.

## Declining Pay Rolls Depress Income

One of the outstanding features of the current situation is the sharp acceleration in the decline of income payments. The downward drift in income has been characteristic since February, with the exception of the temporary fillip which occurred in June and July due to the redemption of adjusted service certificates. During most of this period, declining factory pay rolls have been the dominating influence, more than offsetting the rise in military payments and the minor increases in other components. Until the end of the Japanese war, however, the declines registered were fairly small.

Although including only 2 weeks of peace, income payments in August registered one of the largest drops for any one month since 1929-the earliest period for which monthly income payments measures exist. September brought a further decline though data are not yet available to provide the exact measure.

The major cause of the rapid shift in August income payments was the fall in manufacturing pay rolls-a trend which is bound to continue for some time.

As analyzed in last month's Survey, the contraction of pay rolls is not merely the result of falling employment. Many of the workers remaining at their old jobs or finding new ones have experienced a significant drop in their weekly wages-not only because of the elimination of overtime and premium pay but also because the jobs available outside of the war industries generally pay lesswhile the cost of living does not fall.

The concern of the workers over their living standards, intensified by the fear of unemployment, has expressed itself in widespread demands for substantial increases in the hourly wage rates to compensate for the loss of overtime and premium pay. While employers recognize the desirability of wage increases at this time-when there are offsetting compensating factors in their costs as well as prospects that Congress will amend the tax laws so as to permit a higher proportion of retained profitsthey cannot be certain of their imme-

## Chart 2a.—Business Indicators

diate cost-price relationships or the amount of wage increases that is properly justified. Consequently, collective bargaining has been accompanied by some strikes, and threats of others.

In terms of numbers of workers affected, the current strikes are not of very large proportions; nor is there evidence that they are as yet seriously interfering with the progress of reconversion. Yet the danger to orderly reconversion exists if the number of strikes spread in the fashion they did at the end of the last war. At the same time, the issues that are involved relate to fundamental economic policies that will affect the course of business activity for a long period ahead.

## Construction Moving Up

In the field of construction, which will take up an important part of the resources released from war production, some increase in activity has occurred. It takes considerable time, however, to overcome the material and other bottlenecks which impede the resumption of large-scale construction.

Progress will continue slow until well into next year, notwithstanding that the elimination of L-41, the order used by WPB to restrict construction, was made effective as of October 15. This will remove the building limitation, but will not make available the critical supplies. Steps are being taken to speed up the output of construction materials and, until these are generally available, there will be a problem of preventing price inflation in the construction field.

Problems similar to those of getting private construction under way are typical also of the consumer durables field. Plant clearance of machinery and equipment for war goods appears to be going ahead rapidly and active preparations for quick resumption of long-restricted consumer goods were strongly evident last month. Although there was some increase in the flow of these goods in September, they were but a drop in the bucket as compared to the declines that have taken place elsewhere. The magnitude of the major production and organizational problems that must be solved by industry is such that some time must elapse before the counter-pressures can gain sufficient momentum to stem the industrial downtrend and play the determining role in directing the course of business activity.

## Stock Prices at 8-Year Highs

Indexes of stock prices took a favorable turn following the war's end, registering a gain of more than 8 percent over the 6 weeks ending September 26. The gain was sharpest for industrials and rails, although railway stocks did not exceed the highs of a few months previous. The indexes of industrial and utility stock prices in September were the highest since 1937.

This rather sharp upturn appears to reflect investors' appraisals of a composite of factors affecting the economic outlook-reconversion prospects, the strong undercurrent of buying power,
expected reductions in taxes, and prospective good business conditions.

## President's Message to Congress

The important economic dislocations accompanying the decline in general economic activity create serious problems not only for the immediate transition period but for the longer-run postwar years ahead. In an attempt to bridge the gap between war and peace for the attainment of the full employment and full production objectives of national policy, the President, in his message to Congress early in September, recommended a broad program of legislative action. Contained in the message were proposed policies for agriculture, housing, taxation, public works, veterans, small business, and research, as part of a general program aimed at fuller utilization of the Nation's resources in the years of peace.
From the more immediate viewpoint, the coexistence of powerful inflationary and deflationary pressures led the President to recommend that prompt action be taken to adjust the inadequacies in the State laws relative to unemployment insurance and to raise substantially the minimum wage level specified in the Fair Standards Act. At the same time, he stressed the importance of retaining wartime controls to combat speculative excesses which may develop as they did in 1919. It is well to keep in mind the extent to which prices rose in that year, leading to the precipitous collapse in the spring of the following year.

## Durable Goods Shipments React Sharply

Manufacturers' deliveries of war goods, which have been declining since early spring, turned downward at an accelerated rate in August and caused a pronounced drop of 14 percent in total shipments of the durable goods industries in that month. Since a large reduction had already occurred in the previous month, August shipments of the durable goods industries were down more than onefourth from the average of the first 6 months of the year. As shown in chart 1, these sharp declines in the durable goods industries are in bold contrast to the mild dips which have occurred in shipments of nondurable goods industries in the recent months.
The dollar volume of durable goods shipments in August is estimated at 5.4 billion dollars, which is the lowest monthly total since June 1942. Further sizable curtailments in these shipments can be expected in the coming months, since it will take time for the expansion of civilian heavy goods to offiset the dominating influence of the large cutbacks in military items.

All industries in the durable goods group showed declines in the value of goods shipped in August, although the decreases differed widely, reflecting the varying importance of munitions orders. Deliveries in the aircraft industry were off a third from the preceding month and declines of about a seventh occurred in the iron and steel, nonferrous metals, and machinery (other than electrical) industries.

The easing of the manpower and materials situation, together with other factors, has tended to stimulate activity in certain of the nondurable goods industries in the recent period. The value of shipments increased between July and August in the textile, apparel, and paper industries.

## Partial Recovery in Steel

The companion charts on this and the preceding page illustrate the extent to which some of the major business indicators reacted to the ending of the war.

After declining in August to the lowest volume in over 5 years, steel production climbed steadily during the succeeding month to approximately 84 percent of capacity by the month's end. While this operating rate is low relative to the high rates which have been maintained in recent years, it still assures ample steel for most civilian needs.

This does not mean that steel will flow at once into finished products available for consumption. It is expected, however, that in view of the difficulties of organizing all productive phases required to get considerably enlarged quantities of autos and other products to consumers, steel will flow into fabricating processes at an adequate rate.

Though there is no available measure of the rate at which the organizational processes incident to reconversion are proceeding, reports from the principal industrial centers indicate that the change-over is proceeding at a good pace. The initial phase has been, of course, to clear plants in order to realign production facilities and to start the materials and parts flowing so that they will be available in adequate quantities when production lines are ready to roll.

The prompt action in cutting back war production has made resources generally available for this reconversion, but the actual job of speeding up output has to be worked out by the individual industries.

## Tin One of Materials in Short Supply

In contrast to the relatively easy supply situation in steel and in copper and aluminum, there are a few materials which remain scarce despite the cutbacks in munitions production. Tin is one of the more important of these. The War Production Board is not expected to free tin for unrestricted civilian use until the important foreign sources are reopened.

The continued tightness in tin supplies reflects the heavy requirements of tin in the shipbuilding program and for food containers. Since reductions in military requirements have been relatively less in these areas than in munitions production generally, the amounts of tin which have been freed with the war's end have been relatively smaller than in the case of other metals. The quantities of tin which have been released have come largely from lower requirements for brass and bronze for bearings used in motorized vehicles and for solder which Digitized goes inte fomponent parts for all types http://frasef products.org/
as financing assistance for essential foreign requirements.

## Liquidating Lend-Lease

Although lend-lease was formally abolished as of VJ-day, this did not mean the immediate cessation of the flow to foreign countries of supplies procured under the lend-lease program. Goods that had already been transferred at shipside continued in transit; and where alternative financial arrangements had been agreed upon-as with France, Belgium, and Holland in particular-additional supplies procured as part of the lend-lease program are moving from our ports. For a large part of the remaining require-ments-originally under lend-lease pro-curement-alternative agreements are still being negotiated to finance the shipment of those products wanted by the foreign countries whose economies were geared to war and who are now in urgent need of continuing the flow of supplies for reconstruction and relief purposes.

Negotiations between the United States and Great Britain are on the basis of continuing the flow of only selected goods formerly to have been supplied under lend-lease. Russia, on the other hand, has indicated a willingness to purchase all goods from her lend-lease program subject to the successful completion of financing negotiations now in process. As negotiations are completed, a large volume of goods will be flowing from our ports over the next months, representing the final liquidation of lend-lease programs but financed under new arrangements.

But the transformation of lend-lease exports is but one aspect of a developing financing and supply problem. The mounting intensity of this problem is signalized by the complex trade and financing negotiations-now in process between the United States and the other nations-to provide reconstruction and development supplies and by the rise of world relief needs to levels not yet reflected in UNRRA purchases of supplies or in presently contemplated authorizations for that agency.

## Decline in Exports Continues

With the problems of financing and supply assistance still in the process of resolution, exports continued the rapid decline begun in June with the cessation of European hostilities. Total shipments in August at 730 million dollars were 16 percent lower than in June, 31 percent below the March to May average.

August lend-lease shipments, continuing the decline which had begun well before VJ-day, were 46 percent below their March to May average. Non-lendlease shipments- 332 million dollars in August-were well above their war depressed levels but were not rising sufficiently to offset the declines in lendlease shipments.

Relief exports have been increasing witls some rapidity since VE-day. In May, UNRRA shipments amounted to 9.1 million dollars; in July, they reached an Digitized for FRAStimated 32 million dollars but shiphttp://fraser.stloments of of other relief goods declined from
10.7 million dollars in March to 4.3 million doliars in July. At such levels relief shipments can have but a small effect upon the over-all volume of United States export activity, though the necessity of meeting mounting world needs in the immediate future may enlarge their importance and offset to some extent the tendency for other categories to decline.

## Retail Sales Insensitive to War's End

In the introduction to this review of the business situation it was observed that the recession in business activity is characterized by its selectivity. In those segments of the economy where wartime restrictions held down the level of business, no adverse reaction occurred. One of these is retail trade and here volume has on the whole remained insensitive to the declines in income and employment.

The sharpest gains in August sales from last year occurred in filling station sales, which surged upward in the second haif of the month following the termination of $21 / 2$ years of stringent gasoline rationing. Sales at eating and drinking places continued in high vol-ume- 9 percent above August 1944-but food store sales were practically unchanged from a year ago. The substantial easing of rationing benefited food
stores only to a small extent, because the available supplies fell short of satisfying consumer demands.

Sales of retail stores in August were 5 percent above a year ago, despite the 2-day closing following the surrender announcement. After seasonal adjustment, August sales were practically unchanged from the preceding month.

Preliminary indicators for September are that sales have continued firm to date. Naturally, retailers are looking over their stocks and orders in view of the fact that the sellers' market which they have enjoyed for 3 years is now running out - for some lines of merchandise it will be a matter of history before many more months. The "hard goods" will, of course, be in short supply for a considerable period and it will be up to the manufacturers to secure equitable distribution. OPA price controls are expected to limit prices under the policy now in effect.

Preliminary indications are that sales in the third quarter of this year will be about 5 percent above the corresponding period of 1944. This volume of sales, seasonally adjusted, would be 2 percent below the peak sales of the first quarter of 1945 but well above the level of the second quarter. The gain reflects to a small extent the appearance on the market of some long-scarce items.

## Revised Federal Budget

Although the Japanese surrender came when fiscal year 1946 was only a month and a half old, expenditures for war activities will continue to dominate the Federal budget through June 1946. Tine latest budget revision indicates that over 50 billion dollars, or three-fourths of total Federal outlays, will go for war activities in the current niscal year, as compared with 70 billion dollars estimated in the one-front war budget of August 1 and with peak war spending of more than 90 billion dollars in fiscal year 1945.

That Federal spending does not fall more precipitously stems from the fact that war expenditures include many nonmunitions items-pay, including mustering-out payments, and subsistence of armed forces, transportation, relieffeeding, contract termination-which will continue to be large for many months. On the other hand, expenditures for munitions and war construction, which constituted almost two-thirds of war outlays last year, are being drastically reduced in line with the announced cutbacks in munitions production.

## Quarterly Pattern of War Spending

The major downward adjstment in Federal war expenditure is taking place in the first and second quarters of the fiscal year as munitions production drops off. This is indicated by the following Bureau of the Budget estimates projecting the quarterly pattern of war spend-
ing in the current fiscal year cannual rates, in billions of dollars) :

By the final quarter of the year, the annual rate of war spending is expected to be 32 billion dollars, or almost 50 billion dollars below the first quarter's rate and almost 60 billion dollars below last year's total. Nevertheless, war activities in this final quarter will still account for two-thirds of the total Federal budget.

The over-all receipts and expenditures picture for the fiscal year is summarized in table 1. As compared with the 40 billion dollar decline in estimated war expenditures relative to fiscal year 1945, total Federal spending is expected to be reduced by only 34 billion dollars. The principal expanding items in the budget are in the "aftermath-of-war" cate-gory-veterans' benefits, tax refunds, and interest on the public debt-and in estimated outlays for international finance.
The international group of expenditures includes 950 million dollars for payments to the International Monetary Fund and 317 million dollars for capital stock of the International Bank for Reconstruction and Development, repre-
senting our contributions under the Bretton Woods agreements. In addition about 1 billion dollars will be spent to enlarge the capital stock of the ExportImport Bank. A further contribution of 1.8 billion dollars to the International Monetary Fund is to be paid from the Exchange Stabilization Fund and is, therefore, excluded from the budget estimates.

## Receipts Turn Downward

The latest budget revision also reduces estimated tax receipts for the fiscal year to 36 billion dollars which compares with the record total of 46 billion dollars last year. This deciine reflects in part the tax relief bill passed in July and in part the anticipated effects of the war's end on national income and hence tax payments.

Tax legislation now being considered in Congress will operate further to reduce this year's receipts, although the major impact of reductions in tax rates will not be felt until fiscal year 1947. Any lowering of the rates on individual incomes will not become effective until January 1946, and thus they will apply to only half of this fiscal year. Changes in the corporation income and excess profits taxes, which are also expected to become effective next January, will not reduce Federal receipts until many months later.

## Deficit To Be Narrowed

The sharper reductions in expenditures relative to receipts indicate a decided narrowing of the budget deficit. For the fiscal year as a whole, the deficit undei existing tax legislation is estimated at 30 billion dollars, as compared with 54 billion dollars in the 12 months ended June 1945. In the last quarter of ihe fiseal year, however, the deficit would be narrowed to an annual rate of about 11 billion dollars, or less than one-fourth as large as in the first quarter.

In view of uncertainties on the side of both receipts and expenditures, it is not possible to estimate when the budget will be brought into balance. The period of adjustment, however, is certain to take longer than after the last war when the budget began to show surpluses within a year after the armistice was signed.

Source: Burcau of the Budget.

## New Victory Loan

The rise in the public debt is now estimated at 14 billion dollars for the current fiscal year, bringing the debt total to 273 billion dollars by the year-end. The amount of the debt increase is considerably below the year's deficit, because of the anticipated drawing down of the Treasury's cash balance which was very large at the close of the last fiscal period.

The major part of the new funds to be raised will be obtained in the Victory Loan drive to get under way at the end of Oeto'er with an announced goal of 11 billion dollars. As in former drives, chief emphasis will be placed on sales to individual investors-especially series E bond purchasers-although the series $E$ quota of 2 billion doliars is only half as large as in the Seventh War Loan. The reduction in income payments due to lay-offs of war workers and a large-scale return to the prewar work week is certain to reduce the response of small investors to the loan drive.

## Changes in Employment

Displacement of workers from war jobs continued throughout the first month following Japanese surrender, although the heaviest impact of the initial wave of cut-backs was felt in the first 10 days of the period. Slight increases in nonmunitions employment were insufficient to offset the sharp decline in work on war contracts. Despite some withdrawals from the labor force, unemployment rose sharply and claims for unemployment compensation increased from 300,000 to over a million and a half. Thus, reabsorption of war workers into DigitizedivilianAeñployment emerged as an imhttp://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis
mediate and developing problem for the economy.

## Wer Workers Laid Off

Over $21 / 2$ million workers were released from war jobs during the first month following Japanese surrender, according to a War Manpower Commission estimate. Within the first 10 days after cessation of hostilities about $1,800,000$ workers were released. Lay-offs dropped during each succeeding week and totaled only 160,000 during the week ending September 14.

The geographical concentration of the cut-backs emphasized the local impact of problems of reabsorbing displaced workers. Gross reductions in war employment were heaviest in the major centers of aircraft, ordnance, and shipbuilding production-Michigan, Ohio, New York, New Jersey, Pennsylvania, Illinois, and on the west coast. In each of four metropolitan areas-New York, Detroit, Chicago, and Los Angeles-lay-offs exceeded 100,000 .
Where plants were totally shut down there was, of course, no selection in the incidence of displacement. Where reductions in force occurred, however, the impact appears, from the disproportionately high lay-offs of women, to have fallen most heavily on workers with least skill or seniority, although the fact that many women were drawn into the industrial labor force only temporarily naturally affected the result.
Decreases in employment of women in the munitions industries between July 15 and September 1 are estimated by the War Manpower Commission at 40 percent, whereas male employment dropped only 21 percent. Similarly, an August separation rate of 51 per hundred for women in private shipyards is reported by the Labor Department, contrasted with a separation rate of 34 per hundred for men.
Further reductions in war employment will continue through next summer. Although over-all reductions may be more gradual, workers in particular communities and industries will face a difficult period of readjustment. Shipyard employment, which is still holding up, will drop when the remaining ships scheduled for completion are delivered and the backlog of repair work is reduced. Additional workers in ordnance plants will also be dismissed gradually as machinery and fixtures are dismantled and ammunition is prepared for storage. This process will be accelerated as the workers in Government plants-arsenals and shipyards-comparatively little affected thus far, are released, and as warwork in Government agencies is liquidated. Gross displacement between mid-September and July may approximate an additional 1.5 to 2.0 million workers.

## Declines in Employment

The above estimates represent gross releases of workers from establishments engaged in war production. They do not take into account the extent to which the displaced workers may be absorbed into existing job opportunities or may retire from the labor force. Some such readjustments have taken place. These have, as yet, been small relative to the number of workers displaced, and hence a net decline in employment and a rise in unemployment occurred.

In addition to reductions in munitions employment, the termination of war contracts temporarily depressed employment in such civilian type industries as textiles and furniture. Slight increases in employment on civilian orders in the munitions industries as the reconversion process developed, and in
some of the nonmunitions industries, were insufficient to sustain employment in the face of declining Government orders.

The sharp decline in employment in the so-called munitions industries is shown in chart 3. Between mid-August and mid-September employment in the metal-using, rubber and chemical plants dropped some 2 million workers. This slash in employment was as large proportionately as the total decline which occurred in the 21 months between November 1943-when war employment declines began-and the end of hostilities. It contrasts with monthly declines of 300,000 to 360,000 in the 3 months between European victory and the end of the war.

## Sharp Cuts in Aircraft and Shipbuilding

Most of the cuts in munitions employment followed directly upon the Japanese surrender. The net decrease in employment in these industries during August, most of which occurred in the last 2 weeks, is estimated at $1,400,000$ by the Bureau of Labor Statistics on the basis of a special survey. More than half of this cut occurred in the aircraft industry, where the working force declined by almost three-quarters of a million employees-over half the total of the industry. The reduction in shipbuilding exceeded 200,000 -a drop of 20 percent from employment at the end of July. Decreases were also substantial in small-arms and artillery ammunition, electrical machinery, and ordnance employment.

The following table shows the sharp reductions since May in employment in aircraft plants, including airplane, engine, propeller, glider and special-purpose plants, and in the construction and repair of naval and cargo vessels in United States navy yards and private shipyards:
[Thousands of workers]

|  | Employment in aircraft |  |  | Employment in ship-building and repair |  |  |

## Employment in Nonmunitions Industries

In August, employment in the nonmunitions group also declined. Taken in conjunction with declines in employDigitized for FRArent in the munitions industries this http://fraser.stlouisfed.org/

During the coming months it is to be expected that the gap between the number of estimated unemployed and the number of workers claiming compensation will again widen as secondary displacement of workers increases in noncovered employment and the discharged war workers exhaust their benefit rights.
Both indicators, it should be noted, understate the current level of unemployment to some degree. In the case of the compensation claims this arises from the fact that many of the displaced workers are not eligible for benefits. At the same time the estimate on unemployment, on the basis of a Census survey in a particular week of the month, tends to understate the full volume of unemployment in a period of rapid change, such as the present when large numbers of workers are becoming unemployed. The significant fact shown by both indicators is that unemployment is rising sharply.

## Reabsorption Problems

Some of the workers now becoming unemployed, as cutbacks in the wake of victory reduce employement opportunities, will in time be able to return to work in the same plants and on jobs similar to those they held during the war. Workers in converted factories which produced aircraft parts, tanks, communications equipment and ordnance may find reemployment in the civilian production of automobiles, radios, and other durable goods. Such reabsorption will probably not be general, however, since it is apparent that the shipyards, aircraft and ordnance plants, accounting for the bulk of the layoffis, will be able to reemploy only a fraction of their wartime forces.
The great majority of displaced war workers, therefore, face a readjustment problem involving geographical, industrial and occupational shifts, complicated by wide differences in prevailing wage scales. Whereas cutbacks were concentrated in large centers of employment, job opportunities are unevenly distributed throughout the nation. In addition, they are largely in such low wage pursuits as trade and service. The relatively fewer openings as yet available in industrial and construction activity are primarily limited to heavy work, for which the large number of light assembly workers now being released may not be qualified.
As of September 14, following a month in which 2.5 million workers were laid off, some 700000 job openings were on file with local United States Employment Service offices. Reports of the War Manpower Commission indicate that wage rate specifications for many of these openings compare unfavorably with war industry wage rates or with rates normally found in the manufacturing industries still in process of reconversion.
Some illustration of the local problem is provided by the situation in Detroit and Los Angeles. As of September 8, Detroit lay-offs had reached 136,000 and incomplete figures on claims for unemployment compensation were reported at $\mathbf{1 0 4 , 8 0 0}$. Unfilled job orders at local

United States Employment Service offices, however, were reported at only 11,000 , of which 1,600 paid under 75 cents an hour. Similarly Los Angeles, with estimated lay-offs of 103,000 and unemployment compensation claims of 62,200 reported only 38,000 job orders, about onethird in trade and service occupations. Half of these openings paid hourly rates under 75 cents.

It will necessarily take some time before the heavy industries are in a position to employ substantial numbers, and before workers can move to the new locations of employment. The proposals now under consideration in Congress for extending the duration and maximum amount of unemployment benefits and for paying travel allowances to displaced workers would facilitate these readjustments.

In the meantime, lay-offs are continuing and uncmployment will rise in volume at least until the reconversion process is actually completed in the major industries and until civilian production is under way. In addition to the unemployment resulting from the further layoffs from industrial employment to be expected, a major problem of the coming months will be the absorption of millions of men demobilized from the armed forces.

Demobilization of the armed forces is stepping up sharply and it is now expected that close to $10,000,000 \mathrm{men}$ and women will be released by the Army and Navy through next June. Discharges from the Army during the month of September considerably exceeded previous expectations. If the weekly separation rate reached by the month's end is maintained, releases in October will be close to a million, and that rate may even be increased during the late fall and winter.

## Chart 4.-Unemployment and Claims for Compensation

${ }^{1}$ Data include persons 14 years of age and over; excludes institutional population.

Sources: U. S. Department of Commerce and Social Security Board.

Although inductions and voluntary enlistments will continue, the number will be only a small fraction of the separations. The new inductees will be primarily young men, many without previous employment, while the vast majority of the released veterans, many of them experienced, will be seeking jobs.

## New Labor Force Estimates

The extent of unemployment during the coming months will be a product of both the employment opportunities which the economy can offer and of changes in the labor force. Some decrease in the labor force can be anticipated as individuals who found work during the emergency leave the ranks of job seekers. However, not all persons who entered the labor market for patriotic or other reasons will be able or want to withdraw and the question of how many women, older workers, and handicapped will leave the labor force in coming months cannot now be answered.
A more accurate measure of the size of the labor force and, therefore, of the influence of the above factors on employment and unemployment will be available as a result of recent revisions in the monthly estimates of the Census Bureau.
In July, the Bureau introduced changes in the wording of questions and interpretation of the schedule used by enumerators for the Monthly Report on the Labor Force. The revisions were developed in consultation with an interdepartmental committee under the sponsorship of the Division of Statistical Standards of the Bureau of the Bucget. No change in the basic labor force concept and the definitions of employed and unemployed persons, which have been in use since the 1940 Census of Population, is involved.

The Census classification of an individual as employed or unemployed depends upon his activities during the particular week in which the survey is conducted. Employed persons include those who were at work for pay or profit or who worked without pay on a family farm or in a family business (excluding those engaged exclusively in home housework or incidental chores) and those who had a job or business but did not work because they were on vacation, temporarily ill, idle because of bad weather, or temporarily laid off with definite instructions to return to work within 30 days of layoff. Unemployed persons include all those not at work or without a job and looking for work during the week and those who would be actively seeking work except for temporary illness, indefinite lay-off, or belief that no work is available in the community or in their line of work.

The questions previously asked by enumerators tended to omit certain groups of persons from the labor force who should have been counted as employed according to the above definitions. In particular, students and housewives who did some paid work in addition to their school or household duties did

# War-Strengthened Railroads Face New Prospects 

By Haskell P. Wald

## Part I

AMERICAN RAILROADS are returning to peacetime operations in a much strengthened financial condition. An extended period of freight and passenger revenues far in excess of any previous amounts has enabled the roads to make substantial progress in scaling down their fixed charges by paying off funded debts and by favorable refunding operations, while at the same time making large capital outlays and building up substantial reserves to meet emerging postwar problems.

Clearly, the rail carriers have been given a sharp financial lift which has far-reaching implications for the industry's postwar outlook.

Several indicators testify to the phenomenal recovery of railway finances. Annual net income after taxes averaged 16 times larger during 1942-44 than during 1935-39. On the basis of income before taxes, the increase was twenty-six fold. At the end of June 1945 , class I roads as a whole held enough cash and Government securities-over 3 billion dollars-to cover all current liabilities with money to spare.

Coupled with these financial gainswhich are quite in contrast to the experience of World War I-have been impressive economies of operation and performance achievements never before approached. Indeed, the salient feature of the wartime record of the railroads is the manner in which the carriers have handiled the greatly expanded traffic load with relatively small increases in the resources at their disposal.

The developments in railway finances and operations during the war period should be viewed against the background of the dismal experience of the prewar decade when, at one time, as many as 109 line-haul steam railroads (including 39 Class I roads), operating 31 percent of the total miles of line operated by all roads, were in the hands of receivers and trustees; and against the

Note.-Mr. Wald is a member of the Current Business Analysis Unit, Bureau of Foreign and Domestic Commerce.
background of events during the twenties when the rail carriers were burdened with surplus capacity chiefly because of the competitive inroads made by trucks and passenger cars.

## Role of Railroads in the Economy

The contrast between this history and the more recent events focuses attention on the extent to which the railroads will contribute to the postwar goal of high and sustained production and employment. It is clear that the industry can no longer provide the mainspring of economic activity as it did during much of the last century-particularly during the 1880 's when the rate of railroad construction reached its peak-but it can still play an important sustaining role in the national economy.

The war period has highlighted the stake of the railroads in the achievement of high national production and income by demonstrating the full potentialities of the decreasing cost phenomenon which is an outstanding feature of the industry. Surplus railway capacity and a heavy burden of fixed charges are problems that need lead to crises only in periods when over-all business activity is low. Given the prospect of a sustained period of good business conditions, the railroads can embark on a program of new construction, replacement of equipment, and wide-scale modernization which could entail capital outlays approaching the highest amounts spent in any earlier period.

During the period between the two wars the railroads spent an average of over 500 million dollars a year on plant and equipment. This amount was more than one-fifth of the annual capital outlays of all manufacturing and mining industries and about 8 percent of total annual expenditures for producers' durable goods.

It is reasonable to expect that railway investment will continue to afford an important outlet for savings in the period ahead. The dollar volume of railway investment will probably be much larger than the average amount in the interwar years, although the relative share
of the railroacs in total private investment may be somewhat reduced, due to more rapid growth in other classes of investment.

The present study is being published in two parts. This first part surveys the wartime expansion of traffic and the performance record of the railroads and analyzes the changing cost-price relationships from the standpoint of their effects on railway net income before and after Federal income and excess profit taxes.

In the second part of the study, to appear in a subsequent issue of the Survey, it is proposed to review the disposition of the wartime earnings, the progress which has been made in reducing the burden of fixed charges, and the financial outlook for the railroads under alternative levels of national production.

## Expansion of Railway Traffic

The improved finances of the railroads have their source in the greatly expanded commodity and passenger transportation induced by the war and in the economies of operation which accompanied more intensive use of resources. As shown in chart 1 , all previous traffic records have been dwarfed by the rapid rise in recent years. Approximately 96 billion passenger miles were performed by the railroads last year, compared with 24 billion in 1940 and 47 billion in 1920 , the pre-World War II peak.

Freight movement, which is the predominant source of railway income, reached 741 billion revenue ton miles in 1944, practically double traffic in 1940 and far in excess of the peak in the last war and of the relatively high volume in the late twenties.

Preliminary estimates for 1945 indicate that total passenger miles and ton miles will decline moderately from last year's record amounts as a result of the termination of the war. Nevertheless, the 1945 totals will still be higher than in any year prior to 1943.

The portion of direct war traffic in these record movements of passengers and freight has, of course, been substantial. It is estimated that almost half the

Chart 1.—Railway Revenue Traffic, All Railways ${ }^{1}$

${ }^{1}$ Data do not include switching and terminal companies.
Source: Interstate Commerce Commission, except data for 1945, which are estimates of the U. S. Department of Commerce.
freight tons originated in 1944 represented raw materials or supplies for use in munitions production or finished war matériel. Military use, plus furlough travel of service personnel, accounted for about 40 percent of railway passenger miles (excluding commutation) last year.

A further factor contributing to the recent traffic volume has been the diversion of traffic from other forms of transport, arising out of special wartime conditions. Such diversion was first felt in substantial volume in 1941, with the withdrawal from domestic transportation of some coastwise shipping and intercoastal shipping operating through the Panama Canal. Beginning in 1942, the wartime restrictions on gasoline, tires, and new equipment fell heavily on private motor cars and on motor trucks, curtailing both the relative and absolute amounts of traffic so hauled.

As a result, the railroads moved 66 percent of the total domestic intercity freight transportation-including coastwise and intercoastal shipping-in 1944, as compared with 45 percent in 1940. A still more notable shift occurred in passenger travel, where the proportion of the total passenger miles-including intercity travel in private automobilestransported by railroads rose from 9 percent in 1940 to 41 percent in 1944.

## Moderate Increases in Equipment

Alongside the unprecedented volume of freight and passenger traffic, the increases in railroad equipment during the war period seem extremely moderate. It is now obvious that we entered the war with a substantial surplus of reDigitizeerye capacity in the form of equipment
which was being greatly under-utilized, was in need of repairs, or was being retained to carry seasonal peak loads or to serve as a stand-by.
The roads have been able to meet virtually all the wartime demands placed upon them with about 1,900 ( 4.5 percent) more locomotives in service than in 1940, 109,000 ( 5.6 percent) more freight cars, and less than 1,900 ( 4.2 percent) more passenger cars. (See table 1.) This striking result has been achieved by using existing equipment more intensively than ever before-by rebuilding and restoring to operation many locomotives and cars previously in disuse, keeping bad order equipment at'a minimum, running locomotives and cars many more miles per day, increasing the length of trains, and heavier loading.
Insofar as passenger traffic was concerned, this was not done without considerable over-crowding and inconvenience to passengers. These discomforts were accepted as a wartime accompaniment and, therefore, afford no measure of what passengers will accept from now on. The carriers will require new passenger equipment, notwithstanding the large drop ahead in passenger-miles.

It is clear that in meeting the chatlenge of the war years, the railroads have learned many new methods of more economical operation which will lead to increased postwar efficiency. In part, however, the recent achievements in performance on handling freight are not expected to be duplicated in peacetime, since they are the direct result of such factors as the changed composition of traffic and the longer haul brought about by the war, and the concerted action
by Government agencies, carriers, and shippers, in recognition of the war emergency, to obtain better loading and quicker release of cars, to divert traffic from congested lines, and to improve operations in various other ways.

The increases in railroad rolling stock since 1940 mark a reversal of a downtrend that began a few years after the last war. The reduction in over-all equipment persisted despite the continued heavy freight movement through 1929 and the revival of traffic volume following 1932. Even after the additions in the past few years, equipment numbers are still far less than in the last war or in the decade of the twenties.

Advances in technology have partially counteracted the decline in numbers of units. The performance differential between new installations and retirements has been largest in the case of locomotives, although the average capacity of freight cars has been increasing steadily for many years. The extent to which these developments have progressed is illustrated by the statistics in table 2, presenting detailed information on railroad equipment and capacity for the end of 1929, 1940, and 1944.

Source: Interstate Commerce Commission.

The opposing changes in traffic volume and equipment between 1929 and 1944 highlight the impressive improvements in railroad performance. Revenue ton-miles were almost two-thirds larger in the later year than in 1929 and more than three times as many passenger miles were travelled. Nevertheless, all major categories of rolling stock were significantly below 1929 in terms of both numbers of units and aggregate capacity. The number of railroad employees in 1944 also was substantially less than in 1929.

The figures for passenger-train cars are particularly striking, since the more than one-fourth decline in the number of passenger-carrying cars (coaches, combination coaches, and parlor and sleeping cars) since 1929 has been accompanied by a corresponding reduction in seating capacity. That so many more passengers were able to be carried in 1944 is a reflection of the extreme underutilization of passenger equipment before the war, as well as of the overcrowding to which reference has already been made. The only new passenger-carrying cars built during 1943 and 1944 were 1,200 troop sleepers being used exclusively in organized military movements.

In the case of freight cars, the decline in aggregate freight-carrying capacity during the 1929-44 period was less than the reduction in the number of cars, since average car capacity rose from 46 to 50 tons.

Although the use of poweriul diesel units has grown rapidly since 1940, these units still accounted for only 7 percent of total locomotive tractive effort of class I roads at the end of 1944. The over-all improvement in the average tractive effort of locomotives since 1929 has been largely due to the retirement of many obsolete steam locomotives and to the marked superiority of steam locomotive replacements over the units retired. As a result of the gain in tractive effort per locomotive, there was only a 10 percent decline in aggregate tractive effort between 1929 and 1944, as compared with the approximately one-fourth reduction in the number of locomotive units in service.

## Increased Utilization Since 1940

Because additions to rolling stock were of relatively minor importance in enabling the railroads to meet the demands of the war economy, the major explanation must be found in much more intensive utilization of available equipment. Various indicators of equipment utilization are included in table 1.

In the first place, the carriers achieved notable results in their efforts to keep as much of their equipment as possible in serviceable condition. In many instances equipment repairs were so extensive as to amount to rebuilding. The reductions in the ratios of unserviceable to total equipment since 1940 had the effect of placing into operation almost 4,800 additional locomotives (or many more than the actual increase in the over-all number in service), 112,000 freight cars, and more than 1,100 passenger cars. If 1939 had been used for the comparison
with 1944, the gains would have appeared even more marked, since substantial improvement had already been achieved by 1940.

In addition to reducing their bad-order equipment, the railroads have made much more effective use of their serviceable locomotives and cars. As indicated in the table, gross ton miles per serviceable freight locomotive and car miles per serviceable pasenger locomotive, increased 45 and 50 percent, respectively, between 1940 and 1944. Moreover, miles
per freight-car day of serviceable freight cars rose 31 percent.
Not only are freight cars traveling more miles per day, but they are carrying much heavier loads. Chiefly in response to Office of Defense Transportation orders prescribing minimum loads for less-than-carload and carload freight, the average loading of freight-carrying cars increased from 27.6 tons to 32.7 tons between 1940 and 1944, a gain of almost one-ffth. The Office of Defense Transportation has estimated that the equiv-

alent of aproximately 187,000 cars were added to the car supply in 1944 as a result of the increased loading of merchandise cars and carload freight.
The relative increases in the average number of passengers per car have been considerably larger than the gain in freight loading. This was possible partly because of the extremely low over-all utilization of passenger-carrying equipment before the war.
An average of only one-fourth of the coach capacity and one-third of the parlor and sleeping car capacity was used in 1940. By 1944 the percentage utilization had increased to 63 percent for coaches and 78 percent for parlor and sleeping cars. Because of wide variations in demand-supply relationships and because of the necessity of moving trains on fixed schedules published in advance, it is never possible to have full utilization of passenger equipment on a Nation-wide basis.

The higher wartime occupancy rates reflect to some extent the carrying of standees in coaches on the more conjested runs and also the fact that each berth is counted as having a capacity of one passenger, whereas in military movements two soldiers generally occupy a lower berth.

## Railway Earnings

Equally as impressive as the gains in traffic and in operating efficiency has been the wartime improvement in the over-all financial position of the railroads, as summarized in the condensed income account in table 3. Two developments are especially noteworthy: The sizable contribution to net operating income made by passenger operations (chart 2) and the rise of net income before taxes to amounts which eclipse earlier years by wide margins (chart 3 ).

## Passenger Service No Longer in Red

As illustrated in the first of these charts, passenger operations have been making a positive contribution to net railway operating income since 1942 , after having failed to pay their allocable share of expenses in each year since 1929. ${ }^{1}$ In 1943, passenger service accounted for 280 million dollars of net operating income, or for about one-fifth of the combined income from passenger and freight operations. Net operating income from passenger service declined in absolute amount in 1944 but continued to account for roughly the same relative share of the combined income.
The gain in pasenger revenues has not been caused entirely by the expansion of military and civilian travel, since a 10 percent increase in standard and commutation passenger fares became effective February 10, 1942. Authority with respect to the increase in commutation fares, however, was revoked some 15 months later. While the increased fares added approximately 130 million dollars

to operating revenues in 1943, and somewhat more than that in 1944, probably not over one-fourth of the increase in revenues was caried through to net income after taxes, due to the high income tax rates paid by most roads on their marginal earnings.
Coach fares at present are on the basis of 2.2 cents per mile and the fare applicable in sleeping and parlor cars is 3.3 cents plus Pullman surcharges. Actual revenue collected per passengermile is considerably below these standard rates, due to reductions in round-trip fares, application of direct-line fares over circuitous routes, and special reduced fares for furloughed and discharged personnel of the armed forces.
During 1943 and 1944, revenue per pas-senger-mile (excluding commutation traffic) was about 1.9 cents (an average of 1.7 cents in coaches and 2.4 cents in parlor and sleeping cars). Commutation traffic, which is carried on a lower fare base, yielded about 1.1 cents per passenger-mile in these years.

## Gain in Freight Earnings

Net operating income allocable to freight operations, if taken before deduction of Federal income taxes, increased about proportionately with the gain in traffic volume between 1940 and 1943. The heavy wartime tax rates, however, held the gain in net operating income after taxes in 1943 to about 15 percent above 1940. Declines were registered between 1943 and 1944 in net

operating income, whether measured before or after income taxes, due to a rise in operating costs relative to revenues.
As indicated in chart 2 , net operating income from freight service, as well as income from combined services, has been declining since 1942. It is shown in subsequent paragraphs that this reversal in trend, which was counter to the movement in traffic volume, is attributable for the most part to the operation of the carry-over provisions of the Federal income tax laws.
The general level of freight rates now in effect is practically the same as has existed continuously since 1938 , with the exception of the period between March 18, 1942, and May 15, 1943, when rate increases were authorized by the Interstate Commerce Commission. Owing in part to changes in length of haul, composition of traffic, and the importance of land-grant and special governmental tonnage, and in part to individual rate reductions, revenue per ton-mile declined to 0.949 cents in 1344, as compared with 0.983 cents in 1938.

Net railway income after fixed charges, taxes, and all other deductions showed a much larger gain between 1940 and 1944 than did net operating income. The different rates of increase simply reflected the effect of deducting from net operating income the heavy load of fixed charges. Because of these charges, the proportion of operating income which is carried through to net income increases sharply with advances in operating revenues.
The earning power of the railroads at close to capacity operations is strikingly demonstrated by the steeply rising trend of net income before Federal income taxes, shown in chart 3. The peak of 2.2 billion dollars reached in 1943 compares with an annual average of almost 75 million dollars during 1935-39 and a prewar high of 980 million dollars in 1929. This response of income to the rise in traffic volume has obvious postwar inplications from the standpoint of potential railway earnings under the existing cost-price structure and relatively heavy traffic volume.

Despite wartime tax rates, net income arter taxes has increased several fold

1943. Included in the 1944 group were 15 companies whose properties were in receivership or trusteeship as of the close of the year.
It is evident, therefore, that the divergences in the movement of railway net income before and after taxes can be ascribed in large part to the carryover privileges in the income tax law. That the peak in railway net income after taxes was reached in 1942 was largely the result of carrying forward prior net losses and unused excess profits tax credits.
Without the tax savings permitted by the carry-forward provisions, the peak would have come in 1943. Similarly, the large reduction between 1943 and 1944 in income after taxes reflected in part the exhaustion of unused excess profits tax credit carry-overs and the consequent rise in the effective income tax rates in the latter year.

Atiention should also be called to another aspect of the income taxes which have been paid by the railroads. While the refundable portion of the excess profits tax-amounting to 10 percent of the excess profits tax-is not reported in tax accruals and, therefore, is included in railway income, no allowance can of course be made at this time for the postwar refunds which many roads may receive under the carry-back provisions. Some of the heavy wartime tax load will be wiped out over the next year, should individual roads suffer a sharp setback in earnings as a result of the ending of the war.

## Decreasing Cost Industry

The behavior of costs and earnings as passenger and freight traffic soared has emphasized the large stake which railroads have in the continuance of high national production and employment in the future. Long a text-book example of an industry operating under decreasing cost conditions, the roads have

[^1]seen all major elements of cost decline sharply per unit of traffic hauled.

When revenue traffic is measured by an average of ton-miles and passengermiles (weighted by respective average unit revenues), it is seen that almost 30 percent fewer man-hours were required per unit of traffic in 1944 than in 1940. The quantity of fuel consumed per unit of traffic showed about the same relative reduction over this period. These gains reflect the various performance achievements of the carriers and, in addition, the larger proportion of gross ton-miles represented by revenue traffic in recent years.

Especially noteworthy is the fact that the economies associated with more intensive utilization of manpower and equipment have more than offset the wartime increases in wage rates and materials prices. As shown in table 5, when various costs are expressed in terms of cents per revenue dollar, they all are lower in 1944 than before the war, with the exception of charges for accelerated amortization. As a consequence, net income before taxes accounted for about 20 cents out of each revenue dollar in 1944, as compared with $51 / 2$ cents in 1940.

The trend toward lower costs per revenue dollar continued until 1944, when the reversal in cost trends in that year translated the further lise in revenues into the decline in income before taxes shown in chart 3. In each of the previous years the dollar increase in net income before taxes exceeded the rise in revenues.

The generally inverse relationships which have existed between unit costs and traffic volume should be analyzed in terms of the special factors which have been operative during the war years. Only in this manner is it possible to evaluate the rise in net income and to appraise the bearing of decreasing cost conditions on the postwar financial outlook for the industry.

## Clanges in Wages

Wage rate increases effective December 1941 and January 1942 and further increases effective in 1943 have resulted in raising the average straight-time hourly rate of wages paid by railroads from 73 cents in 1940 to 83 cents in 1942 and 92 cents in 1944 . Average employee compensation per hour, including overtime pay, rose from 75 to 96 cents during this period.

On the other hand, the Department of Lsabor index of revenue traffic per man-hour, which is presented in table 6, has increased by more than 40 percent since $1940-a$ gain more than sufficient to offset the higher costs due to wage rate increases. As a result of the partially compensating changes in wage rates and traffic per man-hour, wage and salary payments took 4 cents less out of each dollar of revenue in 1944 than in 1940.

The figures in table 6 show that the relative increases in traffic handled per man-hour have been much greater for passenger than for freight traffic. This development was partly a consequence of the sharper rise in passenger traffic

Table 6.-Indexes of Railway Traffic Per Man-Hour ${ }^{1}$

and was reflected in the relatively larger gains in net income from passenger service, which were noted earlier.

## Fuel Costs

Fuel costs have followed a similar pattern, although the economies in consumption have not been neariy as marked as in the case of labor productivity. Average prices paid for coal, which accounted for almost 70 percent of fuel costs in 1944, have risen 36 percent since 1940. For all fuel and power combined, the average price rise was 33 percent, the bulk of the rise occurring after 1942 .

Reflecting heavier train loads, fuel costs per car-mile experienced larger relative increases. Nevertheless, the rise in traffic and operating revenues per car-mile was sufficient to keep fuel costs per dollar of revenue fractionally below the amount in 1940-5.7 cents in 1944, as compared with 5.8 cents in the earlier year.

## Other Materials and Supplies

The prices of materials and supplies (other than fuel) rose about one-iourth during the 1940-44 period. The figures in table 5 suggest that these cost increases, like the higher wage rates and fuel prices, also were outweighed by the expansion of revenues. It should be noted, however, that the item, "all other" deductions," shown in the table, includes various operating expenses and deductions other than the cost of materials and supplies.

## Deferred Maintenance

There is little evidence that the railroads in the aggregate have been forced to defer any sizeable amount of maintenance work because of shortages of materials and difficulties in hiring workers during the war years. This does not mean that some special types of work and maintenance in certain individual situations have not been impeded by the tight supply conditions. On the whole, however, these deficiencies appear to have been of minor importance in the over-all picture and, moreover, to have been offset to some extent by over-maintenance in other situations.

Of prime importance in enabling the railroads to achieve such a good maintenance record was the priorities assistance granted by the War Production Board. The vital role of transportation in the war economy was fully recognized and railway maintenance needs were often
given precedence over other demands for scarce materials.

Any overstatement of railway earnings because of forced curtailment of maintenance work is likely to have been very small for other reasons as well. It has been many years since the roads have been financially as able to spend on way and structure and on equipment as they have been during the war period. The availability of ample funds, combined with the high excess profits tax rates to which most roads have been subject, must have exerted powerful influences to overcome whatever materials and labor shortages that have existed and to undertake as much maintenance work as possible.
Measurement of the amount of maintenance actually deferred during the war years is extremely difficult, particularly because there often is no way of defining normal maintenance standards. Moreover, the pressure of war traffic has brought into service much old equipment that was ready or scheduled for retirement and there is always an incentive for the carriers to keep maintenance outlays on such equipment at a minimum. A measure of deferred maintenance has little meaning in such circumstances, since much of the amount estimated to have been deferred may never be made up.

## Record Dollar Outlays for Maintenance

No evidence of forced curtailment of work is shown by the dollar amounts spent each year for maintenance of way and structures and of equipment, since these expenditures more than doubled between 1940 and 1944. Maintenance outlays of about 2.3 billion dollars (exclusive of charges for depreciation and amortization) in the latter year were the largest in history.
On the other hand, it is known that the effectiveness of current dollar expenditures has been sharply reduced by higher costs of labor and materials. Therefore, the number of man-hours employed on maintenance work provides a better indicator of the real increase in actual maintenance performed. The rise in maintenance man-hours between 1940 and 1944 was 56 percent, or somewhat more than half the relative increase in maintenance expenditures.
The 56 percent increase in maintenance man-hours can be compared with a rise of about 65 percent in total gross ton-miles, including locomotives and tenders, produced in freight and passenger service combined. The latter measure is a generally accepted indicator of the intensity of utilization of railway plant and equipment. The relative increase in gross ton-miles has been larger than the increase in car-miles, but considerably smaller than the gain in revenue traffic.

A rough measure of the adequacy of the maintenance work performed can be obtained by relating maintenance manhours to gross ton-miles. Such a calculation indicates that maintenance man-hours per million gross ton-miles declined from 836 in 1940 to an estimated 790 in 1944-a decline of 5.5 per-
cent. The ratios were somewhat below the 1944 figure in the two preceding years.

The decline which has occurred in the ratio of maintenance man-hours to gross ton-miles by no means demonstrates undermaintenance. While certain classes of maintenance expenditures are almost entirely dependent upon the intensity of utilization of railway plant and equipment, other classes are practically unaffected by the volume of traffic, or are affected only to a small extent.

The Interstate Commerce Commission has stated that from $60-70$ percent of road and equipment maintenace is usually estimated as attributable to the intensity of utilization. In view of this fact, a declining ratio of maintenance man-hours to gross ton-miles may be entirely normal as commodity and freight movement shoots up sharply as in the war period.

An attempt to estimate the dollar value of the wartime accumulation of deferred maintenance, including provision for inadequacy and obsolescence, was made by the Commission in its annual report for 1944. The figure there cited is $\$ 300,000,000$. Studies made by the Commission's Bureau of Valuation indicate that most of this amount can be assigned to roadway and structure, rather than to equipment. In fact, there is some evidence of surplus maintenance for certain classes of rolling stock.

The estimate of $\$ 300,000,000$ indicates an annual rate of deferred maintenance of about 4 percent of maintenance expenses in the years 1942-44. It is equal to about 5 percent of income before taxes in these years and to about 4 percent of income after taxes (taking into consideration an approximate adjustment of income tax liabilities for the tax savings that would have been realized if the estimated deferred maintenance had been allowed as a deduction for tax purposes).

## Five-Year Amortization

The small overstatement of earnings indicated by the Commission's estimate of deferred maintenance has been counterbalanced by above-normal charges made to operating expenses resulting from the use of the 20 percent amortization rate for "emergency facilities" in lieu of normal depreciation. The accelerated amortization provision has been in the law since 1940 and applies to all facilities certified as necessary for national defense. The Commission requires the carriers to charge such amortization to maintenance expenses.
The railroads have availed themselves of this privilege to such an extent that practically all purchases of new equipment since 1942 were being amortized on a 5 -year basis until the emergency period defined in Section 124 of the Internal Revenue Code was terminated at the end of September 1945. Through the end of last year, facilities costing almost 1 billion dollars had been certified as emergency facilities. Charges to operating expenses for amortization of the cost of these facilities aggregated
about 430 million dollars in the years 1941-44. More than 90 percent of these charges have been for equipment.

## Understatement of Net Income

The accelerated amortization deductions represent legitimate operating expenses only insofar as the facilities concerned will have little or no use after the war; but the bulk of the defense facilities purchased by the carriers consists of equipment which will no doubt have many years of useful life after the amortization period has terminated.

Thus, the net effect of the amortization provision is an understatement of railway earnings during the war emergency, which will be balanced by an overstatement in subsequent years when the facilities will be adding to revenues without making a corresponding addition to operating expenses for depreciation that otherwise would have been applicable. Moreover, with lower tax rates in prospect for the postwar period, the railroads will realize permanent tax savings in addition to several years' postponement of actual tax payments.

In the case of the small amount of road property emergency facilities, it is impracticable to estimate the excess of the amortization charges over the normally applicable depreciation, since accrual depreciation accounting is applicable only to roadway property other than the track and its appurtenances (Retirement accounting is generally used for the latter classes of property). Such an estimate, however, is possible for the emergency facilities comprising equipment, which accounts for the bulk of such facilities.

According to the Commission, if the composite equipment depreciation rate during the years 1941-44 were substituted for the 20 percent rate, depreciation charges would have amounted to about one-sixth of the charges for equipment amortization-or 67 million dollars instead of 393 million dollars. It will be noted that the difference of 326 million dollars is somewhat higher than the previously mentioned estimate of deferred maintenance. The excess of amortization over normal depreciation was largest in 1944 when it amounted to 142 million dollars, or more than 7 percent of net income before Federal income taxes.

## Basis for Large Tax Refunds

Not only do the accelerated amortization provisions depress earnings during the war period, but they also provide the basis for substantial tax refunds. As previously mentioned, the emergency period defined in the Internal Revenue Code was recently terminated by Presidential proclamation. In consequence, railroads may elect to speed up their amortization charges to cover the shortened emergency period. Refund claims may then be filed for the tax savings which are indicated by the recomputation of prior taxes on the basis of the increased charges.

For example, if a railroad purchased some freight cars at the beginning of 1943 which were duly certiffed as emer
(Continued on page 19)

# Sales of Chain Grocery and Combination and Variety Stores by Regions, 1944 

By Reba L. Osborne

TO take advantage of increased opportunities following the war, business requires additional facts as aids in formulating decisions as to the location of new and the expansion of established enterprises. One body of data required is regional summaries of specific lines of activity. The present article presents some new regional data arising from a recent survey of two important areas of chain store trade, namely, grocery, including combination stores, and variety stores.
With the exception of the drug store trade and sales of general merchandise in rural areas, ${ }^{1}$ there have not been any generally available data on the relative changes in chain store activity in the various geographical regions of the country. The latest detailed figures were those provided by the 1939 Census of Business. In order to provide a current guide, surveys were undertaken on a regional basis of two of the more important fields of chain store activity-grocery and variety.
It thus became possible to compare region by region the changes in the areas of trade under pressure of war and the position of the chain grocery and variety establishments engaged in such trade at the beginning of the transition period. In addition, the data obtained served as a partial check on the accuracy of the Bureau's estimates of total retail sales for the country as a whole in the sales lines measured here.

The summary data afford detailed analyses of the chain stores covered and permit the establishments engaged in this business to compare their own sales with the regional average. This will give them a sight on their own position in
${ }^{1}$ (a) "Wartime Trends in the Drug Store Market," a survey of the chain and independent drug store trade conducted by the Bureau of Foreign and Domestic Commerce in collaboration with A. C. Nielsen Company and published in detail for 1943. (b) Sales of General Merchandise in Rural Areas by Regions, a breakdown of rural general merchandise sales by four main geographical regions, published currently by the Bureau of Foreign and Domestic Commerce.

Note.-Miss Osborne is a member of the Business Statistics Unit, Bureau of Foreign and Domestic Commerce.
terms of the current situation and of planning future activity.

## Grocery and Combination Chains

Grocery and combination stores constitute the most important segment of the chain store field, their sales accounting for about one-third of the total dollar sales volume of the chain indus-
try and one-fourth of the Nation's total retail food store business. Although these stores operate in all regions of the country, fully half of their total sales are made in the Middle Atlantic and East North Central States where most of the stores are located. A national average of 36 dollars per person was spent in these stores in 1944.

Chart 1.-Relationship of Chain Variety Store, and Grocery and Combination Store Sales to Disposable Income of Individuals

Source: U. S. Department of Commerce.

Chart 2.—Sales of Chain and Independent Grocery Stores

Source: U. S. Department of Commerce.

Despite the many war-born restrictions affecting food distribution, chain grocery stores increased their dollar volume of business about one-fourth during the three war years, 1942-44, and reached a record volume of 4.7 billion dollars in 1944. The gain, however, reflected little more than the increase in the price level of 1944 over 1941.

In the early part of the war period before stocks were depleted and food supplies curtailed, chains were enjoying a tremendous increase in sales volume, exceeding by a comfortable margin the increases shown by independent grocers (see chart 1). A rise of 20 percent in dollar value was recorded by the chains in 1941 over 1940, while independent grocers had an increase of 12 percent. After the establishment of General Maximum Price Regulations by the Office of Price Administration in May 1942, chains were in a less favorable position than independents in maintaining their gains.
There were a number of reasons for this development. In part, the chains were unable to continue selling many of their special leader items which were caught by price ceilings, leaving very little profit margin. Also, after rationing was introduced, there was a tendency for some consumers to shift to independent food stores where an established personal relationship enabled them to
obtain certain scarce items with a greater degree of regularity.

Gasoline rationing and the pressing problems of labor supply seemed to affect the chain stores much more adversely than independents. This was especially evident in the huge supermarkets established on the outskirts of towns.
The resulting shift in the relative positions of the independent and chain grocery stores after the second quarter of 1942 is clearly shown in the lower half of chart 1. Chain store sales increased 22 percent compared to a 30 percent rise for independents in 1942. In the following year chain stores sales actually dropped 4 percent while those of independents continued to rise to a total that was 17 percent higher than in 1942. In 1944, when food supplies became markedly easier, chain store sales rose 8 percent over 1943 while the independents' margin of gain narrowed to 10 percent.
In late 1944 and early 1945, partly as a result of depleted reserves caused by an overoptimistic expectation of an early end of the war in Europe, and partly because of increased military purchases in the tense period following the Battle of the Bulge, food supplies were tighter than at any previous time. As a result, sales of both chains and independent stores fell off. This decline, however, has been arrested and with improved
supplies for the majority of food items in the final quarter of 1945 , both chains and independents will finish out the year at a relatively high level of sales.

The proportion of sales going to chains and independents has varied considerably in the period under discussion. As shown in the lower portion of chart 1 , the largest share going to chains, 44 percent, was in 1933 when so many independents had been forced out of business. This ratio decreased to 36 percent by 1937 for two reasons: (1) the increased number of independent stores; and (2) new levies introduced in a number of States with tax rates graduated according to the number of stores owned by an individual firm, causing chains to cut down on the number of stores in any given State.

With the advent of the super-markets, the chains began to make further inroads on total sales. Before Pearl Harbor, the ratio of chain to independent grocery stores was approximately 40 to 60. As the war cut more deeply into chains than independents, this ratio has now changed to about 30 to 70. However, a reversal of the wartime trend in the relative positions of chain and independently operated grocery stores will undoubtedly be experienced in the extremely competitive postwar years ahead.

It is of interest to note the effect of changes in consumer incomes on the fluctuation in chain grocery store sales. The upper section of chart 2 shows the relationship of sales to the disposable income of individuals (income payments less personal taxes paid). In this chart the point corresponding to any of the designated years is located by the amount of disposable income as shown on the bottom scale and the corresponding dollar sales on the vertical left-hand scale.

It is clear that in general increasing sales have accompanied rising incomes and conversely when incomes declined dollar sales also dropped. For example, incomes decreased by 44 percent from 1929 to 1933 and sales declined 22 percent; incomes increased by 55 percent from 1933 to 1937 while sales rose by 20 percent. It is also evident from the chart that the relationship shifted markedly in the period 1938 to 1942 from the earlier period 1929-37.

In this earlier period a change of 1 billion dollars in disposable income was associated with a change of 17 million dollars in sales. Whereas, in the period 1938-42, a similar change of 1 billion in disposable income was accompanied by a larger volume of sales, 40 million dollars.

This favorable shift in sales relative to the income change was due in large measure to the development of chain supermarkets which became especially attractive to the driving public. Because of reduced unit costs in supermarket operations, prices were more favorable at the chains and, therefore, attracted a larger group of customers. Finally, rising incomes extended into the low-income groups which spend a relatively larger proportion on food.

The shift in the relative position of the chains after 1942, as discussed above, is also indicated in the flattening out of

Table I.-Sales of Retail Chain Grocery and Combination Stores by Geographic Regions

the line after 1942 as compared with the sharp rise between 1938 and 1942.

## Regional Sales- 1944

In the survey, information was requested for the years 1939 and 1944 only. These data were then tied in with the Census reports for 1939 and 1935 , thus yielding the general regional trends shown for the period 1935-44.

From the summarized data given in table 1, it is seen that while the Nation's total dollar volume of sales by chain grocery and combination stores in 1944 was two-thirds larger than in 1939 and close to double that in 1935, obviously not all of the regions of the country shared equally in this expansion.

In the period $1939-44$, sales in New England stores expanded only slightly more than one-quarter in dollar volume, while in the West South Central Region total sales just about doubled. Exceptional gains were also recorded for the East South Central, South Atlantic, and West North Central States. In the remaining regions, the relative increases were closer to that shown for the Na tion as a whole.

The differences shown in the relative increases in sales among the various regions reflect to a considerable degree the effect of the war-induced population shifts and these in turn are correlated with income changes. In general the position of the region in regard to sales of these stores is set by the changes in population and income.

That these factors do not wholly account for the regional differences in food expenditures in chain groceries is seen, for example, in the Pacific Region. There the population from 1939 to 1944 increased 25 percent-by far the greatest advance shown for any region-and income payments also showed the largest increase, yet total sales in these stores increased by 66 percent in this period, or about equal to the United States total.

Factors other than population and income also influenced food sales of chain stores in varying degrees. The distribution of food supplies was not uniform

## Chain Variety Store Sales

Variety stores, sometimes referred to as the " 5 and 10 's," operate in all States of the Union and the District of Columbia. They serve large cities and suburban areas as well as smaller towns and communities with a wide variety of merchandise generally in the limited price brackets up to one dollar. In recent years, however, some chains have upgraded their lines, featuring merchandise up to 5 dollars or more.
In 1941 chain variety stores became a billion dollar business and by 1944 their sales totaled 1.3 billion dollars-an increase of about 27 percent during the war years. Consumers spent 10 dollars per person in such stores during 1944.

It is of interest to compare the behavior in sales made by these stores with that of department stores, although the latter carry a considerably wider range of higher grade merchandise. In the period from 1939 to 1942, these two types of outlets in the general merchandise field had not shown marked divergence in their relative accomplishments. Total sales for variety stores went up 37 percent, while the corresponding increase for department stores was 41 percent.

Since 1942, however, the department store trend has been more sharply accentuated and their sales have expanded at more than twice the rate of variety stores. Thus in 1944 dollar sales of department stores increased by 25 percent over 1942, while the comparable increase for variety stores held to 11 percent. In the first half of 1945 , sales for variety stores remained at the 1944 level, but department store sales rose about 8 percent over the previous year.
The more rapid dollar volume of sales increases for department stores could be attributed in large part to the greater choice of merchandise available and the wide price range they afforded. With little price control on high-priced luxury items and demand constantly increasing, total sales naturally moved up rapidly.

Variety stores, on the other hand, were suffering from increasing shortages of the type of low-priced goods which they commonly sold and which they were unable to replace with higher-priced substitute items. The supply of their old standbys such as candy, stationery, toys, and hardware were all sharply curtailed. In addition, the usual variety store trade, with more money to spend because of wartime prosperity, tended to shift to quality goods not merchandised by these stores.

This relationship is also brought out in the lower part of chart 2 where chain variety store sales are related to disposable income. From the beginning of the series in 1929, an upward trend in sales relative to income is indicated until 1942 after which the rise is practically arrested. This upward trend is related to the growth in the number of variety stores and their expansion in both the commodities offered for sale and the range of price lines handled-the line of demarcation between the more developed variety stores and some of the smaller
operating from 100 to over 1,000 stores in the different regions.
Sales of each State, as reported in the 1939 Census of Business, were projected on the basis of the percentage change in dollar sales as indicated by the sample material for 1944 over 1939. State figures were added to obtain regional totals; these regional totals were in turn combined to arrive at a national total.
In projecting 1939 figures, any one firm noticeably dominating the trend of the sample group, was eliminated and the percentage change computed from the remainder for the period 1939-44 was then applied to the corresponding 1939 Census figure. The figures omitted were then added to the respective totals.
The grocery and variety sales estimates for 1944 , built up in this manner from State and regional sample data, gave national aggregates for both trades which closely approximated the Bureau's 1944 estimates which are based on data currently reported by slightly smaller sample groups. Since there was little difference in these two totals, the regional sales were adjusted to equal the Bureau's original estimate for the country as a whole.

While the regional estimates of sales for these two chains are derived from a somewhat limited sample in some areas, it is believed that they give fairly accurate indications of the changes which have occurred during the period covered.
This sample study was initiated as a one-time survey to provide the trade information desired. Because of the extensive changes in the economy that are expected and their effect on consumer purchasing it may be deemed desirable to attempt another such study for the year 1945.

Similar information on other trades surveyed will be published as final data become available.

## The Business Situation

(Continued from page 7)
not always report themselves as working in response to the first question in the old schedule, "Was this person at work in a private or Government job last week?" The new form provides iurther questions which indicate whether persons who may not consider themselves as in the labor force, such as students, housewives, and retired workers, performed some work, or had a job or looked for work during the week.
The second change is in the treatment of unpaid family work. Previously, enumerators were asked to distinguish

## MARKET ANALYSIS AIDS TO

Copies available upon request to the Bureau of Foreign and Domestic Commerce
between incidental chores and unpaid family work of substantial amount, and to report only the latter as employment. Difficulty in defining "incidental chores" resulted in lack of uniformity in the returns. Under the new procedure, the total number of hours of unpaid family work is reported, and persons working less than 15 hours a week are considered to be engaged merely in incidental chores and are excluded from the labor force.

Two enumerations were made in July, first on the old and then on the new basis. The new schedules yielded a higher estimate of the labor force and employment, and a slightly lower estimate of the number unemployed. The main effect of the changes was an increase of $1,600,000$ in estimated civilian employ-ment- 900,000 in nonagricultural industries and 900,000 in agricuiture. The total increase in the civilian labor force was slightly smaller than the reported increase in employment, since the number of workers reported as unemployed decreased by about 140,000 .

Over four-fifths of the increase in employment consisted of women. Correspondingly, the number of women reported as engaged in their own housework and, therefore, not in the labor force, decreased by over one million. The use of the new schedule also resulted in an increase in the estimate of employment of school-age boys and girls and a decrease of more than 200,000 in the estimated number not in the labor force because of school attendance. Most of the increase in agricultural employment was due to the addition of about half a million unpaid family workers who had been exchuded from the labor force under the old definition because thiey were considered as engaged in incidental chores.
The new estimates for July and August are, of course, not comparable with figures for past periods. On the basis of detailed comparisons of the results of the old and new schedules, the Census Bureau will make whatever revisions are possible for the months prior to July 1945.

## War-Strengthened Railroads Face New Prospects

## (Continued from page 14)

gency facilities, the company can now elect to recompute its taxable income for 1943 and 1944 on the basis of amortization charges for the facilities in question distributed over 33 months (January 1943 through September 1945) instead of over 60 months.

Using September 1945 as the cut-off date for purposes of recomputation of amortization charges, it is estimated that the increased amortization now permitted the railrcads for the emergency period amounts to approximately 400 million dollars-without allowing for new emergency facilities certified since the end of 1944. Uncertainty as to the marginal tax rates that would be applicable prevents making an accurate estimate of the amount of tax refunds that may result, but it is not at all unlikely

## CAPITAL OUTLAY PLANS OF BUSINESS

Containing reprints of three articles which appeared in the June and July, 1945, issues of the Survey of Current Business, summarizing the Business, summarizing the Commerce survey of the postwar plans of the manufacturing, railway, and electric and gas industries.
Copies available upon request to the Bureau of Foreign and Domestic Commerce
that ine refunds would amount to twothirds or more of the additional amortization deductions.

## Conclusion as to Wartime Earnings

The responsiveness of railway earnings to larger traffic volume and more intensive utilization during the war is significant from the standpoint of potential postwar earnings, although it does not in itself provide any accurate indication of cost behavior under more normal conditions. Various temporary expedients have been resorted to in recent years in view of the urgency of increasing operating efficiency and speeding the flow of war goods to the fighting fronts. On the other hand, continued capital improvements after the war will tend to counteract the effect of eliminating these expedicnts. Cost behavior in future years, therefore, will not necessarily duplicate the war patiern.

All factors considered, there does not appear to be any convincing evidence that the railway financial barometers tend to present an inflated picture of wartime earnings for railroads in the aggregate. It seems that the accelerated amortization provisions have understated net income at least to the full extent of the small apparent overstatement that might be attributed to forced curtailment of maintenance work. In view of the important cushions in the Federal incone tax laws, tax refunds are likely to be received which will place wartime earnings in an even more favorable light.

Because of war tax rates, the carriers have not reaped the major part of the gains associated with decreasing costs under heavy traffic movement. Never.theless, their net earnings after taxes have been sufficient to permit the accumulation of sizable reserves and a reduction of the long term debt of class I roads from 11.3 billion dollars to 9.8 billion dollars between 1940 and 1944. A part of the debt reduction of 1.5 billion dollars reflects the notable progress which has been made in reorganizing roads in receivership.

For these reasons, the railroads appear to be in a considerably improved financial position as peacetime transportation once again becomes their major task. Further factors which enter into an appraisal of the postivar financial prospects of the industry will be covered in the second part of this study to appear in a subsequent issue.

INDEXES OF PIROUUCTION-WORKER PAY ROLLS (1939=100)

[^2]
## Monthly Business Statistics

The data here are a continuation of the statistics published in the 1942 Supplement to the Survey of Current Business. That volume contains monthly data for the years 1938 to 1941, and monthly averages for earlier years back to 1913 insofar as available; it also provides a description of each series and references to sources of monthly figures prior to 1938 . Series added or revised since publication of the 1942 Supplement are indicated by an asterisk (*) and a dagger ( $\dagger$ ), respectively, the accompanying footnote indicating where historical data and a descriptive note may be found. The terms "unadjusted" and "adjusted" used to designate index numbers refer to adjustment of monthly figures for seasonal variation.

Data subsequent to August for selected series will be found in the Weekly Supplement to the Survey.

| Unicss otherwise stated, statistics through 1941 and descriptive notes may be found in the 1942 Supplement to the Survey | 1945 | 1944 |  |  |  |  | 1945 |  |  |  |  |  |  |

## p Preliminary $\quad \uparrow$ Revised.

The total includes data for distributive and service industries and government not show separately.
Ncw series. For a description of the indexes of the volume of farm narketings and figures for 1929-42, see pp. 23-32 of the April 1943 Survey; indexes through 1942 were computed by the Department of Commerce in cooperation with the Department of Agriculture: later data are from the latter agency. Data for 1913-41 for the dollar figures on cash farm income are shown on $p$. 22 of the May 1943 Survey lut the annual totals have been revised beginning 1940; revised monthly averages based on the new totals are as follows (millions or dollars). Casb farm income, total including Government payments-1940, 759; 1941, $979 ; 1942,1,335 ; 1943,1,668 ;$ income from marketings-1940, $695 ; 1941,930 ; 1942,1,276 ; 1943,1,612 ;$ the monthly fgures have not as get been adjusted to the revised totals. Data beginning 1939 for the new series under industrial production are shown on p. 18 of the December 1943 issue.
Theviscd series. Data on income payments revised beginning January 1939; for figures fur 1939-41, see p. 16 of the April 1944 Survey and for $1942-44$, p. 20 of the May 1945 Survey. The indexes of eash income from farm marketing have been completely revised; data beginning 1913 are shown on p. 28 of the May 1943 Survey. For revisions for the indicated series

Revised. ${ }^{\circ}$ Preliminary.
New series. Indexes of munitions production for 1940-43 are shown on p. 24 of the February 1945 Survey; subsequent revisions in the 1943 data are available on request. tievised series. For revisions for the indicated unadjusted indexes and all seasonally adjusted indexes shown above for the industria! production series, see table 12 on pp. $18-20$ of the December 1943 issue. Seasonal adjusument factors for a number of industrics included in the industrial production series shown in the Survey have been fixed at 100 beginging various months from January 1939 to July 1942; data for these industries are shown only in the unadjusted series as the "adjusted" indexes are the same as the ungdjusted. The Ludexes of shipments have been revised beginning 1939 to incorporate corrctions in conipany reports due to renegotiations and other revisions and to take account ore changes in the Weighting factors; the series "products of petroleum and coal" has been substituted for "petroleum refining" shown prior to the March 1945 survey; data for other serie
the revised basis beginning in the February 1945 Survey and annual totals back to 1939 are on p. 22 of that issue; complete monthly revisions are available on request.

Preliminary. Revised. 8 See note marked " $\S$ " on $p$. $S-6$ of the April 1943 Survey in regard to enlargement of the reporting sample in August 1942.
New series. The series on consumer expenditures, origically published on a monthly basis in the October 1942 Survey (pp. 8-14), are now compiled quarterly onis (data are quarterly totals) and bave been adjusted to accord with the annual totals shown as a component of the gross national product series (see p. 5 of the February 1945 Survey for $1941-44$ dollar totals and p. 13 , table 10 , of the April 1944 issue for $1939-40$ totals); the quarterly data are shown on the revised basis beginning in the February 1945 issue; quarterly data beginning $1: 399$ are a vailable on request.
$\dagger$ Revised series. For revised data (dollar figures and indexes) on sales of retail stores for Jamuary 1943 to June 1944, and earlier revisions for a number of series, see table on pp. 19 and 20 of the Septeinber 1945 Survey; except as given in this table, data for 1929, 1933, and 1935-42 are correct as published on pp. 7 and $11-14$ of the Novernber 1943 Survey. Data beginning July 1944 were revised in the September 1945 Survey.

Revised．
Sample changed in July 1942．data are not strictly comparable with figures prior to that month
Sew series．Data beginning 1932 for the newspapers and periodicals and printing，book and job，industries will be published later；see November 1943 Survey for data beginning
August 1942．Data for the aircraft engine industry beginning 1939 will also be published later．

 to this note．Data prior to 1942 for all revised serjes will be published later．

[^4]A rate or
h or med the 4 ${ }^{*}$ New series. Earlier data for the serips on taxable Treasury notes are available on p. S-14 of the April 1942 and succeeding issues of the Survey. Data on consumer credit beginindex), 1929-43; single payment loans, 1929-October 1943; total instalment debt, total cash loan debt. commercial bank debt, 1934-43; insured repair and modernization debt feries now represents insured FHA loans), 1934-September 1943; credit union data, 1941-September 1943; total instalment sale debt and automotive dealers, 1941 ; charge account sale debt, December 1941-April 1942; Service debt, January 1941-April 1942. Except as indicated, the 1929-41 figures on pp. 16-20 of the Novenber 1942 Survey are correct and the estimating procedure ts essentially the same as that used originally; revisions resulted largely from adjustmeut of the monthly serics to new bench-mark data and improvement in the method of reporting consumer credit by commercial banks. Recent revisions are explained in detail in the December 1944 and January 1945 issues of the Federal Reserve Bulletin;

| Unless otherwise stated, statistics through 1941 and deseriptive notes may be found in the 1942 Supplement to the Survey | 1945 | 1944 |  |  |  |  | 1945 |  |  |  |  |  |  |

'Revised. PPreliminary. $\ddagger 36$ companies having 82 percent of the total assets of all United States legal reserve companies. 1 Discontinued by compilers.
$\otimes 39$ companies having 191 percent of replaced by a larger one and the 1943 data revised accordingly; revisions tor January-September 1943 are apailable on request.
Q39 companies having 81 percent of the total life insurance outstanding in all United States legal reserve companies. ©Or increase in earmarked gold ( - ).
The feerat Cina
1942 to January 1943. The official rato for Cavade has been 9009 sirce first quoted in March 1940 42 to January 1943 . The official rate for Canada has been $\$ 0.909$ since first quoted in March 1940.
Thata for Mexico, included in the total as published through March 1942, are no longer available. For revised monthly averages for 1941 and 1942 for the total and Canada and for data for 1944 have been adjusted to agree with the annual estimate for that year by adding $\$ 59,000$ to cach 1941 and January-May 1942 are available on request. The 0 unt should be added to the January-M ay 1944 fgures for the two items published in earlier issues.
*New series. The series on payments to policyholders and heueficiaries, compiled by the Institute of Life Insurance, represents total payments in the United States, including payments by Canadian companies: data are based on reports covering 90 to 95 percent or the total and are adjusted to allow for companies not reporting; data beginning September 1941 are available in the November 1942 Survey; earller data are available on request. The new series on bank deposits and currency outside banks are compiled by the Board of Governors of the Federal Reserve System and are partly estimated. Demand deposits adjusted exclude cash items in process of collection. The figures for time deposits include postal savings redeposited in banks and amounts not so deposited. The amount of U. S. deposits can be obtained by subtra
deposits. Monthly data beginning January 1943 and earlier semiannual and annual data will be published later.
†Data for the indicated series have been published on a revised basis beginning in the February 1944 Survey and are not comparable witt data in earlier issues (see note in
March 1945 Survey for explanation of the revision, which extended back to January 1941. and the effect on the 1941-42 data); revisions for January 1941 -October 1942, also earlier Digitized for FRgimall fevisions in value data for ordinary and the total back to December 1938, are available on request.

## Jievised. 8 Special issues to government agencles and trust funds. QFigures are on the basis of Daily Treasury Statements (unrevised). ${ }_{1}$ Partly estimated. ©Revisions for second quarter of 1944, 171.3.

2 November 1944 and May 1945 data include prepayments on secur
${ }^{2}$ November 1944 and May 1945 data include prepayments on securitics dated Dec. 1, 1944, and June 1, 1945, sold in the Sixth and Seventh War Loan drives, respectively.
TV he totals for 629 companies the miscellaneous group, and net
OT The totals for 629 companies, the miscellaneous group, and net profits for 152 companies have been revised beqinning 1941 and transportation equipment beginning 1942; scattered visions have been made also in 1943 data for other series; revisions through the second quarter of 1944 are available on request.
IFor 1941 revisions see p . S-17 of the November 1942 issue. Data for the arricultural adjustment urogram, shown separutely
lief shown scmarately throuch the doly 1044 iscue are included in the "all other" item. Deht retirements, which have heen rough the February 1944 issue, and unemployment Geginning September 1944 data are reported quarterly and for some items (notably farm mortgage and other acricultural loans all other small, are excluded.
or sale all other assets) are not comparable with earlier data owing to cbanges in regulations morternine repots from the ural onns, all other loans, business property, property held
*New series. For data beginning 1929 for profits and dividends of 152 companies, see $p$. 21 , table 10 , of the April 1942 Survey. Data for net income after taxcs of class A and $B$ electric utilitijes have been substituted for data for 28 companies: they include affiliated nonelectric operations and cover 95 percent of all electric power operations. Data beginning duplication in the figures for R. F. C. and its subsidiaries has heen eliminated beginning October 1943 ; see footnote marked "*", on p. S-18 of the April 1944 issue. The series on war savings honds is from the Treasury Department; amounts outstanding are at current redemption valnes except series $G$ which is stated at par; this item and redemptions cover all savings bonds series, including pre-war issues; sales represent funds received during the month from sales of series $\mathbf{E}$, $\mathbf{F}$, and $G$, the series issued since april 1941 (for sales beginning
Mav 1941, see p. S-16 of the October 1942 Survey). The series on expenditures of Government corporations and credit agencies includes net transactions on account of redemptions
of their obligations and other net expenditures by the Reconstruction Finance Copporation, the Commodity Credit Corporation, and other lending agenciess trassactions of these Digitized fageriecsarenot included in Treasury direct budget expenditures and receipts shown above; since October 1941 funds for these agencies are provided by the Treasur 5 . http://fraser.stloulsfed. orgies: see note in the December 1943 Survey regarding changes in the classifications; the figures fnclude payments urallocated, pending advices, at end of month.

## $r$ Revised.

* New series. For data heginning 1929 for the transportation indexes, see pp. 26 and 27 , table 5 , of tbe May 1943 Survey (small scattered revisions bave been madei $n$ the data beginning 1940 for the series marked " $\dagger$ ", as published in the Survey prior to the December 1943 issue; revisions are available on request). See p. 22 of the February 1945 Survey for annual totals on lend-lease exports for $1941-44$; monthly data prior to December 1943 will be shown later.

For revised data for 1941 and 1942, see p. 22, table 4, of the June 1944 Survey.

## Reviscd. ${ }^{\circ}$ Deficit. 1 See note marked " $\sigma$ "." ${ }^{2}$ Not available. ORevised: not comparable with data shown in the Survey prior to the March 1945 issue.

 only prior to October 1944 (comparable figure for October, 46, 839 ); beginning that montly they include stocks of both liquid and solid sodium hydroxide.

are data for 2 plants which manufacture sodium metasilicate directly without going through the soluble glass stage; comparable data beginning la41 will be published later.

1944 Surveys; 1942 data on the old basis, comparable with figures for earlier years. are available in the Marcb and April 1943 issues.
I Data for 3 companies operating nutside of United States, included in original reports for 1943 to date, are excluded to have all figures cover the same companies.

 $\ddagger$ Incl
included.

Revised. orsee note marked " $\sigma$ "" on p. S-27. $\ddagger$ Reflects all types of wholesale trading for cash or short-term credit. See also note on item in June 1945 Survey. : Original estimates (see note marked " $\dagger$ ") adjusted to agree with January-March total based ou more complete quarterly report. "Total for first quarter.
IData cover total production of distilled spirits for beverage purposes by registered distillerics, including, in addition to rum and brandy, gin, whisky, and other spirits for the months in which production of these spirits was authorized (in the November 1944 to July 1945 issues of the Survey amounts reported as "cther and unfinishcd" spirits were included only duced for beverage purposes by industrial alcohol plants in certain months as follows (tax gallons): August 1944 (estimated amount available for beverage purposes), $11,514,000$; 1945 duced for beverage purposes by industrial alcoho plants in certain months as inlows (tax gallons): August 1944 (est
†Data for manufactured and natural gas have been revised beginning i920 (reclassifying the companies on the basis of the type of gas distributed in 1943) and are not strictly comparable with figures shown in the october 1944 and earlier issues; beginning 1945 detailect reports from an reporting utilities are obtained quarterly only; 945 sales data are esti-
 spirits for beverage purposes for January 1940 -July 1943 are available on request. Revisions in the 1941 and 1942 monthly data for the other alcoholic beverage series not published in issues of the Survey through March 1944 are shown on p. S-25 of the April 1944 Survey; seattered revisions in the July 1943 to January 1944 data for fermented liquor, rectified spirits and wines, and still and sparkling wines are shown on p. S-23 of the June 1945 issue. 1943 revisions for indicated dairy products series are shown on p. 13 of the March 1945 issuesee note marked " $\dagger$ " on p. S-25 of the February 1945 Survey for sources of 1941-42 revisions, except for the series on utilization of fluid milk in manufactured dairy products which bas been revised for 19:0-42 (these revisions are available on restuest).

Stocks, cold storage, end of month.........................

- Revised. - No quotation.

## .

$\ddagger$ Compiled by the U. S. Department of Labor; see note in April 1944 Survey.
§Prices since May 1943 bave been quoted for sacks of 100 pounds and have been converted to price per barrel to have figures comparable with earlier data.
†The hog-corn ratio has been shown on a revised basis beginning in the March 1943 Survey; revised data beginning 1913 will be published later. The series for feeder shipments
of cattle and calves and sheep and lambs have been revised beginning January 1941 to inciude data for Illinois; revisions are shown on pp. S-26 and S-27 of the August 1943 Surver.
"New series; annual figures befinning 1927 and monthly figures for $1941-43$ are shown on $p$. 20 of the March 1945 issue.
$\oplus$ Miscellaneous meats includes only edible offal beginning June 1944; trimmings formerly included in "miscellaneous meats" are now distributed to the appropriate meat items. The total includes veal. shown as 9 new item in the original reports beginuing June 1944 (some of this veal formerly may have been included with trimmings in "miscellaneous
meats"), and also beginning June 1944, data for sausage and sausage products and canned meats and neat products which were not reported previously; separate data for these items through June 1945 are given in notes in earlicr issues; July and August 1945 data are as follows (thousands of pounds): Veal-July, 8,053 ; Ated previously; separate data ior these items July, 32,787; August, 32,972 ; canned meats and meat products-July, 20.339 ; August, 20,502 .
DData relate to regular flour only; in addition, data for granular flour bave been reported beginning 1943; see note in previous Surveys for data through June 1945. Granular flour Digitizedata forjudy 1945 : Wheat grindings $3,168,000$ bushels; production, 689,000 barrels; offal, $55,152,000$ pounds; percent of capacity, regular and granular flour combined, 81.9.

LUMBER AND MANUFACTURES

## - Revised.

 - Not available.*New series. The plywood and veneer series are from the Bureau of the Census and are practically complete. Data beginning September 1941 for softwood plywood are shown on p. 16 of the September 1944 Survey; data beginniug September 1942, for hardwood veneer are published on p. 14 of the November 1944 issue. The hardwood plywood figures pubished prior to the May 1945 Survey have been revised owing to corrections received from one company; the revised figures will be published later.
thevised series. Data for the indicated lumber series as published in the 1942 Supplement and in the statistical section of the monthly Survey prior to April 1945 issue have been revised as follows: Totallumber stocks, total softwood stocks, and Southern pine stocks and unfilled orders beginning 1929; hardwood stocks, beginning 1937; Western pine ncw orders, unfiled orders and stocks beginning 1942; West Coast woods new orders, production, and shipments beginning 1938, and all other series beginning 1941 . The revisions reflect largely adjustment of the monthly series to $1941-43$ annual data collected by the Bureau of the Census. Revisions through 1939 for total lumber stocks and total softwood and hard wood stocks and through 1941 for other series are available in a special table on pp. 27 and 28 of the March 1943 Survey except that $798,000,000$ should be added to the published stock figures for total humber, total softwoods and Southern pine, and 111,000,000 to Southern pine unfilled orders (these additions are to carry back a revision to include data for concentration yards); all revisions are available on request. The Census for 1942 and 1943 included many mills in the Eastern States not previously canvassed; this affects the comparability of
current statistics with those for years prior to 1942 for Southern pine and for total lumber, total softwoods, and total hardwoods. U. Forest Service estimates of total lumber procurrent statistics with those for years prior to 1942 for Southern pine and for total lumber, total softwoods, and total hardiwoods. U. S. Forent Service estimates of total lamanber pro-
duction for $1939-41$, based on census data adiusted for incomplete coverage, and census total for 1942 are shown in the table on p. 22 of the February 1945 issue (revisions for 1943 and

$r$ Revised. IBeginning 1943 data cover virtually the entire industry. ©Designated "tin plate" prior to the July 1044 Survey but included terneplate.
oneginning July 1944 the coverage of the industry is virtually complete; the coverage was about $97-98$ percent for September 1942-June 1944 and 93 percent prior thereto.
§ Deginning January 1945, percent of capacity is calculated on annual capacity as of Jan. 1, 1945, of $95,501,480$ tons of penthearth, Jessemer, and eiectric steel ingots and steel for castings; data for July-December 1944 are based on capacity as of July 1, 1944 ( $94,050,750$ tons) and earlier 1944 data on capacity as of Jan. 1, 1944 ( $93,648,490$ tons).

* Of the 99 manufacturers on the reporting list for Jan. 1, 1942, 30 have discontinued shipments of these products for the duration of the war.
- Beginning 1944 data represent net shipments (total shipments less shipments to members of the industry for further conversion) instead of net production for sale outside the industry, as formerly. For 1942 data, except for April, see the October 1942 and July 1943 Surveys; for A pril data see note at bottom of p. $S$ - 31 in the September 1943 issue.
*New series. For a description of the series on scrap iron and steel and pig iron consumption and stocks and 1939-40 data, see note marked "**' on p. S-29 of the November 1942 mately comparable with data from the Iron Age in the 1942 Supplement (data in the Supplement are inshort tons instead of long tons as indicated); see p. S-30 of the Mas 1943 Survey for further information on this series and data for 1941-42. The new pig iron price, f. o. b. Neville Island, replaces the Pittsburgh price, delivered, shown in the Survey prior to the A pril 1943 issue. For data beginning January 1942 on aluminum production see p. 24 , table 6 , of the June 1944 Survey. Data for aluminum fabricated products cover total shipments of castings, forgings, sheet, strip, plate, rods, bar, and other shapes, and are available beginning January 1942; data for gray iron castings are based on reports of foundries accounting Digitized for FRan ${ }^{\text {beopt }} 98$ percent of the total tonnage of the gray iron castings industry for January-November 1943 and 93 percent thereafter. Both series are from the War Production Board.

## METALS AND MANUFACTURES—Continued

[^7] $\sigma^{2}$ For data beginning fanuary 1942 for the indicated copmer, lead, and zine series, see p. 24, table 6 , of the Jume 1944 Survey. 1 Discontinued by reporting source.
§ Revisions in unfiled orders for Arril-July 1942 are availabic on request; data cover 8 companies for March 1943 to Scntember 1944 and 9 therealter.
$\oplus 1944$ data based on reports of 124 manufacturers (see note in April 1945 Survey); 20 of these reported no production, shipments. orders, or stocks in 1945
 the entire iadustry; in prewar years the reporing concerns represented over 95 percent of the total

TRevised. $\ddagger$ For rerisions for 1842 and the early months of 1943 . see note for paperboard at bottom of p. S-35 of the July 1944 Survey.
§Computed by carrying forward March 1943 figures on the basis of percentage changes in data for 59 identical companies rcporting to the National Paperboard Association. tRevised series. Revised wood pulp production data for 1940-43 and sulphite stoeks for all months of 1943 are shown on page 20 of December 1944 Survey; revised 1942 stock figures
for all series are on pp. 30 and $S-31$ of the June 1943 issue. The data exclude defibrated, exploded, and asplund fiber. The paper series from the Amprian for all series are on pp. 30 and S-31 of the June 1943 issue. The data exclude defibrated, exploded, and asplund fiber. The paper series from the American Paper and Pulp Associa tion beginning in August 1944 Survey are estimated industry totals and are not comparable with data shown in earlier issues; there have been further small revisions in the data as published prior to the Junc 1945 issue; revisions for 1943 and January-March 1944 , together with earlicr data, will be published later.
New series. The new paper series from the Bureau of the Census cover production of all mills including producers of building paper and building boards; for comparable 1942 20 of the September 1944 Survey. The indexcs for folding paper bores are from the Folding Paper data beginning 1934 for shipping containers and a description of the series, see $p$. 20 of the September 1944 Survey, The indexse for folding paper bores are from the Folding Paper Box Association, based on reports of members accounting for around 50 percent o

${ }^{\mathrm{r}}$ Revised. ${ }^{1}$ Production of $64 \times 60$ for which ginnings of 1944 crop.
2 September 1 estimate of 1945 crop.
o'Production of $64 \times 60$ for which prices through June 1943 were shown in the Survey has been discontinue
8 Total ginnings to end of month indicated.
$\ddagger$ For revised figures for cotton stocks for August 1941 -March 1942 see p. S-34 of the Mer 1943 Surver The total © Price of $56 \times 56$ sheeting.
94, including stocks on farms and in transit, were $10,626,000$ bales, and stocks of foreign cotton in the United States were 118,000 bales.
OData for September and December 1944, and January and April 1945 are for 5 weeks; other months, 4 weeks.

- Data exclude carpet and rug looms operating on blankets and cotton fabrics and, through October 1943, woolen and worsted looms operating entirely on cotton yarns (no separate
 $\dagger$ Revised series. For monthly 1941 data for the yarn price scries see p. S-35 of the November 1942 issue ( 1941 monthy average so. \$355). The farm price series has been revised the Mag 1943 Survev); data include wool held by the "t" on p. S-35 of the June 1944 Survey. Wool stocks have been published on a revised basis beginning 1942 (see p. S-35 of Mag 1943 Survev); data include wool held by the Commodity Credit Corporation but exclude foreign wool held by the Defense Supplies Corporation.
*New
ontaining by weight 51 percent or more cotton; for data for first half of 1943 , see p . $\mathrm{S}-35$ of the August 1944 Surve fiarlier dation of cotton broad woven goods (except tire fabrics) wool price series are shown on or more cotton; for data for first half of 1943 , see p. S-35 of the August 1944 Survey; earlier data will be shown later. Data beginning $193 G$ for the new

Unless otherwise stated, statistics through 1941 Uniess otherwise stated, statistics through 1941 and descriptive notes may be

## - Revised.

§Beginning in this issue of the Survey, 1845 data for pyroxylin spread represents amount actually spread (including amount spread on fabric and nonfabric materials, instead of estimates based on spread of an 8-pound jelly as reported previously; totals for January-June 1945 reported on the two bases differed only slightly. Shipments and unilled orders for 1945 include an undeterminable amount of custom coating of nonfabric materials (but not other nonfabric coatings) and probably some custom coating of fabrics other than cotton. Data for July 1945 include reports for 3 companies which did not report previously; these companies accounted for 7 percent of pyroxylin spread and 11 percent of shipments for that month; it is not known at present when these companies began operations.
$\dagger$ Revised series. The indicated Canadian indexes have been sbown on a revised basis beginning in the December 1942 Survey, except for construction which was revised in the August 1945 issue and mining which was revised in the April 1944 issue; the revisions affected principally indexes beginning January 1940 ; the agricultural marketings indexes and the distribution index were revised back to 1919 and minor revisions were also made in data prior to 1940 for other series. All series are available on request.
*New series. The new series on woolen and worsted goods are compiled by the Bureau of the Census from repprts of manufacturers who account for 98 percent or more of total Digitized for Fparoduction; available data for 1937-43 for woolen and worsted goods are on p. 19 of the May 1945 Survey; yardage is reported on an equivalent 54 -inch linear yard except blankets which $\mathrm{http}: / /$ fraser.stlseribptioh ofgthe series); data beginning 1936 will be published later.
