# THE BUSINESS SITUATION 

By the Office of Business Economics

BUSINESS ACTIVITY in September continued in an expending phase. Production edged upward and supplies improved in many lines, with inventories still playing an important role, though the rate of accumulation has been reduced from the very high July rate.
Despite small declines in some of the basic indicators, it was still apparent that the economy was being bolstered in September by the same fundamental demand pressures which have been operating throughout the first postwar year. A comparison of the summer rise in retail trade with the changes in commodity prices suggests that the sales advance was largely a response to higher prices, with some evidence that rising prices coupled with the increasing flow of durable goods is taking some of the keen edge off the demand for nondurable goods.
In contrast to the buoyant trends in production and sales and the favorable current earnings reports, prices of common stocks continued to decline rapidly during the first 3 weeks of September and then moved within a narrower range slightly above the month's low and about one-fifth below the postwar peak in June. Bond prices also declined over this period. Short-term interest rates, on the other hand, showed little change in September, after some firming in the preceding month.
The major immediate effect of these security market developments was a sharp falling off in new security flotations. Notwithstanding these evidences of a somewhat firmer money market, the volume of commercial, industrial, and agricultural bank loans rose steadily throughout the month.

## Some Declines, But No Basic Change

The pattern of business developments during September differed somewhat from that of preceding months in that some scattered declines occurred. These were not, however, symptomatic of any reversal in basic trends but could be

## The Month in Review

The postwar expansion in economic activity made further headway in September. The declines noted in a few business indicators were largely attributable to particular local conditions rather than to any changes in the fundamental pressures which have bolstered production, sales, and income since the end of the war.

Although the broad price averages were lower in September because of the roll-back in meat and livestock prices and in a few other products, prices of other than these commodities rose further during the month.

Most of the statistical series used in this review of the business situation will be found in the statistical section at the back (pp. S-1 to S-40).
ascribed to special circumstances not directly related to the over-all economic situation.

Department store sales rose somewhat less than 20 percent in September, as compared with a 25 percent gain expected on the basis of seasonal factors. As a result, the seasonally adjusted index declined to about the level in June and July. This less-than-seasonal rise was partly due to the curtailment of sales in New York City, influenced by the truck tie-up and the temporary stoppage of parcel deliveries, and in Pittsburgh, where a labor-management dispute halted power production during the latter part of the month. Outside these areas, department store sales showed closer to the usual seasonal advance.
Another deviation from earlier trends was noted in the weekly index of wholesale prices, which declined during the first 2 weeks of the month. Despite the rise in the succeeding period, the index for the last week of September was still

3 percent below the figure for the last week of August. The over-all price de.cline did not reflect any abatement of the market forces pushing up prices, but was entirely due to the Decontrol Board's decision to reimpose ceilings on livestock, meats, and a few other products. When livestock and meat prices are excluded, the wholesale price index shows a gain of approximately 3 percent for the 4 weeks ending September 28.

Finally, both total and miscellaneous freight carloadings rose less than seasonally in September, resulting in a dip in the adjusted indexes. This interruption in the uptrend which characterized freight movement during the preceding 3 months reflected the effects of the maritime strike which tied up a large number of freight cars at the water front.

With the notable exception of meat production, which declined sharply as the new ceilings became effective in the early part of the month, the broad trend in output was upward in September as in the preceding months. The weekly output of steel ingots at the end of the month was at a postwar high. In addition to the reconversion industries, where the trend has been upward for many months, August production reports showed rising trends in building materials, textiles, and rubber products, as well as in many other lines.

## Inventory Rise Continues

Changes in business inventories are still among the more dynamic factors in the current situation, even though the rate of increase slowed considerably in August following the very large increase in July. The importance of this factor of temporary strength in the market is analyzed in the article, "Postwar Role of Business Inventories," appearing in this issue and need not be reviewed at this point.

The trend of manufacturers' shipments in the durable and nondurable goods industries is illustrated in chart 1. It will be noted that part of the large July rise in manufacturers' inventories reflected a delay in shipments in the nondurable goods industries because of
price uncertainties. The further accumulation in August, on the other hand, was associated with large increases in shipments throughout manufacturing.
On a daily average basis, the JulyAugust rise in the dollar value of manufacturers' shipments amounted to 8 percent. The August figure exceeded the February low by more than onefifth. In the durable goods industries, however, the value of shipments was more than 50 percent higher than in February.

## Summer Spurt in Income Payments

Consumer spending has been buoyed in recent months by the heavy volume of income payments flowing to individuals. The bulk of the rise occurred between June and July, when the seasonally adjusted annual rate of payments was lifted from 162 to 168 billion dollars. There was a further increase in August which raised the rate to almost 170 billion dollars. It will be remembered that at the peak of the war-February 1945-the rate was 165 billion dollars and the full-year rate for 1945 was 161 billion dollars.
Moreover, lower individual income tax rates in effect this year have reduced the leakage between actual and retained earnings. Thus, disposable income-the amount available to consumers to spend or to save-has shown a larger gain reiative to wartime levels than is indicated by the income totals.
The exceptionally large advance since June was centered in two components of income payments, wages and salaries and net income of agricultural proprietors. In dollar terms, the increase in wage and salary payments outweighed the advance in farm income, although, percentagewise, the latter gain was far more striking.
The circumstances surrounding the rise in the net income of farm operators are well known. Income from livestock marketings was the dominant factor, as the run of cattle and hogs to the Nation's slaughterhouses was exceedingly heavy following the lifting of price ceilings on June 30. However, substantially higher prices were the rule throughout agricultural commodity markets and helped to raise the value of all classes of farm products sold during this period.

The effects of the restoration of price ceilings on livestock and meats in early September are described in a subsequent section of this review. It may be noted here that, although cash income from farm marketings declined in September (on a seasonally adjusted basis), it was still as high as income a year ago. The higher prices this year offset the lower physical volume of marketings.

## Chart 1.-Manufacturers' Shipments ${ }^{1}$

: Adjusted for the number of working days in month. Source of data: U. S. Department of Commerce.

## Increases in Wages and Salaries

The recent gains in wage and salary payments are wholly attributable to private industry, but it is noteworthy that the Government pay roll has remained above the June level on a seasonally adjusted basis, despite further reductions in the armed forces and in other classes of Federal workers. Higher Federal pay rates went into effect on July 1 for both military and civilian personnel.

Wages and salaries in manufacturing industries have been increasing both because of rising employment and because of higher rates of pay. Average weekly earnings of production workers rose from \$41.30 in January-March of this year to just under $\$ 43$ during the AprilJune period and to $\$ 44.60$ in August. Weekly earnings in the latter month were still less than the average wartime pay envelope in manufacturing, since the reduction in the workweek from 45 to 40 hours and the shift to lower-paying industries more than offset the boosts in wage rates.

## Income Gain Goes for Consumption

The uptrend in income payments was not so rapid as the increase in consumer spending at the higher prices prevailing and savings of individuals were thereby reduced. As already noted, the trend of retail sales during the summer months closely followed the index of retail prices. Since more units of durable goods were being sold as compared to earlier in the year, the over-all sales data suggest a falling off in the physical volume of sales at nondurable goods stores.

The pattern of retail buying during the first half of 1946 is analyzed in the article, "Retail Sales and Consumer Income since VJ-day," appearing in this issue. The article demonstrates that the post-VJ-day rise in consumer spending was sufficient to restore the prewar relationship between total retail sales and disposable income-during the war period, of course, sales were considerably below the line of relationship. It is also demonstrated, however, that the different classes of retail sales showed marked deviations from the long-term sales-income relationships. In general, sales at nondurable goods stores were exceptionally high relative to the level of income during the first half of 1946 and sales at durable goods stores were exceptionally low by this same standard.

## "Distortions" in Sales Pattern Persist

On the whole, the July and August sales data reveal some slight tendencies toward correcting these "distortions" in the pattern of sales for the different lines of merchandise. In the case of sales at durable goods stores. the gap between actual sales and the volume indicated by the level of disposable income was somewhat narrowed during July and August, although a substantial gap still remained to be closed as durable goods become more generally available. Sales at nondurable goods stores continued to rise despite their already high level relative to consumer income. Evidently, the higher cost of day-to-day necessaries was the dominant influence during these months.
Among the imponderables in the outlook for consumer spending is whether the current rate of savings provides a sufficient cushion for increased spending as purchases of durable goods continue to expand, as they are bound to do in the period ahead. Any extensive use of liquid asset holdings and of consumer credit to finance purchases of durables will result in a marked reduction in the rate of current savings.

## Labor Market Tightens

As a result of the continued heavy pressure of demand for goods, the volume of nonfarm employment has moved steadily upward, after allowance for seasonal influences, at a pace which has outdistanced the additions to the civilian labor force resulting from the return of veterans and, to a smaller extent, the backflow of former war workers. The volume of unemployment was cut to about 2 million in August and September and the number of veterans awaiting reentry into the labor force has been reduced. In the 13 months since VJ-day,
there has been a net gain of more than 4 million persons in civilian nonagricultural employment.

The summer gains in nonfarm employment were centered in manufacturing in-dustries-almost all industry groups within manufacturing shared in the in-creases-and in construction. The gains in construction employment, however, were considerably below the monthly increases earlier this year. The uptrend in employment in the trade and service industries also has markedly slowed down in comparison with the increases a few months ago.

## Low Lay-Off Rate; High Quit Rate

Further evidence of less slack in the labor market can be found in the declining lay-off rate and the rising quit rate. However, neither lay-offs nor quits were back to the rates which prevailed during the 1943-44 period when war production was in full swing.

The July quit rate of 45 per 1,000 was more than 5 times that of prewar years. Moreover, quits constituted three-fourths of all separations. In the prewar period, the number of quits per 1,000 workers typically was far below the number of lay-offs.

## Leeway for Further Expansion

Despite the evidences of a tighter job market, there is room for further expansion. In the first place, veterans and others are still entering the labor force and the number unemployed can be reduced further. Secondly, the estimates of employment include many workers with part-time jobs as well as a large number of workers with jobs but not actually at work during the census week for various reasons such as temporary lay-offs, definite instructions to report to a new job, and vacations, as well as illness. Thirdly, the size of the labor force is flexible and could expand should any large number of attractive job openings remain unfilled for an extended period of time.

There is leeway for further gains in production, even without an expansion in employment, since maladjustments typical of a rapid change-over in production, though gradually clearing, are still in evidence. Manufacturers' inventories lack much in the way of balance and supply and materials bottlenecks prevent uninterrupted full-scale operations in some industries. As the Nation's factories approach their peacetime potential, one would expect that over-all efficiency would increase, just as was the case after the war production machine shifted into high gear in late 1943. Work stoppages could, of course, impede the attainment of this improvement.

## Construction Up One-fourth in Quarter

September marked the third successive month that the dollar value of new construction activity exceeded a billion dollars. As a result, construction outlays were about 25 percent higher in the third quarter of the year than in the second quarter. All classes of construction shared in the rise.
The value of new construction put in place in September is estimated at $\$ 1,060$ million, slightly less than in August for which the revised estimate is $\$ 1,074$ million. The slight reduction in September volume indicates that the seasonal peak may have been reached. Normally, October produces approximately the same volume as September, and November marks the first month in which a large decline due to seasonal factors is noted. Because of the large volume of construction under way at the present time, it is expected that both October and November volume will be unusually well sustained. Recently reported increases in the supply of lumber and other major building materials may make this counterseasonal expectation a reality.
The Housing Expediter has reported that 708,000 dwelling units had been started under the Veterans' Emergency Housing Program as of August 31, 1946. These included almost 465,000 permanent dwellings and 160,000 dwellings designated temporary reuse construction, with the balance consisting of conversions of existing facilities and house trailers.

Of greater current importance to home seekers is the fact that 350,000 dwelling units have been completed in the first 8 months of this year and made available for occupancy. The completions include 236,000 permanent dwelling units, either conventional or factory built. As a reflection of the longer periods of time necessary to complete con-

struction jobs under way, somewhat less than half of these permanent units were started this year. Completions of all types of units reported for the month of August amounted to 63,000 units.

## Pressure on Prices Continues Strong

Recent price developments have given no indication of a relaxation of the upward pressures on commodity prices. Prices have declined only in isolated cases-with the exception of the rollbacks.
As may be seen from table 1, the overall average of wholesale prices declined 4 percent in September due to the effects of the rollbacks. Wholesale meat prices were reduced by about 40 percent, although in late September these prices were almost 20 percent higher than in June 1946. The largest increases for broad commodity groups were in the prices of textiles, cereals, and dairy products.
Further upward adjustments were made in ceilings, but the number of changes was far below that of the preceding month. Featuring the upward revisions were a further rise in cotton goods ceilings to offset higher wages in some mills and also higher raw cotton: pricas; and a 20 cent per hundredweight rise in flour ceilings-an adjustment also required by higher operating costs. In addition, one of the large automobile manufacturers was given a 6 percent increase to compensate for retarded output.

## Cost of Meat Substitutes Rises

Toward the end of the month food prices began to reflect the effects of the decline in the supply of meat in retail stores. Poultry prices, for example, increased more than one-third during the 4 weeks ending September 28 and fish: prices also rose substantially.

There were no major changes in the extent of the decontrolled area of prices, although the short-supply list published by the Department of Agriculture at the end of September resulted in the de-: control of a few additional processed foods. The Decontrol Board met to review its earlier findings with respect to dairy product prices, but its new decision continued the free pricing of these. products on the ground that the price increases which had occurred were not "unreasonable" under the terms of the price control renewal act.

# Agricultural Prices and Production 

In recent months the lifting of controls from most farm products and the subsequent restoration of ceilings on some commodities have been accompanied by large fluctuations in farm prices. After the sharp summer rise, the index of wholesale prices of farm products declined in early September, due to the price roll-back in livestock and fats and oils, but then advanced so that by the end of the month the index was within 4 percent of the August high.

Changes in the index of prices received by farmers during and after the two world wars are compared in chart 2 . It is noteworthy that the index was higher in mid-September than the top reached after World War I, despite the decline from August because of the roll-backs.
The index of prices received was at approximately the same level at the beginning of the two wars. During the first year of each war, farm prices remained remarkably stable (see the left panel of chart 2); then, in both periods the index began to advance. Although for several months this advance in prices was more rapid in the second World War than in the first, the total rise during the period before this country's entry was not so large in World War II.

When we entered World War II, therefore, farm prices were lower than when we entered World War I (see center panel). During the first 15 months following Pearl Harbor, however, farm prices rose more rapidly than in the similar period in World War I, and in March 1343 were nearly as high as in the corresponding month (July 1918) in the earlier period. However, during the few remaining months of World War I, prices rose an additional 8 percent, whereas in World War II prices were approximately stabilized for nearly 2 years.

A further advance was registered during the last quarter of 1944 and in the early months of 1945 , so that at the end of World War II, farm prices were nearly as high as in November 1918. During the period between VJ-day and June 1946, the index rose at a slightly more rapid rate than in the corresponding period following the Armistice. Then, as price controls lapsed, farm prices jumped 14 percent in two months reaching a point in mid-August 6 percent higher than the post-World War I peak in May 1920. The September decline from the August peak averaged 2 percent. In relation to the general price level, farm prices have led the advance since VJ-day, whereas after World War I, farm prices rose less rapidly than other prices.

Prices received by farmers on September 15 were 2 percent lower than a month earlier, reflecting the price roll-backs in livestock and fats and oils, but they remained above the post-World War I high in 1920.

On the food production front, meat has been the focal point of interest due to the sharp reduction in animal slaughter coincident with the reimposition of ceilings on livestock and meat. The wide variations in livestock marketings, which were low in June, very high in July and August, and extremely low again in September, have dominated monthly changes in farm income.

## Effects of Changes in Subsidies

The changes in subsidy payments since June have had a different effect upon prices received by farmers than upon wholesale and retail food prices. Except for the dairy production payments, which have been discontinued, the principal food subsidies were paid to processors in order to roll back or to prevent rises in wholesale and retail food prices. During the time these payments were being made, there was a less than normal spread between prices received by farmers and retail prices. Consequently, the removal of these subsidies on June 30 resulted in immediate advances in wholesale and retail prices; their restoration at a later date brought a decline. This was only one of the factors, of course, operating during the period when price controls lapsed.

## Corn Higher Despite Bumper Crop

After the broad advance in agricultural prices in July and August, the prices of some products, notably livestock and fats and oils, were reduced in September by the restoration of price ceilings. On the other hand, increases occurred in uncontrolled items, including food grains, dairy products, and poultry and eggs.

The price received for wheat was 5 cents per bushel higher on September 15 than on June 15, and a further rise occurred in the latter part of the month. The peak price of wheat was reached in July following a series of advances in the price of wheat which took place coincident with the heavy shipment of relief supplies abroad.

Before the lapse of price control, a bumper wheat crop in the United States was being harvested and crops larger than a year ago were in prospect in Europe and in Canada, Australia, and Argentina. Furthermore, government procurement of wheat for export dropped in June, and the report on stocks of wheat on June 30 showed them to be higher than previously estimated. Consequently, the situation had eased sufficiently so that wheat prices advanced only moderately after June-less than the amount of the bonus paid for wheat delivered for export in May.

A much larger advance took place in corn prices. Although a record corn crop also was in prospect, stocks of oldcrop corn were very low. Strong demand from corn processors and feed mixers bid prices up well above $\$ 2$ per bushel in Chicago-in mid-July cash corn prices were higher than wheat prices for the first time since 1940 -but prices dipped

Source: U. S. Department of Agriculture.
moderately in August. Corn ceilings were not restored by the Decontrol Board and restrictions on the use of feed grains were relaxed. During September corn prices again reached $\$ 2$ per bushel, which was more than 50 cents higher than the June ceiling.
The rapid movement in corn was not so much a reflection of the prospective future supply-demand position as of the fact that immediately available supplies from the carry-over were very low. By contrast, feed grain supplies for the next year are estimated to be the largest on record, and the number of animals to be fed is less than in recent years.
Compared with the jump in cash corn from $\$ 1.44$ to around $\$ 2$ a bushel, the January futures closed on September 30 at \$1.34, as against \$1.46 on June 29.

## Wide Changes in Wholesale Meat Prices

Prices received by farmers for all meat animals were sharply lower in September following the record advance of 28 percent in July and August, but they were still 8 percent higher than in June. The changes in prices at the farm level were less, however, than those at wholesale and retail. The differences were partly attributable to the lapse and the restora-
tion of subsidies. Between the last week in June and the last week in August the BLS index of wholesale meat prices rose 88 percent but by mid-September, when the index included the new ceilings, it was only 18 percent higher.

## Dairy Prices Advance

In contrast with livestock and meat prices, the rise in the prices of dairy products by the end of August was about in line with the amount of the subsidy previously paid. However, a further advance in September raised prices 31 percent above June, although some of the rise was due to seasonal factors.
Wholesale prices of 8 domestic fats and oils averaged about 50 percent higher in August than in June. Taking into account the fact that supplies are expected to remain below normal for at least a year, the Decontrol Board restored June 30 ceilings on most fats and oils except butter. Increases recommended by the Secretary of Agriculture were granted by the OPA in September.

## Cotton Carry-Over Reduced

A number of factors contributed to a sharp advance in cotton prices which
brought prices received by farmers in September 36 percent higher than in June and 63 percent higher than a year ago.
The rise in cotton prices is only indirectly related to the lapse of controls, since the price of raw cotton had not been controlled. However, the new price control legislation requires that ceilings on cotton goods reflect the market price or the parity price of raw cotton, whichever is higher, while the legislation previously in force simply required that ceilings reflect the parity price. Thus cotton prices are free to rise and have risen very considerably above the parity level.

World carry-over of cotton, which rose nearly $31 / 2$ million bales during the war, has in the year since the war ended fallen about 4 million bales and a further decline is in prospect in the year ahead. Furthermore, the proportion of American cotton in the carry-over has been reduced and a small crop is estimated for 1946.

## Food Output at High Level

The sharp changes in farm prices have affected the outlook for food production during the year very little, although price

Chart 2.-Prices Received by Farmers in Two War and Postwar Periods ${ }^{1}$

Data are as of the 15th of each month.

swings have influenced the rate of livestock marketings. The latest estimates of food production for 1946, shown in table 2 , reflect some downward revision in livestock output from eariier ones but these estimates are very tentative, as the livestock situation is not yet clarified.
Food-crop production for 1346 was little affected by the price adjustments, since most plantings had already been made in the first half of the year. Excellent weather during the summer brought upward revisions in the estimate of total food-crop output which is now expected to be 8 percent above last year with several record crops forecast.

Food-livestock output for 1946 is now estimated to be 5 percent below production last year with some reduction in
each major group. Part of the decrease in output occurred during the first half of the year, but additional changes are expected as a result of the shifts in price relationships which have occurred during recent months. These are discussed below.

## Feeding Less Profitable

Any effect that the lapse of price control may have had on farm production will be registered in livestock output. Immediately after June 30, the prices of livestock and livestock products as well as the prices of feed for livestock spurted sharply. Changes which took place in the ratio of the prices of principal livestock products to the prices of feed are shown in chart 3.

In all cases, a drop in the ratio indicates that feeding is less profitable whereas a rise means that feeding is more profitable. Curiously enough, the principal feeding ratios all became less favorable in July, and, although somewhat higher in August, they were still less favorable than a year earlier and lower than the long-time average. In September with price cellings restored for livestock but not for feed, the hog-corn ratio again became unfavorable. In relation to the futures prices of corn prevailing in September, the hog ceiling prices provide a feeding ratio which is about the same as the long-time average.

The actual response of farmers to these price developments is not yet clear. If dairymen have altered feeding operations or changed the number of cows kept for milk production the effect of this will not, be apparent for several months.

## Livestock Marketings

The marketing of all elasses of livestock was sharply affected by the anticipated and actual price changes. Anticipating higher prices, farmers reduced marketing of livestock in the latter part of June and then rushed stock to market during July and August when price controls were off.

The heavy slaughter of hogs continued throughout August, but receipts dropped off sharply in September and remained at a fraction of normal volume throughout the month (see lower part of chart 4). The heavy marketings reduced the number of mature hogs on farms, which already was 10 percent below the previous year on June 1, before the large marketings began. However, there was little liquidation of young pigs, which were farrowed this spring and which will be ready for market beginning in October. These pigs received less corn than usual and hence made less than usual growth during the summer when corn was scarce and expensive.

Hog marketings next spring and summer may also be reduced as a result of the unfavorable hog-corn ratio which prevailed this spring and early summer when sows were being bred for fall farrowing. In past years, unfavorable hogcorn ratios in these months have been associated with reduced fall pig crops. Next spring's pig crop may be larger than in 1946, however, if the record corn harvest now in prospect restores a favorable feeding ratio.

In contrast with hog marketings, the movement of cattle to slaughter tapered off during the latter part of August and was lower for the month than a year ago (see upper panel of chart 4 r. Also, the number slaughtered for the three-month period, June, July and August, was lower than in the same period-although noninspected slaughter in June may have been higher than a year ago.

A liquidation of fed cattle did take place, however, partly because of the high cost of corn but primarily because of the high price of even partly finished cattle. The number of cattle on feed lots in the corn belt on August 1 was 45 percent lower than a year earlier.

The number of grass-fed cattle as well as of all beef cattle on farms is at a

Chart 4.-Livestock Slanghter, Federally Inepected
MLLIONS OF animals

Sources of data: U. S. Department of Agriculture except data ior september 1945 , which are estimates of the U.S. Department of Commerce.
near record level and far above the prewar average. Developments on the price front will have an important effect on the rate of movement of cattle to slaughter.

## Gain in Farm Income

Although the prospects for farm production during this year have been little affected by the sharp price changes and the shifts in marketing schedules, these changes have had an important effect
upon the amount and the distribution of cash farm income. Farm income fell off in June of this year, as farmers reduced marketings of both crops and livestock awaiting the outcome of price control legislation.

In July, the advancing prices brought heavier crop marketings and particularly heavy runs of animals for slaughter. As a result of both of these influences, cash income from farm marketings (seasonally adjusted) rose 23
percent in July, but declined 6 percent in August, at which point it was 20 percent higher than a year earlier. Preliminary estimates show September income to be about the same as a year ago.

Income for the full year 1946 will be about 10 percent higher than in 1945, according to recent Department of Agriculture estimates, but income in the final half of this year as compared with the last 6 months of 1945 may be as much as 20 percent higher.

# International Transactions: Second Quarter of 1946 

The value of goods and services transferred to foreign countries totaled almost 4.2 billion dollars in the second quarter of 1946, an increase of $800 \mathrm{mil}-$ lion dollars over the preceding quarter. This rise was the net result of an expansion of 1 billion dollars in the value of goods transferred to other nations and a 200 million dollar decline in services. The increase in the commodity account was due not only to larger shipments of goods from the United States, but also to a sharp rise in sales of United States owned property abroad, primarily goods declared surplus since the end of the war.
Goods and services obtained from abroad declined from 1.7 to 1.6 billion dollars from the first to the second quarter of the year. The reduction in payments for services rendered to our armed forces more than offset slightly higher imports of merchandise.
The 2.6 billion dollar excess of goods and services transferred over goods and services received was financed in the following manner (in billions of dollars):

```
Unilateral transfers (UNRRA contri-
    butions and other gifts)........-.}0.
Net long-term loans_.........-----------
Net flow of gold and short-term
    capital_
    1.0
Payments, not specifled_

The above tabulation indicates that unilateral transfers and increased lending operations were not sufficient to meet the larger gap between receipts and payments and that foreign gold and dollar balances underwent a further sizable depletion in the second quarter. However, the pressure on foreign reserves may be expected to ease as a result of the passage of the British loan and the extension of new Export-Import Bank credits.

\section*{Merchandise Transfers Rise}

Improvements in the domestic supply situation of many manufactured goods,

The United States balance of international payments during the second quarter of 1946 was characterized by a very sharp increase in Government loans to foreign countries and a smaller, yet substantial, increase in the liquidation of forcign gold and dollar holdings.

The accompanying section is the second of a series of quarterly presentations of the balance of international payments of the United States. The first of the series was published in the July issue.
large shipments of foodstuffs, particularly of wheat, to European countries, and to a lesser extent price rises brought exports during the second quarter 1946 to an annual rate of nearly \(\$ 10\) billion. Tctal sales and other transfers of goods to foreign countries, including transfers of lend-lease material, surplus goods, and civilian supplies by the armed forces, rose to an annual rate of \(\$ 13.8\) billion. This figure was higher than transfers in 1945, and only \(\$ 3\) billion less than the wartime peak of commodity transfers to foreign countries reached during 1944.

\section*{Transfers Through Government Channels}

When hostilities ended, the government of the United States, particularly the Armed Forces, had in foreign countries huge supplies of material with considerable civilian use value. Up to June 30, 1946, surplus goods having an original cost of \(\$ 3.6\) billion had been disposed of for about \(\$ 1\) billion, or 28 percent of cost.
The rise in surplus property disposals
from the first to the second quarter of 1946 (see table 3) was accounted for chiefly by the bulk sale of surplus goods to the Government of France for \(\$ 300\) million negotiated as a part of the overall war settlement with that country. On the basis of preliminary data it appears that realizations from surplus property disposals during the third quarter will approximately equal the second quarter figure, but are likely to decline sharply thereafter.

Transfers of merchandise procured through lend-lease channels also continued at a relativey high rate in the second quarter. At the conclusion of the war the value of goods in the lendlease "pipe-line" amounted to roughly \(\$ 1.2\) billion. Of this total about \(\$ 0.9\) biilion was transferred by the end of June. The marked rise in transfers under credit lend-lease from the first to the second quarter was due to a rise of transfers as reflected in financial records and does not represent the actual movement of exports.

Transfers of commodities through UNRRA were about 20 percent higher than in the first quarter. The rise may continue during the following few months but decline sharply thereafter, especially since the UNRRA program is to be completed by the early part of 1947. Transfers of civilian supplies by the armed forces in former enemy countries may possibly decline, particularly in Europe, because of better harvests in that area.

On balance, therefore, total transfers of merchandise through government channels are likely to show a decline during the third quarter of 1946 since the backlog of lend-lease transfers is rapidly being extinguished. A further decline in the fourth quarter may be expected as the stock of undisposed surplus goods is reduced.

\section*{Rise of Private Exports To Continue}

Private exports, which showed a gain of \(\$ 350\) million or 24 percent over the preceding quarter, are likely to continue an upward trend as both private and government controls are relaxed and the long waiting period between the placing of orders and the resulting deliveries is shortened. If private exports continue to increase at the rate exhibited since VJ-day, it is likely that they would more than offset the decline in Govern-ment-procured exports.

\section*{Uptrend in Imports}

Imports for consumption from foreign countries rose from the first to the second quarter of 1946 by about \(\$ 70\) million, or 6.5 percent, to an annual rate of \(\$ 4.6\) billion. The small setbacks in May and June were followed by a sharp rise of

imports during July to the annual rate of almost \(\$ 5.2\) billion.
The rise during the second quarter was most pronounced in semimanufactured and manufactured goods, the two categories which in the first quarter were farthest from the prewar relationship to the national income. \({ }^{1}\) With continued reconstruction and increased production abroad and with rising prices in this country, imports should show a faster rise in the near future than during the first half of the year-assuming uninterrupted shipping services.

\section*{Export Surplus of 2.6 Billion Dollars}

As already noted, the excess of goods and services transferred to foreign countries over those received amounted to about 2.6 billion dollars during the second quarter. This excess was larger than in any quarter since the beginning of 1945, but it was less than during 1943 and 1944. However, part of the second quarter export surplus (as recorded for balance of payments purposes) does not represent currently produced goods and seivices. More than \(\$ 500\) miliion of our transfers consisted of surplus goods located abroad and perhaps as much as \(\$ 200\) million included under lend-lease transfers represented bookkeeping entries for transfers actually made some months earlier.

\section*{Financing the Export Surplus}

The method of financing the second quarter export surplus has already been indicated. Compared to the first quarter of 3945 the major change was in the outflow of long-term capital. The increase in foreign loans was due entirely to larger government loans, most of which mereiy reflected the government transfer of goods previously discussed. This applies particularly to lend-lease and surplus property credits, shown in table 6. Of the total government loans authorized or anticipated, amounting to nearly \(\$ 10\) billion, excluding our investments in the Monetary Fund and the International Bank, about \(\$ 2.5\) billion had been disbursed by June 30. At the rate at which these loans were utilized during the second quarter of 1946, the total volume of government credit authorized or anticipated would be exhausted before the middle of 1948.

\section*{Foreign Reserves Reduced}

Because long-term capital movements and contributions did not suffice to finance the export balance, foreign countries had to sell gold and draw upon their dollar holdings to the extent of nearly

\footnotetext{

quarter
\end{tabular}

1 The data estimates for the first quarter are revisions of estimates published on p. 17 of the SURVEY for July 1946.
\(\$ 500\) million during the quarter. A large part of the liquidation consisted of British and French holdings.

Foreign short-term balances in the United States at the end of June still amounted to about \(\$ 6.4\) billion. In view of the need for gold and dollar balances by foreign countries as legal reserves and working capital, the liquidation of these assets could not continue at an annual rate of nearly \(\$ 2\) billion without forcing these countries into retrenchment of expenditures in the United States.

It appears, however, that reductions of foreign dollar balances may have been unusually high during the first 6 months of the year. The need for imports from the United States was very urgent and certain lines of credit were not yet available. With the passage of the British
loan in July, the conclusion of the Ex-port-Import Bank loan to France in May, and the increased deliveries of goods financed through other Export-Import Bank loans, the pressure on gold and dollar reserves may be eased for at least the near future.

Comparison With 1919
The international transactions of the United States during the first 6 months of 1946 demonstrate the extent to which the United States is aiding in the relief and reconstruction of war-damaged countries, and the extent to which our export trade is made possible without current and, in some cases, ultimate repayment. In chart 5, the 1946 transactions are compared with those after World War I. The excess of goods and services transferred to foreign countries is shown to be almost twice as high as after the first World War. This reflects the more extensive destruction and dislocation brought about by the recent war, the greater capacity of this country to make available to foreign nations the commodities and services they need, and the degree to which we have been willing to render assistance in relief and rehabilitation.

Table 6.-Foreign Long Term Loans by United States Government

1 The data for the first quarter are revisions of the estimates published on p. 21 in the Survey for July 1946.

Chart 5.-Financing the United States Export Surplus of Goods and Services

: Total for 1919 includes \(\$ 164,000,000\) for net exports of gold.
Source of data: U. S. Department of Commerce.

Of the net exports of commodities and services, 35 percent were made available in 1946 through public and private gifts and contributions which do not require repayment, as against 21 percent in 1919. Also in contrast to 1919, a substantial part of the 1946 export surplus was financed through the liquidation of gold and other liquid assets which foreign countries held at the end of the war.

On the other hand, loans which mortgage the future of the borrowing coun-tries-and which, if they are used for the purchase of relief supplies, do not in-
crease the borrowers' productivity as compared to the prewar period-are now used to a relatively smaller extent than in 1919 to finance foreign import needs. Nevertheless, foreign indebtedness to the United States Government is increasing at a rapid rate and may be expected to total as much or more than the debt incurred during and after World War I. In contrast to the last war, however, a large portion of the present loans are used to increase the productiveness of foreign industries.

\title{
Retail Sales and Consumer Income Since VJ-Day
}

\author{
By Louis J. Paradiso
}

IN THE OCTOBER 1944 issue of this Survey the article entitled "Retail Sales and Consumer Income" traced the wartime developments in consumer purchases of goods as reflected by sales at retail stores in relation to the prewar pattern of buying. This analysis reviewed the prewar pattern of sales relative to the volume of consumer purchasing power and the modification of the pattern during the war years.

The shifts which have occurred in retail sales since VJ-day both from the pattern of the war years and from the prewar period have been substantial and significant. The nature of these shifts and their implications should be of interest to every retailer and other businessmen directly or indirectly concerned with the production of goods and their distribution through retail channels. It is the purpose of this analysis to bring up to date the retail sales-income relationships published in the above-mentioned article and to discuss their implications for business prospects.

\section*{Total Retail Sales Rise}

It will be recalled: (1) that during the war years, dollar sales of retail stores increased steadily but at a much less rapid rate than the disposable income of individuals (total income payments received by individuals less personal tax payments). The unavailability of many consumer durable goods, the channeling of a larger-than-normal proportion of income into savings, and price and rationing controls were the major factors in holding down purchases at retail stores after 1941 to levels which were considerably below the amount which would have been purchased with the wartime income on the basis of the prewar relationship of sales to income shown in chart 1.

\footnotetext{
Note.-Mr. Paradiso is Chief of the Business Structure Division, Office of Business Economics.
}

\section*{Summary}

The pattern of retail sales since VJ-day has shifted substantially from both the war and prewar experience-with significant implications for business prospects.

During the war years, consumers saved an abnormal portion of their spendable income. Within less than a year after the war, however, the prewar relationship of spending to income had been reestablished. But an examination of the internal structure of retail sales discloses marked distortions from the prewar pattern. Sales at nondurable goods stores are considerably above expectations based on prewar salesincome relationship. Despite large gains from wartime levels, sales of durable goods stores are still far below "normal."

With a larger flow of durable goods, the direction of future dynamic shifts in sales by lines of trade will be largely determined by one of two alternatives: (1) purchases at nondurable goods stores may decline relative to income and purchases at durable goods stores may rise so that the present "distortions" will be corrected; or (2) consumers will increase their total spending relative to income at the expense of a decline in current savings below the rate indicated by prewar spending habits.
(2) As is indicated in chart 2 , the increase during the war years in the dollar sales at nondurable goods stores-such as food stores, eating and drinking places, general merchandise stores, apparel stores, drug stores, and filling sta-
tions-was very nearly in line with the prewar relationship of sales to income. In other words, the prewar relationship was not distorted in this field during the war years.
(3) Consequently, as the lower panel of chart 2 indicates, most of the gap between sales expectations and actual sales is attributable to the falling off in sales at durable goods stores during the war years.

What has occurred since VJ-day in this pattern of expenditures in relation to incomes? The annual rate of all retail sales in the first half of 1945 was \(\$ 73.5\) billion while the disposable income was at an annual rate of \(\$ 141.6\) billion. During this period sales were still about \(\$ 19\) billion (annual rate) below the amount expected with the disposable income which prevailed, using again the prewar relationship as a yardstick. Following VJ-day, however, sales increased at a very rapid rate so that in the first half of 1946 they were more than 25 percent above the first half of 1945. In contrast, the disposable income in the first half of this year was slightly less than in the corresponding period of 1945. These changes are shown in table 1.
These contrasting movements of retail sales and disposals income resulted in closing the gap between the sales that could have been expected on the basis of the prewar relationship and the actual sales in the early part of 1946. Chart 1 clearly shows this situation with the point for the first half of this year almost on the prewar line of relationship. A similar relationship for all of consumer expenditures for goods and services versus income indicates that net savings of individuals in the first half of 1946 were no longer abnormally high as was the case in the war years but had fallen back in line with the prewar pattern of savings to income.

So the first point to keep in mind is that with the patriotic motive for ab-
normal savings gone after VJ-day, concomitant with increased supplies of gasoline, foods and other consumer goods, and with prices permitted to rise, consumers quickly reestablished their prewar relationship of spending to income.

The immediate reaction is that such a. development is favorable for business since, on the surface, it implies that consumers have adjusted themselves to a normal peacetime spending relation to income. However, an examination of recent spending at retail stores by lines of trade reveals the existence of marked distortions in the pattern of consumer buying which should be recognized for what they may portend when a more balanced supply of goods again introduces an intensified competition for the consumer's dollar.

\section*{Pattern of Sales Shifts}

To come back to chart 2 showing what happened to the two broad types of retail outlets-the nondurable goods stores and the ciurable goods stores-it may be noted that in the prewar period sales of each of these two major groups were very closely in line with disposable income.

Following VJ-day sales of nondurable goods stores, which previously had been on the line of relationship with income, shot up while income fell. In the first half of 1946 sales of these stores amounted to an annual rate of more than \(\$ 75\) billion- \(\$ 12\) billion above the amount suggested by the prewar relationship of sales to income.

As more consumer durable goods were produced, sales of durable goods stores also increased, although it must be remembered that many of these stores took on nondurable goods lines during the war and continued this trend after the end of the war. In view of the gradual increase in consumer durables flowing into distributive channels, the gains in sales of durable goods stores, a year after the end of the war, while impressive relative to their volume during

\section*{Chart 1.-Relationship Between Sales of All Retail Stores and Disposable Income of Individuals}

Soure of data: U. S. Department of Commerce.
the war, were still far from the amount which consumers would have purchased if more goods had been available.

The underbuying at durable goods stores, on the basis of prewar relationships, can be read from chart 2 as about \(\$ 12\) billion (annual rate). Since the deferred demands for many consumer durables are substantial, purchases at these stores would have more than covered the \(\$ 12\) billion gap if sufficient consumer durables had been available. The deficiency insofar as total sales are concerned was compensated for by the sharp rise in sales at nondurable goods stores which, to repeat, was just enough
to bring aggregate sales in line with their prewar relation to income.

\section*{Adjustment for Price Factor}

In view of the recent sharp upward movement in prices and the fact that during the war period and after the end of the war, prices were controlled, the question might be raised as to whether the above conclusions would be significantly changed if both retail sales and disposable income were adjusted for price changes. Chart 3 shows the relationship between total retail sales and disposable income after a rough adjust-
ment of retail sales by the Office of Business Economics' index of prices at retail stores and of disposable income by the Bureau of Labor Statistics consumers' price index. \({ }^{1}\)

It has been pointed out previously the difficulty of price adjustment of dollar totals in a period of shifting demand and considerable upgrading of purchases of both a voluntary and involuntary character. Consequently, while there is this limitation in considering these adjusted measures individually, for the present purpose where the interest is in the relation of one measure to the other, the relative positions of the points shown in chart 3 are not seriously affected since the same "errors" appear in both measures. The chart suggests that essentially the same pattern prevailed in terms of "physical" quantities as in terms of dollar comparisons.

\section*{Shifts by Kinds of Business}

These developments raise a number of questions regarding the prospects for retail trade in the months ahead. Before discussing their import it is necessary to make clear the changes which have occurred since VJ-day by major lines of trade.

Charts 4 and 5 and tables 2 and 3 bring up through the first half of 1946 the relationships and data previously given in this Survey, October 1944. The charts reveal the kinds of business in which sales are in excess of the amount called for on the basis of the prewar salesincome relationship and those in which deficiencies still exist.

Using the prewar relationships as a basis for calculating sales \({ }^{2}\) with disposable income of \(\$ 140\) billion in the first half of 1946, table 2 shows the difference between the actual sales and calculated sales (at annual rates) for 25 kinds of businesses.

\section*{Automotive Dealers}

It is clear from this table that by far the largest deficiency in relation to incomes lies in sales of motor vehicle dealers. Assuming the extension of the prewar relationship, these dealers could have

\footnotetext{
\({ }^{1}\) This latter index is more inclusive in that it includes, in addition to prices of goods, the prices of services. Therefore, it is the more appropriate one to use in adjusting the disposable income for price changes.
\({ }^{2}\) The relationships are presented in the October 1944 issue, p. 14. Note the following changes due to revisions in the basic data:

Drug stores, \(S=345+17.11 \mathrm{I}\),
Liquor stores, \(S=-628+16.96 \mathrm{I}\),
where \(S\) represents sales in millions of dollars and I represents disposable income in billions of dollars.
}
increased their sales by more than \(\$ 10\) billion, if more automotive products had been available during the first half of 1946. In other words, sales of these dealers would have been \(\$ 14\) billion with the disposable income of \(\$ 140\) billion, instead of the actual sales of only \(\$ 4\) billion.

However, two points are in order here. First, sales of \(\$ 14\) billion by motor vehicle dealers imply roughly eight million new cars at current prices. Obviously, sales of this magnitude and their timing depends on the rate of output of the automobile industry.

Second, it must not be assumed that with a continuation of this high level of consumer incomes sales of motor vehicle dealers could be expected to continue at the \(\$ 14\) billion rate, assuming adequate supplies. This figure is calculated from a relationship derived from years of wide cyclical changes. Consequently, when a high level of consumer income is reached in a cyclical movement, sales will be correspondingly high.

If, on the other hand, the high level of consumer income is sustained over many years, the kind of analysis presented here

\section*{Chart 2.-Relationship Between Sales of Durable and Nondurable Goods Retail Stores and Disposable Income of Individuals}

Source of data: U. S. Department of Commerce.

\section*{Chart 3.-Relationship Between} Sales of All Retail Stores and Disposable Income of Individuals, Adjusted for Price Changes \({ }^{1}\)

1 See text for methols used for deflation.
Source of data: U. S. Department of Commerce.
throws no light on expected sales of motor vehicle dealers. Once the new owners associated with the high income level have purchased their automobiles, they wili go on a replacement basis thereafter so that sales under these conditions can be expected to drop from the high cyclical level. On the other hand, other factors, such as the price and production policies followed by the industry, may constantly attract new car owners. This is characieristic of many other consumer durables so that not only motor vehicle dealers but all those dealing with other important consumer durabie goods should keep in mind the nature of the calculations derived from relationships based on cyclical period. To some degree, these same considerations may also apply to some nondurables.
In contrast to the motor vehicle dealers, sales of automobile parts and accessories dealers rose very sharply after VJ-day, reaching a level in the first half of the year 15 percent above the amount that could have been expected in terms of the extension of the past relationship to income. This sharp increase resulted from greater use of cars with the lifting of gasoline rationing and the necessity of keeping the constantly aging stock of prewar cars in rolling condition. The fact that the average age of cars will continue to be high until a substantial proportion of the present car population is replaced by new cars means that auto parts and accessories dealers will experience good business for some time to come.

Chart 4.-Relationship Between Sales of Durable Goods Retail Stores, by Types of Stores, and Disposable Income of Individuals \({ }^{1}\)

Data for 1945 and 1946 are half-yearly totals, seasonally adjusted, at annual rate.
2Sales of farm implement dealers are related to cash farm income, which includes governmental payments beginning with 1933
Includes both durable and nondurable good storeB.
Sources of data: U. S. Department of Commerce, except cash farm income through 1944, which is from the U. S. Department of Agriculture.
stores they were still comparatively low in the first half of 1946, on the basis of peacetime experience. The main problem is that of production, and sales of these stores should continue to increase as the quality of the goods handled by them becomes better and their flow increases.

\section*{Jewelry Siore Sales}

The trend in jewelry store sales is of especial interest since its behavior has been unlike that of any other durable goods group. Sales in these stores were fairly well in line with increasing income throughout the war period because this was one area where supplies of one kind or another were available. Since VJ-day more of the scarce jewelry items have become available, e. g., watches. Consumers have stepped up their pur-
chases to the point where in the first half of 1946 they were almost 20 percent above the amount associated with disposable income on the basis of past experience. Part of this rise undoubtedly reflects deferred demand for many articles of jewelry but part of it is due to the fact that with supplies of many durable goods still short, consumers have tended to divert part of their income to the purchase of luxury items. Because the jewelry business ranks at the head of the sales-income sensitivity list, sales of jewelry stores may be expected to be particularly vulnerable to declines in income.

In summary, of the eight kinds of durable goods businesses, only two-auto accessories and parts dealers and jewelry stores have experienced sales beyond the amounts usually associated with current levels of income. Hardware store sales
are in line with income. The others, dominated by motor vehicle dealers, have not yet experienced a volume of sales commensurate with income on the basis of the prewar relation of sales to income.

\section*{"Excess" Buying in Nondurables.}

All major nondurable goods trades with the exception of filling stations and variety stores have experienced a sales volume since VJ-day far above that which is normally associated with the current level of consumer income. The most outstanding gains relative to income were made by women's apparel and accessories stores, eating and drinking places, and the general merchandise group.

This development is attributable to many factors, chief of which are: (1) With many durable goods unavailable

Chart 5.-Relationship Between Sales of Nondurable Goods Retail Stores, by Types of Stores, and Disposable Income of Individuals \({ }^{1}\)

1 See footnote 1 at bottom of chart, on next page.

\section*{Chart 5.-Relationship Between Sales of Nondurable Goods Retail Stores, by Types of Stores, and Disposable} Income of Individuals-Continued \({ }^{1}\)

1 Data for 1945 and 1946 are hall-yearly totals, seasonally adjusted, at amual rate.
2 Data for 1929 are not available (prohibition year):
Source of data: U. S. Department of Commerce.
after the end of the war and with the incentive to save a disproportionate amount of their income gone, consumers shifted their purchases to nondurables; (2) returning veterans both men and women had to outfit themselves anew and many of them established new households thus creating a demand for many types of goods which, while temporary, is still continuing; (3) further tradingup and price increases were much more pronounced in the nondurable goods fields, particularly in view of the slow appearance of low-price commodities; and (4) individuals held much larger cash balances than in the prewar years, which influenced some individuals to spend more on nondurables than they would otherwise.

The charts clearly indicate the major developments in the nondurable goods lines. Briefly these are:
(1) Women's apparel stores had an extraordinary volume of business through the war years and the rate of increase has been stepped even further since VJday.
(2) Sales of shoe stores in the first half of 1946 have been at a rate 25 percent above the income-sales relationship of prewar years despite the fact that there were shortages of many types and styles of shoes.
(3) Food store sales recorded a sharp rise in the six months following VJ-day despite some decline in disposable income; the increase during the first 6 months of this year was more moderate
but nevertheless at a faster rate than is normally the case in relation to the increase in the income which occurred.
(4) Eating and drinking places provide an outstanding example of a very sharp upward trend in sales throughout the war period followed by an acceleration in the increase after the end of the war. On the basis of the prewar relation these places could have been expected to do an \(\$ 8\) billion business in the first half of 1946 whereas actually their annual rate of sales was \(\$ 12\) billion.
(5) Department store sales (including mail-order houses) recorded a very sharp rise in sales in the 6 months following VJ-day but the increase has been in line with the rising income in the first 6 months of this year. Sales for this group,
however, are almost 20 percent above the amount associated with current levels of income and this at a time when these stores were handling a relatively low volume of durable goods.

\section*{Implications of Recent Trends}

The current pattern of buying naturally raises the question of what it means for the future. A continued high volume of consumer expenditures is essential in order to have a high volume of production and employment. The demand for practically all types of consumer durables will continue strong for some time to come.
The basic problem then is whether consumers will continue their extraordinary purchases of nondurables and luxury items, once heavy deliveries of durable goods begin. This does not mean to suggest, however, that all durable goods will be insensitive to any price unsettlement which may develop elsewhere. Furniture stores, for example, comprise a durable goods group where the deficiency in sales relative to income is fairly small and where the problems are not unlike those of some of the nondurable goods stores. Trading-up and
higher prices contributed to the rise in sales at furniture stores where frequently the quality of the product did not come up to prewar standards. As the flow of durables increases, consumers will become more price and quality conscious in those durable goods areas where they are now buying nearly in line with the prewar relationship to income.
There are two possibilities in the current situation: (1) That the spending habits of consumers have changed from prewar so that they will continue to buy in excess of the amount associated with the prewar sales-income relationship at nondurable goods stores \({ }^{3}\) while at the same time increasing their expenditures at durable goods stores (this would imply a decline in the usual relation of consumer savings to income); or (2) that as more durable goods become available, consumers will curtail their purchases at nondurable goods stores to the point where total retail sales are in line with the prewar relationship to income.

\footnotetext{
\({ }^{3}\) Although the statistics are very crude, they suggest that a shift in the propensity to consume may have occurred after the first World War, see "Retail Sales and Consumer Income," loc. cit. p. 13.
}

If consumer income increases sufficiently, sales at nondurable goods stores can, of course, be maintained or increased even under the second alternative. It must be pointed out, however, that if sales of nondurables get back in line with the prewar relationship, their maintenance at the current high levels implies an increase in disposable income from the current level of \(\$ 140\) billion to \(\$ 170\) billion, or about one-fifth.
At the moment there is no evidence as to which of the two alternatives will eventuate. Indeed, definite trends cannot be established until there is a much larger flow of durable goods. However, if the second alternative should develop, that is, if consumers shift part of their purchases at nondurable goods stores when durables become available in larger quantities, then many retailers, particularly those in nondurable goods lines, will have to face the prospect of reductions in the current rates of sales and profits. This would be reflected in orders of manufacturers and a readjustment of inventory holdings which would in turn influence prices. Such actions would, of
(Continued on \(p\).31)

\title{
Regional Patterns of Department Store Sales
}

\author{
By Clement Winston and Marie L. Puglisi
}

DURING THE WAR and since VJ-day the geographical distribution of retail trade has changed significantly from the prewar pattern. An over-all analysis for the Nation of changes in retail sales by lines of trade since VJ-day is covered by Mr. Paradiso in another article in this issue. This analysis is concerned with the regional shifts and tendencies of retail trade since 1929. It also examines the different sales trends shown for individual cities within a few of the regions.

Because of the lack of regional information for other kinds of retail businesses it was necessary to restrict the study to department store sales. \({ }^{2}\) But sales of these stores constitute an important segment of retail trade, and comprise widely diversified lines of goods. An analysis of such data thus serves as a reflection of the regional pattern of retail trade as a whole.

This study specifically will be concerned with the relation between the cyclical pattern of sales in the prewar years 1929 to 1940 in the various regions and in the country as a whole and with the relation between the pattern of sales in selected cities in a given region and in the region itself. By this means it will be possible to determine the extent to which sales in some regions are running ahead or behind the United States total and, similarly, the relative gains or losses made by selected cities within the regions.
In addition, the prewar patterns will be examined in relation to the wartime developments in order to throw light on the nature of the postwar adjustments. This type of analysis should be useful

not only to those interested in department stores but also to retailers and businessmen in general as an aid in appraising the effects of changes in the purchasing power in various localities and its consequent reflection in the pattern of retail sales.

\section*{Department Store and Total Sales}

Since the behavior of department store sales is to be utilized as a means of evaluating the entire sales picture, the relationship between department store sales and total retail sales for the country as a whole should first be established. The close correspondence between the movement of these classes of sales is shown in chart 1.

Two points can be made from this chart. First, in the prewar years the relative changes in department store
sales and in all retail sales have been consistently in the same direction from one year to the next, with the important qualification that the changes in department store sales over the period covered were less pronounced than the total. During the depression, department store sales fell much less than sales of all stores while in the subsequent recovery period, they did not recover so much perceniagewise. The relative change of department store sales in the 1929-40 period can be stated quantitatively by deriving the average statistical relationship between sales of department stores and total retail sales. \({ }^{2}\)

The relationship implies that on the basis of the experience of 1929-40 a change of 10 percent in total retail sales was associated on the average with a change in the same direction of about 7 percent in department store sales. This result stems primarily from the fact that some important goods not handled by department stores, of which automobiles is an outstanding example, are the most sensitive to depression and recovery influences.

Second, the prewar relationship has been markedly changed since 1941, department store sales have increased at a faster rate relative to all retail sales. The relationship which prevailed in the period from January 1942 to July 1946 is as follows: A 10-percent change in all retail sales was associated, on the average, with an 11-percent change in department store sales.

\footnotetext{
\({ }^{2}\) The statistical relation used in a linear least squares regression of the logarithms of department store sales on total retail sales. The relationship is as follows:
\[
Y=4.285 X .
\]
where \(Y=\) department store sales (index,
\(1935-39=100\) ) and \(X=\) retail sales (index, \(1935-39=100\) ).
For details regarding the use of this method to retail trade data see the article in the October 1944 Survex, "Retail Sales and Consumer Income."
}

This break in the relationship after 1941 was largely a consequence of the wartime regulations which eliminated or sharply curtailed the production of many consumer durable goods such as automobiles, refrigerators, and washing machines. The decrease in the availability of these durables as well as of building materials and hardware tended to increase the relative share of department store sales in the total. Moreover, since consumers were not able to buy these hard goods they increased their purchases of nondurables which are handled generally by department stores.

\section*{Regional Department Store Sales}

This analysis makes no attempt to determine the factors affecting department store sales by regions. It simply relates the fluctuations of department store sales in each district to changes in total United States department store sales in a way that brings out the basic character of the relationship of the region to the national total. Similarly, department store sales in a city are related to the district's sales.

The regions covered by the twelve Federal Reserve districts are shown in the accompanying map. The relative importance of the various regions in relation to total department store sales is given in table 1, which also gives the percentage changes for the cyclical swings from 1929 to 1939.

It is evident from the table that in general the districts which showed the largest relative drop in sales from 1929

Chart 1.-Sales of All Retail Stores and of Department Stores

Scurces of data: Board of Governors of the Federal Reserve System and U. S. Department of Commerce.
to 1932, also recorded the largest relative increases in the recovery period. According to this measure, the districts reflecting the greatest volatility were: Atlanta, Dallas, Chicago, Cleveland, San Francisco, Richmond, and St. Louis, while those tending to be relatively more stable in the cyclical survey were: New

Federal Reserve System: Boundaries of Federal Reserve Districts and Their Branch Territories

Source of map: Board of Governors of the Federal Reserve System.

York, Boston, Philadelphia, Minneapolis, and Kansas City.

Such a method of comparison, however, is subject to at least two shortcomings. First, the comparisons are based on two periods only. A method which takes into account the changes for all the other years would be more desirable. Second, it does not disclose the fact that some districts have shown tendencies for growth over the period while others have been declining.

In order to measure the sensitivity of department store sales to depression and recovery influences and to determine the rate of growth (or decline) aside from the changes in business conditions, a correlation analysis technique has been used. Department store sales for each district have been related to total United States department store sales for the period of years 1929-40. From each relationship it is possible to evaluate the average percent change in district sales which is associated with a given percentage change in United States department store sales. Also aside from changes in United States department store sales, the relationship serves to indicate the annual rate of growth or decline in the district sales.

These relationships are shown in the form of scatter diagrams in chart 2. Note that in contrast to the usual form of these scatter diagrams wherein an arithmetic scale is employed, each of these shown in the chart are drawn on a per-

\hline
\end{tabular}
centage scale so that the relative changes can be more readily compared.

\section*{Sensitivity to National Total}

Table 2 shows the sensitivity of the district sales to total United States department store sales based on the results of these correlations covering the experience of the prewar period. In the New York district, for example, the number 7.6 indicates that, according to past experience, a 10 percent change in department store sales for the Nation was associated on the average, with a 7.6 percent change for the district and in the same direction. In other words, for the New York district, department store sales tend to be less sensitive than the national sales.

The New York, Boston, and Minneapolis districts showed the lowest sensitivity, a 10 percent change in sales for the entire United States being associated on the average with changes of less than 8 percent for these districts. In only two of the remaining districts, Philadelphia and Richmond, were average rates of change significantly less than for the country.

The remaining six districts were characterized by a greater volatility in relation to total sales. Corresponding to a 10 percent change in the sales of the nation's department stores the average rates of change in these districts ranged from 12.4 percent for Dallas to 10.9 percent for St. Louis. The Kansas City district alone, on the average, tended to match through the prewar period the changes in sales in all United States department stores.

\section*{Growth and Decline, 1929-40}

The story told by these sensitivity indexes, however, is not complete. The direct relationships of sales in each district to the national total as measured
by the sensitivity figures do not fully explain the differences in behavior for all of the districts. Other significant factors operated to cause a growth or decline in department store sales in the prewar period in certain of the districts. This can be observed by referring again to chart 2.

If, in the chart, we examine the panel for the Atlanta district, for example, we note that although United States department store sales were about the same in 1930, 1937 and 1939, sales in the Atlanta district had risen progressively in the period from an index of 91 in 1930, to 105 in 1937, and to 113 in 1939. The net upward trend after allowing for the effect of total sales is shown in the lower panel. The points are determined by plotting the ratios of actual district sales for each year to the corresponding reading for the district on the regression line shown in the upper panel. The trend indicates that on the average department store sales in the Atlanta district tended to rise about 3 percent per yearall other factors remaining the same.

The net trend of sales in each district after allowing for changes in the national total is shown in table 3. It is observed that in three of the five districts in which sensitivity was low, the New York, Boston, and Philadelphia districts, downward trends were exhibited. On the average, over the period 1929 to 1940 , sales of department stores in the New York and Boston districts tended to decline, considering all other factors constant, at the rate of about 2 percent per year. In the Philadelphia district the net downward trend was about 1 percent per year.
In five of the regions representing the Southeastern, Southern, and Western states and the Chicago area an upward trend was in evidence. The sharpest upward growth, about 3 percent per year,

\hline
\end{tabular}
was shown for the Atlanta district as was already indicated above. In the Dallas and Richmond districts the rate of growth was about 2 percent per year while in San Francisco and Chicago it was a little less than 1 percent per year. The Richmond district was the only one of the less sensitive regions in which an upward tendency was indicated. In the remaining four districts no definite trends toward growth or decline were observed.

After introduction of the trend factors it is interesting to note the extremely close correlation that appears to exist between department-store sales in the districts and the national total over the prewar period. In comparing the average percent of error in the sales computed by the formulas to the actual values in each district, it is found that the maximum average error for any of the districts is less than 3 percent, and that it exceeds 2 percent in only 3 of the 12 districts.

\section*{Changes in War Period}

In general, the prewar tendencies by districts persisted into the war period with several noteworthy exceptions. Sales for the Minneapolis and St. Louis districts, since the war, increased in line with the total for the country on the basis of the prewar relation. Four of the five districts which showed an upward shift in the prewar period, namely, Dallas, Atlanta, San Francisco, and Richmond, continued the prewar trends in the war period. The Chicago district was an exception faring unfavorably in relation to total department store sales after 1941. For example, total department store sales increased by 56 percent from 1941 to 1945 whereas sales for the Chicago district rose by only 43 percent. The three regions which showed pronounced downward shifts in sales, namely, New York, Boston, and Philadelphia, continued the downward drift but at a greatly reduced rate. In fact, for the New York and Boston districts the gains in department store sales in
the late years were large enough to wipe out practically all of the prewar downward trend.

The Cleveland district showed a definite loss in sales since 1942 relative to the gains made by all department stores when compared to the prewar relation. If the prewar relation had continued,
sales in the Cleveland district in 1945 would have been 14 percent above the actual figures shown. On the other hand, sales in the Kansas City district showed a pronounced gain relative to the national total from 1942 to 1945 in comparison to the prewar pattern. Department store sales in this district were

12 percent above what could have been expected had the prewar relationship prevailed.

\section*{Patterns of Sales by Cities}

The districts as defined in this study are fairly broad and the sales patterns

Chart 2.-Relationship Between Department Store Sales for Each Federal Reserve District and for the United States

of cities within the districts may vary significantly. Consequently, an analysis of regional differences, while valuable, needs to be supplemented by a study of the pattern of sales for the principal cities within the districts.

It is beyond the scope of this article to attempt to present, in detail, analyses of every city within the 12 districts. Rather it is to suggest an approach to the problem and to illustrate the diverse patterns involved by the use of a few examples. \({ }^{3}\)

Two districts with the principal cities in each have been selected for illustrative purposes, namely, the New York and Chicago districts. The presentation given is necessarily sketchy in its analysis of the causes of shifts in the regional sales patterns. It does indicate, however, a type of analysis that is valuable for a more thorough understanding of regional sales behavior.

\section*{New York District}

As already pointed out, department store sales in this district were marked by low sensitivity relative to the country as a whole and by a downward trend. Indexes of department store sales for the period after 1929 are available for six cities in the New York district: New York, Newark, Bridgeport, Buffalo, Rochester, and Syracuse. The relationships between sales in these cities and in the district are presented in chart 3.

New York City is, of course, the dominant city in this region. In the period 1929 to 1940 there is practically a one-to-one relationship between department store sales in the city and in the district. However, in the early war years, department store sales in New York City showed a much smaller proportional rise than sales of the district as a whole. Apparently within the New York district many of the less industrialized cities further inland made more rapid advances than New York City. This was influenced perhaps by the Government policy during the war to put much of the new war industrial facilities further inland and to scatter them for security reasons. After a time, however, as greater and greater production was required, the diversified facilities of the older industrial regions were needed and these began to be used to the utmost and further expanded. This is reflected in New York City, after 1942, in a more rapid rate of employment and purchasing power which resulted in a reversal of the trend in department store sales relative to the district. Thus, by 1944 sales in the city

\footnotetext{
sthe data utilized and the formulas derived for other cities for which data exists are available upon request.
}
had about returned to the prewar line of relationship. In the first half of 1946 department store sales were continuing above the previously established line.

Newark showed a certain similarity to New York City in the prewar period, although not with the same degree of regularity. Here, also, no well defined time trend was evident and on the average the rate of change of department store sales in Newark tended to match that shown for the district. After 1942 a trend downward from the line of relationship developed but appeared to slow up considerably between 1944 and 1945. Data so far available for 1946 seem to indicate that the movement between 1944 and 1945 has also extended into 1946.
In the remaining four cities for which complete data are available there are two facts which stand out in the prewar years. First, department store sales in each of the cities showed a high sensitivity relative to changes in sales for the whole district and, second, in each case there was a definite upward trend. A change of 10 percent for the district was associated with a change of 14 percent in sales of department stores in Buffalo and Syracuse; on the average department store sales in Bridgeport and Rochester showed a sensitivity of about 12 percent. In Bridgeport and Syracuse department store sales tended to increase relative to the total for the district at the rate of 2.1 percent per year; for Rochester and Buffalo this increase was at the rate of 1.9 and 1.6 percent per year, respectively.

After 1940 the behavior of department store trade in the four cities discussed above showed considerable variations which were influenced to a large extent by war exigencies. In Bridgeport the sharp upward trend continued until 1942 as the plants in that area were swamped with war orders. After that date, the shift of some of the ammunition, guns, and aircraft engine programs into newly developed plants outside the area and later cutbacks in some of these programs were reflected in the reversal of trend shown by department store sales. By 1944 such sales in Bridgeport were actually below the line of relationship and this downward trend does not yet appear to have been arrested in the early part of 1946 .

In Buffalo the upward trend continued for a year longer-until 1943-before the downward trend began. In this case the downward trend was largely the result of cut-backs in the plane production program and their effect on total output. By 1945, however, the level of department stores sales in Buffalo was only slightly above the line of relationship. In the first part of this year increases in department store sales in Buffalo com-
pared to the previous year were lower than the average shown for the region, reflecting the effects of reconversion and labor difficulties that affected this area somewhat more than other parts of the same district.
In Rochester and Syracuse the reversal of trend after 1943 was not so sharp as for Bridgeport and Buffalo. Nevertheless, department store sales in these two cities have been moving at a rate lower than that shown for this district as a whole, preliminary figures indicating that 1946 will find sales for both cities further below the net trend line established in the prewar period.

\section*{Chicago District}

As we had seen before, department store sales in the Chicago district over the interval 1929-40 were characterized by a fairly high volatility of movement compared to changes in the United States total sales of such outlets and also by a rising trend. After 1940, however, this trend was reversed and continued down-
ward to 1945. There is no indication of a change in this downward drift in the first half of 1946.

Complete data for all years beginning with 1929 are available for a number of important cities in this district. The relationships for six cities are shown in chart 4. The cities divide generally into two groups: Those in which an upward trend in department store sales is indicated over the war period and those for which the opposite is true. In the group showing a downward trend are found Chicago, Detroit, and Milwaukee, while an upward trend is indicated for Indianapolis, Peoria, and Fort Wayne.
The largest city involved is, of course, Chicago. Department store sales in Chicago in 1939 amounted to 44 percent of the total for the five States comprising the district and to over 80 percent of such sales in Illinois.
It is observed that over the interval preceding 1941 the rate of change in department store sales for Chicago was about equal, on the average, to that of

Chart 4.-Relationship Between Department Store Sales for the Chicago Federal Reserve District and for Selected Cities Within the District

Sources: Basic data, Board of Governors of the Federal Reserve System; computations, U. S. Department of Commerce.
the district. However, a sharp downward trend was shown throughout the period, sales of such retail outlets in the city tending to decline relative to the district at about 1.6 percent per year.

Such a downward trend in department store trade was characteristic of practically all of the large metropolitan areas studied. It was only slight for New York City but fairly strong for most of the others. To a certain degree, the tendency of these large cities to spread out, the inability of department stores to keep pace with them, and the more rapid growth of smaller communities within the district kept department store sales in the large cities from maintaining a rate of growth commensurate with the entire district.
For Chicago the downward movement relative to the total for the district continued until 1942. Thereafter it slowed down considerably as the first phases of war expansion were completed and more of the new contracts and expansion programs began to be moved into the larger cities.

The wide diversity of manufacturing facilities available in this city and the generally simpler problems of reconversion than in some less diversified regions are evident in the first half of 1946 as preliminary figures show a rise in department store sales above that shown for the district. This would indicate a contratrend movement in 1946.

Detroit shows a somewhat different behavior. Because of its dependence upon the production of heavy durable goods it could be expected that considerable volatility would be visible in all measures of its economic activity. Department store sales in Detroit in the base period 1929 to 1940 show much greater fluctuation than sales in the district. Over this period a change of 10 percent in department store sales for the district was associated, on the average, with a 13 percent change for Detroit.

The downward trend indicated up to 1938 showed evidence of reversal at that time as the prewar upswing of civilian and war durables began having a strong effect on this durable goods production center.
In addition to the heavy production of civilian durables, the munitions expansion program began getting under way even before Pearl Harbor as the foundations of the tremendous tank and plane arsenal were laid, and production of planes and tanks started. After Pearl Harbor production of civilian durables virtually ceased and all such facilities
began to be converted to military production.
The sharp upward movement in department store sales in Detroit relative to the district that began in 1938 and continued to 1942 was a reflection of this industrial activity. The more rapid expansion of production facilities in the

rest of this area after 1942 was reflected in a less-than-average increase in Detroit as compared with the district. In the early part of 1946 reconversion and Iabor problems affected Detroit strongly, so that department store sales lost further ground relative to the district.

The picture shown for Milwaukee was similiar in some respects to that for Chicago, except that the downward trend in the prewar period was less strong. Thereafter, the effects of war facilities expansion and production were continuously in evidence as a sharp upward trend of sales in the city relative to the district ensued. In the first half of 1946 Milwaukee department store sales continued their gains relative to the district so that as yet there are no signs of a slackening of the upward movement previously indicated.

For Indianapolis and Fort Wayne a certain degree of similarity was evident. In both, the upward trend shown in the prewar period continued through the war years to 1945. Although in Peoria a similar upward trend was shown in the prewar years, a somewhat erratic movement occurred thereafter. A downward trend developed which was reversed in 1942 and continued upward to 1945.

In all of these cities the war facilities expansions were of a very diversified character. Because of this, conversion to civilian production should not be a very severe problem and as a consequence they are likely to maintain, to some extent, their position in the industrial picture given to them by their war gains.

\section*{Use of This Analytical Tool}

These examples point to the type of regional analysis which should be useful to retailers and other distributors of merchandise. While there are many factors which account for the regional differences in sales, it is clear from the available data that the dominating factor is the purchasing power of individuals.

Whether a retailer is engaged in a purely local or a statewide or a national enterprise, the use of income data for analytical purposes is the same. Since it is generally easier to secure national and State income estimates than it is to secure local data, the businessman or analyst can use the methods herein described to secure a more accurate appraisal of the probabilities with regard to the particular market in which he is interested. The retailer can, for example, make this general over-all analysis, and particularize it on the basis of his experience and peculiar knowledge of local and regional situations.

\title{
Postwar Role of Business Inventories
}

\author{
By D. Stevens Wilson
}

THREE OF THE more important immediate problems which many business firms faced with the ending of the war were: (1) Settlement for and disposal of "war" goods upon contract terminations; (2) filling the pipe lines for the production of civilian finished goods, and (3) accumulating at least a minimum stock of new goods which were unavailable during the war.
The inventory trends since the end of the war in manufacturing, retailing and wholesaling have reflected essentially the filling of the production pipelines and the stocking up of newly produced goods. Manufacturers in particular had to fill large deficits in many types of civilian inventories and the demand for goods stemming from this source was a significant factor in the level of and character of industrial output during the past year.
The inventory accumulation has been large throughout the transition, and the recent acceleration of this movement has been the subject of conjecture and concern as to its significance with regard to future economic tendencies. Specifically, several basic questions have been asked in this connection. What is the position of the current inventory volume relative to production or sales? Is the recent rapid rate of inventory accumulation a danger signal? What are the implications of changes in inventory policy which must come after the pipelines have been filled and this source of demand stops?

\section*{Business Inventories at Record High}

To appraise the current position of inventories relative to sales it is necessary to compare the inventory accumulation of the past year with earlier experience and to evaluate over-all inventory totals. Table. 1 shows that the book value of inventories held by manufacturers, wholesalers and retailers was \(\$ 31\) billion at the end of August of this year, compared with \(\$ 27\) billion a year ago. The net accumulation of \(\$ 4\) billion in 12 months, repre-

\footnotetext{
Note.-Mr. Wilson is a member of the Business Structure Division, Office of Business Economics.
}

713188-46-4

\begin{abstract}
Summary
The gross increase in business inventories in the year following the end of the war was nearly 7 billion dollars, the highest 12month increase on record. The rise during July and August was at an even more rapid rate, carrying total business inventories to new peak levels. Large inventories, however, are made necessary by a high rate of sales. The sales-inventories relationship does not yet reveal any marked excesses.

The internal composition of inventories is unbalanced; distributors' stocks are low and manufacturers' supplies are deficient in many important respects, though the over-all amount is high. Until balance is achieved and output flows smoothly into consumption, the inventory total can be expected to increase.

The current situation poses two important questions. Will sales increases keep pace with the expected inventory rise from now on? When the present inventory buying subsidies and all current output moves to market, will other demands expand sufficiently to offset the drop in inventory buying? Any appraisal of the course of business activity and employment over the next year or two hinges to an important extent on the answers to these questions.
\end{abstract}
senting an increase of 15 percent, was divided about equally between the manufacturing and distributive trades.

\section*{Gross Change in Business Inventories}

However, the net accumulation of \(\$ 4\) billion, i. e., the change in book value of inventories shown by the firms' records, does not represent all of the accumulation of civilian goods which took place since the end of the war. As a result of contract terminations and liquidations a
large volume of war goods was transferred from business inventories. Business firms not only replaced the total amount of "war" goods liquidated, but also accumulated additional amounts so that a net accumulation actually took place over the liquidation period (see table 2). The value of civilian goods offsetting the "war" goods liquidated, plus the net accumulation is the gross accumulation. The latter is the real measure of the extent to which current production flowed into inventories in the postwar period.

The great bulk of the liquidation of war inventories in business hands took place in the year period, July 1945 to June 1946. During this period the liquidation amounted to \(\$ 4.5\) billion. Therefore, to secure a reported net increase in book inventories in the 12 months following July 1945, the gross rise of inventories cf goods in all stages of fabrication for use in the civilian markes was about \(\$ 7\) billion. This is the largest accumulation on record for any 12 -month period.
The major portion of this took place in the second half of 1945 and in the so-called "war" manufacturing industries. Though the liquidation movement reached a peak late in 1945 (see chart 1) and had virtually stopped by June 1946, it was a continuing significant factor during the first half of this year. The net increase of \(\$ 2.6\) billion plus the \(\$ 1.5\) billion required to offset the liquidation meant that the gross increase in business inventories for the first half year was over \(\$ 4\) billion, or an annual rate of \(\$ 8\) billion.

By midyear of 1946 the liquidation of war inventories had about run its course so that in the current quarter it is a negligible factor. The reported, or net accumulation, is again a measure of the actual change. The rise in July was \(\$ 1.3\) billion and in August \(\$ 1.1\) billion, an average of \(\$ 1.2\) billion per month, or an unprecedentedly large annual rate of over \(\$ 14\) billion. There has been a marked acceleration of trend, even discounting the effects of the price rise of the summer months and the resulting, irregularity of the movement of some goods through distributive channels.

Most of the offsetting through liquidation of war inventories by the accumulation of stocks for civilian use was in manufacturing where the bulk of the war contracts was held. The bilizondollar rise in manufacturers' stocks from July 1945 to June 1946, therefore, considerably understates the gross change, or actual inventory accumulation; which would be over \(\$ 5\) billion. The book value of manufacturers' inventories at the end of August was \(\$ 18.4\) billion, \(\$ 500\) million above the wartime peak reached in late 1943 when nearly half of the production total was of war goods.
Viewed in the perspective of the historical relation of inventories to sales, the position of manufacturers' inventories was approximately in line with aggregate sales at the end of June, while the distributors' inventories were still low. In addition, inventories of both manufacturers and distributors were unbalanced as to composition as will be evident from the discussion which follows. While manufacturers' shipments have risen since June, the more rapid advance in inventories has, in the third quarter, raised manufacturers' stocks somewhat above the indicated level derived from the past sales-inventory relationships.

\section*{Wartime Shipments-Inventory Relation}

To appraise the significance of this record level of manufacturers' inventories in relation to shipments, it is of

Table 1.—Business Inventories \({ }^{1}\)
[Billions of dollars]
\begin{tabular}{l|r|r|r}

\end{tabular} & Retail
\end{tabular} Total
\({ }^{1}\) These are estimates derived from many sources. The manulacturing data are based on reports to the Department's monthly Industry Survey by a representative group currently comprising over 2,500 firms. For a detailed description of the method used see this Survey, September 1940 . The data on wholesale inventories are based on a sample of wholesale firms reporting monthly inventory changes to the Bureau of the Census; tests for representation and for reliability of estimates were made by comparison with the Census of Wholesale Trade for 1935 and 1939; all wholesale establishments were combined into iour homogeneous groups, the sample for each of which provided fairly reliable results on the Casis of the Census movement from 1935 to 1939 ; the Census value of inventories for 1939 has been carried for each of the gronps. Estimates of retail inventories for each of the groups. Estimates of retail inventories and wholesalers because of the more limited availability of current data; for details of sources and methods see his Survey, March 1944, pp. 18-20.

Chart 1.-Manufacturers' Inventories Liquidated Through War Contract Termination \({ }^{1}\)

1 See footnote, table 2.
Sources: U.S. Department of Commerce, based upon data of the U.S. War and Navy Departments.
interest to examine the pattern of this relation since 1939. During the 1939-46 period there have been several distinct inventory movements, a fact which prevents any uniform treatment of the relationships which existed between inventories and manufacturers' shipments. Obviously, changes in inventories are associated with changes in shipments, though not always by any fixed amount or ratio. Obviously, also, inventory changes anticipate sales fluctuations to the extent that it is possible to project them with reasonable accuracy, though not always by the same time lag.
A variety of factors such as price and material controls operated throughout the war to influence management decisions and the ability to carry them out, so that no pattern is discernible which was consistent with the prewar ship-ments-inventory relationships. However, the shifting importance of the more pertinent factors is clearly evident from the actual movement of inventory holdings.

Manufacturers' shipments, reflecting first the improvement in general business from the 1938 recession and then the impetus of the war and war production, expanded quite regularly from 1939 to the early months of 1945. (See table 3.) Total inventories, however, reached a peak in late 1943, fully 18 months before the peak month of shipments. The time lag between the high point in inventories and in shipments of finished goods was extreme and not indicative of a normal or peacetime production period.

An early over-all ceiling was reached
on inventories because of actual supply shortages. Critical materials were placed on an allocation basis early in 1942. As a matter of fact, there was comparatively little increase in total manufacturing stocks after late 1942 by which time the bulk of war supply contracts had been let and contractors were beating the bushes for materials in preparation for large war production. That inventories were excessively high in relation to shipments in that initial war production period is evident from the rapid drop which occurred throughout 1944 and up to June 1945 while shipments were maintained at peak levels. With improved controls and production in high gear, inventories were reduced by mid-1945 to the level of January 1942. Shipments were then 50 percent larger than in early 1942.

The significance of this adjustment should not be lost sight of when viewing the present accumulation which stems from the same basic conditions, and must of necessity be likewise temporary in character. When the many bottlenecks to present output are overcome and a smooth flow of goods through productive and distributive channels again obtains, a somewhat parallel reduction in inventories can be expected.

\section*{Inventories by Degree of Fabrication}

The internal composition of inventories also shifted rapidly during the 1939-46 period. (See chart 2.) The classification by stages of fabrication is not precise as an absolute measure of degree of fabrication. Rather, it represents an aggregation of individual company designations. Many companies

\({ }^{1}\) Excludes inventories retained or repurchased by contractors. Includes an undetermined amount of inventory held for use in fixed-fee management type contracts, Some of which did not appear in contractors book-value figures. The estimated total was derived from reports tory turned over to them through termination clains tory turned over to them through termination clalms figures taken from business accounting records.
consider any purchased supplies as raw materials irrespective of the amount of processing which may have been donethe finished goods of one company are often the raw material of another. There is more uniformity within the goods-in-process category, but no way of determining how closely they approach the finished stage or whether the ultimate market is the consumer or another manufacturer.

Raw material holdings began to increase in mid-1940 with the initiation of the defense program and reached a peak at the end of 1942. After a period of relative stability, they declined until June 1945, from which point they have again risen quite steadily. The sharp rise of the past two months carried the dollar value of raw material stocks to a point well above the war peak. (See table 3.)

Inventories of goods-in-process also increased as the war production program advanced. The high point for the rise, however, was not reached until late in 1943, some time after the peak in raw materials. The drop which characterized the end of the war production period began in late 1944 and continued until the end of 1945, reflecting the liquidation of war inventories. The value of work-in-process has risen steadily throughout 1946 as civilian output has expanded, but the total is still considerably short of the 1943 levels.

Chart 2.-Manufacturers' Inventories, by Stages of Fabrication

Source of data: U. S. Department of Commerce.

There has been some feeling that the recent inventory accumulations are to a certain extent involuntary, representing work-in-process which manufacturers were unable to complete as shipping stocks, because a part or component was

1 Inventories for 1939-44 are 13-month averages; inventories for 1945 and 1946 are as of the end of each quarter or month.
missing. This reasoning continues with the thought that when supply difficulties are adjusted, output and shipments of finished goods would increase sharply, and while this may bring a temporary rush of goods to market, it would also cut down stocks. To some extent this is true, but only to a limited degree. The rise in goods-in-process since the year-end low has been only about a billion dollars, or less than half the rise in total inventories, and has not been more than could be expected in face of the \(\$ 2\) billion increase in shipments.
Finished goods stocks, in marked contrast to the movement of other types of inventories, have remained quite constant throughout the entire period. There was a slight increase early in 1942 reflecting the finishing off of the civilian goods before production was prohibited or curtailed, and a rising tendency has been evident since June 1945. However, the aggregate is now less than 20 percent higher than the dollar value in 1939, or less than the average price rise over this period. Manufacturers appear to be handling a dollar volume of shipments 130 percent above 1939 with shipping stocks which undoubtedly represent a lower physical quantity of finished goods.

\section*{Are Inventories Too High?}

The gross rate at which business inventories were being accumulated in the year following VE-day, July 1945 to June

1946, was extreme in any terms, in the light of past experience. However, it cannot be considered excessive; it was prompted by compulsion for speedy reconversion. In order to achieve an approximate balance between civilian stocks and output it was necessary to replace the liquidated war inventories as fast as possible and to further augment them to support the higher potential production.

This rise, however, has been accented by an even more rapid increase in the months of July and August, when manufacturers alone added \(\$ 1.2\) billion to the value of inventories at the end of Fune. With total inventory holdings at an alltime peak, the natural reaction is to question the level-are inventories too high, or has the postwar accumulation merely succeeded in filling pipelines necessary to high level peacetime business?

As previously pointed out, only the manufacturers' holdings are above earlier peaks but it is only recently that they have moved above the historical line of relationship. Stocks of retailers are still below the level of 1942 , and while there was an obvious inventory bulge at that time, the present levels reflect a sizable price increase and probably represent a lower physical volume. Meanwhile, dollar sales at retail in 1946 are running 60 percent above those of 1942. Much of the same situation applies in the wholesale fields. That is, in the distributive areas, despite recent additions to inventories, the current level of sales would indicate that some further accumulations, over-all, will be needed to bring stocks into line with normal relationships.

Within the manufacturing field, there is less uniformity. As pointed out above, stocks of finished goods have not risen sufficiently to reflect the higher prices. Undoubtedly some further rise is to be expected, although movements in shipping stock figures are never of very great magnitude.

The level of goods-in-process inventory, when related to shipments, shows an approximate balance even after the recent sharp rise. (See chart 3.) The relationship pictured on the chart, indicates that throughout the entire 193946 period, work-in-process was geared rather c'osely to shipments. The normal rate of increase of stocks is much slower than that of shipments as the slope of the regression line shows-a rise of \(\$ 2\) billion in shipments is associated with an increase of less than one billion in inventories. The July-August figures are not out of line in light of past experience.

Inventories of raw materials, on the other hand, having achieved a new peak
with shipments still below the high, stand well above the line of relationship shown on chart 3. Manufacturers appear to be anticipating a level of shipments equal to or in excess of the wartime peak; in terms of present shipments volume, however, over-all holdings are high. With respect to certain components and critical materials, this does not hold true-lack of balance in inventories which prevents smooth production is a big factor in the present low output
and low productivity of labor. Apparently, the lag in production time between raw materials and finished goods has been extended to allow for contingencies such as strikes, material shortages and price changes.

On an over-all basis, total manufacturers' inventories are not excessive in view of the volume of business expected for the first part of next year. However, should shipments volume fail to materialize, trouble could quickly develop,

\section*{Chart 3.-Relationship Between Manufacturers' Inventories, by Selected Stages of Fabrication, and Shipments \({ }^{1}\)}

\footnotetext{
\({ }^{4}\) Lines of regression were fitted to data for prewar years.
Source of data: U. S. Department of Commerce.
}
particularly since the time lag has become unsually long to hedge against production uncertainties.

Durable vs. Nondurable Goods Industries
The sales-inventory situation as between industries and industry groups is not uniform. The difference in pattern during the 1939-46 period between the durable and nondurable groups is pictured in the top parts of charts 4 and 5. Combined working stocks (raw materials and goods-in-process) of durable manufacturers (chart 4) are still below the wartime peak and are considerabiy in excess of requirements based on current shipments. However, shipments are also relatively low, and are expected to rise considerably as output reaches more normal proportions. In light of expected shipments, therefore, working stocks are not too high, but the extended time lag is marked.

The durable goods picture is pointed up in the lower half of chart 4 relating to the transportation equipment industry, including automobiles. Shipments have been held cown by the difficulties of automobile production, and a sharp rise from the levels existing during the first part of 1946 could develop rapidly, which would bring working stocks into balance.

In the nondurable industries, conversely, both inventories and shipments are high-above previous peak levels. However, there is as yet no disparity evident in the relationship existing between sales and working stocks. (See chart 5.)

In the lower half of chart 5 sales of the textile, apparel and leather products group are related to working stocks. It is in this group in the past that weakness in the output-price situation has first developed. Despite the recent inventory accumulations here, the relationships do not appear far out of line with past experience; however, the present shipments level is very high. It should be noted that the data for this group are presented on a 4-quarter average basis to eliminate seasonal influences.

In general, working stocks held by manufacturers must be weighed in terms of the varying sales-inventory relationships. In the durable industries, inventories obviously anticipate larger shipments. In the nondurable industries there is an approximate balance, but at a very high level of both shipments and stocks. If shipments of durable goods can meet expectations without disturbing sales of nondurable goods, the present inventory position is not excessive.

\section*{Inventories and the Price Rise}

During July and August when invenDigiticories \(\bar{W}\) Were \({ }^{\text {Frising }}\) rapidly, prices also adhttp://fraser.stlouisfed.org/
to shipments, however, the price problem makes little difference. Any increase in prices which affects inventories will be reflected also in the value of shipments. The question of inventory adequacy-are stocks low or high in relation to shipments-can be judged in current price terms without reference to price changes.
Implifications of the Recent Accumulation
There are two distinct questions raised by the present inventory situation. One, are stocks adequate-is the existing level too high or too low and what will be the future trend? Two, what is the economic significance of a rapid rate of inventory accumulation, particularly with respect to any slowing or reversing of this rate?

The current level of inventories is not unwarranted when measured objectively against sales. However, the conditions are not uniform and would seem to indicate that further inventory increments will take place merely in the process of achieving balance.
As pointed out above, distributive inventories are below the level of adequacy in view of present sales. The same holds true of finished goods stocks of manufacturers. The lack of balance within the working stocks of manufacturers also presages some further increase as parts deficiencies are overcome. How much inventory will be added and in what period of time are imponderables; certainly, the gap could be filled rather quickly at the July-August rate, but this pace is not expected to continue. The major problem in this connection concerns the rise in sales which must accompany the increased stocks if the present overall balance is to be maintained.
In the realm of economic significance, the danger inherent in a period involving an increase in inventories is that it leads almost inevitably to a subsequent lowering of the level of output. Whenever a part of current production is channeled into stocks, the amount available for consumption is reduced. This exerts an upward pressure on prices because of the relatively short supply situation created, and on output in an effort to increase the supply. When inventories stop rising, the pressure is removed and unless outside forces act to increase consumption, output quickly becomes adequate and prices less firm.

The real damage in the past has been that in this adjustment process, current output is usually discovered to be more than adequate when inventory building subsides. Hence, prices drop in an attempt to move output into consumption, and inventories once considered inadequate are now suspect or may prove

Chart 5 .-Relationship Between Manufacturers' Inventories and Shipments, All Nondurable Goods Industries, and Textiles, Apparel, and Leather \({ }^{1}\)

1 Lines of regression were fitted to data for prewar years.
Data plotted are 4 -quarter moving averages centered at the third quarter. Basic data for inventories are for the end of mid-month in each quarter and for shipments are monthly average for quarter.
Source of data: U.S. Department of Commerce.
too high. A recession in output, employment and income normally ensues.

A further danger is that some time during the process the increase in inven-
tories may shift quickly from a voluntary to an involuntary accumulation because buying slackens, or increases less than anticipated. Under these circum-
stances much the same economic reaction described above develops, but perhaps to a more striking degree. Thus, in any period of rising inventories, particularly one of a rapid increase, the problem is one of attempting to moderate the severity of the subsequent decline, and to determine, insofar as possible, the timing of the downturn.

In order to bring particular areas into balance an dto complete filling the pipe lines, business inventories can rise moderately for another three to six months without being excessive relative to sales or shipments. Further sharp increases, however, of the kind experienced in July would soon bring over-all inventories out of balance with sales and would inevitably be followed by a serious readjustment.

In any case, however, buying for inventories cannot go on indefinitely. At some time in the future, a time which is
not now predictable, the pipe lines will be filled and inventories will be sufficient or more than sufficient to support the current high volume of shipments. At such time buying for inventories will be cut at least to a replacement basis. The problem will then be what will absorb the added output shifted to consumption channels when inventory accumulation stops or is reversed.
While increased buying may come from any of a number of sources, it may be well to examine the possibilities of a few of the more important ones. Government expenditures, for example, have been a large balancing factor for a number of years. However, the present tendencies are toward curbing these outlays. Other central forces are business capital outlays, construction, exports, and consumer expenditures. With these, two problems arise. The rate of consumption
in these areas is already high and will be higher when the peak of inventory building is reached. Although further expansion cannot be ruled out as an offsetting factor, it is pertinent to question the timing. Will the offset be gauged so as to neatly counteract any deflationary impact?

These considerations indicate the current tendencies and the factors which must be taken into account in appraising the effects of a cessation in inventory accumulation. Unless the economy is not to suffer a set-back when inventory building stops, somewhere in the private and government sectors must be found an aggregate increase in demand to offset the loss in inventory demand. This must be in addition to the increased demand necessary to absorb the higher output which is implied in the present level of inventories when related to shipments.

\section*{Retail Sales and \\ Consumer Income}

\section*{(Continued from p.17)}
course, have deterrent effects on other areas of the economy which in turn would result in secondary and tertiary effects on retail trade.

That there are factors which may contribute to the maintenance of consumption above the prewar relationship should not be overlooked. The dispersion between the low-income and high-income groups was very much narrowed during the war. While since the end of the war this trend was reversed, currently the dispersion of income is probably much narrower than prewar. Previous studies on income and expenditure distributions \({ }^{4}\) have shown that lifting the income of the low-income groups relative to the high has tended to increase total consumption relative to total income.

Another important factor is the much higher level of liquid assets which individuals now hold in relation to prewar. Here, again, the statistical evidence is inconclusive as to the effect on consumption of larger cash holdings of individuals, but in view of the sizable increase in these holdings as a result of the huge wartime savings, their effect on the propensity to consume may be significant.

The impact on the economy will be drastically different depending on

\footnotetext{
\({ }^{4}\) "Consumer Expenditures in the United States," National Resources Committee, 1938.
}
whether the first or second alternative eventuates. In particular, every businessman and especially the retailer has a vital interest in these developments and
should constantly be on the alert to appraise and evaluate their significance to his operations and policies.

\section*{Monthly Business Statistics}

The data here are a continuation of the statistics published in the 1942 Supplement to the Survey of Current Business. That volume contains monthly data for the years 1938 to 1941 , and monthly averages for earlier years back to 1913 insofar as available; it also provides a description of each series and references to sources of monthly figures prior to 1938. Series added or revised since publication of the 1942 Supplement are indicated by an asterisk (*) and a dagger ( \(\dot{\dagger}\) ), respectively, the aceompanying footnote indicating where historical data and a deseriptive note may be found. The terms "uoadjusted" and "adjusted" used to designate index numbers refer to adjustment of monthly figures for seasonal variation.

Data subsequent to August for selected series will be found in the Weekly Supplement to the Survey,

- Preliminary. r Revised.

New series. For a description of the indexes of the votume of iarm marketings and figures for 1929-42, see pp. 23-32 of the A pril 1943 survey; indexes since 1042 are from the Department of Agriculture. Data for \(1913-41\) for the doilar figures on cash farm income are shown on \(p\). 28 of the May ig43 Survey; revised monthly averages begioning 1940 based on annual data are a stllows (millions of doliars). Cash fam income, total moluding Government payments-1940. \(759 ; 1941,979 ; 1542,1,335 ; 1943,1,645 ; 1944,1,753 ;\) income from market-ints-1940, \(695 ; 1941,930 ; 1942,1,276 ; 1943.1,612 ; 1944, \xi, 586 ;\) the monthly figures have not as yat been adjusted to the revised totais. Data beginning lose for the new series under industrial production are shown on p. 18 of the Decemter 1943 issue.
tRevised series. Data on income payments revised beginning Tanuary 1939; for figures for 1639-41, see p . 16 of the A pril 1944 Survey and for 1842-44, p. 20 of the May 1945 Survey. Reviseci data begiming 1913 for the indeaes of cosh income from farm marketings are shown on p. 28 of the May 1942 Gurvey. For revisions for the indicated series on industrial production, see table 12 on pp. 18-20 of theDecember 1943 issue.

p Preliminary. \({ }^{\circ}\) Revised. \& Data for August and November 1945 and January, May and August 1946 are for 5 weeks; other months, 4 weeks.
1 Data published currently and in earlier issues of the Surcey cover 4 -and 5 -week, periods except that December figures include awards through Dec. 31 and January Agures begin Jan. 1: beginning 1939 the weekly data are conbined on the basis of weeks ended on Saturday within the months unless a week ends on the ist and \(2 d\) of the rionth when it is taciuded in fagures for the preceding month (exceptions were made in the case of weeks ended Aym. 3, 1943, and Feb. 3. 1945, which were included in the precediug nonth).
7 Revised \(1942-43\) data for urhen dwelling units are available on reguest. Data for publiciy financed units, shown separately berinning in the May 1946 issue of the survey, were formerly induded in the 1 family classification; they have not been reported by type of dwelling since April iga3 but have been predominantly family since that date. These data and the indexes of building constructiou above, based on permits issued or Federal contrarts awarded duing the month, prior to 1945 , are censidered a measure of construction gtarted during the month; in recent months cintical shortages of buiding naterials and hemitiog orcers have causen considerabie delays in the siart of construcion, or, ins some cases, fbandonment of the work; the data since
than volume started during the month.
*New series. Pstimates of total nonfarm dwelling units include data for urban dweling usits given above and data for rural nonfarm dweiling units whicb are uot shown sepa-
 of Commere and Labar: several of the compant efies hape
 indexes of building construction have been revised for January 1940 to October 1944; revisions are available on request; see aliso note marked " \(\%\) " concerning recent data

*Preliminary. TRevised. \& See note marked "s" on p. S-6 of the April 1943 Survey in regard to eulargement of the reporting sample in Angust 1942
*New series. The series on consumer expenditures, originally pubhished on a monthly basis in the October 1942 Survey (pp. 8-14), are now compiled quarterly only (data are quarterly totals) and have been adjusted to acord with the annual totals shown as a component of the gross national product series; for dollar figures for \(1939-40\) see p. 13 , table 10 , of the April 1944 Survey and for \(1941-44\), p. 8 , table 6 , of February 1946 issue; data in the lat ter tatle and bhase above are on a revised basis, they differ from figures published in the January 1946 Survey and earlier issues owing to the inclusion of expenditures of military personnel abroad in the total and services (dollar figures for this item are given in the footnote to the table on \(p .8\) of the February 1946 Survey); indexes beginning 1939 , both inciuding and excluding expenditures of military personnel abroad, are avaliable on request. \(\dagger\) Revised series. For revised data (dollar figures and indexes) on sales of retail stores for January 1943 to June 1944, and earlier revisions for a number of series, sec table on pe. 19 and 20 of the September 1945 Survey (corrections for 9 . 19 . March 1944 indexes-building materials and hardware stores, 143.6 ; jewelry siores, 460.7 ; June 1944 index for apparel
 \(11-14\) of the November 1943 Survey, Data have been reised beginning January 1945, largely to adjust the
shown on p. 24 of the August 1946 Survey (data beginning May 1945 were revised in the July 1946 issue).

- Revised.
\({ }_{8}^{6}\) For 1941-43 data for shipbuilding see p. 19 of December 1944 Survey; 1939-44 data for aircraft and aircraft engines are on p. 20 of the August 1945 issue. For data for December 1941-July 1942 for machine tools, see note marked " \(\dagger\) " on p. S-10 of the November 1943 Survey.
* Now secies. Data begimning 1939 for the estimates of production workers for individual manufacturing industries will be shown later; data published in the Survey beginning with the December 1942 issue, except as indicated in note marked " \(\delta\) ", are comparable with figures published currently. Data for \(1929-43\) for all manufacturing, total durable goods and total nondurable goods industries, and the industry groups are shown on p. 22 of the December 1945 Survey, and revised data for January 1944-February 1945 are on p. 24 of the July 1946 issue.
dividual industries (except as indicated in note marked "floyment and of production-worker pay rolls (pp. S-12 and S-13) have been completely revised; for \(1939-41\) data for the Individual industries (except as indicated in note marked f") and 1939-40 data for the unadjusted series for all manufacturing, total durable goods and total nondurable goods in20 of the October 1945 issue, and for January 1944-February 1945, p. 24 of the July 1946 issue; all revisions through February 1945 for the adjusted totals (p. S-11) will be shown later.

\section*{Revised. Preliminary.}
\(\ddagger\) Sample was changed in November 1942; data are not strietly comperable with figures prior to that wonth.
§ Sample was changed in July 1942; data are not strictly comparable with figures prior to that month,
N New series. Indexes of pay rolls beginning 1939 for retail food establishments and 1940 for water transportation are shown on p. 31 of the June 1043 Survey. Data beginning 1032 for the newspapers and printing, book and job, industries will be published later; see November 1943 Survey for data beginding August 1942 . Data for the aircraft engine industry beginning 1029 will also be published later;

S-11 for sources of revised datar " \(\dagger\) " on \(p\). S-10 regarding revisionsin the indexes of pay rolls in manufacturing industries and sources of revised data and note marked " \(\dagger\) " on shown on a revised basis beginning in the March 1943 Survey and data are not comparable with figures shown in earlier issues (see note marked " "p" on p. \(\mathrm{S}-13\) of the July 1944 Survey); data prior to 1942 have not been published in the Survey and will be shown in a later issue; there were no revisions in the data for industries that do not carry a reference to this note.

r Revised. \({ }^{p}\) Prellminary. \$Sample was changed in November 1942; data are not strictly comparable with figures prior to that month.
- The average for workers who were employed in February was \(\$ 1.217\); this average is affected by strike conditions, since maintenance workers were left on during the strike while low-paid production workers were out; the average is therefore omitted from the table above to avoid misinterpretation.
- Not comparable with data prior to July 1945; comparable June 1945 figures: Dyeing and cleaning, \(\$ 0.757\); power laundries, \(\$ 0.657\).
tData beginning April 1945 are not comparable with earlier data; see note for hours and earnings in telephone industry at the bottom of \(p\). S-13 of the April 1946 Survey. IRates as of September 1, 1946: Construction-common labor, \$1.072; skilled labor, \$1.85.
New series. Data on hourly earnings for 1937-43 for the telephone industry are shown on p. 20 of the May 1945 Survey (see also note marked "t" above regarding a change in the date in April 1945) and data for the telegraph industry beginning June 1943 are on p. S-14 of the January 1945 issue. Data on hourly earnings beginning March 1942 for the other nonmanufacturing industries and beginning August 1942 for the printing and publishing subgroups are available, respectively, in the May 1943 and November 1043 issues, and data tSee note " 9 " on p. S-13.

- Revised. \({ }^{\circ}\) Preliminary. © Deficit. 8 Special issues to Government agencies and trust funds. \(\otimes\) Data are on basis of Daily Treasury Statement (unrevised).
\({ }^{1}\) Partly estimated. Includes prepayments on securities sold during loan drive beginning in the month but issued after the close of the month.
- Revised figure for second quarter 1945, 198.3.
- Quotations are or foreign silver through Julg 1946 (figure tor that months covers July \(11-31\); thereafter quotations apply also to domestic and Treasury silver if such silver enters into New York market transactions. The U. S. Governmont price for newly mined domestic silver was \(\$ 0.7111\) through June 1946 and \(\$ 0.905\) effe ctive July 1,1946 .

Cand and the
a Publication of data suspended during the war period; data for November 1941 to February 1945 will be published later.
\(\sigma^{2}\) The totals for 629 companies, the miscellaneous group, and net profits of 152 companies have been revised beginning 1941, transportation equipment beginning 1942, and other series for some quarters of 1943; revisions are shown on p. 31 of this issue.
\(\ddagger\) For 1941 revisions see p . 17 of the November 1942 Survey; debt retirements which have been comparatively small in recent years are excluded.
 for a brief description of the new series on bank deposits and currency outside bank and fagures beginning June 1943; earlier data for these series will be published later. Data beginning July 1940 for the series on the war program are shown on p. 29 of the June 1943 Survey; beginning July 1940 data are from the Treasury Dany Statement; earier figures were supplied by the War Production Board. See note in April 1943 Survey for a brief deseription or the series on war savings bonds and p. S-16 of the October 1942 Surveyf or sales beginn ing
May 1941; beginning March 1945, amount outstanding includes matured bonds not turned in for redemption. Data for expenditures of Government corporations bave been shown on Digitizedaforised basiskeginning in the Centemher 1946 survey; see note in that issue for an explanation of the revision.

Revised. \({ }^{\text {Slnee February }} 1945\) data are from the New York Stock Exchange; except for June and December. data are estimates based on reports for a sample group of firms.
New series. Data for 1941 for dividend payments are on p. 20 of the February 1944 Survey. Final revisions for 1942 and 1943 will be published later. For revisions for all \(\dagger\) Revised serles. The price series for domestic municipal bonds was revised in the April 1943 Survey; see \(p\). S-19 of that issue for data beginning February 1942 and an explanation of the revision; earlier data will be puhlished later. Data through December 1943 for the revised series on prices and yields of U. S. Treasury bonds are shown on \(p\). 20 of the September earlier issues of the Survey; there were no partlally taxeexempt byads due or callable in 15 years or over after December 15 .

\(;\) Revised.
\$ Sen note marked " " \(\overline{\text { N }}\) " on p . S-22.
chandse exports, Datata on shipping weight of exports and imports are compiled by the U. S. Department of Commerce. Bureau of the Census; they represent pross weight of merchandise exports and imports, including weight of containers, wrappings, crates, etc. Data beginning January 1943 will be published later. See \(p\). 32 of the February 1946 Survey oxports although, since the prostam officially ceased to operate at the end of the war, the reciplent nations had, with few exceptions, arranged to finance them prior to the exportation of the merchandise. Monthly data prior to February 1945 for Columbia and Venezuela will be shown later.

CHEMICALS AND ALLIED PRODUCTS-Continued

- Revised. \(\oplus\) Excludes data for Mississippi, which has discontinued monthly reports; data prior to March 1046 shown in the September Survey and earlier issues include this State.
"Revised. \(\oplus\) Excludes data for Mississippi, which bas discontinued monthly reports; data prior to March
1 Includes data for two companies which did not report prior to August 1946 .
I Includes production for beverage purposes, reported separately through October, as follows (thous. of proof gallons): Aug. 6,042; Sept., 4,414; Oct., 6,954. These amounts and total production shown above after October are included also in data for production of distilled spirits shown on \(p . S-26\).

See note in the April 1946 Survey with regard to differences between these series and similar data published in the 1942 Supplement to the Survey.
- Data for ethyl alcohol, except stocks at denaturing plants, continue data published in the 1942 Supplement to the Survey but suspended during the war period; stocks at denatur-

 total tax-paid withdrawals of distilled spirits shown on \(p\). 8-26.
 photographic in addition to edible gelatin; data prior to March 1945 Wm be shown later.
\(\otimes\) Data continue series published in the 1942 Supplement but suspended during the war period; data for all series for October 1941-February 1945 will be published later. (Corrected data for 1937 -July 1945 for total and nitrogenous fertilizer imports will also be shown later (tankage not fertilizer has been excluded).

Revised. ©"See note marked " \(\sigma^{7 \prime \prime}\) " on page \(\mathrm{S}-29 .{ }^{2}\) Dec. 1 , estimate. : September 1 estimate.
§Data contlinue series published in the 1942 Supplement which were suspended during the war period; data for October 1941-February 1945 will be published later
*Revised 1943 data are shown on p. 13 of the March 1945 Survey; see note on item in February 1945 issue regarding earlier data; January 1944 -June l945 revisions will be shown
ter.
\(\dagger\) Revisions for consumption of distilled spirits for beverage purposes for \(1940-44\) are available on p. 22 of July 1946 Survey. See note marked " \(\dagger\) " on p. S- 25 of the April 1946 Survey for sources of 1941-42 and July 1943-January 1944 revisions for other alcoholic beverage series; revisions for fiscal year 1945 are shown on p. S-27 of the May 1946 issue. Revisions for 1920 to June 1945 for the series on utilization of fuid milk in manufactured dairy products are available on request; see note marked " \(t\) " on p. S-26 of the April 1946 Survey for sources of \(1941-43\) revisions for dried skim milk production and note marked " \(\dagger\) " on p . S-25 of that issue for sources of 1941-43 revisions for the other indicated dairy products series. Final revisions for all dairy products for 1944 and preliminary revisions for January to June 1945 for condensed, evaporated, and dried skim milk will be published later. Crop estimates
for barley and potatoes have been revised for \(1929-41\); for 1941 revisions, see February 1943 Survey, \(p\). 25 ; 1929-40 data are available on request.

r Revised. I For data for December 1941-July 1942, see note in November 1943 Survey.
\(t\) Compiled by the U.S. Department of Labor; see note in A pril 1944 Survey.
Comphed by the U. S. Department of Labor; see note in A pril 1944 Survey.
\(o^{7}\) Cold storage stocks of dairy products, meats, poultry and eggs include stocks owned by U. S. Department of Agriculture and other Government agencies, stocks her Armed Forces stored in warehouse space not owned or operated by them, and commercial stocks; stocks held in space owned or leased by the Armed Forces are not included.

8 Data continue series published in the 1942 Supplement but suspended during the war period; data for October 1941 -February 1945 will be published later.
\(\oplus\) Data for edible offal are comparable with figures beginning Jume 1944 shown as "miscellaneous meats" through the April 1946 Survey (see note in that issue). "Miscellaneous

 were included as "miscellaneous meats" prior to June 1944.
April 1945 Survey).
 shipments of sheep and lambs has been revised beginning 1941 to include data for Illinois; revisions are shown on p. S-27, of the August 1943 Survey.

\section*{\({ }^{2}\) Revised. \({ }^{1}\) Cancellations exceeded new orders by the amount shown above. \({ }^{2}\) Total for January and February. \(\quad\) Data not available.}
\&Data continue series shown in the 1942 Supplement but suspended during the war period (it should be noted that data for iron and steel are shown in long tons in that volume); data for October 1941-February 1945 will be published later.
\(0^{2}\) Since June 1944 the coverage of the malleable iron castings industry has been virtually complete (see note in April 1946 Survey regarding earlier data); total shipments include shipments for sale and for use by own company, an affiliate, subsidiary or parent company. New orders for sale has been substituted for total new orders which has been discontinued; data beginning November 1944 for unflled orders and beginning 1936 for new orders and shipments for sale will be published later.
*New series. Data beginning September 1941 for sortwood plywood are shown on \(p\). 16 of the September 1944 Surver, For a description of the series on scrap iron and steel and pig iron consumption and stocks and \(1939-40\) data, see note marked "** on p. S-29 of the November 1942 Survey; later data are available on p. S-30 of the April 1942 and subsequent issues. The series on pig iron production is approximately comparable with data in the 1942 Supplement (data in the Supplement are in short tons instead of long tons as indicated); see p. S-30 of the May 1943 Survey for further information on this series and data for \(1941-42\). The pig iron price series replaces the Pittsbu
prior to the April 1943 issue. Data for gray iron castings represent industry totals beginning in the June 1946 Survey; see note in that issue. able figures for January-April 1945.

\end{tabular}
\& Revised. \({ }^{1}\) Total for January and February. ' Discontinued by reporting source. © Beginning 1943 data have covered the entire industry.
\(\S\) For 1946 percent of capacity is calculated on annual capacity as of Jan. 1, 1946, of \(91,890,540\) tons of open-bearth, Besserner, and electric steel ingots and steel for castings; 1945 data re based on capacity as of Jan. 1, 1945 ( \(95,501,580\) tons).
\(\ddagger\) Based on information recently available it is estimated that data beginning 1945 represent substantially the entire industry; in prewar years the coverage was about 90 percent.
See March 1944 Survey for comparable data for 1942 ; the series now covers 57 manufacturers (two formerly reporting discontinued production of bearing metal).
Total shipments less shipments to members of the industry for further conversion; data prior to 1944 were net production for sale.

onew series. Data for aluminum fabricated products cover to tal sbipments of castings, forgings sheet, strip plate, rod
hipped to other manufacturers for further fabrication into other wrought products; data were compiled by the War Production Board through September 1945 and by the Bureau of the

 seriously affected. For revised figures for early months of 1945 , see p. S-33 of the June 1946 issue.

- Revised. §See note in April 1946 Survey for basis of data. \(\ddagger\) For revisions for January 1942-March 1943, see note for paperboard at bottom of p. S-36 of July 1944 Sirvey. TData continue series pablished in the 1942 Supplement but suspended during the war period; data for October 1941-February 1945 will be published later.
for all series are on pp. 30 and 31 of the June 1943 issue; there have been further revisions in the 1943 data for ground wood and total production shown in the Ded 1942 stock figures and unpublished revisions in the 1944 production data for these two series; all revisions will be shown later. The data exclude defibrated, exploded and asplund fiber; stock data are stocks of own production at mills. The paper series from the American Paper and Pulp Association beginning in the August 1944 Survey are estimated industry totals and are not comparable with data shown in earlier issues; there have been further small revisions in the 1943-44 data as published prior to the June 1945 issue; these revisions and earlier data will be published later.
*New series. The new paper series are from the Bureau of the Census and cover production of all mills including producers of building paper and building boards; for 1942 monthly averages and data for the early months of 1943 , see P. S-32 of the August 1944 issue. For data beginning 1034 for shipping containers, see \(p\). 20 of the September 1944 Survey. For Digitized databegnding June 1943 for folding paper boxes, see p. S-32 of the August 1944 Survey; earlier data will be published later. Minor revisions in the January-May 1944 figures for (folding paper boxes and January 1943-May 1944 data for shipping containers are available on request.

\(r\) Revised. \(0^{7 S}\) See note in April 1946 Surver
\$Data continue series published in the 1942 Supplement but suspended during the war period; data for October 1941-February 1946 for exports and January 1942-February 1945 for other series will be published later; revisions for production, shipments and stocks of pneumatic casings for March-June 1945 and inner tubes for March-July 1945 will also be shown later.

IIncludes natural gasoline, cycle products, and liquefied petroleum gases at natural gasoline plants, and benzol. Sales of liquefied petroleum gases for fuel and for ehemicals and transfers of cycle products, shown separately above, are deducted before combining the data with straight run and cracked gasoline to obtain total motor fuel production.
\$Data are from the Civilian Production Administration and continue similar series from the Rubber Manufacturers Association published in the 1942 Supplement; the coverage is complete. Data for November 1941-February 1945 will be published later
New series. Exports are from the Bureau of the Census; other series are compiled by the Civilian Production Administration and the coverage is complete. Data prior to March 1945 will be shown later.

* Revised. 'See note marked " 0 "". Wata for October 1945. January, April and July 1946 are for 5 weeks; other months, 4 weeks.
- Based on cloth prices for July 24 , 1946 , from "The Textile Apparel Analysis" for first 3 weeks of the month and OPA ceilings for last week.
§Data continue series published in the 1942 Supplement but suspended during the war period; data for October 1941-February 1945 will be published later.
§Data continue series published in the 1942 Supplement but suspended during the war period; data for october 1941 -February 1945 will be published later. tinued during the war period); the price of \(64 \times 56\) cloth was \(\$ 0.096\) for October 1945 -February 1946 and \(\$ 0.107\) for March 1946.

OThis series was substituted in the November 1943 Survey for the price of \(56 \times 60\) sheeting, production of which was discontinued during the war period.
- Data through August 1945 exclude activity of carpet and rug looms operating on blankets and cotton fabrics.
†Revised series. For 1941 data for the yarn price series, see p . \(\mathrm{S}-35\) of the November 1942 issue. Wool stocks have been published on a revised basis beginning 1942 (see \(p\). S-35 of the May 1943 Survey); data include wool held by the Commodity Credit Corporation but exclude foreign wool beld by the Defense Supplies Corporation.
*New serics. For data beginning 1943 for production of cotton cloth and a brief description of the data, see p. S-35 of the August 1944 Survey; earlier data will be shown later. For earlier data for cotton and rayon goods finishing, see \(p\). 23 of the August 1946 issue. Rayou broad woven goods production, and wool yarn production are from the Bureaul of the Census and represent virtually complete covcrage; data beginning in 1943 will be shown later. Data beginning 1939 for the price of raw territory wool are shown on p . 24 of the February 1945 Survey. Data beginning 1936 for the price series for Australian wool, which is from the Department of Agriculture, will be shown later; prices are before payment of duty. Digitized for foilahle data for 1937-43 for woolen and worsted goods production, see p. 19 of the May 1945 Survey.
