MONTHLY BUSINESS STATISTICS—1949 MONTHLY AVERAGES

Attention is directed to the 1949 averages published on pages S-1 to S-40 of the *March* issue. Those averages used in conjunction with those in the 1949 *Statistical Supplement* to the Survey of Current Business provide, in most instances, continuous data beginning with 1935 for approximately 2,600 statistical series, comprising a variety of subjects.

Copies of the *March* issue of the Survey of Current Business (price 25¢) and the 1949 *Statistical Supplement* to the Survey of Current Business (price \$1.25) are available from the nearest Department of Commerce field office or from the Superintendent of Documents, U. S. Government Printing Office, Washington 25, D. C.

The Business Situation

By the Office of Business Economics

Incoming business of durable-goods manufacturers' was higher than shipments early this year.....

BILLIONS OF DOLLARS

extending the upturn in unfilled orders.

BILLIONS OF DOLLARS

U. S. DEPARTMENT OF COMMERCE, OFFICE OF BUSINESS ECONOMICS 50-136

Business activity moved forward in March completing a quarter of moderate expansion in the economy. With termination of the coal strike, output in the mines and in steel recovered, enabling industrial consumers to replenish stocks for the maintenance of high volume operations. The boom in residential construction progressed and the usual seasonal expansion occurred at levels nearly 50 percent above those of last year. The flow of personal incomes—temporarily augmented by National Service Life Insurance dividend payments to veterans—reached \$219 billion at an annual rate, with the total during the first 2 months of this year exceeding the end-of-1949 rate by almost \$7 billion. The underlying trend of income in this period was upward, aside from this nonrecurring dividend and the effects of the strikes.

Consumption trend mixed

Consumer spending in the first quarter responded to the expanded income flow, with the durable-goods lines showing the more favorable trend. In apparel and general merchandise stores, Easter activity appeared to be below expectations with some attendant accumulation of inventories. Aggregate retail sales in February were about 1 percent above the previous peak of August 1948 on a seasonally adjusted basis, and held close to this volume in March. The greatest gains were in automobiles and in furniture, refrigerators, washing machines, ranges, and other appliances, the sales of which are related in large part to the sharp rise in building activity.

Investment rising—Government outlays steady

The trend in business spending in the first quarter of 1950 was also stronger than in most of 1949, when investment in both inventories and in plant and equipment was declining. Except for involuntary reductions in stocks directly attributable to work stoppages, there was virtually no liquidation in inventories. Business outlays for plant and equipment were about the same in the first quarter of the year as in the final quarter of 1949, though a survey of investment programs suggests some decline in the second half of 1950, as described in the article on this subject in this issue of the SURVEY. The cessation of the decline in orders for machinery and for industrial and commercial construction, together with the rise in residential building, reversed the downward trend in private-capital formation as a whole.

Federal Government expenditures in the first quarter of the year were somewhat below those implied in the official budget estimates of January but were running about on a par with the \$25-billion annual rate, on a seasonally adjusted basis, prevailing at the end of 1949. State and local expenditures were likewise firm with continued heavy disbursements for road building and school and other public construction.

Production Trends

The largest increases in output in the first quarter of the year were centered in the durable-goods industries. With rising demand for consumer durables, construction materials and equipment, and continued strength in the demand for automobiles, incoming business of manufacturers rose sharply at the start of the year, resulting in an advance in shipments and an accumulation of unfilled orders. As chart 1 shows, this development, essentially, represented an acceleration of the recovery in progress in this segment since autumn of last year.

The recent trends in industrial production are illustrated in some detail in table 1. In almost all industries output was moving upward in the first quarter of the year to volumes substantially above their lows of 1949, though still under the peaks reached earlier in the postwar period. Steel production, recovering from the effect of the work stoppage in coal, reached 97 percent of capacity at the end of March.

Sharp recovery in durable goods

Output of nine durable semifinished materials during the first 2 months of 1950 was from 6 to nearly 70 percent above the 1949 low points. The rise for finished durable goods ranged from 12 percent for tractors to more than 60 percent for refrigerators, nearly 80 percent for electric ranges and 167 percent for television and television-radio-phonograph combination sets. Automobile production was also high

and, as depicted in chart 2, exceeded output in the same period of 1949 despite the strike in the plants of a major producer.

Chief exception to the general picture of recovery among finished durable goods was railway freight cars, production of which was down 50 percent in the first quarter of the year. Here there has been some recent pick-up in orders for new equipment. Unfilled orders on the books of freight car builders and railroad car shops rose from 12,000 in December 1949 to 31,000 in March. While this volume is equivalent to 15 months' output at the rate of production prevailing in the first quarter of this year, it is little more than 3 months' production at the rate the industry was operating in 1948.

Less recovery in the nondurables

Among nondurable goods, as the table shows, advances in 1950 were in general considerably smaller. Furthermore, there is evidence that the increases noted in this table for textile consumption have not been accompanied by a commensurate advance in output of finished apparel. Sales of apparel manufacturers in January and February declined by 6 percent from the fourth quarter 1949 rate and were nearly 30 percent below the corresponding months of last year. Inventories—especially of purchased goods and goods in process—were substantially higher. Sales of apparel retailers showed little change from the fourth quarter 1949 rate but were 11 percent below the corresponding months of last year.

Department of Commerce, Bureau of the Census, American Iron and Steel Institute, American Railway Car Institute, Automobile Manufacturers Association, Implement Trade Journal Company, National Electrical Manufacturers Association, American Washer and Ironer Manufacturers Association, Vacuum Cleaner Manufacturers Association, Radio Manufacturers Association, Rubber Manufacturers Association, National Association of Hosiery Manufacturers.

Chart 2.—Automobile Production

Source of data: Automobile Manufacturers Association.

Normal Coal Production Resumed

Coal output made a rapid comeback following return of miners to the pits in the first week of March, mounting from a weekly average of 2.5 million tons during the strike period in February to approximately 13 million tons in the last 3 weeks of the month—the highest weekly rate with few exceptions in the past 2 years. This rate of production has permitted some replenishment of stocks depleted by the extended strike.

An outstanding feature of development in this industry has been the declining volume of consumption in relation to the level of industrial output. The modest downturn in business activity from the 1948 postwar peak was accompanied by a more than proportional reduction in the demands made upon the Nation's fuel resources in general. This decline was concentrated primarily in bituminous coal as chart 3 suggests. From 519 million tons in 1948, bituminous coal consumption declined to 445 million tons in 1949, a drop of 15 percent. Consumption of energy from other mineral fuels or water power during the same period showed little change.

The work stoppages in coal output—as well as the adoption of a 3-day workweek during a large part of 1949—was of course a prime factor in reducing stocks in this period. During the first 2 months of 1950, consumption was restricted by the supply available as conservation measures were adopted to stretch dwindling supplies.

Pattern of fuel consumption

Fuel consumption, in toto, is of course directly related to the volume of business activity. Superimposed upon this relationship is a long-term down trend, reflecting progressive advances in technology and management in achieving economies in the utilization of energy. These two factors—the volume of business activity and gradual economies over time—account in the main for fluctuations in energy consumption, as shown in the upper panel of chart 3.

The "calculated" line in this chart indicates the volume of consumption as derived from the relationship among these

variables, based on experience during the years 1923-40. Only in the war years, when there were profound alterations in the structure of the economy, were there substantial deviations between the actual and the calculated volumes.

Analysis of the demand for bituminous coal is considerably more complex. In addition to the factors affecting aggregate energy consumption, the demand for individual fuels is affected by relative costs. For the long-term as well as the recent behavior of bituminous coal consumption, this latter factor is of particular importance.

In order to appraise this, the relationship between bituminous coal consumption and the principal determining factors was computed from data for the period 1923 through 1940. The explanatory variables include: (1) Industrial production—the chief source of demand; (2) the price of bituminous coal; (3) the price of fuel oil—chief competitor in industrial markets; (4) time trend, representing principally

Chart 3.—Total Energy Consumption from Mineral Fuels and Water Power, and Bituminous Coal Consumption

¹ Calculated total energy consumption is based upon a linear least squares regression of total domestic energy consumption on industrial production, disposable personal income (roughly adjusted for price change) and time. Coefficient of correlation=0.98. Calculated bituminous coal consumption is based upon a linear least squares regression of bituminous coal consumption on industrial production, prices of bituminous coal and fuel oil, and time. Coefficient of correlation=0.99.

Source of data: U. S. Department of Commerce, Office of Business Economics, based upon data from U. S. Department of the Interior, Bureau of Mines; U. S. Department of Labor, Bureau of Labor Statistics; and Board of Governors of the Federal Reserve System.

gradual changes over time in efficiency of operation and in the extension of facilities available for utilization of coal as well as for competing fuels. These factors, historically, explained virtually all the fluctuations in bituminous coal consumption, as indicated by the close correspondence between the "calculated" line derived from this relationship, shown in the second panel of chart 3, and the actual consumption. In the war years, for reasons already noted, there were deviations, but in subsequent years the prewar relationship was restored.

Rising coal costs

Analysis of the elements of this correlation provides some insight to the historical trends as well as the recent behavior of bituminous coal consumption. Of outstanding importance is the fact that the volume of coal consumed has declined gradually during the past 25 years in relation to the volume of industrial production. This development was only in small part due to the progressively more efficient utilization of energy by industry. Of even greater influence was the growth in facilities for utilization of other fuels, and especially, the rising cost of coal in relation to the cost of competitive products. The extent of the change in cost of bituminous coal relative to the cost of directly competing fuel oil is illustrated in the following tabulation:¹

Period	Percent change			
	Price of bituminous coal, mine run	Price of fuel oil		
		Residual oil, No. 6, Oklahoma	Bunker C, New York	Diesel, shore plants, New York
1948 to 1949.....	+6	-56	-37	-10
1940 to 1949.....	+101	+102	+42	+84
1926 to 1949.....	+101	-12	+9	-----

As the tabulation shows, the disparity of movement between the two prices was especially pronounced in the movement from 1948 to 1949. Unlike bituminous coal, the price of fuel oil responded sensitively to the adjustment in demand during this period. Consumption of energy derived from all fuels and waterpower declined only moderately—by 5 percent—between 1948 and 1949, while consumption of bituminous coal dropped by 15 percent.²

Price and Wage Developments

The over-all level and structure of prices have been characterized by remarkable stability since the summer of last year, reflecting the firmness of demand as well as rigidities in several important cost elements. Most of the important revisions in market quotations from 1948 highs occurred in the first 6 months of 1949. Through early 1950 the principal development at retail has been the continued gradual downward adjustment of food prices to the lower level of farm prices established in 1949, as described in the February issue of this SURVEY.³ In wholesale markets the major change was the leveling off of the decline in farm prices and the suggestion of moderate recovery in this segment in February and March. Since July of last year the index of wholesale prices of commodities other than farm products and foods has varied within a range of less than 1 percent.

¹ It is of interest to note that much the same generalization will hold if comparison is made with the price of natural gas, which also competes with bituminous coal though not to the same extent as does fuel oil. The price of natural gas in 1949 was less than 2 percent higher than in 1948, only 13 percent higher than in 1940, and 7 percent higher than in 1926.

² The basic trends in the industry were reviewed in the July 1948 SURVEY in the article "Changing Patterns of Fuel Consumption" by Murray F. Foss.

³ See especially pp. 11-12.

Table 2.—Percent Change in Prices and Hourly Earnings

Industry group ¹	November 1948 to July 1949	July 1949 to February 1950	November 1948 to February 1950

Wholesale prices.....	-9	0	-9

¹ Approximate comparability between prices and hourly earnings for the various groups was obtained by regrouping and reweighting, when necessary, the basic data of the Bureau of Labor Statistics.

Source: U. S. Department of Commerce, Office of Business Economics, derived from U. S. Department of Labor, Bureau of Labor Statistics.

Wages rising

As shown in table 2, the lowering of the level of prices of industrial goods was accompanied by a slow upward drift in hourly earnings of employees in most manufacturing industries for which comparable data can be secured. In addition, it should be noted, labor costs have been raised in some industries by increased employer contributions to pension and welfare funds. Industrial prices in February were 5 percent below their high of November 1948. During the

same period hourly earnings in manufacturing industries have advanced by almost 2 percent.

This disparity in movement is also apparent if attention is directed to the change from the 1948 average to the 1949 average and comparison made between hourly earnings in all nonagricultural industries and changes in consumer prices, as the following tabulation shows:

	Percent change from 1948 to 1949
Consumer prices.....	-1.2
Average hourly earnings in nonagricultural industries.....	+3.6

A gradual advance in hourly earnings in relation to prices is a development which, of course, is ordinarily to be expected in response to progressive gains in productivity and does not necessarily imply a change in the relative size of the distrib-

utive shares of national income. From 1948 to 1949 the ratio of the compensation of employees to national income in the business sector of the economy (excluding government enterprises), did, however, rise somewhat—from 57.8 to 59.0—on the basis of preliminary data. This ratio was about the same in 1949 as in 1946 and 1947, and moderately above other years of high level employment. In 1929 the ratio was at 55.6 and in 1941 at 57.3. Thus, despite the relative behavior of prices and hourly earnings, there was only a moderate alteration in the distribution of national income between employees' compensation and all other shares in 1949, which resulted primarily from the drop in farm income, and the resulting relationship did not differ markedly from earlier prosperous years.

Farmers' Planting Intentions

DURING the past 2 years farm output was at a higher rate than in any earlier year and 6 to 8 percent above the wartime peak in output reached in 1944. As demand for United States farm exports declined with improved supplies abroad and domestic demand eased slightly, stocks of many farm products began to accumulate. In order to control stocks and to reduce the cost of price support, programs to curtail farm production were placed in operation on basic farm products for 1950. Some indication of the reaction of farmers to these programs may be seen in the regular report of the Department of Agriculture on farmers' planting intentions for 1950.

This report suggests a moderate reduction in over-all acreage, compounded of a reduction for the principal crops where production controls are in operation and an expansion for other crops which are not under control. Although spring plantings reported for 1950 are about 4 million acres larger than a year earlier, the total acreage which farmers intend to have under cultivation this year is somewhat lower. This reflects in part a reduction in winter wheat plantings last fall of over 9 million acres. In addition it may be noted that prospects for cotton are not included in the spring planting report, and for this crop marketing quotas already established call for a cut of about 5 million acres. The net effect upon total acreage in crops in 1950 may be a reduction of about 3 percent below the 370 million acres in 1949. The impact of part of this, of course, may be offset by higher yields per acre.

The acreage subject to controls represents over half of the cropland in 1949, with wheat, corn, and cotton accounting for almost all of the controlled acreage. Table 3 shows the intended acreage for 1950 for the principal crops, excluding cotton, compared with actual plantings in previous periods. For the group subject to control, a reduction in acreage from last year of 18 million is in prospect. This is offset by an expected expansion of 13 million acres of crops which are not subject to control at the present time.

The principal adjustment in acreage expected in 1950 as compared with 1949 reflects varying degrees of adjustment in the major crop regions as well as some changes which offset each other and are thus concealed in the total figures for the United States. There is an advantage, then, in viewing the expected shifts in crop patterns within the three broad areas corresponding to the principal crops under control—the wheat, corn, and cotton belts.

Net curtailment in wheat belt

In the 14 principal wheat growing States the changes in acreage from 1949 to 1950 are indicated as follows in millions of acres:

Declines		Increases	
Wheat.....	-10.1	Rye.....	+0.3
Flaxseed.....	-1.0	Oats.....	+3.1
Corn.....	-1.8	Barley.....	+2.4
	-12.9	Sorghum.....	+2.7
		Hay.....	+0.4
		Sugar beets.....	+0.1
			9.0

The decline in flaxseed reflects a substantial reduction in support price. The cut in corn acreage is primarily in the commercial corn areas in Minnesota and Nebraska which are adjacent to the corn belt proper. Most of the expansion in the wheat area is in oats, barley, and sorghum. In addition there was a substantial rise in fallowing.

Preliminary estimates of winter wheat production for 1950 indicate that yields will be lower than last year, because of unfavorable weather, with output placed at 764 million bushels, or about 15 percent less than in 1949. The total acreage on which farmers in the wheat belt intended to grow crops this year is 4 million smaller than 1949 plantings.

Offsetting shifts in corn belt

By contrast, farmers in the 5 central corn belt States indicated that they would plant about the same total acreage in 1950 as in 1949. Expected reductions of about 10 percent, or 3.6 million acres of corn, in these States were nearly offset by expansions in hay, soybeans, oats, rye, and barley. If the adjacent States, Minnesota and Nebraska, are included the cut in corn acreage amounts to 5.3 million acres and the net reduction in total crop acreage in this area rises from about one-half million to 1.2 million.

This tendency of the corn belt to maintain acreage is partly attributable to the fact that the reduction in corn was small. Farmers who grow no more corn than they need for feeding livestock on their own farm were not necessarily affected by the acreage allotments which are applicable only to those who plan to sell corn. In addition, corn belt farmers had numerous alternatives for crop expansion, as indicated by the significant rise in acreage of 5 crops on which there were neither restrictions nor announced reductions in support price.

It may be noted that prospective acreage for corn is particularly subject to change, since most farmers did not know at the time they reported what allotments they would receive for 1950.

Plantings reduced in South

A complete report is not available on planting intentions in the South, since the collection of official information on cotton crop prospects prior to July 1 is legally restricted.

(Continued on p. 24)

Capital Investment Programs and Sales Expectations in 1950

AMERICAN business, exclusive of agriculture, plans another year of large capital expansion, although the aggregate investment will be less than the high figures of the previous 2 years. Expenditures for the construction of new plant and the purchase of new equipment are scheduled at \$16.1 billion during 1950. This is \$2 billion, or 11 percent less than in 1949.

This downward adjustment in capital outlays is not due to any expectation of a change in the current favorable market for goods, but stems rather from the gradual catching up on the backlog demand for plant and equipment carried over from the war. Actually, businessmen responding to this survey anticipate that sales in the aggregate will be as high in 1950 as in the preceding year.

These results are based on reports submitted between mid-January and mid-March in the annual survey of plant and equipment expenditures and sales conducted jointly by the Office of Business Economics and the Securities and Exchange Commission. The data presented in this article are estimates for all nonagricultural business based on a sample composed of most corporations registered with the Securities and Exchange Commission and a large number of unregistered manufacturing companies, unincorporated as well as corporate, reporting to the Office of Business Economics.

Investment Programs

In 1950 as a whole, anticipated business expenditures of \$16.1 billion on new plant and equipment compare with \$18.1 billion of capital outlays in 1949. Plant and equipment costs have risen slightly in the early months of 1950 and are currently about the average level prevailing in 1949. It would appear that the physical volume of outlays in 1950 based on current anticipations may be off about as much as the indicated dollar volume.

The \$8.4 billion of expenditures planned by businessmen in the first half of 1950 is 8 percent below actual expenditures in the corresponding period of 1949. However, this volume of outlays, on a seasonally adjusted basis, represents maintenance of the rate of expenditures which prevailed during the second half of 1949 (see chart 1).

This evidence of continued strength in fixed investment in the current period is corroborated by the new and unfilled orders data in the early months of 1950. Orders received during January and February by manufacturers—including producers of machinery and equipment—generally showed substantial increases over the end of 1949, rising even more than sales.

First half steady—second half to decline

Thus, the major impact of the reduction of capital outlays anticipated for 1950 will be felt in the second half of the year. A proper evaluation of the extent of this decline requires

NOTE.—MR. BRIDGE AND MR. BECKLER ARE MEMBERS OF THE BUSINESS STRUCTURE DIVISION, OFFICE OF BUSINESS ECONOMICS.

adjustment for seasonal influences and for factors peculiar to anticipatory data. Allowing for the normal seasonal influences found in actual expenditures, the implied decline from the first to the second half of the year is almost 13 percent. However, actual expenditures as reported in the fourth quarter, unlike anticipated outlays, are raised by the concentration of certain charges to capital accounts in the end of year statement. Making rough allowance for this factor the decline would be closer to 10 percent.

Chart 1.—Trend in Business Expenditures for New Plant and Equipment ¹

¹ Data exclude expenditures of agricultural business and outlays charged to current account. Anticipated expenditures were reported by business between mid-January and mid-March of 1950.

² Latest plotting point is for the last half of 1950, seasonally adjusted, at annual rate.

Sources of data: U. S. Department of Commerce, Office of Business Economics, and Securities and Exchange Commission. Seasonal adjustment by Office of Business Economics.

In addition, past surveys have indicated that anticipated outlays in the latter part of the year are understated relative to the early part of the year due to the lesser completeness of future programs as compared to near-term budgets. Thus in the second half of 1949, as well as in earlier years, actual expenditures were somewhat higher than those anticipated at the beginning of the year. Moreover, the returns from a special questionnaire designed to determine the reasons for differences between actual and planned expenditures for individual companies indicate that there is a systematic tendency in this direction.

It is, therefore, likely that the suggested downturn in the second half of 1950 is somewhat overstated—and may be closer in magnitude to the decline which took place from the

first to the second half of 1949. This would also suggest that the anticipation for the year as a whole may err on the low side.

Each major group lower for the year

For the year 1950, every major industry anticipates a lowered rate of plant and equipment investment. (See chart 2.) Railroads and other transportation show the largest cut-backs from 1949, amounting to 31 and 35 percent, respectively. Gas and electric utilities anticipates the smallest decline (6 percent), with manufacturing concerns a close second (7 percent). The mining and commercial and miscellaneous groups report declines varying little from the average for all industries.

Within manufacturing, both plant and equipment expenditures are expected to decline with the proportion of equipment to total outlays rising moderately. There was little difference by size of firm among manufactures in the relative changes in planned capital outlays.

Postwar Trends in Capital Outlays

The capital programs of business for 1950 should be appraised against the background of the earlier postwar developments in outlays for plant construction and producers' durable equipment. These outlays reached an all-time high in late 1948, after an uninterrupted 3-year period of intensive expansion and modernization of industrial facilities. By and large, the expenditures during this period had eliminated a considerable portion of the backlog in business demand for capital goods which had accumulated during the war.

The leveling off in fixed capital outlays during the latter half of 1948 developed into a moderate decline in the subsequent year. A reduction was also noted in other areas of domestic investment during the first half of 1949, as inventories and residential construction—particularly the former—joined in the downward adjustment in general economic activity. During the second half of the year, business fixed capital investment continued to decline, although a rise in residential construction in the third and fourth quarters and a lower rate of inventory liquidation at the close of the year exerted a stabilizing force on aggregate private domestic investment.

Influence of price movements

The rise and subsequent decline in the value of fixed capital outlays reflected in part the movements of prices. The postwar rise in plant and equipment prices continued until early 1949, although the wholesale price index for all commodities reached its peak the preceding summer. By the fourth quarter of 1949, the average of plant and equipment prices was about 5 percent lower than a year earlier. Dollar outlays had fallen 14 percent so that the reduction in the physical volume of investment approximated 10 percent. The present survey results indicate a leveling out in investment in the early months of 1950 and then a resumption of the decline in both dollar outlays and in physical volume which had started in early 1949.

While there are several factors resulting in these trends, including the movements of sales and profits, probably the principal influence has been the reduction in the backlog of demand for capital goods in 1949 and 1950. There are various independent indications of the importance of this factor in recent years.

Reasons for slackened pace of investment

First, the preliminary findings of a survey, initiated by the Office of Business Economics to determine the factors influ-

Chart 2.—Business Expenditures for New Plant and Equipment, by Industry Groups¹

¹ Data exclude outlays charged to current account. Anticipated expenditures were reported by business between mid-January and mid-March of 1950.

² Data include trade, service, communications, construction and finance.

Sources of data: U. S. Department of Commerce, Office of Business Economics, and Securities and Exchange Commission.

encing changes in the rate of fixed investment, are pertinent. On the basis of early returns, of those reporting companies anticipating a reduction of more than one-third from their 1949 capital outlays, approximately three-fifths indicate that "completion of current capital investment program" is the principal reason for this decline.

Second, an evaluation of postwar investment trends can be made in terms of the long-term trend in the demand for producers' durable goods. On this basis, the anticipated capital outlays in the second half of 1950 is quite close to the secular level which prior experience suggests is necessary to maintain facilities and provide for normal growth in produc-

tive capacity. A similar comparison for earlier years indicates that outlays in 1947 and 1948 were considerably, and in 1949 somewhat, above the secular trend.¹

Thus, the influence of capital goods backlogs in the current demand situation is dwindling rapidly. The demand for capital goods is more closely in line with past relationships to the physical volume of over-all economic activity and to net income in 1950 than in any previous postwar period.

Chart 3.—Business Expenditures for New Plant and Equipment: Actual and Anticipated¹

¹ Data exclude expenditures of agricultural business and outlays charged to current account. Anticipated expenditures were reported by business between mid-January and mid-March of the respective year.

Sources of data: U. S. Department of Commerce, Office of Business Economics, and Securities and Exchange Commission.

The substantial growth in the business population during the 1946-48 period and its subsequent stabilization also had a pronounced effect on the postwar trend in capital goods investment. On the basis of a study presented in another article in this issue, "Capital Requirements of New Manufacturing Firms," it is estimated that the direct contribution of newly formed firms accounted for 10 percent of the total investment in new plant and equipment during the 3 years 1946 through 1948.

The greatest impact on aggregate demand by new firms occurred in 1946—the highest year on record in the number of entrants into the business population. This factor declined in importance throughout 1947 and 1948 and has been fairly insignificant in 1949 and thus far in 1950.

Anticipated versus actual outlays

In evaluating the 1950 investment intentions of business, attention should be drawn to the degree of accuracy with which businessmen have anticipated their actual outlays in the past. In 1949, aggregate expectations of business were almost fully realized as nonagricultural business firms spent \$18.1 billion, within 1 percent of the amount that they had anticipated spending at the beginning of the year. In corresponding surveys covering 1947 and 1948 (see chart 3), planned outlays were 14 percent below those realized in the former year and 3 percent below those realized in the latter year.

The experience in these annual surveys augmented by the more numerous quarterly surveys suggests that the degree

of accuracy in businessmen's projections of their dollar expenditures on plant and equipment is closely related to movements in capital goods costs. In 1947, when businessmen underestimated their outlays by 14 percent, the price rise for capital goods during that year was of the same order of magnitude. In 1948, with a smaller increase in capital goods' costs and a greater availability of supplies, businessmen were able to forecast their expenditures with a greater degree of reliability.

It is quite possible, therefore, that anticipated outlays are largely in terms of physical volume and prevailing prices and hence, do not sufficiently take account of price factors. It should be pointed out, however, that the general easing of supplies and the elimination of restrictions on nonresidential construction during 1947 and 1948 may also have permitted larger increases in capital outlays than were considered feasible at the beginning of these periods.

As pointed out above, anticipated outlays for new plant and equipment in 1949 were about 1 percent below actual expenditures while costs fell somewhat more between the end of 1948 and the end of 1949. The coincidence between planned and realized expenditures is especially noteworthy since this period was a turning point in postwar business investment.

Though movements in prices are not likely to affect perceptibly the investment plans of business this year, there are two factors which may cause actual expenditures to diverge from expectations. First, changes in economic conditions do have some effect on investment plans. Thus, actual expenditures in the first half of 1949 were lower than those anticipated as a result of a temporary deterioration in the economic picture, while estimated expenditures in the first quarter of 1950 are higher than those initially planned because of an improvement in business conditions. Second, as pointed out earlier, there is probably some understatement in anticipated fixed capital outlays for any period well in the future, since businessmen generally tend to be conservative in their budgets or stated plans and are less likely to report their more tentative plans over the longer term.

Quarterly trends

The trend of capital-goods investment during the first three quarters of 1949, after allowance for seasonal influences, was one of steady decline—falling approximately 12 percent from the peak annual rate of \$20 billion of outlays in the fourth quarter of 1948. During the last quarter of 1949 and the first quarter of 1950, expenditures remained at the third-quarter rate of \$17.5 billion.

Both the fourth quarter of last year and the first quarter of 1950 were revised upward about 8 percent from their initial anticipations. To a large extent the upward revision in the earlier quarter was attributable to accounting adjustments. The revision in the first quarter of this year, however, was largely due to the improvement in the business situation at the close of 1949 and during the early months of 1950. These upward revisions occurred in all major industrial groups.

Anticipated outlays in the second quarter are about \$500 million (at seasonally adjusted annual rates) below the first quarter. The bulk of this decline was expected in manufacturing—although the data for the second half of 1950 indicate that capital-goods outlays in this industry will decline less from the first half than in any other major group.

Manufacturing investment down moderately

Capital outlays of manufacturers are expected to total \$6.7 billion during 1950, compared with \$7.2 billion in 1949, and \$8.3 billion in 1948. The anticipated decline in expenditures in 1950 is more moderate, both in absolute and rela-

¹ See "The Demand for Producers' Durable Equipment," SURVEY OF CURRENT BUSINESS, June 1949.

tive terms, than that which occurred from 1948 to 1949. This is especially noteworthy since it was in this area that the weakening of private domestic investment in 1949 was most evident.

Anticipated expenditures during the first half of 1950, after adjustment for seasonal influences, are somewhat higher than the level which prevailed during the latter half of 1949. During the second half of 1950, seasonally adjusted capital expenditures by manufacturers are expected to fall somewhat less than 10 percent—but, for reasons discussed above, the decline may not be that large.

There are substantial differences in the 1950 investment programs among the component groups in this industry. For example, the automobile group anticipates a sizable increase; the steel and food groups, little change; chemicals, a moderate decrease; petroleum, a somewhat larger decline; and the textiles, leather, and apparel group, a very large decrease.

The expected increase in capital outlays by the automobile industry in 1950 will involve considerably larger expenditures for both plant and equipment. In large part, this is due to new facilities designed to improve the effectiveness of production, and to large outlays resulting from the growing importance of automatic transmissions.

In the petroleum industry, expenditures for new capital goods this year are expected to be below the high 1949 total. There is a general trend toward heavier expenditures for exploration, production, and pipe-line construction, but it is anticipated that reductions in outlays for refining and marketing facilities will be more than offsetting.

When the 1950 plans of manufacturing companies are examined in terms of firm size, it is found that there is little difference between the smaller and larger firms in the relative changes from last year's capital outlays.

Manufacturing construction and equipment expenditures

In 1950, as in 1949, manufacturing expenditures on equipment are expected to increase relative to expenditures on plant—although in absolute terms anticipated expenditures for equipment in 1950 are somewhat less than in 1949.

In the early postwar period, with aggregate demand for industrial products considerably above supply, the efforts of producers were directed toward a rapid increase in capacity and output, though limited by restrictions on construction and shortages of materials. As can be seen in the following tabulation for manufacturing and mining firms, equipment outlays in the 1946-48 period slowly declined relative to

plant expenditures, but remained above the immediate prewar average.²

	1939-40 average	1946	1947	1948	1949	1950
Percent of equipment expenditures to total new plant and equipment outlays ²	64	72	71	69	73	75

During 1949 and 1950 the completion of a high proportion of the immediate postwar capital expansion programs and developments toward keener competitive conditions have reversed the downtrend in the equipment proportion of total outlays which had characterized the immediate postwar years. A higher proportion of equipment outlays, as well as of total capital expenditures, has been taking the form of replacement and modernization expenditures rather than additions to capacity. In the near future, cost reducing machinery will probably become an increasingly significant part of plant and equipment expenditures though capital investment for new products may also rise in importance.

Railroad outlays down

The reduction in expenditures for new plant and equipment anticipated for 1950 by the railroads exceeds that of all other major industries with the exception of the other transportation group. Railroad outlays are expected to decline 31 percent from 1949, reflecting the effects of reduced traffic and earnings during 1949 and also the completion of a considerable portion of their postwar expansion in road construction and equipment installation.

The downward trend in capital outlays has been especially noticeable in deliveries of freight cars, one of the major components of railway purchases. Shipments during the early months of 1950 were approximately one-fourth as large as those in the corresponding period of 1949. This is reflected in the railroads' anticipation that total equipment outlays in the first half of this year will be 35 percent below the same period last year—as compared to a 15 percent decline in construction expenditures.

Capital outlays in the first and second halves of this year are each expected to be about 31 percent below the corresponding periods of last year. The extent of the downturn in the second half of 1950, however, may be overstated. The roads' prospects for earnings and traffic in 1950 appear more favorable each month. Despite the work stoppage in

² Mining is included in these figures since manufacturing and mining were not segregated in the prewar estimates. The 1939-40 estimates are not completely comparable to those in the postwar period.

879643-50-2

coal in the first quarter, estimated carloadings in the first 2 quarters of this year are above the corresponding periods of 1949. Although unfilled orders for freight cars are considerably below a year ago, they have doubled since December. These orders indicate that a higher rate of deliveries may occur in future months. In addition, the backlog in orders for passenger cars and locomotives continues high.

The replacement of coal-burning steam locomotives by Diesel-electric engines has been proceeding at a record rate. As a result of this program 35 percent of the 1949 freight traffic of class 1 roads was hauled by Diesel-electric locomotives as compared with 10 percent in 1946 and less than one percent in 1941. Installations of Diesel locomotives in the first 2 months of 1950 exceeded the previous year's rate by 10 percent.

Utilities investment remains high

Capital expenditures by electric and gas utilities in 1950 are programmed at \$2,940 million, 6 percent below the previous year but approximately 10 percent above 1948. Seasonally adjusted data indicate that little decline from the fourth quarter is expected in the first half of 1950, so that the indicated annual decline will be concentrated in the second half of this year.

Expenditures by both the electric and gas utilities are expected to decline this year. In the electric-utility industry, increased outlays in transmission lines and general plant construction are expected to be more than offset by lower investment in generation and distribution facilities. A major element of strength in the gas-pipe-utility field is line construction. During 1949, long-distance lines brought increasing quantities of natural gas from the Texas, Louisiana, Oklahoma, and Kansas fields into the heavily populated northeast area. Much larger quantities are expected to reach this area during 1950 with completion of such projects as the 1,850-mile pipe line from the lower Rio Grande Valley to the New York metropolitan area.

Sales Anticipations

Sales anticipations for the entire year 1950 were reported in this survey along with annual plans for capital outlays. According to the replies of this representative cross section of American industry, business firms in aggregate expect to maintain in 1950 approximately the same level of sales as in 1949.

Within industry groups, modest advances in sales volume are anticipated by electric and gas utilities and manufacturing—industries, which, as noted above, expect the smallest cut-backs in capital outlays compared with 1949—while slight reductions are expected by trade and transportation concerns other than railroads. The following table shows the anticipated changes in sales in 1950 and actual and anticipated changes in the 1947-49 period for selected industries. The data indicate that sales expectations in 1948 and 1949 were realized within a reasonable margin of error.

Percentage change in sales¹

	1947 to 1948		1948 to 1949		1950
	Actual	Anticipated	Actual	Anticipated	Anticipated
Manufacturing.....	+11	+5	-6	-1	+2
Electric and gas utilities.....	+12	+12	+7	+4	+6
Trade.....	+8	+2	-5	0	-2
Other transportation.....	+16	+19	+3	-1	-3

¹ The percentage changes in actual sales are based upon total sales for manufacturing and trade, and revenues by utilities and nonrail transport agencies. Data on revenue anticipations were not collected for railroads.

The postwar trend in manufacturing sales is shown in chart 4. Within manufacturing, 1950 sales in most major industries were expected to be little changed from their 1949 levels.

However, the producers' goods industries, unlike other manufacturers, anticipated a slight decline in their sales this year, reflecting the moderately lower capital outlays programmed by business as a whole.

Chart 4.—Manufacturers' Sales

¹ Anticipated sales were reported by business between mid-January and mid-March of 1950. Source of data: U. S. Department of Commerce, Office of Business Economics.

In correspondence with the findings noted above concerning investment programs by size of firm, sales anticipations show little evidence of significant differences between large and small manufacturers. This is in rather sharp contrast to the size comparison in the previous survey conducted early in 1949. In that survey large manufacturers anticipated an increase in sales volume for 1949 over 1948 of approximately 5 percent as compared with an expected decline of 4 percent for medium-size firms and 8 percent for the smallest size group.

It may be noted that sales programs of business are not so firm as investment plans. Sales for a particular firm are subject to forces of demand largely outside the control of the individual business concern. Investment decisions, on the other hand, although influenced by the current demand for the firm's sales product, are determined by other independent considerations and in addition involve commitments some time in advance.

While manufacturing and trade anticipated that the end of the upward movement in sales in the early postwar period would occur in 1949, they did not envisage the extent of the decline that was actually experienced. In the previous year, manufacturing and trade firms anticipated only part of the increase which occurred in sales. These differences, for reasons indicated in the discussion of investment programs, can be explained largely in terms of movements in prices subsequent to the time the anticipations were reported. However, sales expectations—to a much greater extent than investment plans—are probably also considerably influenced by the rate of operations at the beginning of the period. The greater accuracy of anticipated sales by electric and gas utilities reflects the relative stability in their prices as well as the close relationship between capacity and consumption over the postwar period.

Capital Requirements of New Manufacturing Firms

THE RAPID growth in the business population through mid-1948 and its relative stability thereafter was a significant factor in the postwar trend in investment. The purpose of this article is to provide a quantitative measure of the contribution to over-all investment by new manufacturers in the 1946-48 period and the manner in which such investment was financed. In addition, data are presented on the industrial differences in average and aggregate capital requirements of new manufacturing firms. As discussed at length in the technical notes, the results are based upon the reports of about 1,100 new manufacturing firms which furnished information for the years 1946 through 1948. This article supplements a similar analysis for new trade firms in the December 1948 SURVEY.

These two studies go a long way toward providing an appraisal of the effects of changes in the postwar business population upon the total volume of investment in fixed assets and inventories. While other industries remain uncovered—notably services and construction—new manufacturing and trade firms combined probably account for more than 90 percent of the inventories and 60 percent of the plant and equipment investment of all new nonagricultural firms.

Summary

Of the estimated \$2 billion total of initial capital requirements by new manufacturers during the 1946-48 period, \$800 million was expended on new plant and equipment, \$300 million on inventories, \$500 million in additional working capital, and \$400 million on used plant and equipment. The expenditures for new plant and equipment and for inventories were each about 4 percent of the similar investment by all manufacturing firms. For all nonagricultural business combined, it is further estimated that the direct initial contribution to aggregate investment by new firms in this period amounted to about 10 percent in new plant and equipment and 15 percent in inventories.

About \$1.2 billion of the capital requirements of new manufacturers was financed out of the entrepreneurs' accumulated personal savings. An additional \$300 million was supplied by parent companies' loans and equity investment, and loans by relatives, partners, officers, and directors. Advances by banks, merchandise and equipment suppliers, and government agencies accounted for over \$450 million of the initial funds—banks alone accounted for over \$250 million, merchandise suppliers for \$50 million, and equipment suppliers for \$150 million. The remaining investment funds came from the sales of more than \$50 million of new stock and \$10 million of bond issues.

This distribution of the major sources of funds was quite similar to that found among new trade firms. For both industry groups, equity financing, including the personal saving of entrepreneurs, constituted about two-thirds of the total sources of funds for new firms.

NOTE.—MR. BRIDGE AND MISS HOLMES ARE MEMBERS OF THE BUSINESS STRUCTURE DIVISION, OFFICE OF BUSINESS ECONOMICS.

The capital markets were of little importance as a source of funds for new firms. Combining new manufacturing and trade concerns, about \$100 million was raised from public issues during this 3-year period. Bank loans—constituting over 13 percent of the total sources of funds for new manufacturing and trade firms—were more important, amounting to more than \$1.0 billion for the two groups combined. While new trade and manufacturing firms accounted for over 10 percent of the total change in outstanding bank loans during this period, public issues for these new firms represented less than 1 percent of total net new issues.

Aggregate and Average Investment

The establishment of 166,000 manufacturing firms in the 3 years 1946 through 1948 resulted in an estimated initial capital investment of approximately \$2 billion.¹ The lumber and timber basic products industry accounted for almost 25 percent of this investment and nearly 45 percent of the total number of new manufacturing concerns. This group included over three-fifths of all firms without any employees—and, as a result, had the lowest average investment of any major industry.

The textiles industry with less than 2 percent of the total new entrants accounted for 6 percent of the aggregate investment as a result of its high average requirements. New manufacturers in the food, apparel, metals, machinery and stone, clay and glass industries accounted for from 6 to 9 percent each of the over-all investment. The lowest aggregate investment—and the lowest number of new firms—were in the rubber and petroleum products industries.

As compared with manufacturing, the initial capital requirements of new wholesale and retail trade firms in the 3 years 1945-47, as indicated in the previous survey, amounted to \$1.5 billion and \$5 billion, respectively. (See chart 1.)² The average initial investment of manufacturing firms, inclusive of no-employee firms, is estimated at \$12,000 as compared to \$22,000 and \$9,500, respectively, in wholesale and retail trade.

The average initial investment of new lumber firms was only slightly over \$6,000, compared to an average investment by new non-lumber manufacturers of \$16,500. Lumber and apparel were the only industries with investment below the average for all manufacturing. The largest average investment, \$43,000 and \$22,000, respectively, was found in the textiles and food processing industries.³

¹ This figure is based on appropriately weighted sample data plus a rough estimate of the investment of new manufacturers without any employees. This estimate is more fully discussed in the technical notes.

² These estimates have been slightly revised since publication in the December 1948 SURVEY OF CURRENT BUSINESS due to a revision of the population statistics (see "Revised Estimates of the Business Population, 1929-48," SURVEY, June 1949). It will be assumed in this article that no adjustment is necessary for the differences in timing in the two studies. 1946 and 1947—the 2 years common to both surveys—accounted for more than 70 percent in trade, and 75 percent in manufacturing, of all entrants in these fields during the respective survey periods. While fixed assets and other costs were considerably higher in 1948 than in 1945, the number of new manufacturing firms established in 1948 was one-fifth lower than in the earlier year.

³ On a more detailed industry breakdown, some industries—e. g., automobile manufacturing—would show a higher average investment than the groups indicated above.

Charts 2 and 3 show the average investment of new firms for the major manufacturing industries and by sales-size within these industries. In view of the low average investment for the universe of new lumber firms, it is interesting to note that, when firms with no employees are eliminated, the average investment in this field is higher than the average for all manufacturing industries. The average investment in apparel was lower, and in food and textiles higher, than the all-industry average for a given sales-size. The latter results are consistent with the over-all figures inclusive of firms without employees.

As pointed out in the previous article on trade firms, the availability of capital and the price level in the postwar period had a considerable influence on both aggregate investment or scale of operations of these firms and the distribution of that investment among uses as well as sources. It is also quite possible that the average experience differs from the optimum capital requirements of these firms.

Limitations of the sample data

Thus far, this article has presented universe estimates based on the sample data. The size of the sample, however, does not permit the derivation of all of the universe estimates necessary for comprehensive examination of the characteristics of new manufacturing firms. In the following detailed analyses of the survey results, the unadjusted sample data will be used whenever there is stratification by size and legal status. This stratification adjusts for the inadequate representation of firms no longer in business, and for other disproportions of the sample. Where such stratification is not

shown, the sample data have been weighted by size and legal form of organization.

The shortcomings of the data and some measures of their sampling variability are fully discussed in the technical notes. It may be noted here that the major limitation in the sample arises from the absence of firms with no employees, though an adjustment for this group has been made in arriving at the universe estimates. In general, the errors of estimation associated with the sample data are relatively small. However, in tables 1 and 6 where dollar figures by size and industry are given, the large number of cells results in rather sizable sampling variability in some instances so that the data should be used as orders of magnitude rather than precise measures.

It should be noted that the investment-size classification is based on initial investment without regard to either year of entry or subsequent changes in assets. The sales-size tabulation is based on 1948 sales without any allowance for either the year of entry or the differential growth in sales during the 1946-48 period. The classification of firms operating from 6 to 11 months in 1948 was based on the annual rate of their partial year sales in 1948. Firms operating less than 6 months in 1948 were eliminated from this tabulation.

Another factor meriting mention here relates to the timing of the data submitted by the sample firms. The reporting firms could be divided into three clearly defined groups. The first group, consisting of 92 percent of the sample, reported their investment essentially at the time they started production.

The second group reported their assets and liabilities on the last day of their first calendar or fiscal year in business. These companies (about 3 percent of the sample) reported small amounts of trade receivables and net profits or losses. The initial investment of these firms was adjusted by either reducing (or increasing) their investment by the amount of net profits (or losses) reported.

The last group (about 5 percent) reported their investment some time before their start of production. These companies typically report their entire investment as current assets (other than inventories) and, on the sources side, as equity capital. Since many firms in this group were still exploring credit lines, there was some understatement in the amount of reported investment. The reports of these firms were eliminated from the sample tabulations.

Sources of Capital Supply

About 59 percent of the capital requirements of all new manufacturers was met by the equity capital investment of the entrepreneurs themselves. Another 7 percent was also equity capital coming from parent companies and the capital markets—mainly the former. The remaining 34 percent was debt financing, with the banks supplying 13 percent (mostly mortgage loans), merchandise and equipment supplies 9 percent, and bond sales less than 1 percent. Loans by individuals, parent companies, and governmental agencies accounted for 11 percent.

The distribution of the sources of capital supply of new manufacturing establishments differed according to size of firm, legal status, industry and, within firms, by the uses of invested capital. The most significant divergencies are noted when comparison is made in terms of sales-size and investment-size (tables 2 and 3).

As the firm-size increased, the relative investment in total equity capital among both corporate and noncorporate firms declined and total debt financing increased. However, within corporate equity capital, the relative importance of stock subscriptions by parent companies and by the general

public varied directly with size of firm, while those by officers and directors varied inversely.⁴ Similarly, within debt financing, while merchandise credit, industrial bank loans, and mortgages on business properties increased with firm-size, there was a tendency for nonbank, nonsupplier credit to decrease. The latter tendency was due to the influence of loans from friends and relatives—an important source of funds for the smaller concerns.

When the sample data were examined by legal status, it was found that the equity in new corporate firms was somewhat larger than in new unincorporated concerns within comparable size groups due to the greater availability to corporations of parent company and general public equity funds (see chart 4). Within comparable—and especially in the larger—sales-size groups, personal savings of noncorporate entrepreneurs were a higher proportion of initial investment than were stock subscriptions of officers and directors in corporations.

Chart 2.—Manufacturing Firms Starting Operations in the 1946-48 Period: Average Initial Investment, by Industry¹

¹ See text footnote 1, page 11.

² Classification excludes machinery and transportation equipment.

Source of data: U. S. Department of Commerce, Office of Business Economics.

The methods of financing new firms are also associated with, and in some cases dependent upon, the distribution of these funds into the various types of assets. For example, the entrepreneur purchasing a plant has access to either a mortgage loan or an industrial loan, secured by his plant. The volume of credit available from suppliers of merchandise and equipment is, of course, related to the size of inventory and equipment investment. Bank credit is also obtained on equipment and inventories—although these types of collateral are not so important as plant.

⁴ It should be noted that, in this article, stock subscriptions by the general public refer to stock subscribed by other than the officers, directors, and parent or affiliated companies of a new firm—and not necessarily to widely distributed public offerings. There was only one sizable public issue registered with the Securities and Exchange Commission which was in the scope of this survey. This issue by an automobile company accounted for over one-fourth of the estimated stock sales to the general public.

Sources by industries

In general, the industrial differences in the distribution of the sources of investment funds among new manufacturing firms were found to be related to variations in fixed assets and inventory requirements, and, to a lesser extent, to average investment. This can be seen by referring to the data in table 4. For example, apparel manufacturers with relatively low plant and inventory investment received proportionately less industrial and mortgage bank loans and less merchandise supplier credit than did most other industries. They purchased moderately less equipment and received moderately less equipment credit than did the average new manufacturing firm. And, as might be expected on the basis of their low average investment, apparel manufacturers relied relatively more heavily on equity capital (including personal savings) than did most other industries.

Sources of funds of new and established corporations

Although balance sheet data are not available for all noncorporate manufacturers, comparison can be made between the liabilities of new manufacturing corporations and those of existing corporations. The relative initial equity among new firms was found to be considerably greater than among small concerns which have been operating for a period of years and which are most directly comparable in size to new firms.

The initial short-term liabilities of new manufacturing corporations were much lower, and long-term liabilities were about the same, as were the corresponding proportions among small existing concerns. In long-term liabilities, the considerably smaller proportion of bonded debt of new firms was offset by the relatively larger mortgage debt.

Flow of saving into investment

It is estimated that all manufacturers starting operations in the 3 years 1946 through 1948 transferred more than \$1.2 billion of their accumulated personal savings into assets of their businesses. Approximately \$550 million of this investment was channeled into new corporations in the form of stock subscriptions by officers and directors. The remainder represented the personal savings of noncorporate entrepreneurs.

Thus, with the over \$4.4 billion of personal savings invested in new trade firms, about \$5.6 billion of the \$8.5 billion total capital requirements of new manufacturing and trade firms in the 3 postwar years was met by the past savings of the entrepreneurs themselves. Additional stock subscriptions by parent or affiliated companies and the general public brought the total equity capital initially invested to about \$5.8 billion. Of this amount, \$4.8 billion went into noncorporate enterprises and \$1.0 billion into corporate concerns. In addition, these new firms provided direct investment outlets for other individuals' savings—mostly in the form of personal loans and, to a much lesser extent, in new issues of bonds.

Based on the sample, 47 percent of both corporate and noncorporate new manufacturing firms was financed entirely through personal savings or through capital stock subscriptions of officers and directors.⁵ An additional 48 percent supplemented personal savings with debt financing. Of the remaining 5 percent, 2 percent (almost 4 percent of the corporate sample) financed entirely through parent company stock investment, almost 3 percent (6 percent of the non-

⁵ Since the use of personal savings has been found to vary inversely with size of firm, the exclusion of firms with no employees from the sample results in an understatement of the proportion of firms financing entirely through personal savings.

corporate sample) entirely through debt financing and less than one-half of one percent entirely through stock sales to the general public.

Chart 3.—Manufacturing Firms Starting Operations in the 1946–48 Period: Average Initial Investment, by Industry, Grouped According to Sales in 1948¹

¹ The data represented by this chart should be used to indicate orders of magnitude rather than precise measures of average investment. See also footnote 1, table 1, and "Technical Notes" section in the text.

² Classification excludes machinery and transportation equipment.

Source of data: U. S. Department of Commerce, Office of Business Economics.

Bank credit as source of funds

Bank credit was the most important form of debt financing utilized by new manufacturers in the 1946–48 period. This result is similar to that found in the survey of new trade firms. Of the more than \$250 million of bank credit to new manufacturers, 37 percent was mortgage loans on business properties, 20 percent was mortgage loans on other properties and the remaining 43 percent was in the form of nonmortgage industrial loans.

For sample firms only, about one out of every five reported receiving bank credit totaling 35 percent of their combined initial capital requirements and 15 percent of the requirements of all sample firms. In general, bank credit was utilized to a greater extent proportionately by firms with a larger investment in fixed assets, by the larger concerns and, for a given size of company, by noncorporate firms for which such credit was more readily available as a result of their unlimited liability. New firms owning their plants, accounting for 21 percent of the concerns in the sample, received 75 percent of all bank credit.

When examined by type of bank loan, it is found that non-mortgage loans and mortgage loans on business properties tended to assume greater relative importance as firm size increased, while the relative importance of mortgage loans

on nonbusiness properties varied inversely with size. The latter result was probably due to the greater use of mortgage loans on residences by the smaller entrepreneurs.

Supplier credit and capital requirements

Suppliers of merchandise and equipment to new manufacturing firms advanced almost \$200 million of the latter's initial capital requirements. Almost three-fourths of this credit was on the purchase of equipment. While this was partly a reflection of the greater investment by new firms in equipment than in inventories, it may also be evidence that supplier credit was relatively easier on equipment purchases than on merchandise purchases. For all new firms, merchandise credit was 18 percent of inventory investment while equipment credit was 24 percent of new equipment outlays. It should be noted that small existing firms also utilize equipment to a greater extent than inventories as collateral on bank loans.⁶

The sample returns pointed to clear relationships between merchandise credit and inventory investment and between equipment credit and equipment purchases. In general, the data indicated that the relative proportions of both equipment and equipment credit to total investment varied inversely with size, while the proportions of both inventories and merchandise credit varied directly with size. However, there was a tendency for the ratios of credit to purchases of both equipment and merchandise to increase with firm-size—probably reflecting the better credit standing of the larger firms.

Other sources of funds

Almost \$250 million of the initial credit needs of new manufacturers was supplied by nonbank and nonsupplier sources. Among the sample's corporate firms about 25 percent was supplied by officers and directors, 18 percent by parent companies, 16 percent by stockholders of undesignated type, 5 percent by government agencies (mainly Reconstruction Finance Corporation and the War Assets Administration), 5 percent by nonbank mortgages, 6 percent by personal loans (other than those stipulated above), and 25 percent by unspecified lenders.

Among the sample's noncorporate firms, personal loans accounted for 49 percent of "other" sources, Government loans for 21 percent, nonbank mortgage loans 3 percent, partners' loans 3 percent, and unspecified lenders 24 percent.

In general, these sources of funds, as a whole, are found to account for a decreasing proportion of total requirements as sales-size increases. They also were relatively larger among corporate firms than among noncorporate concerns due to the large volume of parent-company advances. Among the smallest sales-size group, however, these sources of funds are proportionately larger among noncorporate firms due to a high concentration of personal loans from friends and relatives.

The Disposition of Investment Funds

Manufacturing firms entering the business population in the 1946–48 period invested somewhat over 60 percent of their total capital in fixed assets, almost 15 percent in inventories, while the remaining one-fourth was kept for other working capital needs.

The relative proportion invested in fixed assets is somewhat larger, and in inventories somewhat lower, than the

⁶ For firms with assets under \$50,000, according to a Federal Reserve Bank loan survey, the value of outstanding loans on November 20, 1946, secured by equipment were about three times those secured by inventories. For all firms, however, the latter type of loan is more important than the former type.

Chart 4.—Corporate and Noncorporate Manufacturing Firms Starting Operations in the 1946–48 Period: Percentage Distribution of Sources and Uses of Initial Investment, by Legal Status, Grouped According to Sales in 1948¹

³ Includes renovation, land, and a small amount of depletable resources.

Source of data: U. S. Department of Commerce, Office of Business Economics.

corresponding investments of either new trade firms or large and small established manufacturing firms. This is due in part to the fact that while a new manufacturer initially obtains the necessary plant and equipment consistent with the expected volume of operations in his early stage of development, his purchase of inventories can frequently be delayed until he receives his orders.

When examined in terms of size of firm, the sample indicated that the larger new manufacturing firms tended to invest relatively more heavily in current assets than did the smaller firms.

Plant and equipment outlays

It is estimated that \$1.2 billion was expended for fixed assets by new manufacturers in the 1946–48 period. Almost \$600 million was for new equipment, about \$200 million for the new plant and over \$25 million for renovation of rented plant. Used equipment and used plant outlays were somewhat less than \$300 million and \$100 million, respectively, while land purchases amounted to almost \$50 million.

The expenditures for new plant and equipment by new manufacturers were about 4 percent of the total expenditures of all manufacturers in this period. In trade—a field where there is considerably less concentration of large firms—new firms made about one-third of the fixed asset investment of all trade firms.

Utilizing the findings in the new trade firm survey, and making rough allowance for uncovered industries, it is estimated that all new firms in the postwar period through 1948 accounted for about 10 percent of the new plant and equipment expenditures by all nonfarm business—both old and new. It should be borne in mind that few new firms enter the railroad and public utility fields which in the

1946–48 period accounted for close to 30 percent of the nonfarm business investment in plant and equipment.

This estimate of the contribution of new firms measures only the immediate and direct investment of these firms. No allowance is made for either capital outlays for plant and equipment by other groups for rental to new firms, or for the replacement of used plant and equipment sold to new firms. In addition, data collected in this survey (which will be presented more fully in a subsequent article on the operating experience of new manufacturers) indicate that the capital goods investment of successful new firms grew quite rapidly in their first 2 years of operation.

It should be borne in mind, however, that the postwar business population experienced its greatest growth in 1946, grew moderately in 1947 and early 1948 and has been relatively stable since mid-1948. Thus the contribution of new firms to business investment has been of dwindling importance since 1946.

An outstanding difference between new trade firms and new manufacturing firms was noted in the size and industry relationships between fixed assets and total investment in the two groups. In the case of trade firms, there was clear evidence that within lines of trade the proportion of plant expenditures to total investment varied directly, while the proportion of equipment investment varied inversely, with firm size. Within manufacturing industries, while such tendencies existed, the relative importance of fixed investment more closely corresponded with type of industry than it did with size. These differences in trade and manufacturing arise mainly from the more homogeneous fixed assets requirements of the various lines of trade as compared to the heterogeneous nature of the different fabricating processes.

In manufacturing industries with high plant expenditures relative to total investment, such as food processing, stone, clay and glass, and transportation equipment, it was found that even the smallest sales-size group had proportionately greater plant investment, than did the largest new firms in industries like apparel, textiles and machinery. Plant investment by apparel manufacturers was relatively negligible even in the largest sales-size group. The relative importance of equipment outlays, similarly, was more closely related to industry than to size.

Working capital requirements

The initial investment in inventories by new manufacturers in 1946, 1947 and 1948 amounted to \$300 million—over 4 percent of the net change in inventories of all manufacturing concerns. The proportion of new inventory investment made by new trade firms was about one-third of that made by all trade firms. Making an arbitrary allowance for the contribution of new firms outside the trade and manufacturing fields, it is estimated that all new nonagricultural firms in the period between 1945 and 1948 made about 15 percent of the total new investment in nonfarm inventories.

Within the manufacturing sample, inventories were found to be larger relative to total investment among the larger firms than among smaller concerns. This was also true among new wholesale and retail trade firms.

Other working capital, as a proportion of total investment, increased with sales-size among the smaller sales-size groups. However, the proportion began to decline with size for the groups with sales of over \$250,000—in large part as a consequence of the rapidly increasing relative importance of inventories.

Plant ownership and rental

Based on the reporting panel (firms with one or more employees), the average capital requirements of new manufacturers occupying their own plant was about three times that of the average new firm renting its plant. The survey results were as follows:

	Renters	Nonrenters
Corporate:		
Average investment.....	\$43, 500	\$146, 400
Average plant investment.....		46, 700
Noncorporate:		
Average investment.....	14, 800	35, 300
Average plant investment.....		9, 600

As a result of the differential in size of average investment and the additional credit facilities arising out of plant ownership, there are marked differences in the relative distribution of the sources and uses of funds between renters and nonrenters. The latter group finance their investment to a considerably greater degree through bank credit, mortgage loans and bonds than do the former group (see table 5).

Since a large proportion of the nonrenters' initial capital goes toward plant purchase, their investment in equipment, inventories and other current assets is lower relative to total investment than the corresponding investment of renting concerns. If plant outlays are removed entirely from the distribution of invested funds, it is found that nonrenters invest proportionately more in equipment and inventories and less in working capital other than inventories. The larger relative investment in inventories and lower investment in other working capital needs are primarily functions of the larger average size of the nonrenting group. The explanation of the larger proportionate investment in equipment, which, as noted previously, generally varies inversely with size of firm, is that a large number of plant renters were able to also rent fixtures and machinery.

Surviving and discontinued firms

The Office of Business Economics is planning a survey of the factors resulting in business failures. While the present survey was not designed to study the distinguishing characteristics between surviving and discontinued firms, the sample returns make possible a few general observations.

The outstanding difference was in the average size of investment. The average investment of the unsuccessful firms in the sample was about 55 percent of that of the sample's surviving firms. Another significant characteristic of discontinued firms was their relatively low initial investment in new plant, even when allowance is made for their smaller average size.

It is still a matter of speculation as to the extent that these firms unsuccessfully sought, or would have been helped by, outside financing. Another question arises as to the part that plant ownership plays in delaying the abandonment of enterprises which are not conspicuously successful.

Investment turn-over

The sales per dollar of investment among new manufacturing concerns, as among new trade firms and established manufacturers, was found to be greater for smaller firms than for larger firms. Comparison by occupancy status and industry (table 6) confirms the finding in the trade study that investment turn-over tends to decrease as plant size increases.

Within manufacturing industries, the largest volume of sales per dollar of investment occurred in industries such as apparel and leather products—industries reporting the lowest relative plant investment. On the other hand, food, construction materials and metals show the smallest investment turn-over and proportionately high plant requirements.

Differences among industries, as might be expected, appear to be closely related to the average ratio of net profits to sales. There tends to be an inverse relationship between profit margins on sales and investment turn-over since, in the industries where margins are high, entrepreneurs are willing to invest more heavily relative to sales. It is obvious, of course, that profit margins are affected by, as well as affect, investment turn-over. It should also be noted that other characteristics of the different industries, including the investment size of the average firm, influence their sales per dollar of investment.

Table 1.—Manufacturers Starting Operations During 1946–48: Average Initial Investment by Industry, Grouped According to Sales in 1948¹

Industry	Sales sizes [Dollars]		
	Under \$50,000	\$50,000– \$249,999	\$250,000 and over
Food and kindred products.....	14, 900	77, 500	238, 400
Textile-mill products.....	8, 400	63, 100	107, 100
Apparel and related products.....	6, 500	16, 400	42, 600
Lumber and timber basic products.....	8, 200	49, 200	131, 900
Furniture and finished lumber products.....	5, 200	28, 600	72, 200
Stone, clay and glass products.....	10, 300	49, 400	104, 200
Metals and metal fabricating ²	9, 600	38, 600	101, 900
Machinery.....	11, 500	23, 500	70, 700
Transportation equipment.....	11, 300	26, 800	234, 800
Miscellaneous.....	12, 800	29, 300	107, 500

¹ The figures in this table should be used to indicate orders of magnitude, and not precise measures of average investment, since some of the cells are based on small samples and firms with no employees are omitted. Data are based on the initial investment and make no allowance for subsequent changes in asset position. The sales size classification of firms operating less than 12 months in 1948 was based on the annual rate of their partial year sales in 1948. Firms operating less than 6 months in 1948 were eliminated.

² Metal fabricating industries exclude machinery and transportation equipment.

TECHNICAL NOTES

The present study on new manufacturing firms, like the previous one covering trade, is based on replies to a questionnaire by a sample of companies drawn from the records of the Bureau of Old Age and Survivors Insurance, Federal Security Agency. The sample was selected from the list of manufacturing companies registering with the BOASI which started a new business during the period 1946-48. It thus excludes manufacturing firms without employees, which generally have no occasion to report to BOASI. Estimates for this last group were, however, included in the total investment and financing figures.

Questionnaires were mailed to all manufacturing firms listed as having 20 or more employees, and to a 5 percent sample of those with fewer than 20 employees. Roughly half of the returns in the first mailing were reported out of business, or for other reasons not at the address given. Sample tests against BOASI records have shown that practically all firms not located by the Post Office have ceased current reports to BOASI and may be presumed to be out of business.

From the companies for which no returns were received in the original mailing, a 20 percent sample was drawn for follow-up by registered mail and by personal contact through the field offices of the Department of Commerce. The group used for the field follow-up consisted of the firms geographically accessible to the field offices. Returns were obtained from about 40 percent of the mail follow-ups, and from 75 percent of the companies contacted in the field.

On the basis of the mail and field returns, it was estimated that almost 50 percent of the companies in the original universe were no longer in business, a figure which checks closely with the independently derived business population estimates of the OBE. A small proportion of firms were found to be out of scope, because they either were not in manufacturing or started in business before 1946. Of those in scope and still in business, about 30 percent submitted reports. In addition, enough returns were elicited from firms no longer in business to provide a basis for making estimates for this group.

Sources of error

In the study of new trade firms, three sources of error in addition to the usual sampling variability were cited. The first of these was due to the inability to obtain replies from all companies in the sample, since those willing and able to respond might differ significantly with regard to their investment characteristics from those who did not reply. The second source, related to the first, was the inadequate coverage of firms no longer in business at the time of the survey. Finally, the sample represented only firms registered with the BOASI and included few if any companies with no employees.

The present study was planned so as to reduce or eliminate the first two types of error. While it was not feasible to obtain a sample of zero-employee firms, the smaller importance of this group in manufacturing as compared with trade makes this third source of variation of less account. Consequently, the estimates for manufacturing given in this article have a smaller margin of error than those for trade enterprises.

¹ Excludes firms with no employees.

² Small firms are those with initial investment of under \$10,000; large firms are those with initial investment of \$10,000 and over.

Source: U. S. Department of Commerce, Office of Business Economics.

Apart from the estimates for all manufacturing in charts 1 and 2, no adjustment was made for the zero-employee firms. It should also be noted that the tables which show the proportions of initial investment coming from various sources or applied to various uses are based on unweighted sample compilations when grouped by size and legal status. This procedure is valid because it was found that when the returns were grouped by legal status and size of initial investment, no significant differences existed between firms in business and those no longer in existence, or between those replying to the initial mailing and those contacted in the follow-up.

Without this grouping, it was found that corporations were disproportionately represented among the initial response and among firms still in business. Also, both corporations and unincorporated businesses showed higher average initial investment in the initial response as compared with the follow-up, and for firms still in operation as compared with those which had left the business population.

The estimates of average investment by industry group and sales size presented in table 1 are averages of the sample returns without adjustment for bias due to nonresponse or for disproportionate representation of firms still in business. Thus the figures in this table should be used as an indication of orders of magnitude applicable to firms other than the zero-employee group, rather than as precise measures of average investment.

Coefficients of variation for a number of the estimates were computed to indicate the degree of variability due to sampling in these figures. The relative sampling error in two out of three random samples does not exceed in absolute value the percentage given by this coefficient; 19 times in 20 it is less than twice this percentage.

The coefficient of variation for the linear unbiased estimate of total investment was 7 percent. The coefficient for the percentage of total investment of new corporations represented by equity capital was 5 percent, while the corresponding figure for noncorporate businesses and personal saving was 7 percent. The equity and personal saving proportions were selected for the computations because the sample indicated that the underlying distributions were U-shaped; the coefficients of variation for other over-all proportions estimated should be substantially smaller in most cases.

The coefficients of variation applicable to the various industry and size groups are larger than those for the total figures; since the sampling error increases as the number in the sample is reduced. An indication of the effect of sample size on variability is given by the coefficient of variation which was computed for the percentage of total investment in the form of equity for food corporations of the middle sales size group. In this sub-group, the sample contained 12 firms, and the coefficient for the estimated proportion was nearly 12 percent, compared with 5 percent for all corporations. Only in the industry-sales size break-down were there any cells with comparably small samples.

The estimates were carried out in two ways. A "linear unbiased" estimate for the sampled universe, together with an adjustment for the group of zero-employee firms, yielded a figure of \$1.8 billion for total investment of new manufacturing firms during the period 1946 to 1948. A biased estimate with smaller sampling variability, employing the independent OBE business population estimates, gave a comparable total of \$2.2 billion. In view of the various upward adjustments to the BOASI universe required to bring it to the OBE base, the round number of \$2 billion has been used in this text.

In obtaining the unbiased estimate, the returns in each of the two employee-size strata were grouped by legal status, and in each group were separated into three classes: firms replying initially, firms replying in the follow-up, and firms out of business. The total investment reported in each class was multiplied by its appropriate weight to obtain the total for the universe sampled. Average investment for the firms with no employees was estimated by extrapolation on the basis of the sample returns from firms with one and two employees.

Since it was not feasible to obtain complete response even on the field follow-up, the possibility of bias due to nonresponse has not been completely eliminated. This limitation is not believed to be serious.

Foreign Transactions of the U. S. Government in 1949

UNITED STATES Government foreign-aid programs in 1949 furnished assistance to the extent of nearly \$6.0 billion in grants and credits. Grants were by far the greater part of the total amounting to \$5.3 billion—about one-fourth more than in 1948—while credits, at \$0.7 billion, were less than half as much as in the previous year. A comparison of grants and credits from 1946 through 1949 is shown in chart 1.

Total aid since the approximate end of the war, or from July 1, 1945, amounted to almost \$26 billion. During the first two full years after the war, 1946 and 1947, credits exceeded grants, mainly as a result of withdrawals on the British loan authorized in 1946. For subsequent years aid was extended mostly through grants, which in 1949 grants were furnished largely under the European Recovery Program.

The ERP strongly emphasized grants rather than credits (which would have required repayment and increased the future dollar requirements of the borrowing country) and aid extended under that program, which was about one-third of total aid in 1948, accounted for more than two-thirds of 1949 assistance.

In the last half of 1949 aid rendered by the U. S. Government fell off by more than one-fifth from the first half, due mostly to the decline of grants under the European Recovery Program. Such grants had reached a maximum in the second quarter. The decline resulted from reduced ERP appropriations, which reflect a diminishing need for aid until the scheduled completion of the program in 1952. Table 1 shows grants and credits by program from July 1, 1945, through 1949, while table 2 presents them by country for 1948 and 1949.

Transactions other than those in connection with grants and credits further provided a net disbursement of dollars to certain foreign areas. These transactions include purchases and sales of goods and services, payments of administrative expenses abroad, and contributions to international organizations. They do not include disbursements made for grants and credits or receipts realized from repayment of credits, including interest, and reverse grants (grants to the U. S. Government). Purchases abroad of goods and services are included, however, even though such goods and services may become grants. These other transactions in 1949 resulted in disbursements of \$1.7 billion and receipts of \$0.5 billion. Table 4 shows such "other" cash disbursements and receipts by country for 1948 and 1949.

The U. S. Government, in turn, received payments from other countries. Collections in 1949 to reduce the principal amount of loans outstanding and to pay interest amounted to \$239 million and \$97 million, respectively. For the previous year these collections amounted to \$456 million and \$100 million. Grants to the U. S. Government amounted

to the equivalent of \$230 million in 1949 and \$23 million in 1948, all but a small amount in 1948 the result of counterpart funds accruing to this country under programs of the Economic Cooperation Administration.

Economic Cooperation Administration

To ECA was assigned the responsibility for helping the free nations of Western Europe attain a degree of economic recovery which would obviate the need for extraordinary outside aid after 1952. From the beginning of the European Recovery Program in April 1948 through 1949 the ECA provided by grants and credits approximately \$6.0 billion in goods and services to participating countries, about one-half consisting of food and agricultural commodities and the balance mostly of industrial products such as raw materials, semifinished products, machinery, and vehicles. Almost two-thirds of these supplies were procured in the United States. Aid provided other than by financing purchases of supplies and equipment included ocean freight charges, technical assistance—comprising primarily services of experts required for the introduction of advanced production methods—and payment of certain parcel post and other transportation costs on private relief shipments.

Procurement authorizations under the program amounted to \$8.0 billion for the same period. More than three-quarters of this amount applied to five countries, the United Kingdom, France, Italy, Germany, and the Netherlands.

NOTE.—MR. WARNER IS A MEMBER OF THE STAFF OF THE CLEARING OFFICE FOR FOREIGN TRANSACTIONS, OFFICE OF BUSINESS ECONOMICS.

ERP grants in 1949

Total assistance under the European Recovery Program in 1949 amounted to \$4,160 million as compared with \$1,873 million in the previous year. Grants alone amounted to \$3.7 billion in 1949.

About 80 percent of the 1949 grants were in the form of cash reimbursements, the remainder representing mostly Government shipments. The United Kingdom was the largest recipient of grants from the United States under the program, receiving more than one-quarter of the total, followed by France, receiving more than one-fifth, and Germany about one-eighth. Grants to some ERP countries included certain amounts which were conditional upon furnishing aid to other participants under the intra-European payments plan. Therefore, in order to arrive at the amount of net aid received under the program the exchange of aid received or provided under the plan must be taken into consideration.

The intra-European payments plan under ERP

After the war a pattern of bilateral economic relations was prevalent in Europe which tended to hinder trade. The intra-European payments plan was introduced under the European Recovery Program, in order to encourage multi-lateral trading and to expand commerce so that Europe

might provide for itself, through trade, more of the essential goods and services it required. This plan provided that grants would be extended by the United States Government upon condition that the recipient member of the plan furnish an equivalent amount of aid or drawing rights in its currency to one or more other members.

In 1949 drawing rights utilized by members of the plan amounted to \$809 million, but the countries furnishing these drawing rights received only \$722 million in conditional aid from the United States. Those countries which extended the excess of drawing rights will eventually receive conditional grants to cover the difference.

In the case of Belgium-Luxembourg net aid provided under the plan amounted to \$264 million—or \$12 million more than all aid received from the U. S. Government—which placed this area in the unique position of granting net aid under the program during 1949. Net ERP aid received or provided for 1948 and 1949, is shown in table 3.

A little more than one-tenth of 1949 aid under ERP was extended through credits, as compared with about one-quarter for the previous year. Credit utilizations of \$476 million in 1948 and \$425 million in 1949 were mainly the result of the \$1.0 billion made available exclusively for loans and guaranties in the first appropriation authorization for ECA. In the appropriation act by Congress for the

next year ECA received authority to loan an additional \$150 million against which no commitments had been made as of December 31, 1949.

ERP loans amounted to only \$47 million in the last half of 1949 compared to \$379 million in the first half, as final utilization of loans originally negotiated in late 1948 was nearing completion. The largest recipients of ERP loans in 1949 were the Netherlands (\$98 million) the United Kingdom (\$81 million) and Ireland (\$64 million.) The Export-Import Bank acts as agent for ECA in executing and administering loans.

Other credits

The Export-Import Bank extended the major share of 1949 credits in 1949 other than those by ECA. Disbursements on the Bank's loans in 1949 amounted to \$185 million, less than half the \$429 million of the previous year, with the major share going to Italy, Chile, Mexico, and Japan. Loans by EIB are generally made for projects which increase the productive capacity of the borrowing countries.

Credit commitments by EIB which were unutilized at the end of 1949 amounted to \$430 million; lending authority which had not been committed amounted to \$889 million. Collections on credits by this agency in 1949 consisted of \$144 million to reduce principal and \$61 million for interest. In 1948 these collections were respectively \$261 million and \$57 million.

Credits resulting from the transfer of surplus property abroad were only \$29 million in 1949, as against \$212 million the previous year. In 1948 final credits of \$60 million were included on account of the transfer of merchant ships. Credits on other types of surplus were largely concluded by the middle of 1949 when this property had been largely disposed of and agencies responsible for disposal were in the process of liquidation.

Credits utilized in 1949 included those extended by the Army to Japan under the natural fibers revolving fund, amounting to \$27 million. Credits were extended from this

fund to purchase raw cotton; repayment is made from the proceeds of the manufactured textiles. The United Nations received \$20 million in 1949 as part of a \$65-million loan to build their headquarters building in New York City.

Civilian supplies for the occupied areas

The second largest grant program last year was civilian supplies furnished by the military, more than nine-tenths of which are for the people of the occupied areas of Germany and Japan. Such aid amounted to \$1,300 million in 1948 and \$928 million in 1949. The decline was in large part the result of programs for certain countries having been transferred to ECA.

Food items—especially grains—together with agricultural supplies and petroleum products made up most of the civilian supplies furnished in 1949. Considerable quantities of industrial raw materials were provided to Japan. Even though civilian supplies furnished by the Army to Germany in 1949, at \$431 million, were only a little over half the previous year, the increase in ERP grants resulted in a total of approximately \$900 million for both years. Supplies furnished Japan increased from \$388 million in 1948 to \$426 million in 1949.

Assistance to China and Korea

The Government of China largely lost control of the mainland of that country through military reverses in 1949. Consequently, U. S. Government aid was sharply curtailed, especially in the latter half of the year. Total aid in 1949 was \$111 million, about half that for 1948, and all but a negligible amount in the form of grants. Approximately two-fifths of grants in 1949 were military supplies; the balance, grants by ECA, resulted mainly in shipments of cotton, rice, and petroleum products.

Early last year ECA was assigned the responsibility of providing assistance to Korea to take the place of civilian supply programs of the Army. Accordingly, the extent of

supplies furnished by the Army decreased, while aid furnished by ECA increased. Total aid for 1949 amounted to \$86 million, grants by the ECA amounting to \$29 million and by the Army to \$57 million. In the previous year, aid to Korea included \$10 million of credits due to the transfer of surplus property and \$96 million due to civilian supplies granted by the Army.

Philippine aid

As a measure of good will to the Philippine people, the United States early undertook to provide some degree of compensation for property damages resulting from the war. The U. S. Government in 1949 paid \$162 million for such damages to private property. Payment of claims for damage to public property amounted to \$11 million for the year. Administrative services relative to these claims amounted to \$3 million. In this connection, administrative services and the costs of training Filipinos in certain specialized fields amounted to \$27 million. Total Philippine aid was \$203 million in 1949, and for 1948 about \$130 million.

Greek-Turkish aid

In 1947 Congress passed legislation to assist Greece and Turkey. Grants furnished under this program last year amounted to \$116 million for Greece and \$56 million for Turkey—about half of the 1948 total for these countries. The aid supplied under the Greek-Turkish program was largely of a military nature, especially for Turkey. Greece received technical and material assistance to fight forces within her borders threatening her independence, and Turkey received similar help to modernize her defense establishment.

Additional assistance went to these countries through the ECA, which assumed the responsibility of providing them with economic aid after July 1948. Aid extended by ECA included grants to Greece of \$58 million in 1948 and \$129 million in 1949, and to Turkey \$10 million last year.

Assistance through international organizations

Since the aftermath of the war found great numbers of people in Europe displaced from their homes, the U. S. Government last year contributed \$71 million to the International Refugee Organization, which seeks to care for these people and also to resettle them. (Contributions for this purpose had amounted to \$89 million in 1948.) In addition to contributions to the IRO the U. S. Government in 1949 paid \$15 million to the United Nations to assist persons displaced from their homes as a result of the recent war in Palestine.

The International Children's Emergency Fund, established by the United Nations, operates primarily for the benefit of children in European countries, especially as regards health requirements. Contributions by the U. S. Government to ICEF in 1949 amounted to \$18 million.

Transactions not included under grants or credits

In addition to transactions abroad in connection with grants and credits, other operations of the U. S. Government abroad resulted in payment and receipt of funds. Disbursement for these other purposes amounted to \$1.7 billion in 1949. Supplies and materials purchased accounted for one-third of this total. Military pay and allowances accounted for more than one-fourth. Other sizable disbursements were for administrative expenses abroad and operation of facilities.

U. S. Government disbursements abroad were about a half billion dollars less in 1949 than in the previous year. The greatest part of this decline represented reduced procurement of supplies and materials abroad. This was largely accounted for by the Government discontinuing purchases of

tin to supply domestic industry, depending upon private traders to import these requirements. Also, purchases of sugar from Cuba for the occupied areas were reduced as these areas were able to acquire supplies elsewhere or develop their own production.

Japan, Germany, the Philippines, and the United Kingdom and its dependencies were the recipients of more than half of disbursements in 1949. In the first three areas there are large military establishments requiring disbursements for pay and allowances. However, payments to the United Kingdom largely represented procurement from its dependencies.

Receipts from such U. S. Government foreign transactions—other than those resulting from grant and credit transactions, of course—amounted to \$544 million last year. Two-thirds were the result of sales. Military agency sales to Army PX's and Navy Ships Stores amounted to \$135 million; sales of commodities, mostly whole grains, amounted to \$106 million. Another large source of receipts was remittances of \$106 million to the United States by Government personnel abroad.

These receipts declined about \$400 million in 1949 from the previous year. About half of the decline was due to reduced sales including surplus property, for example, had been largely disposed of in 1948.

More than half the receipts in 1949 were from Japan and Germany. Because of the large numbers of American personnel, chiefly members of the armed forces in those areas, receipts from personal remittances and sales to Army PX's were high.

NOTE.—Data included in this article constitute the basis for Government transactions in the balance-of-payments statements of the International Economics Division, Office of Business Economics. Differences may be due to the use in the balance-of-payments statement of preliminary data which include estimates. Other discrepancies may result from conceptual differences. (For example, in the balance of payments, loans guaranteed by the Export-Import Bank are included in private rather than in Government capital movements.) Further differences may arise from the attempts to enter transactions in the balance of payments at the time they are assumed to have taken place, rather than the time transactions appear in the accounts of the reporting Government agencies.

The Business Situation

(Continued from p. 5)

However, the adoption of strict marketing quotas this year makes possible a general idea of intended land use in 1950. Excluding cotton, planted acreage for 1950 is indicated to be about one and one-half million greater than a year earlier. The cotton allotment originally announced for 1950 of 21 million acres is 6.4 million less than that grown in 1949 but the allotment has since been increased by more than 1 million acres by special legislation.

Since marketing quotas for cotton are coupled with rather severe penalties for overplanting and selling more than the allocated quota, overplanting is rare. In prewar years, the acreage of cotton grown varied from 80 to 90 percent of allotments.

In view of the large reduction in cotton acreage allotments from last year's plantings, the rise in intended acreage of crops other than cotton of less than 1.5 million acres is partly attributable to the fact that a group of other crops in the South were also subject to control. Wheat in the Southwest and tobacco, peanuts, and rice in the various States of the South were curtailed—all with the aid of production controls. Excluding Oklahoma and Texas, the principal expansions were a rise of one million acres in corn and soybeans.

More important changes are indicated in Oklahoma and Texas where expansion totaling nearly 4 million acres is indicated for grain sorghums, oats, corn, and barley offset by a contraction in wheat of nearly 3 million acres, but changes in these States are not a net addition to those discussed above since they were included in the totals for the wheat belt States.

Appraisal of results

On the whole the control programs were successful in reducing acreage—although not necessarily production—of specific crops, and the total cut-back of these crops is indicated to be as much as 20 to 25 million acres, or about 10 percent. Possibly the corn program was least successful, and even here the commercial corn areas reduced acreage by about 10 percent. In addition to the basic crops which were all under control programs, cut-backs were made in flaxseed and potatoes—both of which have been heavily supported. In fact, the group of crops whose acreage has been reduced accounted for more than 85 percent of total price support

expenditure for 1948 crops, the last crop-year for which data are available. With minor exceptions, these products have mandatory price support at 90 percent of parity for 1950.

¹ Includes acreage planted in the fall of 1949 for harvest in 1950.² Acreage harvested.³ Grown alone for all purposes.

Source: U. S. Department of Agriculture, Bureau of Agricultural Economics.

Much of the expansion in acreage occurred in crops whose prices have also been supported, but the level of support in 1950 may be considerably lower than for the basic crops. The feed grains—oats, grain sorghum, and barley—are expected to expand 9 million acres. All of these have received extensive price support and all are substitutes for corn within rather wide limits. Expansions are also indicated in soybeans and rye, both of which have been receiving price support, and also in hay for which no price support is provided. Most of the crops in this group where plantings are expected to increase do not have mandatory price support programs; the actual support levels and the commodities to be supported for 1950 had not been announced at the time of the survey of farmers' planting intentions.

Monthly BUSINESS STATISTICS

THE DATA here are a continuation of the statistics published in the 1949 Statistical Supplement to the SURVEY OF CURRENT BUSINESS. That volume contains monthly data for the years 1945 to 1948, and monthly averages for earlier years back to 1935 insofar as available; it also provides a description of each series and references to sources of monthly figures prior to 1945. Monthly averages for 1949 are shown in the March 1950 issue of the SURVEY. Series added or revised since publication of the 1949 Supplement are indicated by an asterisk (*) and a dagger (†), respectively, the accompanying footnote indicating where historical data and a descriptive note may be found. The terms "unadjusted" and "adjusted" used to designate index numbers and dollar values refer to adjustment of monthly figures for seasonal variation.

Data subsequent to February for selected series will be found in the Weekly Supplement to the SURVEY.

Unless otherwise stated, statistics through 1948 and descriptive notes are shown in the 1949 Statistical Supplement to the Survey	1949											1950

† Revised. ‡ Preliminary.

† Data have been revised beginning January 1947 to incorporate revisions in reports on production and sales of farm products; revised figures for January 1947-July 1948 appear on p. 23 of this issue. Revisions for January 1949 are as follows (units as above): Total cash receipts, including Government payments, 2,295; farm marketings and CCC loans, 2,279; crops, 1,016; livestock and products, 1,263; dairy products, 301; meat animals, 740; poultry and eggs, 215; indexes of cash receipts—all commodities, 343; crops, 356; livestock and products, 333; indexes of volume—all commodities, 138; crops, 147; livestock and products, 132. ♂ Seasonal factors for a number of industries were fixed at 100 during 1939-42; data for these industries are shown only in the unadjusted series.

Unless otherwise stated, statistics through 1948 and descriptive notes are shown in the 1949 Statistical Supplement to the Survey

* Revised. * Preliminary. * See note marked "S" on p. S-2.

* New series. Except as otherwise stated, seasonally adjusted dollar sales and inventories have been substituted beginning with the October 1949 Survey for the unadjusted dollar values and indexes formerly shown; for earlier figures and details regarding the new series, see pp. 12-24 of the October issue. Sales and inventories of service and limited-function wholesalers only are published currently on p. S-10. * The term "business" here includes only manufacturing and trade. Business inventories as shown on p. S-1 cover data for all types of producers, both farm and nonfarm.

Unless otherwise stated, statistics through 1948 and descriptive notes are shown in the 1949 Statistical Supplement to the Survey	1949											1950

† Revised. * Preliminary.

† For comparability with data prior to 1945, figures for certain subsequent months have been revised to exclude railroad failures. Revisions are shown in the February 1950 Survey. * New series. Beginning with the December 1949 Survey, dollar values of manufacturers' new orders have been substituted for the indexes shown prior to the October 1949 issue; figures are available for the 48 States beginning 1946, and for 47 States (excluding Louisiana) beginning July 1945.

§ March 1950 indexes: All farm products, 237; crops, 215; food grain, 224; feed grain and hay, 174; tobacco, 389; cotton, 236; fruit, 193; truck crops, 168; oil-bearing crops, 230; livestock and products, 258; meat animals, 308; dairy products, 243; poultry and eggs, 165.

† Revised series. Beginning with the February 1950 issue of the Survey, data are revised (effective back to 1910) to reflect changes prescribed in the Agricultural Acts of 1948 and 1949; revisions prior to December 1948 will be shown later.

Unless otherwise stated, statistics through 1948 and descriptive notes are shown in the 1949 Statistical Supplement to the Survey

* Revised. † For actual wholesale prices of individual commodities, see respective commodities.

† The Department of Labor is currently reviewing and revising the samples of commodities and of reporters for the indexes, subgroup by subgroup, to reflect postwar changes in production and distribution. As subgroup revisions are completed, the revisions are incorporated in the pertinent group indexes and the all-commodity index and the subgroup indexes are revised retroactively for the entire period covered by the revision; however, to avoid repeated revisions of the group indexes and the all-commodity index, these are not revised retroactively more than 2 months. If introduction of a revised subgroup into the calculations changes significantly the levels of the group indexes and the all-commodity index, the latter indexes computed with the original sample for the first month of the revision will be provided in a footnote. In some instances, it is necessary to correct previously published indexes because of late reports, incorrect reports, or other errors in prices previously used. Indexes for the latest 2 months are preliminary and are currently revised to incorporate corrections received in the 2 months following. Any additional corrections received are incorporated in final annual summaries issued in the middle of the year. Indexes for June-December 1948 were corrected in the August 1949 SURVEY. Corrected indexes for January-May 1948 are available upon request.

Unless otherwise stated, statistics through 1948 and descriptive notes are shown in the 1949 Statistical Supplement to the Survey	1949											1950

*Revised. †Preliminary.

‡Data, reported at the beginning of each month, are shown here for the previous month. †Revisions for 1944-November 1948 are available upon request.

§Comparable data on magazine advertising cost (Publishers' Information Bureau, Inc.) are available back to January 1948 only. Beginning with the October 1949 SURVEY, five new components are shown (marked with "§"); the total of the two components "household equipment, etc." and "household furnishings" covers all items formerly included in "electric household equipment" and "household furnishings, etc." Data for January-July 1948 for the new components are available upon request.

§See note marked "†" above.

Unless otherwise stated, statistics through 1948 and descriptive notes are shown in the 1949 Statistical Supplement to the Survey	1949												1950

† Revised.

† Revised series. Dollar estimates of sales for all types of retail stores have been revised for various periods back to 1943; specific periods for which the series have been revised are as stated in the notes below. Adjusted dollar values for sales and inventories of all types of retail stores have been substituted beginning with the October 1949 SURVEY for the index numbers formerly shown; monthly data for 1946-48 for both the unadjusted and adjusted series appear on pp. 21-23 of that issue. Revised data on sales of chain stores and mail-order houses for 1943-July 1948 are shown on p. 23 of this issue of the Survey. Unpublished revisions are available upon request.

‡ Revised beginning 1943. § Revised beginning 1948. ¶ Revised beginning 1947. ○ Revised beginning 1945.

† Revised. ‡ Preliminary.

§The adjusted indexes of department-store sales have recently been revised. Atlanta, 1944-April 1948; Chicago, 1945-April 1948; Cleveland and Minneapolis, 1946-March 1948; Kansas City, 1945-March 1948; New York, 1946-January 1949; Philadelphia, 1944-March 1948; Richmond, 1946-May 1948. Data for these districts (except New York and Richmond) appear on p. 24 of this issue. Revised data for 1919-48 for San Francisco are available upon request. Current revisions for Dallas are tentative, pending completion of the revision for earlier periods. Department-store sales indexes for the United States reflect all revisions in the districts and, therefore, are subject to further adjustment. Recent revisions of data on department-store stocks, by districts, are reflected in the U. S. total which is also subject to further revision. The indexes of rural sales of merchandise have been recomputed on a 1935-39 base; data through 1948 appear in the 1949 STATISTICAL SUPPLEMENT. The series on wholesale trade have been revised back to 1939; monthly figures for 1946-48 and annual data beginning 1939 are shown on pp. 18-20 of the October 1949 SURVEY; unpublished revisions are available upon request.

§Data for 1947 and 1948 (shown in the 1949 STATISTICAL SUPPLEMENT) have been revised; revisions prior to August 1948 are available upon request.

†Revised series. See note marked "†" on p. S-11.

Unless otherwise stated, statistics through 1948 and descriptive notes are shown in the 1949 Statistical Supplement to the Survey

† Revised. ‡ Preliminary.

† Revised series. Beginning with the October 1949 Survey, the indicated series on employment, pay rolls, and hours and earnings have been revised to incorporate three major changes: (1) adoption of the current Standard Industrial Classification for manufacturing industries; (2) reclassification of reporting establishments on the basis of major postwar product or activity; (3) adjustment to 1947 bench-mark levels and a revision in estimating production-worker employment. Revised data on employees in nonagricultural establishments (unadjusted) by major groups are shown on p. 24 of the November 1949 Survey. The Federal Reserve adjusted figures for the total nonagricultural and manufacturing employment and the adjusted indexes for manufacturing production workers were further revised in the December 1949 Survey. All unpublished revisions are available upon request.

Unless otherwise stated, statistics through 1948 and descriptive notes are shown in the 1949 Statistical Supplement to the Survey	1949											1950

† Revised. * Preliminary.

† Beginning July 1, 1948, farm mortgage loan data are reported quarterly.

‡ In accordance with Public Law 38, 81st Congress, the Regional Agricultural Credit Corporation of Washington, D. C., was dissolved and as of April 16, 1949, its assets were transferred to the Farmers Home Administration.

† Revised series. See note marked "†" on p. S-11.

§ Rate as of April 1, 1950: Common labor, \$1.493; skilled labor, \$2.478.

* New series. Comparable data prior to January 1948 are not available.

Unless otherwise stated, statistics through 1948 and descriptive notes are shown in the 1949 Statistical Supplement to the Survey	1949											1950

^a Revised. ^b Preliminary. ^c Beginning September 12, series changed from one to two bond issues (2 percent December 1952-54 and 2½ percent March 1956-58). Average for old series for September is 1.25 percent. ^d Revised to include transactions relating to Foreign Economic Committee Trust Fund; revisions for June 1948-January 1949 are shown in the note at bottom of p. S-14. ^e Beginning November 1949, data represent interest due and payable; previously, interest paid. ^f Excludes war assets

Unless otherwise stated, statistics through 1948 and descriptive notes are shown in the 1949 Statistical Supplement to the Survey	1949											1950

* Revised. † Preliminary.

†Revisions for January-May 1948 for United States and total gold production are shown in the August 1949 SURVEY, p. S-18. Revisions for January-July 1948 for securities issued (SEC data) are available upon request.

*Revised data for January-August 1948 are shown in the November 1949 SURVEY, p. S-18.

†U. S. Government deposits at Federal Reserve banks are not included.

*New series. Data on profits and dividends cover large manufacturing corporations (total assets end of 1946, \$10,000,000 and over); annual data beginning 1939 and quarterly data beginning 1946 are available upon request. Data on securities issued for manufacturing (prior to this issue of the SURVEY, included with "industrial") and communication (formerly included with "public utility" and "industrial") are available beginning January 1948. †Revised series. Data (covering electric, gas, and water companies) are available beginning January 1948.

Unless otherwise stated, statistics through 1948 and descriptive notes are shown in the 1949 Statistical Supplement to the Survey	1949											1950

* Revised.

* New series. The data for production, compiled by the U. S. Tariff Commission beginning July 1948, are essentially comparable with the series for shipments and consumption (reported by the Bureau of the Census) previously shown here, except for inventory changes (which tend to balance out over a short period) and the inclusion of a few companies not formerly covered. Data for alkyd resins and rosin modifications are not available prior to 1949.

Unless otherwise stated, statistics through 1948 and descriptive notes are shown in the 1949 Statistical Supplement to the Survey	1949											1950

† Revised. 1 December 1 estimate. 2 No quotation.

‡ The total includes wheat owned by the Commodity Credit Corporation and stored off farms in its own steel and wooden bins; such data are not included in the break-down of stocks.
 § Revised series. Data for rough rice, included in rice exports, have been revised using a new conversion factor supplied by the U. S. Department of Agriculture, which takes into account changes in milling practices; revisions for 1933 to July 1948 are available upon request. Revised data for January 1947 to July 1948 for wheat-flour production and grindings of wheat will be published later.

Unless otherwise stated, statistics through 1948 and descriptive notes are shown in the 1949 Statistical Supplement to the Survey	1949												1950

* Revised.

1 Corrected monthly figures are not available; January-July 1949 total (including revisions for January and February) is 218,055 short tons.

2 Price for 5 pounds; quotations formerly for 1-pound package.

3 December 1 estimate. 4 No quotation.

5 This series continues data in the 1942 STATISTICAL SUPPLEMENT to the SURVEY; there were no shipments for 1942 to 1947 except for January, February, and May 1942 (12,136, 1,120, and 8,618 short tons, respectively). Data for January-July 1948 are shown on p. S-30 of the October 1949 SURVEY.

NOTE FOR LUMBER SERIES, p. S. 31.—Exports of sawmill products for 1948 have been adjusted to exclude box shooks, in accordance with the revised commodity classification effective January 1949. Revisions for January-July 1948 are shown in a footnote on p. S-38 of the October 1949 SURVEY.

Minor revisions for total lumber production, shipments, and stocks for 1946-47 (since publication of the 1949 STATISTICAL SUPPLEMENT) are available upon request. Revised data for total lumber for January-July 1948 and revised data for Western pine for January 1947-March 1948 are also shown in the above-mentioned note.

Unless otherwise stated, statistics through 1948 and descriptive notes are shown in the 1949 Statistical Supplement to the Survey	1949											1950

Revised. Revised exports of sawmill products for January 1949 are as follows (M bd. ft.): Total (all types of lumber), 45,423; Douglas fir—total, 24,787; sawed timber, 7,980; boards, planks, scantlings, etc., 16,807; Southern pine (total), 9,139.

1948 data for production of shoes and slippers have been revised; revisions January–July are shown in the September 1949 Survey on p. S-31.

The figures include a comparatively small number of "other footwear" which is not shown separately from shoes, sandals, etc., in the distribution by types of uppers; there are further small differences between the sum of the figures and the totals for shoes, sandals, and play shoes, because the latter, and also the distribution by kinds, include small revisions not available by types of uppers. See note at the bottom of p. S-30 of this issue regarding revised lumber series.

Unless otherwise stated, statistics through 1948 and descriptive notes are shown in the 1949 Statistical Supplement to the Survey	1949											1950

* Revised.

† Revised data for January 1949 are as follows (short tons): Iron and steel products—total exports, 436,706; scrap exports, 10,001; total imports, 288,189; scrap imports, 166,448.

‡ For 1950, percent of capacity is calculated on annual capacity as of January 1, 1950, of 99,392,800 tons of steel; 1949 data are based on capacity as of January 1, 1949, 96,120,930 tons.

Unless otherwise stated, statistics through 1948 and descriptive notes are shown in the 1949 Statistical Supplement to the Survey	1949												1950

* Revised. ^a Preliminary.^aThe number of companies reporting beginning the second quarter of 1949 is as follows: Direct current, 28; polyphase induction, 32 in the second and third quarters, and 33 in the fourth quarter.*New series. Compiled by the *Industrial Furnace Manufacturers Association*, representing orders (less cancellations) for metallurgical and other purposes as reported by 24 to 28 companies. Currently, the combined data for electric and fuel-fired furnaces account for about 80 percent of the industry total. New orders for January 1949 amounted to \$1,047,000. Data prior to 1949 will be shown later.

Unless otherwise stated, statistics through 1948 and descriptive notes are shown in the 1949 Statistical Supplement to the Survey

^r Revised.

¹ Because of substitutions in the reporting companies, data beginning October 1949 are not strictly comparable with earlier figures. September 1949 figures strictly comparable with October: Mine run, \$8.618; prepared sizes, \$9.300.

² New basis. Beginning January 1950, coverage was increased to include one East Coast terminal not previously reporting; comparable December 1949 figure, 75,435,000 barrels.

³ Includes stocks of heavy crude in California.

⁴ Revised series. Prices for kerosene (N. Y. Harbor, No. 1 fuel, bulk lots, f. o. b. refineries or terminals, excluding all fees and taxes) have been substituted for those for water white (Pennsylvania) formerly shown; comparable January 1950 figure on the new basis, \$0.103. Data beginning 1935 will be available later.

Unless otherwise stated, statistics through 1948 and descriptive notes are shown in the 1949 Statistical Supplement to the Survey	1949											1950

The Balance of International Payments of the United States, 1946-48

The position of the United States in the world economy since the cessation of hostilities is here revealed within the framework of the balance of international payments. As the official economic record of our international transactions this basic volume points up the problems which arose from unsettled conditions in international economic relations and the attempts made during that period to find a solution for them.

Here is the comprehensive record of what the United States has contributed to and received from other countries during three crucial years of the postwar era. Coverage includes current account transactions . . . the exchange of goods and services . . . merchandise trade . . . transportation . . . foreign travel . . . Government and private services . . . income on investments . . . private and Government aid . . . private loans and investments . . . liquidation of foreign capital and gold . . . international investment position of the United States . . . the transactions broken down by major foreign areas.

Illustrated with charts and containing summary statistical tables, this publication is a valuable source of information for all who wish to know of the size and scope of United States international aid and related programs designed for the improvement of world economic conditions.

As part of the continuing series of publications on the international transactions of the United States this bulletin together with *International Transactions of the United States During the War, 1940-45* (price 60 cents) and *The United States in the World Economy* (reprint price 55 cents) presents the historical record of United States participation in world trade since the First World War.
