## Purchasing Power Moves Ahead in 1959

Higher consumption reflects this

And greater use of installment credit

EExtension of the business advance at a better-thanseasonal pace, and on a broadening scale, is evident from the data now available for the spring quarter. This follows upon the large advance in the opening quarter which is measured and reviewed in the summary of the national income and product later in this issue.
Demands are rising briskly in most markets. In fact, the only broad area of demand which is still lagging is the foreign market. Exports in recent months have tended lower. With imports rising, and despite a decline in the outflow of capital, the adverse balance in our foreign transactions has continued high. In recent weeks, the gold outflow has resumed after a temporary halt earlier this year.

## Size of income rise

The strong current performance of the economy is eridenced clearly by the rise in personal income. Figures for April place the overall total at a seasonally adjusted annual rate of $\$ 3721 / 2$ billion-up more than $\$ 3$ billion from March and about $\$ 71 / 2$ billion from February. Increases in the preceding half year had areraged around $\$ 1$ billion per month. April personal income was $\$ 23$ billion, or $61 / 2$ percent, larger than in the same month of 1958 .

The current upsurge in the flow of income to individuals has reflected wholly an enlarged volume of disbursements from productive activity. Transfer payments have changed little as the continuing decline in unemployment insurance benefits has approximately counterbalanced the general uptrend in other types of social insurance benefits.

The income expansion has centered primarily in wages and salaries. At amnual rates, aggregate payrolls in the economy adranced about $\$ 3$ billion in both March and April, reaching a record high of $\$ 253$ billion.

## Employment up

The adrance in payrolls, in turn, has derived principally from higher employment, although further increases in hourly earnings and hours worked also have contributed. The employment reports for April indicate an extension of the significant improvement which had been noted for March-sizable gains in number of jobs and an accompanying reduction in unemployment.

Seasonally adjusted employment in nonagricultural establishments in April, totaling 51.8 million, was up more than 600,000 from February. Increases in March and April were of roughly similar magnitude, with about half of the total rise reported in manufacturing where it was concentrated in the durable goods industries. Improvement was especially marked in the broad metals group.

Employment has also picked up considerably in the con-
struction industry, where more-than-seasonal expansion has occurred in a number of types of projects. Employment increases this spring have been registered by most other broad industrial divisions of the economy-as, for example, trade, services, and finance.

## Government fiscal position improved

The rise in corporate profits and personal incomes in the past year has been a primary factor in the improvement of the Federal Government's fiscal position. As shown in the following section, the $\$ 10$ billion deficit on national income and product account recorded in the second quarter a year ago had declined to a rate on the order of $\$ 2$ billion by the opening quarter of this year. For the current quarter, little change in Federal outlays and a further increase in taxes are expected. It seems likely that by midyear the Federal budget as measured in the national income accounts will be approximately in balance on a seasonally adjusted basis.

The conventional administrative and cash budgets, on the other hand, will continue to register sizable deficits in the spring quarter. The main reason for this difference is that in these budgets corporate profits taxes are recorded on a receipt basis-rather than on an accrual basis as in the national income accounts-and hence do not yet reflect the recent upturn of corporate profits.

## Rise in retail sales

The steady advance in personal income has been reflected in expanding retail sales. Preliminary figures for April indicate sales for the first 4 months of the year at a seasonally adjusted amnual rate of $\$ 213$ billion, 8 percent above the recession period a year ago. Most of this advance was in physical volume.

Fales at durable good stores registered another marked rise this spring following the large gains made in the closing months of last year. This has been especially true for auto-
motive dealers, which experienced a 10 -percent increase in their total sales in the first quarter of this year compared to the fourth quarter of 1958, seasonally adjusted.

Sales by building materials and hardware dealers have registered a sharp advance so far this year. Seasonally adjusted, sales in the first quarter were more than 3 percent above the fourth quarter. Furniture and appliance sales have been tending slowly upward for a year. In both of these groups the strength in home buying has been a stimulating factor.

Retail sales of nondurable goods stores were up 5 percent for the first 4 months of the current year from the corresponding period of a year ago; practically all of the rise was in physical volume.

Sales of all major groups of nondurables are higherincreases ranging up to 2 percent-than in the closing months of last year. Compared to a year ago, the most marked advances have been registered by general merchandise and drug stores. Sales of food stores have been rising slowly over the past year and in the first quarter of this year were 3 percent above a year ago. These sales were well maintained during the 1957-58 recession. Retail food prices averaged somewhat lower this year than a year ago so that the dollar sales adrance reflects a somewhat larger increase in volume.

## Little change in overall prices

Prices hare shown little net change in recent months and now average a little higher than a year ago. Both at retail and wholesale, products of farm origin have shown appreciable declines, and nonagricultural prices have tended upward. For the wholesale group, industrial prices turned up in mid-1958 and since then have risen a little more than 2 percent-about the equivalent of the rate of rise for the 2 years preceding the recent recession, i.e., mid-1955 to mid1957. During that period farm and food prices were also rising most of the time, and the average of all prices showed a rather steady increase.

# National Income and Product 

## in the First Quarter of 1959

T保 tinuing to dominate the economic scene, the first-quarter GNP figures show. At a $\$ 467$ billion annual rate, the Nation's output was up $\$ 14$ billion from the quarter before and St0 billion above its early 1958 low.

These increases are primarily the reflection of gains in the physical volume of production; the overall price advance has been limited during the past year.

The expansion of markets since 1959 opened has followed the basic pattern set in the latter part of 1958. Consumer buying and the swing to inventory accumulation each contributed around $\$ 5$ billion to the latest GNP rise. Housing construction registered another $\$ 11 / 2$ billion increase, as did State and local purchases. Net exports declined somewhat further.

The rise of Federal Government purchases was checked
after the turn of the year, and a limited pickup occurred in business fixed inrestment.

The continued improvement in most of the Nation's markets has affected the national income since mid-1958 chiefly through recovery in the compensation of employees and in corporate protits. The characteristically volatile profitshare, which during the business downswing fell $\$ 12$ bit lion-or 27 percent-at annual rates has since registered an advance of even larger proportions. This advance and an expansion of $\$ 71 / 2$ billion in employee compensation accounted for most of the $\$ 20$ billion rise of national income during the second half of last year, to a rate of $\$ 37.31 / 2$ billion in the final quarter. The further substantial increase which is clear from incomplete data for the opening quarter of 1959 also centered in these components.

Personal income has shown a lesser rise in this period.
the impact of higher earnings having been cushioned-like the effect of the previous decline-by the contracyclical swing in transfer payments and the short-run insensitivity of corporate dividends to changes in profits.

## The first year of recovery

The first quarter marks the completion of a full year since the 1958 low point of GNP. It is of some interest to compare the expansion of output and employment in this period with the gains recorded during the first four quarters of recovery following the low of 1949 and that of 1954.

No two cyclical movements are ever more than broadly alike, of course, and the market readjustment of 1957-59

## Percent Changes in Real GNP in Three Postwar Cycles

The Drop<br>From previous peak to low qir. of -

The First Year of Recovery From the recession low to-

2nd qtr. 1950

2nd qtr. 1955

Ist qtr. 1959
-

The Net Movement
From previous peak through
first year of recovery

differed in many important respects from those recorded in earlier postwar years. The current upswing, for example, owes part of its strength to an inventory buildup which reflects special as well as cyclical factors; on the other hand, the recent decline in net exports has also involved various special circumstances. Conditions in these and most other major markets were appreciably different in early 1955, and of course had been still different in early 1950. Notwithstanding such variations in detail, however, the new quarterly measure of real GNP shows that the advance of close to 8 percent during the past year's recovery was substantially the same as those recorded for the initial year of recovery following the lows of 1949 and 1954.

The downward phase, however, was somewhat more severe in the third postwar recession than in its predecessors. This difference is reflected in the lesser extent to which a year of recovery has carried the economy above its previous peak. Real output in the most recent quarter was 2 percent above the highs of early 1957. As the adjacent chart shows, the corresponding gains recorded during the two previous cycles had been somewhat larger than this.

Besides these movements in real output the rising value of the GNP has also reflected some advance in average prices, particularly during the business downswing. A comparable rise in the index occurred during the four quarters of business contraction which ended in the spring of 1954 , it may be noted.

## CONSUMER INCOME AND BUYING

Disposable personal income in the opening quarter of 1959 was at an annual rate of $\$ 321$ billion, up $\$ 5$ billion from the previous quarter. The bulk of this advance was reflected in personal consumption expenditures, which reached a first quarter rate above $\$ 300$ billion. In the absence of significant price changes overall, the 5 -percent rise in personal consumption expenditures since early 1958 has been almost matched by an increase in the physical volume of consumption.

A recovery in auto buying has accounted for one-fourth of the advance in personal consumption expenditures from year-ago rates. After having reached a seasonally adjusted low of slightly more than $\$ 13$ billion at the close of the 1958 model year, auto purchases have moved up 30 percent since the introduction of the new models last autumn. Most of the rise was registered early and was followed by a lull. A further moderate gain came late in the first quarter and was extended in April. Thus, late data indicate that a spring upturn in sales may be emerging for the first time since 1955.

Consumer purchases of other durables maintained the $\$ 23$ billion annual rate to which they had returned after mid1958. Contributing to the strong demand for major kitchen goods in particular has been the advance in residential construction. During the recession total consumer purchases of durables other than autos fell only briefly below the plateau which had been maintained through 1956 and 1957. Prices having been stable since late 1957, real sales are also back to the prerecession rate.

With purchases of clothing rising above their 1956-57 level and the expansion in food outlays continuing, personal expenditures for nondurable goods reached $\$ 145$ billion in the first quarter of 1959 .

In contrast to the experience of last year, the recent gain in dollar outlays for food was accompanied by near-stable prices and involved an increase in real consumption. Since the first quarter of last year food expenditures have grown by about $21 / 2$ percent while prices have moved fractionally lower as abnormal supply stringencies eased.

Consumer spending on services has continued to increase in each recent quarter as the number of households grew. The slow but steady rise of prices in this area has also continued; during the past year the price advance has contributed nearly as much to total expenditure as has the expansion of real demand.

## INVESTMENT DEMAND

Business inventories and residential construction contintinued as major elements of demand strength; in addition, the opening quarter of the year was marked by some firming of plant and equipment purchases.

## Advance in inventories

Nonfarm inventories rose by $\$ 5$ billion, at seasonally adjusted annual rates. Anticipated supply shortages contributed to this advance. The move toward restocking was quite pervasive in character, however, and seems to have followed the course of current operating needs, which rose with the continuing upswing in general business activity.
Recent inventory changes have been consistent with experience in the comparable stage of the two preceding postwar business cycles. After the upturn in national output in the spring of 1958 -as in early 1950 and in the autumn of 1954 inventories continued to be reduced, although the rate of liquidation tapered sharply. The ratio of the physical volume of nonfarm stocks to real GNP dropped well below the postwar average. This ratio declined further in the first quarter, as the rise in production outstripped that in total stocks.

A major share of the increase in nonfarm holdings centered in the durable goods manufacturing industries, in which earlier reductions had been particularly heavy. The inventory swing in these lines has been associated with large movements in sales and new orders.

Recent developments in this area have been influenced also by anticipations of possible interruption in steel supplies.

The advance in the primary and fabricated metals industries carried the holdings of these producers to about the same levels which had been maintained for some time prior to the recession. In the machinery and transportation equipment industries, equally heavy absolute increases left inventories almost one-sixth below the prerecession aggregates.

For durable goods manufacturing as a whole the major part of the first-quarter increase was in purchased materials, with more moderate rises recorded in goods in process and in finished goods.

Changes in other nonfarm inventories were on the whole much more moderate, though in the aggregate they represented roughly one-third of the total increase. In general these stocks had been subject to far less liquidation than had those of durables manufacturers, and some of them had already begun to show increases in the second half of last year.

In nondurable goods manufacturing the principal increases during the first quarter occurred in the food and beverage group and in rubber. In the latter industry strikes materialized in April.

The movement of trade stocks reflected mainly the course of auto dealers' holdings. As in the final quarter of 1958, a greater than seasonal expansion in these accompanied improved sales.

## Residential construction strong

Outlays for residential construction during the winter rose $\$ 11 / 2$ billion to a seasonally adjusted annual rate of
$\$ 211 / 2$ billion. This was the highest figure on record, being nearly $\$ 3$ billion above the peak quarters of 1955.

The 1955 peak, like the present high, was reached a year after a trough in general business activity. In each case the Federal Government had taken a number of specific steps to help release potential demand for new dwelling construction. The administrative and legislative actions of early 1958-lowering downpayment requirements, raising interest rate ceilings, extending the VA programs, and supporting the secondary market-interacted with the general monetary policy and prevailing market forces to make the lending of money on mortgages relatively attractive. As can be seen from the accompanying chart, lenders last year showed rising interest in conventional as well as Government-backed mortgages. This was in contrast to the 1954 experience, when the increases had been heavily concentrated in the FHA-VA segment. The financial aspects of these developments are reviewed in the debt article which appears elsewhere in this issue.

Seasonally adjusted housing starts in the first quarter of 1959 were more than two-fifths above the low of a year ago. In line with the experience of early 1955 , little change in the number of starts has been noted on a monthly basis since the mid-autumn of 1958. As the third panel of the chart shows, the increase in applications for Government-backed mortgages has apparently leveled off also.

## Business fixed investment firms

Business expenditures for fixed investment-producers' durable equipment and construction-registered a modest advance in the opening quarter of the year to an annual rate of $\$ 43$ billion. This was $\$ 5$ billion below the prerecession peak, and $\$ 2$ billion above the low point of last year. In the $1953-55$ cycle, business outlays for fixed investment had shown greater strength both in the recession phase and during the recovery.
The cyclical swing in plant and equipment spending has centered as usual in manufacturing; the cutback and subsequent expansion in other industries have been less pronounced overall. Among the manufacturing industries the fourth-to-first quarter rise was about equally divided between durable and nondurable goods producers.
Outside of manufacturing, the outstanding development of the first quarter was the rise in spending for transportation equipment. Air carriers' outlays increased as the conversion to jet aircraft was stepped up, and the railroads also scored advances.

## GOVERNMENT DEMAND

Total government purchases of GNP rose $\$ 11 / 2$ billion in the first quarter, to a seasonally adjusted annual rate of $\$ 961 / 2$ billion. The increase centered in State and local governments, and reflected growth in the number of both school and nonschool employees as well as in highway outlays. First-quarter highway spending, at a $\$ 61 / 2$ billion annual rate, was up about 10 percent from a year ago, the increase having accompanied a rise in activity under the Federal-aid highway programs.
The expansion in Federal purchases of goods and services which began a year ago tapered in the opening months of 1959 after having carried the total $\$ 5$ billion above the low recorded in late 1957. The leveling off since the turn of the year reflected primarily the course of nondefense expenditures. Haring accounted for over two-thirds of the expansion during 1955-largely because of a spurt in CCC
price support outlays-nondefense buying dipped in the opening months of 1959.

## Federal deficit shrinks

The first-quarter Federal deficit on income and product account appears to have been around $\$ 2$ billion, at seasonally adjusted annual rates. The substantial decline from the $\$ 71 / 2$ billion of the previous quarter and the peak $\$ 10$ billion reached in mid-1958 has reflected mainly the recovery in corporate tax accruals and a rise in social security contributions. Higher yields from other taxes have also contributed to the improvement, the individual income tax accounting for the bulk of the rise in these. On the expenditure side, a decline in total payments for unemployment compensation has helped considerably to improve the budgetary position.

## Residential Constructiôn

after upswing in starts

Rise checked in applications for FHA-VA commitments

[^0]Corporate profits taxes in the national income accounts, being measured on an accrual basis, have reflected immediately the vigorous rebound since last summer in corporate profits. The conventional administrative and cash budgets count taxes on a when-collected basis, and accordingly do not yet show the effects of the current improvement in the tax base.

Social security legislation which went into effect January 1 increased the scale of benefits as well as that of contributions. The growth of payrolls with general business recovery was reflected in the course of social security fund receipts; the $\$ 2$ billion rise in the annual rate of such receipts in the first quarter was due mainly, however, to changes in the tax provisions for the support of the Old Age and Survivors Insurance program. Employer and employee contributions were increased from $21 / 4$ to $21 / 2$ percent of covered earnings, rates for self-employed workers were also advanced, and the maximum amount of taxable earnings for any individual was raised from $\$ 4,200$ to $\$ 4,800$. At the same time benefits went up by an average of 7 percent, resulting in a $\$ 1 / 2$ billion rise in the annual rate of payments.

## Net exports off

The recent downward movement in net exports continued in the opening months of 1959. Merchandise exports, which during 1958 had been approximately stable from quarter to quarter at an annual rate of a little over $\$ 16$ billion, dipped after the turn of the year. Merchandise imports extended the strong upward movement which has been apparent since the second half of 1958. In part, this uptrend has been associated with the economic recovery here. There has been some growth in the demand for industrial materials and certain types of equipment, and purchases of a variety of consumer goods have continued to increase, reflecting a mixture of cyclical and special circumstances.

Petroleum imports expanded at the end of 1958 and rose further early in 1959. A factor in the movement was the prospect of mandatory import quotas; these went into effect early in March, after having been under discussion for some time.

## THE FLOW OF INCOME

Reflecting the upturn in market demand, national income advanced strongly during the second half of last year. The annual rate of $\$ 3731 / 2$ billion reached in the closing quarter was $\$ 22$ billion above the low level of early 1958 and $\$ 5$ billion above the mid-1957 peak.
The rate of increase during the latter half of 1958 was about $\$ 10$ billion per quarter. Although data are as yet incomplete, present indications are that a further increase at least as large took place in the initial quarter of 1959.

Corporate profits accounted for about three-fifths of the rise in national income which occurred from the opening to the closing quarter of last year. Most of the remaining upswing was in employee compensation and in earnings of nonfarm proprietors, although property income shares also edged up during 1958. Farm income reached a high in the spring quarter and, though tending somewhat downward since then, remained substantially above its 1957 level.

## Employee compensation at new peak

Having fallen sharply after mid-1957 and leveled off in the first half of last year, total employee compensation advanced in each succeeding quarter. A $\$ 7$ billion upsurge

The numbering of the following tables conforms to that used in U.S. Income and Output, recently issued as a supplement to the Survex (see announcement on the back cover of this issue). This volume presents a full explanation of the new quarterly reporting system, as well as data for 1946-57.

a Estimate based on incomplete data.
their long-term upward trend, have been the most important single factor in the rise in wage and salary disbursements during the past year. Since the spring of 1958 payrolls have also reflected an upturn in arerage weekly hours of work and a recovery in employment.
Employment has moved up more slowly than the other factors affecting the wage-salary total, and as recently as last March was about 2 percent less than in the third quarter of 1957 . At a comparable point in the 1954-55 cyclical upswing, it may be noted, employment was about 1 percent above the preceding peak. This difference reflected mainly the lesser advance reported for nommanfacturing employment this time than last.

For manufacturing as a whole, employment in March of this year was about 5 percent less than in mid-1954; this was about the same relative shortfall as the one found at a comparable stage of the preceding cyclical upswing.

Employment in nommanufacturing industries is reported about even with the prerecession high : after a year of business recovery from the 1954 recession, it was 3 percent above the previous peak. The current statistics on employment outside of manufacturing are preliminary, however, and revisions in them may affect this comparison somewhat.
(Continued on page 26)

# Public and Private Debt in 1958-59 

THE CIHARACTER and volume of debt formation were markedly affected by the business recession that terminated early last year, and by the subsequent recovery.

The business recession centered in the production of durable goods, with sharp cutbacks in durables inventories. business fixed investment, and consumer durable purchases. During the downswing, corporate and consumer borrowing, which are closely associated with these outlays, fell off. As the economy recovered in the latter part of 1958, outlays on durable goods stabilized or advanced, as did the associated forms of debt. With continued strong recovery so far this year, such debt has risen further.

Government borrowing advanced sharply last year with the rise in expenditures and decline in tax receipts; and a spurt in residential construction activity was accompanied by a considerable expansion in residential mortgage debt.

## Debt changes in 1958

Net public and private debt outstanding at the end of 1958 amounted to over $\$ 770$ billion, an increase of $\$ 34$ billion having taken place during the year. In 1957, the total outstanding had risen $\$ 29$ billion.

The step-up last year in the rate of debt formation is traceable chiefly to an $\$ 8$ billion advance in Federal net debt, which had been reduced in the preceding 2 years.

The rise in State and local debt about maintaned its 1957 pace, amounting to around $\$ \pm$ billion for the year. Corporations reduced their current liabilities sharply in the aggregite and their total net debt rose only $\$ 3$ billion, after having expanded $\$ 12$ billion the year before.

Persons and unincorporated enterprises borrowed a net total of close to $\$ 19$ billion, $\$ 5$ billion more than in 1957. Nonfarm mortgage debt increased almost $\$ 13$ billion, the second largest rise in such debt in the postwar period. Farm debt also expanded, as did financial and commercial obligations: little change was reported in the outstanding total of consumer credit.

## Rise in 1959

Debt developments so far this year have continued to reflect the progress of the business recovery. As detailed elsewhere in the Surver, nearly all major categories of demand have moved up in this period. Particularly important for the current debt situation have been the recovery of consumer auto buying, the record value of housing activity, and the higher spending by business for inventories and fixed facilities.
With these developments, nearly all major categories of private borrowers have stepped up their demands on the

[^1]money and capital markets. Specific instances are noted below as the availability of data permits.

Public debt formation has remained high. State and local issues have continued to appear in near-record volume. Expenditures exceeded receipts for the Federal Government also in the early months of the year; most of the rise in tax accruals had not yet been reflected in collections.

## SAVING AND INVESTMENT

The recession phase of last year's cyclical swing in business was marked by a sharp reduction in private investment. For the year as a whole, such investment was down substantially from 1957, the rise in residential construction having only partially offset the decline in business outlays for capital investment.

Gross private saving was almost unchanged from the 1957 total. The rate of saving was off slightly in the early months of the recession, as the drop in gross undistributed earnings of corporations exceeded the rise in personal saving. With the improvement in business, however, both components were higher in the second half.

For all governments combined, the recession brought a substantial swing in budgetary position, from a modest surplus to a substantial deficit. The change was most marked in the case of the Federal Government, but was also apparent for State and local governments, which as a group recorded a somewhat larger deficit on income and product account last year than the year before.

With demands for private funds off and governmental requirements up, there was a corresponding shift in the pattern of borrowing. Total private debt formation of $\$ 2.2$ billion last year was down from 1957. Government borrowing, totaling over $\$ 12$ billion, showed a sharp rise from 1957 .
Corporations and persons alike moved in the direction of increased liquidity last year.
With corporate saving high and tangible invest ment down, nonfinancial corporations added to their holdings of cash and U.S. Go ernment obligations; their outstanding indebtedness rose only about 1 percent, and there was considerable refinancing of short-term into long-term obligations.

Personal investment outlays rose somewhat last year, as increased purchases of houses and a buildup of farm inventories offset decreases in other categories. The rise in investment purchases was financed mainly by borrowing. With saving unchanged, persons acquired about the same total of financial assets in 1958 as in the previous year, but showed a marked preference for fixed-value claims. In particular, deposits with banks and other financial institutions increased sharply.

With the help of these funds, the institutions in turn financed a record expansion in their assets.

## Pattern of Borrowing in Postwar Business Cycles

U. S. Department of Commerce, Office of Business Economics

## Monetary and credit policy

An increase in the volume of liquid assets was facilitated by Federal Reserve operations as the recession deepened in early 1958. The monetary authorities utilized all the major instruments at their disposal to ease credit conditions and to expand the lending capacity of the banking system.
Discount rates, which already had been reduced in late 1957, were cut further in the first half of last year. Reserve requirements against demand deposits were reduced, while the effects of a gold outflow were approximately offset by open market purchases of securities.

These actions provided the basis for a record peacetime expansion in the money supply. Demand deposits (adjusted) were up $\$ 51 / 4$ billion over the year. Time deposit.s in commercial banks rose $\$ 71 / 2$ billion.
The bulk of the monetary expausion in 1958 occurred during the first half. After the business upturn the monetary anthorities limited the expansion in bank credit to seasonal demands, and the discount rate was raised twice.

With business demand for lom funds being slack during most of the year, commercial banks used their expanded lending capacity to purchase Government securities in :m amount about equal to net Treasury borrowing. The banks also acquired a record volume of municipals and were active in the mortgage market.

With the supply of funds up and loan demand off, interest rates fell during the business recession. This movement was reversed after midyear as the economy recovered and the pace of borrowing increased. The fall which occured was steeper in short- than in longer-term rates; the subsequent. rise has not yet brought complete recovery in the case of short-term issues. Bond yields had mored above their previons peaks by the turn of the year.

While the movement in interest rates generally conformed to supply and demand conditions, the timing and extent of the changes, partly reflected market anticipation of the shifts in these conditions. Thus the steepest drop in yields came in the early months of the recession, and before there had been any substantial increase in the money supply; and the rise in yields was sharpest just at the outset of the business, recovery.

The abrupt turnaround in interest rates early last summer, in particular, was preceded and accompanied by speculative activity in the bond markets, in olving substantial buying on margin. With the economic outlook improving and the prospect of a marked increase in the supply of Federal obligations, there followed substantial liquidation of margined and other holdings. This switch intensified the rise in interest rates during the summer, when bond prices underwent the sharpest break in many years.

## GOVERNMENT DEBT

Total net debt of all govermments combined rose markedly last year, as the Federal component turned upward to register an $\$ 8$ billion adrance and State and local debt increased $\$ 4$ billion.

Net Federal Govermment and agency debt rose $31 / 2$ percent. during calendar 1958 , to reach a total of $\$ 2321 / 2$ billion. This was the largest increase in the postwar period. Gross delt amounted to $\$ 3101 / 2$ billion at yearend, after an expansion a little greater than that in net debt. While intra-gorernmental holdings of Treasury obligations were off $\$ 1$ billion, Treasury adrances to other Govermment agencies rose by $\$ 11 / 2$ billion.

Last year's increase in Federal debt matched the substan-
tial Federal deficit on income and product account. Govermment outlays rose with the increases in personal transfer payments, agricultural price support activity, and grants-inaid under the highway program. At the same time Federal receipts fell off. Corporate tax accruals shrank with the tax base, and yields from various other levies tapered.

With expenditures up $\$ 71 / 2$ billion and taxes down $\$ 31 / 2$ billion, the $\$ 3$ billion surplus in national income and product account realized in 1957 was replaced in 1958 by an $\$ 8$ billion deficit. (The Administrative Budget showed a similar movement, but on a somewhat lesser scale since it measures taxes in terms of collections rather than accruals and shows expenditures exclusive of trust account transactions.)

The rise in public holdings of Treasury obligations amounted to $\$ 9$ billion. Close to $\$ 1$ billion of this involved no change in net debt, however, since it replaced Federal agency securities in the hands of the public. Underlying the decline in the latter was a shift in the method of financing the activities of the Federal National Mortgage Association. During 1957 , this agency had issued about $\$ 2$ billion of debentures to the public, using more than half the proceeds to repay previous Treasury advances. Last year this procedure was reversed, nearly a billion dollars of publicly held debt being paid off as the Association increased its borrowing from the Treasury.

Commercial banks acquired $\$ 8$ billion of Federal Government securities during the calendar year. (See chart.) The Federal Reserve System purchased $\$ 2$ billion in implementing its policy of monetary ease, and holdings by nonfinancial corporations rose about $\$ 1$ billion, providing an outlet for the companies' liquid funds.

Individuals, in contrast, reduced their holdings of Federal securities by about $\$ 21 / 2$ billion last year. I half-billion dollars of this reduction represented a continued decline in savings bonds-which, however, was substantially less than the $\$ 2$ billion net redemption of 1957 and was concentrated among the issues of larger denomination. Persons acquired a net total of almost $\$ 1$ billion in Series E and $H$ savings londs, as sales rose above 1957 and redemptions prior to maturity fell off. Although such redemptions were down for the Nation as a whole from the exceptionally heavy 1957 volume, there was some indication of increased redemptions in geographic areas where the recession was especially severe.

Individuals reduced their holdings of marketable Federal obligations by about $\$ 2$ billion, reversing the 1956-57 buildup. These securities are available only in large denominations, so that their ownership is restricted for the most part to higher income groups in the population. The 1958 reduction in individuals holdings involved some taking of capital gains on such bonds during the first half; the attractiveness of such securities was also reduced by the upward movement in the stock market as business improved.

With calls on life insurance companies' loan funds down, a small net increase in Federal securities held by the carriers (included in other institutions in the chart) reversed an 11vear decline. The business downswing was in similar fashion reflected in the portfolios of mutual savings banks, fire and casualty insurance companies, and trusteed pension plans, as all these groups reported a slowing in the rate of Federal security liquidation.

Savings and loan associations have been steady purchasers of government securities in recent years, since their liquidity requirements have increased in line with the advance in their share capital. They continued to build up their holdings last year.

State and local govermments took a substantially smaller
volume of Federal obligations for their investment funds than in any other recent period. The increasing stringency of State and local finances generally may have been a factor in this slowdown.

Foreign holdings, including those of central banks, were about the same at the end of 1958 as at the beginning. In the first half of the year, however, foreign central banks and other official institutions reduced their holdings of short-term Federal securities by about $\$ 1$ billion, investing the proceeds in time deposits at commercial banks, which afforded a higher yield. As interest returns rose in the latter half of the year, foreign central banks reacquired about $\$ 1$ billion of these short-term Governments.

Although Treasury borrowing amounted to $\$ 9$ billion on a net basis, the marketable portion rose by $\$ 111 / 2$ billion last. year, as $\$ 21 / 2$ billion of nonmarketable securities matured or were redeemed prior to maturity.

The rise in marketable Federal debt extended to all major instrument classes. During the period of relatively low interest rates in the first half, the Treasury issued bonds with maturities of 27 and 32 years, carrying coupon rates of $31 / 4$ and $31 / 2$ percent respectively-in contrast with the $33 / 4$

## Commercial Banks Acquired Bulk of

 Federal Debt Increase in 1958
percent market yield on long-term bonds which had prevailed in late 1957. Substantial amounts of bonds maturing in 6 to 8 years were floated in this period, and the Treasury also issued a number of medium term notes carrying sulbstantially lower interest rates than previously.

After the advance in interest rates which began around the middle of the year, the Treasury relied more on certificates and other short-term obligations. So far in 1959, the Treasury has continued to depend mainly on short-term offerings, although bond issues of limited size were floated in January and March. A recent innovation in Treasury financing is the issue of 6 - and 9 -month bills, to complement the 3 - and 12 -month issues previously available by providing a wider range of short-term maturities for investors.

## State and local government debt

The net debt of State and local governments to other economic units amounted to $\$ 51$ billion on June 30, 1958, about $\$ 4$ billion more than a year earlier. (These comprehensive statistics of State and local government debt outstanding, unlike other figures presented in this report, are not prepared on a calendar-year basis.)

The pace of new borrowing was stepped up during calendar 1958 as State and local governments expanded construction of schools and highways. As indicated elsewhere in the Surver, this rise in construction activity helped to sustain business during the recession and has been one of the factors in the recovery. It was financed in part through higher Federal grants-in-aid, particularly for highways. In addition current revenues played their usual important role as a source of funds for these purposes.

Two and a half billion dollars of the increased lending capacity of commercial banks was applied to the acquisition of State and local government obligations-the largest annual volume of such purchases on record. Other important sources of loan funds included nonlife insurance companies and individual investors.

## CORPORATE FINANCING

Last year's recession was clearly apparent in the pattern of corporate fund uses and sources. While liquid asset holdings were increased, physical investment fell $121 / 2$ billion, as inventories were liquidated and plant and equipment spending was cut back. Internal fund sources were off moderately, a sharp fall in retained earnings being partly offset by a continued advance in depreciation allowances. Demand for new external funds declined steeply. Short-term liabilities of nonfinancial corporations were reduced $\$ 6$ billion after having held about even during 1957, and long-term borrowing slowed.

## Need for funds down

Nonfinancial corporations reduced their inventories $\$ 5$ billion last year. The decline reached a peak in the second quarter. It was checked toward yearend, and inventory accumulation was resumed around the turn of the current year.

Plant and equipment spending was also reduced in 1958. Such outlays by nonfinancial corporations amounted to $\$ 261 / 2$ billion last year, 20 percent less than in 1957. The fall ceased after midyear, and by early 1959 a moderate rise was reported.

Internal fund sources showed the effect of the business cycle in a $\$ 31 / 2$ billion decline in retained earnings, which totaled $\$ 5$ billion last year. Profits fell sharply in the manufacturing, mining, and tramsportation industries in particular. With the continued rise in depreciation allowances, however, the total decline in the flow of internal funds amounted to only about $\$ 2$ billion, as compared with the $\$ 121 / 2$ billion drop in physical investment.

Reflecting these changes the purchase of tangible assets absorbed only about 80 percent of the internal funds which became available, leaving $\$ 5$ billion for acquisition of financial assets and retirement of debt.

Cash and bank deposits of nonfinancial corporations rose $\Psi^{21 / 2}$ billion. Part of this advance reflected a sharp increase in corporate ownership of time deposits in commercial banks. Corporations also increased their holdings of U.S. GovernDigitized for FRASER

 by the U.S. Treasury and other Federal agencies. It thus equals Federal Government and agency debt held by the public.
3. Details of Federal obligations shown in table 3 of debt articles previous to May 1958, and omitted here, may be found for 1958 and prior years in the Treasury Bulletin.
4. Bonds, debentures, and notes payable
5. Long-term debt is defined as having an original maturity of 1 year or more from date of issue; short-term debt as having an original maturity of less than vear
 ment of Commerce, Bureau of the Census, and Office of Business Economics.

The notion of saring as an internal fund source is much less useful here than in the case of corporate business, because of the extent to which personal saring and investing are done by different individuals. If the individuals who invest in tangible assets in any given year were considered as a separate group, their investment funds would probably be seen to come predominantly from external sources. Home buyers, for example, generally rely only to a very limited extent on their own current-period savings. A substantial part of individuals' tangible investment, however, is financed by the savings of other individuals. Part of this financing is direct, through interpersonal loans. A much larger part is accomplished through savings institutions as intermediaries. Because of this latter circumstance, the 1958 shift of financial investment toward the more liquid forms which these institutions provide seems to have helped increase the availability of mortgage loan funds.

Time deposits at commercial and mutual banks rose nearly $\$ 8$ billion. Shares held in savings and loan associations and credit unions increased $\$ 61 / 2$ billion. Demand deposits were also reported higher. Although total holdings of U.S. Government securities declined, it is noteworthy that series E and H savings bonds showed a net increase of almost $\$ 1$ billion; such a shift toward fixed-value claims has been a feature of the downward phase of each postwar recession.

At the same time that savings accounts were rising, individuals apparently took a smaller share not only of Federal marketable securities but also of new municipal and corporate issues than in 1957.

As business recovered there was an increase in stock market activity. The bulk of such activity represents sales from one person to another and does not appear in the standard statistics on personal asset acquisition. The importance of the rise in stock prices for interest rates and the bond market has already been noted.

The debt of individuals and unincorporated enterprises rose by nearly $\$ 19$ billion, $\$ 5$ billion more than during 1957 . Mortagage debt was up to $\$ 13$ billion. Farm, financial, and commercial debt also expanded, while consumer credit showed little change over the year.

## Mortgage debt spurts

Mortgage debt owed by individuals and unincorporated enterprises rose 10 percent last year to a total of $\$ 145$ billion. This increase was second only to the 15 percent expansion reported for 1955 . As residential construction activity increased and a marked upsurge developed in the sales of existing homes, mortgage debt on housing rose $\$ 101 / 2$ billion.

The increase in residential construction last year was one of the sharpest on record. It came after two years of declining activity, and provided a stimulus to the upward movement of the entire economy in the recovery phase of the business cycle.

There has been a general shift from tenancy to home ownership in the years since the end of World War II. At the end of that conflict about two-fifths of the Nation's families owned their own dwellings. Today, the proportion of owner-occupancy has reached three-fifths. The impressive advance in home ownership and an associated upgrading of housing standards, combined with the substantial growth in population, have involved a heavy construction of new homes. This has tended to add strength to overall market demand, and particularly to cyclical advances, during the entire postwar period.

Fluctuations in housing demand during this period have reflected to a very large extent variations in the supply of mortgage money.

Stringencies in this supply hare tended to affect most strongly the arailability of FHA and VA loans; fixed yields, Digitized for FRASER
the uncertainty of discounts, and a relatively low equity ratio have reduced the attractiveness of these instruments to lenders in tight-money periods. The changes in Gov-ernment-backed mortgage lending are shown in the accompanying chart.

Several conditions contributed to an expansion in the supply of mortgage credit last year: reduced corporate demands on the money and capital markets; the freeing of bank reserves by the cut in reserve requirements; the record volume of savings deposits in financial institutions; and the commitment by the Federal National Mortgage Association of $\$ 1$ billion for the purchase of Government-backed mortgages.

## Net New Borrowing: <br> One- to Four-Family Nonfarm Mortgages

These conditions were reflected in a sharp expansion in conrentional mortgage lending, which has been stable in other recent years, as well as in FHA-insured loans. In addition to the factors affecting the supply of mortgage money in general, certain specific Government actions helped to stimulate the volume of lending covered by FHA insurance. The allowable FHA interest rate had been raised to $51 / 4$ percent in August 1957, and in April 1958 minimum downpayment requirements were reduced.
The new rate on FHA-insured mortgages represented an attractive yield, and discounts practically disappeared during the period of capital market ease. Though moderate discounts reappeared on such instruments with the return of tighter conditions in the second half, a large volume of loan funds was forthcoming. Over the year as a whole the 1958 increase in FHA loans outstanding was greater than in any other two postwar years combined. (New VA-guaranteed mortgage lending fell short of repayments on previous loans, though the volume of such lending rose toward yearend.)

The Federal National Mortgage Association was authorized to acquire $\$ 1$ billion in new mortgages, and a substantial number of houses were started under this program late in the year. Because of the time lag between starts and sales, rery little of this money was disbursed by the FNMA during the year, but the commitments made facilitated the borroning of construction money.

Home mortgage lending by commercial banks amounted to $\$ 11 / 2$ billion last year: in 1957 such institutions reported little net change in such loans. Over half the increase went into conventional loans, while FHA-insured loans accounted for the balance.

Mutual savings banks also acquired about $\$ 11 / 2$ billion of home mortgages; this compares with $\$ 1$ billion in 1957. Last year's mortgage lending was concentrated in FHAand VA-backed loans; mutual banks were the only financial institutions which reported substantial acquisitions of the latter.
Savings and loan associations acquired almost half of the net total of all home mortgage debt incurred last year, and accounted for two-thirds of the growth in consentional mortgages, as a record inflow of savings provided ample funds.
Life insuance company lending was down somewhat for last year as a whole. Toward the end of the year, howerer, mortgage activity by the companies rose, and increased commitments were made to purchase mortgages during 1959. Life companies' acquisition of home mortgages tends to lag somewhat behind increases in building activity, since such institutions do not normally finance home construction.

The volume of home mortgage loans acquired by individmals and other investors increased somewhat last year over the 1957 rate.
Mortgages on multifamily residential and commercial properties rose $\$ 21 / 2$ billion to a yearend total of $\$ 32$ billion. The increase last year was substantially greater than in 1957. There has been a sharp pickup in apartment-house building activity in the last 2 years, the number of dwelling units started in multifamily structures having increased 40 per-

standing, table 1 .
3. Includes portfolio loans of the Veterans' Administration.

Soures: Federal Home Loan Bank Board; Board of Governors of the Federal Rusever System; U.S. Department of Commerce, Office of Business Economics.
cent in each year. The accompanying rise in mortgage debt was tinanced principally by commercial banks, mutual sarings banks, and life insurance companies.

## Consumer borrowing

Consumer credit outstanding at the end of last year amounted to a little over $\$ 45$ billion, practically unchanged from the end of 1957 . While automobile loans were down $\$ 11 / 2$ billion for the year, increases were reported in personal installment loans and most other categories of consumer credit.
New extensions of automobile credit during 1958 were $\$ 21 / 2$ billion less than in 1957 , as personal consumption expenditures for automobiles and parts fell $\$ 3$ billion. The drop in auto credit extensions, like that in purchases, came early in the year. Both purchases and new borrowing remained steady at the lower levels until the introduction of the new models in the fimal quarter, when they moved sharply upward. With improvement in auto sales so far this year, automobile credit has continued to expand.
The increase in personal loans, while substantial, was somewhat less than had been recorded during 1957, as net new lending slowed in the recession months. With the business recovery such loans resumed their recent-year rate of advance, and at the beginning of 1959 totaled $\$ 2 / 3$ billion more than a year earlier.
Consumer credit held by commercial banks showed practically no change last year, a decline in auto and other durable goods paper offsetting expansion in personal in-

## (Continued on page 28)

# Rise in the Business Population 

Concerns operating in the United States numbered 4.6 million at the end of 1958 , up 55,000 firms or $11 / \pm$ percent from a year earlier. This continnes the small net gains that have been characteristic of recent years. The average annual rise over the past decade has been 60,000 , with the highest years being 1055 and $195(5$.

Among the major groups, the number of firms in the service and finance divisions-each up abont $21 / 2$ percent-showed the largest relative gains in 1908. Wholesale trade and contract construction each increased roughly 2 percent, and the transportation division about 1 percent. Retail trade gained one-half of 1 percent last year; continued advances in filling stations and the automotive groups tended to balance further declines among general merchandise and food firms. The number of firms in manufacturing and in mining and quarrying declined slightly during 1958 .

## New quarterly series

This article presents, for 1951 and later years, a general revision of the business population estimates regularly prepared by the Office of Business Economics (tables 2 and 3). Introduced for the first time in the adjacent chart and in table 1 are seasonally adjusted quarterly estimates of the business population.

Previously all business population estimates were available with a time lag of 6 months, and starting in 1953 these series were prepared only semiannually. In the new seasonally adjusted series for the business population as a whole, the time lag has been reduced to about 1 month and the overall estimates have been restored to a quarterly basis, although the method used does not yield industry or other breakdowns. Quarterly movements within years and estimates for the two most current quarters are based on tabulations obtained from the Bureau of Old-Age and Survivors Insurance and from information on changes in the number of telephones.

## Steady rise in concerns

Most conspicuous in the chart on turnover in the business population is the reconversion period following World War II during which a marked "deficit" in the number of operating concerns was made up. The number of new businesses exceeds the number discontinued in each quarter of the period shown except the third of 1949 . That brief interruption in the quarterly increase in seasonally adjusted operating concerms is probably as much a reaction from the marked growth during the reconversion period as a reflection of the recessionary influences of that year.

The chart suggests an upward trend in both new and discontinued businesses starting in 1949 and continuing to date. On a rate basis, however, as shown in the chart on page 17

NOTE-MISS CHURCHILL is A MEMBER of THE PCSINESS STRUCTURE DIVISION, OFFICE OF RUSINTESS ECONOMICS.
new businesses have been quite steady since 1949 and discontinuances since 1944 .

On a seasonally adjusted basis, new and discontinued businesses since 1950 have more often than not moved in the same direction quarter by quarter so that the net increments by which the business population changes (lower panel of the chart below) show more stability than either of its components. The business population has tained an a verage of about 16,000 firms per quarter from 1950 to date. The slowing down of business activity during $195-54$ and $1957-58$ resulted in a much smaller rise while greater than average net changes occured during all of 1955 and 1956. Growth in the business population began to slacken during 1956 although not dechining appreciably below the average for recent years until late 1957.

## Distribution of firms

Business population statistics relate to the entire private economy of the United States ${ }^{1}$ but do not include activities classified in agriculture and the professional services. Each legal entity is counted only once and is classified by industry according to the major activity of the firm as a whole.

There is no cutoff based on size of firm except that a selfemployed person is not considered a business firm unless he has either at least one paid employee or an established place of business. Firms in the business population as defined account for 85 percent of the income originating in the private economy and proride employment to a similar percentage of all nongovernmental wage and salaried workers. The comparable proportions inclusive of Government are 75 and 70 percent, respectively.

Small concerns comprise the bulk of the business population; about two-fifths of all firms have no employees, threefourths have fewer than four, and only one firm in twenty employs twenty or more.

Retail trade and the service industries, the two major industry divisions directly serving the ultimate consumer, together account for three-fifths of all operating concerns. The proportion of all businesses found in the remaining broad industry divisions ranges from 10 percent in construction to about 1 percent in mining and quarrying.

## Long- and short-term changes

This article is primarily concerned with changes in the business population since 1951. A brief review of longterm trends and cyclical movements in number of operating concerns is provided to furnish perspective for recent periods.
Over the long-term, growth in the business population has been primarily affected by the underlying growth of real demand and output, combined with the increase in the human population. In 1900 there were roughly 1.6 million nonfarm businesses in the United States-or about 21 firms for each 1,000 persons; currently there are about $261 / 2$ firms per 1,000 persons. In other words, over the long-term relative growth in number of businesses has exceeded that in number of persons.

Although the business population is relatively more stable than inany other economic series, it is responsive to changes in economic conditions. Thus the number of firms per 1,0000 persons, which had reached 25 by 1929 , fell during the depression to 22 in 1933, and did not regain the 25 until 1939. During World War II the number of firms per 1,000 persons again dropped to 22 in 1943 and 1944. In 1948 toward the end of the reconversion period, per capita firms in operation reached 27 , and then declined slightly to 26.5 where it has remained for the past 5 years.

The response of the business population to changes in business conditions is brought out in another way in the chart on page 17 , which shows the actual number of firms in operation as well as the number "expected" on the basis of a relationship with real gross national product and time.? During the thirties, and since 1947 , the expected and actual numbers of firms in operation are quite close, while the

[^3]large "deficit" which developed during the war was quickly made up after hostilities ceased.

## Variations since 1951

Table 2 presents revised annual estimates of the business population and its turnover from 1951 to date, while table 3 provides additional industry detail for the combined 5year period from 1951 through 1955. Comparable business population estimates by major industry divisions for the years 1929-50 and by detailed industry for 1945-50 can be found in the January 1954 issue of the Surver. The rerision is primarily based on complete tabulations of employers filing social security tax returns for the first quarters of 1951 and 1956. It should be noted that for periods following the first quarter of 1956 the estimates are essentially extrapolations which are subject to revision when later benchmark data become a a ailable.

The revision removes a downward bias of 3 percent in the number of operating concerns between the 1951 and 1956 benchmarks; the extrapolation of the higher level brought the revision to 5 percent in 1958, with generally little effect upon inter-industry relationships.

From 1951 to 1958 the business population increased by about half a million firms or 13 percent. In these 8 years, contract construction and the finance division gained relatively the most with the service industries, wholesale trade, and the transportation division also showing better than average relative gains. Retail trade also showed a gain, with large relative increases among motor vehicle and accessory dealers and firms operating filling stations more than offsetting declines in the number of general merchandise and food firms.
Manufacturing among the major industry divisions shows the smallest relative growth in number of concerns for the 8 years 1951 through 1958 . The number of nondurable-

## BUSINESS POPULATION

remains close to expected levels

Table 1.-Number of Firms in Operation, 1945-59

Soure: U.S. Department of Commeree, Office of Business Economics.
goods manufacturers dropped slightly during 1951, regained the loss the following year and has shown steady though small declines each year since 1953.
During the two recessionary periods 1953-54 and 1957-58, growth in the business population as a whole was slowed. Manufacturing, mining, and the mansportation divisions were most responsive to the slowdowns while the service industries and wholesale trade were little affected.
The most industry detail in which business population estimates are prepared is that shown in table 3; such data are not now available beyond the end of 195 . Alhough each of the major industry devisions shared in the increase in number of operating concerns over the 5 years 1951-55. this pattern does not extend to more closely-defined industry groups within the three divisions for which more industry detail is ayailable.
Manufacturing, for example, shows the smallest of the relative increases among the major industry divisions. Six of the nineteen manufacturing groups declined between Fanuary 1,1951 and the beginning of 1956 , with the largest relative decreases occurring among textile, leather, and apparel manufacturers. Six industries increased more than 15 percent in the 5 -year period: rubber and petroleum refining in the nondurables, while the remainder were metalfabricating industries.

Among retail trade firms, filling stations increased relatively the most. The growth in number of discount houses may explain in part the large relative increase among firms deating in appliances and radios.
The continuing trend toward supermarkets is reflected in the steady declines among food firms. Each of the three categories of fool firms declined from 1951 to 1956, and

which the current number of operating concerns is lower than in 1939.

The general merchandise group contains not only department and rariety stores but the "general stores" characteristic of rural areas. Decreases in the number of general stores are probably responsible for the decline of the group as a whole with the tendency toward suburban shopping centers acting as a brake on expansion. Suburban shopping centers are more likely to include branches of centrally located stores than independent retailers.

During the 1951-55 period, business services and miscellaneous repair shops and hotels and other lodging places were the service groups expanding most rapidly. Changes within the remaining service groups ranged between a sam

## Patterns of

BUSINESS TURNOVER RATES

of over 5 percent for automobile garages and repair shops to a decline of the same magnitude for producers, distributors and exhibitors of motion pictures.

## Turnover in business concerns

During 1958, there were 411,000 new and 356,000 discontinued businesses; in addition, 372,000 going concerns were sold, reorganized, or otherwise acquired by new owners. A slight rise from the previous year occurred in the number of both new and discontinued businesses while the number of business transfers declined slightly.

New businesses refer to firms newly established while discontinuances include all liquidations regardless of the reason for going out of business. Only about half of all discontinued businesses are liquidated in order to prevent or minimize a loss while the number of bankruptcies, or firms going out of business with known loss to creditors, represent less than 5 percent of the total. (Data on "Commercial and Industrial Failures" are compiled by Dun and Bradstreet, Ine.)

As has been noted above the upward trend in number of new and discontinued businesses since 1949 is largely a reflection of growth in the business population. To facilitate comparisons among industries, entry and discontinuance rates per 1,000 firms in operation are shown in table 3 and, for selected broad industry divisions, in the chart on page 17 .

Although the rates of growth differ, entry rates in each of the divisions charted tend to follow the same pattern year by year, as do discontinuance rates. Entry rates seem to be more responsire to changes in business conditions and, as would be expected, the conditions associated with a rise in entry rates also tend to be associated with a dip in discontimuance rates. These generalizations hold quite well not only for the major divisions charted, but also for the divisions omitted from the chart and for the industry groups as well.

Although turnover rates are similar by industry in broad morements, considerable variation in the level of these rates is apparent from the chart and from the 5 -year arerages shown in table3. Previous articles on the business popula-

 and Survivors' Insurance.
tion have shown that turnover rates differ not only by industry but by size of firm, by legal form of organization, and by age of firm. ${ }^{3}$ Additional factors of undoubted though unmeasured effect are industry differences in capitalization, demand for products or services, and ease of entry-the latter probably being closely associated with degree of risk.

When industries are ranked with respect to new and discontinued rates, the ranks agree quite closely except for groups undergoing marked growth or decline. However, relatively high rates of growth are not necessarily correlated with high turnover rates nor with high transfer rates.

[^4]Federal Reserve Bank of St. Louis

Under conditions which maintain the number of firms operating within an industry at a constant level, business births would of course equal business deaths. Since they fluctuate within narrower ranges over time, discontinuance rates serve as the better estimate of this "sustaining" turnover rate which, with due allowance for variations in composition with respect to size, age, etc., are the closest available indicators of comparative ease of entry and degree of risk.

Among the major industry divisions the highest discontinuance rate appears in construction and the lowest in the finance division. The transportation division is also substantially above average in this respect, mining and manfacturing slightly above, while wholesale and retail trade
(Continued on page 26)

# Recent Experience of Growth Products 

THIS article carries forward the evaluation of procluction growth trends earlier developed and published in the April 1957 Survey of Current Business.

During periods of general business fluctuations, particular industries and products typically move in diverse directions and in varying degrees of amplitude. In the 1957-58 business decline, for example, production of durable manufactures and minerals registered a sharp reduction while output of nondurables dropped only moderately.

For individual products, the diversity of production movements was even more striking. This fact can be seen from Table 1, which lists output data for 1957 and 1958 for some 300 -odd items, approximately the same ones included in the previous revjew. The products have been classified on the basis of the average annual rate of change in output from 1929 through 1957 - or from the first year production data are available-as (1) rapidly growing, (2) moderately growing. and (3) declining, and have been arranged according to the order of magnitude of change.

It the outset, it should be reemphasized that an analysis of this type has certain limitations. First, the list of products is a partial one only. Many items which are widely known to be new and growing do not appear in the table for lack of data or for other reasons. While industry representation by products is substantial in most cases, there is considerable undercoverage in a number of important industries for which physical quantity data are not available.

This is particularly true for the electrical and nonelectrical machinery industries, which produce the bulk of producerss equipment. Product representation in these two groups consists for the most part of consumer durable goods lines which constitute only a small proportion of their total output. Data on output of heary machinery and equipment shown in the table are limited to a relatively few products such as farm and industrial tractors and specialized types of farm machinery. Despite these limitations, howerer, the selected products listed range over the entire field of manufacturing. mining. and the service industries. It is estimated that the combined weight, in terms of the value added, of the manufactured and mining products included in the table accounts for roughly three-fifths of the total weight of the Federal Reserve industrial production index.

Nlso, it should be restated that, because growth rates for individual products are affected by the base year for the rate calculations, the percentage changes shonld not be used in any precise sense as a measure of growth. In the case of new products, growth rates are calculated from a low base and therefore run high in the early years of development, but then the rates generally fall sharply as production expands.

For added perspective, the accompanying table includes product data for 1948 . Particular caution should be used, however, in an analysis of growth involving only the postwar years, when a variety of temporary or unusual factors were

[^5]at work. For example, some items did not get into full production until several years after the end of the war; production of others was abnormally high in the years immediately after the war.

As might be expected, the growth rates for the great majority of the products listed in the table differ only slightly from those presented in the April 1957 simber, which were based on the change in output from 1929 through 1955, so that the individual products generally remain within the same broad range of percentage changes. Where changes in rates of growth occur, they are for the most part limited to 1 or 2 percentage points in either direction, though some exceptions to this general pattern are noted.

## Response to business fluctuations

Past experience has shown that the output of durable goods items generally has reacted more markedly to business fluctuations than nondurables and services. In the latest recession, about two-thirds of the 300 products tabulated registered production declines.

The decreases in output were widespread throughout the manufacturing and mining industries. About three-fourths of the durables, three-fifths of the nondurables, and all of the mining items listed in the table recorded production decreases from 1907 to 1958 . The service industries as a group were relatively more resistant to the business decline. Here, only 7 of the 19 items registered output declines, and these were largely concentrated in industries associated with the transportation industry.

For some of the heary basic groods, such as steel, coal, rails and railroad equipment, machine tools, and automobiles, the production decreases from 195 to 1958 exceeded 15 percent whereas in soft goods lines the reductions generally were well under 10 percent. With the tumaround in business in the spring of 1958 , however, the output of most products recovered sharply and by the end of the year was about as high as or higher than earlier peaks.

## Patterns of fast-growing products

In an amalysis of the growth trends of the fast-growing products and their relationships to business fluctuations, a namber of basic characteristics may be noted. Many of the new products have generally maintained their production uptrend throughout the period: for a large group, the rate of output has shown a marked slowing down and, for a smaller group, production has stopped growing, at least temporarily, and even in some cases has declined.

Of the 100 items which showed increases in the last recession, over half consisted of fast-growing lines. The great majority of these products are affected to some degree during periods of business contractions, but generally in a slowing down in the rate of growth. This is particularly true for those products which had previously shown fast rates of growth. Eren for the new lines, continued growth is con-
ditioned by the basic characteristic of the product and mirket.

The percentage changes in output of fast-growing products from 1957 to 1958, however, were on the whole relatively small. A few notable exceptions on the downside occurred in some of the relatively newer lines such as television sets and tape recorders among household durables, offhighway tractors and diesel-electric locomotives among heavy grods, and a few miscellaneous items such as major automobile accessories and titanium sponge. The large reduction in output of the latter product reflected primarily cutbacks in production of military type aircraft, where the bulk of titanium is consumed.

Examples of various postwar patterns of fast-growing products are depicted in the accompanying chart. The heavy dots pinpoint the production curve during the recession years. It may be useful to compare and examine briefly a few specific products to point out the nature of the expansion and the major underlying factors involved in the growth.

## Examples of continued growth

Polyethylene, antibiotics, and air travel typify those cases which have continued to grow at high rates throughout their market life. All three are relatively new products, with the first two developed during World War II and air travel coming into its own in 1929 .

Polyethylene, a member of the plastics family of products and produced chemically by polymerization of ethylene obtained from petroleum or natural gas, is one of the most rapidly growing products developed in the past two decades. It is used extensively both in industry and by the consuming public, the latter accounting for the larger proportion of total consumption. Food packaging, storage bags, squeeze bottles, housewares, and contaners are some of the large consumer applications; pipe, panels for partitions and walls, floor and wall tile are examples of the principal industrial uses.

Output started off with 1 million pounds in 1943 , expanded to 50 million by 1950 , to 210 million in 1954 , and to neatly 900 million pounds in 1958 , more than a threefold increase in the past 4 years. This fast growth in volume exceeded that of any other chemical product developed durjng and since the war with the exception of synthetic rubber, one of the more notable product achievements of World War II. The steady expansion in output of polyethylene in the postwar period has been an important factor in the growth of the plastics industry.

Intensive chemical research has made possible the development of a wide and almost unlimited market for products made from polyethylene. Research continues and new uses and new products are constantly being developed.
The story is similarly impressive for antibiotics-the socalled "miracle drugs" - a development of chemotherapy. The modern era of chemotherapy actually began with the development and introduction of the sulfa drugs in 1935 . Seven years later, the first antibiotic-penicillin-was marketed. New discoveries of medicinal chemicals in the ensuing years brought streptomycin in the mid-war years and the broad-range drugs, aureomycin, terramycin, tetracycline, and chloromycetin in the 1950 's. There are now well over 20 established preparations reaching the consumer and many more are still in the laboratory stage. Penicillin and streptomycin, however, rank as the most important in terms of value and volume. Shifts in the use and intensity of demand have occurred from time to time among the various antibiotics. The use of sulfa drugs, for example, has declined appreciably in the past decade or so, owing mainly
to the considerable replacement by the antibiotics line of medicines.
Output of antibiotics has shown a consistently high rate of growth. Between 1948 and 1958, the amnual average increase in production amounted to 25 percent. Productionwise, volume is small relative to most other chemical lines. Output expanded from less than 3,000 pounds in 1944 to about 2.5 million pounds in 1958.
Production increases over the years have been accompanied by substantial reductions in prices to the ultimate consumer; the average price of antibiotics has moved from $\$ 860$ per pound in 1948 to a current price of around $\$ 160$ per pound.
Because of its high unit value, the dollar value of manufacturers' sales of antibiotics has expanded to a sizable amount over the years, reaching approximately $\$ 400$ million in 1958, thus contributing importantly to the growth of the chemical industry as a whole.
Air transportation also continues to be one of the fastest growing industries. All segments of the industry-trunkline passenger and freight traffic and, more recently, helicopter service-are still expanding rapidly though the operations of the latter two groups represent only a small fraction of total air tratfic.
The long term, 1929-57, growth rate of air transportation, as expressed in terms of passenger miles flown, has been at an average rate of about 25 percent a year. In the past decade, the growth rate was 15 percent per year and since 1953 it has averaged 10 percent per yeur. Last year, total passenger miles flown exceeded 25.5 billion, some what more than 4 times the volume 10 years ago and more than half again as much as in 1953.
Passenger travel on air lines has continued upward without interruption since the service was inaugurated in the late 20 's. The rate of increase from 1957 to 1958 was considerably smaller than in other recent years due in part to prolonged work stoppages in several major lines which occurred in the closing months of 1958 when traffic is normally at a high rate and in part to the impact of the business decline.

## Where growth has been checked

Television and diesel-electric locomotives represent illustrations of products with a declining or stable market following an initial period of relatively fast growth. To a large extent the production experiences of these two products is explainable by the rapidity with which a high degree of market saturation was obtained.

In the case of television receivers, market acceptance was especially rapid in the early years of development. Production during this period was high and prices were marked down sulstantially. Since 1955 when output reached a peak of 7.8 million units-only a little higher than in 1950the number of receivers produced has declined steadily and in 1958 dropped to 4.9 million, the lowest in 9 years.

During this 12 -year period, over 64 million sets were produced. Concurrently, the number of households with telerision sets increased from about 5 million in 1950 to 32 million in 1955, and to 43 million in 1958, with the proportions to all households advancing from 12 to 67 to 86 percent, respectively. Thus it can be seen that the near saturation point for television receivers was reached within a relatively short period of time, in fact, considerably earlier than for any other major type of household consumer durable goods. For example, 12 years after their introduction on a reasonably large scale, less than two-thirds of the number of households had radios, about one-fourth had refrigerators, and one-fifth had washing machines.

## Production Pattern of Fast-Growing Products in Postwar Years

Some products have maintained their strong uptrend

Growth has slowed in others

and for some lines growth has been checked

Note.-The average annual rates of growth shown in the table below are based upon the change in output from 1929 to 1957 or from first year production data are arailable.

Table 1.-Production of Selected Products and Services, 1948, 1957, and 1958

Table 1.-Production of Selected Products and Services, 1948, 1957, and 1958-Continued

Sales of black and white television sets as a replacement and as a second or third receiver are increasing. Information available on the number of households having more than one set indicates that about 7 percent of households had two or more sets in January 1958, compared with 5 percent in April 1957, and 4 percent in February 1956.

Sales of color television receivers, which have been on the market for the past 3 or 4 years, have not yet reached volume proportions.

For diesel-electric locomotives the market pattern was strikingly similar. This type of locomotive power was introduced for the first time in the midtwenties, largely for experimental purposes. At the end of 1929 , only 22 were in use on Class I railways. In the next 10 years, the number in use expanded to 500 and at the end of 1946 totaled 4,400. Thereafter, a period of rapid expansion followed so that by the end of 1958 , there were over 27,000 diesel-electric locomotives on the railroads, a fivefold increase from 1946.

Locomotive builders quickly supplied the needs of the railroads for diesel-electrics after World War II. From 1947 to 1951, a period when the railroads were rapidly converting from steam to diesel motive power, deliveries increased from about 600 in 1946 to 3,400 units in 1951, averaging 2,300 units for the period as compared with an average of a little over 600 during the war years. Thereafter, the trend was downward as more and more railroads completed their conversion programs. In 1958, a year when railroad traffic and investment expenditures for new equipment were sharply reduced, deliveries dropped to 434 units, the lowest since the war years.

The dieselization program of the railroads appears to be virtually completed having just about replaced the steam locomotive as a means of transportation. In fact, only one new steam locomotive has been installed on Class I railroads in the past 5 years and the number in service has been reduced from 35,000 in 1947 to less than 2,500 in 1958.

## Slower growth for some

Examples of fast-growing products where growth has been temporarily slowed are shown in the center panel of the chart.

For freezers and dryers-2 relatively new consumer hard goods-output appears to have leveled off. Freezer sales have been maintained around the 1 million mark for some years while dryers reached a high of 1.5 million units in 1956 and have since been at a somewhat lower level. Unlike television sets, however, only about 20 percent of wired homes in the United States had these appliances as of January 1, 1959.

Frozen foods rank as an outstanding development in the food industry. Output has been generally upward with most of the growth occurring since World War II. Total frozen food production-fruits and juices, vegetables, meat, prepared foods, and others-reached approximately 5 billion pounds in 1958, or 4 times that of 1947. In 1957 and again in 1958 , production was somewhat below the record volume of 1956 but this was entirely due to unfavorable weather which sharply reduced the crop of oranges and grapefruit suitable for freezing. Actual consumption, on the other hand, continued its strong uptrend.

The basic trend of output of most of the individual frozen food lines is still increasing, though growth rates for the old established products, such as fruits and vegetables, have slowed down noticeably in recent years while those for the newer lines are still expanding. The prepared food grouppot pies, fruit pies, complete packaged dinners, and othersa relatively new development in the frozen food line, is the most rapidly growing segment of the industry.

As has been indicated in the Surver, the broad indicators of economic activity have depicted the nature and character of the recent recession and recovery period. The maximum reduction from peak to trough in total real output of goods and services was 5 percent and the subsequent recovery, which began in the spring months of 1958 and is still continuing, has already exceeded 7 percent. Divergent trends have characterized the movements within the broad aggregates. As the foregoing discussion and table indicate, this was strikingly true for individual products and services where the prodestion patterns of the various old established lines and the new more rapidly growing products varied widely depending on the diverse intensities of demand.

## National Income and Product

(Continued from page 7)

Another view of the recent course of employment is obtained by comparing the entire current cycle to date, including the 2 quarters of decline as well as the 4 of recovery, with a period of like duration following the mid- 1953 peak. Employment is now about as close to the previous high as it was 6 quarters after the earlier downswing began. That earlier period, however, included 4 quarters of decline and only 2 of recovery.

The improvement recorded for April 1959, which is described earlier in this issue, does not substantially alter these comparisons with the experience of the previous cycle.

## Industry pattern of income

The industrial structure of recovery in national income, like the market pattern of the rise in GNP, has continued since the turn of the year along the same general lines which were apparent in the second half of 1958 . The base of the upswing has broadened appreciably, however, in recent months.
Hard-goods manufacturing, mining, and transportation, which had recorded the sharpest declines in the period of contraction, extended the rebound begun last summer. Other nonfarm industries producing and handling commodities generally seem to have stepped up somewhat the pace of their late 1958 advance.

First quarter data on national income are not yet complete. The recent course of the large wage and salary component, howerex, provides a clue to the latest developments in the industrial structure of the income stream. Of particular interest is the gradual fanning out of the effects of the economic recovery to a broader range of industries. This pattern, which was a notable feature of the business upswing in early 1955 also, is seen in the increasing extent to which the continued strong advance in durables manufacturing is accompanied by accelerated payroll gains among
the nondurables and in a wide variety of nonmanufacturing lines.

## Corporate profits

Increases in profits from the recession low of early 1958 gained momentum as the year progressed. By the fourth quarter corporate profits were back to about the early 1957 level. Before taxes and excluding inventory gains and losses, the profits share of national income reached a seasonally adjusted rate of $\$ 44$ billion prior to the end of the year. Data so far available indicate a further advance in early 1959. With taxes absorbing about one half of total pretax profits, and dividends stable as usual, there was a particularly sharp expansion of undistributed profits; these recovered the early 1957 rate of approximately $\$ 10$ billion.

Despite the sharp rebound in the second half of last year, the profits share of national income was lower for 195.8 as a whole than for $1957-\$ 36$ billion, as compared with $\$ 42$ billion. A slightly greater decline was evident in pretax book profits, as inventory gains also dropped. After-tax profits were off proportionately from $\$ 22$ billion in 1957 to $\$ 18$ billion last year. Dividends were maintained at approximately the 1957 figure, while retained earnings fell by two-fifths, to a postwar low of $\$ 6$ billion.

In terms of industrial origin, both the decline and the recovery during 1958 centered in durable goods manufacturing. Auto profits rose sharply in the last quarter and improved earnings in nearly all the other durables groups were apparent from midyear on. Changes in nondwables profits were generally somewhat smaller in dollar magnitude as well as in percentage terms. Most of these industries experienced better profits in the second half of 1958 than earlier, as did almost all nonmanufacturing lines. Among the latter, tramsportation and trade showed the most marked gains.

## Rise in Business Population

(Continued from page 19)
and the services appear within a rather narrow range slightly below arerage.
Within manufacturing the lumber group ranks highest, with an average amual discontinuance rate more than double that of the dirision as a whole and substantially higher than that found for any other group in or out of manufacturing. The lumber group is particularly volatile and although the average lumber firm is small in comparison to other mamfacturing groups. it is not small at least in terms of employment when compared to eating and drinking places in retail trade or miscellaneous repair shops in services, each of which has a much lower arerage discontinuance rate.
In nearly all yeurs new and transferred businesses move in the same direction and, for the business population as a whole, were nearly equal in number over the 5 years $1951-55$. When added together these series represent all newly acquired businesses. The probability that a newly-acquired business will be newly established varies considerably among the industry divisions and groups. Thus, in construction, new businesses outnumber transfers by nearly five to one. In the liquor, drug. grocery, filling station, and hardware
lines of retail trade, on the other hand, new entrepreneurs are more than twice as likely to acquire the business by transfer. While business births exceed or about equal transfers in half of the retail trade groups, this division accounts for two-thirds of all business transfers as compared with about two-fifths of all operating concerns.

## Statistical Note

The sources and methods employed in preparing business population estimates are described in the technical notes to the article, "Recent Business Population Movements," in the January 1954 issue of the Survey of current business. Statistics contained in the 1954 article for 1950 and all available earlier years required no revision and tie in with data presented here. Annual business population estimates on the number of firms in operation begin in 1929 for the major industry divisions and in 1945 for the detailed industries as shown in table 3 of the present article. Business turnover estimates start in 1940 for the divisions and in 1945 for the groups.

# Public and Private Debt 

(Contimued from page 14)
stallment and single-payment loans. Sales finance company holdings of consumer credit declined nearly a billion, mirroring the drop in automobile loans, which account for the bulk of their business. Most other lenders reported small increases.

## Financial debt rises sharply

Financial debt of individuals and unincorporated enterprises rose $\$ 11 / 2$ billion to a total of $\$ 121 / 2$, billion at yearend. This sharp advance centered in the security loan component. Similar advances in such debt had occurred in 1949 and 1954 ; in each instance the increase in security credit accompanied a rise in stock market prices and trading.

During the downward phase of the business cycle in early 1958, the Federal Reserve Board had lowered stock margin requirements to 50 percent. As stock prices resumed their upward movement the volume of security loans rose sharply, and early in August the Board raised margin requirements to 70 percent. With a further upward drift in stock prices, activity, and security loans during the fall, margin requirements were raised to 90 percent. There has since been little further increase in such debt.

Life insurance policy loans- the other major component of financial debt-rose at about the same rate as in other recent years.

Long- and short-term farm debt rose $\$ 3$ billion to a total of $\$ 231 / 2$ billion.

The increase in farm debt during 1958 reflected partly a $\$ 11 / 2$ billion rise in price-support loans made or guaranteed by the Commodity Credit Corporation. Last year's spurt in such loans followed 4 years of gradual reductions in the volume outstanding.

Crop production in 1958 was 10 percent above the plateatu established during other recent years. While there has been a strong secular rise in crop yields per acre, the principal influence boosting production in 1958 was good weather-the best in a decade. The sharpest advance was that reported for wheat, which amounted to around 50 percent. As the record crop was harvested, prices tended to weaken. Many farmers elected to put their output under loan with the Commodity Credit Corporation.

Short-term debt of farmers other than price-support loans rose substantially last year. The increase amounted to $\$ 1$ bil-lion- 40 percent above the 1957 rate of debt formation. There was a buildup in the inventory of cattle on farms and feeder lots during the year, and a continuation of the longterm trends toward purchase of more efficient machinery and the use of a higher volume of purchased inputs also helped to swell the total of borrowings.

Farm mortgage debt rose $\$ 700$ million last year. Although the volume of sales slowed, land prices were up markedly. As in other recent years, the bulk of farm land sold went to increase the size of existing farms.

The statistics here are a continuation of the data published in the 1957 edition of Business Statistics, biennial Statistical Supplement to the Survey of Current Business. That volume (price \$2) contains monthly (or quarterly) data for the years 1953 through 1956 and monthly averages for all years back to 1929 insofar as available; it also provides a description of each series and references to sources of monthly figures prior to 1953. Series added or significantly revised since publication of the 1957 Business Statistics are indicated by an asterisk (*) and a dagger $(\dagger)$, respectively; certain revisions for 1956 issued too late for inclusion in the aforementioned volume appear in the monthly Survey beginning with the July 1957 issue. Except as otherwise stated, the terms "unadjusted" and "adjusted" refer to adjustment for seasonal variation.

[^9]$\oplus$ Revised back to January 1957 to include data for Alaska; unpublished revisions (prior to March 1958) will be shown later. The total for ordinary insurance (beginning 1956) includes adjust ments not distributed by areas.

8 Or increase in earmarked gold (-). shown later.

TThe term "adjusted" denotes exclusion of interbank and U. S. Government deposits; for demand deposits, also exclusion of cash items reported as in process of collection
o'Includes Boston, Philadelphia, Chicago, Detroit, San Francisco, and Los Angeles.

©States represented are: North Carolina, South Carolina, Georgia, Florida, Alabama, Tennessee, Arkansas, Louisiana, Texas, Oklahoma. According to quarterly reports from Virginia, consumption in that State is as follows (thous. short tons): 1958-January-March, 219; April-June, 331; July-September, 76; October-December, 84.
qIncludes data not shown separately. $0^{7}$ For data on lard, see p. S-29.
$\dagger$ Revisions will he shown later as follows: Fertilizer exports and imports (1957); total vegetable oil exports (1957-January 1958) and imports (1957); coconut oil imports (1957).
$\ddagger$ Revisions will be shown later covering 1955, 1956, and January-September 1957 (also 1954 for edible tallow) for production, consumption, and stocks of commodities affected.
9 Consumption figures for edible tallow exclude quantities used in refining; those for inedible tallow, etc., include such quantities through September 1958 only.
$\triangle$ Beginning 1955, data may include some refined oils (not formerly included); consumption figures exclude data for cod, cod liver, and other oils, and stocks include only the quantities of
${ }^{\text {a }}$ Revisions for 1958 (thous. 1b.): January, 90,403; February, 43,416.

## METALS AND MANUFACTURES-Continued

$r$ Revised. ${ }^{p}$ Preliminary. 1 Total for January-March.
$\dagger$ Data for 1947-57 have been revised to incorporatic adjustments to materials from the 1954 Census of Manufactures; revisions appear on p. 19 of the November 1958 Surver.
$\triangle$ Revisions for aluminum castings (1955) and copper, lead, and zinc mine production (1956) will be shown later.
*New series. Source: $\mathcal{E}$. S. Department of the Interior, Bureau of Mines, except imports of tin ore (Bureau of the Census). Tin recovery data represent total secondary tin recovered from scran processed in the United States. The total includes tin recovered in all forms covering alloys, solder, type metal, bablitt, etc., as well as in metal (secondary pig tin and remelt tin) which is shown separately. Data in 1957 Business Statistics represent total production (both primary and secondary).

Unless other wise stated, statistics through 1956 and descriptive notes are shown in the 1957 edition of descriptive notes are shown

${ }^{r}$ Revised. ${ }^{p}$ Preliminary, ${ }^{1}$ Data cover 14 weeks; for other periods, 13 weeks. ${ }^{2}$ Preliminary estimate of production. ${ }^{2}$ Excludes registrations for Oregon; data to be revised later. $\ddagger$ Monthly data for 1947-56 are shown at bottom of p. S-38 of the March 1958 surver.
$0^{T}$ Scattered revisions will be shown later; see corresponding note in March 1959 Survey for periods affected.
$\oplus$ Data besinning January 1958 exclude exports of new cargo transports, included in earlier data. In 1957, slach exports were valued at $\$ 1.4$ million.
New serine (from Bureat of the Census). Datr cover complete units, chassis, and bodies.
Beginning 1958, manufacturers report all assembled complete trailers, including those for which separate chassis were purchased; prior to 1958 , complcte trailers for which a manufacturer purchased the chassis and added the body were excluded from the "complete trailer" classification. ©Data beginning January 1958 include new registrations in Alaska.

Exckudes railroad-owned private refrigerator cars.

## BASIC DATAONTHEUNITEDSTATESECONOMY

PUBLICATIONS

Survey of Current Business four times annually provides the latest data on national income and product in the February, May, August, and November issues. In addition, every year the July National Income Number brings up to date all the detail contained in long-term volumes like the National Income and U.S. Income and Output supplements. Annual subscription, $\$ 4.00$. Single issues 30 cents.
U.S. Income and Output. A recently completed compilation of new and revised income and product data for the period beginning with 1946, for use in conjunction with the 1954 National Income supplement. The text includes an analysis of the American economy as viewed through the national income accounts, a discussion of the development of the accounts over the past quarter century and of the needed directions of future research, and a review and evaluation of the statistical basis of the estimates. 241 pp., $\$ 1.50$.

National Income, 1954 Edition. The authoritative explanation of methods and fundamental concepts underlying the national
income and product accounts with full statistical coverage back to $1929.249 \mathrm{pp} ., \$ 1.50$.

Personal Income by States since 1929. The record of each State's progress as measured by income, with exhaustive statistical and explanatory data. $229 \mathrm{pp} ., \$ 1.50$.

Income Distribution in the United States by size, 1944-50. Describes sources and methods used in determining the distribution of the Nation's purchasing power according to size of family income. Latest data appear in Survey of Current Business. 36 pp., 65 cents.

Income of Hawail. Prepared at the request of the Territory of Hawaii, this report furnishes a comprehensive case-study of a regional market. 73 pp ., illustrated, 55 cents.

Business Statistics, 1957 Biennial Edition. A basic reference volume for businessmen and economists, providing a roundup of the statistics reported in the monthly issues of the Survey of Current Business. 344 pp., $\$ 2.00$.

[^1]:    NOTE-MR. GORMAN IS A MEMBER OF THE NATIONAL INCOME JHVISION OF THE OFFICE OF BISINESS ECONOMICS.

[^2]:    1. Includes regular mortgages, purchase-money mortgages, and sales contracts.
    2. Includes agricultural loans to farmers and farmers' cooperatives by institutional lenders; farmers' financial and consumer delst is included under the "nonfarm" category.
    3. Comprises debt owed to banks for purchasing or carrying securities, customers' debt to brokers, and debt owed to life insurance companies by policyholders.

    Sources: U.S. Department of Agriculture, Agricultural Research Service; Board of Governors of the Federal Reserve System; U.S. Department of Commerce, Office of Business Economics.

[^3]:    1. Data for Alaska and Hawaii are not at present included.
    2. The equation for this relationship is: $Y=2250+5.5$ w $x+13.9 t$ where $Y$ Efirms in thousands, $x=p r i v a t e$ nonfarm gross mational product in billions of 1954 dollars and $t=$ vear- 1929 . The equation was derived from the $1929-40$ period: $\mathbf{R}^{2}=.984$. An equation fitted to the years 1929-40 plus $1950-58$ rields calculated values difterins from those obtained from the eppat tion above by no more than plus or minns. $t$ bercent in any Jear. The equation based on the longer term is $Y=2.26+5.35 x+15.4 t: R^{2}=.998$.
