# the BUSINESS SITUATION

CHART 1

## GNP rose \$14¼ billion in first quarter

U.S. Department of Commerce, Bureau of Economic Analysis

74-1

**S**HARPLY rising prices and declines in automobile production and residential construction characterized the U.S. economy in the first quarter of 1974. GNP increased \$14.3 billion or 4.4 percent at an annual rate, and the apparent increase was due entirely to higher prices. Prices, as measured by the implicit deflator for GNP, increased at an annual rate of 10.8 percent. Real output—GNP measured in constant 1958 dollars—declined at an annual rate of 5.8 percent. This decline came after three quarters of relatively small percentage increases.

The first-quarter increase in current-dollar GNP was entirely in final sales (table 1). Inventory accumulation, in current dollars, dropped from an annual rate of \$18.0 billion in the fourth quarter to \$7.8 billion in the first. The inventory estimate is subject to sizable revision next month—comprehensive data are not available for March and still preliminary for February. The decline in accumulation was concentrated in retail auto inventories. These inventories had increased about \$4 billion in the fourth quarter and declined almost \$5 billion in the first, thus, on a net basis, accounting for virtually all of

the drop in inventory accumulation from the fourth to the first quarter.

Real output per man-hour in the private nonfarm economy, as reported by the Bureau of Labor Statistics, declined in the first quarter of 1974 (table 2). The decline of 3.5 percent at a seasonally adjusted annual rate reflected the pattern typical of cyclical declines: Man-hours were reduced more slowly (2.8 percent) than output declined (6.2 percent). The bulk of the decline in man-hours was due to reduced employment; the decline in average weekly hours including overtime was unusually mild (see discussion of Labor Market Developments).

The 7.2 percent increase (seasonally adjusted annual rate) in compensation per man-hour in the private nonfarm economy in the first quarter of 1974 was off from the previous quarter's 8.5 percent. This deceleration occurred despite the increase in employer social insurance payments (due to the higher social security tax base effective January 1) which, other things being equal, would have produced a first-quarter increase of almost one percent compared to the fourth quarter. The deceleration can in part be attributed to the lower

time hours. With the sharp decline in productivity, the rate of increase in unit labor costs was higher, moving from an increase of 10.5 percent at a seasonally adjusted annual rate in the fourth quarter of 1973 to 11.2 percent in the first quarter of 1974. The first-quarter rate of increase is almost double that of the first three quarters of 1973.

#### Personal consumption expenditures

Consumer outlays for automobiles declined in the first quarter, although the decline was less than in the fourth quarter of last year (table 3). Sales of domestic and imported cars fell from a seasonally adjusted annual rate of 11.7 million units in the third quarter to 9.8 million in the fourth and 9.2 million in the first. Food outlays registered some real decline in the first quarter as they had in the fourth. In current dollars, outlays for the energy component of nondurables did not increase from the fourth quarter to the first quarter, and the energy component of services even declined some. In real terms, both energy components declined more sharply in the first quarter than they had in the previous quarter. The "other" parts of all three consumption categories increased in current as well as in constant dollars, suggesting that the weakness shown in total personal consumption expenditures has been largely confined to the energy-auto items and food.

1. Gasoline and oil, and fuel and ice.
2. Electricity and gas.

Disposable income increased less rapidly in the first quarter than did total consumer outlays, so that the saving rate dropped from 7.3 percent in the fourth quarter of last year to 6.5 percent in the first quarter. The drop is surprising; in the past, reduced outlays for autos have often been accompanied by a jump in the saving rate. Perhaps consumers reduced their saving rate to maintain living standards in the face of the erosion of purchasing power largely due to higher food and energy prices.

#### Fixed investment

The decline in residential construction in the first quarter was very steep,

although less than in the previous quarter (table 4). Both building permits and housing starts, which had declined throughout 1973, seem to have stabilized in the first quarter, suggesting that the downturn in residential construction may have bottomed out.

Business purchases of motor vehicles were down more in the first quarter than they had been in the fourth quarter. The weakening was concentrated in trucks. Other nonresidential investment continued to show strength. Although the first-quarter rate of increase was down somewhat from that of the previous quarter, it was still strong in constant dollars at a seasonally adjusted annual rate of 9 percent.

Table 5.—Net Exports of Goods and Services in Current and Constant Dollars

[Seasonally adjusted at annual rates]

	Current dollars		Constant (1958) dollars				Percent change from preceding quarter (annual rate)	
	Billions of dollars							
	1973		1974	1973		1974	1973	1974
	III	IV	I	III	IV	I	IV	I
Net exports of goods and services.....	7.6	12.8	9.5	7.4	11.6	11.7	-----	-----
Exports.....	104.5	116.4	125.9	67.4	71.0	71.7	22.8	4.3
Imports.....	97.0	103.6	116.4	60.0	59.4	60.0	-3.9	4.5

### Net exports and government purchases

The first-quarter export and import estimates are very tentative. March trade data are not yet available and the items comprising income from the rest of the world, which are at best difficult to estimate so soon after the end of the quarter, are especially troublesome this year because of uncertainties relating to income on oil investment. For all these reasons, the net export figures are subject to large revisions. The preliminary figures show both exports and imports increasing mainly as a result of higher prices (table 5). In real terms, both exports and imports increased only moderately and, again in real terms, the balance was unchanged in the first quarter of this year following a big increase in the fourth quarter of last year.

The export figures include about \$2.5 billion (annual rate) of larger-than-usual arms sales to Israel in the fourth quarter and about \$½ billion in the first. Also, unusual statistical problems relating to the measurement of merchandise imports may have resulted in some overstatement in the first quarter as compared with the fourth. Were it not for these factors, the first-quarter deterioration in the current-dollar balance would have been much less and the constant-dollar balance would have shown some improvement.<sup>1</sup>

1. Another unusual international transaction may be noted. In February 1974 the U.S. Government granted India \$2 billion (quarterly rates) of Indian rupees largely accumulated in the 1950's and early 1960's under aid programs. Tentatively, BEA has decided to treat this transaction as a capital grant in the national income and product accounts, whereas it will be treated as a current transfer in the balance of payments accounts. As a capital grant, it will not create the misleading increases in the national income and product measure of Federal expenditures and deficit in the first quarter that treatment as a current transfer would produce.

### GNP by sector of origin

The patterns of strengths and weaknesses in the economy can be viewed also in terms of the real output by sector of origin (table 7). Certain of the estimates, although useful, are not conceptually perfect. The auto and residential construction estimates include some purchases of raw materials from other sectors when ideally the output originating in a sector would be calculated as its sales less the value of raw materials it purchases. Farm output is actually measured in this way. Because it has not been possible to exclude these raw materials purchases from the auto and construction sectors, these purchases are counted as output originating in these sectors, and the large residual of "other" output is reduced by that amount. This residual may also be affected by problems in the seasonal adjustment of farm, residential construction, and auto output.

The auto estimate, which combines the impact of sales and inventory change, shows that in the first quarter the decline in auto production was more than in the fourth quarter. Residential construction, as was mentioned earlier, showed less weakness in the first than in the fourth quarter. The "other" sector was stable, confirming the impression derived earlier from the examination of the conventional expenditure breakdown of GNP that the decline in the economy was largely confined to automobiles and residential construction.

The Federal Government sales of arms to Israel were made out of Government stocks and were treated in the national income and product accounts as offsets to defense expenditures. Were it not for these sales, defense expenditures would have been higher than shown by \$2.5 billion (annual rate) in the fourth quarter of 1974 and \$½ billion in the first quarter. When account is taken of these sales, Federal purchases register steady increases in the third quarter of 1973 through the first quarter of 1974 (table 6). However, the rate of total expenditure (purchases, grants, transfer payments, etc.) is significantly below the path implied in the Administration's budget document, and unless an increase of a very unlikely size occurs in the second quarter, the national income and product measure of Federal expenditures for the fiscal year ending in June will be far below that projected in the budget.

## Prices

The sectors of sharpest price rise and their impact on U.S. purchasers are highlighted in table 8. In that table, price changes are viewed in terms of the implicit price deflators, which are the by-products of the current- and constant-dollar estimates. The implicit price deflators are composite indexes of the prices of the goods and services included in them, and un-

**Table 7.—Gross National Product by Sector of Origin in Constant (1958) Dollars**

like most price indexes, are based on shifting weights that reflect the changing composition of the included expenditures.

The starting point of the table is the implicit price deflator for GNP. It represents the changes in the prices of the output of goods and services produced by the Nation's economy. From the point of view of U.S. purchasers, exports and their prices should be excluded from the calculations because U.S. purchasers do not buy exports. However, they do buy imported goods, and since imports are excluded from GNP, it is necessary to add imports and their prices into the calculations. Exclusion of exports and inclusion of imports yield the desired measure of prices paid by the U.S. purchasers; it is presented in the table as the implicit deflator for GNP less exports plus imports. The implicit deflators for personal consumption ex-

**Table 8.—Implicit Price Deflators**

1. Gasoline and oil, fuel and ice, electricity, and gas.

penditures show the changes in prices paid by U.S. consumers, and the implicit deflators for the residual "other" show the changes in prices paid by government and investors.

The first-quarter increase in the implicit price deflator of GNP—10.8 percent at a seasonally adjusted annual rate—was the largest yet of the recent series of large quarterly increases. The increases in the prices of goods and services bought by U.S. purchasers (line 4 of the table) have generally run even higher, reflecting the more rapid rate of increase in import prices than in export prices. The first-quarter jump in import prices—due in large part to increased oil prices—widened the differential between the rate of increase in GNP prices and prices of goods and services bought by U.S. purchasers.

Since the beginning of 1973 food prices have increased steadily—averaging a 16.3 percent increase (seasonally adjusted annual rate) per quarter, and consequently food prices alone would have produced a wide differential between the rate of increase of total personal consumption prices and the

prices of the "other" category of personal consumption. However, the differential widened in the first quarter of 1974, and this is traceable to the very sharp acceleration in the rate of increase in consumer energy prices. In the first quarter, consumer energy prices increased at a seasonally adjusted annual rate of 67 percent, compared to 27 and 6 percent in the fourth and third quarters. This price increase is in part a reflection of the increase in price of imported energy. Thus, the increases in the prices of total personal consumption since the beginning of 1973—which in the first quarter reached a 13 percent seasonally adjusted annual rate—were largely due to food and energy prices, while the prices of all other consumer goods increased at a substantially slower rate.

The increasing prices of energy also enter into the acceleration in the prices of items purchased by government and investors. After comparatively mild increases through the fourth quarter, the latter prices also reached a 12 percent seasonally adjusted rate of increase in the first quarter of this year.

# Labor Market Developments

TOTAL employment, as measured in the household survey, rose less than 1 percent at an annual rate from December to March, compared with nearly 3 percent during the third and fourth quarters of last year. Farm employment accounted for all of the increase; non-farm employment was unchanged. The civilian labor force increased at an annual rate of 2 percent, and the unemployment rate increased from 4.8 percent in December to 5.1 in March; all of that increase occurred in January.

Nonfarm employment, as measured by the establishment survey, changed little from December to March, after an increase of 3½ percent (annual rate) during the fourth quarter (table 1).

**Table 1.—Percent changes, Nonfarm Payroll Employment <sup>1</sup>**

[Seasonally adjusted at annual rate]

	1973				1974
	I	II	III	IV	I
<b>Total</b> .....	5.0	3.3	2.3	3.5	0.1

Services.....	5.8	3.3	5.6	4.2	3.1
Mining.....	2.0	13.1	2.6	8.5	4.4

<sup>1</sup> Changes are computed from final months of each quarter.

The increase in that quarter reflected very large gains in October and November; employment declined in December, when the oil shortage first began to have an impact on economic activity. Employment effects related to the oil shortage were first evident in industries other than manufacturing. Retail trade employment fell 110,000 in December and another 13,000 in January, largely as a result of layoffs of workers in retail automobile establishments and filling stations. Employment in services, where monthly increases of 40 to 60 thousand

had been usual, was unchanged in December and January, as reduced employment at motels and other travel-related service establishments offset small gains elsewhere. Recently, however, growth of employment has resumed in both the trade and service industries.

Reductions in manufacturing employment occurred mainly in the first quarter, when the impact of the oil shortage became severe (table 2). Manufacturing employment fell 6 percent at an annual rate from December to March, with declines in each month of the quarter. Employment cutbacks in transportation equipment accounted for about two-thirds of the drop; nearly all of the decline was in the motor vehicle industry, as producers reduced production in an effort to bring inventories into better balance with sales. Auto sales had begun to weaken significantly in October, but major cuts in production were not made until mid-December. In the primary and fabricated metals industries, which supply components and materials to auto producers, employment fell at an annual rate of about 10 percent in the first quarter.

In the manufacturing industries producing largely consumer goods (such as the electrical equipment, furniture, apparel, and textile industries), employment declined about 7 percent during the first quarter. Most of that drop occurred in March. In industries producing largely capital goods (such as the nonelectrical machinery and instruments industries), employment continued to increase, though at a much slower rate than in the fourth quarter of 1973.

Chiefly because of the employment declines in industries related to auto production, the unemployment rate in durable goods industries rose from 3.9 percent at the end of the fourth quarter to 5.0 percent at the end of the first (table 3). Among the major durable goods producing States, the increase in

unemployment was most pronounced in Michigan, where about 8 percent of all workers covered by the State unemployment insurance system were claiming benefits in mid-March—about double the national average. In other States in which much of durable goods output is related to auto production, but less than in Michigan (e.g., Indiana, Ohio, and Wisconsin), the rates of unemployment for insured workers have increased recently, but remain in the moderate range of 2.9 to 4.2 percent.

The unemployment rate in nondurable goods manufacturing also increased from December to March, but the rise was only about half that in durable goods. In trade and services, where employment increased recently, unemployment rates were somewhat lower in March than in December.

In comparison to the reduction in manufacturing employment, the reduc-

tion in the length of the workweek was unusually small—0.4 hours, seasonally adjusted, from 40.7 in December to 40.3 hours in March. The production cutbacks centered in the auto industry and took mainly the form of plant shutdowns lasting a week or longer.

Workers prefer this arrangement to shorter weekly hours because it entitles them to unemployment insurance payments. In the statistics, plant shutdowns lasting a week or longer are reflected in reductions in employment rather than in hours.

ceeded internally generated funds by 30 percent. This compares with a shortfall of internal funds of only 3 percent in the 1961–64 expansion and 14 percent in the 1954–57 expansion. In the short run, corporations typically have only very loose control over certain of their financial uses of funds such as consumer and trade credit. If these uses are taken into account, an alternative measure of corporate needs for external funds is suggested—the sum of expenditures on physical assets and nonliquid financial assets less internal funds. Using this measure, corporate needs for funds in this expansion are even greater than in earlier periods.

## Sources and Uses of Funds: Nonfinancial Corporations

The volume of funds raised in the credit and equity markets has been extraordinarily heavy in recent years and it is likely that the demand for funds will remain high in 1974. Since nonfinancial corporations account for the major share of debt and equity financing, it is of interest to examine their sources and uses of funds. In the 3 years since the beginning of the economic expansion in the first quarter of 1971, there has been a tremendous expansion in nonfinancial corporations' needs for funds. By the end of 1973, these corporations had invested more than \$300 billion in physical assets and raised nearly \$400 billion through internal and external sources. As can be seen in the accompanying chart, both these magnitudes far exceed their counterparts in earlier expansions.

The following discussion focuses on the behavior of nonfinancial corporations in the 12 quarters beginning in the first quarter of 1971 as contrasted with equal timespans for the expansions beginning in the fourth quarter of 1954 and the second quarter of 1961. The discussion brings out significant differences in the sources to which corporations turned to raise funds in this expansion and smaller, though important, differences in the use to which they put them. The expansion which started in the third quarter of 1958 was omitted from the analysis because it lasted less than 12 quarters.

### Alternative relations between sources and uses

One standard approach for gauging the need for external financing is measuring the excess of corporate ex-

penditures on physical assets—plant, equipment, and inventories—over internally generated funds. In the 1971–I to 1973–IV period, expenditures ex-

### *Internal sources of funds*

The composition of nonfinancial corporate internal sources of funds in the economic expansion which began in 1971 differs sharply from its composition in earlier upturns. The two sources of internal funds are capital consumption allowances and retained earnings. The former have been rising strongly and steadily throughout the postwar period; in the 1971-I to 1973-IV expansion, they accounted for 42 percent of net funds raised, a proportion that is in line with historical trends. The shortfall in internal funds is entirely attributable to retained earnings, which were only 9½ percent of net funds raised, a sharp drop from their more than 20 percent contribution in 1954-57 and 1961-64. Retained earnings equal profits less profit tax accruals and dividends paid. The definition of profits is the same as that used in the national income and product accounts—i.e., “inventory profits” are excluded.

Ordinarily, retained earnings rise quite strongly in the initial phases of an upturn in economic activity, because dividends lag the rise in profits. In the 1971-73 period, however, the growth in profits was small. The basic factors limiting the rise in profits have not been adequately identified. The long-term downtrend in the growth of profits which has characterized large parts of the postwar period may have played a part. Among the specific factors in the 1971-73 period, the acceleration of inflation may have contributed to the profits squeeze, because prices of raw materials originating outside the non-farm corporate sector—for example, imports and farm products—rose disproportionately. Retained earnings were adversely affected because inflation boosted the effective tax rate on corporate profits. Taxes are levied on book profits, which include inventory profits, and these have been extraordinarily high. In the 1971-73 period,

the inventory valuation adjustment—which is a measure of such profits—amounted to \$29 billion as compared with \$5.9 billion in the 1954-57 expansion and only \$0.4 billion in 1961-64.

### *External sources of funds*

In order to close the gap between projected expenditures and internal sources of funds, corporations turned to the credit and equity markets. For the period as a whole the distribution of financing between short- and long-term funds was roughly in line with earlier experience. Net funds raised through short-term instruments amounted to 32 percent of total credit market financing, not much different from the 34 percent in 1954-57, although more than the 23 percent in 1961-64. However, the pattern of financing during the course of the 1971-73 expansion has differed strikingly from that of earlier periods.

Typically there is a shift from short-term financing to long-term financing over the course of an expansion. Corporations usually enter an expansionary period with relatively high liquidity balances and these balances are quickly augmented by increases in retained earnings. Accordingly, corporations first turn to short-term sources of funds—such as bank loans—to finance their inventory investment and plant and equipment expenditures. Later they turn increasingly to equity issues or bond flotations. This scenario did not hold in the 1971-73 period. Because of heavy bank borrowing in 1970 corporations entered the 1971 upturn with extraordinarily low liquidity and, as explained above, the usual recovery of retained earnings did not materialize. Consequently, corporations channeled their financing into the equity and long-term debt markets, in spite of a sharp fall in short-term rates and only moderate declines in long rates. In 1971-72, 85 percent of net funds raised in the credit markets by nonfinancial corporations was long term. In 1973, the situation was reversed. Short-term

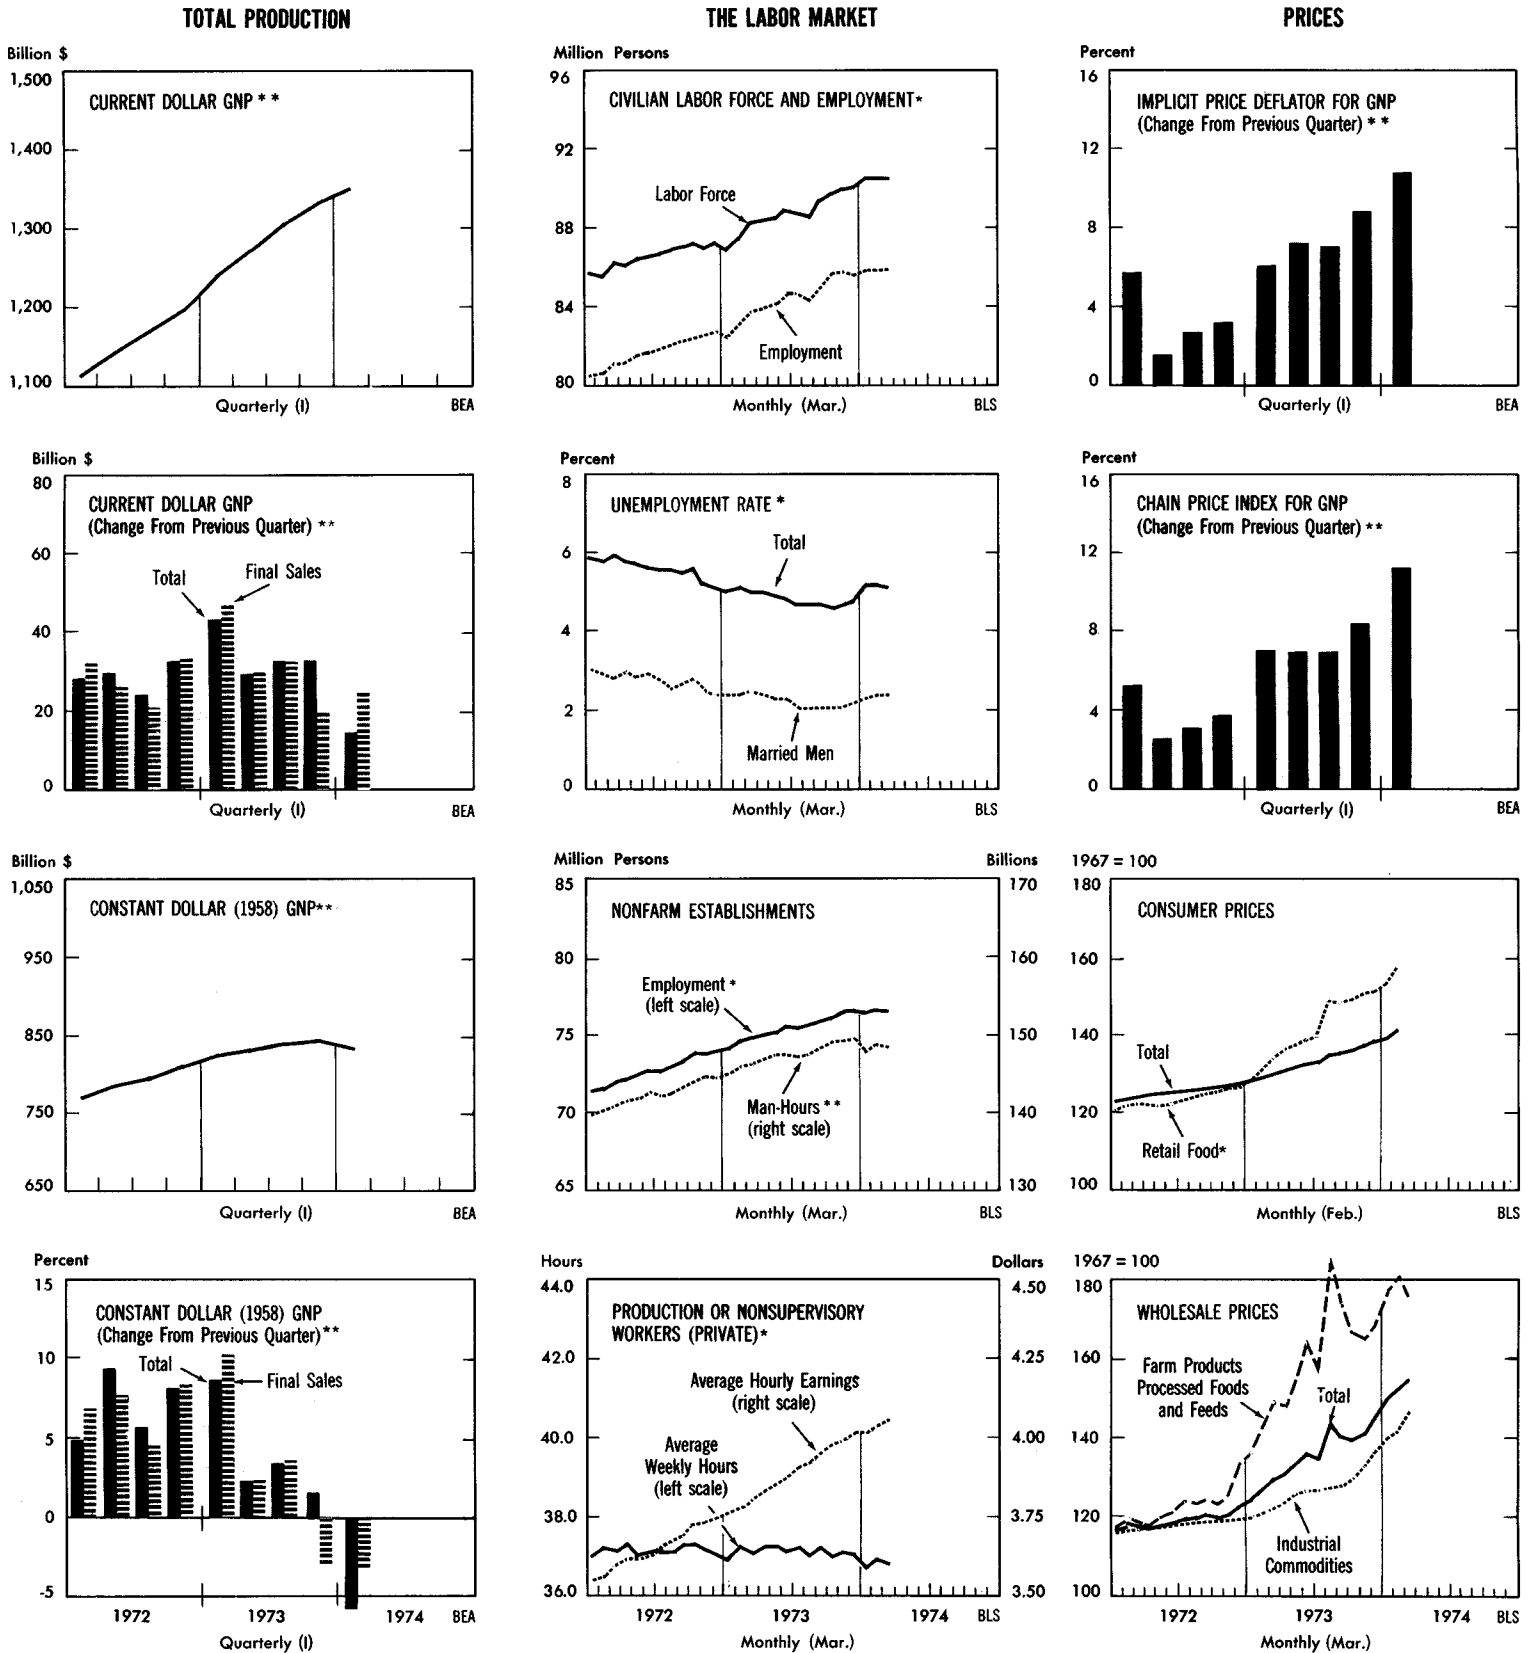

interest rates rose to new highs while long-term rates rose only moderately. Nevertheless, corporations borrowed heavily in the short-term markets and raised a relatively small volume of funds in the capital markets. The reason for the heavy volume of short-term financing was the widespread expectation of an imminent decline in long-term market rates. Uncertainty over the economic outlook was a major factor contributing to depressed prices in the stock market, and new equity issues were not an attractive alternative source of funds. In 1973 credit markets financing was evenly split between short- and long-term instruments.

### *Uses of funds*

While the proportion of corporate expenditures going into fixed investment remained constant in the three expansions under review, there were striking differences in the proportions going into inventory accumulation and into the building up of liquid assets. Investment in inventories accounted for only 4.3 percent of corporate uses of funds in 1971-73 or just about half of the proportion in the two earlier expansions.

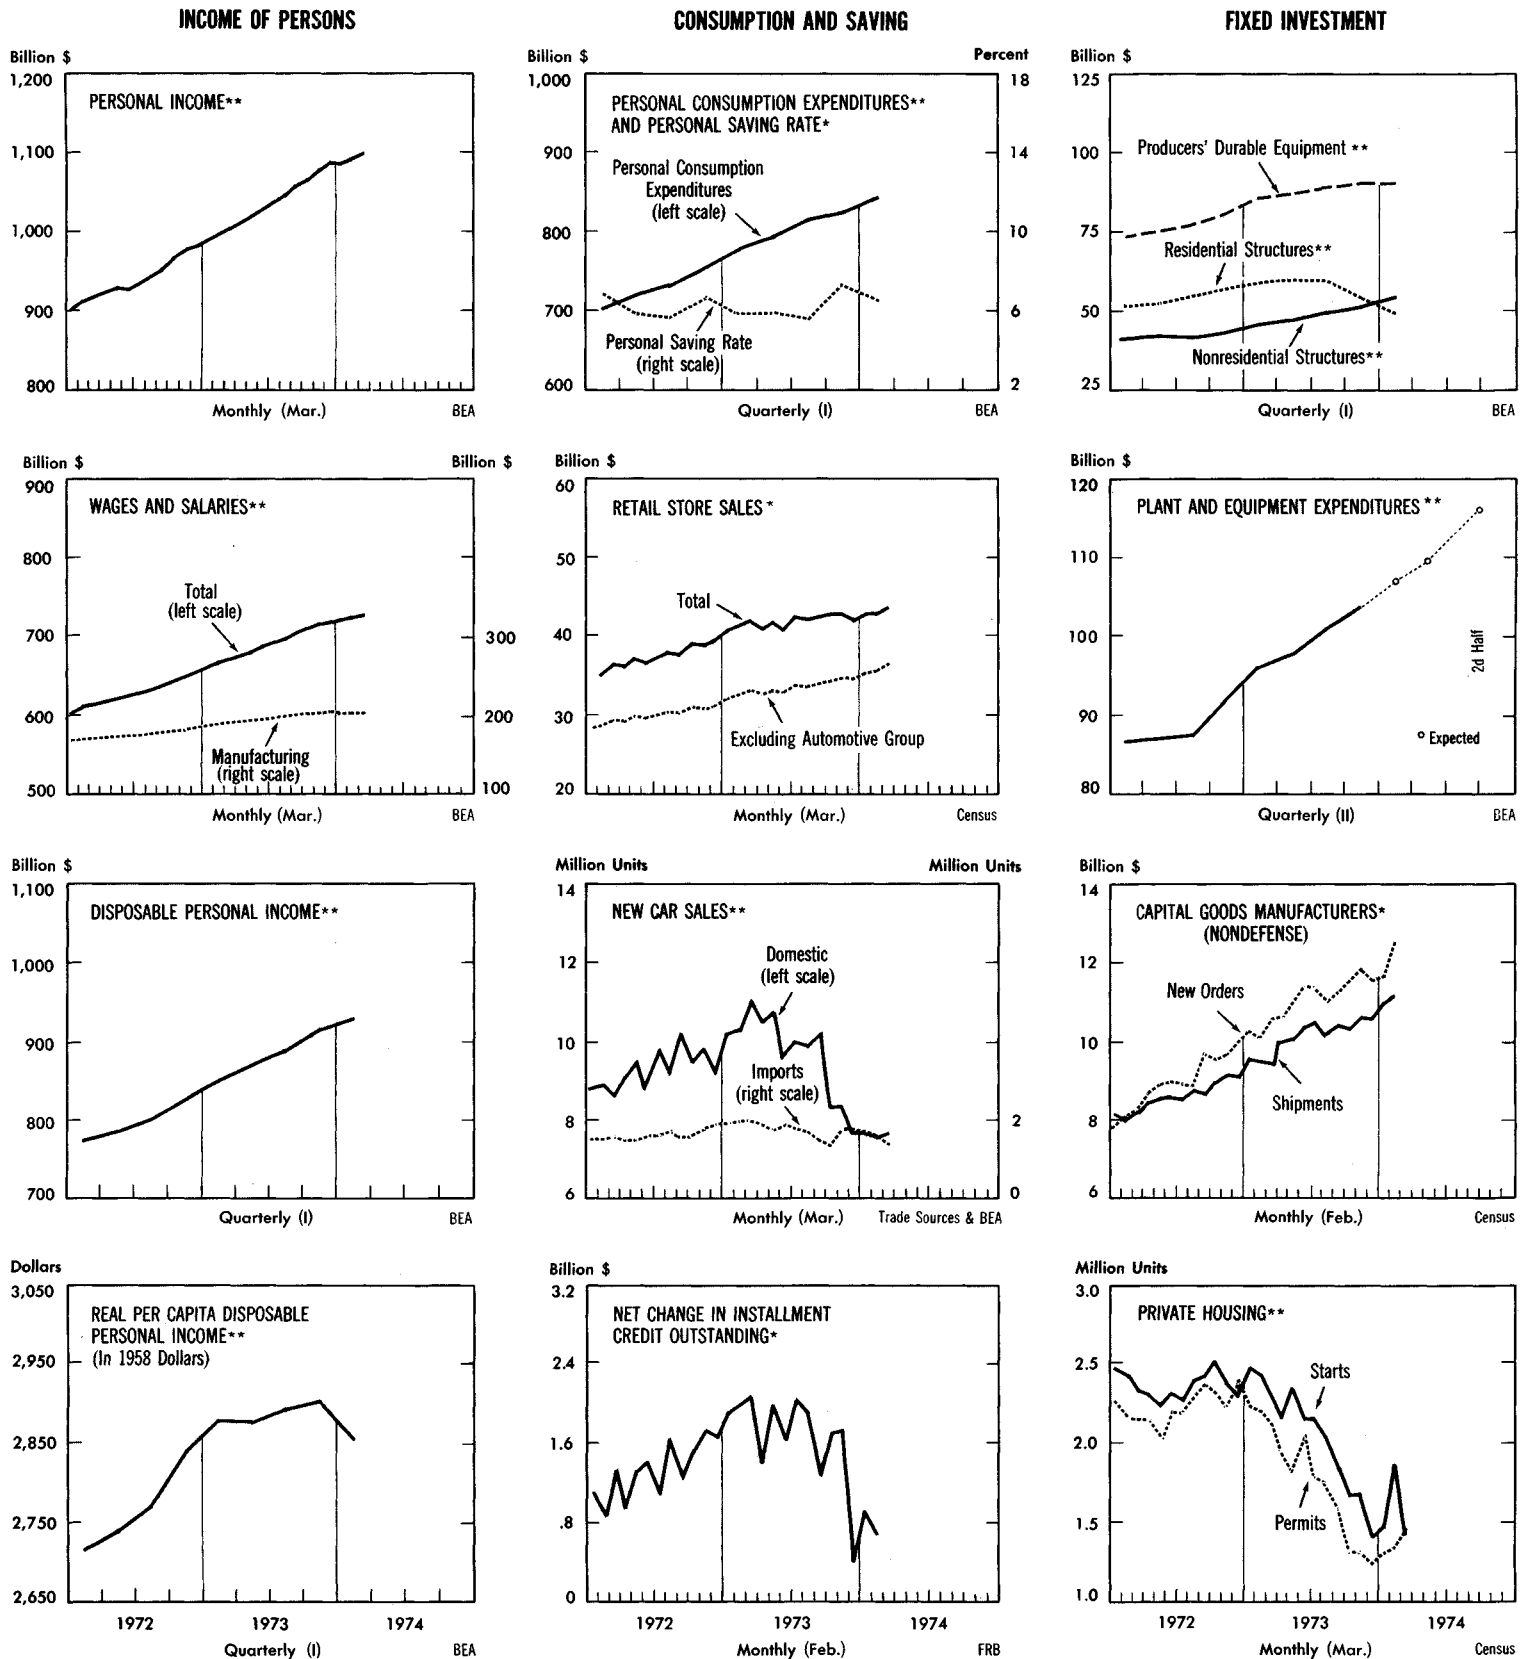

Another dramatic difference in corporate uses of funds has been the large buildup in liquid asset balances. Since the fourth quarter of 1970, corporations have increased their holdings of liquid assets by \$35 billion. Several factors account for this buildup. Increases in international business call for substantial foreign currency balances, particularly since the introduction of floating exchange rates. Further, the uncertainties associated with the current inflation have made it more difficult for corporations to project their internal funds and have increased their desire to maintain cash reserves for contingencies. At the same time, it has become less costly for firms to maintain liquid assets since the opportunities for investing them at relatively high rates have broadened considerably.

- In the first quarter GNP rose only about \$14¼ billion; real GNP declined 5% percent
- In March: The unemployment rate was about unchanged at 5.1 percent
- The wholesale price index rose 1.2 percent (monthly rate)

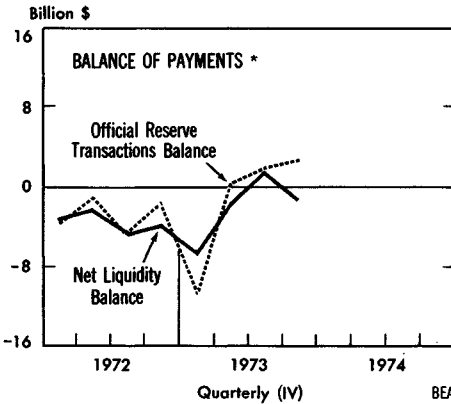

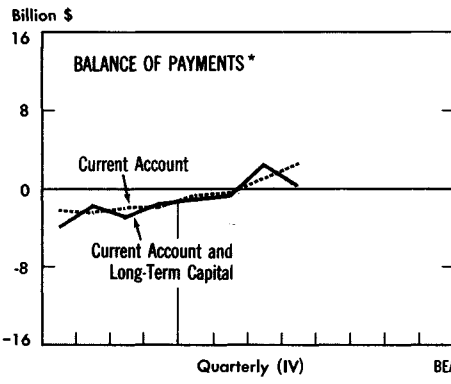

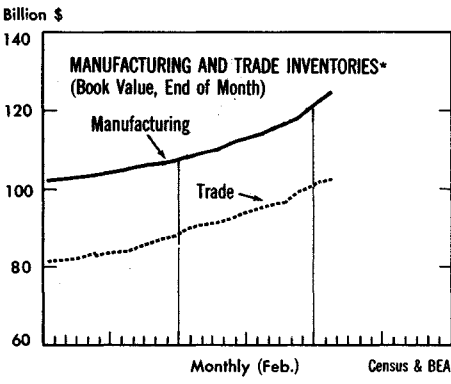

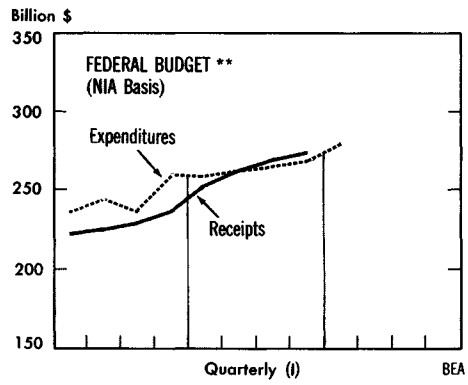

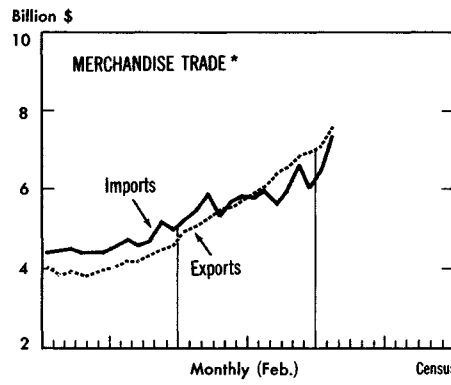

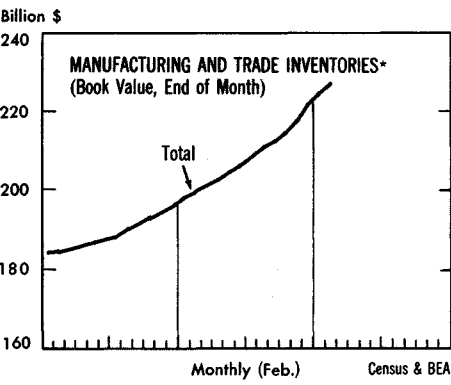

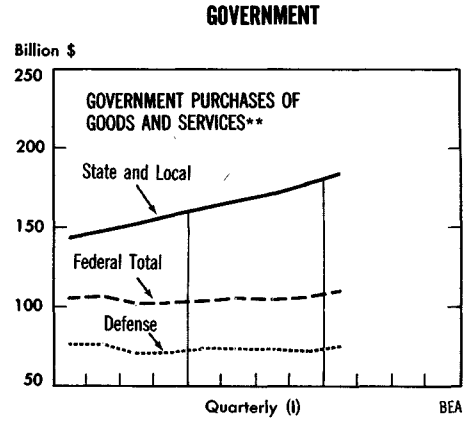

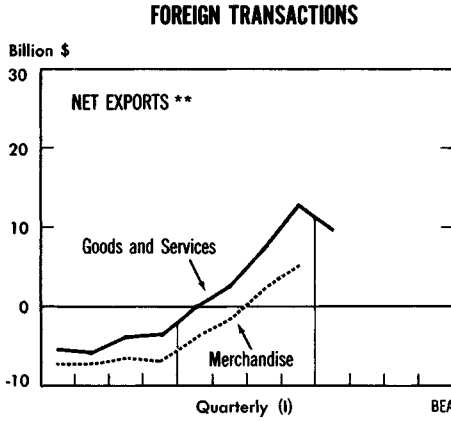

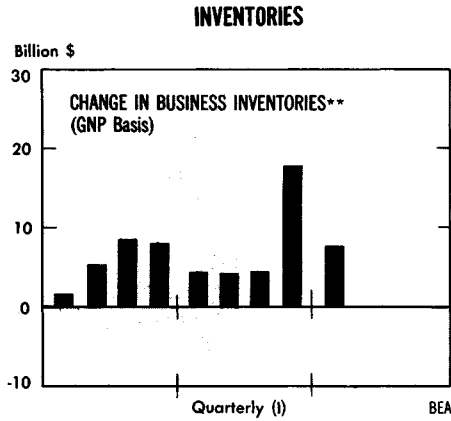

\* Seasonally Adjusted \*\* Seasonally Adjusted at Annual Rates

- In first quarter: Disposable personal income advanced \$12¾ billion
- Consumer spending increased \$19½ billion
- Business fixed investment rose \$2½ billion; residential outlays declined \$4½ billion

\* Seasonally Adjusted \*\* Seasonally Adjusted at Annual Rates

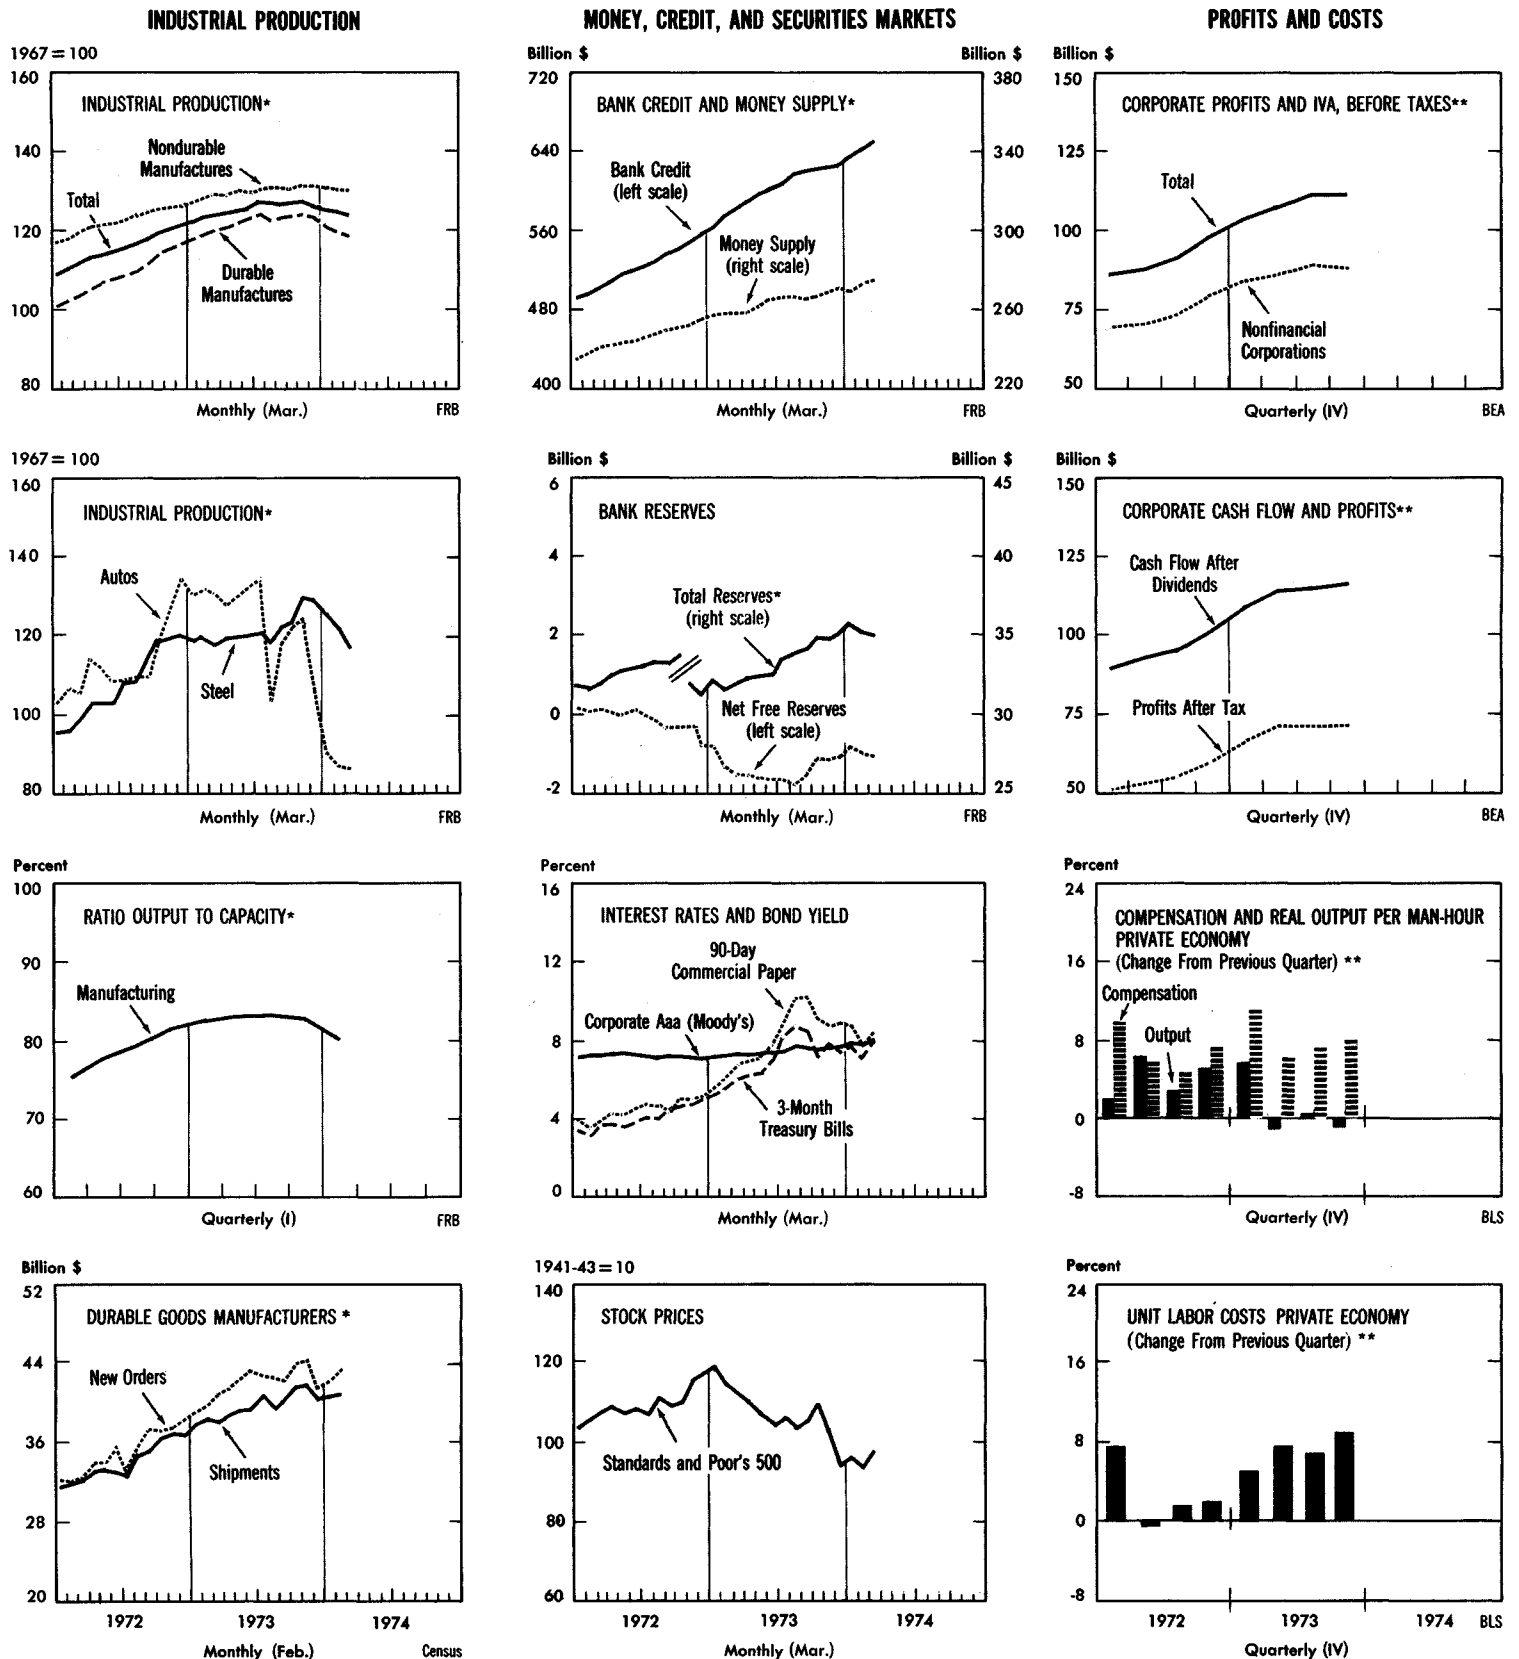

- In first quarter: Inventory investment declined \$10¼ billion
- Net exports of goods and services fell \$3¼ billion
- Federal Government purchases rose \$4½ billion and State and local \$5¾ billion

\* Seasonally Adjusted \*\* Seasonally Adjusted at Annual Rates

- In March: Industrial production declined 0.5 percent
- Bank credit and money supply rose further
- Interest rates and bond yields moved higher

## HISTORICAL STATISTICS

THE national income and product data for 1929-63 are in *The National Income and Product Accounts of the United States, 1929-1965, Statistical Tables* (available at \$1 from Commerce Department District Offices or the Superintendent of Documents; see addresses inside front cover). Each July SURVEY contains preliminary data for the latest 2 years and fully revised data for the preceding 2. The July 1973 issue has data for 1969-72. Prior July issues have fully revised data as follows: 1968-69, July 1972; 1967-68, July 1971; 1966-67, July 1970; 1965-66, July 1969; 1964-65, July 1968. BEA will provide on request a reprint of the fully revised data for the years 1964-69.

**Table 4.—Relation of Gross National Product, National Income, and Personal Income (1.9)**

	1972	1973	1973	1973	1973	1973	1973	1974
<b>Gross national product</b> .....	1,155.2	1,289.1	1,199.2	1,242.5	1,272.0	1,304.5	1,337.5	1,351.8
Less: Capital consumption allowances.....	102.4	110.0	105.1	106.9	109.0	110.5	113.5	115.9
<b>Equals: Net national product</b> .....	1,052.8	1,179.1	1,094.1	1,135.5	1,163.0	1,194.0	1,223.9	1,236.0
Less: Indirect business tax and nontax liability..	109.5	117.8	112.8	115.6	117.2	118.5	119.9	121.2
Business transfer payments.....	4.6	4.9	4.7	4.8	4.9	5.0	5.1	5.2
Statistical discrepancy.....	-1.5	2.9	.2	1.1	3.2	3.7	3.7	-----
Plus: Subsidies less current surplus government enterprises.....	1.7	.4	2.2	.9	.4	.6	-.2	-2.7
<b>Equals: National income</b> .....	941.8	1,053.9	978.6	1,015.0	1,038.2	1,067.4	1,095.1	-----
Less: Corporate profits and inventory valuation adjustment.....	91.1	109.0	98.8	104.3	107.9	112.0	111.9	-----
Contributions for social insurance.....	73.7	92.1	75.8	89.3	90.9	93.0	95.0	99.8
Wage accruals less disbursements.....	-.5	-.1	.0	.0	-.3	.0	.0	.0
Plus: Government transfer payments to persons.....	98.3	112.6	107.3	108.8	110.8	113.7	116.9	122.1
Interest paid by government (net) and by consumers.....	32.7	37.1	33.7	34.7	36.1	38.0	39.7	41.3
Dividends.....	26.0	27.8	26.4	26.9	27.3	28.1	29.0	29.5
Business transfer payments.....	4.6	4.9	4.7	4.8	4.9	5.0	5.1	5.2
<b>Equals: Personal income</b> .....	939.2	1,035.4	976.1	996.6	1,019.0	1,047.1	1,078.9	1,093.0

**Table 5.—Gross Auto Product in Current and Constant Dollars (1.15, 1.16)**

	Billions of current dollars							
	1972	1973	1973	1973	1973	1973	1973	1974
<b>Gross auto product</b> <sup>1</sup> .....	43.6	49.7	45.6	51.5	51.2	49.6	46.5	32.8
Personal consumption expenditures.....	39.4	42.9	41.2	45.1	44.6	44.5	37.4	34.6
Producers' durable equipment.....	7.0	7.6	7.3	8.0	7.9	7.8	6.6	6.1
Change in dealers' auto inventories.....	-.5	1.5	-.4	.9	1.2	-.5	4.3	-4.9
Net exports.....	-2.7	-2.7	-2.9	-2.8	-2.9	-2.7	-2.4	-3.5
Exports.....	3.0	3.8	3.3	3.6	3.6	3.8	4.2	4.3
Imports.....	5.7	6.5	6.2	6.4	6.5	6.5	6.6	7.8
<b>Addenda:</b>								
New cars, domestic <sup>2</sup> .....	37.9	43.1	39.5	44.0	44.8	43.5	40.3	27.8
New cars, foreign.....	8.6	9.9	9.4	10.6	9.8	9.5	9.9	10.4
	Billions of 1958 dollars							
<b>Gross auto product</b> <sup>1</sup> .....	39.0	44.2	41.4	46.4	45.5	43.6	41.3	29.3
Personal consumption expenditures.....	35.2	38.1	37.3	40.4	39.6	39.1	33.2	30.7
Producers' durable equipment.....	6.3	6.8	6.7	7.2	7.0	7.0	5.9	5.4
Change in dealers' auto inventories.....	-.4	1.3	-.3	.8	1.0	-.4	3.9	-4.2
Net exports.....	-2.4	-2.4	-2.6	-2.4	-2.5	-2.4	-2.1	-3.0
Exports.....	2.6	3.4	3.0	3.2	3.1	3.3	3.8	3.7
Imports.....	5.0	5.7	5.5	5.6	5.6	5.7	5.9	6.7
<b>Addenda:</b>								
New cars, domestic <sup>2</sup> .....	34.6	39.3	36.7	40.6	40.7	39.3	36.7	25.4
New cars, foreign.....	7.9	9.2	8.8	9.9	9.0	8.7	9.1	9.5

1. The gross auto product total includes government purchases.  
 2. Differs from the gross auto product total by the markup on both used cars and foreign cars.

1. Excludes gross product originating in the rest of the world.  
 2. This is equal to the deflator for gross product of nonfinancial corporations, with the decimal point shifted two places to the left.  
 3. Personal saving as a percentage of disposable personal income.  
 4. On February 18, 1974, the U.S. Government granted to India \$2,015 million (quarterly rate) in rupees under provisions of the Agricultural Trade Development and Adjustment Act. Tentatively, this transaction is being treated as capital grants paid to foreigners in the national income and product accounts but as current unilateral transfers in the balance of payments accounts. Accordingly, this transaction is excluded from Federal Government transfers to foreigners and related totals shown in tables 12, 13, and 15, and is included in the first quarter of 1974 as -\$8.1 billion (annual rate) in capital grants received by the U.S. shown in tables 12 and 15.

# State and Regional Income in 1973

Total personal income rose 3.0 percent, seasonally adjusted, from the third to fourth quarters of 1973. Income rose in 48 States and was unchanged in Rhode Island and Michigan. In Rhode Island, income was held down by a decline in military payrolls resulting from base reductions; in Michigan, there was a decline in manufacturing payrolls associated with cutbacks in auto production. In 36 States, the increase in personal income exceeded the 2½ percent rise in consumer prices (as measured by the implicit price deflator for personal consumption expenditures); in 14 States, the increase fell short of the rise in prices and consumer purchasing power was reduced. However, undoubtedly there were groups in each State that did either better or worse than the State average.

Fourth quarter increases were largest in the Rocky Mountain, Plains, Far West, and in the Southeast regions. The key factor in the Plains was farm income; in the Far West and Southeast, manufacturing payrolls provided the major impetus; and in the Rocky Mountain region, payrolls in service-related industries rose substantially.

The smallest regional income changes—less than the advances in consumer prices—were in the Mideast and New England. Gains in manufacturing payrolls and in most service-related activities were generally below average in both regions.

## *Income in calendar year 1973*

In the year 1973, income in the Nation rose 10¼ percent. In all States and the District of Columbia, the rise exceeded the 5¼ percent increase in consumer prices by two percentage points or more.

## *Regional income gains*

The largest relative gains—13¼ percent—were in the Rocky Mountain and Plains regions. The gains in the Rocky Mountain were widespread, with the advances in all major nonfarm industries well above the national average. In the Plains, the advance was due entirely to an increase of more than 50 percent in farm income; income rose at about average rates in most nonfarm industries.

Increases in the Great Lakes, Southeast, Southwest, and Far West were close to the national average. The smallest gains were in New England (9 percent) and the Mideast (8½ percent) where changes in most major industries were well below the national average.

## *State patterns*

The largest 1972–73 advances, ranging from 13½ to 30 percent, occurred in North Dakota, South Dakota, Idaho, Kansas, Minnesota, Iowa, Colorado, Nevada, and Wyoming. In the first six,

of these States farm income was up 40 percent or more, compared with a U.S. advance of a little more than 25 percent. The effect of these large increases was accentuated by the unusual importance of agriculture in their economies. In each of these States, farm income accounts directly for 10 to 30 percent of the total compared with a U.S. average of 3 percent. In Colorado, Nevada, and Wyoming, there were large gains in nearly all service-related industries; in Nevada and Wyoming, construction, manufacturing and mining payrolls also were up sharply.

At the other end of the scale, income rose by only 7¼ to 8½ percent in Rhode Island, West Virginia, New York, Massachusetts, and in the District of Columbia. In all of these areas, payrolls in the construction industry and in most service-related industries were weak. In addition, there was pronounced weakness in Federal payrolls in Rhode Island and Massachusetts—where military bases were reduced or closed—and in mining payrolls in West Virginia, as coal production was little changed from 1972 to 1973.

NOTE.—The estimates of State personal income were prepared in the Regional Economics Division by Q. Francis Dallavalle, Gordon Lester, Jr., and Steven Johnson. Special programming was done by David Cartwright and Yvonne Collins. The analysis was written by Robert B. Bretzfelder.

# State Projections of Income, Employment, and Population to 1990

Many individuals participated in the preparation of these projections. The overall program was under the supervision of Robert E. Graham, Jr., Associate Director for Regional Economics and Daniel H. Garnick, Chief of the Regional Economic Analysis Division. Robert B. Bretzfelder assisted in the preparation of this article.

Henry L. DeGraff, Assistant Chief of the Regional Economic Analysis Division had direct responsibility for the projections. Edward A. Trott, Jr., Chief of the Projections Section of the Division participated in the development of the methodology and provided immediate supervision of the projections work. Eugene Janisch was a principal in the development of the methodology as well as in the preparation of the projections. Others who participated in the making of the projections were Lyle Spatz, Kenneth Johnson, Marian Sacks, and Tasia Anton. Computer programming for the report was carried out by Eleanor Curry, Evelyn Richardson, Claudia Harkins, and Sherlene Lum under the supervision of David Cartwright. Mary A. Moul, Selina Arnette, and Mildred Barnett performed the secretarial services.

The Regional Economic Measurement Division prepared the historical personal income estimates on which the income projections were based. Lowell D. Ashby, Assistant Chief of the Division assisted in the development of the national projection methodology and in the preparation of the national projections.

BEA wishes to acknowledge the assistance of the Economic Research Service (ERS), U.S. Department of Agriculture in the preparation of the agricultural income projections. The projection program has been a joint effort of the BEA and the ERS to prepare economic data for use in water resources development planning. The program was initiated at the request of the Water Resources Council and has been funded in part by the Council and certain of its member agencies.

Later this year the WRC will publish a seven volume report prepared by BEA and ERS presenting projections for 173 economic areas, 20 water resources regions and 205 water subareas, the 50 States, 253 SMSA's and the non-SMSA portions of the economic areas and water subareas.

The State estimates of total and per capita personal income in this report differ from the State series regularly published in the August issue of the SURVEY on two counts.

First, these estimates are expressed in dollars of constant (1967) purchasing power, whereas the regular State income series is expressed in current dollars.

Second, as with the regular State income series, the data in this report reflect the State of residence of the population and of income recipients and employees, but there is one major exception: the earnings data in table 4 reflect the State in which earnings recipients work. The earnings data are presented on a where-worked basis because in most uses of the data this is the preferred concept. Also, data with which to adjust earnings in each industry from a place-of-work to a place-of-residence basis are not available. Such an adjustment has been made for total income, however.

The Bureau of the Census published "Preliminary Projections of the Population of States: 1975 to 1990" in March 1972 as *Current Population Reports, Series P-26, No. 447*. Those projections are based on various assumptions about future patterns in the components of population change (fertility, mortality, interstate migration, and net immigration from abroad). The assumptions are entirely demographic; no specific assumptions were made about economic factors which could influence future trends in the demographic components of population change. In the projections presented here, the emphasis is on economic projections, mainly personal income, and the population projections are essentially a by-product of the income and employment projections.

**T**HIS article presents projections of income, employment, and population, by States and regions, for 1980 and 1990. These projections are a revision of those published in the April 1972 issue of the SURVEY.

After a summary statement regarding the uses of the projections and a description of the nature of the revisions, there follows a review of the projections by region. Tables 1-3 show personal income, population, and per capita income for selected years 1950-90 by States and regions. Table 4 shows, in addition, the industrial sources of income in each State and region. Finally, a section on methodology tells how the projections were prepared.

## *Uses of the projections*

Projections of the type presented here can be useful in the assessment of future public and private demands for goods and services. These include, for example, consumer, industrial, and government demands; demands for physical capital related to energy, water resources development, pollution abatement, housing, and transportation; and demands for various types of labor.

The projections aid in foreseeing problems such as subnormal economic growth or low per capita incomes so that corrective policies can be adopted.

The projections also provide a framework for program evaluation purposes. If a remedial or developmental program is under consideration in an area, the projected income structure of that area can be modified to reflect the expected effects of the program. Comparison of

the modified projections with the initial ones provides a quantitative measure of the effects of the program, beneficial or adverse, in each region affected.

### *Nature of the revisions*

The revisions incorporated into these projections are of two types. The first results from changes in national totals the effects of which are spread rather uniformly among States. The second type stems from changes in projected regional trends caused by the incorporation of additional data into the historical series, by changes in methodology, or by new analyses. The second type of revision has differential impacts among States.

The largest single revision was a lowering of the national population totals projected for 1980 and 1990, a revision that stemmed from a decline in projected fertility rates. The earlier projections of income, employment, and population which BEA initiated in 1967, assumed a population of 270 million in 1990. This implied a projected fertility rate shortly after the turn of the century of approximately 2,800 births per 1,000 women. The revised projections assume a 1990 population of 246 million, implying a fertility rate of approximately 2,100 per 1,000 women—a rate that will no more than replace population once it has stabilized.<sup>1</sup> Although it is not possible to forecast the fertility rate two decades ahead with any degree of certainty, the fact that this rate has declined from 3,767 in 1957 to a preliminary estimated rate of 1,900 in 1973 makes the lower of the two figures for 1990 appear more probable at this time.

Projected employment in 1990 was revised downward only slightly as the population revision centered in persons below working age. Moreover, the effect on employment of the small downward revision in population was partly offset by a projected increase in female labor force participation rates.

The projected national total of personal income in 1990 was revised downward from \$1,663 billion to \$1,517

billion (in 1967 dollars), a decrease of 9 percent. This decline reflects the combined effects of a small downward revision in projected employment, a lesser rate of increase in productivity, and fewer hours worked per person per year.

Projected regional trends in certain industries were revised on the basis of 3 years of additional data. The data for the later years were especially useful in separating trend developments from the economic effects of the Vietnam war, inflation, and the business cycle.

Finally, as explained in the appendix, a significant improvement was made in the method by which the population was projected.

### **The Projections**

In absolute values, projected trends are generally strongly up in all measures and in all States and regions, although in a few States, increases in population and employment are small. With all income figures expressed in 1967 dollars, changes in income represent changes in purchasing power, or real income.

Personal income in the Nation is projected to rise from \$691 billion in 1969 to \$1,517 billion in 1990, an increase of 119 percent. Among regions, the increases range from 105 percent in the Plains to 146 percent in the Southeast. Among States, they range from 69 percent in North Dakota to 203 percent in Florida.

Population is projected to rise from 201 million in 1969 to 246 million in 1990, an increase of 22 percent. Among regions, population increases by as little as 11 percent in the Plains to as much as 30 percent in the Southeast. Among States, the range is from 2 percent in Kansas and Wyoming to 65 percent in Florida.

When the effects of population on total income growth are eliminated by calculating per capita income, the resulting per capita real income measure—perhaps the most meaningful of all from a welfare standpoint—is projected to rise from \$3,435 in 1969 to \$6,166 in 1990, an increase of 80 percent. Regionally, per capita real income increases

from as little as 73 percent in the Far West to as much as 90 percent in the Southeast. By States, the increases are from 69 percent in Nevada to 101 percent in Mississippi, a much narrower range than that in population, employment, or total income. Despite the tendency for per capita income in low income States to grow more rapidly than in high income States, the gap remains wide in 1990. Mississippi's per capita income of \$4,428 in 1990 is 28 percent below the national average and New York's figure of \$7,338 is 19 percent above it.

### **Regional Trends**

When dealing with a large number of individual States and regions, perspective tends to become blurred by the mass of individual values shown. A useful device for portraying meaningful regional economic developments is relative trend.

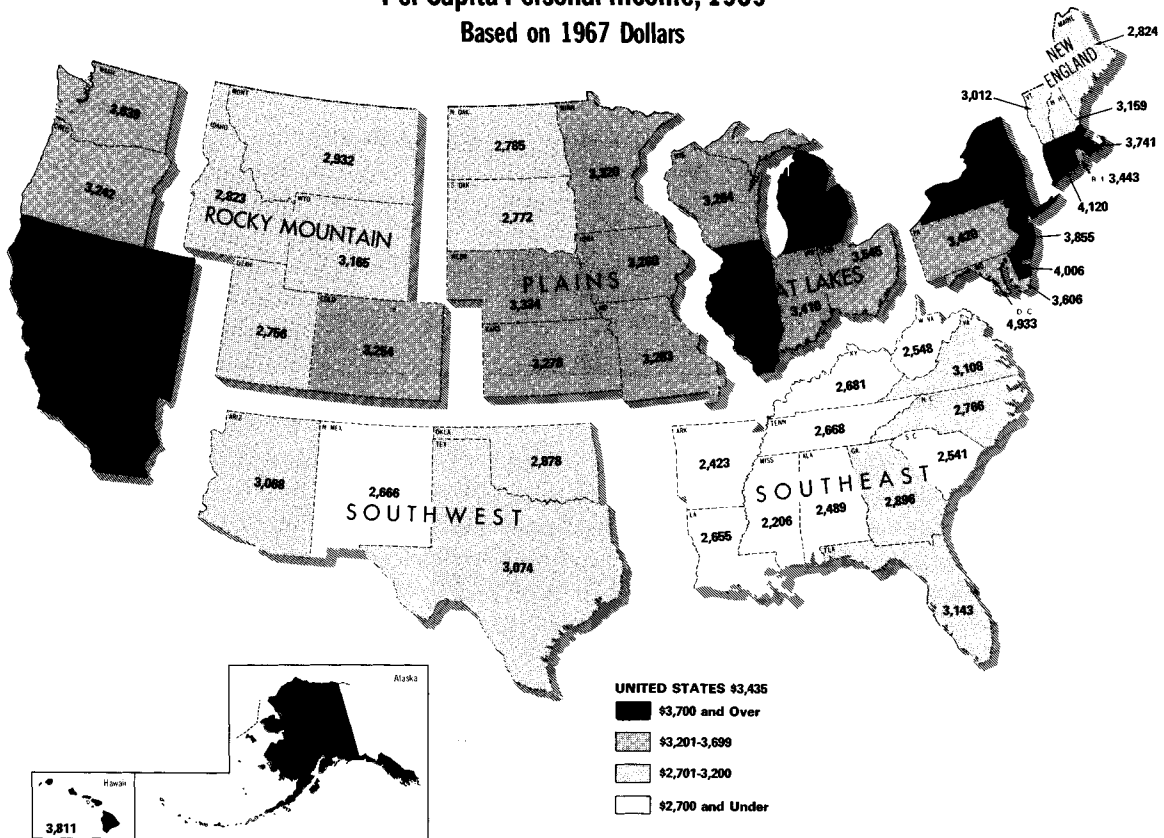

Trend is a long-term concept connoting secular growth or decline. Relative trend as used in this article refers to a change in an area's share of the national total. That is, trend in an area is measured by comparing the long-term rate of change in the area with that in the Nation. The difference between the two is a measure of relative trend. The national trend, both historical and projected, is up strongly, and all States and regions share in the gains—some more than others. A downward relative trend in a region, therefore, usually means less-than-average percentage growth; in only a few instances does it signify an absolute decline in the measure.

The accompanying tabulation contains a summary of relative regional trends in real income, employment, population, and per capita real income. Each value was derived by dividing the regional percentage change in the indicated measure by the national percentage change in the same measure. Four features stand out: The direction of the trends, continuation of historical trends, a diminution in trends over time, and consistency of trend among the four principal measures. These are discussed briefly in the following paragraphs, with the main focus on personal income.

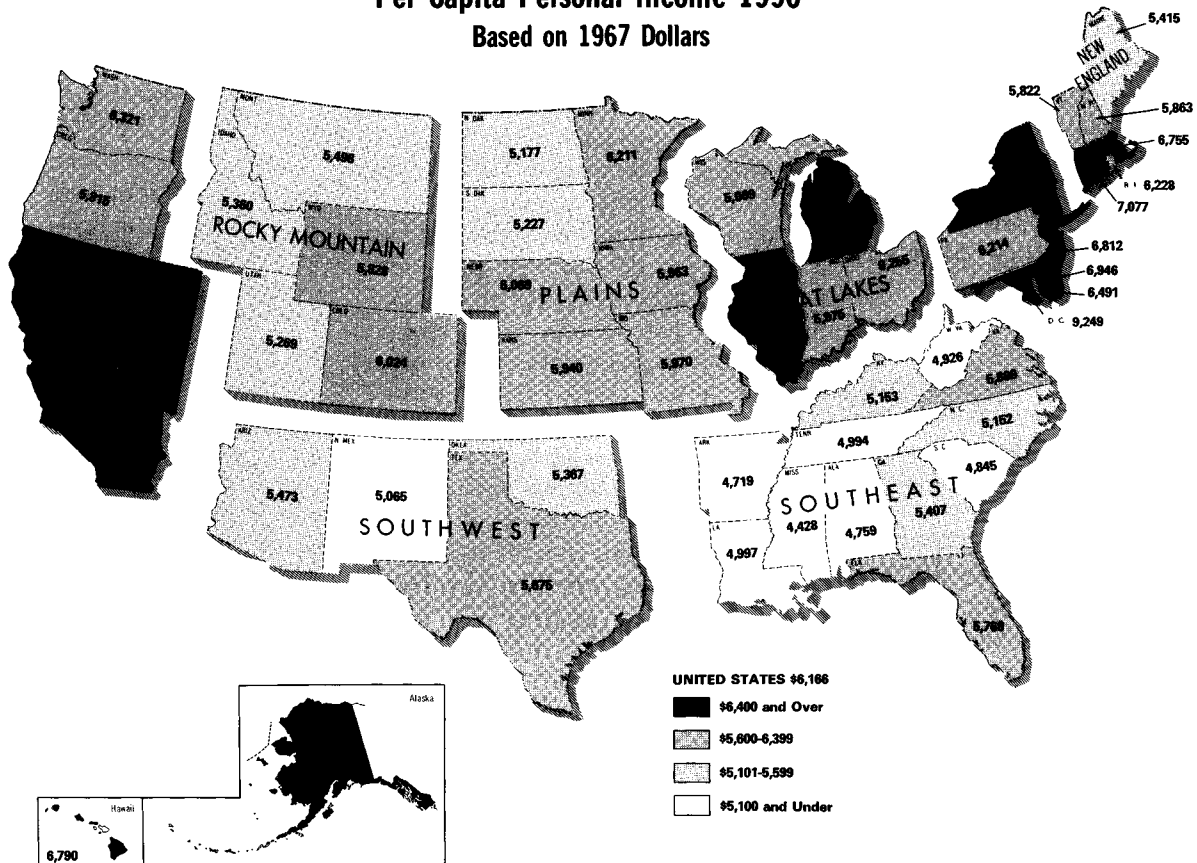

1. Both national population projections were prepared by the Bureau of the Census. The 270 million figure is from that agency's "C" series; the 246 million is from the Bureau's "E" series.

Plains.....	74	88	49	69	45	50	98	105

1. Values represent the percentage changes in the regions divided by the corresponding percentage change in the Nation and multiplied by 100.

A pronounced shift of income away from the northeast and north central parts of the country to the southern and western portions is projected. The Far West and New England are exceptions to this generalization in the sense that they move at approximately the national rate.

In six of the eight regions, the projected rates of income growth relative to that in the Nation represent continuations of trends that prevailed in the previous two decades.<sup>2</sup>

In each of the six regions in which there was a continuation of past trends, there was a deceleration in the trend. That is, in each of these six regions the rates of change are closer to the national rate from 1969 to 1990 than from 1950 to 1969.

In the Far West and Rocky Mountain regions, historical trends were reversed. From 1950 to 1969, personal income in the Far West rose 166 percent, outpacing every region and exceeding the growth rate of the Nation by nearly two-fifths. In contrast, from 1969 to 1990, personal income in the Far West expands 117 percent, approximately the same as the national rate.

Also breaking with trend continuity, but in the opposite direction, is the Rocky Mountain region. From 1950 to 1969, personal income in the Rocky Mountain States rose at a less-than-average rate. Over the 1969 to 1990 period, it rises at a somewhat faster

pace than in the Nation. It should be noted that both historically and projected the divergence of the regional trend from the national is small in this region.

A comparable situation regarding trend continuity obtains among States. This is seen in the two maps. Although 10 States move into or out of the average growth category between the historical and projected periods, no State moves from the fast-growth to slow-growth category or vice-versa.

Consistency of projected regional trends among the four measures is striking. Using the trend in income as the yardstick, there are 24 instances in which a regional trend in a factor may exhibit consistency or inconsistency with that in income (three measures times eight regions). In 18 instances, the regional trends in employment, population, and per capita income accord with that in personal income. In four of the eight regions, consistency was complete. In one other, consistency was marred by "no-trend" in one measure. Four of the five remaining inconsistencies occurred in the Rocky Mountain and Far West regions, where a reversal of trends in income had been projected. The fifth exception is in the Plains where all relative trends are down except that in per capita income.

### Regional Summaries

The following section gives the regional highlights of the projections with some comparisons with historical trends.

### Regions with increasing shares of total income

The Southeast, Southwest, and Rocky Mountain regions are projected to increase their shares of total income between 1969 and 1990. For the first two regions, this represents a continuation of past trend; for the third, it is a departure.

*Southeast and Southwest*—Income expands more rapidly from 1969 to 1990 in the Southeast (146 percent) and Southwest (131 percent) than in any other region. In the main, this is a continuation of past trends with only a small decrease in the rate of growth relative to the Nation. However, the factors responsible for the past and projected uptrends differ greatly.

Historically, agriculture has dampened relative income growth in these two regions, while Federal payrolls (military and associated civilian) have boosted it. In the projections these roles are reversed. Although agriculture remains a dampening factor, its role as an income source in both the Southeast and Southwest has diminished so much that its impact over the next two decades is comparatively small. Conversely, government income limits future income growth substantially as military strength is reduced one-fourth below its 1971 level.

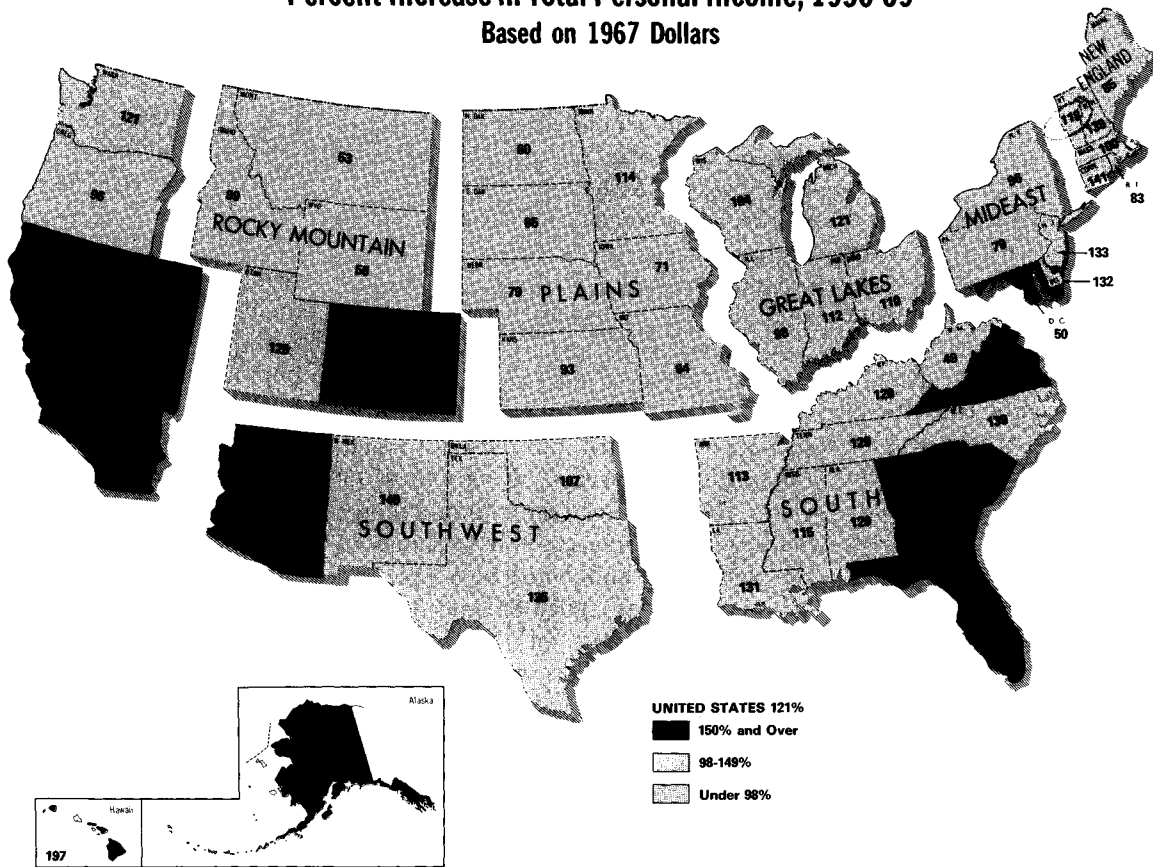

Manufacturing continues to boost income growth in both regions, but the type of manufactures changes. Much of the Southeast's past progress in industrialization, and to a lesser extent that of the Southwest, stemmed from the shift of the textile and apparel industries into these regions. Although these industries continue to grow at above-average rates, other manufacturing industries grow even faster. Increases in chemicals, machinery, fabricated metals, paper, printing, and a variety of miscellaneous manufacturing industries provide the main impetus for an expansion in total manufacturing half again as fast as that in the Nation as a whole.

Income growth in the Southeast and Southwest is boosted further by three special factors. Both regions—the Southeast because of Florida and the Southwest because of Arizona—are

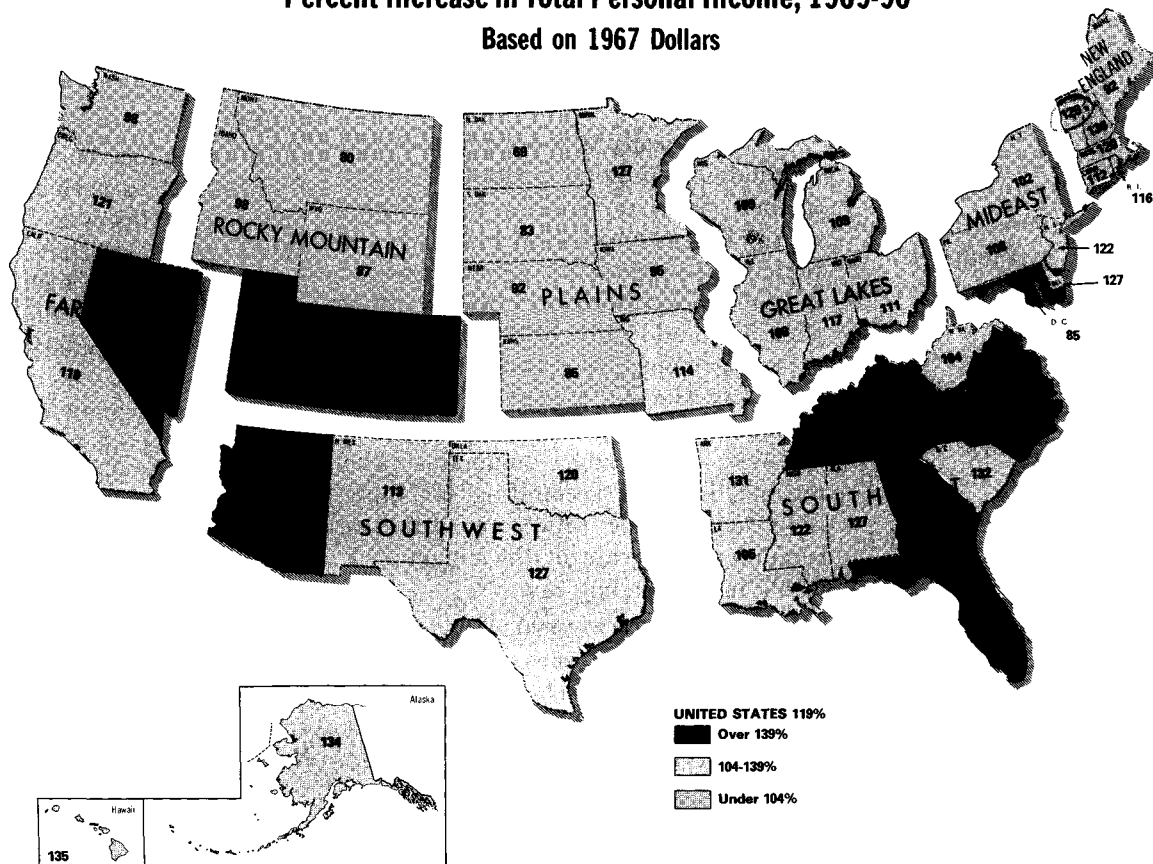

2. Although the projection methodology relies on past trends, as must any methodology for large scale regional projections, a mechanical extension of past trends is not a necessary result. As is pointed out below, reversals of trends are projected in certain areas.

CHART 8

### Percent Increase in Total Personal Income, 1950-69 Based on 1967 Dollars

### Percent Increase in Total Personal Income, 1969-90 Based on 1967 Dollars

U.S. Department of Commerce, Bureau of Economic Analysis

attracting large numbers of retirees from other areas who bring with them transfer payments and investment income earned prior to retirement. Consumer demand from these groups stimulates growth in the two regions' service-type industries. Second, tourism and recreation are expanding rapidly in certain areas of the Southeast and Southwest thereby creating a new "basic" industry. This, in turn, is contributing to economic expansion through the multiplier mechanism. Finally, a portion of the income growth in these regions represents the effects of a "catching up" in their service industries. In the past, some of the financial and business services consumed by the households and businesses of the regions were imported. The projections envision the growth within the regions of industries providing a large part of these services.

Employment is projected to grow at about the same rate over the next 20 years as over the past 20 in the Southeast. In relative terms, this represents an acceleration, for in the Nation as a whole the rate of employment growth diminishes. The Southeast's employment experience reflects the same industrial pattern as that which underlies income growth with one major exception. The decline projected in military strength limits employment growth more than it does income because the decline in military strength is accompanied by an increase in the average wages of military personnel.

In the Southwest, employment grows at a rate only a little faster than in the Nation whereas in the previous two decades it exceeded the national rate substantially. As in the Southeast, the slowdown in future employment growth is mainly the result of a decline in military strength.

Population in the Southeast, which grew at less than the national rate during the historical period is projected to grow one-third faster. This reversal of the population trend stems mainly from an increase in the number of persons migrating into the area in response to expanding economic opportunities because much of the previous excess labor supply of the region has been absorbed into the labor force. In addi-

tion an increasing number of retirees are locating in the region.

As would be expected from the relative movements of projected personal income and population, per capita income continues its above-average advance in both the Southeast and Southwest. Although migration of workers attracted into the regions by higher wage rates increases per capita income, this is offset partly by the fact that retiree immigrants generally have less-than-average incomes. As a result, the rate of per capita income growth relative to that in the Nation continues to converge toward, but does not reach, the national average. Even after 60 years (1929-90) of faster-than-average per capita income growth, incomes in the Southeast and Southwest are projected to average only 85 and 90 percent, respectively, of the national average in 1990. The remaining gap in the Southeast, though significant, is substantially less than the 48 percent deficit of three decades earlier.

*Rocky Mountain*—During the 1950's and 1960's income in the Rocky Mountain region rose somewhat less than average. It rises at an above-average rate over the next two decades. This trend reversal can be explained from two viewpoints—geographical and industrial.

Geographically, the reversal of trend originates mainly in Colorado, where income rises at above-average rates during both the historical and projected periods. Over the same periods, income in the Rocky Mountain States other than Colorado rises at below-average rates. In the historical period, Colorado mitigated the downtrend but did not overcome it. In the projected period, however, Colorado dominates the region's income (accounting for more than half of the total) and turns a lagging growth rate in the region as a whole into a leading one.

Industrially, the reversal of trend stems from a shift in the roles of agriculture and manufacturing. During the 1950-69 period, the growth of income was limited by a decline in agricultural income which in 1950 accounted for 14 percent of all income in the region. From 1969 to 1990, agricultural income

continues to lag but its dampening influence will be much less because it accounts for a much smaller percent of the total. Manufacturing, on the other hand, which accounts for increasing proportions of total income is the primary factor in the better-than-average growth of income in the region.

The trends of population and employment in the Rocky Mountain region run counter to those in income in both the historical and projected periods. That is, employment and population gains were above-average from 1950 to 1969 and are below-average over the next two decades. As noted earlier, total income also moved in opposite directions relative to the Nation in each period.

The explanation for these apparently contradictory trends lies in the changes in industrial structure that have occurred and are projected to continue. In the historical period, employment and population rose rapidly in Colorado as manufacturing and Federal Government activities expanded. These increases more than offset the relative declines caused by the slow growth of agriculture throughout the area, because employment and population do not respond as quickly to changes in agricultural income as they do to changes in income in manufacturing and government. In the projections, the same situation continues to prevail with regard to agriculture and manufacturing. However, a decrease of one-fourth in military strength which is substantial in Colorado turns an otherwise above-average growth in employment and population into a relative decline.

With employment, and therefore population, rising much more rapidly in the region than in the Nation from 1950 to 1969 and income growth lagging, per capita income in the Rocky Mountain States failed to keep pace with that in the Nation. With a reverse situation projected for income and employment over the next two decades, per capita income outpaces that in the Nation.

#### *Regions with average income trends*

In both the Far West and New England, income is projected to expand at average rates. This contrasts with

the experience of these two regions over the past two decades.

*Far West*—Since 1929, the Far West has been the fastest growing region as all major income sources rose at above-average rates, and as large numbers of persons, both labor force participants and retirees, migrated into the region. In the mid-1960's, however, income expansion leveled off and then fell slightly behind that in the Nation as cutbacks in the space program and aircraft production and changes in military production to meet the Vietnam war need for more conventional materiel all reduced the demand for the specialties of the Far West. Adding to this were the crowded conditions that developed in parts of the area making them less attractive environments.

Over the next two decades, income in the Far West expands at about the same rate as in the Nation. Some relative gain occurs in the early 1970's as the economic distortions of the late 1960's are eliminated.

Two major industries warrant special attention because their roles are basic. Labor earnings in manufacturing show a small lag relative to those in the Nation as a whole. This lag originates in the region's large nonautomotive transportation equipment industry. For many years this industry has been the sparkplug of the manufacturing economy of the Far West. After reaching a peak in 1969, labor earnings in this industry declined 25 percent over the next 2 years and are not expected to regain the 1969 peak until 1980 or later. Even then they are projected to expand at a rate below that of total manufacturing in the Far West. Similarly, military payrolls, which have accounted for much of the Far West's topranking economic growth in the past, expand by about one-fourth over the next two decades, compared to a more than doubling of other types of income in the region. The sluggishness in these two basic industries is transmitted to the region's associated service-type industries causing them to expand at less-than-average rates.

Employment and population, following the trend of income, grow at a much slower pace than in the past. The relative rate of growth in employment is

not significantly different from that in income. Population growth holds up much better than does income or employment because of immigration of retirees who, though forming a smaller group than in the past, nonetheless add significantly to the area's population.

Per capita income in the Far West continues its longtime convergence toward the U.S. average as its nonlabor force population expands more rapidly and its average wages grow less rapidly than those in the Nation. In 1950, per capita income in the region was 20 percent above the national average; in 1969, the difference was 11 percent; in 1990, the margin is 7 percent.

*New England*.—In the 1930's and 1940's, income growth in New England fell substantially behind the national average. During the 1950's and 1960's, the lag was considerably reduced. Over the next two decades, the region grows at approximately the national rate.

This projection reflects two opposing forces. Manufacturing, which has long been a mainstay of the New England economy, continues to lag behind its national counterpart. Whereas labor earnings in manufacturing increase 80 percent nationally from 1969 to 1990, in New England they increase only 56 percent. This much of a lag in an industry that accounts for more than one-fourth of all income in the area, has a significantly depressing effect on labor earnings in supporting industries.

If manufacturing is excluded, however, projected income growth in New England exceeds that in the Nation by a small margin. Industries mainly responsible for this are the public utilities and the service industries, especially the professional services, particularly education. Recreational services provide strong impetus to income growth in Vermont and New Hampshire. As a result, these two States rank 11th and 15th in the rate of projected total income growth.

Employment and population follow the pattern of income change, and, as a result, per capita personal income holds at 7 percent above the national average.

### *Regions with declining shares*

The Mideast, Great Lakes, and Plains regions grow at less-than-average rates from 1969 to 1990. The relative declines are less than half as much as those that occurred from 1950 to 1969.

*Mideast and Great Lakes*.—These two regions represent the old, mature, industrial center of America. The relative decline foreseen for these regions in part reflects the projected growth of the newer areas of the country, and, in part, the movement of some industries out of older into the newer areas. For example, some of the shift of textiles and apparel from the Mideast to the South represented such a shift of productive resources.

In the Great Lakes and Mideast nearly every major industry expands at below-average rates in the next two decades. The only significant exceptions are the above-average gains in non-automotive transportation equipment in the Great Lakes region and the above-average increases in government in both regions.

In the two regions, the decline in income is accompanied by declines in employment and population. However, because of a tendency for older, unemployed persons to remain in the area of their former employment, population will not adjust in direct proportion to the decline in income. Accordingly, per capita income in these two regions declines slightly, relative to that in the Nation. Nonetheless, per capita incomes remain above the national average.

*Plains*.—In the Plains also, total income grows at less than the national average. The most important reason for this is that agriculture and food manufacturing are the principal industries in this area and both of these industries are slow-growth industries in this region as well as in most other areas of the country.

In these circumstances, even though agriculture is projected to grow about 20 percent faster than in the Nation as a whole, it cannot boost total income growth in the Plains significantly.

The relative income lag projected for the Plains is only half as large as that which occurred between 1950 and 1969. The reason for this lies in two key percentages. In 1950, agriculture accounted for 15 percent of total income in the Plains, whereas by 1969, it accounted for only 8 percent.

## Concepts and Methodology

These projections, as with all efforts to look into the economic future, are based upon an extension of past relationships believed to have relevance for the future. The methodology used in preparing them has four characteristics which distinguish the results from those of a simple linear extension of trends at a summary level.

First, the basic projections were made for 173 economic areas into which BEA has divided the country, using criteria that make the areas especially suitable for economic projection and analysis. The projections for economic areas that cross State lines were disaggregated into the State segments required for reaggregation to State totals.

Second, the economic area projections were made within the framework of projections of the overall U.S. economy. Projections of population, employment, and income were made first for the Nation, then disaggregated geographically.

Third, the projections are based on the assumption that persons in the labor force migrate to areas of economic opportunity and away from areas of economic decline or stagnation. Accordingly, projections of area income and employment were prepared first, and projections of area population derived from them.

Fourth, projections of income were prepared for each of as many as 39 industries in each of the 173 areas. Various methods were used to make the projections, depending upon the individual industry's role in the area's economy. However, the methods used insure that in each of the 173 areas the industrial composition of projected income constitutes an economy with an internally balanced structure. The fact that the projections were prepared in industrial detail makes it possible for the projected

With personal income growing more slowly in the Plains than in any other region over the next two decades, comparably slow growth rates characterize both employment and population, and per capita income improves very slightly (5 percent) relative to the national average.

economic path of an area to depart substantially from past trends.

### *Nature of the projections*

These projections are intended to be a best estimate of what can be expected if there are no policy or program changes of unusual nature or magnitude, such as the establishment of a large number of "new towns" or a major change in some environmental policy such as regulations regarding strip mining or pollution abatement. The projections are neither a goal for nor a limit upon any given region's future economic activity. They carry no connotation of desirability or undesirability.

The projections take no account of the sharp increase in world demand for the agricultural products of this Nation or of regional economic developments that may stem from the energy crisis. The effects of potential developments in agriculture and energy can best be gauged through impact analysis. In this connection, it should be noted that BEA's projection system is designed to facilitate impact analysis, and that work in this area is now going on in BEA.

As noted, the projections presented here are based on an extension of past relationships believed to have relevance for the future. The choice of relationships to be extended and the methodology for extending them are based on assumptions, some of which are stated explicitly and some of which are implicit in the projection methodology. The assumed conditions are those believed to have the greatest probability of realization. Thus, the projections represent an attempt, imperfect though it may be, to forecast, the economic future.

In general, long range projections are more likely to prove wrong than are those made for short periods, and projections in detail are more likely to prove wrong than those in which only broad aggregates are produced. Accordingly, projections for 1990 are probably less reliable than those for 1980; projections for a specific industry in a specific region are probably less reliable than those for the same industry nationally; and earnings projections for a specific industry are probably less reliable than those for total earnings or total income. By the same token, a projection of the labor force at the national level for 1990 is probably quite reliable because that labor force will be drawn almost entirely from a population the size and age distribution of which are known, though projected participation rates may be wrong. However, a projection of the 1990 labor force in a given State is related not only to the current State population and future births and deaths, but also to future interstate migration. Accordingly, a State projection is less reliable than the national projection.

### *Assumptions*

The projections are based on longrun or secular trends and ignore the cyclical fluctuations which characterize the shortrun path of the economy. The general assumptions that underlie the projections are as follows:

- (1) Growth of population will be conditioned by a decline of fertility rates from those of the 1962-65 period.
- (2) Nationally, reasonably full employment, represented by a 4-percent unemployment rate, will prevail at both of the points for which projections are made; as in the past, unemployment will be disproportionately distributed regionally, but the disproportion will be diminishing.
- (3) At projection dates, there will be no direct effects on the projections due to foreign conflicts.
- (4) Continued technological progress and capital accumulation will support a growth in private output per man hour of 2.9 percent annually.
- (5) The new products and services that will appear will be accommodated

within the existing industrial classification system, and, therefore, no new industrial classifications are provided.

(6) Growth in output can be achieved without ecological disaster or serious deterioration, although diversion of resources for pollution control will cause changes in the industrial mix of output.

(7) The composition of personal consumption will continue to change.

The regional projections are based on the following additional assumptions:

(1) The factors that have influenced historical shifts in "export" industry location will continue into the future but the sharpness of the shifts will diminish.

(2) Trends toward area self-sufficiency in local-service industries will continue.

(3) Workers will migrate to areas of economic opportunities and away from slow-growth, or declining areas.

(4) Regional earnings per worker and income per capita generally will continue to converge toward the national average.

(5) Regional employment/population ratios will tend to move toward the national ratio except in "retirement" areas.

### **Projection procedure**

The State income and employment projections were made in six major steps.

First, total national population, employment, GNP, personal income, and earnings were projected. Second, the projected national output, employment, and earnings were broken into industry detail on the basis of projected trends in industry shares of the national totals.

Third, projected industry totals of earnings were allocated to the 173 economic areas into which BEA has divided the country. The methodology of this step for each area's "export" industries—those that produce goods and services mainly for export to other areas—was different from the methodology for the area's other industries, i.e., its "residential" industries. Basically, however, earnings in both types of industry were projected by extrapolating past trends.

The nonearnings components of personal income were projected for each area by a method similar to that used for residential industry earnings.

Fourth, area population of persons 14 through 64 years of age were derived from projected area employment. Projections of persons less than 14 years were derived as a function of the 14-64 year group. Projections of population 65 years and over were made by extrapolation of past trends.

Fifth, the fact that many of the 173 BEA economic areas cross State boundaries made it necessary to divide the projected area figures into State segments. Where this involved an SMSA, each State portion was assumed to grow at the rate for the SMSA as a whole.

Sixth, the area projections were aggregated to State totals.

The projections procedure is by no means mechanical. At various points in the process, it is essential that judgment be brought to bear, both in estimating the future rate of change in the industrial composition and location of output, and in checking the internal consistency of the projections.

The decision to derive regional projections through the disaggregation of national totals instead of through the independent projection of each component in each region is based on the assumption that the larger the economic area, the more adequate and reliable are the available statistical measures and, hence, the more reliable are the projections that can be made. This assumption applies also in the decision to derive projections of industrial detail at the national level by first projecting national employment, output, and earnings, and then disaggregating them into national totals for individual industries.

### **Gross national product**

The initial step in preparing the national projections was to project the gross national product. This was done by multiplying projected man-hours worked per year by projected output per man-hour. The variables which entered the determination of man-hours worked include the working-age population, labor force participation rates, general government employ-

ment (civilian and military), and hours worked per year per person.

The Bureau of the Census has made several different population projections, with the birthrate assumption the varying element. In light of the factors prevailing in early 1973, when the decision was made regarding the projected population to be used, the "E" series was selected. Of the Census Bureau's projected population series available at that time, series "E" had the second slowest growth rate. Series "X", which assumes no immigration into the country, had a slightly slower growth rate, but it was not adopted because the immigration assumption did not appear realistic. Series "E" assumes a total fertility rate of 2,100 births per 1,000 women which would maintain a constant population. It shows national population increasing from 204 million in 1970 to 246 million in 1990, an increase of about one-fifth.

The working-age population, labor force participation rate, and hours worked per person per year were each projected separately with the best available analytical studies and expertise utilized in each case. The population of working age is, of course, a subset of the total population; the labor force was derived by applying age- and sex-specific participation rates developed by the Bureau of Labor Statistics to the working-age population. Hours worked per person per year in the private economy were projected to decrease by 0.35 percent per year, compared to the post-World War II average decrease of 0.5 percent per year. The slower rate assumes that the "easy" reductions in hours of work have already been made. A 4-percent unemployment rate was adopted as representing full employment nationally, but regional differences were allowed around the national figure.

Output (real gross product) per man-hour in the private economy increased at a compound annual rate of 3.3 percent from 1948 to 1971. The projection puts productivity growth at a compound annual rate of 2.9 percent from 1971 to 1990. The projected rate is somewhat lower than the 1948-71 rate to allow for the fact that some part of the productivity growth in the earlier

period was attributable to a massive movement from farm to nonfarm work which cannot be repeated on a similar scale in the future. There is a variety of opinion on the merits of using the 2.9 percent rate. Some forecasts would lower the projected rate still further because of the projected shift in work force distribution away from higher productivity manufacturing to the lower productivity service industries.

Private gross product was projected by multiplying private man-hours by output per man-hour in the private economy. Constant dollar government gross product was projected in accordance with conventional national income and product accounting practice as the number of general government employees times average compensation in the base year.

The sum of projected private and projected government gross product is projected constant dollar GNP, which grows at a compound annual rate of 4 percent between 1971 and 1990.

#### *Personal income and earnings*

Since methodology for measuring gross regional product has not been developed, it was necessary to translate GNP into measures which could be prepared regionally.

The measures chosen for this purpose are personal income and its labor earnings component (the sum of wages and salaries, other labor income, and proprietors' income). The choice rested on three considerations. First, personal income has a comparatively constant relationship to gross national product; second, its regional location is clear and it can be measured with current data sources; and, third, regional estimates of personal income had already been developed.

Projected personal income was derived from the relationship between constant dollar personal income and constant dollar GNP. A function was fitted mathematically to past values of the income/GNP ratio and extended to 1990. The projected 1990 ratio was applied to projected GNP to derive projected personal income.

In a similar manner, the ratio of labor earnings of persons to total personal income was projected and

applied to projected personal income in constant dollars to yield projected earnings in constant dollars. In connection with these constant dollar relationships, it should be noted that constant dollar GNP is a measure of the quantity of production. Constant dollar personal income and earnings are measured in dollars of constant purchasing power.

#### *Industry detail*

The projected values of three national aggregate measures were disaggregated industrially. These are gross product (which at the industry level is gross product originating, or GPO), labor earnings, and employment. The disaggregation was into the 37 industry groups for which local area data on earnings are available. (When the final projections were assembled at the State level, the 37 industries were combined into 28.) The disaggregation was accomplished by extrapolating 1948-71 trends in the industrial composition of gross product, labor earnings, and employment; that is, each industry's shares in total GNP, total earnings, and total employment were extrapolated and applied to the projected all-industry totals of GNP, earnings, and employment.

The resulting projections of GNP, earnings, and employment for each industry were then reconciled. The reconciliation focused on two major considerations. First, projected industry GPO, earnings, and employment were examined in the light of historical trends in the relationships among earnings per worker, GPO per worker, and earnings as a percent of gross product. Second, those ratio relationships for each industry were reviewed in the light of the corresponding all-industry ratios, to judge how well the projected data adhered to the empirical observation that interindustry differences in earnings per worker and GPO per worker diminish over time.

The national projections of industry employment used the data on "persons engaged in production" that are calculated by BEA as an adjunct to the national income and product accounts (table 6.6 in July issues of the SURVEY).

These data are conceptually consistent with the series on gross product originating and earnings. However, the "persons engaged in production" series is not now available on a regional basis, although such a series is under construction. The only employment data with adequate industrial detail now available for all local areas are from the decennial censuses of population. It was necessary, therefore, to convert the projected national employment to the Census employment concepts. This was done by first eliminating government workers. The resulting Census employment figures for each industry were then extrapolated forward by the projected change in the "persons engaged" series. Independently projected estimates of government employment were then added to projected private employment in the appropriate industries to yield national totals of employment. The all-industry employment total was distributed to economic areas. At some future time, the industry totals will be distributed also.

#### *Economic areas*

Once projections had been made at the national level for output, earnings, and employment by industry, the next step was to allocate the national industry totals of labor earnings to sub-national areas. This was done using the 173 economic areas into which BEA has divided the country as part of its program of regional measurement, analysis, and projection. Each area consists of an urban center and surrounding counties in which economic activity is focused, directly or indirectly, on the activity of the center. Each area combines place of residence and place of work of the labor force as nearly as possible so that there is a minimum of commuting across area boundaries.

Each economic area has two types of industries. The "export" industries produce goods and services that are for the most part exported to other areas, providing the earnings with which the area purchases the specialized goods and services of other areas. "Residential" industries produce most of the services and some of the goods required by local business as

intermediate products and by the household sector. Each economic area approaches self-sufficiency with respect to its "residential" industries.

There is considerable similarity among economic areas in the inter-industry relationships—among "residential" industries and between "export" and "residential" industries—within each area. Moreover, these inter-industry relationships within areas exhibit substantial stability over time, although they do change as a result of secular trends and developmental thresholds (points at which local markets for intermediate or consumer products become large enough for local production to supplant all or a portion of imports). These characteristics of similarity and stability in interindustry relationships make the BEA economic areas superior for projection purposes to other geographic areas delineated in accordance with noneconomic criteria. For example, the relationships among industries located within individual counties often appear to be meaningless and random. The meaning of such relationships would become clear, of course, if data were available on county imports and exports so that total input requirements (locally produced plus imported) of each local industry could be calculated. But such data are not available. The BEA economic areas consolidate many of the intercounty trade flows, especially for "residential" industries and therefore make it unnecessary to have trade flow data for "residential" industries, though export-import information is still needed for complete analysis of the "export" industries.

#### **Local area economic measures**

The local area economic measures used in the projections are population, total personal income, earnings by industry of origin, and total employment.

Estimates of total personal income, earnings in 37-industry detail, and the nonearnings component of personal income in each SMSA and non-SMSA county have been prepared by BEA for 1950, 1959, 1962, and annually from 1967 forward. These were aggregated to the 173 economic areas.

Estimates of total employment for the 173 areas were based on the censuses of population for 1940, 1950, 1960, and 1970.

#### **Economic area projections: "Export" industries**

Projections of labor earnings in "export" industries were made, industry by industry for each economic area, on the basis of projections of the trend in the area's share of total national earnings in each industry. The trends in the shares were projected into the future by fitting least squares regression lines to the logarithms of the historical values of the shares and the logarithms of time and extending the curves to 1990. The projected shares derived in this manner were modified judgmentally in some cases, mainly where natural resources were expected to be depleted or where the historical data appeared weak or in error. The projected area shares, after being forced to total 100 percent, were applied to the appropriate national totals to get projected absolute values.

#### **Economic area projections: "Residential" industries**

Projected area earnings in each "residential" industry were derived from the following relationships: (1) The projected regional location quotient (LQ) for the industry, i.e., the ratio of the industry's share of total area earnings to the industry's share of total national earnings; (2) the projected national ratio of earnings in the industry to total national earnings; and (3) projected earnings in total "export" industries in the area.

The area LQ's for each "residential" industry—item (1) above—were projected as follows. Analysis of changes in the area LQ's of individual "residential" industries from 1962 to 1971 showed that economic areas trend toward self-sufficiency in "residential" industries, i.e., LQ's trend toward 1.0. Analysis also showed that the slope of the trend depends upon the magnitude of the LQ. From this analysis, trend values for change in LQ's were set for

several different ranges of LQ value. These trend values were then applied to the LQ of each "residential" industry in 1971 and projected LQ's were determined for 1980 and 1990.

The projected national ratio of earnings in each "residential" industry to total national earnings (item 2 above) was calculated from the national industry earnings projections that were mentioned as the second step of the overall projections methodology.

Item 3 was derived by summing earnings of "export" industries already projected for each economic area. Projected earnings for each "residential" industry in each area were derived as follows: First, the projected LQ for each "residential" industry (item 1) was multiplied by the projected national ratio of earnings in that industry to total national earnings (item 2). This computation gave the projected share of the "residential" industry in the area's total all-industry earnings. These shares were summed for all "residential" industries in the area. Subtracting the sum of "residential" shares from unity gave the "export"-industry share. The division of this share into the projected absolute value of "export" industry earnings—already calculated—yielded projected total all-industry earnings for the area. To this total was applied the projected share of each "residential" industry in the area's total all-industry earnings (the product of items 1 and 2) to obtain the projected absolute value of earnings in each "residential" industry in each area. The sum of the area values for each "residential" industry was forced to equal the previously projected national total for the industry, thereby keeping the projected series within the framework of the national projections.

Certain industries are classed as "residential" in some areas and "export" in others. For example, in one area hotels may serve principally the business community and local residents while in another, such as Las Vegas, they may provide recreation for visitors and so form an "export"

industry. Similarly, in one area printing and publishing may involve only local newspaper publishing and local business printing, whereas in another area it may serve a national market through book and magazine publishing. In each area, employment and earnings in such industries were projected in accordance with each industry's character in that area. This procedure necessitated a break of the projected national totals for these industries into that portion to be treated as "export" and that as "residential."

Total labor earnings, the sum of "export" and "residential" industry earnings, make up about 80 percent of total personal income. To complete the projections, property income, transfer payments, and personal contributions to social insurance (which are netted out of personal income) were projected by a modification of the procedure used for "residential" industries.

#### **Population projections**

The natural increase in population in an area—births minus deaths—can be projected quite accurately when the national fertility rate is assumed. The critical element in a local area population projection made within a given national population total is interarea migration. As previously noted it was assumed in these projections that the major motivating factor in migration is economic opportunity except in a few areas which attract an especially large number of retired persons.

Accordingly, area population was for the most part projected as a function of area employment. However, in order to reflect properly changes in population which are not directly related to economic opportunity, the 1970 population in each economic area was grouped into three age categories and each category was projected separately. The three groups are (1) the labor pool (ages 14–64); (2) the pre-labor pool (ages 0–13); and (3) the post-labor pool (ages 65 and over). Population in the labor pool was projected as a function of area employment. Although there have been some variations historically

among areas in the ratio of the labor pool to employment, in most areas they are small. The projection technique recognizes these differences but assumes that they will tend to disappear. As stated earlier, a 4-percent unemployment rate was assumed nationally, with regional variations recognized.

In projecting the functional relationship between the labor pool population and employment, the regional ratio of labor pool to employment in 1970 was moved toward the national ratio. It was assumed, however, that the differential between the regional and national ratios would be reduced rather than eliminated by the end of the projected period.

The projected employment in an area multiplied by the projected labor pool-employment ratio yielded projected population in the 14–64 years age group.

The pre-labor pool population was projected as a function of the total labor pool using the same approach as was used in projecting the labor pool.

The post-labor pool, or retirement, population was projected independently of the employment data as this age group has little measurable relationship to levels of economic activity. Population aged 65 and over for each decade was projected in terms of population aged 55 and over at the preceding decade. The population 55–64 was broken out of the labor pool population at each point using regional percent shares trended to the national percent share in order to provide the necessary estimates of population aged 55 and over.

Historically, area trends in relative income per capita (area per capita income expressed as a percent of national per capita income) in most areas have shown a pronounced tendency to converge toward 100. Projected per capita income relative were computed for each area and were analyzed for trend-stability and convergence. Significant departures from anticipated trends in a few instances caused a re-examination of projected income, employment, and population, with subsequent modification in one or more of these aggregates until satisfactory relationships were achieved.

#### **State projections**

The final step in deriving State projections was to separate into State segments the projections of income, employment, and population for those of the 173 BEA economic areas that cross State boundaries. State totals could then be calculated. The separation of area data into State segments was done by projecting each State's share of the areas' earnings, industry by industry, and of total employment and population on the basis of historical trends in shares. Projected State shares were applied to area totals of income, employment, and population to obtain absolute values for each State segment. This procedure was applied to both "export" and "residential" industries, as the disaggregation of area totals into State segments invalidated the functional relationships between "export" and "residential" industries that hold for economic areas and that can be used at that level to project "residential" industry activity on the basis of "export" industry activity.

The historical income estimates for SMSA's were prepared for each SMSA as a whole and not for the component counties of the SMSA's. Accordingly, for the 27 SMSA's that cross State boundaries and therefore had to be disaggregated, special State breakdowns of the income components were prepared. The percentage distributions derived from these breakdowns were used to disaggregate the projected income of each such SMSA into State segments.

The BEA figures on total and per capita income by State are on a residence basis. In most States, however, the income figures are somewhat different on a where-earned basis because of commuting across State boundaries. The data that are used for adjusting the State income series to a residence basis (for the basic data are on a where-earned basis) are statistically weak and no attempt was made to project such adjustments directly. Instead, total personal income (on a residence basis) in each State was projected as a function of total earnings, (on a where-worked basis) and divided

by projected State population to give projected per capita income by State.

This procedure resulted in total and per capita State income being measured by place of residence. State labor

earnings, however, were measured by place of work. Thus, the difference between a State's total income and total earnings in table 4 is the sum of property income and transfer pay-

ments, less personal contributions for social insurance, plus an implicit commuting adjustment. It should be noted that because of the nature of BEA economic areas, total income in them is

Table 1.—Total Personal Income, by State and Region, for Selected Years, 1950-1990

Source: U.S. Department of Commerce, Bureau of Economic Analysis.

the same whether measured by place of work or place of residence. Accordingly, projected per capita income in economic areas is calculated directly as the quotient of total income and total population.

The earnings data in table 4 are shown on a place-of-work basis for two reasons. First, there is no information currently available that could be used to adjust satisfactorily the earnings data to a place-of-residence basis.

Second, in most uses to which the income projections will be put, earnings serve better on a place-of-work basis, whereas total and per capita income data are preferred on a residence basis.

Table 2.—Population by State and Region, for Selected Years, 1950–1990

Source: U.S. Department of Commerce: 1950-71, Bureau of the Census; 1980 and 1990, Bureau of Economic Analysis.

Because the geographic area of the District of Columbia is quite small in comparison with that of most of the States, because it has many of the characteristics of a central city rather than of a complete SMSA, and because

its future population probably depends upon the resolution of various problems more social than economic, no attempt has been made to project its population. Instead, the 1970 Census count has been held constant through-

out the projection period. Earnings of persons working in the District and total personal income of the constant resident population are projected for the District of Columbia in the same manner as for the States.

\*Employment and employment/population ratio are for 1970.  
 †Includes rest of the world which is quantitatively significant only in the District of Columbia.  
 (D) Deleted to avoid disclosure of data pertaining to an individual establishment.  
 (S) Too small to project. (L) Less than \$100,000.

NOTE.—Deflation of 1950, 1969, and 1971 is accomplished by applying the implicit price deflator for personal consumption expenditures to each item at the county level. Hence, industry detail may not add to summary aggregates.

# 1974 Business Investment Plans Largely Unaffected by Energy Shortages

ACTUAL and prospective shortages of oil and other sources of energy had virtually no effect on total capital expenditures planned for 1974, according to a special survey conducted by the Bureau of Economic Analysis (table 1). The 1974 investment projection (a 13 percent increase over 1973), published last month in these pages, reflects the results of this survey.

The survey, conducted as part of the Bureau's regular canvass in late January and February, showed that 20 percent of the firms had changed their investment programs because of energy shortages. The impact of these shortages varied among the major industry groups with offsetting effects.

Firms were asked: "Would the new capital expenditures reported for the

year 1974 have been different if there had been no actual or expected shortages of petroleum products, gas, and electricity?" Those firms indicating "yes" were asked to quantify the difference. In interpreting the results of the survey, it should be kept in mind that many firms may not have been able to assess fully the consequence of the energy situation on their 1974 investment programs. Moreover, because of the complexity of investment considerations, it is difficult to pinpoint the effect of any single factor.

Several industries reported that their 1974 investment plans were increased substantially because of the energy situation. Petroleum refiners and gas utilities—basic energy producers—reported the largest net increases, 7.3 percent and 3.0 percent, respectively. Industry and trade sources indicate that these industries have stepped up spending sharply for exploration and development of new sources of oil and gas. Investment plans were increased also for petroleum refining facilities, and several gas utility firms budgeted substantial funds for facilities to transport and process liquified natural gas. Railroads raised their investment plans about 2 percent; it appears that much of this increase is associated with the transportation of coal, with the mining industry showing a net increase in its investment plans of 1.9 percent.

Air transportation reported the largest relative net reduction—3.0 percent; several airlines reduced equipment orders due to the shortage of jet fuel and gasoline. In the motor vehicle industry, an increase of investment in facilities for the production of small cars partially offset a reduction for large cars.

Thirteen percent of the companies surveyed in February reported that they had lowered their investment programs as a result of the energy situation

public utilities, 14 percent. Reduced outlays were reported by 29 percent of the air transportation firms, 21 percent of "other transportation" firms, and 20 percent of public utilities. In the commercial and communications industries, a relatively small proportion of firms reported changes—predominantly reductions. In manufacturing, 20 percent of the firms surveyed reported changes, with increases and decreases about evenly balanced. Table 2 also shows the relative distribution of the size of changes. About half of the firms indicated that the changes were less than 10 percent.

The effects of the energy situation on 1974 investment programs reflect a variety of factors. In addition to those already noted firms in many industries plan to install fuel-saving equipment and to modify existing equipment to provide more efficient fuel use. Some firms are converting facilities to use alternative fuels. Modifications in the design of new structures—such as added insulation—are also planned.

while 7 percent reported that outlays would be higher (table 2). There was wide dispersion in these percentages among the major industry divisions. In air transportation, 21 percent of the firms reported higher outlays and in

## Subsidies Less Current Surplus of Government Enterprises and Government Transfer Payments to Persons

HISTORICAL data are presented here for certain series first published for 1969-72 in the July 1973 issue of the SURVEY.

Table A shows annual data, 1960-72, on the breakdown of subsidies less

current surplus of government enterprises. July 1973 SURVEY table 3.15 was the first publication of such detail for this category.

Table B shows annual data, 1947-72, on the breakdown of government trans-

fer payments to persons. The information is published in July SURVEY table 3.9, and differs from the old format of table 3.9 only in the provision of additional detail.

1. Formerly included in State unemployment program. 2. Formerly included in military pension, disability, and retirement payments. 3. Formerly called other veterans benefits.  
 4. Formerly included in other. 5. Formerly comprised special types of public assistance.

# CURRENT BUSINESS STATISTICS

THE STATISTICS here update series published in the 1973 edition of BUSINESS STATISTICS, biennial statistical supplement to the SURVEY OF CURRENT BUSINESS. That volume (available from the Superintendent of Documents for \$5.15) provides a description of each series, references to sources of earlier figures, and historical data as follows: For all series, monthly or quarterly, 1969 through 1972 (1962-72 for major quarterly series), annually, 1947-72; for selected series, monthly or quarterly, 1947-72 (where available). Series added or significantly revised after the 1973 BUSINESS STATISTICS went to press are indicated by an asterisk (\*) and a dagger (†), respectively; certain revisions for 1972 issued too late for inclusion in the 1973 volume appear in the monthly SURVEY beginning with the August 1973 issue. Also, unless otherwise noted, revised monthly data for periods not shown herein corresponding to revised annual data are available upon request.

The sources of the data are given in the 1973 edition of BUSINESS STATISTICS; they appear in the main descriptive note for each series, and are also listed alphabetically on pages 189-90. Statistics originating in Government agencies are not copyrighted and may be reprinted freely. Data from private sources are provided through the courtesy of the compilers, and are subject to their copyrights.

Unless otherwise stated in footnotes below, data through 1972 and descriptive notes are as shown in the 1973 edition of BUSINESS STATISTICS	1971	1972	1973	1971				1972				1973				1974

\* Revised.    ? Preliminary.    † Before extraordinary and prior period items.  
 ? Includes data not shown separately.  
 ⊕ Applies to passengers, baggage, cargo, and mail carried.  
 § Passenger-miles as a percent of available seat-miles in revenue service; reflects proportion of seating capacity actually sold and utilized.    ⊙ Total revenues, expenses, and income for all groups of carriers also reflect nonscheduled service.    Δ Effective July 1973, carrier group referred to as "International;" no change in comparability of data.  
 \* New series. Source: Interstate Commerce Commission; data not available prior to 1972.  
 ♂ Indexes are comparable for the identical quarter of each year (and from year to year).  
 ⊕ Natl. Railroad Pass. Corp. (Amtrak), not included in AAR data above, for 1972 and 1st 6 months of 1973 (mil. dol.); Pass. revenues, 138; 74; net income, -148; -79 (ICC).

Unless otherwise stated in footnotes below, data through 1972 and descriptive notes are as shown in the 1973 edition of BUSINESS STATISTICS

Δ Revised. Preliminary. 1 Annual data; monthly revisions are not available.  
 Δ Effective Jan. 1974 includes items not covered for earlier periods: Aluminum—pipes, tubes, blanks, etc.; copper—imports of alloyed refined, and exports of ores, concentrates, blister, etc.

⊕ Includes secondary smelters' lead stocks in refinery shapes and in copper-base scrap.  
 ⊙ Producers' stocks elsewhere, end of Mar. 1974, 4,600 short tons.

Unless otherwise stated in footnotes below, data through 1972 and descriptive notes are as shown in the 1973 edition of BUSINESS STATISTICS	1972	1973	1973										1974

\* Revised.    † Preliminary.    ‡ Annual data; monthly revisions are not available.  
 ‡ Excludes figures for rubber-tired dozers.    § For month shown.    ¶ Data cover 5 weeks; other periods, 4 weeks.    † Includes nonfarm industrial tractors previously classified in the tractor shovel loader group shown above; for Jan. 1974, shipments of this type totaled 3,398 units valued at \$24.0 mil.  
 ‡ Effective June 1973 SURVEY, index revised back to 1970.  
 § Effective Jan. 1973, data reflect total market as follows: Sets produced in the United States, imports by U.S. manufacturers for sale under their brand name and, beginning 1973, sets imported directly for resale.  
 ¶ New series. Source: Association of Home Appliance Manufacturers.  
 † Includes data not shown separately.  
 ‡ Monthly revisions for 1972 will be shown later.

Unless otherwise stated in footnotes below, data through 1972 and descriptive notes are as shown in the 1973 edition of BUSINESS STATISTICS	1972	1973	1973										1974

† Revised. ‡ Preliminary. § Reported annual total; revisions not allocated to months.  
 † Publication of monthly rubber statistics was discontinued by the Census Bureau effective with the Dec. 1972 report (Series M30A). Data beginning Jan. 1973 are from the Rubber Manufacturers Association and are not strictly comparable with earlier data. ‡ Beginning January 1974, data reflect reduction in basis weight of newsprint from 32 to 30 lbs. for 500 sheets measuring 24" x 36"; data for January 1974 on 32-lb. basis (thous. short tons): Canada—production, 840; shipments, 815; stocks, 222; United States—production, 289; shipments, 285;

mill stocks, 29; consumption by publishers, 586; stocks at and in transit, 676.  
 ‡ Represents the sum of book paper, uncoated and writing and related papers formerly shown separately; data for new orders no longer available for the individual items.  
 § As reported by publishers accounting for about 75 percent of total newsprint consumption.  
 ¶ Monthly data are averages for the 4-week period ending on Saturday nearest the end of the month; annual data are as of Dec. 31.

Unless otherwise stated in footnotes below, data through 1972 and descriptive notes are as shown in the 1973 edition of BUSINESS STATISTICS	1972	1973	1973												1974

# INDEX TO CURRENT BUSINESS STATISTICS, Pages S1-S40

## SECTIONS

### General:

Business indicators	1-7
Commodity prices	8, 9
Construction and real estate	10, 11
Domestic trade	11-13
Labor force, employment, and earnings	13-17
Finance	17-22
Foreign trade of the United States	22-24
Transportation and communication	24-25

### Industry:

Chemicals and allied products	25, 26
Electric power and gas	26
Food and kindred products; tobacco	27-30
Leather and products	30
Lumber and products	31
Metals and manufactures	31-34
Petroleum, coal, and products	34-36
Pulp, paper, and paper products	36, 37
Rubber and rubber products	37
Stone, clay, and glass products	38
Textile products	38-40
Transportation equipment	40

## INDIVIDUAL SERIES

Advertising	11, 16
Aerospace vehicles	40
Agricultural loans	17
Air carrier operations	24
Air conditioners (room)	34
Aircraft and parts	7, 40
Alcohol, denatured and ethyl	26
Alcoholic beverages	11, 27
Aluminum	33
Apparel	1, 4, 8, 9, 11-16, 40
Asphalt	35, 36
Automobiles, etc.	1, 4, 6, 8, 9, 11, 12, 20, 23, 24, 40
Balance of international payments	3
Banking	17, 18
Barley	27
Battery shipments	34
Beef and veal	28
Beverages	9, 11, 22, 23, 27
Blast furnaces, steel mills	5-7
Bonds, outstanding, issued, prices, sales, yields	20, 21
Brass and bronze	33
Brick	38
Building and construction materials	4, 6, 7, 11, 31, 38
Building costs	10, 11
Building permits	7
Business incorporations (new), failures	5
Business sales and inventories	5
Butter	27
Cattle and calves	28
Cement and concrete products	9, 11, 38
Cereal and bakery products	9
Chain-store sales, firms with 11 or more stores	13
Cheese	27
Chemicals	5, 6, 9, 14-16, 20, 23, 25, 26
Cigarettes and cigars	30
Clay products	9, 38
Coal	5, 9, 23, 34, 35
Cocoa	23, 29
Coffee	23, 29
Coke	35
Combustion, atmosphere, heating equipment	34
Communication	2, 20, 25
Confectionery, sales	29
Construction:	
Contracts	10
Costs	10, 11
Employment, unemployment, hours, earnings	13-16
Fixed investment, structures	1
Highways and roads	10, 11
Housing starts	10
Materials output indexes	11
New construction put in place	10
Consumer credit	18
Consumer expenditures	1
Consumer goods output, index	4
Consumer price index	27
Copper	33
Corn	27
Cost of living (see Consumer price index)	8
Cotton, raw and manufactures	8, 9, 22, 38, 39
Cottonseed oil	30
Credit, short- and intermediate-term	18
Crops	3, 8, 27, 28, 30, 38
Crude oil	5, 35
Currency in circulation	20
Dairy products	3, 8, 9, 27
Debits, bank	17
Debt, U.S. Government	19
Deflators, GNP	2
Department stores	12, 13
Deposits, bank	17, 20
Dishwashers	34
Disputes, industrial	16
Distilled spirits	27
Dividend payments, rates, and yields	2, 3, 20, 21
Drug stores, sales	12, 13

Earnings, weekly and hourly	15, 16
Eating and drinking places	12, 13
Eggs and poultry	3, 8, 9, 29
Electric power	5, 9, 26
Electrical machinery and equipment	4, 6, 7, 9, 14, 15, 20, 23, 24, 34
Employment estimates	14
Expenditures, U.S. Government	13, 19
Explosives	26
Exports (see also individual commodities)	1, 3, 22-24
Failures, industrial and commercial	7

Farm wages	16
Fats and oils	9, 23, 29, 30
Federal Government finance	19
Federal Reserve banks, condition of	17
Federal Reserve member banks	17
Fertilizers	9, 25
Fire losses	11
Fish	29
Flooring, hardwood	31
Flour, wheat	28
Food products	1, 4, 6, 8, 9, 14-16, 20, 22, 23, 27-30
Foreclosures, real estate	11
Foreign trade (see also individual commod.)	22-24
Foundry equipment	34
Freight cars (equipment)	40
Fruits and vegetables	8, 9
Fuel oil	35, 36
Fuels	4, 8, 9, 23, 34-36
Furnaces	34
Furniture	4, 9, 12-15
Gas, output, prices, sales, revenues	5, 9, 26
Gasoline	1, 35
Glass and products	38
Glycerin	26
Gold	19
Grains and products	8, 9, 22, 27, 28
Grocery stores	12, 13
Gross national product	1
Gross national product, price deflators	2
Gross private domestic investment	1
Gypsum and products	9, 38
Hardware stores	12
Heating equipment	9, 34
Hides and skins	9, 30
Highways and roads	10, 11
Hogs	28
Home electronic equipment	9
Home Loan banks, outstanding advances	11
Home mortgages	11
Hosiery	40
Hotels and motor-hotels	25
Hours, average weekly	15
Housefurnishings	1, 4, 8, 11, 12
Household appliances, radios, and television sets	4, 8, 9, 12, 34
Housing starts and permits	10
Imports (see also individual commodities)	1, 3, 23, 24
Income, personal	2, 3
Income and employment tax receipts	19
Industrial production indexes:	
By industry	4, 5
By market grouping	4
Installment credit	13, 18
Instruments and related products	4, 6, 14, 15
Insurance, life	19
Interest and money rates	18
Inventories, manufacturers' and trade	5-7, 11, 12
Inventory-sales ratios	5
Iron and steel	4, 9, 11, 20, 23, 31, 32
Labor advertising index, stoppages, turnover	16
Labor force	13
Lamb and mutton	28
Lead	28
Leather and products	4, 9, 14-16, 30
Life insurance	19
Livestock	3, 8, 9, 28
Loans, real estate, agricultural, bank, brokers' (see also Consumer credit)	11, 17, 18, 20
Lubricants	35, 36
Lumber and products	4, 9, 11, 12, 14, 15, 20, 31
Machine tools	34
Machinery	4, 6, 7, 9, 14, 15, 20, 23, 24, 34
Mail order houses, sales	12
Man-hours, aggregate, and indexes	15
Man-made fibers and manufactures	9, 39
Manufacturers' sales (or shipments), inventories, orders	5-7
Manufacturing employment, unemployment, production workers, hours, man-hours, earnings	14-16
Manufacturing production indexes	4, 5
Margarine	29
Meat animals and meats	3, 8, 9, 22, 23, 28, 29
Medical and personal care	9
Metals	4-7, 9, 14, 15, 20, 22, 23, 31-33
Milk	27
Mining and minerals	2, 4, 5, 9, 14-16, 20
Monetary statistics	19, 20
Money supply	20
Mortgage applications, loans, rates	11, 17, 18, 19
Motor carriers	24
Motor vehicles	1, 4, 6, 8, 9, 11, 20, 23, 40
Motors and generators	34

National defense expenditures	1, 19
National income and product	1, 2
National parks, visits	25
Newsprint	23, 37
New York Stock Exchange, selected data	21, 22
Nonferrous metals	4, 6, 7, 9, 20, 23, 33
Noninstallment credit	18
Oats	27
Oils and fats	9, 23, 29, 30
Orders, new and unfilled, manufactures	7
Ordinance	14, 15
Paint and paint materials	9, 26
Paper and products and pulp	4-6, 9, 14-16, 20, 23, 36, 37
Parity ratio	8
Passenger cars	1, 4, 6, 8, 9, 11, 12, 20, 23, 24, 40
Passports issued	25
Personal consumption expenditures	1
Personal income	2, 3
Personal outlays	2
Petroleum and products	4-6, 8, 9, 14, 15, 20, 23, 35, 36
Pig iron	31, 32
Plant and equipment expenditures	2
Plastics and resin materials	26
Population	13
Pork	28, 29
Poultry and eggs	3, 8, 9, 29
Price deflators, implicit, GNP	2
Prices (see also individual commodities)	8, 9
Printing and publishing	4, 14-16
Private sector employment, hours, earnings	13-16
Profits, corporate	2, 20
