the BUSINESS SITUATION

REAL GNP increased 2½ percent at an annual rate in the third quarter, after a decline of the same size in the second (table 1).¹ The swing was in final sales. It was partly offset by inventory investment, which dampened the third-quarter increase and the second quarter decline in GNP (chart 1). As can be seen from table 2, the second-quarter decline in final sales was concentrated in motor vehicles. In the third quarter, when final sales of motor vehicles increased little, the increase in final sales other than motor vehicles was in personal consumption expenditures (PCE) and net exports.

Prices.—As measured by the implicit price deflator, the increase in GNP prices decelerated from 9½ percent at an annual rate in the second quarter to 8½ percent in the third. In addition to changes in the prices of the goods and services that make up GNP, the implicit price deflator reflects shifts in the composition of these goods and services. Its deceleration in the third quarter is traceable mainly to the change in

1. The third-quarter GNP estimates are based on the following major data sources: For *personal consumption expenditures* (PCE), retail sales, and unit auto and truck sales through September; for *nonresidential fixed investment*, the same information for autos and trucks as for PCE, manufacturers' shipments of machinery and equipment for July and August, July and August construction put in place, and investment plans for the quarter; for *residential investment*, July and August construction put in place, and housing starts for July and August; for *change in business inventories*, July and August book values for manufacturing and trade, and unit auto inventories through September; for *net exports of goods and services*, July and August merchandise trade, and fragmentary information on investment income for the quarter; for *government purchases of goods and services*, Federal unified budget outlays for July and August, State and local construction put in place for July and August, and State and local employment through September; and for *GNP prices*, the Consumer Price Index for July and August, the Producer Price Index through September, and unit value indexes for exports and imports for July and August. Some of these source data are subject to revision.

business inventories component of GNP. The real change in several types of inventories that are high-priced (in the sense that their prices have increased relatively more, compared with the valuation year 1972, than did the average of other GNP prices) was larger in the second quarter than in the third. The fixed-weighted price index, which does not reflect compositional shifts, increased 9½ percent in both quarters (table 3).

The fixed-weighted price index for PCE increased 11½ percent at an annual rate in the third quarter, compared with 10½ percent in the second. As shown in chart 2, food prices decelerated, and prices of energy and of other PCE accelerated. The acceleration in other PCE prices was mainly in services, where it was widespread.

Prices of PCE for energy increased 66 percent at an annual rate, compared with 53½ percent in the second quarter and 19½ percent in the first. Gasoline prices increased about 75 percent in both the second and third quarters, compared with about 25 percent in the first. Fuel oil prices continued to accelerate, from about 25 percent in the first quarter and 80 percent in the second to 120 percent in the third. Sharp increases in the prices of crude oil were a major factor in the accelerations. Effective April 1, OPEC raised prices 9 percent—on top of a 5-percent increase effective January 1—and authorized its members to add surcharges on their own initiative. A further increase of 16 percent was generally effective July 1. Tight crude oil supplies, due to disruption in Iran's production earlier in the year and cutbacks in other countries, provided a favorable setting for the imposition of surcharges and for

79-10-1

price increases by non-OPEC countries. Mexico, for example, increased the price charged for its exported crude oil by 32 percent effective July 1. Gasoline prices were affected, in addition, by the shortage in the second quarter, and Government controls and regulations, some of them designed to improve the allocation of gasoline supplies among regions. Prices of fuel oil are not subject to Federal controls, and reflected tight supplies throughout the period. The phased decontrol of domestic crude oil prices, which began June 1, has not yet

had a major influence on consumer energy prices.

Natural gas price increases, at annual rates, accelerated from 9 percent in the first quarter and 16 percent in the second to 30 percent in the third. Electricity prices increased about 27 percent in the third quarter, up from about 20 percent in the second and 5 percent in the first. Crude oil and natural gas are important costs in generating electricity; increases in their price were transmitted to consumers via fuel adjustment clauses.

Food prices increased 3½ percent at an annual rate in the third quarter, down from 6½-percent and 17½-percent increases in the second and first quarters, respectively. The major factor in the third-quarter deceleration was a decline in prices of meat, poultry, and eggs. Pork and poultry prices reflected record or near-record production. Consumer substitution of them for beef contributed to a decline in beef prices.

Prices paid by investors and government in the third quarter continued to increase in a range close to 10 percent.

Employment and unemployment.—The civilian labor force increased 900,000 after declining 180,000 in the second quarter (table 4). The changes in em-

1. Gasoline and oil, fuel oil and coal, electricity, and gas.

ployment were very similar to those in the labor force, and unemployment increased only 115,000. The unemployment rate was 5.8 percent, up 0.1 percentage points from the second quarter. The increase was confined to adult men, and was the first increase for that group since the fourth quarter of 1976.

Changes in employment as measured by the establishment survey differed substantially from those shown by the household survey. According to the establishment survey, employment was up 630,000 in the second quarter and only 410,000 in the third. In both quarters, the largest increases were in the service-producing industries. Employment in the goods-producing industries has changed little since the first quarter. Average weekly hours were up 0.1 after declining 0.3 in the second quarter. The swing in manufacturing hours was more pronounced—an increase of 0.3 hours after a decline of 0.8. Second-quarter hours had been reduced by several special factors, including strikes and the unusual timing of religious holidays.

Costs and productivity.—The increase in real output of the business economy other than farm and housing was only fractionally larger than the increase in hours, and productivity increased only slightly—½ percent at an annual rate (table 5). This increase followed substantial declines—3½–4½ percent—earlier in the year. Estimates of quarterly changes in productivity are subject to

large margins of error. It is particularly difficult to interpret the estimates for 1979.

Compensation per hour increased 8½ percent, compared with 8 percent in the second quarter and 10½ percent in the first. The first-quarter increase included about 2 percentage points attributable to increases in the minimum wage and employer contributions for social insurance. Excluding these special

factors, the increase in compensation per hour has been in the range of 8–8½ percent over the past year. Unit labor costs increased 8 percent in the third quarter, substantially less than in the second and first quarters and about the same as in the fourth quarter of 1978.

Personal income and its disposition

Personal income increased \$51 billion in the third quarter, compared with \$40

tributive and services industries were larger than in the second quarter. Transportation, where strikes held down the second-quarter increase, contributed to this step-up.

The largest differences between the second- and third-quarter changes in the components of personal income were in the income of farm proprietors and in transfer payments. Farm proprietors' income declined \$4 billion in the third quarter, after a fractional decline in the second. The major factor in the larger decline was a swing in cash receipts. Cash receipts from crops increased much less in the third quarter than in the second; an acceleration in prices was more than offset by a swing in the volume of marketings. Cash receipts from livestock declined for the second quarter, largely due to declines in prices.

Transfer payments increased \$17½ billion, compared with \$6½ billion in the second quarter. The acceleration was more than accounted for by cost-of-living increases in benefits paid under several Federal programs. These increases, most of which were effective July 1, added \$11½ billion to third-quarter transfer payments; \$9½ billion was accounted for by the 9.9-percent increase in social security benefits.

Personal taxes, which are deducted from personal income in deriving disposable personal income, increased \$15½ billion in the third quarter, compared with \$10½ billion in the second (table 7). Most of the acceleration was in State and local taxes. In the second quarter, these taxes had not changed as tax reductions in New York and California offset growth in the State and local tax base.

In the third quarter, disposable personal income—the income available for spending and saving—increased about \$35 billion and personal outlays \$54 billion (table 8). In the second quarter, income had increased \$29½ billion and personal outlays \$23 billion. Reflecting these changes, the personal saving rate, which had been 5.0 percent in the first quarter, increased to 5.4 percent in the second and dropped to 4.1 percent in the third.

A 4.1-percent personal saving rate was approached only three other times

CHART 3

U.S. Department of Commerce, Bureau of Economic Analysis

Data: Census
79-103

in the last 25 years. As always, it is difficult to explain the saving rate and changes in it. Two specific changes that led to reductions of disposable income in the third quarter work in the direction of explaining the third-quarter drop in the saving rate. These are the \$4 billion reduction in farm proprietors' income and the \$4 billion swing in State and local taxes due to legislative changes. The effect on the saving rate of the third-quarter cost-of-living increases in Federal benefits is harder

to assess. Little is known about the pattern of spending out of this kind of income increment—one-time, received by retirees, and expected because legislated. Moreover, because statistically, personal saving is the difference between disposable personal income and personal outlays, the saving rate depends on the adjustment of income and outlays for seasonality. The cost-of-living increases in benefits are not seasonally adjusted; in contrast, outlays made out of them are adjusted,

but perhaps not fully. The large and abrupt changes that occurred in PCE for motor vehicles in the second quarter and in PCE for energy in the second and third quarters probably also affected changes in the saving rate.

Inflation gives rise to more general difficulties in the explanation of consumer spending and saving. In the shortrun, consumers try to maintain living standards and reduce saving to help them to do so. In the longrun, they reduce spending in line with reductions in real income. Moreover, spending and saving behavior is likely to depend on the rate of inflation and changes in it. It is not possible to sort out the relative importance of these factors in the present situation. Also, capital gains and losses, which are not included in personal income, become larger and more volatile under inflation, and more important relative to personal income as a source of consumer spending. Because little is known about the size and composition of capital gains and losses and about the way they influence consumer spending, their presence complicates the explanation of the saving rate. If expectations are taken into account, the explanation of consumer spending and saving is further complicated. Consumers may step up current spending, especially for durable items, in order to beat prospective price increases. Alternatively, because inflation creates uncertainty and/or erodes the purchasing power of savings, they may step up saving to compensate for this effect.

Real PCE increased 4½ percent at an annual rate in the third quarter, after a decline of 3 percent in the second (table 9). The decline in the second quarter was more than accounted for by PCE for motor vehicles and for energy. The sharp decline in motor vehicles partly reflected concern over the price and availability of gasoline. This concern is suggested by the shift in the composition of new car sales toward domestic small cars and imports. In the third quarter, PCE for motor vehicles was flat, and there was a shift in composition back toward large cars. Although incentive and cash rebate programs complicate the analysis of the

situation, this pattern strongly suggests that the concern over gasoline lessened. (For a detailed discussion of unit auto and truck sales and production, see the article on "Motor Vehicles, Model Year 1979" later in this issue.) PCE for energy increased moderately in the third quarter. Its second-quarter decline was traceable not only to the gasoline shortage, but also to a reduction from unusually high first-quarter expenditures for electricity and natural gas for home heating.

PCE for most categories of goods other than motor vehicles and energy was stronger than in the second quarter. Furniture and equipment increased more. Food increased in the third quarter after small declines in the second, as did clothing and shoes. Services other than energy increased in line with their trend.

Fixed investment

Real nonresidential fixed investment increased 3½ percent at an annual rate, after a small decline in the second quarter (table 10). The swing was due to investment in motor vehicles.

Real residential investment continued to recede, after a sharp drop in the first quarter from a plateau maintained in 1978. In the third quarter, it was 7 percent below that plateau.

Single-family construction accounted for the entire decline. The decline was mainly due to adverse financial developments. The fact that there was no strong makeup in single-family housing starts in the months after the severe weather supports this interpretation (chart 3). Net inflows to thrift institutions—savings and loan associations and mutual savings banks—have slowed since the first quarter, partly in response to the mid-March regulatory changes that eliminated the premium paid by thrifts on 6-month money market certificates (MMC's) over the rate paid by commercial banks on their MMC's and by the Treasury on 6-month bills. Although the proportion of total thrift deposits held in these certificates increased through August, growth in thrift MMC's decelerated. It is too early to tell whether the regulatory changes effective in July that increased the return on passbook savings

CHART 3

Constant-Dollar Business Inventories, Final Sales and Final Sales of Goods and Structures, and Inventory-Sales Ratios

Note.—End-of-quarter inventories, seasonally adjusted; final sales seasonally adjusted at annual rates. Blue lines represent ratios of inventory stocks to final sales.

U.S. Department of Commerce, Bureau of Economic Analysis

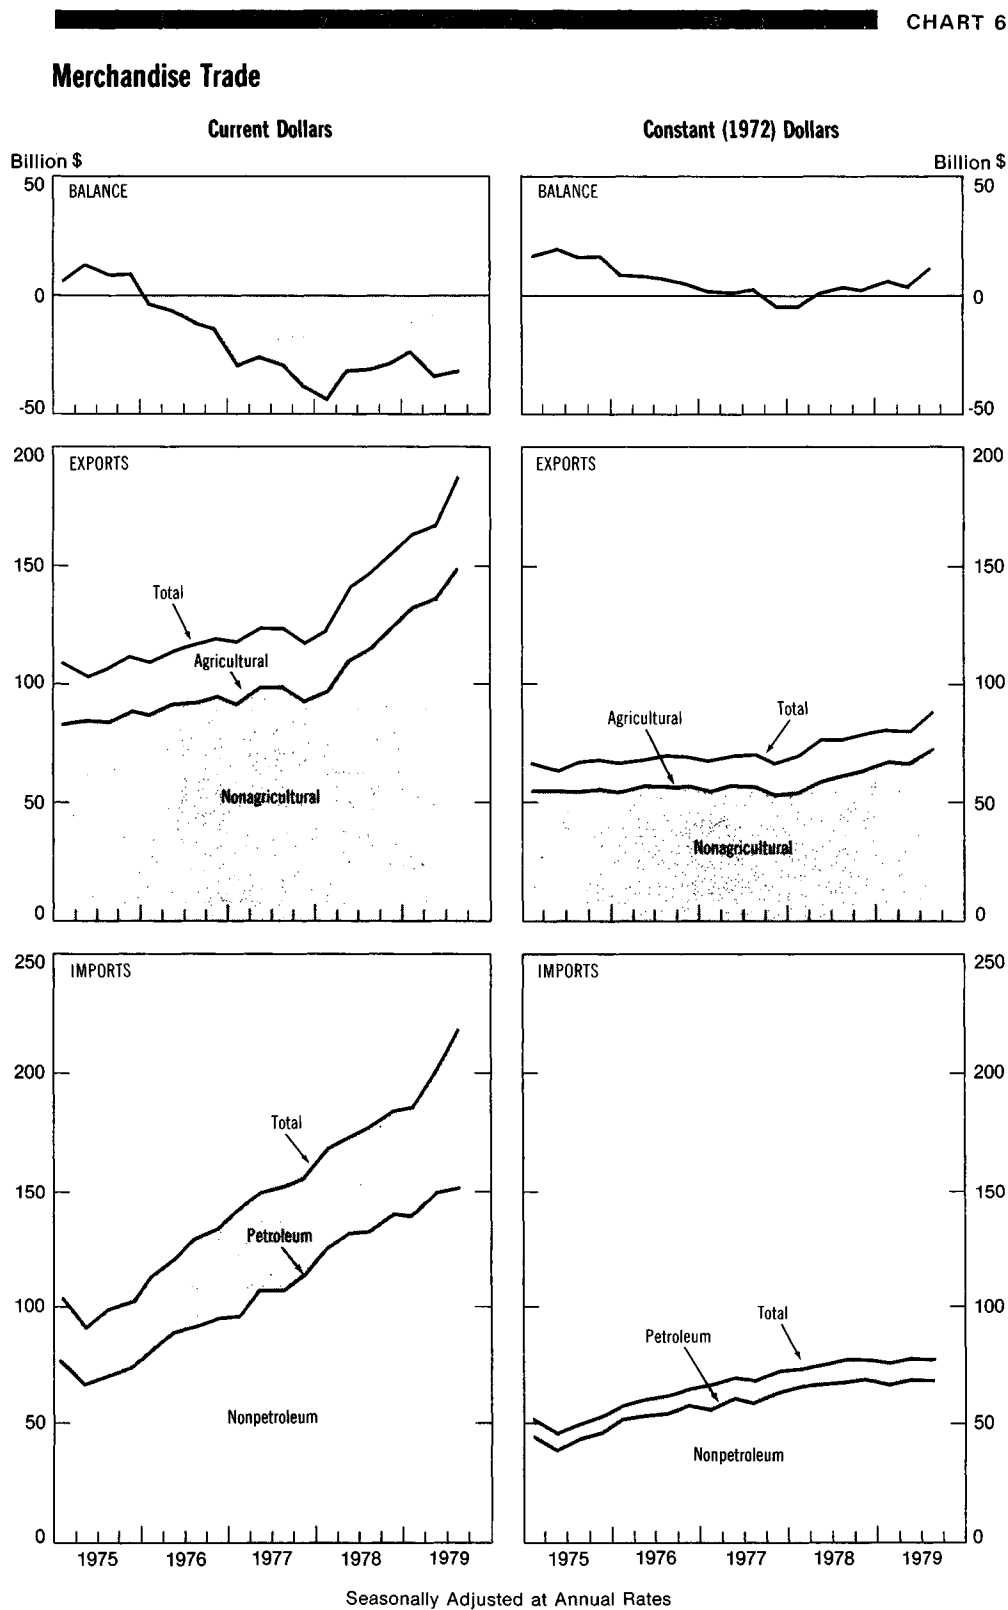

79-105

accounts will increase savings inflows. Reflecting the slowdown in net inflows, mortgage commitments were down from their high of last November, although they were supported by large increases in advances to savings and loan associations from the Federal Home Loan Bank Board and by secondary mortgage market activity.

Interest rates continued to increase through the third quarter (chart 4). The average rates on contracts and on commitments for conventional new-house loans both increased about 40 basis points from the second quarter, and over 75 basis points since the beginning of the year. The prime rate—to which the rate for construction loans is tied—increased to 13.25 percent by the end of September. Credit tightening by the Federal Reserve Board in early October led to further increases in interest rates.

Construction of multifamily units has been maintained. The Section 8 Housing Assistance Program has helped sustain subsidized rental construction. As indicated by construction loans for condominiums closed at savings and loan associations, which increased steadily from the third quarter of 1978 through the second quarter of this year, condominium construction has gained strength.

Inventory investment.—Real inventory investment was \$10 billion in the third quarter, down from \$18 billion in the second. The lower rate of accumulation was attributable to inventories of motor vehicles. These inventories accumulated at a rate of \$3½ billion in the second quarter and were liquidated at a rate of \$4½ billion in the third. Both auto and truck inventories were down, and as a result, inventory-sales ratios, which had risen to levels regarded as excessive, improved. (See the article on motor vehicles.) Inventories other than of motor vehicles—the total as well as durables and nondurables separately—accumulated at the same rate in the second and third quarters. In durables, a larger accumulation in wholesale trade was about offset by a smaller accumulation in manufacturing. The latter was

U.S. Department of Commerce, Bureau Economic Analysis

79106

largely in the "other" transportation equipment group, and reflected increased aircraft shipments.

Chart 5 relates business inventories to total business final sales and to

business final sales of goods and structures. Analytical use of the former relationship implies that the production of services results in a demand for inventories that is similar to that

generated by the production of goods and structures. Use of the latter implies that the production of services does not generate demand for inventories. Both implications are extremes. As can be seen from the chart, both ratios declined in 1978. The levels to which they fell in the fourth quarter were, respectively, well below 1968 and about the same as 1968, a period that is often considered normal. In the first and second quarters of 1979, the ratios increased substantially as inventories increased while final sales were flat or declined. In the third quarter, as final sales increased strongly and the addition to inventories was substantially smaller than earlier in the year, the ratios declined. The ratio of business inventories to business final sales, after falling to 0.269 in the fourth quarter of 1978, increased to 0.278 in the second quarter of 1979 and fell back to 0.276 in the third. The corresponding figures for the ratio of inventories to final sales of goods and structures were 0.419, 0.441, and 0.437.

Net exports

Real net exports increased \$6 billion in the third quarter, after a decline of \$4 billion in the second (table 11). The swing was in merchandise trade. Exports—both agricultural and nonagricultural—increased substantially in the third quarter (chart 6). The former reflected large shipments of grain and soybeans to Eastern Europe. In the latter, capital goods were a major factor. Their sharp increase in the third quarter after a decline in the second was largely due to shipments of civilian aircraft. Imports were unchanged in the third quarter, after increasing in the second. Both petroleum and nonpetroleum

n.a. Not available.

imports were unchanged in the third quarter. A second-quarter increase in nonpetroleum imports had been centered in industrial supplies and materials, which have shown substantial fluctuations recently. A decline in petroleum imports had provided a partial offset.

Government purchases

Real government purchases were unchanged in the third quarter, after declining 3½ percent at an annual rate in the second (table 12). Federal purchases declined in both quarters. The Commodity Credit Corporation's agricultural price support operations accounted for the declines. In the second quarter, these operations had turned from net loan extensions to net redemptions, as—in response to higher market prices—farmers withdrew crops previously placed under loan. In the third quarter, these redemptions increased.

NIPA Federal sector.—Table 13 is in current dollars and rounds out the information on Federal receipts and expenditures. Expenditures increased \$22½ billion, compared with \$6 billion in the second quarter. The major step-ups were in transfer payments, which have already been mentioned, and in grants-in-aid to State and local governments for public assistance, education, and community development. Receipts are expected to increase substantially more in the third quarter than in the second. The step-up is expected to be in corporate profits tax accruals, for which reliable estimates cannot yet be made. Corporate profits and corporate profits tax accruals declined in the second quarter, reflecting the decline in economic activity. They are expected to increase sharply in the third quarter, when economic activity increased. The Federal deficit on an NIPA basis is likely to remain close to \$7 billion.

^p Preliminary.

1. Equals GNP in constant dollars measured as the sum of final products less GNP in constant dollars measured as the sum of gross product by industry. The quarterly estimates are obtained by interpolating the annual estimates with the statistical discrepancy deflated by the implicit price deflator for gross domestic business product.

NOTE.—Table 6: The industry classification within the business sector is on an establishment basis and is based on the 1972 Standard Industrial Classification.

Footnotes for tables 2 and 3.

1. Equals GNP in constant dollars measured as the sum of final products less GNP in constant dollars measured as the sum of gross product by industry. The quarterly estimates are obtained by interpolating the annual estimates with the statistical discrepancy deflated by the implicit price deflator for gross domestic business product.

2. Held constant at level of previous quarter.

NOTE.—Table 2: "Final sales" is classified as durable or nondurable by type of product. "Change in business inventories" is classified as follows: For manufacturing, by the type of product produced by the establishment holding the inventory; for trade, by the type of product sold by the establishment holding the inventory; for construction, durable; and for other industries, nondurable.

Table 3: The industry classification within the business sector is on an establishment basis and is based on the 1972 Standard Industrial Classification.

^p Preliminary.

1. Inventories are as of the end of the quarter. The quarter-to-quarter change in inventories calculated from current-dollar inventories shown in this table is not the current-dollar change in business inventories (CBI) components of GNP. The former is the difference between two inventory stocks, each valued at end-of-quarter prices. The latter is the change in the physical volume of inventories valued at average prices of the quarter. In addition, changes calculated from this table are at quarterly rates, whereas CBI is stated at annual rates.

2. Quarterly totals at annual rates.

3. Equals ratio of nonfarm inventories to final sales of business. These sales include a small amount of final sales by farms.

NOTE.—Table 16: Inventories are classified as durable or nondurable as follows: For manufacturing, by the type of product produced by the establishment holding the inventory; for trade, by the type of product sold by the establishment holding the inventory; for construction, durable; and for other nonfarm industries, nondurable. The industry classification is based on the 1972 Standard Industrial Classification.

Table 17: The industry classification of compensation of employees, proprietors' income, and rental income is on an establishment basis; the industry classification of corporate profits and net interest is on a company basis. The industry classification of these items is based on the 1972 Standard Industrial Classification.

Table 23.—Implicit Price Deflators for the Relation of Gross National Product, Net National Product, and National Income (7.6)

Gross national product	141.70	152.05	150.82	153.45	156.68	160.22	163.81	167.14
Less: Capital consumption allowances with capital consumption adjustment	151.2	163.6	162.2	165.2	168.0	170.9	175.4	180.1
Equals: Net national product	140.7	150.8	149.6	152.2	155.5	159.1	162.6	165.8
Less: Indirect business tax and nontax liability plus business transfer payments less subsidies plus current surplus of government enterprises	129.1	131.8	133.1	131.0	131.6	135.1	137.7	139.0
Residual								
Equals: National income	142.6	153.4	151.9	154.8	158.5	162.1	165.6	

^p Preliminary.

1. Consists of final sales and change in business inventories of new autos produced in the United States.

2. Consists of personal consumption expenditures, producers' durable equipment, and government purchases.

NOTE.—Table 21: "Final sales" is classified as durable or nondurable by type of product. "Change in business inventories" is classified as follows: For manufacturing, by the type of product produced by the establishment holding the inventory; for trade, by the type of product sold by the establishment holding the inventory; for construction, durable; and for other industries, nondurable.

Tables 22 and 24: The industry classification within the business sector is on an establishment basis and is based on the 1972 Standard Industrial Classification.

^p Preliminary
 NOTE.—Table 27: The implicit price deflator for GNP is a weighted average of the detailed price indexes used in the deflation of GNP. In each period, the weights are based on the composition of constant-dollar output in that period. In other words, the price index for each item is weighted by the ratio of the quantity of the item valued in 1972 prices to the total output in 1972 prices. Changes in the implicit price deflator reflect both changes in prices and changes in the composition of output. The chain price index uses as weights the composition of output in the prior period, and, therefore, reflects only the change in prices between the two periods. However, comparisons of percent changes in the chain index also reflect changes in the composition of output. The fixed-weighted price index uses as weights the composition of output in 1972. Accordingly, comparison over any timespan reflect only changes in prices.

Second-Quarter Deceleration in State Personal Income

STATE personal income increased 2.2 percent in the second quarter of 1979 after an increase of 2.8 percent in the first quarter. Private nonfarm wage and salary disbursements (payrolls), which increased 1.9 percent in the second quarter compared with 3.4 percent in the first, more than accounted for the deceleration. They decelerated in 40 States and the District of Columbia and accelerated in 10 States.

Nationally, the deceleration was most pronounced in manufacturing, and, in the States, it was generally larger in those in which manufacturing accounts for a large share of private nonfarm payrolls. The deceleration was large—2 percentage points or more compared with a national average of 1.5 percentage points—in 21 States; in most of

these, manufacturing's share of private nonfarm payrolls was above the national average (table 1). Twelve of the 21 States were in the Northeast-Great Lakes manufacturing belt. In each of the 12, payrolls in both durables and nondurables manufacturing contributed to the deceleration and, partly as a result, so did payrolls in service-type industries. Second-quarter declines in motor vehicle production were a major factor in a substantially smaller increase in Ohio and a decline in Michigan.

Six of the remaining nine States with a large deceleration were in the Southeast. In each of the six, payrolls in manufacturing and related service-type industries and in construction (except in Arkansas) contributed. In West

Virginia, in addition, mining payrolls declined after increasing in the first quarter. In each of the other three States—Nevada, Arizona, and South Dakota—payrolls in construction and service-type industries contributed. In Nevada and Arizona, the weakness in service-type payrolls partly reflected the adverse effects on the tourist industry of the second-quarter gasoline shortage in California.

Among the 10 States in which private nonfarm payrolls accelerated, only Maryland, New Mexico, Alaska, and Oklahoma registered an acceleration of 1 percentage point or more. In each of these four States, payrolls in construction and mining (except in Maryland) contributed to the acceleration.

Motor Vehicles, Model Year 1979

SALES of new motor vehicles declined to 14.7 million in the 1979 model year—fourth quarter 1978 to third quarter 1979—from a record 15.3 million in 1978. Both new passenger car and new truck sales were down. Large increases in the price of gasoline in the first and second quarters of 1979 and a gasoline shortage in the second quarter affected sales of both cars and trucks and raised the market shares of domestic small cars and imports and the market share of imported trucks. Inventories of these vehicles were tight by the end of the second quarter, but inventories of many domestic large cars and light trucks were excessive. At the end of the model year, manufacturers responded with sales incentives to reduce inventories and restore balance. Production of both cars and trucks was strong at the beginning of the model year but weakened as the year progressed.

New Cars

Retail sales of new passenger cars totaled 11.0 million in the 1979 model year, down from 11.3 million in 1978. The decline was more than accounted for by domestic sales, which fell from 9.3 to 8.7 million. Import sales were up slightly from 2.0 to 2.2 million and accounted for a record 20½ percent of total sales.

On a quarterly basis, sales were flat at 11.2 million (seasonally adjusted annual rate) in the fourth quarter of 1978, peaked at 11.7 million in the first quarter of 1979, dropped sharply to 10.5 million in the second, and recovered slightly to 10.8 million in the third (chart 7). Domestic small car and import sales increased through the first

three quarters of the model year, reaching records of 4.0 million and 2.5 million, respectively, before declining somewhat in the last quarter. Intermediate car sales declined through the first three quarters of the model year and recovered strongly in the last quarter. Full-size car sales were strong in the first two quarters of the model year, then dropped steeply, and partly recovered in the last quarter.

Gasoline shortage and price increases

Major factors affecting the pattern of sales in the first and especially the second quarters were the large increases in gasoline prices and the gasoline shortage. As was the case during 1973–74, the gasoline shortage resulted in long lines at the pumps in many areas and in the introduction of rationing programs such as restricted days for purchase based upon license plate number and maximum and/or minimum amounts for purchases. The average retail price of regular gasoline in 52 cities jumped 39 percent from the third quarter of 1973 to the second quarter of 1974, and, after increasing gradually over the next 4½ years, jumped 37 percent from the fourth quarter of 1978 to the third quarter of 1979 (chart 8). Reflecting concern over the price and availability of gasoline, the composition of new car sales shifted toward smaller, more fuel-efficient domestic small cars and imports in both 1973–74 and 1979 (chart 9). In the third quarter of 1973, prior to the oil embargo, domestic large cars (full-size and intermediate models) accounted for 60 percent of total new car sales, a percentage they had held for the previous 2 years. As the embargo began to take effect, the large car share of sales declined to 53 percent in the

CHART 7

Retail Sales of New Passenger Cars

79107

fourth quarter and bottomed at 50 percent during the height of the gasoline shortage in the first quarter of 1974. Over the same period, the domestic small car share increased from 25½ to 34 percent, and the import share from 14½ to 16 percent. After the shortages were alleviated and the price increases abated, the large car market share partly recovered to 52½ percent.

During 1979, a similar shift in sales composition occurred. In the fourth quarter of 1978, large cars accounted for 51½ percent of total sales, about the same market share as 4 years before. Domestic small cars held 31½ percent and imports 17 percent of the market. As in 1973-74, sales began to shift coincident with the price increases and prior to the peak shortages. At the height of the shortage in the second quarter, large cars accounted for only 38½ percent of total sales; domestic small cars and imports established record shares of 37½ and 24 percent, respectively.

Fuel economy

The shift in the composition of new car sales aided the manufacturers in meeting the Corporate Average Fuel Economy (CAFE) standard for 1979 of 19.0 miles per gallon (mpg). The CAFE for each manufacturer is based on the average mpg ratings and number produced of its models. According to preliminary Environmental Protection Agency (EPA) estimates, the average for all 1979 cars was more than 20.0 mpg, well above the standard, and each manufacturer exceeded its own CAFE projection made at the beginning of the model year.

Most of the improvement in the overall fuel economy of new cars in the last several years can be attributed to the production of more economical cars rather than to a shift in sales composition. Downsizing—the reduction of exterior size and weight without affecting interior size—of intermediate and full-size models and the introduction of new model small cars raised average fuel economy per model. As a result of the downsizing program, most intermediate and full-size models are smaller than they were several years ago,

CHART 8
Gasoline Prices

79-10-8

although the size categories remain unchanged. A popular full-size model that had a wheelbase of 121 inches and weighed 4,451 pounds in 1976, was reduced to 118 inches and 3,973 pounds by 1979. A popular intermediate model was reduced from 116 inches and 3,960 pounds in 1976 to 108 inches and 3,298 pounds by 1979. Substitution of lightweight metals, plastic, and smaller engines also contributed to reduced vehicle weight. The lighter 1979 models were more fuel efficient: According to EPA estimates for city driving, the full-size model improved from 13 mpg in 1976 to 15 mpg in 1979 and the intermediate model from 16 mpg to 19 mpg. Another factor that has contributed somewhat, and will contribute more, to improved fuel economy is the increased use of diesel engines in large cars. Although still accounting for less than 5 percent of large car sales, diesel engine use

more than tripled last year; diesel engines were rated about 5 mpg higher than conventional engines in the same models.

In the small car category, introduction of several new high-mileage subcompact models raised overall fuel economy. Increased installation of four-cylinder instead of six-cylinder engines also resulted in improved fuel economy for small cars; a four-cylinder engine was rated 3 mpg higher than a six-cylinder engine in the same 1979 subcompact model. Measures to enhance the acceptability of small cars include the use of turbochargers to provide extra power when needed in smaller engines and front-wheel drive to preserve interior space. Downsizing of compacts is underway; the first downsized line of compacts was introduced at mid-year as 1980 models. Downsizing of several other compact models is scheduled for 1981 and 1982, as is the introduction of several replacement subcompact models.

New car pricing

Continuing the practice begun in 1978, U.S. car manufacturers raised new car prices several times during the model year. By applying several small price increases instead of one large yearly increase, manufacturers are able to react more quickly to changes in production costs and to adjust individual model and option prices—e.g., prices of large eight-cylinder engines—to changes in market conditions. At model-year introduction last fall, prices were raised an average of 4-4½ percent on all models, compared with about 6 percent the previous 2 years. Prices were raised in December and April by about 2-2½ percent and again in July by about 1 percent. The introduction and December increases were higher on large cars, which were selling well in the beginning of the model year. The higher increases on large cars were prompted by concern about meeting the CAFE standard; manufacturers also boosted the price of large eight-cylinder engines to discourage their selection by buyers. As the year progressed, the shift in sales composition lessened the concern about CAFE, and the highest increases were on small cars. Announced price in-

creases on the 1980 models are 4-5 percent—about the same as last model year; the highest increases are on small cars.

Prices of imported cars are affected not only by manufacturers' prices but also by exchange rates. During the 1978 model year, prices of the most popular imports were raised over 20 percent, largely due to the depreciation of the U.S. dollar against the Japanese yen and German mark. Concurrently, U.S. manufacturers held down price increases on domestic small cars, putting imports at a competitive disadvantage. From November 1978 to the end of the 1979 model year, the depreciation of the U.S. dollar halted, and price increases on domestic small cars exceeded those on imports. Price increases announced by several leading Japanese manufacturers on their 1980 models are in the 1-2½ percent range, considerably less than those on comparable domestic models.

New car inventories and production

At the beginning of the 1979 model year, domestic new car inventories were 1,652,000 (seasonally adjusted), their lowest level since mid-1977, and the inventory/sales (I/S) ratio was 2.1, close to the 2.0 level considered desirable. In the fourth quarter of 1978, production at 9.5 million, and sales at 9.3 million (both at seasonally adjusted annual rates) were strong; inventories increased to 1,740,000, but the I/S ratio was only 2.2. First-quarter production, up slightly to 9.6 million, was boosted by the stockpiling of 1980 models for midyear introduction by one major manufacturer. Sales stabilized at 9.3 million, but the composition shifted toward small cars. Inventories edged up to 1,800,000, and the I/S ratio to 2.3. Inventories, however, were unbalanced; supplies of several small car models were tightening, and some intermediate and full-sized models were overstocked. In the second quarter, the situation worsened; intermediate and full-size car sales declined sharply, but small car sales increased to record levels. Total production was cut to 8.7 million; manufacturers periodically suspended production at many large car manufacturing plants as inventories accumu-

CHART 9
Market Share of New Car Sales During Gasoline Shortages

Based on Seasonally Adjusted Annual Rates
Data: Motor Vehicle Manufacturers Association of the United States, Inc. and Ward's Automotive Reports; seasonal adjustment by BEA.
U.S. Department of Commerce, Bureau of Economic Analysis 79-109

lated. Small car production was limited by plant capacities, and inventories were run down. In April, a truckers' strike and lockout slowed production of all models, further reducing small car inventories. Nevertheless, total production still exceeded total sales by a wide margin. Inventories were a record 1,914,000 by the end of the second quarter, the I/S ratio was up to 2.9, and the unbalance persisted.

Recent developments

In the third quarter, U.S. manufacturers took steps to alleviate the in-

ventory buildup. To clear the way for the 1980 models, they offered bonus payments to dealers and direct rebates to consumers on slow-selling, overstocked intermediate and full-size 1979 models. Introduction of the 1980 models was delayed to mid-October to provide more time for sale of the 1979's. Helped by these actions, domestic intermediate and full-size sales picked up markedly from the second quarter—intermediates from 2.2 to 2.7 million and full-size from 1.8 to 2.2 million. By the end of the quarter, inventories were reduced to about 1,700,000, and the I/S ratio to 2.4. Domestic production, mostly 1980 models, dropped to an extremely low level—7.9 million—in the third quarter. Plant downtime for model changeover was extended, line speeds were slowed and work shifts eliminated, and periodic closings continued at plants producing large cars. By the end of the third quarter, the U.S. automotive industry had more than 85,000 workers on indefinite layoff.

According to current schedules, fourth-quarter production will be at about the same low level as in the third quarter. The sales picture for the fourth quarter and the rest of the 1980 model year is clouded by uncertainty about the extent to which the dealer incentive and consumer rebate programs "borrowed sales" from the future, about the impact recent increases in interest rates will have on the cost and availability of financing for purchases by consumers and businesses and for inventory carrying charges for dealers, and about the effect further gasoline price increases or shortages might have.

New Trucks

Retail sales of new trucks totaled 3.7 million in the 1979 model year, the first model year decline since 1975. New truck sales peaked at a record 4.3 million (seasonally adjusted annual rate) in the fourth quarter of 1978, declined slightly to 4.0 million in the first quarter of 1979, dropped sharply to 3.3 million in the second quarter, and remained at that level in the third (chart 10).

More than three-fourths of all new trucks sold in the United States in the 1979 model year were domestic light

by business—residences bought by consumers are classified as investment. Common sense suggests that such purchases are investment rather than consumption.

Third, about 15 percent of GNP originates outside of the business system. Nonbusiness production includes the services provided by household employees (and by the employees of non-profit institutions), the services provided by government employees, and the services provided to foreigners by factors of production owned by residents of the United States (net of the services provided to the United States by factors of production owned by residents of foreign countries). The first two categories of nonbusiness production are measured by the compensation of employees of households (and nonprofit institutions) and of government. The last category is measured by the net inflow from abroad of employee compensation and—much more important—of property incomes (interest, dividends, and branch profits). The household and institutional component is included in consumer purchases (sales to consumers); the government component, in government purchases (sales to government); and the foreign component, in net exports (sales to foreigners).

Fourth, in addition to monetary transactions, GNP includes “imputations” for certain items of production in kind. These amount to less than 10 percent of GNP. The major items are: wages and salaries in kind, food and fuel produced and consumed on farms, the value of services rendered by owner-occupied dwellings, and the value of services furnished without payment by financial intermediaries. Each of these imputations is made in order to obtain a better view of total national output and of its distribution. This statement can be illustrated by one of the imputations for wages and salaries in kind. If only monetary transactions were taken into account, meals provided free to restaurant workers—unlike meals sold by restaurants—would not appear as part of GNP, and the wages of restaurant workers would be understated relative to the wages of workers who receive their wages in monetary form.

GNP as a sum of incomes

The second way of measuring GNP is based on a self-evident proposition:

$$\text{Value of production} = \text{costs of production} + \text{profits.}$$

To shorten the discussion, the following explanation omits the application of this formula to the single business unit, and applies it directly to the business system as a whole. When the formula is applied to the business system, a major category of costs of a single business unit—current-account purchases—cancels out because, as has been explained, the current-account purchases of one unit are the sales of another. The costs remaining in the formula for the business system fall into four main categories: compensation of employees, net interest, depreciation and other capital consumption allowances, and indirect business taxes. Employee compensation consists mainly of wages and salaries, but includes also employer contributions to social security and private pension and welfare funds. Net interest is interest paid by the business system less the interest it receives. Depreciation, etc., represents the cost of plant and equipment used up in production. Indirect business taxes are taxes that can be charged to business expense—for example, sales and excise taxes and business property taxes.

The difference between the value of business production and the costs just enumerated is business profits, of which corporate profits is the largest category. Corporate profits are measured before taxes on them. (Corporate profits taxes are not an expense in the strict sense of the word, because, unlike business expenses proper, they cannot be determined before profits are calculated.) The other major profits category is the income of unincorporated business (sole proprietorships and partnerships), including the independent professions. The last category of profits, called rental income of persons, is very similar to the income of unincorporated business.

This itemization of costs and profits is applicable to business production. The

items used to measure nonbusiness production were enumerated earlier. In measuring GNP as a sum of incomes, these items are combined with like items of business costs and profits. For example, the compensation of employees of households is combined with the compensation of employees of business, and the net inflow of interest from abroad is combined with net interest paid by business.

The National Income and Product Account

The results derived so far are shown for the year 1978 in the National Income and Product (NIP) Account, which is account 1 of table 1. On the right-hand side, GNP is measured as a sum of products. On the left-hand side, it is measured as a sum of incomes. The following points are intended to help make the table intelligible.

First, the items “subsidies, etc.,” “business transfer payments,” and “statistical discrepancy” are new. The first of these can be regarded as negative indirect business taxes. The business transfer payments item is largely bad debts incurred by consumers. Sales on the right-hand side of the account include credit sales before defaults; accordingly, bad debts are an element of business cost. They are labeled transfer payments (the term used in the NIPA’s for gifts), because they represent values paid to consumers for which they do not render services. Finally, the statistical discrepancy is the GNP measured as a sum of products less GNP measured as a sum of incomes. In theory, the statistical discrepancy should be zero, because profits is a residual—the value of production less the costs of production. In practice, the statistical discrepancy is not zero, because the income and product sides of the NIP account are estimated independently, and—given the imperfection of the source data—are subject to error.

Second, the term “inventory valuation adjustment” is attached to proprietors’ income and to corporate profits. This term flags that, with respect to inventory accounting, these two forms of profits are based on the method used in the NIPA’s rather than on methods

sumption allowances, which are deducted from gross private domestic fixed investment to express it on a net basis.

National income is the incomes that originate in the production of goods and services attributable to labor and property supplied by residents of the United States. Thus, it measures the factor costs of goods and services produced. Incomes are recorded in the forms in which they accrue to residents, and are measured before deduction of taxes on those incomes. They consist of the compensation of employees, proprietors' income, rental income of persons, corporate profits, and net interest.

Compensation of employees is the income accruing to employees as remuneration for their work. It is the sum of wages and salaries and supplements to wages and salaries.

Wages and salaries consists of the monetary remuneration of employees, including the compensation of corporate officers; commissions, tips, and bonuses; and receipts in kind that represent income to the recipients. It consists of *disbursements* (1-3) and *wage accruals less disbursements* (1-4). Disbursements is wages and salaries as just defined except that retroactive wages are counted when paid rather than when earned.

Supplements to wages and salaries consists of employer contributions for social insurance and of other labor income. *Employer contributions for social insurance* (1-6) includes employer payments under the following programs: Federal old-age, survivors, disability, and hospital insurance; State unemployment insurance; railroad retirement and unemployment insurance; government retirement; and publicly administered workman's compensation. *Other labor income* (1-7) includes employer contributions to private pension and welfare funds, and directors' fees.

Proprietors' income with inventory valuation and capital consumption adjustments (1-8) is the monetary income and income in kind of sole proprietorships and partnerships, including the independent professions, and of producers' cooperatives. Interest and dividend income received by proprietors, and rental incomes received by persons who are not primarily engaged in the

real estate business are excluded. The inventory valuation adjustment is described under corporate profits and the capital consumption adjustment under capital consumption allowances.

Rental income of persons with capital consumption adjustment (1-9) is the monetary income of persons from the rental of real property, except the income of persons primarily engaged in the real estate business; the imputed net rental income of owner-occupants of nonfarm dwellings; and the royalties received by persons from patents, copyrights, and rights to natural resources. The capital consumption adjustment is described under capital consumption allowances.

Corporate profits with inventory valuation and capital consumption adjustments is the income of corporations organized for profit and of mutual financial institutions that accrues to residents, measured before profits taxes, before deduction of depletion charges, after exclusion of capital gains and losses, and net of dividends received from domestic corporations. In addition to profits earned in domestic operations, corporate profits includes net receipts of dividends and branch profits from abroad. In other major respects, profits are defined in accordance with Federal income tax regulations. The capital consumption adjustment is described under capital consumption allowances.

Profits before tax is corporate profits without inventory valuation and capital consumption adjustments.

Profits tax liability (1-12) is Federal, State, and local taxes on corporate income.

Profits after tax is profits before tax less profits tax liability. *Dividends* (1-14) is payments in cash or other assets, excluding stock, by corporations organized for profit to stockholders who are U.S. persons. *Undistributed profits* (1-15) is corporate profits before tax less corporate profits tax liability and less dividends. It equals the change in corporate net worth stemming from current operations. It may also be viewed as the sum of purchases of fixed assets, the change in the book value of corporate inventories, and the net acquisition of financial assets, less the

sum of capital consumption allowances, net borrowing, and net stock issues.

Inventory valuation adjustment (1-16) is the change in the business inventories component of GNP (CBI), which is measured as the change in the physical volume of inventories valued in prices of the current period, less the change in the value of inventories reported by business (book value). The IVA is required because, according to the inventory accounting methods used by business, the change in book values generally differs from the CBI. Measurement of inventory change as physical volume change valued in prices of the current period conforms its treatment to that of all other components of GNP. An alternative definition of the IVA as the excess of the replacement cost of inventories used up over their historical acquisition cost is often helpful. That this definition is equivalent to the definition stated above follows from the fact that, according to all methods of inventory valuation used by business, inventory purchases in an accounting period are reflected in book values in the prices of that accounting period. To make the measurement of charges against GNP consistent with GNP, the IVA must be applied to reported corporate profits and proprietors' income, because these are based on the same accounting methods that underlie the book value of inventories.

Net interest (1-18) is interest paid by domestic business less interest received by it, plus net interest received from abroad. In addition to monetary interest flows, net interest includes flows of interest in kind (imputed interest). The latter have their counterparts in similar service charges. The portion of the imputed interest flows that is allocated to consumers and government is a component of net interest and the associated service charges are included in PCE and government purchases.

Business transfer payments (1-20) includes corporate gifts to nonprofit institutions and bad debts incurred by consumers. Most of PCE is stated before deduction of consumer bad debts; corporate profits and proprietors' income are stated after allowance for bad debts. Accordingly bad debts have to be entered explicitly among the

charges against GNP. They are entered as a component of businesses transfer payments because, like gifts, they fit into the general category of transfer payments, which are defined as payments to persons for which the latter do not perform current services.

Indirect business tax and nontax liability (1-21) consists of tax liabilities (except employer contributions for social insurance) that are chargeable to business expense in the calculation of profit-type incomes, and of certain other business liabilities to general government that it is convenient to treat like taxes. Indirect business taxes includes sales, excise, and property taxes. Taxes on corporate income are excluded because such taxes cannot be calculated until profits are known, and in that sense, are not a business expense. Nontaxes includes regulatory and inspection fees, special assessments, fines and penalties, rents, and royalties, and donations. Nontaxes generally excludes business purchases from government of goods and services that are similar to business purchases of intermediate products from other businesses. Government receipts from the sale of such products are netted against government purchases so that they do not appear in GNP and other measures of production.

Subsidies less current surplus of government enterprises (1-22). *Subsidies* is the monetary grants paid by government to business, including government enterprises at another level of government. The *current surplus of government enterprises* is their sales receipts less their current outlays. In the calculation of their current surplus, no deduction is made for depreciation charges and net interest paid. Subsidies and current surplus are often combined because government enterprises may incur deficits by selling goods to businesses at lower than market prices in lieu of giving them subsidies. This is also the major reason for not counting the current surplus of government enterprises as a profit-type income and, accordingly, as part of factor charges.

Statistical discrepancy (1-23) is GNP less charges against GNP other than

the statistical discrepancy. It arises because GNP and charges against GNP are estimated independently by a methodology that is subject to error.

Capital consumption allowances with consumption adjustment (1-25). *Capital consumption allowances* consists of depreciation charges and accidental damage to fixed business capital. For non-farm business, they are as reported on Federal income tax returns. For farms, nonprofit institutions, and owner-occupied houses, depreciation charges are not based on income tax returns, but instead are NIP calculations. *Capital consumption adjustment* (1-17) is the tax return-based capital consumption allowances less capital consumption allowances that are based on estimates of economic service lives, straight-line depreciation, and replacement cost.

Personal income and outlay account

Personal income is the income received by persons from all sources, that is, from participation in production, from transfer payments from government and business, and from government interest, which is treated like a transfer payment. Persons consist of individuals, nonprofit institutions, private noninsured welfare funds, and private trust funds. Proprietors' income is treated in its entirety as received by individuals. Life insurance carriers and private noninsured pension funds are not counted as persons, but their saving is credited to persons. Personal income is the sum of wage and salary disbursements, other labor income, proprietors' income, rental income of persons, dividends, personal interest income, and transfer payments, less personal contributions for social insurance.

Disposable personal income is personal income less personal tax and nontax payments. It is the income available to persons for spending or saving.

Wage and salary disbursements (see 1-3).

Other labor income (see 1-7).

Proprietors' income with inventory valuation and capital consumption adjustments (see 1-8).

Rental income of persons with capital consumption adjustment (see 1-9).

Dividends (see 1-14).

Personal interest income is the interest income of persons from all sources. It is the sum of net interest (see 1-18), plus *interest paid by government to persons and business* (2-14) less *interest received by government* (2-15) plus *interest paid by consumers to business* (2-16). The last item consists of all interest paid by individuals in their capacity as consumers, and accordingly excludes interest payments on mortgages and home improvement loans, because homeowners are treated as businesses in the NIPA's. The derivation of personal interest income can be explained as follows. Net interest equals interest paid by producers (that is, business and U.S. residents supplying labor and property services to abroad) to persons and government less interest received by producers from consumers and government. It therefore falls short of interest received by persons from producers by the amount of interest received by producers from consumers and government, and exceeds interest received by persons from producers by the amount of interest received by government from producers. Accordingly, the former is added to net interest, and the latter is deducted, to obtain personal interest income.

Transfer payments to persons is income payments to persons, generally in monetary form, for which they do not render current services. It consists of business transfer payments (see 1-20) and *government transfer payments* (2-19). Government transfer payments include payments under the following programs: Federal old-age, survivors, disability, and hospital insurance; supplementary medical insurance; State unemployment insurance; railroad retirement and unemployment insurance; government retirement; workmen's compensation; veterans, including veterans life insurance; food stamp; black lung; supplemental security income; and direct relief. Government payments to nonprofit institutions, other than for work under research and development contracts, is also included.

Personal contributions for social insurance (2-20) includes payments by employees, self-employed, and other individuals who participate in the fol-

lowing programs: Federal old-age, survivors, disability, and hospital insurance; supplementary medical insurance; State unemployment insurance; railroad retirement insurance; government retirement; and veterans life insurance.

Personal tax and nontax payments (2-1) is tax payments (net of refunds) by persons (except personal contributions for social insurance) that are not chargeable to business expense, and of certain other personal payments to general government that it is convenient to treat like taxes. Personal taxes includes income, estate and gift, and personal property taxes. Nontaxes includes passport fees, fines and penalties, donations, and tuitions and fees paid to schools and hospitals operated mainly by government. Nontaxes generally excludes purchases by persons from government of goods and services that are similar to goods and services purchased by persons from business.

Personal outlays is personal consumption expenditures (see 1-26), interest paid by consumers to business (see 2-16) and *Personal transfer payments to foreigners*, net (2-5). The last item is personal remittances in cash and in kind to abroad less such remittances from abroad.

Personal saving (2-6) is personal income less the sum of personal outlays and personal tax and nontax payments. It is the current saving of individuals (including proprietors), nonprofit institutions, private noninsured welfare funds, and private trust funds. Personal savings equals the change in the net worth of persons, which may also be viewed as the sum of net acquisition of financial assets (such as cash and deposits, securities, and the net equity of individuals in life insurance and in private noninsured pension funds) and physical assets less the sum of net borrowing and of capital consumption allowances.

Government receipts and expenditures account

Personal tax and nontax payments (see 2-1).

Corporate profits tax liability (see 1-12).

Indirect business tax and nontax liability (see 1-21).

Contributions for social insurance (see 1-6 and 2-20).

Purchases of goods and services (see 1-40).

Transfer payments is transfer payments to persons (see 2-19) and *transfer payments to foreigners*, net (3-4). The latter is U.S. Government nonmilitary grants to foreign governments in cash and in kind, and of U.S. Government transfer payments, mainly retirement benefits, to former residents of the United States.

Net interest paid is interest paid by government less interest received by government (see 2-15). The former is interest paid to persons and business (see 2-14) and *interest paid to foreigners* (3-8). Interest paid to foreigners is interest paid by the U.S. Government to foreign businesses, governments, and persons.

Subsidies less current surplus of government enterprises (see 1-22).

Wage accruals less disbursements (see 1-4).

Surplus or deficit (-), national income and product accounts (3-12) is government expenditures less government receipts as defined in the NIPA's. It may also be viewed as the net acquisition of financial assets by general government and government enterprises, and net government purchases of land and of rights to Government-owned land including oil resources.

Foreign transaction account

Imports of goods and services (see 1-39).

Transfer payments to foreigners (see 2-5 and 3-4).

Interest paid by government to foreigners (see 3-8).

Net foreign investment (4-8) is U.S. exports of goods and services and capital grants received by the United States, net (see below), less imports of goods and services by the United States, transfer payments to foreigners (net), and U.S. Government interest paid to foreigners. It may also be viewed as the acquisition of foreign assets by U.S. residents less the acquisition of U.S. assets by foreign residents. It includes the errors and omissions item in the detailed balance of payments accounts.

Exports of goods and services (see 1-38).

Capital grants received by the United States, net (4-2) is mainly the allocation of special drawing rights to the United States.

Gross saving and investment account

Personal saving (see 2-6).

Wage accruals less disbursements (see 1-4).

Undistributed corporate profits with inventory valuation and capital consumption adjustments (see 1-15, 1-16, and 1-17).

Capital consumption allowances with capital consumption adjustment (see 1-25).

Government surplus or deficit (-), national income and product accounts (see 3-12).

Capital grants received by the United States, net (see 4-2).

Statistical discrepancy (see 1-23).

Gross private domestic investment (see 1-30).

Net foreign investment (see 4-8).

Definitions of Sectors

In addition to the breakdown of GNP that appears in the five-account summary of the NIPA's, GNP can be broken down by sectors—business, households and institutions, government, and the rest of the world.

Business consists of all organizations that produce goods and services for sale at a price intended at least to approximate costs of production. In the main, it covers private enterprises organized for profit, both corporate and noncorporate, including farm operators, the independent professions, and lessors of real property. Mutual financial institutions, private noninsured pension funds, cooperatives, nonprofit organizations serving business, Federal Reserve banks, and federally sponsored credit agencies are also included, as well as government enterprises. Owner-occupied dwellings and buildings owned by nonprofit institutions serving individuals are considered to be business establishments selling their current services to their owners.

The business sector accounts for the bulk of GNP, and like GNP, can be measured either in terms of the value of the goods and services it produces or in terms of the costs incurred and the profits earned in its production.

Households and institutions consists of households of families and unrelated individuals; nonprofit institutions serving individuals; private trust funds; and

private noninsured welfare funds. Its production is measured by the compensation of its employees.

Government consists of all Federal and State and local government agencies except government enterprises. Its production is measured by the compensation of its employees.

Rest of the world consists of foreigners as transactors with U.S. residents. Its

production is measured by its net payments of labor and property incomes to the United States.

For some purposes it is useful to have a measure of production that excludes rest-of-the-world production. This is the *gross domestic product*, which is the market value of the goods and services produced by labor and property located in the United States.

ERRATUM

An additional correction to the *U.S. National Income and Product Accounts: Revised Estimates 1976-78*, in the July 1979 SURVEY: In Table 1.1, line 23 (National defense) for the third quarter of 1976 should be 86.2 billion dollars rather than the published 86.3 billion dollars.

A Money Market Model With the Federal Funds Rate as the Endogenous Monetary Policy Variable

FOR the money market model (MMM) presented in this article, the Federal funds rate was chosen as the principal monetary policy variable of the Federal Reserve System (Fed). This choice was made because the Fed used the Federal funds rate as its principal monetary policy variable during the 1970's.¹ The new MMM includes equations showing how the Fed set the Federal funds rate by reference to the unemployment rate, the rate of inflation, and the growth of the money stock,

and how changes in the Federal funds rate cause changes in the other variables of the model. It shows interactions among variables that differ considerably from those shown by the typical MMM, which is constructed as though the Fed used nonborrowed reserves as the principal monetary policy variable. Problems that stem from this construction are not encountered by the new model.

When the new MMM is made part of a complete macroeconomic model, the Federal funds rate and, in turn, the other money market variables of the MMM are determined by changes that are generated by the macroeconomic model. Endogenization of monetary policy responses to these changes significantly alters the properties of a macroeconomic model. For example, estimates of fiscal policy multipliers obtained from the BEA quarterly econometric model, of which the new MMM is a part, are smaller if monetary policy responses are endogenous than if Fed policy variables are set exogenously. This result is likely to hold for macroeconomic models that have a structure similar to that of the BEA model.

NOTE.—Discussions with Charles Sivesind of the Federal Reserve Bank of New York were a great help in preparing this article. Frank de Leeuw, George Green, and the staff of the Business Outlook Division provided useful criticism. Mark Rees and Lincoln Anderson provided expert assistance.

1. Raymond F. Lombra and Raymond G. Torto provide an especially convincing account of Fed behavior in "The Strategy of Monetary Policy," *Economic Review* of the Federal Reserve Bank of Richmond, Sept./Oct. 1975. See also Charles Sivesind, "A Structural Model of Money Stock Determination," Federal Reserve Bank of New York, August 19, 1976, and William Poole, "The Making of Monetary Policy: Description and Analysis," *New England Economic Review*, March/April 1975.

Simplified version of the new MMM.—Table 1 lists the equations of a simplified version of the new MMM, which are presented here to facilitate understanding of the detailed presentation later in this article. The major simplifications are that (1) only the principal explanatory variables are included, (2) the equations are in linear form and do not contain lags, and (3) the money supply consists of currency and one broadly defined type of commercial bank deposit.

To endogenize Fed response, the Federal funds rate is related to three variables that are generally endogenous in econometric models: the unemployment rate, the rate of inflation, and the rate of growth of the money stock. The Federal funds rate responds negatively to the unemployment rate and positively to the rate of inflation and to the rate of growth of the money stock (equation 1).

Equation 2, which exploits the prevalence of arbitrage in the market for short-term securities, relates the 3-month Treasury bill rate to the Federal funds rate. The Treasury bill rate, in turn, is an important variable in equations 3 and 4, which explain rates paid on time deposits at commercial banks and at thrift institutions. Along with per capita GNP and the deflator for GNP, these interest rates are important variables in the demand equation determining the money stock (equation 5). The equation shows that the money stock responds negatively to the Treasury bill rate and the thrift deposit rate and positively to the commercial bank time deposit rate. In equation 6, currency in circulation is related to con-

THE study on which this article is based was completed before the Federal Reserve announced changes in its operating procedures in early October. Starting at that time, a target rate of growth of a member bank reserve aggregate replaced a Federal funds rate target as the principal guide to open market operations. The model described in the article includes an equation determining the Federal funds rate target, but—because there is no history on which to base a similar equation for a growth of reserves target—it does not contain an equation determining that target. Therefore, the change in the Federal Reserve's operating procedures reduces the usefulness of the model in stimulating money market developments. However, despite this unavoidable limitation, because the model was designed to be flexible, it remains a most useful tool for simulating not only the effects of the Federal Reserve's new operating procedures but also the effects of a wide range of its possible procedures. Also, the study provides a useful analysis of the Federal Reserve's behavior in the 1970's. For these reasons, the article is being published although many of its results are based on the Federal Reserve's previous operating procedures.

THE EDITOR-IN-CHIEF

sumer expenditures. In equation 7, required reserves are determined by the money stock, by the share of deposits held by member banks, and by the reserve requirement ratio. Equations 8 and 9 show that banks exactly satisfy reserve requirements with a mix of borrowed and nonborrowed reserves that depends on the relationship between the Federal funds rate and the discount rate. The discount rate is determined by equation 10, which shows that the Fed changes the discount rate when the Federal funds rate changes. Equation 11 is an identity reflecting the Fed balance sheet. It shows that the Fed changes its holdings of Federal debt (i.e., engages in open market operations) to match changes in currency and nonborrowed reserves.

The chain of reactions in the new MMM may be illustrated as follows: Assume that the Federal funds rate is increased initially in response to a change in one or more of the variables that influence the Fed in setting the Federal funds rate. The increase in the Federal funds rate will cause the Treasury bill rate to increase and lead to a reduction of the money stock. This reduction will reduce required reserves and lead to a reduction in desired holdings of nonborrowed and borrowed reserves. Next, the model predicts open market sales of Treasury securities by the Fed sufficient to achieve the reduction in reserves to a level consistent with the increased Federal funds rate that resulted from the assumed change. Of course, because the money stock has been reduced, there will be further changes in the Federal funds rate, which will damp the initial change.

Differences between new and typical MMM.—To throw light on differences between the new and the typical MMM, the new MMM can be restructured (without reestimation) so that it is similar to the typical MMM in that nonborrowed reserves becomes the principal policy variable. In the restructuring, the Federal funds rate equation is eliminated and the equation for nonborrowed reserves is transposed so that the Federal funds rate becomes the dependent variable.²

2. Equation 8 of table 1 would read:

8'. $RFED = (a_8 + b_8)RDIS + d_8RESR - RESNB/c_8$.

Table 1.—Equations for the Simplified Version of the New Money Market Model

1. $RFED = a_1 - b_1UR + c_1\dot{P} + d_1\dot{M}$	7. $RESR = R \cdot RMBD(M - CUR)$
2. $RTB = a_2 + b_2RFED$	8. $RESNB = a_8 + b_8RDIS - c_8RFED + d_8RESR$
3. $RTD = a_3 + b_3RTB + c_3RSL$	9. $RESB = -a_9 - b_9RDIS + c_9RFED + (1 - d_9)RESR$
4. $RSL = a_4 + b_4RTB + c_4RTD$	10. $RDIS = a_{10} + b_{10}RFED$
5. $M/(PGNP \cdot N) = a_5 + b_5GNP/N + c_5RTD - d_5RSL - e_5RTB$	11. $\Delta FRFD = \Delta CUR + \Delta RESNB$
6. $CUR = a_6 + b_6C\$$	

Definitions of Variables

RFED: Federal funds rate	GNP: Real gross national product
UR: Unemployment rate	CUR: Currency in circulation
\dot{P} : Rate of inflation	C\$: Consumption expenditures
\dot{M} : Rate of money stock growth	RESR: Required reserves
RTB: 3-month Treasury bill rate	R: Required reserve ratio
RTD: Rate on small denomination time deposits at commercial banks	RMBD: Share of deposits held by member banks
RSL: Rate on insured time deposits at thrift institutions	RESNB: Nonborrowed reserves
M: Money stock	RDIS: Discount rate
PGNP: Deflator for GNP	RESB: Borrowed reserves
N: Population	FRFD: Fed holdings of Federal debt

In the restructured model, the reserves variable must be set exogenously because, inasmuch as the Fed has not used nonborrowed reserves as its principal policy variable, it is not possible to include an equation that predicts how the Fed would change nonborrowed reserves in response to changing economic conditions. Accordingly, the restructured model exhibits the problems of the typical model. First, the endogenous variables of the typical MMM are subject to errors that stem from errors made in setting nonborrowed reserves exogenously. Second, even if nonborrowed reserves are accurately set, the short-term interest rates predicted by the typical MMM are subject to error. The error stems from the system of reserve requirements—these requirements are fractional, apply only to member banks, and vary according to the size of the bank and the type and maturity of the deposit—and from the inelasticity of the relationship between the money stock and the Treasury bill rate. Given the complexity of the system of reserve requirements, it is difficult to predict changes in the money stock from changes in nonborrowed reserves, and given the inelasticity of the money stock-Treasury bill rate relationship, errors in the money stock result in large errors in short-term interest rates.

The new MMM avoids these problems. First, errors that stem from setting the principal policy variable exogenously are avoided because, as shown in the simplified equations, the

new MMM starts with the Federal funds rate and determines that rate endogenously. Second, the chain of causation built into the typical model is reversed. In the new model, the chain runs from short-term interest rates to the money stock to nonborrowed reserves, and the errors stemming from the system of reserve requirements do not affect predictions of the money stock and short-term interest rates.

Interactions among variables in the new MMM differ considerably from those in the typical model and more reliably represent actual interactions among these variables as long as the Fed follows its policy of controlling the Federal funds rate. Simulations of the effects of changes in reserve requirements and in the discount rate illustrate the major differences.

In a simulation of changes in reserve requirements, the new MMM predicts that these changes have little impact on the Treasury bill rate or on the money stock. This prediction reflects the fact that in the new MMM the Fed validates its desired Federal funds rate by changing the volume of reserves. Accordingly, if a change in reserve requirements tended to alter the Federal funds rate, the effect of such a change on the Federal funds rate, and thus on the Treasury bill rate and on the money stock, would be offset by a change in the volume of reserves. In contrast, in the typical model, with nonborrowed reserves set exogenously, increases in reserve requirements lead to declines in

the money stock and increases in the Treasury bill rate.

In a simulation of changes in the discount rate using the new MMM, changes in the discount rate alter the mix of borrowed and nonborrowed reserves, leaving required reserves, the Treasury bill rate, and the money stock unchanged. In the typical model, changes in the discount rate lead to roughly equivalent changes in the Treasury bill rate.

In the section that follows immediately, evidence is presented that the Federal funds rate was the principal monetary policy variable of the Fed in the 1970's. The next two sections present and evaluate the reliability of the new MMM. The final section presents fiscal policy multipliers that show that the properties of the BEA quarterly econometric model are significantly altered by the endogenization of monetary policy responses.

Fed policy variable during the 1970's

This section identifies the principal monetary policy variable used by the Fed to guide open market operations during the 1970's. By policy variable is meant the monetary variable the Fed controls to attain its goals. Presumably the principal policy variable is one of the three—growth of reserves, growth of the money stock, and the Federal funds rate—for which the Fed publishes "target" ranges. For the variables that are not the principal policy variable, the target ranges are predic-

tions consistent with the achievement of the target for the principal policy variable, and like all predictions, are subject to error, especially in turbulent years.

Table 2 is an adaptation of a table used by Raymond E. Lombra and Raymond G. Torto.³ The table shows 2-month "target ranges" set at Federal Open Market Committee Meetings in 1974 for the growth of the money stock, the growth of reserves, and the Federal funds rate as well as actual values for these variables. The growth of reserves and the growth of the money stock often fell well outside the target range, and the Federal funds rate generally fell well within the target range. It can be concluded that the growth of reserves was not the principal policy variable, because it often fell outside the target range even though it is easy to control. Inasmuch as the growth of the money stock is difficult to control, it cannot yet be ruled out as the principal policy variable simply because it often fell outside the target range. The Federal funds rate appears to be the principal policy variable because it generally fell within the target range and, if the growth of the money stock had been the principal policy variable, it would have been difficult to predict the Federal funds rate over the substantial range in which it varied in 1974.

Information for later periods confirms these conclusions. The actual values for the Federal funds rate generally con-

tinued to fall within the target range.⁴ Of course, it was easier to make accurate predictions for these periods, and accordingly, the actual values for the growth of the money stock and for reserves fell more often within the target range than in 1974.

It still could be argued that growth of the money stock was the principal policy variable, but that the Fed attempted to achieve its targets over periods longer than 2 months, e.g., four quarters. However, this view is not supported by the data. Since 1975, when the Fed began publishing four-quarter target ranges for M1 and M2 growth, the actual values often fell outside the target range. For example, during 1976-77, actual values for M1 and M2 growth were within the target ranges set during 1975 and 1976 in only 50 percent of the cases.

The equations of the money market model

This section presents the new MMM. The equations are presented and discussed in the following order: Federal funds rate; Treasury bill rate and time deposit interest rates; monetary aggregates; and bank reserves, discount rate, and Fed balance sheet. The discussion covers specification and statistical tests of the equations.

Federal funds rate.—Evidence has been presented that the Fed used the

4. For example, in 1976 the actual value of the Federal funds rate was always within the target range. See Alan R. Holmes and Peter D. Sternlight, "The Implementation of Monetary Policy in 1976," *Federal Reserve Bank of New York Quarterly Review*, Spring 1977.

3. "Strategy of Monetary Policy."

Table 2.—Two-Month Target Ranges and Actual Values for Key Monetary Variables in 1974

Date of Federal Open Market Committee Meeting	Growth of money stock (M1) (seas. adj. annual rate)		Growth of reserves available to support private deposits (seas. adj. annual rate)		Federal funds rate (percent) ²

 2. Target range and actual value apply to statement week averages during inter-meeting period.
 3. Upper limit of range raised between meetings to figure shown.
 4. Lower limit of range lowered between meetings to figure shown.

NOTE.—Actuals for the money stock and reserves do not reflect benchmark revisions or revisions in the seasonal factors made following the period to which data relate.

Source: Adapted from Raymond E. Lombra and Raymond G. Torto, "The Strategy of Monetary Policy," *Economic Review* of the Federal Reserve Bank of Richmond, Sept./Oct. 1975.

Federal funds rate as its principal policy variable during the 1970's. In setting the Federal funds rate, high employment and domestic price stability were the major goals that the Fed sought to attain. However, because monetary policy is believed to affect these goals not only via interest rates but also via the money stock, the Fed, in setting the Federal funds rate, also took the growth of the money stock into consideration.⁵ Accordingly, Fed behavior during the 1970's can be modeled using unemployment, domestic price stability, and money stock growth to explain the Federal funds rate. Usually the Fed increased the Federal funds rate when unemployment decreased, when the rate of inflation increased, and when the rate of growth of the money stock increased; usually it decreased the Federal funds rate when these variables moved in the other direction. The way in which these relationships are specified and estimated is explained below.

To obtain the coefficient estimates for the equations of the MMM, including the Federal funds rate equation, the iterative instrumental variables (IIV) technique was used to deal with the problem of simultaneous equations bias.⁶ This problem was present because, as can be recalled from the discussion of the simplified version of the MMM, several endogenous variables appear as explanatory variables in other equations of the MMM.

Techniques that deal with simultaneous equations bias involve the construction of instrumental variables. Because of its volatility, construction of such a variable for money stock growth to be used in the Federal funds rate equation is difficult. Two-stage least squares technique would be inadequate because the instrumental

variable, which is constructed under this technique by linear regression on exogenous and predetermined variables, would be inefficient and unlikely to yield satisfactory results in a second-stage regression. The IIV technique used the money stock equations of the MMM to build an instrumental variable for money stock growth that provides more efficient estimates of the coefficients, in addition to reducing simultaneous equations bias. The IIV technique also increased the efficiency—relative to the two-stage least squares technique—of the coefficient estimates in the other equations of the MMM to which it was applied to build instrumental variable for short-term interest rates and other volatile endogenous explanatory variables.

The Federal funds rate equation is presented in table 3.⁷ The unemployment variable was measured by the gap between the actual unemployment rate and the "high-employment" unemployment rate. The latter was set at 4 percent through 1974 and increased to 4.5 percent in 1975:1 and to 5 percent in 1975:2. Of course, the unemployment rate compatible with price stability had in fact increased more gradually, reflecting increasing labor force participation of groups that experience relatively high unemployment rates as well as other factors. Increases were not introduced into the equation, however, until 1975, on the assumption that there was a lag in policymakers' recognition of the increases.⁸ The domestic price stability variable is measured by a distributed lag of past actual rates of inflation, which is a proxy for the expected rate of inflation. The price index used to calculate this proxy was the implicit price deflator for GNP. A Pascal lag structure was used to ensure that any rate of inflation, if maintained, will

Table 3.—Equation for Federal Funds Rate¹

$$\begin{aligned} \text{RFED} = & -3.61 - 2.24(\text{UR}-\text{URF}) + \\ & \begin{matrix} (4.9) & (5.6) \\ 1.18 & \text{PEXP} + 0.336 \text{MIG} + \\ (4.5) & (3.5) \\ 0.515 & \text{RFED}_{t-1} \\ (4.7) & \end{matrix} \\ \bar{R}^2 = & 0.907, \bar{S} = 0.786, 1970:1-1976:4^2 \end{aligned}$$

Definitions of Variables

- RFED: Federal funds rate (percent)
 UR-URF: Deviation of unemployment rate from "high employment" unemployment rate (percent)
 UR: Unemployment rate (percent)
 URF: "High employment" unemployment rate, equal to 4.0 before 1975, 4.5 in 1975:1, 5.0 after 1975:1 (percent)
 If UR were less than URF, zero would be entered for (UR-URF)
 MIG: Growth rate of M1 over two quarters less 6.0 (percent): $(2(M1_{t-2})/M1_{t-2} - 0.0591) 100$
 PEXP: A distributed lag proxy for the expected rate of price change (percent): $1.4 \text{PEXP}_{t-1} - .49 \text{PEXP}_{t-2} + .09 \text{PDOT}$
 PDOT: $400(\text{PGNP} - \text{PGNP}_{t-1})/\text{PGNP}_{t-1}$
 PGNP: Implicit price deflator for GNP

1. Because a lagged dependent variable is present in the Federal funds rate equation, a correction for autocorrelation was attempted but not used because the estimated parameter for the lagged error term (U_{t-1}) was insignificantly different from zero.

2. The sample period begins in 1970:1, because it was about that time that the Fed gave increased weight to money stock growth (specifically M1 growth) in determining the target for the Federal funds rate.

NOTE.—In table 3-6, t-ratios are given in parentheses below coefficient estimates. Adjusted R^2 , the standard error (\bar{S}), the Durbin-Watson statistic (D/W), and the sample period are presented. (The D/W statistic is inapplicable and therefore omitted when equations include a lagged dependent variable but do not include a correction for serial correlation.) In equations that incorporate a correction for first-order autocorrelation, U_{t-1} indicates a lagged error term.

cause the expectations variable to approach the actual rate. The variable for the growth of the money stock was measured by the deviation of M1 growth over two quarters from a target rate of growth. A 6-percent rate of growth—a rate close to the average growth rate in the sample period—was used for this target; use of any particular rate affects only the value of the constant term in the equation.⁹

9. Sivesind, "Money Stock Determination," developed a monthly rate-setting equation similar to the equation developed here.

Ray Fair, in a Cowles Foundation discussion paper entitled "The Sensitivity of Fiscal Policy Effects to Assumptions about the Behavior of the Federal Reserve," also comes to the conclusion that short-term interest rates responded positively to money stock growth and the rate of inflation.

5. Economic growth is a Fed goal also, but it was not listed separately, because its relationship to the high employment goal is very close. No reference is made to exchange rates, even though they are frequently mentioned by the Fed in explaining its policies, because the relationship between domestic price stability and exchange rates is close.

6. The IIV technique used was suggested by Herman Wold, "Nonlinear Estimation by Iterative Least Squares," *Research Papers in Statistics*, F. N. David, ed., John Wiley and Sons, 1966. In Wold's technique, model solution values for the endogenous variables are used directly as regressors. His technique differs from the one discussed by M. Dutta and E. Lyttkens, in "Iterative Instrumental Variables Methods and Estimation of a Large Simultaneous System," *Journal of the American Statistical Association*, vol. 60, 348.

7. A lagged dependent variable was used in many of the equations of the model. Use of a lagged dependent variable causes the dependent variable to respond to changes in the explanatory variables with a distributed lag. In these equations, the coefficient of an explanatory variable measures the initial-period response of the dependent variable to changes in the explanatory variable. If the coefficient of the lagged dependent variable is c and the coefficient of another explanatory variable is b, the permanent response of the dependent variable to a sustained change in the explanatory variable is $b/(1-c)$.

8. The Council of Economic Advisers upped its estimate of the "high employment" unemployment rate from 4 percent to 4.9 percent in its January 1977 report.

$$DD = M1 - CURR$$

Definitions of Variables

N: Population (millions of persons)	TIME: Time trend, 1955:1 = .01
GNP: Gross national product (billions of 1972 dollars)	CURR: Currency in circulation
RTBR: Regulation Q effect (see text)	C\$: Personal consumption expenditures
U: Error term	DD: Demand deposits.
TD: Time deposit component of M2	

1. Monetary aggregates are as defined by the Fed.

NOTE.—Equations for the monetary aggregates are usually specified in linear logarithmic form because they include as explanatory variables both interest rates, which do not trend over time, and other variables—e.g., the money stock, GNP, the implicit price deflator for GNP, and population—that do trend.

Instrumental variables were used for all current-period explanatory variables (including M2 in the TD equation) except GNP, N, and TIME.

During the 1970's, the Federal funds rate was extremely volatile. For example, from early 1972 to late 1973 it increased 6.5 percentage points, and from 1974:3 to 1975:1 it dropped 6.8 percentage points. Despite this volatility, the fit of the Federal funds rate equation, as summarized by its adjusted R^2 seems acceptable.¹⁰ Each coefficient has the appropriate sign and, judged by its t-ratio, is statistically significant. The size of these coefficients show that, in setting the Federal funds rate, the Fed responded actively to each of the explanatory variables.

Although the Federal funds rate equation fits well within the sample period, it is a linear approximation to a more complex relationship. For example, it would be unreasonable to expect—as the equation predicts—that the Fed will change the Federal funds rate proportionately to changes in the unemployment rate if that rate exceeded, say, 9 percent. Use of the equation to predict or simulate Fed policy should therefore be confined to values of the explanatory variables that are close to the range of values observed in the sample period.¹¹

Treasury bill and time deposit interest rates.—The equations for the interest rates on 3-month Treasury bills, small denomination time deposits at commercial banks, and time deposits at savings and loan associations are presented in table 4. The equation for the Treasury bill rate will be discussed in

10. The fit of an equation using the same variables to explain the growth of nonborrowed reserves was much poorer.

$$RESNB/RESNB_{t-1} = 0.24 - .003 (UR - URF) - 0.105 MIG_{t-1}$$

(0.8) (0.3) (0.4)

$$- 0.001 PEXP$$

(0.2)

$$+ 0.334 RESNB_{t-1} / RESNB_{t-2} + 0.257 U_{t-1}$$

(1.7)

$$\bar{R}^2 = .182, \bar{S} = 1.75, 1970:1-1976:4$$

RESNB: nonborrowed reserves
 U_{t-1} : a lagged error term

11. To avoid "data mining" given the shortness of the sample period, the linear logarithmic form was the only alternative functional form tried. The linear form was chosen even though in the logarithmic form also each explanatory variable had the appropriate sign and was statistically significant. After the study was completed, a form using a logistic function for the unemployment term was found that reduces the Fed's marginal response to the unemployment rate gap at both high and low values of the gap. Although this function does not result in a superior fit, it copes better with extreme values for the goal variables.

some detail because this equation links the Federal funds rate with the other equations of the MMM and because it differs from the type of equation used to explain the Treasury bill rate in the typical model.¹²

The close relationship between the Federal funds rate and the Treasury bill rate can be used to establish the link between the Federal funds rate and the remainder of the model. The closeness of the relationship between these two rates is due to arbitrage by banks. Banks can lend without risk in the Federal funds market, usually for a one-day period, or they can purchase Treasury bills, which are subject to capital gains and losses. Arbitrage tends to equalize the Federal funds rate and the one-day-holding-period yield expected on Treasury bills.

In addition to the Federal funds rate, the Treasury bill rate equation includes two variables designed to measure expected changes in the Treasury bill rate. The first expectations variable is the difference between the current Federal funds rate and a cumulative average of its past values. This expectations variable is based on the well-known regressive expectations hypothesis.¹³ If the Federal funds rate is high relative to its historical average, market participants will tend to feel that the Fed is more likely to decrease than increase the Federal funds rate over the near term. The further the Federal funds rate is from its historical average, the more certain this expectation becomes. The equation, accordingly, incorporates the squared value of the difference with its sign preserved. This difference should be negatively related to the Treasury bill rate.

The second expectations variable is the ratio of the combined Federal and State and local government surpluses to gross national product. This ratio measures the expected impact of government financing requirements, and should be negatively related to the Treasury bill rate.

12. In such models, equations for the Treasury bill rate usually are expanded versions of the type of equation discussed in footnote 2, with the Treasury bill rate replacing the Federal funds rate as the dependent variable.

Definitions of Variables

RESNB: Federal Reserve System member bank reserves—nonborrowed	REST: Federal Reserve System member bank reserves—total
RDIS: Federal Reserve System discount rate	RESE: Federal Reserve System member bank reserves—excess
RESR: Federal Reserve System member bank reserves—required	RESF: Federal Reserve System member bank reserves—free
RESB: Federal Reserve System member bank reserves—borrowed	FRFD: Federal Reserve System holdings of Federal debt
RMBD: The portion of demand deposits held by Federal Reserve System member banks	FRPC: Federal Reserve System paid capital
RRD: The effective required reserve ratio for member bank demand deposits	TRCURRE: Treasury liabilities included in CURR (coins)
RMBT: The portion of time deposits held by Federal Reserve System member banks	TRCDFR: Treasury cash and deposits at Federal Reserve banks
RRT: The effective required reserve ratio for member bank time deposits	TRGOLD: Book value of Federal gold stock ²
TDT: Total time deposits at commercial banks	FRONA: Federal Reserve System other net assets

1. G1 if G1 has the same sign this quarter and last quarter. 0 if G1 has the opposite sign this quarter and last quarter.
2. The Treasury has issued gold certificates to the Federal Reserve in exchange for Federal Reserve notes. The value of the certificates is almost exactly the same as the book value of the Federal gold stock.

As shown in table 4, the t-ratio obtained for the coefficient of the Federal funds rate is exceptionally high and the coefficients of the expectations variables have appropriate signs. The overall fit of the equation is good, despite the wide fluctuations in the Treasury bill rate during the sample period. The absence of significant autocorrelation in the error terms, as indicated by the Durbin-Watson statistic, is an encouraging sign that important explanatory variables have not been omitted.¹⁴

The equations for the interest rates on small denomination time deposits at commercial banks and on time deposits at savings and loan associations utilize a methodology similar to that used by

Gary Fromm and Allen Sinai.¹⁵ Dummy variables are set by comparing the deposit rates with the relevant weighted average of the respective ceiling interest rates.¹⁶ These dummy variables are used

14. The equation for the Treasury bill rate has a short sample period. When the Treasury bill rate is used as an explanatory variable in equations with longer sample periods, an instrumental variable for the Treasury bill rate based on exogenous and predetermined variables was used for the part of the sample period that precedes the sample period for the Treasury bill rate and the IIV instrumental variable was used thereafter.

15. "A Policy Simulation Model of Deposit Flows, Mortgage Sector Activity, and Housing," December 1974, Economic Society Meeting.

16. If the gap between the commercial bank time deposit rate and its ceiling rate is less than 0.20 percentage points, DUMA is set equal to zero, otherwise it is set equal to 1.0. In the equation for the rate on savings and loan time deposits, DUMB is set in a similar manner, but using 0.22 as the cutoff percentage. The cutoff percentages for DUMA and DUMB were determined prior to the application of the IIV technique.

to separate periods in which rate ceilings were constraining factors.

The equations show that during periods when the time deposit rate was below the ceiling rate, the time deposit rate responded to changes in the Treasury bill rate, which measures the rate of return banks can easily earn on marginal additions to their portfolios. Also, because the Fed has often increased the ceiling rate just before actual rates reached it, changes in the ceiling rate were found to be related to the time deposit rate.

The rate on savings and loan deposits responded to changes in the mortgage interest rate, which is a good measure of the rate of return on additions to savings and loan portfolios. These deposit rates responded also to increases in the commercial bank rate, because savings and loan associations attempt to prevent deposit outflows to commercial banks.¹⁷

Monetary aggregates.—The basic equation for the monetary aggregates is for M2 because, during 1975 and 1976, equations for M1 commonly overpredicted badly but equations for M2 fit acceptably well (table 5).¹⁸ To determine M1, a variable in the equations for the Federal funds rate, an equation modeling the share of M2 held as small denomination time deposits at commercial banks was used in conjunction with an identity.

The equations show that holdings of real M2 per capita responded positively to real per capita GNP and the commercial bank time deposit rate and that they responded negatively to the Treasury bill rate and the time deposit rate at savings and loan associations, which measure the opportunity cost of holding commercial bank deposits.¹⁹ In addition,

17. In deriving the coefficients, the mortgage interest rate was treated as endogenous. This treatment necessitated the inclusion of equations for the corporate bond rate and the 4-6 month commercial paper rate in the estimation procedure. These equations are not part of the MMM, and are not included in table 4.

18. See Stephen M. Goldfeld, "The Case of the Missing Money," *Brookings Papers on Economic Activity*, vol. 3, 1976.

19. Because the distribution of wealth is skewed relative to the distribution of income, an increase in per capita GNP is expected to lead to a more than proportionate increase in wealth and therefore in M2, which is a form in which wealth is held. The equation for M2 is specified in per capita terms so that only increases in real GNP that are associated with increases in per capita real GNP cause real M2 to increase more than proportionately; increases in real GNP that are not associated with per capita increases cause real M2 to increase proportionately. Increases in the price level of GNP are assumed to increase M2 proportionately.

3	3.26	8.50	8.67
4	5.60	13.48	16.85

1. Midpoints of 4-quarter target ranges.

Demand deposits are determined by an identity that uses M1 and currency.

Bank reserves, discount rate, and Fed balance sheet.—The first two equations in table 6 show that banks minimize costs by holding a larger share of reserve requirements as borrowed reserves when the Federal funds rate is high relative to the discount rate than when it is low. The discount rate is determined by an equation that shows that the Fed changes the discount rate if recent changes of the Federal funds rate have opened a substantial gap between the two rates.

Identities for the remaining bank reserve aggregates and for the Fed balance sheet complete the list of equations. It is important to include the latter identity in an MMM, because it shows Fed holdings of Federal debt. Profits earned from interest on these holdings, unlike interest receipts on other holdings, are returned in toto to the Treasury, and therefore do not result in disposable income to the private sectors of the economy.²¹

Reliability of the money market model

Due to the presence of lagged dependent variables and quantitatively important simultaneous feedback among equations, regression results for single equations do not provide adequate information to judge the reliability of the MMM. Dynamic simulations of the model provide important additional evidence of its reliability. The results of such simulations are presented in this section.

The first set of simulations was designed to test the model's accuracy within the sample period. The simulations, performed over the 1971:1-1976:4 period, varied in length from one quarter to eight quarters. All possible simulations of each length were performed. Error characteristics for these simulations are presented in table 7.

Overall, the simulations were accurate. The model tended to produce small overestimates for the monetary aggregate.

21. See Lincoln Anderson and Russell Sheldon, "An Econometric Specification of the Federal Government Budget Financing Constraint," Sept. 25, 1979, an unpublished BEA paper.

tion, the equation for M2 includes a variable to capture the interaction between the Treasury bill rate and ceilings on the small denomination time deposit rate.²⁰

20. This variable, RTBR, was defined as follows: RTBR equals the ratio of the Treasury bill rate to the ceiling rate on small denomination time deposits at commercial banks if the Treasury bill rate exceeds the ceiling rate, otherwise RTBR equals 1. When RTBR exceeds 1, there should be a tendency toward disintermediation to which banks cannot respond by increasing deposit rates. The elasticity of M2 with respect to the Treasury bill rate should be larger when ceilings inhibit rate responses by banks, and the results obtained support this hypothesis.

The equation for time deposits shows that the share of time deposits in a given level of M2 decreases when the opportunity cost rates increase and that it increases when the commercial bank time deposit rate increases. These results imply that M1 is less sensitive to interest rates than is time deposits.

The equation for currency, which is necessary to determine the component of M1 subject to reserve requirements, was taken from the 1976 version of the BEA quarterly econometric model.

gates, and the average overestimate increased only gradually as the length of the simulation was increased. It tended to produce gradually increasing underestimates for the rate on savings and loan deposits, but the average underestimate was very small. It showed no consistent tendency to over- or underestimate either the commercial bank time deposit rate or the Treasury bill rate, nor did the root mean square error or mean absolute error indicate deterioration after the one-quarter simulation.

In order to gauge the maximum accuracy that the model could produce if the money stock were used as the principal monetary policy variable, the M2 equation was transposed so that the Treasury bill rate became the dependent variable, and the equation was simulated with all explanatory variables held at actual values. The root mean square errors and mean absolute errors were 0.87 and 0.71, respectively. These statistics are much larger than those for the Treasury bill rate shown in table 7. If nonborrowed reserves were used as the principal monetary policy variable, errors could be expected to be even larger because they would include errors that stem from linking nonborrowed reserves to M2.

To evaluate the extent to which the equation for the Federal funds rate is the source of the simulation errors shown in table 7, similar simulations were performed with the Federal funds rate set exogenously at actual values. The results are presented in table 8. A comparison of tables 7 and 8 shows that the simulations for the money stock aggregates performed better when the Federal funds rate was endogenous. The better performance is due to the fact that, with the Federal funds rate endogenous, errors in money stock growth rates produce changes in the Federal funds rate that reduce the size of the errors. With the Federal funds rate exogenous, this type of feedback is absent and—at least in this simulation—the effect of its absence more than offset the effect of the increased accuracy in the simulated value of the Treasury bill rate that was due to the exogenization of the Federal funds rate.

For the Treasury bill rate, the decrease in mean absolute error was quite small—about 20 to 25 basis points. Results for the rates on savings and loan deposits and on commercial bank time deposits were not appreciably affected. Although these results are based on simulations within the sample period, the fact that the model's accuracy was not appreciably increased by the use of actual values for the Federal funds rate is an encouraging sign.

As a final test within the sample period, the model was simulated with the Federal funds rate endogenous over the entire 1971:1–1976:4 period. The results of this test are presented in table 9. For a model with quantitatively important lagged dependent variables and strong simultaneous feedback, a simulation of this length is a rigorous test. The model performed well, showing a strong tendency to resist deterioration in accuracy.

Simulations outside the sample period were performed to evaluate the accuracy of the Federal funds rate equation. Simulations were performed using the Federal funds rate equation and, for purposes of comparison, using an equation for the Treasury bill rate obtained by transposing the M2 equation.²² In each case the BEA quarterly econometric model with the MMM was used to produce five simulations, each four quarters in length over the 1977:1–1978:4 period. Single equation errors were used to adjust each equation of the BEA model, except the Federal funds rate equation in one case, and the transposed equation for the Treasury bill rate in the others, so that the model would track actual values if the two equations accurately predicted their dependent variables.²³ Thus, all errors in these simulations stem from errors in the prediction of these dependent variables. Table 10 presents root mean square errors for the Treasury bill rate and for gross national product, calculated for

22. In addition to the transposition of the M2 equation, two further steps were needed to provide a consistent model: The Federal funds rate equation was eliminated, and the equation for the Treasury bill rate (the first equation in table 4) was transposed so that it determined the Federal funds rate.

23. The existence of rounding in published data prevents the model from exactly tracking actual values. A base solution of the model that differs from actual values only due to rounding was used to calculate errors.

Table 11.—Multipliers for Real GNP

Quarters after \$1 billion increase in nondefense Federal purchases	Endogenous monetary policy variable	Exogenous monetary policy variable		
	Federal funds rate (1)	Federal funds rate (2)	Non-borrowed reserves (3)	M2 (4)
0.....	1.03	1.05	1.05	1.04
1.....	1.80	1.88	1.86	1.86
2.....	2.07	2.25	2.17	2.18
3.....	2.06	2.36	2.18	2.20
4.....	1.93	2.36	2.05	2.10
5.....	1.60	2.16	1.73	1.79
6.....	1.20	1.91	1.39	1.44
7.....	.79	1.67	1.05	1.08
8.....	.46	1.53	.79	.81

one, two, three, and four quarters from each jumpoff quarter of the simulations. Column 1 presents these results for the Federal funds rate equation; and columns 2 and 3 presents these results for the Treasury bill rate equation, with M2 set at actual values and at the midpoints of the Fed's four-quarter target ranges, respectively. The table shows that the simulations were more accurate when the Federal funds rate equation was used than when the transposed M2 equation was used to predict the Treasury bill rate, using either actual values or target values for M2.

Impact of the money market model on properties of the BEA model

The properties of a model can be summarized by multipliers, which measure the change in endogenous variables of the economic system that are induced by a change in an exogenous variable.²⁴ Multipliers for a sustained \$1 billion increase in nondefense Federal purchases are used to show the impact of the endogenization of monetary policy on the properties of the BEA model.

In table 11, multipliers are shown for the quarter of the increases in purchases and for eight quarters thereafter. Column 1 shows the multipliers for GNP when the Federal funds rate is endogenous. Columns 2–4 show the multipliers when a monetary policy variable—the Federal funds rate, nonborrowed reserves, or M2, respectively—is set exog-

24. See Albert A. Hirsch, "Policy Multipliers in the BEA Quarterly Econometric Model," *SURVEY OF CURRENT BUSINESS*, June 1977.

enously at actual values.²⁵ As can be seen from the table, the multipliers are smallest when the Federal fund rate is endogenous and largest when it is set exogenously. The difference between the two sets of multipliers is due to the fact that when the Federal funds rate

25. For the modifications of the model necessary to treat M2 as the principal policy variable, see p. 43 and footnote 22. To treat nonborrowed reserves as the principal policy variable, the first equation in table 6 is transposed so that it predicts the Federal funds rate and the equation for the Federal funds rate is eliminated.

is set exogenously the initial increase in government purchases is not allowed to increase the Federal funds rate. If the Federal funds rate is not allowed to increase, its effect on other interest rates and hence on final demand will be absent even though a reduction in unemployment, an increase in inflation, and an acceleration of money stock growth are likely to be associated with the increase in government purchases. The multipliers when M2 and nonborrowed reserves are set exogenously

are very similar to each other and smaller than when the Federal funds rate is set exogenously, but they are larger than when the Federal funds rate is endogenous. Their smaller size, relative to multipliers when the Federal funds rate is set exogenously, is traceable to the fact that when nonborrowed reserves or M2 is set exogenously, interest rates must be higher to offset the increased demand for money that is generated by the increase in government purchases.

CURRENT BUSINESS STATISTICS

THE STATISTICS here update series published in the 1977 edition of BUSINESS STATISTICS, biennial statistical supplement to the SURVEY OF CURRENT BUSINESS. That volume (available from the Superintendent of Documents for \$6.25) provides a description of each series, references to sources of earlier figures, and historical data as follows: For all series, monthly or quarterly, 1973 through 1976 (1966-76 for major quarterly series), annually, 1947-76; for selected series, monthly or quarterly, 1947-76 (where available).

The sources of the data are given in the 1977 edition of BUSINESS STATISTICS; they appear in the main descriptive note for each series, and are also listed alphabetically on pages 181-182. Statistics originating in Government agencies are not copyrighted and may be reprinted freely. Data from private sources are provided through the courtesy of the compilers, and are subject to their copyrights.

Unless otherwise stated in footnotes below, data through 1976 and descriptive notes are as shown in the 1977 edition of BUSINESS STATISTICS	1976	1977	1978	1976	1977				1978				1979

FOOTNOTES FOR PAGES S-1 THROUGH S-36

General Notes for all Pages:

- r Revised.
- p Preliminary.
- e Estimated.
- c Corrected.

Page S-1

1. Estimates (corrected for systematic biases) for July-Sept. 1979 and Oct.-Dec. 1979 based on expected expenditures of business. Expected expenditures for the year 1979 appear on p. 18 of the Sept. 1979 SURVEY.
2. Includes communication.
 - *. Data for the individual durable and nondurable goods industries appear in the Mar., June, Sept., and Dec. issues of the SURVEY.

Page S-2

- †. Revised series. Estimates of personal income have been revised back to 1975; revisions prior to May 1978 are on p. 36 of the July 1979 SURVEY.
- ‡. Includes inventory valuation and capital consumption adjustments.
- #. Includes data for items not shown separately.
- *. Revised data back to 1976 will be shown in the 1979 BUSINESS STATISTICS.

Page S-3

1. Based on data not seasonally adjusted.
 - *. See note "¶" for p. S-2.
 - #. Includes data not shown separately.
 - †. See note "†" for p. S-4.
 - *. New series. Data back to 1967 available from BEA.

Page S-4

1. Advance estimate; total manufacturers' shipments for Sept. 1979 do not reflect revisions for the selected components.
 - †. Revised series. Data revised back to 1958 to reflect (1) benchmarking of shipments and inventories to the 1974, 1975, and 1976 Annual Surveys of Manufacturers, (2) recalculation of new orders estimates, and (3) updating of the seasonal factors. A detailed description of this revision and historical data appear in reports "Manufacturers' Shipments, Inventories, and Orders" M3-1.7 (1958-1977) and M3-1.8 (1967-1978), available from the Bureau of the Census, Washington, D.C. 20233.
 - *. New series. Data back to 1967 available from BEA.
 - #. Includes data for items not shown separately.

Page S-5

1. Advance estimate; total manufacturers' new and unfilled orders for Sept. 1979 do not reflect revisions for the selected components.
 - †. See similar note for p. S-4.
 - #. Includes data for items not shown separately.
 - ‡. Includes textile mill products, leather and products, paper and allied products, and printing and publishing industries; unfilled orders for other nondurable goods industries are zero.
 - *. For these industries (food and kindred products, tobacco, apparel and other textile products, petroleum and coal, chemicals and allied products, and rubber and plastics products) sales are considered equal to new orders.

Page S-6

1. Based on unadjusted data.
2. Beginning Jan. 1978, includes TV and sound equipment and repairs formerly in "health and recreation."
3. Beginning Jan. 1978, residential.
4. Beginning Jan. 1978, includes additional items not previously priced.
5. Includes bottled gas.
 - ‡. Compiled by Dun & Bradstreet, Inc.
 - #. Includes data for items not shown separately.
 - §. Ratio of prices received to prices paid (parity index).
 - *. Data through 1977 are for urban wage earners and clerical workers; beginning Jan. 1978, there are two indexes, all wage earners and clerical workers, revised (CPI-W), and all urban consumers (CPI-U). These indexes reflect improved pricing methods, updated expenditure patterns, etc.; complete details are available from the Bureau of Labor Statistics, Washington, D.C. 20212.
 - *. New series. Earlier data available from BLS.
 - †. Beginning Jan. 1978, CPI-U.

Page S-7

1. Annual average computed by BEA.
 - §. For actual producer prices of individual commodities see respective commodities in the Industry section beginning p. S-22. All data subject to revision four months after original publication.
 - #. Includes data for items not shown separately.
 - ‡. Beginning Mar. 1979 SURVEY, data have been revised (back to 1967) to reflect new seasonal factors.

Page S-8

1. Computed from cumulative valuation total.
2. Data are no longer available; 1978 annual represents Jan.-July.
3. Based on a sample of 14,000 permit-issuing places.
 - *. Beginning Jan. 1979 SURVEY, monthly and annual data have been restated to reflect the purchasing power of the dollar as measured by finished goods; comparable data for periods prior to November 1977 will be shown in the 1979 BUSINESS STATISTICS.
 - ‡. Beginning Jan. 1978, based on CPI-U; see note "¶" for p. S-6.
 - #. Includes data for items not shown separately.
 - §. Data for Aug., Nov. 1978, March, May, and Aug. 1979 are for five weeks; other months four weeks.
 - @. Data for new construction have been revised back to Jan. 1975 and are available from the Bureau of the Census, Washington, D.C. 20233.
 - @@. Monthly revisions back to Jan. 1975 will be shown in the 1979 BUSINESS STATISTICS.
 - ‡‡. This index has been revised to a new comparison base (1972=100); monthly data back to Jan. 1970 are available upon request.

Page S-9

1. Index as of Oct. 1, 1979; building, 281.1; construction, 290.6.
2. Effective Dec. 1978, data are no longer available; annual total represents Jan.-Nov. 1978.
 - #. Includes data for items not shown separately.
 - *. Home mortgage rates (conventional first mortgages) are under money and interest rates on p. S-15.
 - §. Data include guaranteed direct loans sold.
 - ‡. Source: Media Records, Inc. 64-City Newspaper Advertising Trend Chart.
 - @. These indexes are restated on the 1972=100 base; monthly data back to 1972 will be shown in the 1979 BUSINESS STATISTICS.

Page S-10

1. Advance estimate.
2. Comparable data for periods prior to May 1977 are not available.
 - †. Effective April 1979 SURVEY, data have been revised back to Jan. 1967; revisions for earlier periods as well as a summary of the changes, are available from the Census Bureau, Washington, D.C. 20233.
 - #. Includes data for items not shown separately.
 - §. Includes sales of mail-order catalog desks within department stores of mail-order firms.

Page S-11

1. As of July 1.
 - #. Includes data for items not shown separately.
 - ‡. Revisions for July 1976-Mar. 1978 appear in "Populations: Estimates of the Population of the United States and Components of Change—1940-79," P-25 No. 802 (June 1979), Bureau of the Census.
 - †. Effective Oct. 1979 SURVEY, data have been revised based on March 1978 benchmark levels and updated seasonal adjustment factors; effective Oct. 1978 SURVEY, data have been revised to conform to the 1972 SIC and adjusted to March 1977 benchmark levels, therefore, data are not strictly comparable with earlier periods. See "BLS Establishment Estimates Revised to Reflect New Benchmark Levels and 1972 SIC," in Oct. 1979 and Oct. 1978 Employment and Earnings.

Page S-12

- †. See corresponding note on p. S-11.
- §. Effective October 1978 SURVEY, includes data formerly shown separately under ordnance and accessories.
 - @. Formerly shown as Electrical equipment and supplies.
 - *. Production and nonsupervisory workers.

Page S-13

- †. See note "†" on p. S-11.
- §. See note "§" on p. S-12.
- @. See note "@" on p. S-12.
- *. Production and nonsupervisory workers.

Page S-14

- †. See corresponding note on p. S-11.
- *. Production and nonsupervisory workers.
- ‡. Earnings in 1967 dollars reflect changes in purchasing power since 1967 by dividing by Consumer Price Index; effective Mar. 1979 SURVEY, data reflect new seasonal factors for the CPI.
 - §. Wages as of Oct. 1, 1979; Common, \$11.12; Skilled, \$14.65.
 - #. Includes data for items not shown separately.
 - @. Insured unemployment (all programs) data include claims filed under extended duration provisions of regular State laws; amounts paid under these programs are excluded from state benefits paid data.
 - @@. Insured unemployment as a percent of average covered employment in a 12-month period.

Page S-15

1. Average for Dec.
2. Average for the year.
3. Daily average.
- #. Includes data for items not shown separately.
- §. For demand deposits, the term "adjusted" denotes demand deposits other than domestic commercial bank and U.S. Government, less cash items in process of collection; for loans, exclusive of loans to and Federal funds transactions with domestic commercial banks and include valuation reserves (individual loan items are shown gross: i.e. before deduction of valuation reserves).
- *. Adjusted to exclude domestic commercial interbank loans and Federal funds sold to domestic commercial banks.
- ‡. Data beginning Dec. 1978 reflect a reduction in the number of banks reporting (from 317 to 171) and changes in consolidation basis as well as content of several asset and liability items. Unless otherwise stated, comparable data for earlier periods will be available later.
- *. New series. Beginning Dec. 1978, data are for all investment account securities; comparable data for earlier periods are not available.

Page S-16

1. Data are for fiscal years ending Sept. 30 and include revisions not distributed to the months.
- †. Beginning Jan. 1979 SURVEY, the consumer credit group has been completely restructured; comparable data for periods prior to Nov. 1977 are available from the Federal Reserve Board, Washington, D.C. 20551.
- #. Includes data for items not shown separately.

Page S-17

1. Reported annual total; revisions not distributed to the months.
- §. Or increase in earmarked gold (-).
- *. At all commercial banks.
- #. Includes data for items not shown separately.

Page S-18

1. Beginning Jan. 1978, data are based on a new classification system and include nonmonetary gold; the overall total and the commodity groups (but not the items within the groups) have been revised back to Jan. 1977 to reflect these changes.
2. Effective Oct. 1979 SURVEY, data are no longer available.
- §. Number of issues represents number currently used; the change in number does not affect the continuity of the series.
- *. Prices are derived from average yields on the basis of an assumed 3-percent 20-year bond.
- ‡. For bonds due or callable in 10 years or more.
- #. Includes data for items not shown separately.
- @. Effective Feb. 1979 SURVEY, seasonally adjusted data have been revised to reflect sums of commodity components; comparable data for periods prior to 1977 will be shown in the 1979 BUSINESS STATISTICS.
- @@. Data may not equal the sum of the geographic regions, or commodity groups and principal commodities, because of revisions to the totals not reflected in the component items.

Page S-19

1. See note 1 for p. S-18.
- #. Includes data not shown separately.
- §. Data may not equal the sum of geographic regions, or commodity groups and principal commodities, because of revisions to the totals not reflected in the components.
- @. See note "@@" for p. S-18.

Page S-20

1. See note 1 for p. S-18.
- #. Includes data not shown separately.

Page S-21

1. Domestic trunk operations only (averaging about 90 percent of domestic total).
2. Annual total; quarterly revisions are not available.
3. Before extraordinary and prior period items.
4. For month shown.
5. Beginning Jan. 1979, data are based on a new sample of freight shipments for 1976. The new indexes have been linked to the old indexes to maintain comparability.
6. Data are for unlinked passenger trips.
- #. Includes data for items not shown separately.
- §. Total revenues, expenses, and income for all groups of carriers also reflect nonscheduled service.
- ‡. Beginning Jan. 1975, defined as those having operating revenues of \$10 million or more; beginning Jan. 1977, \$50 million or more.
- *. Average daily rent per room occupied, not scheduled rates.
- @. Beginning Jan. 1979, data include visits to Badlands and Theo. Roosevelt National Parks (formerly classified as recreational areas).

Page S-22

1. Annual total; monthly revisions are not available.
2. Data withheld to avoid disclosing operations of individual companies.
3. Beginning Jan. 1979, data include chemically-treated fertilizer and sodium nitrate containing over 16.3% nitrogen by weight; not strictly comparable with data shown for earlier periods.
4. Because of an overall revision to the export commodity classification system effective Jan. 1, 1978, data may not be strictly comparable with those shown for earlier periods.
5. See "*" note, this page.
6. Effective Jan. 1979, data are no longer reported separately.
7. Represents solutions containing ammonia and ammonium nitrate-urea solutions; not comparable with other published data.
8. Annual total for monthly data where available; not comparable with earlier periods.
9. Effective Sept. 1979 SURVEY, data beginning Jan. 1979 are for value of shipments; comprise three new product categories. Comparable data for these new categories are not available prior to Jan. 1979. However, the difference between total value of shipments and total factory sales (formerly shown) is considered statistically insignificant.
10. Beginning July 1979, data include potassium magnesium sulfate and are not strictly comparable with data for Jan. 1977-June 1979. Deliveries prior to Jan. 1977 include potassium magnesium sulfate.
- #. Includes data for items not shown separately.
- §. Data are reported on the basis of 100 percent content of the specified material unless otherwise indicated.
- ‡. Monthly revisions, back to 1975 for some commodities, will be shown in the 1979 BUSINESS STATISTICS.
- @. Monthly revisions for Oct. 1976-Feb. 1978 will be shown in the 1979 BUSINESS STATISTICS.
- *. Beginning Jan. 1977, data exclude potassium magnesium sulfate; not strictly comparable with those shown for earlier periods.

Page S-23

1. Includes Hawaii, not available on a monthly basis; monthly revisions for 1976 will be shown in the 1979 BUSINESS STATISTICS.
2. Reported annual total, including Hawaii; monthly data are preliminary and subject to change.
- §. Data are not wholly comparable from year to year because of changes from one classification to another.
- @. Monthly revisions, for some series back to 1976, will be shown in the 1979 BUSINESS STATISTICS.

Page S-24

1. See note 4 for p. S-22.
2. Crop estimate for the year.
3. Stocks as of June 1.
4. Stocks as of June 1 and represents previous year's crop; new crop not reported until June (beginning of new crop year).
5. Previous year's crop; new crop not reported until Oct. (beginning of new crop year).
6. Sept. 1, estimate of 1979 crop.
7. Beginning Jan. 1978, data for condensed and evaporated milk are reported under the single heading "total milk and cream, condensed and evaporated"; data for dry whole milk and nonfat dry milk are under the heading "total dry milk, whole and nonfat." See also note 4 for p. S-22.
8. Ten-month average; Feb. and June prices not available.
9. See note "@@" for this page.
10. Less than 50 thousand bushels.
11. Oct. 1 estimate of 1979 crop.
- §. Excludes pearl barley.
- #. Bags of 100 lbs.
- *. Revised crop estimates for 1970-75 will be shown in the 1979 BUSINESS STATISTICS.
- @. Monthly revisions, for some series back to 1976, will be shown in the 1979 BUSINESS STATISTICS.
- ‡. Monthly revisions back to 1975 will be shown in the 1979 BUSINESS STATISTICS.
- @@. Data are quarterly except for June (covering Apr. and May) and Sept. (covering June-Sept.).

Page S-25

1. See note 4 for p. S-22.
2. See note "*" for this page.
3. Effective Mar. 1979, prices are for Central U.S. and Los Angeles; comparability not affected.
4. Beginning July 1977, prices represent Midwest and Los Angeles and are not comparable with those shown for earlier periods representing East Coast and Los Angeles; annual average is for July-Dec.
5. Average for five months (Aug.-Dec.).
6. Prices for Sept. 1977-Mar. 1979 are estimated; actual price not available. Annual averages for 1977 and 1978 reflect these estimates and are not comparable with other periods.
- §. Cases of 30 dozen.
- *. Bags of 132.276 lbs.
- ‡. Monthly revisions back to Jan. 1975 will be shown in the 1979 BUSINESS STATISTICS.
- @. Monthly revisions back to 1976 will be shown in the 1979 BUSINESS STATISTICS.
- #. Effective Feb. 1979, prices are for Central U.S. (including East Coast); comparability is not affected.

Page S-26

1. See note 4 for p. S-22.
2. Beginning Jan. 1978, data are not comparable with those shown for earlier periods; refined sugar now reported with raw.
3. Reflects revisions not distributed to the months.
4. Crop estimate for the year.
5. Data no longer available; see note 2 for this page.
6. Beginning Aug. 1978, prices are estimated; not comparable with those shown for earlier periods. Annual average for 1978 represents Aug.-Dec.
7. Effective July 1978, data no longer available; annual average represents Jan.-June.
8. Sept. 1 estimate of 1979 crop.
9. Beginning Sept. 1979, estimated prices are derived from a different source and are comparable with those shown for earlier periods.
10. Oct. 1 estimate of 1979 crop.
- §. Monthly data reflect cumulative revisions for prior periods.
- @. Producers' and warehouse stocks.
- *. Factory and warehouse stocks.

Page S-27

1. See note 4 for p. S-22.
2. Annual total; monthly revisions are not available.
3. Average for Jan.-Sept., Nov., and Dec.
4. Average for Jan.-May and July-Dec.
5. Average for Jan.-Oct.
- #. Includes data for items not shown separately.

Page S-28

1. Annual data; monthly revisions not available.
2. Average for July-Dec.
3. Average for 11 months; price not available for Nov.
4. Average for 11 months; Feb. price not available.

Page S-29

1. Annual data; monthly revisions are not available.
2. For month shown.
- §. Beginning with Jan. 1979 data, units are metric tons; to convert, multiply short tons by 0.907185.

Page S-30

1. Data beginning Jan. 1978 exclude stocks of lead base bullion in transit and at refineries.
2. Less than 50 tons.
3. Annual data; quarterly revisions not available.
4. For month shown.
5. Data are for five weeks; other months 4 weeks.
- §. Beginning with Jan. 1979 data, units are metric tons; earlier data are shown in short tons; to convert, multiply short tons by 0.907185.
- *. Includes secondary smelters' lead stocks in refinery shapes and in copper-base scrap.
- @. All data (except annual production figures) reflect GSA remelted zinc and zinc purchased for direct shipment.
- #. Includes data not shown separately.

Page S-31

1. Reflects revisions not available by months.
2. Beginning July 1977, data include shipments to mobile home and travel trailer manufacturers (formerly excluded); they are not directly comparable with data for earlier periods.
3. Average for eleven months; no price for May.
4. Beginning Jan. 1979, data reflect coverage of additional processing facilities; not strictly comparable with data shown for earlier periods.
5. Data for oven (byproduct) coke have been restated back to Jan. 1979 to include beehive coke which is no longer reported separately. Earlier published data for these two items should be combined for comparability with data shown beginning Jan. 1979.
- #. Includes data for items not shown separately.
- §. Includes nonmarketable catalyst coke.
- *. Includes small amounts of "other hydrocarbons and hydrogen refinery input," not shown separately.
- ‡. Monthly revisions for the following series will be shown in the 1979 BUSINESS STATISTICS: bituminous coal—back to 1975; coke—back to 1977; petroleum and products—back to 1976; anthracite coal production—1977; and wholesale price indexes covering bituminous coal and petroleum and products—1977.

Page S-32

1. Less than 50 thousand barrels.
2. Data exclude small amounts of pulp because reporting would disclose the operations of individual firms.
3. Reported annual totals; revisions not allocated to the months.
4. Effective Jan. 1978, exports of aviation gasoline are no longer reported separately.
5. Beginning Jan. 1979, price includes taxes formerly excluded and is an average based on 48 cities; comparable prices for earlier periods are not available.
6. See note 4 for p. S-31.
- ‡. See corresponding note for p. S-31.
- #. Includes data for items not shown separately.

Page S-33

1. Beginning Jan. 1977, data cover passenger car and truck and bus tires; motorcycle tires and tires for mobile homes are excluded.
2. Beginning Jan. 1979, data are no longer available.
- *. As reported by publishers accounting for about 75 percent of total newsprint consumption.
- §. Monthly data are averages of the 4-week periods ending on the Saturday nearest the end of the month; annual data are as of Dec. 31.

Page S-34

1. Annual total; revisions not allocated to the months.
2. Crop for the year.
3. Beginning 1st quarter 1977, data exclude garment lengths, trimming, and collars; not comparable with earlier data.
4. Data cover five weeks; other months, four weeks.
5. First-of-the-month estimate of the 1979 crop.
- #. Includes data for items not shown separately.
- *. Cumulative ginnings to the end of month indicated.
- §. Bales of 480 lbs.
- @. Monthly revisions back to 1976 will be shown in the 1979 BUSINESS STATISTICS.

Page S-35

1. Effective Jan. 1, 1978, includes reexports, formerly excluded.
2. Season average.
3. Average for sales prior to April 1, 1978.
4. For five weeks; other months four weeks.
5. Monthly average.
6. Average for Jan.-Oct.
7. Average for Feb.-Jun.
8. Average for 11 months; no price for May.
9. Average of Jan.-June.
10. Less than 500 bales.
- §. Bales of 480 lbs.
- *. Based on 480-lb. bales, preliminary price reflects sales as of the 15th; revised price reflects total quantity purchased and dollars paid for the entire month (revised price includes discounts and premiums).
- #. Includes data not shown separately.
- @. Effective Apr. 1979, SURVEY, data include 600 additional firms; comparable data back to Jan. 1977 (except for slacks, jean cut, casual, shown on p. S-36) will appear in the 1979 BUSINESS STATISTICS.

Page S-36

1. Annual total includes revisions not distributed to the months.
2. Estimates of production, not factory sales.
3. See note 4 for p. S-22.
4. Excludes one state.
5. Excludes two states.
6. Excludes three states.
7. Excludes four states.
- @. See note "@" p. S-35.
- #. Total includes backlog for nonrelated products and services and basic research.
- §. Domestic include U.S.-type cars produced in the United States and Canada and foreign-type cars produced in the U.S.; imports cover all other foreign-type cars and captive imports, and exclude domestics produced in Canada.
- *. Courtesy of R.L. Polk & Co.; republication prohibited.
- ‡. Excludes railroad-owned private refrigerator cars and private line cars.

BUSINESS STATISTICS 1977

BUSINESS STATISTICS 1977 is the 21st biennial supplement to the monthly **SURVEY OF CURRENT BUSINESS**.

Annual data for most of the approximately 2,500 series are shown back to 1947. Quarterly series are shown back to 1966, and monthly series back to 1973. For about 400 key series, a longer historical period of monthly or quarterly data is shown in an appendix.

The 1977 edition, like its predecessors, contains detailed explanatory notes describing sources, definitions, methods of compilation, revisions, and the time span for which the data are available. The footnotes in the **SURVEY OF CURRENT BUSINESS** provide information that has become available since **BUSINESS STATISTICS 1977** was published.

BUSINESS STATISTICS 1977 is available from the Superintendent of Documents, U.S. Government Printing Office (GPO), Washington, D.C. 20402. Price \$6.25; 376 pages. Order by stock number 003-010-00059-7; enclose check or money order payable to Superintendent of Documents. **BUSINESS STATISTICS 1977** may be ordered by telephone (202) 783-3238 and charged to Master Charge, VISA, or deposit account at the Superintendent of Documents.

INDEX TO CURRENT BUSINESS STATISTICS, Pages S1-S40

SECTIONS

General:

Business indicators	1-6
Commodity prices	6-8
Construction and real estate	8, 9
Domestic trade	9-11
Labor force, employment, and earnings	11-15
Finance	15-18
Foreign trade of the United States	18-20
Transportation and communication	21

Industry:

Chemicals and allied products	22
Electric power and gas	23
Food and kindred products; tobacco	23-26
Leather and products	27
Lumber and products	27, 28
Metals and manufactures	28-31
Petroleum, coal, and products	31, 32
Pulp, paper, and paper products	32, 33
Rubber and rubber products	33
Stone, clay, and glass products	34
Textile products	34-36
Transportation equipment	36

INDIVIDUAL SERIES

Advertising	9, 14
Aerospace vehicles	36
Agricultural loans	15
Air carrier operations	21
Air conditioners (room)	31
Aircraft and parts	5, 36
Alcohol, denatured and ethyl	22
Alcoholic beverages	9, 23
Aluminum	29
