In This Issue...
A Guide to the NIPA's
Gross Product by Industry Price Measures, 1977-96
U.S. DEPARTMENT OF COMMERCE $\sim$ ECONOMICS AND STATISTICS ADMINISTRATION BUREAU OF ECONOMIC ANALYSIS

Survey of Current Business (issn 0039-6222). Published monthly by the Bureau of Economic Analysis of the U.S. Department of Commerce. Editorial correspondence should be addressed to the Editor-in-Chief, Survey of Current Business, Bureau of Economic Analysis, U.S. Department of Commerce, Washington, DC 20230.

Subscriptions to the Survey of Current Business are maintained, and their prices set, by the Government Printing Office, an agency of the U.S. Congress. Postmaster: Send address changes to:

Superintendent of Documents, U.S. Government Printing Office,

Washington, DC 20402.
The GPO order desk number is (202) 5121800. The subscription complaint desk number is (202) 512-1806.

Subscription and single-copyprices:
Periodicals: $\quad \$ 35.00$ domestic, $\$ 43.75$ foreign.
First-class mail: $\$ 69.00$.
Single copy: $\$ 11.00$ domestic, $\$ 13.75$ foreign.
Make checks payable to the Superintendent of Documents.

Periodicals postage paid at Washington, DC and at additional mailing offices. (UsPs $337^{-}$ 790).

The Secretary of Commerce has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department.

THIS ISSUR of the SURVEY went to the printer on March 10, 1998. Itincorporates data from the following monthly bea news releases: U.S. International Trade in Goods and Services (February 19), Gross Domestic Product (February 27), and Personal Income and Outlays (March 2).

# TABLE OF CONTENTS 

## $\mathcal{S}_{\text {pecial in this issue }}$

17 Gross Product by Industry Price Measures, 1977-96
Price measures of gross product originating (GPO) by industry can be used to compare price changes across industries and to compute industry contributions to the change in GDP prices. For example, the largest contributors to the 2.3percent increase (annual rate) in the GDP price index in 1992-96 were the services industry group and the finance, insurance, and real estate industry group ( 0.7 percentage point each). Unit-cost measures by industry can be used to identify the sources of GPO price change among the cost components of GPO. For example, the labor cost per unit of real GPO declined in 1992-96 for the mining and the durable goods manufacturing industries and was unchanged for the wholesale trade industry.

## 26 A Guide to the Nipa's

bea presents a compilation of information that will help users to better understand the NIPA's. This guide provides the definitions of the major aggregates and components; discusses the measures of real output and prices; explains how production is classified and how the NIPA's are presented; describes the statistical conventions that are used; and lists the principal source data and methods used to prepare the estimates of GDP.

## Regular features

## 1 Business Situation

The "preliminary" estimate of real GDP indicates a 3.9-percent increase in the fourth quarter of 1997, o. 4 percentage point lower than the "advance" estimate; a large downward revision to net exports and smaller downward revisions to government spending and consumer spending were only partly offset by a large upward revision to business inventory investment. Despite these revisions, real GDP growth still shows an acceleration from a 3.1-percent increase in the third quarter. The price index for gross domestic purchases increased 1.4 percent, about the same pace as in the third quarter.
8 Federal Budget Estimates, Fiscal Year 1999
Each year, Bea prepares a "translation" of the administration's budget that puts the budget's receipts and outlays on a basis that is consistent with the framework of the NIPA's. In the NIPA framework, the Federal current deficit would be $\$ 9.9$ billion in fiscal year 1999; the administration's budget shows a $\$ 9.5$ billion surplus. The difference primarily results from the difference in the treatment of government investment in fixed assets; the consumption of fixed capital that is included in the NIPA's is greater than the investment that is excluded.

## LOOKING AHEAD

U.S. Transportation Satellite Account. An article that presents the 1992 transportation satellite account for the United States will be published in a forthcoming issue of the Survey. The transportation satellite account, developed jointly by bea and the Bureau of Transportation, is based on an expansion of the 1992 benchmark input-output accounts. It provides estimates of expenditures on transportation that supplement the existing estimates in the national economic accounts.
© Domestic Content of the Production of U.S. Manufacturing Affiliates of Foreign Companies. An article that compares the domestic content of output of U.S. manufacturing affiliates of foreign companies with that of other U.S. manufacturing companies will be published in a forthcoming issue of the Surver. The article also examines the extent to which U.S. manufacturing affiliates rely on foreign sources for their intermediate inputs and whether the affiliates' production is intended for U.S. or foreign markets.

## B U S I N E S S

This article was prepared by Larry R. Moran, Daniel Larkins, Ralph W. Morris, and Deborah Y. Sieff.

$R$Eal gross domestic product (GDP) increased 3.9 percent in the fourth quarter of 1997, according to the "preliminary" estimates of the national income and product accounts (Nipa's) (table 1 and chart 1 ); the "advance" estimate of real GDP, reported in the February "Business Situation," had shown a 4.3-percent increase. ${ }^{1}$ The downward revision was more than accounted for by a large downward revision to net exports; government spending and consumer spending were also revised down, but by much less. These downward revisions were partly offset by a large upward revision to business inventory investment. Business fixed investment was re-

NOTE.-Chained (1992) dollar series are calculated as the product of the chain-type quantity index and the 1992 current-dollar value of the corresponding series, divided by 100 . Because the formula for the chain-lype quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates usualiy are not additive. Chained (1992) dollar levels and residuals, which measure the extent of nonadditivity in each tabie, are found in NIPA tables 1.2, 1.4 and 1.6. Percent changes are calculated from unrounded data. Percent changes in major aggregates are found in NIPA table 8.1. Contributions of the major components to the quarter-to-quarter percent change in real GDP are in table 8.2.
vised very little. (The sources of these revisions are discussed in the "Revisions" section.)

The picture of the economy presented by the preliminary estimates is somewhat changed from that presented by the advance estimates. As in the advance estimates, real GDP growth accelerated in the fourth quarter, and the acceleration was

## CHART 1

## Real Product:

Change from Preceding Quarter
Billon chained (1092)\$

more than accounted for by upturns in business inventory investment and in net exports. ${ }^{2}$ However, the "preliminary" estimates show a much sharper deceleration in real final sales of domestic product-GDP less the change in business inventories-than was shown by the advance estimates. According to the preliminary estimates, real final sales of domestic product increased 2.5 percent in the fourth quarter after increasing 4.7 percent in the third; the advance estimates had indicated a 3.6 -percent increase in the fourth quarter.
Real gross domestic purchases-GDP less exports of goods and services plus imports of goods and services-increased 3.5 percent in the fourth quarter after increasing 4.3 percent in the third. ${ }^{3}$ A downturn in business fixed investment and a deceleration in consumer spending more than offset a sharp upturn in business inventory investment.

The price index for gross domestic purchases increased 1.4 percent in the fourth quarter after increasing 1.3 percent in the third. The price index for GDP increased 1.4 percent in both the third and fourth quarters.
2. NIPA table 8.2 (on page D-25 in this issue) shows the contributions of the major components to the quarter-to-quarter percent change in real GDP.
3. Gross domestic purchases is a measure of purchases by U.S. residents regardless of where the purchased goods and services are produced.

## Personal consumption expenditures

Real personal consumption expenditures (PCE) increased 3.1 percent in the fourth quarter after increasing 5.6 percent in the third (table 2). Expenditures for durable goods slowed sharply, and expenditures for nondurable goods turned down; in contrast, expenditures for services increased somewhat more than in the third quarter.
Several of the factors usually considered in analyses of PCE showed strength in the fourth quarter (chart 2). The unemployment rate fell to 4.7 percent, its lowest rate in more than 25 years. Real disposable personal income accelerated to 4.5 percent from 2.6 percent. The Index of Consumer Sentiment (prepared by the University of Michigan's Survey Research Center) slipped only slightly from its highest level in 45 years.

Expenditures for durable goods increased only 1.7 percent after jumping 18.4 percent. Motor vehicles and parts decreased after increasing sharply; the downturn mainly reflected a downturn in purchases of new autos and a deceleration in purchases of new trucks, but net purchases of used cars and purchases of parts also contributed. Furniture and household equipment and "other" durable goods expenditures both increased less than in the third quarter. In furniture and household equipment, most of the slowdown was accounted for by computers.

Expenditures for nondurable goods decreased 1.0 percent after increasing 4.3 percent. The

Data: U.S. Department of Labor, Bureau of Labor Statistics
Data: University of Michigan's Survey Research Center
U.S. Department of Commerce, Bureau of Economic Analysis
weakness was widespread but was most pronounced in clothing and shoes and in "other" nondurable goods.

Expenditures for services increased 5.4 percent after increasing 3.9 percent. Household operation accelerated, reflecting an upturn in electricity and gas. "Other" services increased more than in the third quarter; net foreign travel turned up, reflecting an increase in U.S. residents' travel abroad and a decrease in foreign residents' travel in the United States, and recreational services increased about twice as much in the fourth quarter as in the third.

## Nonresidential fixed investment

Real private nonresidential fixed investment decreased 3.5 percent in the fourth quarter after jumping 19.2 percent in the third (table 3). Both structures and producers' durable equipment (PDE) turned down; however, the downturn in PDE was much more pronounced.

Factors that affect investment spending have been generally favorable over the past four quarters: Real final sales of domestic product increased 3.2 percent; the capacity utilization rate in manufacturing increased from 81.4 to 82.1 ; longterm interest rates decreased-for example, the yield on high-grade corporate bonds decreased from 7.52 percent to 6.79 percent; and domestic corporate profits increased at an annual rate of 18.6 percent through the first three quarters of

[^1]1997 (profits data for the fourth quarter are not yet available).

PDE decreased 3.3 percent in the fourth quarter after jumping 24.1 percent in the third. All the major components contributed to the downturn. Information processing equipment, particularly computers and peripheral equipment, increased much less than in the third quarter. Transportation equipment turned down, reflecting a downturn in aircraft. "Other" equipment, particularly agricultural equipment and farm tractors, decreased after increasing. Industrial equipment increased less than in the third quarter.

Structures decreased 4.3 percent after increasing 6.7 percent. The downturn was more than accounted for by a downturn in investment in nonresidential buildings; industrial buildings, "other" buildings, commercial buildings, and hospital and institutional buildings each turned down. In addition, investment in mining exploration, shafts, and wells decreased after increasing. In contrast, investment in utilities changed little after decreasing, and investment in "other" structures increased more in the fourth quarter than in the third; the fourth-quarter increase in "other" structures was the result of the sale by the Federal Government to a private business of the Naval Petroleum Reserve at Elk Hills, California. ${ }^{4}$

## Residential investment

Real residential investment increased 9.7 percent in the fourth quarter after increasing 2.7 percent in the third (table 3). The acceleration was accounted for by single-family and multifamily structures, both of which increased after decreasing.

Single-family structures increased 9.8 percent after decreasing 2.3 percent, and multifamily construction increased 31.4 percent after decreasing 15.6 percent. "Other" residential investment increased 6.4 percent after increasing 12.4 percent. ${ }^{5}$ A sharp slowdown in brokers' commissions more than offset an acceleration in home improvements. The slowdown in brokers' commissions

[^2]reflected a deceleration in home sales that occurred despite a decrease in the commitment rate on 30 -year, fixed-rate mortgages from 7.47 percent to 7.20 percent (chart 3 ).

## Inventory investment

Real inventory investment-that is, the change in business inventories-increased $\$ 26.5$ billion in the fourth quarter, as inventory accumulation picked up to $\$ 74.0$ billion from $\$ 47.5$ billion (table 4). In contrast, inventory investment had decreased $\$ 30.1$ billion in the third quarter, as accumulation had slowed from $\$ 77.6$ billion in the second quarter.

Retail trade inventories increased $\$ 16.5$ billion in the fourth quarter after increasing $\$ 2.8$ billion in the third. Most of the step-up was accounted for by inventories of motor vehicle dealers, which increased substantially after four consecutive quarterly decreases. Inventories of other durable goods increased more than in the third quarter.

Manufacturing inventories increased $\$ 22.3$ billion after increasing $\$ 14.8$ billion. Most of the step-up was in nondurable goods industries, largely reflecting an upturn in petroleum products and accelerations in chemicals and in food. In the durable goods industries, step-ups in other transportation equipment and in "other" durable goods were partly offset by a downturn in motor vehicle inventories.

## CHART 3

Selected Interest Rates

Data: Federal Reserve Board
U.S. Department of Commerce, Bureau of Economic Analysis

Wholesale trade inventories increased $\$ 19.8$ billion after increasing $\$ 14.9$ billion. The step-up was mainly in nondurable goods and was more than accounted for by groceries, by apparel, and by farm products. In durable goods, a step-up in "other" durable goods was mostly offset by a downturn in motor vehicles.
"Other" nonfarm inventories increased about as much as in the third quarter. ${ }^{6}$
Farm inventories increased $\$ 9.8$ billion after increasing $\$ 9.5$ billion. As in the third quarter, an increase in crop inventories more than offset a small decrease in livestock inventories.
The ratio of real nonfarm inventories to real final sales of domestic businesses increased to 2.29 in the fourth quarter from 2.27 in the third. A different ratio, in which innal sales are limited to goods and structures, increased to 4.15 from 4.10. For both measures, the fourth-quarter ratio is close to its average in recent years.
6. "Other" nonfarm inventories includes inventories held by the following industries: Mining; construction; public utilities; transportation; communication; finance, insurance, and real estate; and services.

## Exports and imports

Real exports of goods and services increased 10.0 percent in the fourth quarter after increasing 4.4 percent in the third (table 5). Real imports of goods and services increased 6.4 percent after increasing 14.6 percent.
Real exports of goods increased 14.5 percent after increasing 3.4 percent; exports of both agricultural and nonagricultural goods increased more than in the third quarter. Much of the step-up in nonagricultural exports was accounted for by an acceleration in nonautomotive capital goods, which reflected an upturn in exports of civilian aircraft; in contrast, computers, peripherals, and parts turned down, and "other" nonautomotive and noncomputer goods increased less than in the third quarter. ${ }^{7}$ The step-up in nonagricultural exports also reflected upturns in automotive vehicles, engines, and parts and in consumer goods except automotive and an acceleration in foods,

[^4]feeds, and beverages. Exports of services decreased 0.8 percent after increasing 7.2 percent, primarily reflecting a downturn in travel and a slowdown in "other private services," which includes such services as educational, financial, and telecommunications.
Real imports of goods increased 6.6 percent after increasing 15.4 percent; imports of petroleum and products turned down, and imports of nonpetroleum goods slowed considerably. Much of the slowdown in nonpetroleum imports was accounted for by a slowdown in nonautomotive capital goods, particularly in computers and parts, and by a downturn in automotive vehicles, engines, and parts. Imports of services increased 5.4 percent after increasing 10.1 percent; the slowdown was primarily accounted for by downturns in "other private services," which includes such services as telecommunications and financial, and in direct defense expenditures.

## Government spending

Real government consumption expenditures and gross investment increased 0.4 percent in the fourth quarter after increasing 1.1 percent in the third (table 6). Federal Government spending decreased more in the fourth quarter than in the third, and State and local government spending increased less than in the third.
Federal nondefense spending decreased 8.6 percent after decreasing 5.7 percent. Consumption expenditures decreased more than in the third quarter, primarily reflecting a larger fourthquarter decrease in employee compensation. Investment spending also decreased more than in the third quarter, reflecting a downturn in spend-
ing for structures. The fourth-quarter decrease was the result of the Elk Hills transaction (see footnote 4).

Federal defense spending increased 1.3 percent after increasing 1.2 percent. Consumption expenditures increased after decreasing; the upswing was mostly accounted for by expenditures for durable goods, largely aircraft parts. Investment spending increased less than in the third quarter; the slowdown was attributable to spending for equipment.
State and local government spending increased 1.8 percent after increasing 2.3 percent. Consumption expenditures increased less than in the third quarter, and investment spending decreased slightly after increasing, reflecting spending for structures, which decreased after no change, and spending on equipment, which decelerated.

## Revisions

As noted earlier, the preliminary estimate of a 3.9percent increase in real GDP in the fourth quarter is 0.4 percentage point lower than the advance estimate (table 7); for 1976-97, the average revision, without regard to sign, was 0.5 percentage point from the advance estimate to the preliminary estimate. The downward revision to GDP in the fourth quarter reflected downward revisions to net exports of goods and services and to consumer spending. These revisions were partly offset by a large upward revision to inventory investment.

The downward revision to net exports reflected the incorporation of newly available Census Bu reau data for exports and imports of goods for December. The December data for exports was

[^5] are in NIPA table 8.1.
in line with the assumption that was used for the advance estimates, but the increase in the December data for imports-the largest increase since March 1993-was much larger than bea's assumption.

The downward revision to government spending largely reflected the Elk Hills transaction.

The downward revision to consumer spending was more than accounted for by goods and reflected the incorporation of revised retail sales data for November and December.

The upward revision to inventory investment mainly reflected the incorporation of revised and newly available Census Bureau inventory data. In addition, the upward revision also reflected two other revisions: A special adjustment to remove the effects of a large, one-time "write-down" in the inventories of an aircraft manufacturer, and a revision to the inventory valuation adjustment to reflect the incorporation of newly available data for November on the refiners' acquisition price of petroleum and the incorporation of revised producer price indexes for September and newly available indexes for January that are used in calculating yearend inventory values.

The small downward revision to private nonresidential structures was accounted for by a downward revision to purchases of new structures that more than offset the upward revision due to the Elk Hills transaction. The downward revision to purchases of new structures reflected the incorporation of revised data for October and November and newly available data for December on the value of construction put in place.
The preliminary estimates of the increases in the price indexes for gross domestic purchases and for GDP were each 1.4 percent; each was 0.1 percentage point lower than the advance estimate.
The preliminary estimate of real disposable personal income increased 4.5 percent, 0.2 percentage point lower than the advance estimate; current-dollar personal income was revised down slightly, and personal tax and nontax payments were revised up. The preliminary estimate of
the personal saving rate-personal savings as a percentage of current-dollar disposable personal income-was 3.8 percent, 0.1 percentage point lower than the advance estimate.

1. Based on chained-lype annual (1992) weights.

NOTE.-The preliminary estimates for the fourth quarter of 1997 incorporate the following revised or additional major source data that were not available when the advance estimates were prepared.
Personal consumption expenditures: Revised retail sales for November and December, consumers' share of new-car purchases for December, revised average unit value for domestic new autos for October through December, consumers' share of new-truck purchases for December, and residential electricity usage for Ocrober.
Nonresidential fixed investment: Construction put in place for October and November (revised) and December, manufacturers' shipments of machinery and equipment for November and December (revised), and exports and imports of machinery and equipment for November (revised) and December.

Change in business inventories: Manulacturing retail trade and wholesals and (revised) and December. (revised) and December. Exports and imports of goods and services: Exports and imports of goods for November (revised) and December.
Government consumption expenditures and gross investment: Monthly Treasury Statement detailed data for December, Department of Defense detailed financial reports for the quarter, State and local government construction put in place for October and November (revised) and December.

Wages and salaries: Employment, average hourly earnings, and average weekly hours for November and December (revised). of petroleum imports for November (revised) and December, and housing prices for the fouth quarter.

# Federal Budget Estimates, Fiscal Year 1999 

By Kurt S. Bersani and Ann M. Groszkiewicz

$\tau$he federal Budget of the United States Government for fiscal year 1999 that was released by the President shows a $\$ 9.5$ billion surplus, a turnaround from a $\$ 10.0$ billion deficit in fiscal year 1998. ${ }^{1}$ The fiscal year 1999 surplus reflects the administration's proposed legislation and program changes, the economic assumptions used in making the budget projections, and the laws that have already been enacted. ${ }^{2}$

This article summarizes the proposed legislation and program changes in the administration's budget and the budget estimates. It then presents the budget receipts and outlays in the framework of the national income and product accounts, which are designed to show the composition of production and the distribution of the incomes earned in production. This framework, which differs in concept and timing from the budget, provides a means of gauging the effects of the Federal budget on aggregate measures of U.S. economic activity.

## Proposed legislation and program changes

The fiscal year 1999 budget presents proposed legislation that increases receipts by $\$ 12.9$ billion (table 1). The largest proposal is a tobacco industry settlement that would add $\$ 9.8$ billion to receipts. Proposals to increase receipts both from insurance companies and from corporate-owned life insurance policy holders who borrow against their policies would total $\$ 2.3$ billion: A proposed modification of the existing tax rules for life insurance annuity contracts would amount to $\$ 1.8$ billion, and a proposal to repeal certain tax deductions of interest on corporate-owned life insurance policy loans would amount to $\$ 0.4$

[^6]billion. A proposed extension of corporate environmental and excise taxes for the Hazardous Substance Superfund Trust Fund would add \$1.8 billion.

Proposed legislation that would reduce receipts consists of various tax credits and other tax changes. A proposal to extend a tax credit for certain research and experimentation expenditures through June 30, 1999, would reduce receipts by $\$ 0.8$ billion. A proposal to modify international trade provisions would reduce receipts by an additional $\$ 0.6$ billion. More than 90 percent of this reduction would come from extending to September 30, 2001, the provisions in the General System of Preferences (GSP) that eliminate duty on certain goods from eligible developing countries. In addition, the following proposals, none of which total more than $\$ 0.4$ billion, would reduce receipts: Tax credits to businesses for purchasing energy-efficient equipment, tax credits for certain education initiatives, and increased tax credits for child care.
The budget proposes program changes that would increase total outlays by a net $\$ 0.8$ billion in fiscal year 1999. Among the program changes that would increase outlays, the largest is for general government, which would be augmented by $\$ 3.6$ billion. ${ }^{3}$ Much of this increase would fund Internal Revenue Service improvements in customer service, electronic data collection, and communication.
A proposed $\$ 3.3$ billion increase in allowances would be used for emergencies-such as natural disasters-for unexpected defense expenditures, and for any unanticipated nonemergency expenses caused by the year 2000 conversion. Income security would increase by $\$ 1.3$ billion, the largest portion of which is a $\$ 0.5$ billion proposal to restore food stamps to legal immigrants.
The budget proposes an $\$ 0.8$ billion increase for the administration of justice. Programs to reduce violent crime and to control and prevent juvenile crime would each receive $\$ 0.3$ billion in additional funding. Proposals to increase the number of border patrol agents and to improve wireless communication would increase funding for each by $\$ 0.1$ billion.
The largest proposed decreases in outlays are $\$ 4.4$ billion for national defense and $\$ 1.0$ billion for veterans benefits and services. The reduction in national defense spending would result primarily from the increased privatization and outsourcing of support functions, which would reduce the number of personnel associated with support activities and infrastructure. Most of the decrease in veterans benefits and services would

[^7]result from a proposal to reinstate restrictions on tobacco-related disability-compensation benefits. These benefits would be reduced by $\$ 0.7$ billion as a result of reinstituting a policy that restricts benefits for veterans for tobacco-related disabilities that originated from tobacco use during military service. The remainder of the decrease in outlays is accounted for by other proposals, none of which amount to more than $\$ 0.5$ billion.

## The budget estimates

In the budget, receipts in fiscal year 1999 are projected to increase $\$ 84.9$ billion, or 5.1 percent, to $\$ 1,742.7$ billion (table 2). Receipts in 1998 are projected to be $\$ 1,657.9$ billion, up 5.0 percent from 1997. The projected increase in 1999 is mostly accounted for by increases in social insurance taxes and contributions, individual income taxes, and excise taxes. Projected increases in receipts from social insurance taxes and contributions and from individual income taxes are based on administration assumptions that incomes will increase as a result of real economic growth and inflation. A projected increase in excise tax receipts is based on administration assumptions of increased economic activity in 1999 after a slowdown in 1998 and on higher aviation taxes as a result of the Tax Reform Act of 1997. Miscellaneous receipts are projected to increase $\$ 13.2$ billion, $\$ 9.8$ billion of which is accounted for by the proposed tobacco industry settlement.
Total budget outlays in fiscal year 1999 are projected to increase $\$ 65.4$ billion, or 3.9 percent, to $\$ 1,733.2$ billion (table 3). Outlays in 1998 are projected to be $\$ 1,667.8$ billion, up 4.2 percent from 1997. The projected increase in 1999 is mostly accounted for by increases in four areas:

- Social security—An increase of $\$ 14.7$ billion is accounted for by a $\$ 14.7$ billion increase from current-services outlays that mainly reflects the cost-of-living adjustments

Table 2.-Budget Receipts by Source [Billions of dollars]

|  | Level for fiscal year |  |  |  | Change from preceding fiscal year |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

and assumptions about inflation and about the number of beneficiaries in these programs. Most of the increase in social security is accounted for by old-age and survivors insurance benefits ( $\$ 12.1$ billion).

- Income security-An increase of $\$ 13.5$ billion is accounted for by an increase of $\$ 12.3$ billion in current-services outlays and of $\$ 1.3$ billion in program changes. The increase is distributed over a variety of programs, including unemployment compensation, Federal employee retirement and disability, child care entitlement to States, and food stamps.
- Health-An increase of $\$ 9.7$ billion is accounted for by a $\$ 9.8$ billion increase in current-services outlays. Most of the increase is accounted for by an increase of $\$ 6.9$ billion for medicaid, reflecting assumptions about inflation and the number of beneficiaries in this program. The remaining increases are primarily accounted for by an increase in the Children's Health Insurance Program ( $\$ 1.5$ billion) to provide insurance for currently uninsured children and by an increase for the National Institutes of Health (\$1.0 billion) for biomedical research.
- Medicare-An increase of $\$ 9.1$ billion is more than accounted for by a $\$ 9.4$ billion increase in current-services outlays. The increase is based on the assumptions about inflation and the about number of beneficiaries in this program.

## Relation between budget and NIPA estimates

bea prepares estimates of the Federal sector in the framework of the national income and product accounts (nipa's), which may be used for such purposes as macroeconomic analyses of the impact of changes in Federal receipts and expenditures on gross domestic product and its components. bea makes adjustments to the budget estimates to bring them into line with nipa concepts and definitions. ${ }^{4}$ One major conceptual difference is the treatment of government investment; in the NIPA's, the treatment of government investment in fixed assets and the cost of using these assets is symmetrical with the treatment of fixed investment in the private sector. Transfers of nonproduced assets, such as the sale of land, are excluded from the NIPA's because they do not affect current production. The NIPA's also exclude transactions with Puerto Rico

[^9]and the U.S. Territories, whose residents by niPA definition are not U.S. residents, and transactions of the Federal Communication Commission Universal Service Fund, which pass through a nonprofit institution that is regulated by the Federal Communication Commission.
nIPa receipts differ from budget receipts because of differences in coverage, in netting and grossing (which provide additional information on items that are recorded on a net basis in the budget), and in timing (table 4). For most years, the difference between nipa receipts and budget receipts primarily reflects contributions to government employee retirement funds and proprietary receipts. In the budget, the contributions are included in outlays both as expenditures and as offsetting receipts and thus net to zero; in the NIPA's, they are recorded as receipts in

1. Consists largely of transler payments, subsidies, and grants-in-aid to residents of U.S. territories and Puerto Rico.
2. Consists of agencies not in the budget and the Federal Communication Commission Universal Service Fund payments. Also includes net purchases of silver and minor coin metal. 3. Taxes received from the rest of the workd are included in the budget and netted against expenditures (transter payments) in the NiPA's.
3. Consists largely of proprietary receipls that are netted against outlays in the budget a classiifd as receipis in tor props
. Consists largely of net expenditures of foreign currencies
.
 tures. nomic Analysis.
NIPA National income and product accounts
order to provide separate detail on government retirement funds. In the budget, some proprietary receipts are netted against outlays, but in the nipa's, they are treated as receipts. For 1999, nipa receipts would exceed budget receipts by $\$ 91.2$ billion; contributions to government employee retirement funds would be $\$ 73.8$ billion, and proprietary receipts would be $\$ 33.1$ billion.
nIPA current expenditures differ from budget outlays because of differences in coverage, in netting and grossing, and in timing. They also differ because of the NIPA treatment of government investment in fixed assets and because of the exclusion of financial transactions, such as loans, and the exclusion of sales of nonproduced assets (table 5). ${ }^{5}$ For most years, the difference between the NIPA and budget estimates primarily reflects the netting and grossing differences and the treatment of government investment. nIPA current expenditures includes the consumption of fixed capital, which is not recognized in

| Less: National defense gross investment ${ }^{1}$.................. | 39.9 | 36.3 | 35.4 |
| Equals: National defense consumption expenditures, NIPA's $\qquad$ | 307.5 | 304.7 | 305.7 |

[^11]the budget, and it excludes government investment in fixed assets, which is included in budget outlays. For 1999, nIPA current expenditures would exceed budget outlays by $\$ 110.6$ billion; contributions to government employee retirement funds would be $\$ 73.8$ billion, proprietary receipts would be $\$ 33.1$ billion, and the consumption of fixed capital would exceed investment by $\$ 14.3$ billion.

In the nipa framework, budget outlays for national defense are included in both consumption expenditures and gross investment. These outlays differ from the nIpa estimates for four principal reasons (table 6). First, some defense outlays, primarily disbursements for foreign military sales, are treated as exports in the nipa's. Second, NIPA expenditures are recorded on a delivery basis, and budget outlays are recorded on a cash basis; thus, in the NIPA's, all work-in-progress except shipbuilding is included in the change-in-business-inventories component of gross domestic product. Third, in defense outlays, the cost of the military retirement program is measured as the cash payment from the military personnel appropriation account to the military retirement trust fund. In the nipa's, a payment is added to amortize the unfunded liability for military retirement benefits earned by military personnel for service before 1985, and a payment is also added to amortize the unfunded liability for civilian retirement benefits; these payments are recorded in the budget as intergovernmental

| Surplus or deficit ( - ) .............. | 18.8 | 2.6 | 19.4 | -16.2 | 16.8 |

1. The NIPA current surpus or deficit reflects the treament of oovernment investment which was introduced in January 1996. Current expenditures now include (1) consumption of fixed capital or general government in consumption expenditures, and (2) consumption of fixed capital for for government enterprises as an expense in the calculation of the current suplus of govern-
ment enterprises. Gross investment in fixed assets by general government enterprises is no longer classified as a current-account expenditure in the year the asset is purchased but is ciassified, instead, as an expenditure over the service life of the asset.
Sources: The Budget of the United States Government. Fiscal Year 1999 and the Bureau of Economic Analysis.
NIPA National income and product accounts
transactions. Fourth, the NIPA measure includes general government consumption of fixed capital.

The differences between the budget and nipa estimates of receipts, of outlays, and of the current surplus or deficit are summarized in table 7 . Unlike the budget, which would record a surplus in 1999, the Nipa's would record a deficit primarily because of the difference in the treatment of government investment in fixed assets; the consumption of fixed capital that is included in the Nipa's is greater than the investment that is excluded.

## Fiscal year 1999 NIPA estimates

In the NIPA framework, the current deficit in fiscal year 1999 would decrease $\$ 2.7$ billion, to $\$ 9.9$ billion, after decreasing $\$ 28.1$ billion in fiscal year 1998 (chart 1). This slowdown is due to an acceleration in current expenditures and a deceleration in receipts. The acceleration in current expenditures is due to accelerations in grants-in-aid to State and local governments, transfer payments, and consumption expenditures. The deceleration in receipts is attributable to a deceleration in corporate profits tax accruals.
In the nipa framework, Federal current expenditures would increase $\$ 65.3$ billion in fiscal year 1999 to $\$ 1,843.8$ billion (chart 2). Transfer payments would increase $\$ 36.1$ billion- $\$ 14.5$ billion for social security and $\$ 10.0$ billion for medicare (table 8). Grants-in-aid to State and local governments would increase $\$ 23.4$ billion- $\$ 6.7$ billion for medicaid, $\$ 5.3$ billion for health care, and $\$ 6.9$ for other grants programs. Nondefense

consumption expenditures would increase $\$ 8.0$ billion.
In the nipa framework, Federal receipts would increase $\$ 68.0$ billion in fiscal year 1999 to $\$ 1,883.9$ billion (chart 3): $\$ 57.5$ billion of the increase is due to a higher tax base, and $\$ 10.5$ billion is due to proposed legislation (table 9). The increase in total receipts reflects increases in contributions for social insurance ( $\$ 30.3$ billion), personal taxes ( $\$ 22.7$ billion), indirect business taxes

Sources: The Budget of the Uniled States Government, Fiscal Year 1999, and the Bureau of Economic Analysis.
( $\$ 11.9$ billion), and corporate profits tax accruals ( $\$ 3.1$ billion). The increase in contributions for social insurance reflects higher contributions for the old-age, survivors, disability, and hospital insurance programs. The increase in personal taxes reflects higher withheld income taxes, and the increase in indirect business taxes reflects the proposed tobacco settlement.

Quarterly pattern.-Seasonally adjusted quarterly estimates of NIPA receipts and current expenditures that are consistent with the budget estimates of receipts and outlays for the fiscal year are shown in table 10. The nipa estimates of receipts reflect the quarterly pattern that results from the enacted and proposed legislation and from the administration's projected quarterly pattern of wages and profits. The NIPA estimates of current expenditures reflect the quarterly pattern that results from the enacted and proposed legislation that would adjust pay for Federal Government
employees and provide cost-of-living increases in social security.
In the NIPA framework, the current deficit trends downward from the first quarter of 1997 through the fourth quarter of 1997 and then increases in the first quarter of 1998. The first-quarter 1998 increase reflects the following: Decreases in personal taxes, cost-of-living adjustments that increase social security ( 2.1 percent), and adjustments to Federal employee pay ( 2.8 percent).
The current deficit decreases from the second quarter of 1998 through the fourth quarter of 1998, increases in the first quarter of 1999, and then decreases slightly throughout the third quarter of 1999. The first-quarter increase reflects the following: Cost-of-living adjustments that increase social security ( 2.2 percent), adjustments to Federal employee pay ( 3.1 percent), and higher grants-in-aid to State and local governments.
Table 10 follows.

# Gross Product by Industry Price Measures, 1977-96 

By Robert E. Yuskavage

Brian C. Moyer, John Sporing, and Robert A. Sylvester assisted in the preparation of the estimates and the tables.

$\tau$his article presents annual estimates of prices and unit costs by industry group for 1977-96. The price measures of gross product originating by industry (GPo) provide insight into the sources of change in the aggregate price level by industry. For example, the relative growth rates of prices among industries can be compared, and their contributions to the aggregate (economy-wide) rate of price change can be computed. The unit-cost measures by industry can be used to identify the sources of GPO price change among the cost components of GPO-compensation of employees, indirect business taxes, and property-type income.

These measures of gro prices and unit costs have not previously been included in the articles
on gross product by industry in the Survey of Current Business, and providing them marks another step in continuing efforts by the Bureau of Economic Analysis (bea) to make the industry accounts data more useful. Until last year, these articles dealt almost exclusively with current-dollar and real gPo. In November 1997, bea presented and discussed annual estimates of gross output and intermediate inputs by industry for the first time. ${ }^{1}$

The first part of this article discusses the measurement and interpretation of GPO prices, including the relationship of GPO prices to gross

[^12]
## Gross Product Originating: Definition and Relationship to Gross Domestic Product

Gross product, or gross product originating (GPo), by industry is the contribution of each private industry and of government to the Nation's output, or gross domestic product (GDP). An industry's gro, often referred to as its "value added," is equal to its gross output (sales or receipts and other operating income, commodity taxes, and inventory change) minus its intermediate inputs (consumption of goods and services purchased from other industries or imported).

For the national income and product accounts (NIPA's), GDP is measured as the sum of expenditure components. Gross domestic income (GDI) is measured as the sum of costs incurred and incomes earned in the production of GDP. In concept, GDP and GDI should be the same; in practice, they differ because their components are estimated using largely independent and less-than-perfect source data. bea views gdp as the more reliable measure of output because the source data underlying the estimates of expenditures are considered to be more accurate. ${ }^{1}$ The difference between GDP and GDI is the "statistical discrepancy"; it is recorded in the nIPA's as an "income" component that reconciles GDI with GDP.

Current-dollar GPo by industry is measured as the sum of distributions by industry of the components of GDI. Consequently, the sum of the current-dollar GPO estimates also differs from current-dollar GDP by the statistical discrepancy. In presenting the gro estimates, the statistical discrepancy is included in the GPo of private industries because of bea's view that most of the measurement problems with

[^13]the components of GDI affect the GPO of private industries rather than the GPO of general government or government enterprises. ${ }^{2}$
Real GDP in the NIPA's is also measured as the sum of the expenditure components. Real gPO estimates for most industries are derived using separate estimates of gross output and intermediate inputs. ${ }^{3}$ The sum of the real GPO estimates differs from real GDP by the real statistical discrepancy, which is shown as part of private-industry GPO, and by the category entitled "not allocated by industry," which is the difference between real GDP and the sum of real GPO for the detailed industries and of the statistical discrepancy. The value of the category "not allocated by industry" reflects the lack of additivity of detailed real gro estimates that results from the formula used to calculate real output and from differences in the source data (both current dollars and prices) used to estimate industry gro and the expenditures measure of real GDP. As with the current-dollar measures, bea views the source data used to estimate the components of real GDP to be more reliable. In addition, the amount of detailed data available to calculate real GDP is greater than that for the gross output and intermediate inputs available to calculate real gro. For some industries, no source data are available to measure gross output, and the resulting real gro estimates are prepared using less reliable methodologies.

[^14]output prices and intermediate inputs prices. The second part develops the concept of unit costs in the context of the gro estimates, and it describes how these measures can be used to analyze changes in industry-cost structure and the return to capital. The third part discusses trends in geo prices and unit costs by industry group for 1992-96. Tables 4 and 5 at the end of the article present industry price and unit-cost measures by industry group for 1977-96.

## gro Prices

The gro price index for an industry or industry group represents the implicit price for gross output less intermediate inputs. For most industries and industry groups, the gro price measures are chain-type Fisher price indexes computed from data on gross output and intermediate inputs. For some industries, the GPO price measures are implicit price deflators because data for gross output prices are not available.
Gpo can be defined as either an output measure (gross output less intermediate inputs) or as an input measure (costs incurred and incomes earned); see the box "Gross Product Originating." The measurement of the gro price index is based on gro's definition as an output measure. As an output measure, GPO is the difference between the industry's gross output and its intermediate inputs. Real GPO and the GPO price index can be derived from these separate measures using the double-deflation method. In the double-deflation method, estimates of gross output and of intermediate inputs are used in the calculation of real Gpo. ${ }^{2}$ As an input measure, an industry's GPo represents the value-added inputs (labor services and capital services) that are combined with the intermediate inputs (energy, materials, and purchased services) to produce the gross output of the industry. The gro price index thus represents the implicit price paid by the industry for its value-added inputs. Changes in the GPO price index for the industries for which the double-deflation method is used primarily reflect (1) changes in the prices and quantities of the gross output of the industry, (2) changes in the prices and quantities of the intermediate inputs used by the industry, and (3) changes in the ratio of intermediate inputs to gross output.

[^15]
## Gross output

Gross output prices represent the prices received by an industry for its products. The chain-type price index for gross output is computed from detailed data for the industry on product sales, shipments, and prices. Data on current-dollar product sales and shipments by industry are primarily from annual surveys by the Bureau of the Census. Detailed price indexes for manufacturing and wholesale trade are primarily producer price indexes (PpI's) from the Bureau of Labor Statistics (bls). Price indexes for farm products are from the U.S. Department of Agriculture, and price indexes for mineral products are mostly from the U.S. Department of Interior and the U.S. Department of Energy. Price indexes for selected products-including computers, semiconductors, digital telephone switching equipment, and selected equipment purchased by the U.S. Department of Defense-are from the national income and product accounts (nipa's). Price indexes for retail trade and for services are primarily bls consumer price indexes (CPI's), or they are derived from the nipa's. ${ }^{3}$

## Intermediate inputs

Intermediate inputs prices represent the prices paid by an industry for its inputs of raw materials, semifinished goods, energy, and services purchased from other industries. The chain-type price index for intermediate inputs is computed from detailed data on industry product purchases and prices. Data on the commodity (product) composition of current-dollar intermediate inputs by industry are obtained primarily from bea's input-output accounts. ${ }^{4}$ Detailed price indexes for inputs of manufactured goods are from bls: Primarily ppi's for domestic goods and international price indexes for imports. These indexes are supplemented by selected price indexes from the NIPA's. Detailed price indexes for inputs of services are primarily CPI's, or gross output implicit price deflators. ${ }^{5}$

## Input-output ratio

An industry's input-output ( $\mathrm{I}-\mathrm{o}$ ) ratio is computed as its intermediate inputs divided by its

[^16]gross output. For an industry with one product, changes in the I-O ratio from year to year reflect shifts in the mix between intermediate inputs and value-added inputs (labor services and capital services). Such shifts may be viewed as changes in production technology that result from changes in the optimal input mix. Examples include economies of scale that result from changes in the rate of output and the contracting out of services that were once performed in-house by employees. At the gro industry level, which approximates the two-digit Standard Industrial Classification (sic), changes in the I-O ratio may also reflect changes in the relative size of the detailed industries that the gro industry comprises.
The gro price index can be viewed as a weighted average of gross output prices less intermediate inputs prices; thus, changes in the I-O ratio affect the GPO price index by changing the relative weights associated with these prices. Normally, this effect is small in comparison with the effects of changes in gross output prices or of changes in intermediate inputs prices. ${ }^{6}$

## Relationship to NIPA prices

For the nipa's, gross domestic product (gdp) is measured as the sum of final expenditures. GDP can also be measured as the sum of industry value added. In concept, the GDP price and quantity indexes computed from nIpA final expenditures are consistent with those computed from industry value added because both approaches exclude intermediate inputs. Consistency is maintained between the two approaches by the use of common source data for prices whenever possible. For example, the price indexes that are used for the producers' durable equipment component of nIPA final expenditures are also used for the gross output of durable goods manufacturing industries.
In practice, the results of the two approaches differ because of the lack of data for gross output prices for certain private services-producing industries and because of the lack of annual data for the commodity composition of intermediate inputs by industry. In addition, the two approaches differ in the treatment of trade margins and transport costs. In the niPA's, final expenditures are valued in purchasers' prices which include the wholesale trade and retail trade margins and transport costs incurred as goods move

[^17]through the distribution system from producers (or importers) to final users. In the industry approach, value added is valued in producers' prices. Price measures associated with trade margins and transport costs are classified in the wholesale trade, retail trade, and transportation industries. ${ }^{7}$

As a result, price measures for specific GPO industries are not necessarily comparable to price measures for related nipa expenditure components. For example, the NIPA chain-type price index for all durable goods products may differ from the GPO price index for durable goods manufacturing. GDP prices by type of expenditure reflect the prices of goods and services purchased for final use, whether domestically produced or imported; GPO prices by industry reflect the prices of the industry's gross output net of intermediate inputs. Gross output prices from the industry approach are more comparable to NIPA final expenditure prices, but gross output prices reflect sales by an industry to all of its customers, whereas nipa price measures reflect sales to final purchasers, including sales of imports.

## gro Unit Costs

gro unit costs show the contribution of the cost components of GPO to the GPO price index. GPO measures of unit cost are computed by dividing current-dollar GPO and its components by real (chained-dollar) GPo. ${ }^{8}$ The resulting quotients provide the gro chain-type price index and the part of the price index associated with each component. If the unit cost for a component grows faster than the GPO price index, then the relative importance of that component in the cost structure has increased.
As an input measure, current-dollar gPO is measured as the sum of costs incurred and incomes earned in production; it is equal to gross domestic income, the components of which can be grouped into categories that approximate the shares of labor and capital. The labor share of production can be approximated using compensation of employees, which consists of wage and salary accruals, employer contributions for social insurance, and other labor income (primarily employer contributions to private pension

[^18]plans and health insurance). The capital share of production (property-type income) can be approximated using the remaining components of gro except indirect business tax and nontax liability, which is excluded because it can be viewed as a part of the pretax return to capital that accrues to government rather than to business. ${ }^{9}$
GPO unit-cost measures for compensation of employees (unit labor costs) include wage and salary accruals, employer contributions for social insurance, and other labor income. Unit-cost measures for property-type income (income per unit of gross product) include both debt-financed and equity-financed capital, including capital consumption allowances. Gpo unit-cost measures do not provide information on the separate contributions of labor and capital services or of labor and capital prices to the change in GPO prices, because GPO unit-cost measures attribute changes in GPO unit prices to the components of GPo in proportion to each component's share of current-dollar Gpo. Thus, year-to-year changes in component shares of current-dollar GPO will result in changes in the contributions of the components to GPo prices, even if the prices do not change.

## gPo Prices and Unit Costs for 1992-96

This part of the article presents estimates of changes in GPO prices and unit costs by industry group for 1992-96. The first section discusses differences in GPO price changes among industries, including the effects of differences in changes in gross output prices and in intermediate inputs prices. The second section discusses the contributions of GPO components to changes in the GPO price index.

## gro price changes

The GDP chain-type price index increased at an average annual rate of 2.5 percent in 1992-96; private industries increased 2.2 percent, and government increased 3.3 percent (table 1). Among the private industry groups, the GPO price index for durable goods manufacturing declined 1.2 percent. The gro price indexes for all the other industry groups increased; the increases ranged from 0.4 percent for electric, gas, and sanitary services to 3.8 percent for agriculture, forestry,

[^19]and fishing. Except for electric, gas, and sanitary services, the industry groups with GPO price changes that were less than the GDP price change ( 2.5 percent) were those associated with the pro-

1. Gross product price index

Consists of agriculture, forestry, and fishing; mining; construction; and manufacturing
3. Consists of transportation and public utilities; wholesale trade; retail trade; finance, insur
ance, and real estate; and sevices.
NOTE--Estimates for gross output and for intermediate inputs are shown only for industry groups for which the double-deflation method is used for each detailed industry in the group.
duction and distribution of manufactured goods (manufacturing, transportation, wholesale trade, and retail trade).

The Gpo price changes for private servicesproducing industries ( 2.6 percent) exceeded the GDP price change, and the GPO price change for private goods-producing industries ( 1.2 percent) was less than the GDP price change. The slower growth in the GPo price index for private goodsproducing industries, compared with the growth for private services-producing industries, continues a trend that started in 1982 and continued each year except for 1989 (chart 1). In 1989, the GPO price index for goods-producing industries was boosted by a relatively large increase in gross output prices for oil and gas extraction. Since 1977, GPO prices for private services-producing industries have increased faster than GDP prices; since 1992, a deceleration in GPO prices for private services-producing industries has contributed to a deceleration in GDP prices.

As mentioned earlier, the GPo price index can be viewed as a weighted average of gross output prices and intermediate inputs prices for industries for which the double-deflation method is used. Changes in gro prices are positively correlated with changes in gross output prices and negatively correlated with changes in intermediate inputs prices. GPO prices increase faster than gross output prices when gross output prices increase faster than intermediate inputs

## CHART 1

Chain-Type Price Indexes

$\begin{array}{llllllllll}1977 & 79 & 81 & 83 & 85 & 87 & 89 & 91 & 93 & 95\end{array}$

1. Consists of agricuture, forestry, and fishing; mining; construction; and manufacuring. 2. Consists of transportation and pubtic utilities; wholesale trade; retail trade; finance, insurance and real estate; and services.
U.S. Department of Commerce, Bureau of Economic Analysis
prices; conversely, GPO prices increase slower than gross output prices when gross output prices increase slower than intermediate inputs prices. In 1992-96, GPO prices increased faster than gross output prices in agriculture, forestry, and fishing, in construction, and in communications. GPO prices increased slower than gross output prices in all other industry groups.
In 1996, the GPO price index for private industries increased 2.4 percent, slightly more than the 2.3 -percent increase in the GDP price index. The GPO price index for manufacturing declined for the second consecutive year, as an increase in nondurable goods was more than offset by a decline in durable goods. Three of the four other industry groups for which the Gpo price index either increased less than the GDP price index or decreased are at least partly involved with the distribution of goods to consumers: Transportation (o.6 percent), electric, gas, and sanitary services ( 0.3 percent), wholesale trade ( -1.1 percent), and retail trade ( 0.5 percent). Among the industry groups for which the GPO price index increased more than the GDP price index, the increases were large in agriculture, forestry, and fishing ( 16.6 percent) and mining ( 21.0 percent). The increases were smaller in finance, insurance, and real estate ( 4.1 percent) and services ( 3.4 percent). Government increased 3.7 percent.

Contributions to change.-Gpo prices can be used to assess an industry's contribution to the change in GDP prices. Because real GDP can be viewed as the combined result of aggregate inputs of labor services and capital services, the GDP price index can be viewed as the price index for aggregate inputs of labor services and capital services. Because gro as an input measure represents the industry's value-added inputs of labor services and capital services, the GPo price index can be used to compute contributions to GDP price change.

The extent to which industries contribute to the change in the GDP price index depends on the industry's size relative to GDP as well as on the growth rates in GPO prices. ${ }^{10}$ In 1992-96, the largest contributors to the change in the GDP price index were services and finance, insurance, and real estate ( 0.7 percentage point each) (table 2). Government contributed 0.5 per-

[^20]centage points. ${ }^{11}$ In manufacturing, prices were unchanged, so the contribution of manufacturing prices to GDP price change was o.o percentage point; durable goods manufacturing contributed -o.1 percentage point. In 1995 and 1996, the contribution of durable goods manufacturing was -0.3 percentage point. Finance, insurance, and real estate made the largest positive contribution in each of those years ( 0.8 percentage point).

Gross output prices.-Gross output prices, which are the prices received by producers, can be viewed as a weighted average of the prices for intermediate inputs and for value-added inputs (labor services and capital services). In manufacturing, gross output prices increased only 1.1 percent in 1992-96. Gross output prices in durable goods manufacturing were unchanged, while gross output prices in nondurable goods manufacturing increased 2.3 percent. The slow growth in the prices of manufactured products, especially durable goods, together with the de-
11. The GPO price index for government is an implicit price deflator computed as current-dollar gro divided by real (chained-dollar) gro. For general government, which comprises most of government, current-dollar GPO consists of compensation of employees and consumption of fixed capital. Real consumption of fixed capital is estimated by direct deflation using price indexes from the NIPA's. Real compensation of employees is estimated by extrapolating base-year current-dollar values by an indicator of labor input.
celeration of prices for private services-producing industries, have contributed substantially to the low rate of GDP price change since 1992.

Within durable goods manufacturing, gross output prices in 1992-96 declined in electronic and other electric equipment ( 5.7 percent) and industrial machinery and equipment ( 2.8 percent). The declines were primarily for products deflated with bea's quality-adjusted price indexes: Computers, semiconductors, and digital telephone switching equipment. Gross output price increases in the remaining industries ranged from 1.0 percent for instruments and related products to 4.4 percent for lumber and wood products.

## Unit costs

Because the gro price index measures the change in the cost of the value-added inputs of labor services and capital services, it can be used in combination with the components of GPo to assess their contributions to the change in total value-added costs. When a component of gro unit costs grows faster than the gro price index, then that component's contribution to the growth in unit costs has increased.
The cost per unit of real gro for private industries increased 2.2 percent in 1992-96 (table 3).

[^21]Equals GDP measured as the sum of expenditures less gross domestic income
2. Equals GDP measured as the sum of expenditures less gross domestic income.
3. Equals GDP less the statistical discrepancy and the sum of GPO of the detailed industries. NOTE.-For information on the calculation of the contributions to percent change, see footnote 10 in the text.

Compensation of employees per unit of gro (unit labor costs) increased 1.7 percent. Unit costs for indirect business tax and nontax liability increased 0.8 percent, and unit costs for propertytype income increased 3.2 percent. The larger increase in the unit costs for property-type income indicates that capital costs became a larger part of GPO unit costs during the period or that the return to capital per unit of gross product increased.

In 1992-96, unit labor costs declined in two private industry groups: Mining and durable goods manufacturing. Unit labor costs increased in all other private industry groups except wholesale trade, which was unchanged. In agriculture, forestry, and fishing and in services, the increases in unit labor costs were larger than the increases in total unit costs.

As with Gpo prices, declines and relatively small increases in unit labor costs were in industry groups involved with the production and distribution of goods. In manufacturing, unit labor costs declined at an average annual rate of 1.7 percent in 1992-96, compared with a o.2-percent increase in total unit costs. Unit labor costs in durable goods manufacturing declined 3.5 percent, while total unit costs declined 1.2 percent. In wholesale trade, in retail trade, and in transportation and public utilities, the increases in unit labor costs were substantially smaller than the increases in total unit costs.
In 1996, unit labor costs increased 1.9 percent in all private industries, less than the increase in total unit costs ( 2.4 percent). Unit labor costs increased in all private industry groups except durable goods manufacturing and wholesale trade. Durable goods manufacturing fell 3.9 percent; this fall marked the fourth consecutive year that unit labor costs fell in this industry group. Unit labor costs in manufacturing fell 1.1 percent, the third consecutive annual decline, despite an increase in nondurable goods manufacturing.
In 1996, the increases in unit labor costs exceeded the increase in total unit costs in only three industries: Construction; finance, insurance, and real estate; and services. In construction, unit labor costs rose faster than total unit costs for the first time since 1992; unit property-type income increased only 0.6 percent. In finance, insurance, and real estate, unit labor costs increased considerably more than in the 2 preceding years. In services, the increase in unit labor costs was somewhat less than the increase in 1995.

1. Gross product price index.

Consists of agriculture, forestry, and fishing; mining; construction; and manufacturing.
3. Consists of transportation and public utilities; wholesale trade; retail trade; finance, insurance, and real estate; and services.

NOTES-Estimates for gross output and for intermediate inputs are shown only for industry groups for which the double-deflation method is used for each detailed industry in the group See footnote 2 in the text
Estimates for 1977-86 are shown on the basis of the 1972 Standard Industrial Classification (SIC). Estimates for 1987-96 are shown on the basis of the 1987 SIC.

# A Guide to the nipa's 

By Eugene P. Seskin and Robert P. Parker

$\tau$his guide presents information on the structure, definitions, presentation, and methodologies that underlie the national income and product accounts (NIPA's). This information is from the forthcoming publication National Income and Product Accounts of the United States, 1929-94 and includes the "Updated Summary nipa Methodologies" that was published in the September 1997 issue of the Survey of Current Business. The information reflects the changes that were introduced in the most recent comprehensive and annual revisions of the NIPA's.
The nIPA's show the composition of production and the distribution of incomes earned in production. Thus, they represent a critical element of the U.S. economic accounts, which are designed to provide a consistent and comprehensive picture of the Nation's economy.

The first section of this article describes the definitions and classifications underlying the nIPA's. The second section discusses the presentation of the nipa's, and the third section discusses the statistical conventions used for the nipa estimates. An appendix lists the principal source data and methods used to prepare the estimates of gross domestic product (GDP).

## Definitions and Classifications Underlying the NIPA's

## NIPA entries

The major components of the NIPA's are presented and defined below within the context of the Summary National Income and Product Accounts (see table A on page 28). The five summary accounts show the composition of production and the distribution of the incomes earned in production. In these accounts, production consists of the goods, services, and structures that are produced in the current period. Production, or "current production," and its related incomes do not include gains or losses from the sale of nonproduced assets, such as land, or of financial assets, such as stocks and bonds. In
addition, production does not include gains or losses from holding goods in inventories.

The first summary account is the National Income and Product Account: The right side shows GDP as measured by the sum of goods and services produced in the United States and sold to final users, and the left side shows GDP as measured by the incomes earned in production (gross domestic income) and the "statistical discrepancy" between the two measures. Each of the components in this summary account can be mapped to one of the other summary accounts and can, in turn, be mapped to one or more of the 142 tables that make up the full set of nipa tables. This system of integrated, double-entry accounts provides a comprehensive and unduplicated measure of economic activity within a consistently defined framework. ${ }^{1}$ Thus, the NIPA's-together with the industry, wealth, and regional accounts-can be used to trace the principal economic flows among the major sectors of the economy.
Within the summary accounts, each entry has a counterentry, generally in another account. The parenthetical numbers that follow an entry in table A identify the counterentry by account and line number. Except for the major income and product aggregates, the entries are usually defined in the sequence in which they appear in the five-account summary.

The definition of a component is not repeated for the counterentry, but a cross-reference is made to the first appearance of the definition. After the components in the five-accountsummary are defined, the following other definitions are presented: Final sales of domestic product, gross domestic purchases, final sales to domestic purchasers, population, personal saving as a percentage of disposable personal income, gross saving as a percentage of gross national

[^22]product, U.S. residents, foreign residents, and the rest of the world.

## Major aggregates

Gross domestic product (GDP), the featured measure of U.S. output, is the market value of the goods and services produced by labor and property located in the United States. Because the labor and property are located in the United States, the suppliers (that is, the workers and, for property, the owners) may be either U.S. residents or residents of the rest of the world.

Gross domestic income (GDI) (1-34) measures output as the costs incurred and the incomes earned in the production of GDP. In theory, GDP should equal GDI, but in practice, they differ because their components are estimated using
largely independent and less-than-perfect source data. This difference is termed the "statistical discrepancy" (see page 34 ).

Gross national product (GNP) is the market value of the goods and services produced by labor and property supplied by U.S. residents. Because the labor and property are supplied by U.S. residents (see page 36), they may be located either in the United States or abroad. The difference between GDP and GNP is net receipts of factor income from the rest of the world. These net receipts represent income from the goods and services produced abroad using the labor and property supplied by U.S. residents less payments to the rest of the world for the goods and services

Text continues on page 30.

## Information About nipa Methodology

As part of each comprehensive and annual revision of the NIPA's, BEA publishes a summary description of the principal source data and methods used to prepare the current-dollar and real estimates of gross domestic product. The most recent "Updated Summary nipa Methodologies" was published in the September 1997 issue of the Survey of Current Business and is reprinted as an appendix in this article.
bea has also prepared a series of papers that discuss the concepts that underlie the nipa's and that present detailed descriptions of the methodologies used to prepare the NIPA estimates. ${ }^{1}$ Note, however, that the methodologies described in these papers are subject to periodic improvements, usually as part of the annual and comprehensive revisions of the NIPA estimates. These improvements-which consist of changes in definitions and in source data, the incorporation of new source data, and the use of new estimating methodsare described in the Survey. For example, two major improvements were the shift to gross domestic product as the featured measure of U.S. production and the introduction of a new treatment of government investment. ${ }^{2}$
Copies of the following methodology papers are available from the National Technical Information Service (NTIS).

- An Introduction to National Economic Accounting, Methodology Paper No. 1 (1985)-NTIS accession no. PB85-247567, \$12.50

[^23]- Corporate Profits: Profits Before Tax, Profits Tax Liability, and Dividends, Methodology Paper No. 2 (1985)-NTIS accession no. PB85-245397, \$27.00
- Foreign Transactions, Methodology Paper No. 3 (1987)-NTIS accession no. PB88-100649, \$27.00
- gnp: An Overview of Source Data and Estimating Methods, Methodology Paper No. 4 (1987)-NTIS accession no. PB88-134838, \$24.50
- Government Transactions, Methodology Paper No. 5 (1988)-NTIS accession no. PB90-118480, $\$ 31.50$
- Personal Consumption Expenditures, Methodology Paper No. 6 (1990)-NTIS accession no. Pb90-254244, \$27.00

The results of the most recent comprehensive and annual revisions are published in the following Survey articles.

- "Annual Revision of the National Income and Product Accounts: Annual Estimates, 1993-96, and Quarterly Estimates 1993:I-1997:I" (August 1997)
- "Preview of the Comprehensive Revision of the National Income and Product Accounts: bea's New Featured Measures of Output and Prices" (July 1995)
- "Preview of the Comprehensive Revision of the National Income and Product Accounts: Recognition of Government Investment and Incorporation of a New Methodology for Calculating Depreciation" (September 1995)
- "Preview of the Comprehensive Revision of the National Income and Product Accounts: New and Redesigned Tables" (October 1995)
- "Improved Estimates of the National Income and Product Accounts: Results of the Comprehensive Revision" (January/February 1996)
- "Completion of the Comprehensive Revision of the National Income and Product Accounts, 1929-96" (May 1997)

The methodological information on the nIPA's is also available on bea's Web site at [http://www.bea.doc.gov](http://www.bea.doc.gov).

[^25]produced in the United States using the labor and property supplied by foreign residents. Factor incomes are measured as compensation of employees, corporate profits (dividends, earnings of unincorporated affiliates, and reinvested earnings of incorporated affiliates), and interest.

Gross national income (GNI) (1-31) is the costs incurred and the incomes earned in the production of GNP. GNI is the sum of (1) factor incomes-compensation of employees, proprietors' income, rental income of persons, corporate profits, and net interest; (2) three nonfactor charges-business transfer payments, indirect business taxes, and the current surplus of government enterprises less government subsidy payments; and (3) consumption of fixed capital (cfc), which is the fixed capital "used up" in the production process during the accounting period. GNI and GNP also differ by the statistical discrepancy.

Net domestic product (ndP) is the net market value of the goods and services attributable to labor and property located in the United States and is equal to GDP less CFC.
Net national product (NNP) is the net market value of goods and services attributable to the labor and property supplied by U.S. residents and is equal to GNP less CFC. The measure of CFC used for both NDP and NNP relates only to fixed capital located in the United States. Investment in the capital is measured by private fixed investment and government gross investment.

National income (1-20) is the sum of the factor incomes. It is a net factor-cost measure (net of CFC ) equal to the income that originates in the production of goods and services from labor and property supplied by U.S. residents.

Domestic income, also a net factor-cost measure, is the income that originates in the production of goods and services attributable to labor and property located in the United States.
Personal income is the income received by persons from all sources-that is, from participation in production, from both government and business transfer payments, and from government interest (which is treated like a transfer payment). "Persons" consists of individuals, nonprofit institutions that primarily serve individuals, private noninsured welfare funds, and private trust funds. Personal income is calculated as the sum of wage and salary disbursements, other labor income, proprietors' income with
inventory valuation and capital consumption adjustments, rental income of persons with capital consumption adjustment, personal dividend income, personal interest income, and transfer payments to persons, less personal contributions for social insurance.
Disposable personal income is personal income less personal tax and nontax payments. It is the income available to persons for spending or saving.

## National income and product account

GDP is measured as the sum of personal consumption expenditures, gross private domestic investment (including change in business inventories and before deduction of charges for CFC), net exports of goods and services (exports less imports), and government consumption expenditures and gross investment. GDP excludes intermediate purchases of goods and services by business.

Personal consumption expenditures (1-36) is goods and services purchased by persons resident in the United States. Personal consumption expenditures (PCE) consists mainly of purchases of new goods and of services by individuals from business. In addition, PCE includes purchases of new goods and of services by nonprofit institutions (including compensation of employees), net purchases of used goods by individuals and nonprofit institutions, and purchases abroad of goods and services by U.S. residents. ${ }^{2}$ PCE also includes purchases for certain goods and services provided by government agencies-primarily tuition payments for higher education, charges for medical care, and charges for water and sanitary services. Finally, PCE includes imputed purchases that keep PCE invariant to changes in the way that certain activities are carried out-for example, whether housing is rented or owned, whether financial services are explicitly charged, or whether employees are paid in cash or in kind.
The following conventions are used to classify each PCE commodity: Durable goods (1-37) are commodities that can be stored or inventoried and that have an average life of at least 3 years; nondurable goods ( $1-38$ ) are all other commodities that can be stored or inventoried; and services (1-39) are commodities that cannot be stored and that are consumed at the place and time of purchase.

[^26]Gross private domestic investment (1-40) consists of fixed investment ( $1-41$ ) and change in business inventories (1-46). Fixed investment consists of both nonresidential (1-42) fixed investment and residential (1-45) fixed investment. It consists of purchases of fixed assets, which are commodities that will be used in a production process for more than 1 year, including replacements and additions to the capital stock, and it is measured before a deduction for consumption of fixed capital. It covers all investment by private businesses and by nonprofit institutions in the United States, regardless of whether the investment is owned by U.S. residents. (Purchases of the same types of equipment and structures by government agencies are included in government gross investment.) It excludes investment by U.S. residents in other countries. Nonresidential fixed investment consists of both structures (1-43) and producers' durable equipment (PDE) (1-44).

Nonresidential structures consists of new construction, brokers' commissions on sales of structures, and net purchases of used structures by private business and by nonprofit institutions from government agencies. New construction also includes hotels and motels and mining exploration, shafts, and wells.
Nonresidential pDe consists of private business purchases on capital account of new machinery, equipment such as furniture, and vehicles (except for personal-use portions of equipment purchased for both business and personal use, which are included in PCE), dealers' margins on sales of used equipment, and net purchases of used equipment from government agencies, from persons, and from the rest of the world.
Residential fixed investment consists of private structures and of residential PDE-equipment owned by landlords and rented to tenants. Investment in structures consists of new units, improvements to existing units, mobile homes, brokers' commissions on the sale of residential property, and net purchases of used structures from government agencies.

Change in business inventories (1-46) is the change in the physical volume of goods purchased by private business for use in the production of other commodities or for resale, valued in average prices of the period. It differs from the change in the book value of inventories reported by most business; the difference is the inventory valuation adjustment (described on the next page).
Net exports of goods and services (1-47) is exports ( $1-48$ ) less imports ( $1-49$ ) of goods and
services. Receipts and payments of factor income and transfer payments to the rest of the world (net) are excluded.

Government consumption expenditures and gross investment ( $1-50$ ) consists of net purchases of goods, services, and structures from business and from the rest of the world by general government; payments by general government to households in the form of compensation of employees; the consumption of general government fixed capital, which represents the value of the current services of fixed assets of general government; net purchases of fixed assets by government enterprises; inventory change of government enterprises; and a deduction for general government sales-primarily tuition payments for higher education and charges for medical care. Of this total, gross investment is net purchases of new and used structures and equipment by general government and government enterprises; all other transactions are consumption expenditures. Government consumption expenditures and gross investment excludes purchases by government enterprises (except for fixed assets), transfer payments, interest paid or received by government, subsidies, and transactions in financial assets and in nonproduced assets, such as land.

Compensation of employees ( $1-1$ ) is the income accruing to employees as remuneration for their work. It is the sum of wage and salary accruals and of supplements to wages and salaries.

Wage and salary accruals ( $1-2$ ) consists of the monetary remuneration of employees, including the compensation of corporate officers; commissions, tips, and bonuses; voluntary employee contributions to certain deferred compensation plans, such as $401(\mathrm{k})$ plans; and receipts in kind that represent income. Wage and salary accruals consists of disbursements (1-3) and wage accruals less disbursements (1-4). Disbursements is wages and salaries as just defined except that retroactive wage payments are recorded when paid rather than when earned. Accruals less disbursements is the difference between wages earned, or accrued, and wages paid, or disbursed. In the nIPA's, wages accrued is the appropriate measure for national income, and wages disbursed is the appropriate measure for personal income.
Supplements to wages and salaries ( $1-5$ ) consists of employer contributions for social insurance and other labor income. Employer contributions for social insurance (1-6) consists of employer payments under the following Federal and State and local government programs: Old-age,
survivors, and disability insurance (social security); hospital insurance; unemployment insurance; railroad retirement; government employee retirement; pension benefit guaranty; veterans life insurance; publicly administered workers' compensation; military medical insurance; and temporary disability insurance. Other labor income (1-7) consists of employer payments (including payments in kind) to private pension and profit-sharing plans, private group health and life insurance plans, privately administered workers' compensation plans, supplemental unemployment benefit plans, corporate directors' fees, and several minor categories of employee compensation, including judicial fees to jurors and witnesses, compensation of prison inmates, and marriage fees to justices of the peace.
Proprietors' income with inventory valuation and capital consumption adjustments (1-8) is the current-production income (including income in kind) of sole proprietorships and partnerships and of tax-exempt cooperatives. The imputed net rental income of owner-occupants of farm dwellings is included; the imputed net rental income of owner-occupants of nonfarm dwellings is included in rental income of persons (described below). Proprietors' income excludes dividends and monetary interest received by nonfinancial business and rental incomes received by persons not primarily engaged in the real estate business; these incomes are included in dividends, net interest, and rental income of persons. (See "inventory valuation adjustment" and "capital consumption adjustment.")
Rental income of persons with capital consumption adjustment ( $1-9$ ) is the net currentproduction income of persons from the rental of real property except for the income of persons primarily engaged in the real estate business; the imputed net rental income of owner-occupants of nonfarm dwellings; and the royalties received by persons from patents, copyrights, and rights to natural resources. (See "capital consumption adjustment.")

Corporate profits with inventory valuation and capital consumption adjustments (1-10) is the net current-production income of organizations treated as corporations in the nipa's. These organizations consist of all entities required to file Federal corporate tax returns, including mutual financial institutions and cooperatives subject to Federal income tax; private noninsured pension funds; nonprofit institutions that primarily serve business; Federal Reserve banks; and federally sponsored credit agencies. With several differ-
ences, this income is measured as receipts less expenses as defined in Federal tax law. Among these differences: Receipts exclude capital gains and dividends received, expenses exclude depletion and capital losses and losses resulting from bad debts, inventory withdrawals are valued at replacement cost, and depreciation is on a consistent accounting basis and is valued at replacement cost using depreciation profiles based on empirical evidence on used-asset prices that generally suggest a geometric pattern of price declines. Because national income is defined as the income of U.S. residents, its profits component includes income earned abroad by U.S. corporations and excludes income earned in the United States by the rest of the world. (See "inventory valuation adjustment" and "capital consumption adjustment.")
Profits before tax (1-12) is the income of organizations treated as corporations in the nIPA's except that it reflects the inventory- and depreciation-accounting practices used for Federal income tax returns. It consists of profits tax liability, dividends, and undistributed corporate profits.
Profits tax liability (1-13) is the sum of Federal, State, and local income taxes on all income subject to taxes; this income includes capital gains and other income excluded from profits before tax. The taxes are measured on an accrual basis, net of applicable tax credits.
Profits after tax (1-14) is profits before tax less profits tax liability. It consists of dividends and undistributed corporate profits. Dividends (1-15) is payments in cash or other assets, excluding the corporations' own stock, that are made by corporations located in the United States and abroad to stockholders who are U.S. residents. The payments are measured net of dividends received by U.S. corporations. Dividends paid to State and local government social insurance funds and general government are included. Undistributed profits (1-16) is corporate profits after tax less dividends.
Inventory valuation adjustment (IvA) (1-17) for corporations is the difference between the cost of inventory withdrawals as valued in the source data used to determine profits before tax and the cost of withdrawals valued at replacement cost. It is needed because inventories as reported in the source data are often charged to cost of sales (that is, withdrawn) at their acquisition (historical) cost rather than at their replacement cost (the concept underlying the nipa's). As prices change, companies that value inventory with-
drawals at acquisition cost may realize profits or losses. Inventory profits, a capital-gains-like element in profits, result from an increase in inventory prices, and inventory losses, a capital-loss-like element in profits, result from a decrease in inventory prices. In the nIPA's, inventory profits or losses are shown as adjustments to business income (corporate profits and nonfarm proprietors' income); they are shown as the iva with the sign reversed. No adjustment is needed to farm proprietors' income because farm inventories are measured on a current-market-cost basis.

Net interest (1-19) is the interest paid by private business less the interest received by private business, plus the interest received from the rest of the world less the interest paid to the rest of the world. Interest payments on mortgage and home improvement loans and on home equity loans are counted as interest paid by business because home ownership is treated as a business in the nIPA's. In addition to monetary interest, net interest includes imputed interest, which is paid by corporate financial business and is measured as the difference between the property income received on depositors' or policyholders' funds and the amount of property income paid out explicitly. The imputed interest paid by life insurance carriers and noninsured pension plans attributes their investment income to persons in the period it is earned. The imputed interest payments by financial intermediaries other than life insurance carriers and private noninsured pension plans to persons, governments, and to the rest of the world have imputed service charges as counterentries in GDP and in net receipts of factor income from the rest of the world; they are included in personal consumption expenditures, in government consumption expenditures and gross investment, and in exports of goods and services, respectively.
Business transfer payments (1-21) consists of payments to persons ( $1-22$ ) and to the rest of the world ( $1-23$ ) by private business for which no current services are performed. Business transfer payments to persons consists primarily of liability payments for personal injury and of corporate gifts to nonprofit institutions. Business transfer payments to the rest of the world is nonresident taxes-taxes paid by domestic corporations to foreign governments.

Indirect business tax and nontax liability (1-24) consists of (1) tax liabilities that are chargeable to business expense in the calculation of profit-type incomes and (2) certain other business liabilities to general government agencies that are treated
like taxes. Indirect business taxes includes taxes on sales, property, and production. Employer contributions for social insurance are not included. Taxes on corporate incomes are not included; these taxes cannot be calculated until profits are known, and in that sense, they are not a business expense. Nontaxes includes regulatory and inspection fees, special assessments, fines and forfeitures, rents and royalties, and donations. Nontaxes generally excludes business purchases from general government agencies of goods and services that are similar to those provided by the private sector. Government receipts from the sales of such products are netted against government consumption expenditures.

Subsidies less current surplus of government enterprises (1-25). Subsidies is the monetary grants paid by government agencies to private business and to government enterprises at another level of government. The current surplus of government enterprises is their current operating revenue and subsidies received from other levels of government less their current expenses. In the calculation of their current surplus, no deduction is made for net interest paid. The current surplus of government enterprises is not counted as a profit-type income, and therefore, it is not counted as a factor charge. Subsidies and current surplus are shown as a combined entry because deficits incurred by some government enterprises may result from selling goods to business at below-market prices in lieu of giving them subsidies.

Consumption of fixed capital (1-26) is a charge for the using up of private and government fixed capital located in the United States. It is based on studies of prices of used equipment and structures in resale markets. For general government and for nonprofit institutions that primarily serve individuals, it is recorded in government consumption expenditures and in personal consumption expenditures, respectively, as the value of the current services of the fixed capital assets owned and used by these entities. Private capital consumption allowances consists of tax-return-based depreciation charges for corporations and nonfarm proprietorships and of historical-cost depreciation (calculated by bea using a geometric pattern of price declines) for farm proprietorships, rental income of persons, and nonprofit institutions. Private capital consumption adjustment is the difference between private capital consumption allowances and private consumption of fixed capital.

Receipts of factor income from the rest of the world (1-32) consists of receipts by U.S. residents of interest and dividends, of reinvested earnings of foreign affiliates of U.S. corporations, and of compensation paid to U.S. residents by foreigners.
Payments of factor income to the rest of the world ( $1-33$ ) consists of payments to foreign residents of interest and dividends, of reinvested earnings of U.S. affiliates of foreign corporations, and of compensation paid to foreigners by U.S. residents.

Statistical discrepancy (1-35) is GDP less GDI or gnp less gni. It is recorded in the nipa's as an "income" component that reconciles the income and product sides of the accounts. As noted above, it arises because the two sides are estimated using independent and imperfect data. ${ }^{3}$

## Personal income and outlay account

Personal income is the sum of wage and salary disbursements, other labor income, proprietors' income with inventory valuation and capital consumption adjustments, rental income of persons with capital consumption adjustment, personal dividend income, personal interest income, and transfer payments to persons, less personal contributions for social insurance.

Wage and salary disbursements (see 1-3).
Other labor income (see 1-7).
Proprietors' income with inventory valuation and capital consumption adjustments (see 1-8).

Rental income of persons with capital consumption adjustment (see 1-9).
Personal dividend income (2-11) is the dividend income of persons from all sources. It equals net dividends paid by corporations (see 1-15) less dividends received by government (2-13). Dividends received by government consists of dividends received by State and local governments, primarily by their retirement systems.

Personal interest income (2-14) is the interest income (monetary and imputed) of persons from all sources. It equals net interest (see 1-19) plus net interest paid by government (2-16) plus interest paid by persons ( $2-17$ ). The last item consists of all interest paid by individuals except mortgage interest, which is reflected in net rental income of persons.

Transfer payments to persons is income payments to persons for which no current services
3. For additional details, see the box "The Statistical Discrepancy," in Robert P. Parker and Eugene P. Seskin, "Annual Revision of the National Income and Product Accounts," Survey of Current Business 77 (August 1997): 19.
are performed. It consists of business transfer payments to persons (see 1-22) and government transfer payments (2-20). Government transfer payments includes benefits from the following social insurance funds: Old-age, survivors, and disability insurance (social security); hospital insurance; supplementary medical insurance; unemployment insurance; government employee retirement; railroad retirement; pension benefit guaranty; veterans life insurance; workers' compensation; military medical insurance; and temporary disability insurance. Government transfer payments also includes benefits from certain other programs: Veterans benefits other than life insurance, food stamps, black lung, supplemental security income, public assistance (including medical care and family assistance), and educational assistance. Government payments to nonprofit institutions excluding payments for work under research and development contracts are also included.

Personal contributions for social insurance (2-21) includes payments by employees, self-employed, and other individuals who participate in the following government programs: Old-age, survivors, and disability insurance (social security); hospital insurance; supplementary medical insurance; unemployment insurance; government employee retirement; railroad retirement; veterans life insurance; and temporary disability insurance.

Personal tax and nontax payments (2-1) is tax payments (net of refunds) by U.S. residents that are not chargeable to business expense and certain other personal payments to government agencies (except government enterprises) that are treated like taxes. Personal taxes includes taxes on income, including realized net capital gains; on transfers of estates and gifts; and on personal property. Nontaxes includes donations and fees, fines, and forfeitures. Personal contributions for social insurance is not included. Taxes paid by U.S. residents to foreign governments and taxes paid by foreigners to the U.S. Government are both included in transfer payments.
Personal outlays (2-2) is the sum of personal consumption expenditures (see 1-36), interest paid by persons (see 2-17), and personal transfer payments to the rest of the world (net) (2-5). The last item is personal remittances in cash and in kind to the rest of the world less such remittances from the rest of the world.

Personal saving (2-6) is personal income less the sum of personal outlays and personal tax and nontax payments. It is the current saving of
individuals (including proprietors and partnerships), nonprofit institutions that primarily serve individuals, life insurance carriers, private noninsured welfare funds, and private trust funds. Personal saving may also be viewed as the sum of the net acquisition of financial assets (such as cash and deposits, securities, and the change in the net equity of individuals in life insurance and in private noninsured pension plans) and the change in physical assets less the sum of net borrowing and of consumption of fixed capital.

Government receipts and expenditures account
Personal tax and nontax payments (see 2-1). Corporate profits tax liability (see 1-13).
Indirect business tax and nontax liability (see 1-24).

Contributions for social insurance (see 1-6 and 2-21).

Consumption expenditures (see 1-50).
Transfer payments (3-2) is transfer payments to persons (see 2-20) and transfer payments to the rest of the world (net) (3-4). The latter consists of U.S. Government military and nonmilitary grants in cash and nonmilitary grants in kind to foreign governments and of U.S. Government transfers, mainly retirement benefits, to former residents of the United States.

Net interest paid (3-5). Net interest paid by government is interest paid by government to persons, to business, and to the rest of the world (that is, to foreign businesses, governments, and persons) less interest received by government from persons, from business, and from the rest of the world. Interest paid consists of monetary interest paid on public debt and other financial obligations. Interest received consists of monetary and imputed interest received on loans and investments, including on the balances of State and local government social insurance funds.

Dividends received by government (see 2-13).
Subsidies less current surplus of government enterprises (see 1-25).
Wage accruals less disbursements (see 1-4).
Current surplus or deficit ( - ), national income and product accounts (3-9) is the sum of government receipts (lines 12, 13, 14, and 15 of account 3) less the sum of government expenditures (lines $1,2,5,6,7$, and 8 of account 3). It may also be viewed as the sum of net acquisition of financial assets by general government and government enterprises and net government purchases of land and of rights to government-owned land including oil resources, less net borrowing.

## Foreign transactions account

Imports of goods and services (see 1-49).
Payments of factor income (see 1-33).
Transfer payments to the rest of the world (see 1-23, 2-5, and 3-4).
Net foreign investment (4-10) is U.S. exports of goods and services, receipts of factor income, and capital grants received by the United States (net) (see below), less imports of goods and services by the United States, payments of factor income, and transfer payments to the rest of the world (net). It may also be viewed as the acquisition of foreign assets by U.S. residents less the acquisition of U.S. assets by foreign residents. It includes the statistical discrepancy in the balance of payments accounts.

Exports of goods and services (see 1-48).
Receipts of factor income (see 1-32).
Capital grants received by the United States (net) (4-3) is mainly the allocation of Special Drawing Rights to the United States.

## Gross saving and investment account

Personal saving (see 2-6).
Wage accruals less disbursements (see 1-4).
Undistributed corporate profits with inventory valuation and capital consumption adjustments (see 1-16, 1-17, and 1-18).
Consumption of fixed capital (see 1-26).
Government current surplus or deficit ( - ), national income and product accounts (see 3-9).

Capital grants received by the United States (net) (see 4-3).
Statistical discrepancy (see 1-35).
Gross private domestic investment (see 1-40). Gross government investment (see 1-50).
Net foreign investment (see 4-10).

## Other definitions

Final sales of domestic product is GDP minus change in business inventories; equivalently, it is the sum of personal consumption expenditures, gross private domestic fixed investment, government consumption expenditures and gross investment, and net exports of goods and services.

Gross domestic purchases is the market value of goods and services purchased by U.S. residents, regardless of where those goods and services were produced. It is GDP minus net exports of goods and services; equivalently, it is the sum of personal consumption expenditures, gross private domestic investment, and government consumption expenditures and gross investment.

Final sales to domestic purchasers is gross domestic purchases minus change in business inventories.
Population is the total population of the United States, including the Armed Forces overseas and the institutionalized population. The monthly estimate is the average of Census Bureau survey estimates for the first of the month and the first of the following month; the quarterly and annual estimates are the averages of the relevant monthly estimates.
Personal saving as a percentage of disposable personal income (DPI), frequently referred to as "the personal saving rate," is calculated on a monthly, quarterly, and annual basis as the ratio of personal saving to DPI.

Gross saving as a percentage of gross national product (GNP), sometimes referred to as "the national saving rate," is calculated on a quarterly and annual basis as the ratio of gross saving-the sum of gross private saving, gross government saving, and capital grants received by the United States (net)-to GNP.
U.S. residents are individuals, governments, business enterprises, trusts, associations, and similar institutions that have the center of their economic interest in the United States and that reside or expect to reside in the United States for 1 year or more. (For example, business enterprises resident in the United States include U.S. affiliates of foreign companies.) In addition, U.S. residents include all U.S. citizens who reside outside the United States for less than 1 year and U.S. citizens residing abroad for 1 year or more who meet one of the following criteria: Owners or employees of U.S. business enterprises who reside abroad to further the enterprises' business and who intend to return within a reasonable period; U.S. Government civilian and military employees and members of their immediate families; and students who attend foreign educational institutions.

Foreign residents include international institutions located in the United States, foreign nationals employed by their home Governments in the United States, and foreign affiliates of U.S. companies.

The rest of the world consists of foreign residents who are transactors with U.S. residents.

## Real output and related measures

The chain-type quantity and price indexes, in combination with the current-dollar estimates, provide users with the basic data series from which all other analytical tables and presentations
of the nipa's are derived. The chained (1992) dollar estimates provide measures to calculate the percent changes for GDP and its components that are consistent with those calculated from the chain-type quantity indexes. These estimates also provide comparisons of levels over time and reasonable approximations of the relative importance, and the contributions to growth in GDP, of most components for the years close to 1992. The chained (1992) dollar estimates are also used to compute certain key aggregates, such as per capita GDP.

## Quantity and price indexes

Changes in current-dollar GDP measure changes in the market value of the goods and services produced in the economy in a particular period. For many purposes, it is necessary to decompose these changes into quantity changes and price changes.
The changes in quantities and prices in the nIPA's are calculated using a Fisher formula that incorporates weights from two adjacent periods. For example, the 1992-93 change in real GDP uses prices for 1992 and 1993 as weights, and the 1992-93 change in prices uses quantities for 1992 and 1993 as weights. ${ }^{4}$ These annual changes are "chained" (multiplied) together to form time series of quantity and price. (For more details, see the box "Basic Formulas for Calculating ChainType Quantity and Price Indexes.") Because the Fisher formula allows for the effects of changes in relative prices and in the composition of output over time, the resulting quantity or price changes are not affected by the substitution bias associated with the fixed-weighted formula previously used to calculate changes in quantities and prices. ${ }^{5}$ The Fisher formula also produces results that are not affected by the choice of base periods.

[^27]In addition, because the changes in quantities and prices calculated in this way are symmetric, the product of a quantity index and the corresponding price index equals the current-dollar index. ${ }^{6}$
Chain-type quantity and price indexes that correspond to most of the current-dollar output, product, and expenditure measures are presented in tables $7.1-7.14$ and $7.17-7.20{ }^{7}$ Percentage changes from the preceding period for GDP and its major components and for other aggregates are presented in table 8.1. Contributions by major components to changes in real GDP are presented in table 8.2, which is discussed in more detail below.

## Chained-dollar measures

bea also prepares measures of real GDP and its components in a dollar-denominated form, designated "chained (1992) dollar estimates." For GDP and most other series, these estimates are computed by multiplying the 1992 current-dollar value by a corresponding quantity index number and then dividing by $100 .^{8}$ For example, if a current-dollar GDP component equaled $\$ 100$ in 1992 and if real output for this component increased 10 percent in 1993, then the chained (1992) dollar value of this component would be $\$ 110(\$ 100 \times 1.10)$ in 1993.
For analyses of changes over time in an aggregate or in a component, the percentage changes calculated from the chained-dollar estimates and from the chain-type quantity indexes are the same; any differences will be small and due to rounding. However, because the relative prices

[^28]used as weights for any period other than the base period differ from those used for the base period, the chained-dollar values for the detailed GDP components do not necessarily sum to the chained-dollar estimate of GDP or to any intermediate aggregate. A measure of the extent of such differences is provided in most chaineddollar tables by a "residual" line, which indicates the difference between GDP (or an other major aggregate) and the sum of the most detailed components in the table.

For periods close to the base year, when there usually has not been much change in the relative prices that are used as the weights for the chaintype index, the residuals tend to be small, and the chained (1992) dollar estimates can be used to approximate the contributions to growth and to aggregate the detailed estimates.
As one moves further from the base year, the residual tends to become larger, and the chaineddollar estimates become less useful for analyses of contributions to growth. In general, the use of chained-dollar estimates to calculate component shares or component contributions to real growth may be misleading for periods away from the base year. In particular, for components for which relative prices are changing rapidly, these calculations may be misleading even just a few years from the base year.
To assist users in making valid comparisons across components for periods away from the base year, several changes have been made in the nipa tables. Table 8.2 provides an accurate measure of the contributions of the major GDP components to the percentage change in real GDP for all periods. This table should be used for periods far from the base period, when the overall residual and the errors in contributions to growth become quite large. This table uses exact formulas for attributing growth to the components of GDP and of other aggregates, but the presentation is limited to the contributions to changes from the preceding year or quarter and to changes in the major components of GDP. (For details, see the box "Calculation of Component Contributions to the Change in GDP.")

For some analytical purposes, it may be desirable to calculate contributions to growth for more than a single quarter or year, to calculate contributions to growth for aggregates other than GDP, or to work with real estimates that are denominated in dollars. Two articles in the Survey provide information on how to prepare chaineddollar series with different base periods that permit the calculation of close approximations of

## Basic Formulas for Calculating Chain-Type Quantity and Price Indexes

## Annual indexes

This box shows the basic calculations used to prepare annual and quarterly chain-type quantity and price indexes. The formula used to calculate the annual change in real GDP and other components of output and expenditures is a Fisher index ( $Q_{t}^{F}$ ) that uses weights for 2 adjacent years (years $t-1$ and $t$ ).
The formula for real GDP in year $t$ relative to its value in year $t-1$ is

$$
Q_{t}^{F}=\sqrt{\frac{\sum p_{t-1} q_{t}}{\sum p_{t-1} q_{t-1}} \times \frac{\sum p_{t} q_{t}}{\sum p_{t} q_{t-1}}}
$$

where the $p$ 's and $q$ 's represent prices and quantities of detailed components in the 2 years.
Because the first term in the Fisher formula is a Laspeyres quantity index $\left(Q_{t}^{L}\right)$, or

$$
Q_{t}^{L}=\frac{\sum p_{t-1} q_{t}}{\sum p_{t-1} q_{t-1}}
$$

and the second term is a Paasche quantity index ( $Q_{t}^{P}$ ), or

$$
Q_{t}^{P}=\frac{\sum p_{t} q_{t}}{\sum p_{t} q_{t-1}}
$$

the Fisher formula can also be expressed for year $t$ as the geometric mean of these indexes as follows:

$$
Q_{t}^{F}=\sqrt{Q_{t}^{L} \times Q_{t}^{P}} .
$$

The percent change in real GDP (or in a GDP component) from year $t-1$ to year $t$ is calculated as

$$
100\left(Q_{t}^{F}-1.0\right)
$$

Similarly, price indexes are calculated using the Fisher formula

$$
P_{t}^{F}=\sqrt{\frac{\sum p_{t} q_{t-1}}{\sum p_{t-1} q_{t-1}} \times \frac{\sum p_{t} q_{t}}{\sum p_{t-1} q_{t}}},
$$

which is the geometric mean of a Laspeyres price index $\left(P_{t}^{L}\right)$ and a Paasche price index $\left(P_{t}^{P}\right)$, or

$$
P_{t}^{F}=\sqrt{P_{t}^{L} \times P_{t}^{P}}
$$

The chain-type quantity index value for period $t$ is

$$
I_{t}^{F}=I_{t-1}^{F} \times Q_{t}^{F}
$$

and the chain-type price index is calculated analogously. Chain-type real output and price indexes are presented with the base year (b) equal to 100 ; that is, $I_{b}=100$.

The current-dollar change from year $t-1$ to year $t$ expressed as a ratio is equal to the product of the Fisher price and quantity indexes: ${ }^{1}$

$$
\frac{\sum p_{t} q_{t}}{\sum p_{t-1} q_{t-1}}=P_{t}^{F} \times Q_{t}^{F} .
$$

## Quarterly indexes

The same formulas are used to calculate the quarterly indexes for the most recent quarters, called the "tail" period; quarterly data are substituted for annual data. The tail period begins in the third quarter of the most recent complete year that is included in an annual or comprehensive NIPA revision, so the specific quarters covered change annually. Modified formulas are used to calculate the indexes for the other quarters, called the "historical" period. Quarterly quantity data are used for the quantity indexes, and quarterly price data are used for the price indexes, but the weights-prices for a quantity index and quantities for a price index-are annual data.
The weights that are used for the indexes in the historical period depend on the quarter being estimated. For each quarter, the weights for the closest 2 years are used: For the first and second quarters of a year, the weights are from that year and the preceding year; while for the third and fourth quarters, the weights are from that year and the next year.
All quarterly chain-type indexes for completed years that have been included in an annual or comprehensive revision are adjusted so that the quarterly indexes average to the corresponding annual index. When an additional year is completed between annual revisions, the annual index is computed as the average of the quarterly indexes, so no adjustment is required to make the quarterly and annual indexes consistent. For example, until the 1998 annual revision is released, the chain-type indexes for the year 1997 are derived by averaging the four quarterly indexes for 1997.

## Chained-dollar estimates

The chained-dollar value $\left(C D_{t}^{F}\right)$ is calculated by multiplying the index value by the base-period current-dollar value ( $\sum p_{b} q_{b}$ ) and dividing by $100 .{ }^{2}$ For period $t$,

$$
C D_{t}^{F}=\sum p_{b} q_{b} \times I_{t}^{F} / 100
$$

## Implicit price deflators

The implicit price deflator ( $I P D_{t}^{F}$ ) for period $t$ is calculated as the ratio of the current-dollar value to the corresponding chained-dollar value, multiplied by 100 , as follows:

$$
I P D_{t}^{F}=\frac{\sum p_{t} q_{t}}{C D_{t}^{F}} \times 100
$$

1. See also footnote 6 in the text.
2. For exceptions to this procedure, see footnote 8 in the text.
contributions to real growth or of relative changes for any period. ${ }^{9}$ These articles show how to calculate a chained-dollar series for any period by using the percent changes in the chain-type indexes to compute chained-dollar series indexed to the current dollars of whatever base period is appropriate for the analysis. In addition, these articles provide a number of chained-dollar series over frequently cited time periods, such as decades and business cycles. In computing these series, different base periods were used, depending upon the time period analyzed; for example, for decades and business cycles, the midpoints of the periods were used.

The presentation of detailed quantity indexes, which are accurate for all periods, has been greatly expanded in tables $7.3-7.20$. The annual growth rates for major NIPA aggregates for all yearly intervals for 1970 to the present are shown each month under "Historical Tables" un-

[^29]der "National Data" in the section "bea Current and Historical Data" in the Survey.

## Price indexes

bea's featured aggregate price measure is the price index for gross domestic purchases, which measures the prices paid for goods and services purchased by U.S. residents. This index is derived from the prices of personal consumption expenditures (PCE), gross private domestic investment, and government consumption expenditures and gross investment. In contrast, the GDP price index measures the prices paid for goods and services produced by the U.S. economy and is derived from the prices of PCE, gross private domestic investment, net exports, and government consumption expenditures and gross investment. Thus, the two indexes differ with respect to coverage of the prices of exported and imported goods and services. Price changes in goods and services produced abroad and sold in the United States are reflected in the gross domestic purchases measure but not in the GDP measure; price changes in goods and services produced by the U.S. economy and sold abroad

## Calculation of Component Contributions to the Change in GDP

## Changes from preceding period

The contributions to the change in real GDP provide a measure of the composition of GDP growth that is not affected by the nonadditivity of the GDP components. Two formulas for the contributions of components to the percent change in real GDP are usedone for years following the base year, and the other for the base year and for years preceding the base year.
For years following the base year, the contribution to the percent change in real GDP in year $t$ attributable to the quantity change in component $i\left(C \% \Delta_{i, t}\right)$ is

$$
C \% \Delta_{i, t}=100 \times \frac{\left(p_{i, t-1} p_{t}^{P}+p_{i, t}\right) \times\left(q_{i, t}-q_{i, t-1}\right)}{2 \times I P D_{t}^{F} \times C D_{t-1}^{F}}
$$

where $C D_{t-1}^{F}$ is the chained-dollar GDP in year $t-1$;
$I P D_{t}^{F}$ is the implicit price deflator for GDP in year
$t ;$
$p_{i, t}$ is the price of component $i$ in year $t$;
$P_{t}^{P}$ is the Paasche price index for GDP in year $t ;$
and
$q_{i, t}$ is the quantity of component $i$ in year $t$.
For the base year and years preceding the base year, $C \% \Delta_{i, t}$ is

$$
C \% \Delta_{i, t}=100 \times \frac{\left(\frac{p_{i, t}}{P_{t}^{L}}+p_{i, t-1}\right) \times\left(q_{i, t}-q_{i, t-1}\right)}{2 \times I P D_{t-1}^{F} \times C D_{t-1}^{F}}
$$

where $P_{t}^{L}$ is the Laspeyres price index for GDP in year $t$.
Because these contributions to the percent change are additive, they can be used to calculate the contributions to subaggregates as well as the contributions of the detailed components.
The formula used for the contributions for years after the base period can also be used for the most recent quarters (the "tail" period), except the quarterly results are expressed at annual rates. ${ }^{1}$

## Changes over other periods

Users can also prepare close approximations of contributions to real GDP growth or to the growth of other aggregates using chain-type annual-weighted indexes. In effect, users compute a chained-dollar series for a particular period using the percent changes in the chain-type annual-weighted indexes to compute chained-dollar series indexed to the current dollars of the base period appropriate for the analysis. (For references to additional information on these calculations, see footnote 9 in the text.)

[^30]are reflected in the GDP price measure but not in the gross domestic purchases price measure. For example, a change in the price of imported petroleum that is fully passed on to U.S. consumers would be fully reflected in the price index for gross domestic purchases but not in the GDP price index, because imports are subtracted in deriving GDP.

## Implicit price deflators

bea also prepares another price index, the implicit price deflator (IPD), which is calculated as the ratio of the current-dollar value to the corresponding chained-dollar value, multiplied by 100 (see the box "Basic Formulas for Calculating Chain-Type Quantity and Price Indexes"). The values of the IPD are very close to the values of the corresponding chain-type price index for all periods. ${ }^{10}$
Implicit price deflators for GDP and its major components are presented as index numbers in table 7.1 , and percentage changes from the preceding period for these measures are presented in table 8.1.

## Command-basis GNP and terms of trade

bea also prepares a measure of "real" output-command-basis GNP (see table 1.11). Commandbasis GNP is a measure of the goods and services produced by the U.S. economy in terms of their purchasing power. GNP and command-basis GNP differ in how their real values are prepared: In estimating real GNP, the current-dollar values of the detailed components of exports of goods and services are deflated by export prices, the current-dollar values of the detailed components of imports of goods and services are deflated by import prices, and the current-dollar value of most factor income is deflated by the implicit price deflator for final sales to domestic purchasers. In estimating command-basis GNP, the current-dollar value of the sum of exports of goods and services and of receipts of factor income is deflated by the implicit price deflator for the sum of imports of goods and services and of payments of factor income.
The terms of trade is a measure of the relationship between the prices that are received by U.S. producers for exports of goods and services and the prices that are paid by U.S. purchasers for imports of goods and services. It is measured by the following ratio, with the decimal point shifted

[^31]two places to the right: In the numerator, the IPD for the sum of exports of goods and services and of receipts of factor income; in the denominator, the IPD for the sum of imports of goods and services and of payments of factor income. Changes in the terms of trade reflect the interaction of several factors, including movements in exchange rates, changes in the composition of traded goods and services, and changes in producers' profit margins. For example, if the U.S. dollar depreciates against a foreign currency, a foreign manufacturer may choose to absorb this cost by reducing the profit margin on the product it sells to the United States, or it may choose to raise the price of the product and risk a loss in market share.

## Classifications of production

In the nipa's, production is classified by the type of product, by the sector, by the legal form of organization, and by industry.

## Type of product

Type of product classifications-goods (durable and nondurable), services, and structures-are presented for GDP and the components of final sales of domestic product. Goods are products that can be stored or inventoried, services are products that cannot be stored and are consumed at the place and time of their purchase, and structures are products that are usually constructed at the location where they will be used and that typically have long economic lives. If a product has characteristics of more than one of these classifications, it is classified on the basis of the dominant characteristic.
Accordingly, the following products are included in goods: Restaurant meals; expenditures abroad by U.S. residents except for travel; replacement parts whose installation cost is minimal; dealers' margins on used equipment; and movable household appliances, such as refrigerators, even when they are included in the purchase price of a new home.
The following products are included in services: Food (that is included in airline transportation and hospital charges), natural gas and electricity (except in exports and imports of goods and services); office supplies (that are included in current operating expense of nonprofit institutions); foreign travel by U.S. residents; expenditures in the United States by foreigners; repair services, which include the cost of parts (except replacement parts whose installation cost
is minimal); defense research and development; and exports and imports of certain goods, primarily military equipment purchased and sold by the Federal Government. ${ }^{11}$
The following products are included in structures: Mobile homes; certain types of installed equipment, such as elevators, heating, and air conditioning systems; brokers' commissions on sale of structures; architectural and engineering fees included in the value of structures; land development costs; and mining exploration, shafts, and wells.
In personal consumption expenditures, exports, imports, and government consumption expenditures and gross investment, durable goods have an average life of at least 3 years. In fixed investment, producers' durable equipment consists of goods that have an average life of at least 1 year. In change in business inventories, goods held by manufacturing and trade establishments are classified as durable goods or nondurable goods in accordance with the classification of the industry of the establishment holding the inventories. Inventories held by construction establishments are classified as durable goods; inventories held by all other establishments are classified as nondurable goods.

## Sector

In the NIPA's, a breakdown of GDP is also shown in terms of the three sectors of the economy-business, households and institutions, and general government.

Business: Production by all entities that produce goods and services for sale at a price intended at least to approximate the costs of production, corporate and noncorporate private entities organized for profit, and certain other entities that are treated as business in the nipa's. These entities include mutual financial institutions, private noninsured pension funds, cooperatives, nonprofit organizations (that is, entities classified as nonprofit by the Internal Revenue Service (IRs) in determining income tax liability) that primarily serve business, Federal Reserve banks, federally sponsored credit agencies, and government enterprises. ${ }^{12}$ Business production also includes the services of owner-occupied housing and of buildings and equipment owned and used by nonprofit institutions that primarily serve individuals. Gross

[^32]product of the business sector is measured as gDP less the gross product of households and institutions and of general government. ${ }^{13}$
Households and institutions: Production by households, consisting of families and unrelated individuals, and by nonprofit institutions that primarily serve individuals. Gross product of households and institutions is measured by the compensation paid to domestic workers and to the employees of these nonprofit institutions.
General government: Production of all Federal Government and State and local government agencies except government enterprises. Gross product of general government is measured as the sum of the compensation of the employees of these agencies and of the consumption of fixed capital.

## Legal form of organization

For the domestic business sector, income and its components are shown for four legal forms of organizations-corporate business, sole proprietorships and partnerships, other private business, and government enterprises (employee compensation only).
Corporate business: All entities required to file Federal corporate tax returns (IRS Form 1120 series). These entities include mutual financial institutions and cooperatives subject to Federal income tax, private noninsured pension funds, nonprofit institutions that primarily serve business, Federal Reserve banks, and Federally sponsored credit agencies.

Sole proprietorships: All entities that would be required to file irs Schedule C (Profits or Loss from Business) or Schedule F (Farm Income and Expenses) if the proprietor met the filing requirements, together with owner-occupied farm housing.

Partnerships: All entities required to file Federal partnership income tax returns, irs Form 1065 (U.S. Partnership Return of Income).

Other private business: All entities that would be required to report rental and royalty income on the individual income tax return in IRS Schedule E (Supplemental Income and Loss) if the individual met the filing requirements, taxexempt cooperatives, owner-occupied nonfarm housing, and buildings and equipment owned and used by nonprofit institutions that primarily serve individuals.

[^33]Government enterprises: Government agencies that cover a substantial proportion of their operating costs by selling goods and services to the public and that maintain their own separate accounts. A "mixed" treatment of government enterprises is used in the nipa's: Some types of transactions are recorded as if they were part of the business sector, and others are recorded as if they were part of the general government sector.

Government enterprises are treated like other businesses and included in the nipa business sector: (1) Their sales to final users are recorded as sales by private businesses, (2) their purchases of materials and business services are considered intermediate, and (3) their compensation payments and consumption of fixed capital are deducted in calculating their income. Within the business sector, government enterprises are classified as noncorporate businesses.

Government enterprises are treated like other government agencies: (1) Their interest payments are combined with those of general government rather than those of business, (2) their investment in equipment and structures is combined with general government investment rather than with business investment in gross private domestic investment, and (3) their profit-like income, the current surplus of government enterprises (see the definition on page 33), accrues to general government.

## Industry

Industrial distributions are presented for national income and its components, capital consumption allowances, employment and hours, and the change in business inventories and the stock of business inventories. ${ }^{14}$ The classification underlying the distributions of private activities is based on the Standard Industrial Classification (sic). ${ }^{15}$
Industrial distributions of government activities are not provided; instead, they are combined into a single category. For most series, separate estimates are shown for the activities of the Federal Government, of State and local governments, and of government enterprises. Expenditures by

[^34]the Federal Government and by State and local governments are also shown by type and by function.

The industrial distributions for private activities are based on data collected from "establishments" or from "companies" (also called enterprises or firms). Establishments, as defined in the sIc, are economic units, generally at a single physical location, where business is conducted or where services or industrial operations are performed. Companies consist of one or more establishments owned by the same legal entity or group of affiliated entities. Establishments are classified into an sic industry on the basis of their principal product or service, and companies are classified into an sIc industry on the basis of the principal sic industry of all their establishments. Because large multiestablishment companies typically own establishments that are classified in different sic industries, the industrial distribution of the same economic activity on an establishment basis can differ significantly from that on a company basis. For example, employment of steel-manufacturing companies differs from employment of steel-manufacturing establishments because the employment of these companies includes the employment of establishments that are not classified in steel manufacturing and because it excludes the employment of establishments that manufacture steel but are not owned by steel-manufacturing companies.

Industrial distributions on a consistent establishment or company basis are not available for all NIPA components. As a result, the industrial distribution of national income reflects a mix of establishment and company data. For the following series, the industrial distributions are based on establishment data: Compensation of employees, employment, hours, inventories, rental income of persons, farm proprietors' income, farm net interest, and farm noncorporate capital consumption allowances. For nonfarm proprietors, industrial distributions of proprietors' income, net interest, and capital consumption allowances are based on company data; these data are regarded as being substantially the same as if they were based on establishment data because nearly all unincorporated companies own only one establishment (and the few multiestablishment companies usually own establishments in the same sic industry). For corporations, industrial distributions of profits, nonfarm net interest, and capital consumption allowances are based on company data.

In addition, individual industry series are not fully comparable over time. Historical comparability is affected primarily by two factors. First, the composition of industries may change because of changes in the sic basis that is used for the estimates. This factor affects estimates based on establishment data and on company data.
Second, historical comparability is affected because the industrial classification of the same establishment or company may change over time. This factor affects company-based estimates much more than establishment-based estimates. The classification of a company may change as a result of the following: Shifts in the level of consolidation of entities for which company reports are filed; mergers and acquisitions; and other shifts in principal activities, especially for large diversified firms.

In addition to the sIC industrial distributions of private activities, some NIPA tables show the following special sic groupings, the titles of which correspond to the 1987 sIc:
Financial industries consists of the following sic industries: Depository institutions, nondepository institutions, security and commodity brokers, insurance carriers, regulated investment companies, small business investment companies, and real estate investment trusts. ${ }^{16}$
Nonfinancial industries consists of all other private industries.

Goods-producing industries consists of the following sic divisions: Agriculture, forestry, and fishing; mining; construction; and manufacturing.

Distributive industries consists of the following sIC divisions: Transportation (excluding the U.S. Postal Service); communications; electric, gas, and sanitary services; wholesale trade; and retail trade.

Service industries consists of the rest-of-theworld sector and the following sic divisions: Finance, insurance, and real estate; and services.

## Presentation of the NIPA's

This section describes the release schedule for the nipa estimates, the publication of the Nipa tables, and additional presentations of NIPA and NIPArelated estimates.

[^35]
## Release schedule

For gross domestic product (GDP) and most other nipa series, quarterly estimates are released on the following schedule: "Advance" estimates are released near the end of the first month after the end of the quarter; as more detailed and more comprehensive data become available, "preliminary" and "final" estimates are released near the end of the second and third months, respectively.
For gross national product, gross domestic income, national income, corporate profits, and net interest, advance estimates are not prepared, because of a lag in the availability of source data. Except for the fourth-quarter estimates, the initial estimates for these series are released with the preliminary GDP estimates, and the revised estimates are released with the final GDP estimates. For the fourth-quarter, these estimates are released only with the final GDP estimates.
Monthly estimates of personal income and outlays are released near the end of the month following the reference month; estimates for the preceding 2 to 4 months are subject to revision at that time.

Annual revisions of the nipa's are usually carried out each summer and cover the months and quarters of the most recent calendar year and of the 2 preceding years. These revisions are timed to incorporate newly available major annual source data.

Comprehensive revisions are carried out at about 5 -year intervals and incorporate three major types of improvements: (1) Definitional and classificational changes that update the accounts to portray more accurately the evolving U.S. economy, (2) statistical changes that update the accounts to reflect the introduction of new and improved methodologies and the incorporation of newly available and revised source data, and (3) presentational changes that update the nipa tables to reflect the definitional, classificational, and statistical changes and to make the tables more informative.

## Publication of the NIPA tables

Tables that present the NIPA estimates appear each month under "National Data" in the section "bea Current and Historical Data" in the Survey of Current Business. ${ }^{17}$ The full set of nipa tables consists of 142 tables that present annual, quarterly, and monthly estimates. These tables are grouped into nine categories:

[^36]1. National Product and Income
2. Personal Income and Outlays
3. Government Receipts, Current Expenditures, and Gross Investment
4. Foreign Transactions
5. Saving and Investment
6. Income and Employment by Industry
7. Quantity and Price Indexes
8. Supplemental Tables ${ }^{18}$
9. Seasonally Unadjusted Estimates

The nipa tables are numbered as follows: The number preceding the period is the category number, and the number following the period indicates the specific table in that category; for example, table 2.2 is the second table in the second category "Personal Income and Outlays."

Most of the full set of NIPA tables are published in the issues of the Survey that describe the annual and comprehensive revisions (for example, see the August 1997 Survey); the remaining tables are published in subsequent months. In addition, a set of "Selected NIPA Tables" is published monthly in the SURvey; this set presents the es-

[^37]timates for the most recent six quarters and the most recent 2 years. The selected set comprises 57 tables from the first eight nipa categories (seasonally unadjusted estimates in the ninth category are compiled only once a year and thus are not included in the selected set of tables). Because the numbering system used for the full set of tables is retained in the selected set, gaps occur in the numbering of the selected tables.
A note preceding the nipa tables indicates information on the vintage of the estimates. In general, the nipa tables in the Survey present estimates for the most recent 2-4 years. Historical annual and quarterly estimates for summary NIPA series are presented annually in the Survey and cover the following: Current- and chained-dollar GDP for most of the components in NIPA tables 1.1 and 1.2 and for final sales of domestic product and gross national product; NIPA price indexes and implicit price deflators; and most of the major components of national income and personal income in NIPA tables 1.14 and 2.1. For example, these estimates were published as "Summary National Income and Product Series, 1929-96" in the August 1997 Survey. In addition, historical annual and quarterly estimates for the major NIPA aggregates are published monthly in the Survey.

## Additional presentations of NIPA and nIPA-related estimates

The Survey also presents the following nipa and NIPA-related estimates that do not fit neatly

## Data Availability

The estimates from the national income and product accounts (nipa's) that are prepared by the Bureau of Economic Analysis (bea) are available on three World Wide Web sites and in a variety of other media.

## Web sites

- The bea Web site at [http://www.doc.bea.gov](http://www.doc.bea.gov) presents summary nipa estimates, selected articles from the Survey of Current Business, and the monthly news releases for gross domestic product (GDP) and for personal income and outlays.
- The Web site of the Department of Commerce's stat-usa provides the monthly news releases on gdp and on personal income at the time of release, the underlying-detail NIPA tables, and the complete issues of the Surver; to subscribe, go to the Web site at [http://www.stat-usa.gov](http://www.stat-usa.gov). This information is also available on stat-usa's Economic Bulletin Board; to subscribe, call 202-482-1986.
- The Federal Statistical Briefing Room at the White House Web site at [http://www.whitehouse.gov/fsbr](http://www.whitehouse.gov/fsbr)
provides summary estimates of GDP and of a few other major NIPA aggregates.

## Other media

The NIPA estimates are published monthly in the SURvey; to subscribe, call the Superintendent of Documents of the U.S. Government Printing Office at 202-512-1800.
Summary information on the estimates of GDP and of personal income is available in a recorded telephone message at the time of release. For the gdp estimates, call 202-606-5306; for the estimates of personal income and outlays, call 202-606-5303.
The nipa estimates are also available on diskettes or printouts from bea. For a description of these products and for other information about bea's programs and products, see the "User's Guide to bea Information" on the bea Web site. To order products from bea using Visa or MasterCard, call the Order Desk at 1-800-704-0415 (outside the United States, 202-606-9666).
into the system or publication schedule for the standard NIPA presentation.
"Gross Domestic Product by Industry" presents current- and chained-dollar estimates of gross product, or gross product originating, by industry, which is the contribution of each industryincluding government-to gDP. Estimates for GDP by industry for 1947-96 were published in the November 1997 Survey.
"Reconciliation Tables" in appendix A of the "bea Current and Historical Data" section presents tables that reconcile nIPA estimates with related series and that provide analytically useful extensions of the nIPA estimates. At present, tables in this section show the reconciliation of relevant nIPA series with related series in the balance of payments accounts and the reconciliation of bea compensation with Bureau of Labor Statistics earnings.
"Real Inventories, Sales, and Inventory-Sales Ratios for Manufacturing and Trade"-in the January, April, July, and October issues of the Survey-shows quarterly and monthly estimates for these series. Also shown are quarterly and monthly inventories for manufacturing by stage of fabrication. Historical estimates for these series, quarterly for 1977 forward, were published in the May 1996 Survey, and revised and new estimates for 1993-96 were published in the October 1997 Survey. Estimates for 1959 forward are available electronically to subscribers to stat-usa's Economic Bulletin Board or Internet services (see the box "Data Availability").
"Fixed Reproducible Tangible Wealth in the United States"-usually published in the September issue of the Survey-shows annual estimates of stocks for fixed private capital, governmentowned fixed capital, and durable goods owned by consumers. Revised estimates for 1929-95 were published in the May 1997 Survey and were updated to 1996 in the September 1997 Survey. (The publication Fixed Reproducible Tangible Wealth in the United States, 1925-94 is forthcoming and will present the estimates described above and additional estimates by industry and by type of asset for net stocks, consumption of fixed capital, investment, and average age of net stocks.)
"Selected Monthly Estimates" for personal income by type of income and for the disposition of personal income, including personal consumption expenditures, appears under "National Data" in the "bea Current and Historical Data" section of the Survey. These estimates are also published annually in Nipa tables $2.8-2.11$, and the esti-
mates for the most recent months appear in the personal-income-and-outlays news release.
"Source Data and Assumptions" shows the source data and the bea assumptions for missing key source data that are used to prepare the advance estimates of GDP. This information is available at the time of the news release and is included in the "Business Situation" article in the Survey that presents the advance estimates. ${ }^{19}$

## Statistical Conventions Used for NIPA Estimates

Most of the nIPA estimates are presented in current dollars. Changes in current-dollar estimates measure the changes in the market values of goods or services that are produced or sold in the economy. For many purposes, it is necessary to decompose these changes into price and quantity components. Prices are expressed as index numbers with the base period-at present, the year 1992-equal to 100 . Quantities, or "real" measures, are expressed as index numbers with the base period (1992) equal to 100 ; for selected series, they are also expressed in chained (1992) dollars. (For further details, see the section "Real output and related measures.")

## Seasonal adjustment

Quarterly and monthly nipa estimates are seasonally adjusted at the detailed series level when statistically significant seasonal patterns are present. For most of the series that are seasonally adjusted by the source agency, bea adopts the corresponding seasonal adjustment factors. Seasonal adjustment removes from the time series the average effect of variations that normally occur at about the same time and in about the same magnitude each year-for example, weather and holidays. After seasonal adjustment, cyclical and other short-term changes in the economy stand out more clearly.

## Annual rates

Quarterly and monthly NIPA estimates in current and chained dollars are presented at annual rates, which show the value that would be registered if the rate of activity measured for a quarter or a month were maintained for a full year. Annual rates are used so that periods of different lengths-for example, quarters and years-may

[^38]be easily compared. These annual rates are determined simply by multiplying the estimated rate of activity by 4 (for quarterly data) or by 12 (for monthly data).
$$
r=\left[\left(\frac{G D P_{t}}{G D P_{0}}\right)^{m / n}-1\right] \times 100
$$

Percent changes in the estimates are also expressed at annual rates. Calculating these changes requires a variant of the compound interest formula, where
$r$ is the percent change at an annual rate;
$G D P_{t}$ is the level of activity in the later period;
$G D P_{0}$ is the level of activity in the earlier period;
$m$ is the yearly periodicity of the data (for example, 1 for annual data, 4 for quarterly, or 12 for monthly); and
$n$ is the number of periods between the earlier and later periods (that is, $t-0$ ).

## Appendix

## Updated Summary nipa Methodologies

This appendix presents summary descriptions of the principal source data and methods used to prepare the current-dollar estimates of gross domestic product (GDP) and the estimates of real GDP. ${ }^{20}$ These descriptions have been updated to reflect the methodological improvements that were introduced in the annual revision of the national income and product accounts (nipa's) that was released in July 1997. ${ }^{21}$

## Current-dollar estimates

Table 1 lists the components of current-dollar GDP starting with the components on the product side and proceeding to those on the income side. The subcomponents, with their dollar values for 1996, are grouped according to the methodology used to prepare them.

The column for the annual estimates covers the revision cycle for those estimates and notes the major differences in methodology as the estimates move through the three annual revisions to a benchmark revision. ${ }^{22}$ For example, for "most goods" in personal consumption expenditures (the first item on the product side), the

[^39]table indicates one methodology for benchmark years and another for all other years.
The column for the quarterly estimates covers only the advance estimate for the current quarter-that is, the estimate prepared about a month after the end of the quarter. That estimate, rather than the preliminary or final quarterly estimate, is described because more attention focuses on the "first look" at the quarter. In addition, the column lists only the source data and methods; it does not indicate how many months of source data are available or whether the data are subject to revision by the source agency. Information on the key monthly source data appears each month in the "Business Situation" in the Survey of Current Business. Additional information on the monthly source data used for the advance estimate is available online from the Department of Commerce's Economic Bulletin Board. ${ }^{23}$
The source data listed consist of a variety of economic measures, such as sales or receipts, wages and salaries, unit sales, housing stock, insurance premiums, expenses, interest rates, mortgage debt, and tax collections. For most components, the source data are "value data"; that is, they encompass both the quantity and price dimensions that are required for currentdollar estimates. In these cases, the methodology indicated in table 1 covers only the adjustment of the value data to derive estimates consistent with nipa definitions and coverage.
For those estimates not derived from value data, the table indicates the combination of data with separate quantity and price dimensions that is used to derive the required value estimate and the major adjustments needed to derive estimates consistent with nipa definitions and coverage. On the product side, a "physical quantity times price" method is used for several components. For example, the estimate for new autos is calculated as unit sales times expenditure per auto (the average list price with options, adjusted for transportation charges, sales tax, dealer discounts, and rebates). On the income side, an "employment times earnings times hours" method and variations of a "stock of assets/liabilities times an effective interest rate" method are used for several components.
Some of the source data shown in table 1 for the annual estimates are used as indicators to interpolate and extrapolate the levels established by source data that are more comprehensive, and all of the source data shown for the advance quar-

[^40]terly estimates are used to extrapolate the level of the preceding quarter. In addition, extrapolation and interpolation may be based on trends, as is the case when "judgmental trend" is listed in the table. ${ }^{24}$

Estimating methods.-Table 1 refers to four methods-commodity flow, retail control, perpetual inventory, and fiscal year analysis-used by bea for estimating specific components.

The commodity-flow method is used to obtain the value of final users' purchases of goods and services (that is, commodities) for BEA's benchmark input-output accounts. These values serve as the benchmark for the NIPA estimates of personal consumption expenditures (PCE), of producers' durable equipment (PDE), and of the commodity detail for State and local government consumption expenditures and gross investment. ${ }^{25}$ This method is also used for PDE in nonbenchmark years, but it is implemented in an abbreviated form. An even more abbreviated commodity-flow method is used for current quarterly estimates of PDE.

The retail-control method is used to estimate over one-third of the value of PCE for periods other than benchmark years. This method provides the indicator series used in extrapolating and interpolating the total of "most goods" and the "control" total to which the PCE categories and residential pde included in this group must sum. These PCE categories consist of all goods except autos and trucks, food furnished to employees, food and fuel produced and consumed on farms, standard clothing issued to military personnel, school lunches, and net foreign remittances. ${ }^{26}$

The perpetual-inventory method is used to derive estimates of fixed capital stock, which in turn form the basis for the estimates of consumption of fixed capital. This method is based on investment flows and a geometric depreciation formula; it is used instead of direct measurement of the capital stock because direct measurement is seldom statistically feasible on a comprehensive basis. ${ }^{27}$

[^41]The fiscal year-analysis method provides the framework for the annual and quarterly estimates of Federal Government consumption expenditures and gross investment. The estimates of expenditures are prepared by program-that is, by activity for a group of line items or for an individual line item in the Budget of the U.S. Government. For most programs, the fiscal year analysis begins by adjusting budget outlays for coverage and for netting and grossing differences between these outlays and NIPA expenditures. The expenditures total (as adjusted) for a program is then classified by type of NIPA expenditure-for example, transfer payments and interest paidwith nondefense consumption expenditures and gross investment determined residually. When a fiscal year analysis is completed, the detailed array of NIPA expenditures by program and by type of expenditure serves as a set of control totals for the quarterly estimates. ${ }^{28}$
Balance of payments accounts.-The source data for the foreign transactions reflected in most NIPA components-such as net exports of goods and services and rest-of-the-world corporate profitsare the balance of payments accounts (bPA's), which are also prepared by bea. ${ }^{29}$ As noted in table 1, for some nipa components, the bpa estimates are adjusted to conform to NIPA concepts and definitions. ${ }^{30}$ Annual estimates of these adjustments and their definitions are shown in NIPA table 4.5 , which was last published in the August 1997 Survey on page 82; summary quarterly estimates are shown in "Reconciliation Tables" in appendix $A$ of the Survey.

Other information.--In preparing the annual estimates of several of the income-side components, bea adjusts the source data for various coverage and conceptual differences. For each subcomponent listed below, an annual nipa table reconciles the value published by the source agency with the

[^42]nipa value published by bea and identifies the bea adjustments. The following is a list of the subcomponents and their corresponding reconciliation tables, which were last published in the September 1997 Survey beginning on page 34: Wages and salaries, table 8.25 ; farm proprietors' income, table 8.22; nonfarm proprietors' income, table 8.21; corporate profits, table 8.23; net interest, table 8.24; and consumption of fixed capital, table 8.20.

## Real estimates

Table 2 shows which one of three methodsdeflation, quantity extrapolation, and direct baseyear valuation-is used to prepare the quantity index for each detailed product-side component of real GDP and identifies the source data with which the method is implemented. ${ }^{31}$ Deflation is used for most of the detailed components. In deflation, the quantity index is obtained by dividing the current-dollar index by an appropriate price

[^43]index that has the base year-currently 1992equal to 100 and then by multiplying the result by 100 .
The quantity-extrapolation and direct-base-year-valuation methods are similar in that they both use explicit quantity data. In quantity extrapolation, quantity indexes are obtained by using a quantity indicator to extrapolate from the base-year value of 100 in both directions. In direct-base-year valuation, quantity indexes are obtained by multiplying the base-year price by actual quantity data for the index period and then expressing the result as an index with the base year equal to 100 .
The subcomponents in table 2 are the same as those shown in table 1, but the detail differs to highlight the alternative methodologies used for calculating the real estimates. ${ }^{32}$
Tables 1 and 2 follow.

[^44]Table 1.-Principal Source Data and Estimating Methods Used in Preparing Estimates of Current-Dollar GDP

| Component (billions of <br> dollars) | Subcomponent (billions of <br> dollars) | Annual estimates: Source data and methods used to deter- <br> mine level for benchmark and other years or used to prepare <br> an extrapolator or interpolator | Advance quarterly estimates: Source <br> data and methods used to prepare an <br> extrapolator |
| :---: | :---: | :---: | :---: |

Product side (GDP of $\$ 7,636.0$ billion for 1996 )
Personal
consumption
expenditures
$(\$ 5,207.6)$
Durable and nondurable
goods:
$(\$ 2,169.2)^{1}$

Most goods (except sub-
components listed sep
rately)
$(\$ 1,821.0)$

New autos
$(\$ 86.1)$

Net purchases of used
autos
(\$55.2)

New trucks
(\$63.7)

Gasoline and oil ${ }^{2}$ (\$122.6)

Benchmark years-Commodity-flow method, starting with manufacturers' shipments from Census Bureau quinquennial census and including an adjustment for exports and imports from Census Bureau foreign trade data.
Other years-Retail-control method, using retail trade sales from Census Bureau annual survey or, for most recent year, monthly survey of retail trade.
Physical quantity purchased times average retail price: Unit sales, information to allocate sales among consumers and other purchasers, and average list price with options, adjusted for transportation charges, sales tax, dealer discounts, and rebates, all from trade sources.
Benchmark years--For net transactions, change in the consumer stock of autos from trade sources. For dealers' margin, retail sales from Census Bureau quinquennial census and margin rate from Census Bureau annual survey of retail trade.
Other years except most recent-For net transactions, same as benchmark years. For dealers' margin, franchised dealers' unit sales times sales price, both from trade sources, times margin rate for independent dealers from Census Bureau annual survey; independent dealers' margin from Census Bureau annual survey.
Most recent year-For net transactions, same as benchmark years. For dealers' margin, for franchised dealers, unit sales and sales price from trade sources; for independent dealers, sales from Census Bureau monthly survey of retail trade.
Benchmark years-Commodity-flow method, starting with manufacturers' shipments from Census Bureau quinquennial census and including an adjustment for exports and imports from Census Bureau foreign trade data.
Other years except most recent-Abbreviated commodity-flow method, starting with manufacturers' shipments from Census Bureau annual survey and including an adjustment for exports and imports from Census Bureau foreign trade data.
Most recent year-Physical quantity purchased times average retail price: Unit sales and information to allocate sales among consumers and other purchasers from trade sources and average price based on Bureau of Labor Statistics consumer price index for new trucks.
Benchmark years-Physical quantity purchased times average retail price: Gallons consumed from the Department of Transportation, information to allocate that total among consumers and other purchasers from Federal agencies and trade sources, and average retail price from Census Bureau quinquennial census.
Other years except most recent-Same as benchmark years, except average retail price from the Energy Information Administration.
Most recent year--Physical quantity purchased times average retail price: Gallons consumed and average price, both from the Energy Information Administration.

Same as annual for most recent year.

Same as annual.

For net transactions, residual based on net sales by other sectors. For dealers' margin, unit sales of franchised dealers from trade source and sales price from Bureau of Labor Statistics consumer price index for used cars.

Same as annual for most recent year.

Same as annual for most recent year.

Table 1.-Principal Source Data and Estimating Methods Used in Preparing Estimates of Current-Dollar GDP-Continued

| Component (billions of <br> dollars) | Subcomponent (billions of <br> dollars) | Annual estimates: Source data and methods used to deter- <br> mine level for benchmark and other years or used to prepare <br> an extrapolator or interpolator | Advance quarterly estimates: Source <br> data and methods used to prepare an <br> extrapolator |
| :---: | :---: | :---: | :---: |

Product side (GDP of $\$ 7,636.0$ billion for 1996)-Continued
Personal
consumption expendituresContinued

Durable and nondurable goods-Continued:

Food furnished to employees (including military) (\$8.7)

Expenditures abroad by U.S. residents (\$2.6) less personal remittances in kind to nonresidents (\$1.2)

## Services:

(\$3,038.4)
Nonfarm dwellings-space rent for owner-occupied and rent for tenant-occupied
(\$752.0)

Rental value of farm dwellings
(\$6.1)

Motor vehicle and other repair, other purchased intercity transportation, legal and funeral services, barbershops and beauty parlors, nursing homes, laundries, employment agency fees, accounting and tax return preparation services, recreation (except cable TV, casino gambling, parimutuel net receipts, and lotteries), hotels and motels, and other education and research
(\$508.1)

Benchmark years-For commercial employees, number of employees of appropriate industries from Bureau of Labor Statistics tabulations times BEA estimate of per capita expenditures for food; for military personnel, outlays from the Budget of the United States prepared by the Office of Management and Budget.
Other years-Same as benchmark years, except per capita expenditures for food based on Bureau of Labor Statistics consumer price index for food.
Estimated as part of the balance of payments accounts; see entry for "exports and imports of services, net," under net exports of goods and services.

Benchmark years-Based on data on housing stock and average annual rent from Census Bureau decennial census of housing and residential finance survey, adjusted for utilities billed with rent.
Other years-Based on data on housing stock and average annual rent from Census Bureau biennial housing survey or on the number of households from Census Bureau monthly current population survey and Bureau of Labor Statistics consumer price index for rent.
Benchmark years-Based on data on housing stock and average annual rent from Census Bureau decennial census of housing and survey of residential finance.
Other years-Based on data on net value of real farm housing stock from BEA capital stock series.
Benchmark years-Receipts and expenses from Census Bureau quinquennial census adjusted for receipts from business and governments.
Other years-Receipts for spectator sports from trade sources; for legitimate theaters and other education and research, tabulations of wages and salaries of employees covered by State unemployment insurance from the Bureau of Labor Statistics; for others in this group, Census Bureau service annual survey.

For commercial employees, same as annual for other years; for military personnel, judgmental trend.

Judgmental trend.

Same as annual: For housing stock, judgmental trend; for average rent, Bureau of Labor Statistics consumer price index for rent.

Judgmental trend.

For nursing homes, other education and research, employment agency fees, and clubs and fraternal organizations, wages and salaries derived from Bureau of Labor Statistics monthly employment times earnings times hours; for legitimate theaters and motion pictures, receipts from trade sources; for radio and TV repair, number of TV's based on stock and sales from trade source times Bureau of Labor Statistics consumer price index for appliance and furniture repair; for hotels and motels, rooms rented times average price per room from trade source; for others in this group, judgmental trend.

See footnotes at end of table.

consumption
expenditures-
Continued

## Services-Continued:

Physicians, dentists, and other professional medical services
(\$357.6)

Private nursery, elementary, and secondary schools, day care, welfare activities, and trade unions and professional associations (\$148.6)

Financial services furnished without payment by banks, credit agencies, and investment companies ${ }^{3}$
(\$169.9)
Brokerage charges and investment counseling, bank service charges, intercity transportation except other, and private higher education (\$148.7)

Benchmark years-For nonprofit professional services, expenses, and for others in this group, receipts, adjusted for government consumption, all from Census Bureau quinquennial census.
Other years-Receipts and revenues, adjusted for government consumption, from Census Bureau service annual survey.
Benchmark years-For religious-affiliated schools, enrollment from the Department of Education times BEA estimate of average expenditures per pupil; for nursery schools and day care, expenditures from Bureau of Labor Statistics consumer expenditure survey; for others in this group, receipts and expenses from Census Bureau quinquennial census.
Other years except most recent-For nursery schools and day care, same as benchmark years; for others in this group, annual tabulations of wages and salaries of employees covered by State unemployment insurance from the Bureau of Labor Statistics.
Most recent year-For nursery schools and day care, judgmental trend; for others in this group, tabulations of wages and salaries of employees covered by State unemployment insurance from the Bureau of Labor Statistics.
See entry for "imputed-banks, credit agencies, and investment companies" under net interest.

Years except most recent-For private higher education, expenses, and for others in this group, receipts, all from annual reports of government administrative agencies.
Most recent year-For brokerage charges, bank service charges, and intercity transportation, receipts, from annual reports of government administrative agencies; for private higher education, enrollment from the Department of Education times price index for higher education from trade source.

Domestic services
(\$12.5)

See footnotes at end of table.

For physicians and dentists, judgmental trend; for other professional medical services, wages and salaries derived from Bureau of Labor Statistics monthly employment times earnings times hours.
For political organizations and foundations, judgmental trend; for others in this group, wages and salaries derived from Bureau of Labor Statistics monthly employment times earnings times hours.

Judgmental trend.

For stock brokerage charges, stock exchange transactions from trade sources; for income from sales of investment company securities, sales of open-end investment company shares from trade source; for other brokerage charges and investment counseling and for bank service charges, judgmental trend; for intercity transportation, receipts from trade sources; for private higher education, wages and salaries derived from Bureau of Labor Statistics monthly employment times earnings times hours.
Judgmental trend.

| Corporate profits with IVA and CCAdj (\$735.9) | Domestic profits before tax (\$580.7) | Years except most recent-Receipts less deductions from internal Revenue Service tabulations of business tax returns, adjusted for understatement of income on tax returns and for several conceptual differences. <br> Most recent year--Profits from Census Bureau quarterly survey of corporate profits, regulatory agency reports, and compilations of publicly available corporate financial statements. |
|  | Rest-of-the-world profits before tax (\$95.9) | Estimated as part of the balance of payments accounts: For direct investment income, BEA surveys; for portiflio income, Treasury Department surveys. Adjusted for NIPA coverage of U.S. territories and Puerto Rico-see entry for "exports and imports of goods, net," under net exports of goods and services. |
|  | $\begin{aligned} & \text { IVA } \\ & (-\$ 2.5) \end{aligned}$ | The IVA on the income side for corporations and for nonfarm sole proprietorships and partnerships) and the IVA on the product side (described under the entry for change in business inventories) differ because the source data reflect different proportions of accounting methods (last-in, first-out (LIFO), etc.) underlying reported inventories. The incomeside IVA is based on the product-side IVA, adjusted by the relationship between non-LIFO inventories from Internal Revenue Service tabulations of business tax returns and non-LIFO inventories from the Census Bureau. |
|  | CCAdj (\$61.8) | See entry for "CCAdj" under consumption of fixed capital. |
| Net interest (\$425.1) | Domestic monetary, net (\$87.6) | Years except most recent-For farm interest paid, Department of Agriculture surveys; for residential mortgage interest paid, Census Bureau decennial residential finance survey and mortgage debt from the Federal Reserve Board times a BEA interest rate; for most other interest paid and received by business, Internal Revenue Service tabulations of business tax returns, adjusted for misreporting on tax returns and for several conceptual differences. <br> Most recent year-For farm and mortgage interest paid, same as other years; for other interest, interest receipts and payments from regulatory agencies (such as the Federal Deposit Insurance Corporation), from trade sources, or obtained by applying BEA interest rates to interest-bearing assets/iabilities from Federal Reserve Board flow-of-funds accounts. |
|  | Rest-of-the-world monetary, net (-\$76.4) | Estimated as part of the balance of payments accounts: For direct investment income, BEA surveys; for portfolio income, Treasury Department surveys. Adjusted for NIPA coverage of U.S. territories and Puerto Rico-see entry for "exports and imports of goods, net," under net exports of goods and services. |

For some industries in transportation and some in finance, etc., judgmental trend; for others, same as annual for most recent year. (Released at time of preliminary estimate of GDP for the first, second, and third quarters and of final estimate for the fourth quarter.)
Same as annual. (Released on same schedule as domestic profits before tax.)

Same as annual.

Derived by combining estimates of (1) interest received by persons, (2) government interest paid and received, and (3) interest paid by persons. For (1), judgmental trend; for (2), Monthly Treasury Statement for Federal and judgmental trend for State and local; for (3), consumer debt from the Federal Reserve Board times BEA estimates of interest rates. (Released on same schedule as domestic profits before tax.)

Same as annual. (Released on same schedule as domestic profits before tax.)

| Government consumption expenditures and gross investmentContinued | State and local brokerage charges and financial services furnished without payment. <br> State and local consumption of general government fixed capital. <br> State and local investment in equipment and consumption expenditures, except compensation, consumption of fixed capital, brokerage charges, and financial services furnished without payment. | Services, except as noted, and goods used in maintenance and repair, CPI; goods, except as noted, and electricity, PPI. | See entries under personal consumption expenditures for services. <br> Transportation, books, and postal services, BEA indexes based on Department of Defense prices paid; computers, BEA price index, Bureau of Labor Statistics import price indexes, and PPI. | $\cdots$ | Perpetual-inventory calculations, based on gross investment. |

1. Also referred to as "services furnished without payment by financial intermediaries, except life insurance carriers and private noninsured pension plans."
2. Estimates of real exports and imports of goods and services are prepared separately. Real
and GNP-are prepared by deflation using the implicit price deflator for final sales to domestic purchasers except for imputed interest paid to nonresidents, which is prepared by extrapolation using paid employee hours of relevant institutions.

# BEA CURRENTAND HISTORICALDATA 

National, International, and Regional Estimates

This section presents an extensive selection of economic statistics prepared by the Bureau of Economic Analysis (bea) and a much briefer selection of collateral statistics prepared by other Government agencies and private organizations. Series originating in Government agencies are not copyrighted and may be reprinted freely. Series from private sources are provided through the courtesy of the compilers and are subject to their copyrights.
bea makes its economic information available on three World Wide Web sites. The bea Web site [http://www.bea.doc.gov](http://www.bea.doc.gov) contains data, articles, and news releases from bea's national, international, and regional programs. The Federal Statistical Briefing Room (fsbr) on the White House Web site [http://www.whitehouse.gov/fsbr](http://www.whitehouse.gov/fsbr) provides summary statistics for GDP and a handful of other nIPA aggregates. The Commerce Department's stat-usa Web site [http://www.stat-usa.gov](http://www.stat-usa.gov) provides detailed databases and news releases from bea and from other Federal Government agencies by subscription; information about stat-usa's Economic Bulletin Board (евв) and Internet services may be obtained at the Web site or by calling 202-482-1986.
The tables listed below present annual, quarterly, and monthly estimates, indicated as follows: [A] Annual estimates only; [Q] quarterly estimates only; [QA] quarterly and annual estimates; [MA] monthly and annual estimates.

Reconciliation tables [QA] ............................ D-74
Appendix B: Suggested reading .................... D-75

## National Data

## A. Selected NIPA Tables

The tables in this section include the most recent estimates of gross domestic product and its components; these estimates were released on February 27, 1998 and include the "preliminary" estimates for the fourth quarter of 1997 and for the year 1997.

The selected set of nipa tables shown in this section presents quarterly estimates, which are updated monthly. In most tables, the annual estimates are also shown. Most of the "annual only" nIPA tables were presented in the August 1997 Survey of Current Business; tables $8.20-8.26$ were presented in the September 1997 Survey; and the remaining "annual only" tables-tables 3.15-3.20 and 9.1-9.6-were presented in the October 1997 Survey.

The selected nIPA tables are available on printouts or diskettes from bea. To order nIPA subscription products using Visa or MasterCard, call the bea Order Desk at $1-800-704-0415$ (outside the United States, 202-606-9666).

The news release on gross domestic product (GDP) is available at the time of release, and the selected nIPA tables are available later that day, on stat-usa's Economic Bulletin Board and Internet services; for information, call stat-usa on 202-482-1986. In addition, the GDP news release is available the afternoon of the day of the release, and the selected nipa tables are available about 2 weeks later (when the Survey is sent to the printer), on bea's Internet site [http://www.bea.doc.gov](http://www.bea.doc.gov).

| Residual ................................... | -1.6 | -4.2 | -2.4 | -3.8 | -2.9 | $-3.9$ | -4.6 | -4.8 |

Note--Chained (1992) doliar senies are calculated as the product of the chain-type quantity index and the 1992 current-dollar value of the corresponding series, divided by 100 . Because the formula tor the chain-type quantity ndexes uses weighs or more than one period, the corresponding chained-collar estimates are usually not addiave. The residual line is the difference between the first line and the sum of the most detailed lines Percent changes from preceding period for selected items in this table are shown in table 8.1; contributions to
the percent change in real gross domestic product are shown in table 8.2 .

NOTE-Chained (1992) dollar series are calculated as the product of the chain-type quantity index and the 1992 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type cuantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive The residual line following change in business inventories is the difference between gross domestic product and the sum of final sales of domestic product and of change in business inventories; the residual line following structures is the difference between gross domestic product and the sum of the detailed lines of goods, of services, and of structures.
Percent changes from preceding period for selected items in this table are shown in table 8.1
Table 1.6.-Relation of Real Gross Domestic Product, Real Gross Domestic Purchases, and Real Final Sales to Domestic Purchasers [Bilions of chained (1992) dollars]

| Gros | 6,928.4 | 7,189.6 | 6,943.8 | 7,017.4 | 7,101,6 | 7,159.6 | 7,214.0 | 7,283.3 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Less: Exports of goods and services $\qquad$ | 857.0 | 963.6 | 851.4 | 901.1 | 922.7 | 962.5 | 973.0 | 996.4 |
| Plus: Imports of goods and services $\qquad$ |  | 1,110.0 |  | 1,006.6 | 1,048.9 | 1,099.1 | 1,137.1 | 1,154.9 |

| State and local | 535.2 | 543.7 | 537.0 | 537.9 | 539.9 | 542.1 | 545. | 547.8 |
| Residual | -1.5 | -3.5 | -1.6 | -2.1 | -2.7 | -3.0 | -3.8 |  |

1. Gross domestic business product equals gross domestic product less gross product of households and institutions and of general government. Nonfarm product equals gross domestic business product less gross farm product. 2. Equals compensation of general government employees plus general government consumption of fixed capital
as shown in table 3.8 . NoTE Chained 3.8.
NoIE--Chained (1992) doilar series are calculated as the product of the chain-type quantity index and the 1992
current-collar value of the corresponding series, divided by 100 . Because the formula for the chain-ype quantity indexes uses weights of more than one period, the corresconding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

1. Gross domestic income deflated by the implicit price deflator for gross domestic product.
2. Gross national income deflated by the impicicit price deflator for gross national product:
Note.- Except as noted in footnotes 1 and 2, chained (1992) dollar series are calcutated as the product of the chain-type quantity index and the 1992 current-dollar value of the corresponding series, divided by 100 . Because the formula for the chain-lype quantity indexes uses weights of more than one period, the corresponding chainedcollar estimates are usually not additive.

Table 1.11.-Command-Basis Real Gross National Product
[Billions of chained (1992) dollars]

| Gross national product ........... | 6,932.0 |  | 6,940.2 | 7,023.1 | 7,091.8 | 7,144.4 | 7,198.8 |  |

1. Exports of goods and sevices and receipts of factor income deflated by the implicit price deflator for imports of goods and services and payments of factor income.
2. Ratio of the implicit price deflator for exports of goods and services and receipts of factor income to the corresponding implicit price deflator for imports with the decimal point shifted two places to the right.
NOTE--Chained (1992) dollar series are calculated as the product of the chain-lype quantity index and the 1992 current-dolar value of the corresponding series, divided by 100 . Because the tormula for the chain-type quantity Percent changes from preceding period for selected items in this table are shown in table 8.1.

Table 1.14.-National Income by Type of Income
[Billions of dollars]

Table 1.16.-Gross Domestic Product of Corporate Business in Current Dollars and Gross Domestic Product of Nonfinancial Corporate Business in Current and Chained Dollars

1. Chained-dollar gross domestic product of nonfinancial corporate business equals the current-dollar product deflated by the implicit price deflator for goods and structures in gross domestic product.
2. Chained-dollar consumption of fixed capital of nonfinancial corporate business is calculated as the product of the chain-lype quantity index and the 1992 current-dollar value of the corresponding series, divided by 100 . 3. Chained-dollar net domestic product of nonfinancial corporate business is the difference between the gross
product and the consumption of fixed capial.
3. Personal Income and Outlays

| Residual | -5.1 | -8.1 | -5.7 | -6.0 | -7.7 | -7.5 | -8.9 | -8.3 |

Note-chained (1992) dollar series are calculated as the product of the chain-type quantily index and the 1992 current-collar value of the corresponding series, divided by 100 . Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-oblar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines

1. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.
2. Consumption expenditures for durable goods excludes expencitures classified as investment, except for goods ransferred to foreign countries by the Federal Government.
3. Compensation of government employees engaged in new force-account construction and related expenditures for goods and services are classified as investment in structures. The compensation of all general government employees is shown in the addenda.
4. Consumption of fixed capital, or depreciation, is included in government consumption expenditures as a partial measure of the value of the senvices of general government fixed assets; use of depreciation assumes a zero net return on these assets.

Table 3.8.-Real Government Consumption Expenditures and Real Gross Investment by Type
[Billions of chained (1992) dollars]

NOTE-Chained (1992) dollar series are calculated as the product of the chain-type quantity index and the 1992 current-dollar value of the corresponding series, divided by 100 . Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference beween the first line and the sum of the most detailed lines, excluding the lines in the addenda.
See footnotes to table 3.7 .

Table 3.10.-National Defense Consumption Expenditures and Gross Investment
[Billions of doilars]

1. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.
2. Consumption expenditures for durable goods exciudes expenditures classified as investment, except for goods transierred to foreign countries.
3. Compensation of government employees engaged in new force-account construction and related expenditures for goods and services are classified as investment in structures. The compensation of all general government employees is shown in the addendum.
measure of the value of the services of getion, is included in government consumption expenditures as a partial measure of the value of the services of general government fixed assets; use of depreciation assumes a zero net return on these assets.

NOTE--Chained (1992) dollar series are calculated as the product of the chain-type quantity index and the 1992 current-dollar value of the corresponding series, divided by 100 . Because the formula for the chain-lype quantity indexes uses weights of more than one period, the corresponding chained-doliar estimates are usually not additive. The residual line following the detail for exports is the difference between the aggregate "exports of goods and services" and the sum of the detailed fines for exports of goods and export of services. The residual line following
the detail for imports is the difference between the aggregate "imports of goods and services" and the detailed lines for imports of goods and imports of services. See footnotes to table 4.3

| Residual ................................... |  |  |  |  |  |  |  |  |

1. Includes new computers and peripheral equipment only.

NOTE-CChained (1992) dollar series are calculated as the product of the chain-ype quantily index and the 1992 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-ype quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive.
The residual line is the difference bewween the tirst line and the sum of the most detailed lines.

1. Inventories are as of the end of the quarter. The quarter-to-quarter change in inventories calculated from cur-rent-dollar inventories in this table is not the current-dollar change in business inventories (CBI) component of GDP The former is the difference beween two inventory stocks, each valued at their respective end-or-quarter prices. The latter is the change in the physical volume of inventores valued at average prices of the
2. Quarterly totals at monthly rates. Final sales of domestic business equals final sales of domestic product less gross product of households and institutions and of general government and includes a small amount of final sales by farm.

| Nonfarm inventories to final sales of goods and structures $\qquad$ | 4.10 | 4.07 | 4.08 | 4.13 | 4.10 | 4.15 |

1. Inventories are as of the end of the quarter. Quarter-to-quarter changes calculated from this table are at quarterly rates, whereas, the change in the business inventories component of GDP is stated at annual rates.
2. Quarterly lotals at monthly rates. Final sales of domestic business equals final sales of domestic product less gross product of households and institutions and of general government and includes a small amount of final sales
NOTE.-Chained (1992) dollar inventory series are calculated as the product of the chain-type quantily index and the average of the end-of-year fixed-weighted inventories for 1991 and 1992, divided by 100. Chained (1992) dollar the average of the end-or-year fixed-weighted inventories for 1991 and 1992, divided by 100 . Chaned (1992) dollar corresponding series, divided by 100 . Because the formula for the chaintype quantity indexes uses weights of more than one period, the corresponding chained-doliar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines for inventories.

| Residual ............................................ | -. 2 | -. 4 | 1 | -. 1 | -. 4 | 2 | -. 2 | -. 3 |

1. Includes new trucks only.

NOTE--Chained (1992) doilar series are calculated as the product of the chain-type quantity index and the 1992 current-dollar value of the corresponding series, divided by 100 . Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

## B. Other Nipa and Nipa-Related Tables

## Monthly Estimates:

Tables B. 1 and B. 2 include the most recent estimates of personal income and its components; these estimates were released on March 2, 1998 and include "preliminary" estimates for January 1998 and "revised" estimates for October-December.

1. Disposable personal income in chained (1992) dollars equals the current-dollar figure divided by the implicit

Source: U.S. Department of Commerce, Bureau of Economic Anatysis.
price deflatar for personal consumption expenditures.
2. Monthly estimates equal personal saving for the month as a percentage of disposable personal income for
that monith.

## Annual Estimates:

Except as noted, these tables are derived from the nipa tables published in the August 1997 Survey of Current Business; they are consistent with the most recent comprehensive and annual revisions.

Table B.3.-Gross Domestic Product by Industry, Current-Dollar and Real Estimates for 1994-96

1. The current-dollar statistical discrepancy equals gross domestic product (GDP) measured as the sum of expenditures less gross domestic income--that is, GDP measured as the costs incurred and profits earned in domestic implicit price deflator for gross domestic product.
2. Equals GDP in chained (1992) dollars less the statistical discrepancy and the sum of GPO of the detailed industries.

NOTE-Estimates are based on the 1987 Standard Industrial Classification. The table is derived from tables 7 and to in "Gross Product by Industry, 1947-96" in the November 1997 SURVEY OF CURRENT BUSINESS.

1. Consists of purchases (including tips) of meals and beverages from retail, service, and amusement establishments, holelss, dining and butiet cars, schools, school raieenities, institutions, clubs, and industrial lunchrooms. In-
2. Includes luggage,
3. Consists of watch, clock, and jewelry repairs, costume and dress suit rental, and miscellaneous personal services.
4. Consists of rent for space and for heating and plumbing faciilites, water heaters, lighting fixtures, kitchen cabinets, linoleum, storm windows and doors, window screens, and screen doors, but excludes rent for appliances and furniture and purchases of fuel and electriciiy
5. Consists of space rent (see foomote 4) and rent for appliances, furnishings, and furniture.
6. Consists of transient hotets, motels, clubs, schools, and other group housing.
7. Consists of retrigeralors and freezers, cooking ranges, dishwashers, laundry equipment, stoves, room air condi-
joners, sewing machines, vacuum cleaners, and other applances
8. Indudes such house furrishings as floor coverings, comtort
at procucts, portable lamps, and clocks. Also includes writing equipment and hand, power , pnd , arder fames, mirrors, art procucts, portable lamps, anic ciocks. Also inciuose writing equipment and hand, power, and garden toins.
9. Consists largely of textile house furnishings, including piece goods alocated to house fumishing use. Also indudes lamp shades, brooms, and brushes.
10. Consists of maintenance services for appliances and house furnishings, moving and warehouse expenses, postage and express charges, premiums for fire and thett insurance on personal property less benefits and dividends, and miscellaneous househoid operation services.
11. Excludes drug preparations and related products dispensed by physicians, hospitals, and other medical sev${ }_{1} 12$.
12. Consists of osteopathic physicians, chiropractors, private duty nurses, chiropodists, podiatrists, and others pro-
viding heathh and allied services, not elseewhere classitied. homes, and (2) payments by patients to proprietary and government hospitals and nursing homes.
13. Consists of (i) premiums, less benefits and dividends, for health, hospitalization, and accidental death and dismemberment insurance provided by commercial insurance carriers, and (2) adminisistrative expenses (including consumption of fixed capital) of Blue Cross and Blue Shield plans and of other independent prepaid and selifinsured health plans.
14. Consists of premiums, less benefits and dividends, for income loss insurance.
15. Consists of premiums, less benefits and dividends, for privately administered workers' compensation
16. Consists of (1) operating expenses of lite insurance carriers and private noninsured pension plans, and (2) premiums, less benefits and dividends, of fraternal benefit societies. Excludes expenses allocated by commercial carriers to accicient and health insurance.
17. Consists of current expenditures (including consumption of fixed capitil) of trade unions and professional associations, employment agency fees, money order fees, spending for classified advertisements, tax return preparation 19. Consists of premiums, less benefits and
18. Consists of baggage charges, coastal and inland waterway fares, travel agents' fees, and airport bus fares. 21. Consists of admissions to professional and amateur atheetic events and to racetracks.
19. Consists of dues and fees excluding insurance premiums.
20. Consists of billiard parlors: bowing alleys; dancing, riding, shooting, skating, and swimming places; amusement devices and parks; golf courses, sighiseeng buses and guides; private fiving operations; casino gambling; and other 24. Consists of net receipts of loteries and expenditures for purchases of pets and pet care services, cable TV, film processing, photographic studios, sporting and recreation camps, video cassette rentals, and recreational services, not elsewhere classified.
21. For private institutions, equals current expenditures (including consumption of fixed capital) less receiptssuch as those from meals, rooms, and entertainments-accounted for separately in consumer expenditures, and less expenditures for research and development financed under contracts or grants. For government institutions, equals student payments of tuition.
22. For private institutions, equals current expenditures (including consumption of fixed capital) less receiptssuch as those from meals, rooms, and entertainments-accounted for separately in consumer expenditures. For government institutions, equals student payments of tuition. Excludes child day care services, which are included in reigious and welfare activities.
23. Consists of (1) tees paid to commercial, business, trade, and correspondence schools and for educational sevvices, not elsewhere classified, and (2) current expenditures (induding consumption of fixed capital) by research and research.
cial welfare, foreign relief, and political organizations, museums, libraries, and foundations, the expenditures, social weifare, foreign relief, and political organizations, museums, libraries, and foundations. The expenditures are penditures, and excludes relief payments within the United States and expenditures by foundations for education and research. For proprietary and government institutions, equals receipts from users.
Nores.-Consumer durable goods are designated (d.), nondurable goods (n.d.), and services (s.).
Estimates of foreign travel by U. S. residents (line 108) expenditures were $\$ 0.3$ billion in 1981. Beginning with 1984, estimates of oreign travel by U. S. residents include substanialy improved estimates of U. S. Tesidents 110 ) include, beginning with 1981, nonresidents' student and medical care expenditures in the United States. Student expenditures were $\$ 2.2$ billion, and medical expenditures were $\$ 0.4$ bilion in 1981. Beginning with 1984, estimates of expenditures in the United States by nonresidents include substantially improved estimates of nonresidents' travel expenditures. Expenditures in the United States by nonresidents are subtracted from total personal consumption expenditures (line 110) because they are included in detailed type of expenditure estimates elsewhere in personal Consumption expenditures.
Chained (1992) dollar series are calculated as the product of the chain-type quantity index and the 1992 currentdollar value of the corresponding series, divided by 100 . Because the formula for the chain-ype quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The
residual line is the difference between the first line and the sum of the most detailed lines.

1. Consists of office buildings, except those constructed at industrial sites and those constructed by utilities for
their own use.
2. Consists of stores, restaurants, garages, service stations, warehouses, mobile structures, and other buildings used for commercial purposes.
3. Consists of hotels and motels, buildings used primarily for social and recreational activities, and buildings not elsewhere classified, such as passenger terminals, greenhouses, and animal hospitals.
4. Consists primarily of streets, dams and reservoirs, sewer and water tacilities, parks, and airfields.
5. Consists primarily of dormitories, fraternity and sorority houses, and nurses' homes.

NOTE-Chained (1992) dollar series are calculated as the product of the chain-lype quantily index and the 1992 current-collar value of the corresponding series, divided by 100 . Because the formula for the chain-ype quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

1. Consists of museums, botanical, zoological gardens; engineering and management services; and services, not elsewhere classified.
2. Includes Coast Guard.
3. Beginning with 1993, includes estimates of foreign professional workers and undocumented Mexican migratory

NOTE.-Estimates in this table are based on the 1987 Standard Industrial Classification (SIC).
Compensation equals wage and salary accruals plus supplements to wages and salaries. "Supplements" are listed
in table 8.15 of the August 1997 SuRveY OF CURENT BuINESS.
workers employed temporarily in the United States.

1. Full-time equivalent employees equals the number of employees on full-time schedules plus the number of employees on part-bime schedules converted to a full-time basis. The number of full-time equivalent employees in each industry is the product of the total number of employees and the ratio of average weekly hours per employee for all employees to average weekly hours per employee on fuil-time schedules , engineering and management services; and services, not elsewhere classified.
2. Includes Coast Guard.
3. Beginning with 1993 , includes estimates of foreign professional workers and undocumented Mexican migratory
workers employed temporarily in the United Srates. workers employed temporarily in the United States.
NOTE.-Estimates in this table are based on the 1987 Standard Industrial Classification (SIC).

NOTE-Chained (1992) dollar series are calculated as the product of the chain-type quantity index and the 1992 current-dolar value of the corresponding series, divided by 100 . Because the formula tor the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive.

1. Consists of office buildings, except those occupied by electric and gas utility companies.
2. Consists primarity of stores, restaurants, garages, sevice stations, warehouses, and other buildings used for commercial purposes.
3. Consists of buildings not elsewhere classified, such as passenger terminals, greenhouses, and animal hospitals.
4. Consists primarily of streets, dams, reservoirs, sewer and water facilities, parks, and airfieds.
5. Consists primarily of dormitories, fraternity and sorority houses, and nurses' homes.

## C. Historical Tables

The tables in this section are derived from the "Summary National Income and Product Series" tables that were published in the August 1997 issue of the Survey of Current Business and from the "Selected nipa Tables" that are published in this issue. (Changes in prices are calculated from indexes expressed to three decimal places.)

Table C.1.-Historical Measures of Real Gross Domestic Product, Real Gross National Product, and Real Gross Domestic Purchases
[Quarterly estimates are seasonally adjusted at annual rates]

| Year and quarter | Billions of chained (1992) dollars |  |  | Percent change from preceding period |  | Chain-type price indexes |  | Implicit price deflators |  | Percent change from preceding period |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## F. Transactions Tables

Table F. 1 includes the most recent estimates of U.S. international trade in goods and services; the estimates were released on February 19, 1998 and include "preliminary" estimates for December 1997 and "revised" estimates for November. The sources for the other tables in this section are as noted.

Revised.

1. Reflects adjustments necessary to bring the Census Bureau's component data in line with the concepts and
definitions used to prepare BEA's international and national accounts.
2. Contains goods that cannot be separately identified

## ${ }_{r}{ }^{P}$ Preliminary. <br> ${ }^{r}$ Revised.

1. Credits, +; Exports of goods, services, and income; unilateral transfers to United States; capital inflows increase in foreign assets (U.S. liabilites) or decrease in U.S. assets); decrease in U.S. official reserve assets; increase in foreign ofticial assets in the United Slates.
Debis, - - Imports of goods, services, and income; unilateral transfers to loreigners; capital outtiows (deccrease loreign oficical assels in the United States.
2. Excludes exports of goods under U.S. military agency sales contracts identified in Census export documents, exciudes imporis of goods under direct derense expenditures identified in Census import documents, and reftects various other adjustments (for valuation, coverage, and timing) of Census statistics to balance of payments basis; see table 2 in "U.S. International Transactions, Third Quarter 1997" in the January 1998 issue of the SURVEY.
3. Includes some goods: Mainly militay equipment in line 4; major equipment, other materials, supplies, and petroleum products purchased abroad by U.S. military agencies in line 18; and fuel's purchased by ariline and steamship operators in ines 7 and 21 .
4. Incudes transters of goods and services under U.S. military grant programs.
5. Beginning in 1982 , these lines are presented on a gross basis. The definition of expors is revised to exclude U.S. parents' payments to foreign affiliates and to include U.S. affiliates' receipts from foreign parents. The definition of imports is revised to include U.S. parents' payments to foreign atifliates and to exciude U.S. affiliates' receipts 6. Beginning in 9882 , the "other transfers" component includes taxes paid by U.S. private residents to foreign governments and taxes paid by private nonresidents to the U.S. Government.
6. For all areas, amounts outstanding September 30, 1997, were as tollows in millions of dollars: Line $34,67,148$; line $35,11,050$; line $36,9,997$; line $37,14,042$; line 38, 32,059. Data are preiminary.

Table F.3.-Selected U.S. International Transactions, by Area
[Millions of dollars]

8. Includes sales of foreign obligations to foreigners.
9. Consists of bills, certificates, marketable bonds and notes, and nonmarketable convertible and noncorvertible bonds and notes
10. Consists of U.S. Treasury and Export-Import Bank obligations, not included elsewhere, and of debt securities of U.S. Government corporations and agencies.
f1. Inciudes, primarily, U.S. Government liabilites associated with military agency sales contracts and other transaccions arranged with or through foreign oficicia agencies; see table 4 in "U.S. International Transactions, Third Quar-
ter 1997 " in the January 1998 issue of the SuBveY. ter 1297 Consists of investments in US Corporate and local governments.
13. Conceptually, the sum of lines 70 and 62 is equal to "net foreign invesiment" in the national income and product accoounts (NPA's). However, the foreign transactions account in the NIIPA's (a) includes adjustments to the international transactions accounts for the treatment of gold, (b) includes adjustments for the different geographical
treament of transacions with $U$ U. . teritories and Puerto Rico, and (c) includes services furnished without payment treatment of transacions with U.S. teritories and Puerto Rico, and (c) includes senvices furnished without payment by financial pension plans except life insurance carriers and private noninsured pension plans. A reconciliation of A of tris section of the SURVEY OF CURRENT BUSNESS. A reconciliation of the other foreign transactions in the
 of the SURVEY).

| 1. Index of weighted average exchange value of U.S. dollar against currencies of other G-10 countries. March 1973=100. Weights are 1972-76 global trade of each of the 10 countries. Series revised as of August 1978. For description and back data, see: "Index of the weighted-average exchange value of the U.S. dollar: Revision" on page 700 of the August 1978 Federal Reserve Bulletin. |  |  |  |  | NOTE-All exchange rates are from the Board of Governors of the Federal Reserve System. U.S. interest rates, unemployment rates, and GDP growth rates are from the Federal Reserve, the Bureau of Labor Statistics, and BEA, respectively. All other data (including U.S. consumer prices and U.S. share prices, both of which have been rebased to 1990 to facilitate comparison) are © OECD, February 1998, OECD Main Economic Indicators and are reproduced with permission of the OECD. |  |  |  |  |  |  |  |  |  |  |  |

## I. Charts

## THE U.S. IN THE INTERNATIONAL ECONOMY

[^50]
## Regional Data

## J. State and Regional Tables

The tables in this section include the most recent estimates of State personal income and gross state product. The sources of these estimates are noted.

The quarterly and annual State personal income estimates and the gross state product estimates are available on diskettes or cd-rom. For information on personal income, e-mail reis.remd@bea.doc.gov; write to the Regional Economic Information System, BE-55, Bureau of Economic Analysis, U.S. Department of Commerce, Washington, DC 20230; or call 202-606-5360. For information on gross state product, e-mail gspread@bea.doc.gov; write to the Regional Economic Analysis Division, be-61, Bureau of Economic Analysis, U.S. Department of Commerce, Washington, DC 20230; or call 202-606-5340.

1. Percent changes are expressed at quarterly rates and are calculated from seasonally adjusted unrounded data.

Nore.-The personal income level shown for the United States is derived as the sum of the State estimates.
it omits the earrings of Federal civilian and military personnel stationed abroad and of U.S. residents employed
abroad temporarily by private U.S. firms. It can also differ from the NIPA estimate because of difterent data sources and revision schedules.
Source: Table 1 in "Personal Income by State and Region, Third Quarter 1997" in the February 1998 issue of the Survey of Current business.

1. Per capita personal income and per capita disposable personal income are computed using sonal income because, by definition, it omits the earnings of Federal civilian and military personnel
midyear population estimates of the Bureau of the Census.

NOTE.-The personal income level shown for the United States is derived as the sum of the
State estimates. It differs from the national income and product accounts (NIPA) estimate of per-
stationed abroad and of U.S. residents employed abroad temporarily by private U.S. firms. It can also differ from the NIPA estimate because of different data sources and revision schedules. Source: Tables 2 and 4 in "State Person
October 1997 SURVEY of CURRENT BUSINESS.

NoTE-Totals shown for the United States differ from the NIPA estimates of gross domestic product (GDP) be-
Sources: Tables 9 and 10 in "Comprehensive Revision of Gross State Product by Industry, 1977-94" in the June cause State data exclude the statistical discrepancy (the difference between GDP and gross domestic income), the tal for military structures located abroad and for military equipment, except office equipment; they may also differ from the GDP estimates because of differences in revision schedules.

## Additional Information About bea's NIPA Estimates

## Statistical Conventions

Changes in current-dollar GDP measure changes in the market value of goods and services produced in the economy in a particular period. For many purposes, it is necessary to decompose these changes into quantity and price components. To compute the quantity indexes, changes in the quantities of individual goods and services are weighted by their prices. (Quantity changes for GDP are often referred to as changes in "real GDP.") For the price indexes, changes in the prices for individual goods and services are weighted by quantities produced. (In practice, the current-dollar value and price indexes for most GDP components are determined largely using data from Federal Government surveys, and the real values of these components are calculated by deflation at the most detailed level for which all the required data are available.)
Except for the most recent period, the annual and quarterly changes in real GDP and prices are "chaintype" measures that are both based on the "Fisher Ideal" formula that incorporates weights from two adjacent years. For example, the 1992-93 percent change in real GDP uses prices for 1992 and 1993 as weights, and the 1992-93 percent change in price uses quantities for 1992 and 1993 as weights. Because the quantity and price index numbers calculated in this way are symmetric, the product of the index of real GDP and the index of prices equals the index of current-dollar GDP.
In the most recent period, a variant of the formula is used because only 1 year's information is available for computing the index number weights. Accordingly, bea uses the prices and quantities from the two adjacent quarters as weights to calculate Fisher chaintype measures for those estimates. For example, the 1996:II-1996:III percent change in real GDP uses prices for 1996:II and 1996:III as weights, and the 1996:II1996:III percent change in the GDP price index uses quantities for 1996:II and 1996:III as weights.
bea also presents another measure, known as the "implicit price deflator," in the nIpa tables. The implicit price deflator is calculated as the ratio of currentdollar value to the corresponding chained-dollar value multiplied by 100 .

In addition, bea prepares measures of real GDP and its components in a dollar-denominated form, designated "chained (1992) dollar estimates." These estimates are computed by multiplying the 1992 currentdollar value of GDP, or of a GDP component, by the corresponding quantity index number. For example, if a current-dollar GDP component equaled $\$ 100$ in

1992 and if real output for this component increased by 10 percent in 1993, then the "chained (1992) dollar" value of this component in 1993 would be $\$ 110$ ( $\$ 100$ $\times 1.10$ ). Note that percentage changes in the chained (1992) dollar estimates and the percentage changes calculated from the quantity indexes are identical, except for small differences due to rounding.
Because of the formula used for calculating real GDP, the chained (1992) dollar estimates for detailed GDP components do not add to the chained-dollar value of GDP or to any intermediate aggregates. A "residual" line is shown as the difference between GDP and the sum of the most detailed components shown in each table. The residual generally is small close to the base period but tends to become larger as one moves further from it. In cases where the residual is large, the table of contributions of the major components to the change in real GDP provides a better basis for determining the composition of GDP growth than the chained-dollar estimates.
For quarters and months, the estimates are presented at annual rates, which show the value that would be registered if the rate of activity measured for a quarter or a month were maintained for a full year. Annual rates are used so that time periods of different lengths-for example, quarters and years-may be compared easily. These annual rates are determined simply by multiplying the estimated rate of activity by 4 (for quarterly data) or 12 (for monthly data).
Percent changes in the estimates are also expressed at annual rates. Calculating these changes requires a variant of the compound interest formula:

$$
r=\left[\left(\frac{X_{t}}{X_{o}}\right)^{m / n}-1\right] \times 100
$$

where $r$ is the percent change at an annual rate; $X_{t}$ is the level of activity in the later period; $X_{o}$ is the level of activity in the earlier period; $m$ is the yearly periodicity of the data (for example, 1 for annual data, 4 for quarterly, or 12 for monthly); and
$n$ is the number of periods between the earlier and later periods (that is, $t-o$ ).

Quarterly and monthly NIPA estimates are seasonally adjusted, if necessary. Seasonal adjustment removes from the time series the average impact of variations that normally occur at about the same time and in about the same magnitude each year-for example, weather, holidays, and tax payment dates. After seasonal adjustment, cyclical and other short-term changes in the economy stand out more clearly.

## Reconciliation Tables

Table 1.-Reconciliation of Changes in BEA-Derived Compensation Per Hour with BLS Average Hourly Earnings
[Percent change from preceding period]

|  | 1995 | 1996 | $1997{ }^{P}$ | Seasonally adjusted at annual rates |  |  |  |  |

## Mid-Decade Strategic Plan

bea has published the following articles in the Survey of Current Business on the development and implementation of its strategic plan for improving the accuracy, reliability, and relevance of the national, regional, and international accounts.
"Mid-Decade Strategic Review of bea's Economic Accounts: Maintaining and Improving Their Performance" (February 1995)*
"Mid-Decade Strategic Review of bea's Economic Accounts: An Update" (April 1995)*
"bea's Mid-Decade Strategic Plan: A Progress Report" (June 1996)*
Mid-Decade Strategic Review of bea's Economic Accounts: Background Papers (1995) presents seven background papers that evaluate the state of the U.S. economic accounts and that identify the problems and the prospects for improving the accounts.

## Methodology

BEA has published a wealth of information about the methodology used to prepare its national, regional, and international estimates.

## National

National income and product accounts (NIPA's)
nipa Methodology Papers: This series documents the conceptual framework of the NIPA's and the methodology used to prepare the estimates.

An Introduction to National Economic Accounting (nipa Methodology Paper No. 1, 1985) [Also appeared in the March 1985 issue of the Survey] Corporate Profits: Profits Before Tax, Profits Tax Liability, and Dividends (nIPA Methodology Paper No. 2, 1985)
Foreign Transactions (nipa Methodology Paper No. 3, 1987)
gnp: An Overview of Source Data and Estimating Methods (nipa Methodology Paper No. 4, 1987) [Also appeared in the July 1987 issue of the Survey]
Government Transactions (NIPA Methodology Paper No. 5, 1988)*
Personal Consumption Expenditures (Nipa Methodology Paper No. 6, 1990)

* Items with an asterisk can be found on bea's Internet site at [http://www.bea.doc.gov](http://www.bea.doc.gov).

The methodologies described in these papers are subject to periodic improvements that are typically introduced as part of the annual and comprehensive revisions of the nIPA's; these improvements are described in the Survey articles that cover these revisions.
"Annual Revision of the U.S. National Income and Product Accounts": This series of Survey articles, the latest of which was published in the August 1997 issue,* describes the annual nipa revisions and the improvements in methodology.

The most recent comprehensive revision of the nipa's is described in the following series of Survey articles.
"Preview of the Comprehensive Revision of the National Income and Product Accounts: bea's New Featured Measures of Output and Prices" (July 1995)*
"Preview of the Comprehensive Revision of the National Income and Product Accounts: Recognition of Government Investment and Incorporation of a New Methodology for Calculating Depreciation" (September 1995)*
"Preview of the Comprehensive Revision of the National Income and Product Accounts: New and Redesigned Tables" (October 1995)*
"Improved Estimates of the National Income and Product Accounts for 1959-95: Results of the Comprehensive Revision" (January/February 1996)*
"Completion of the Comprehensive Revision of the National Income and Product Accounts, 1929-96" (May 1997)*
"Updated Summary nipa Methodologies" (September 1997 SURvey)* identifies the principal source data and estimating methods that are used to prepare the estimates of gross domestic product (GDP).

## Availability

For the availability of some of these publications, see the inside back cover of this issue. See also the User's Guide to bea Information: To request a copy, write to the Public Information Office, BE-53, Bureau of Economic Analysis, U.S. Department of Commerce, Washington DC 20230, call 202-606-9900, or visit BEA's Internet site at [http://www.bea.doc.gov](http://www.bea.doc.gov).

Information on the sources and methods used to prepare the national estimates of personal income, which provide the basis for the State estimates of personal income, can be found in State Personal Income, 1929-93 (1995).*
"Gross Domestic Product as a Measure of U.S. Production" (August 1991 SURVEY)* briefly explains the difference between GDP and gross national product.

The conceptual basis for the chain-type measures of real output and prices used in the NIPA's is described in the following Survey articles.
"Alternative Measures of Change in Real Output and Prices" (April 1992)*
"Economic Theory and bea's Alternative Quantity and Price Indexes" (April 1992)*
"Alternative Measures of Change in Real Output and Prices, Quarterly Estimates for 1959-92" (March 1993)*
"Preview of the Comprehensive Revision of the National Income and Product Accounts: bea's New Featured Measures of Output and Prices" (July 1995)*
"bea's Chain Indexes, Time Series, and Measures of Long-Term Economic Growth" (May 1997)*
"Reliability and Accuracy of the Quarterly Estimates of GDP" (October 1993 SURVEY)* evaluates GDP estimates by examining the record of revisions in the quarterly estimates.
"A Look at How bea Presents the nipa's" (May 1996 SURVEY)* explains how to locate the NIPA estimates and some of the conventions used in their presentation.

## Wealth and related estimates

"Improved Estimates of Fixed Reproducible Tangible Wealth, 1929-95" (May 1997 Survey)* describes the most recent comprehensive revision of the estimates of fixed reproducible tangible wealth.

## Gross product by industry

"Improved Estimates of Gross Product by Industry, 1959-94" (August 1996 Survey)* describes the most recent comprehensive revision of the estimates of gross product by industry.
"Gross Product by Industry, 1947-96" (November 1997 SURVEY)* presents the most recent revision to the estimates of gross product by industry and briefly describes changes in methodology.

## Input-output accounts

"Benchmark Input-Output Accounts for the U.S. Economy, 1992" (November 1997 Survey)* describes the preparation of the 1992 input-output accounts and the concepts and methods underlying the U.S. input-output accounts.

## International

## Balance of payments accounts (BPA's)

The Balance of Payments of the United States: Concepts, Data Sources, and Estimating Procedures (1990)* describes the methodologies used in preparing the estimates in the bPa's and of the international investment position of the United States. These methodologies are subject to periodic improvements that are typically introduced as part of the annual revisions of the bPA's.
"U.S. International Transactions, Revised Estimates": This series of Survey articles, the latest of which was published in the July 1997 issue, ${ }^{*}$ describes the annual bpa revisions and the improvements in methodology.

## Direct investment

The coverage, concepts, definitions, and classifications used in the benchmark surveys of U.S. direct investment abroad and of foreign direct investment in the United States are presented in the publications of the final results of the following benchmark surveys.

> U.S. Direct Investment Abroad: 1989 Benchmark Survey, Final Results (1992)*
> Foreign Direct Investment in the United States: 1992 Benchmark Survey, Final Results (1995)*

The types of data on direct investment that are collected and published by bea and the clarifications of the differences between the data sets are presented in the following Survey articles.
"A Guide to bea Statistics on U.S. Multinational Companies" (March 1995)*
"A Guide to bea Statistics on Foreign Direct Investment in the United States" (February 1990)*

## Regional

## Personal income

State Personal Income, 1929-93 (1995)* includes a description of the methodology used to prepare the estimates of State personal income. [Also available on the CD-rom "State Personal Income, 1958-96"]

Local Area Personal Income, 1969-92 (1994)* includes a description of the methodology used to prepare the estimates of local area personal income. [Also available on the cd-rom "Regional Economic Information System, 1969-95"]

## Gross state product

"Comprehensive Revision of Gross State Product by Industry, 1977-94" (June 1997 SURVEy)* summarizes the sources and methods for bea's estimates of gross state product.

## ACCESSING BEA INFORMATION

## BEA's ECONOMIC INFORMATION ON THE INTERNET

BEA web site (http://www.bea.doc.gov), access to summary estimates and other information covering all aspects of BEA's work.

- Latest figures on GDP, personal income, balance of payments, and other national, regional, and international estimates
- Special articles from BEA's monthly SURVEY OF CURRENT BUSINESS, featuring:
presentations of new and improved data sets descriptions of source data and estimating procedures discussions of statistical research and analysis
- Updates on new developments and an e-mail link to BEA

STAT-USA web site (http://www.stat-usa.gov), a subscription service that offers detailed data files for BEA's national, regional, and
 international accounts, a complete electronic version of BEA's monthly SURVEY OF CURRENT BUSINESS, timely access to BEA news releases, as well as a host of economic statistics from other Federal agencies.

## BEA ESTIMATES ON CD-ROM, ON DISKETTE, AND IN PUBLICATIONS

## CD-ROM products

- SURVEY OF CURRENT BUSINESS CD-ROMs-All the issues of the SURVEY for 1994, 1995, 1996 and selected articles back to 1987

## - Regional Economic Information System (REIS) CD-ROM-Income and employment

BEA economic areas; gross state product estimates for 1977-92 and regional projections to 2045

- State Personal Income (SPI) CD-ROM-Income and employment estimates for 1969-95 for all States

## Diskette products

Detailed estimates that underlie the national, regional, and international accounts.

## Publications

In addition to the SURVEY OF CURRENT BUSINESS, BEA publishes comprehensive statistical volumes that also include descriptions of methodology.

For more information on BEA programs and products, contact the Public Information Office of the Bureau of Economic Analysis at (202) 606-9900.

# Need to understand the latest GDP figures? <br> Get details on international trade? <br> Find top States in personal income growth? 

The Survey of Current Business provides the broad scope and the statistical detail to keep you informed, each month, about U.S. economic conditions. The SURVEY is the journal of record for many of the headline-making economic statistics used by decision-makers worldwide in business and government. Other highlights include:

- National Income and Product Accounts
- Industry-level GDP
- International Investment Position
- Federal Budget Estimates
- Gross State Product
- Balance of Payments
- Industry Input-Output Tables
- Local Area Personal Income

"BEA Current and Historical Data"- a statistical section highlighting BEA's national, regional, and international estimates - includes tables and charts ideally suited for use by economic analysts and forecasters.
To keep up with the rapidly changing U.S. economy, subscribe to the SURVEY of CURRENT Business today.

## BEA INFORMATION

The economic information prepared by the Bureau of Economic Analysis (BEA) is available in news releases, in publications, on computer diskettes, on CD-ROM's, and on the Internet. For a description of these products in the free User's Guide to bea Information, write to the Public Information Office, $\mathrm{BE}-53$, Bureau of Economic Analysis, U.S. Department of Commerce, Washington, DC 20230, or call (202) 6069900 . The User's Guide and other information are also available on BEA's home page at http://www.bea.doc.gov.

In addition, the following publications are available from the Superintendent of Documents of the Government Printing Office (gro). To order, write to Superintendent of Documents, p.o. Box 371954, Pittsburgh, pA 15250-7954, call (202) 512-1800 or fax (202) 5i2-2250. Pay by check to the Superintendent of Documents or charge to a gro deposit account, to visa, or to MasterCard.

Benchmark Input-Output Accounts of the United States, 1987, (1994) Presents summary and detailed make and use tables for industries and commodities; tables showing commodity- and industry-output-re-quire-ments per dollar of commodity demanded; and tables showing the imput-output ( $\mathrm{r}-\mathrm{o}$ ) commodity composition of personal consumption expenditures and producers' durable equipment expenditures in the national income and product accounts. Presents concepts and methods used in the 1987 benchmark accounts; concordance beween I-o and 1987 Standard Industrial Classification codes; description of the components of the measures of output, intermediate inputs, and value added; and mathematical derivation of total requirements tables. (468 pages) $\$ 29.00$, stock no. 003-010-00251-4.

Regional Multipliers: A User Handbook for the Regional Input- Output Modeling System (rims II), Third Edition. (1997). This handbook describes the five types of rims in multipliers that are available for nearly 500 industries and for any county or for any group of counties. It details the information that the users need in order to effectively use the Rims in multipliers to analyze the economic and industrial impact of public and private projects and programs on State and local areas. The handbook also includes case studies that illustrate the uses of the rims in multipliers and a description of the methodology that the Bureau of Economic Analysis uses to estimate the multipliers. ( 63 pages) $\$ 6.00$, stock no. 003-010-00264-6.

State Personal Income, 1929-93. (1995) Presents detailed annual estimates for States and regions of personal income for 1929-93, including estimates of per capita personal income, personal income by major source, and earnings by industry. Also presents annual estimates of disposable personal income and per capita disposable personal income for 1948-93 and quarterly estimates of personal income for 1969-93. Provides information about the sources and methods used to prepare the estimates for 1987-93 and samples of all the detailed tables of personal income and employment that are available for regions, States, counties, and metropolitan areas. (444 pages) $\$ 27.00$, stock no. 003-010-00257-3.

Foreign Direct Investment in the United States: 1992 Benchmark Survey, Final Results. (1995) Presents detailed data on the financial structure and operations of U.S. affiliates of foreign direct investors, on the foreign direct investment position in the United States, and on the bal-ance-of-payments transactions between U.S. affiliates and their foreign parent companies in 1992. Includes data for items, such as employment covered by collective bargaining agreements and merchandise trade by product and country of destination and origin, that are only collected in benchmark surveys. Benchmark surveys are conducted every 5 years and are BEA's most comprehensive surveys in terms of both the number of companies covered and the amount of information gathered. The data are classified by industry of affiliate and by country of ultimate beneficial owner, and selected data are classified by State. Provides information about the coverage, the concepts and definitions, and the
classifications used in the survey. (312 pages) $\$ 20.00$, stock no. 003-010-00259-0.
Foreign Direct Investment in the United States: Operations of U.S. Affiliates of Foreign Companies. (1997) Two publications: One presents the revised estimates for 1994 , and the other, the preliminary estimates for 1995 from BEA's annual surveys of the financial structure and operations of nonbank U.S. affiliates of foreign direct investors. The estimates are presented by industry of the U.S. affiliate and by country of the ultimate beneficial owner (UBO) and for selected estimates, by industry of Ubo and by State. Preliminary 1995 Estimates (108 pages) \$8.50, stock no. 003-010-00268-9; Revised 1994 Estimates (108 pages) \$8.50, stock no. 003-010-00267-1.

Foreign Direct Investment in the United States: Establishment Data for 1992. (1997) This publication, which presents the results of a project by bea and the Bureau of the Census, provides the most recently available data on the number, employment, payroll, and shipments or sales of foreign-owned U.S. establishments in more than 800 industries at the Standard Industrial Classification four-digit level and by State and by country of owner. Presents additional information-such as data on value added, employee benefits, hourly wage rates of production workers, and expenditures for plant and equipment-for manufacturing establishments. ( 364 pages) $\$ 28.00$, stock no. 003-010-00265-4.
Foreign Direct Investment in the United States: Establishment Data for Manufacturing, 1991. (1994) A joint effort by BEA and the Bureau of the Census. Presents the most recently available data for foreign-owned U.S. manufacturing establishments (plants) by detailed industry (up to 459 industries), by State, and by country of investor. Includes data on the number of plants, value added, shipments, employment, total employee compensation, employee benefits, the hourly wage rates of production workers, the cost of materials and energy used, inventories by stage of fabrication, and expenditures for new plant and equipment. (220 pages) $\$ 14.00$, stock no. 003-010-00250-6.
U.S. Direct Investment Abroad: 1994 Benchmark Survey, Preliminary Results. (1997) Presents preliminary results from the latest benchmark survey of the worldwide operations of U.S. multinational companies. Contains detailed 1994 data on the operations of U.S. parent companies and their foreign affiliates in 103 tables organized by country and by industry. (140 pages) $\$ 14.00$, stock no. 003-010-00263-8.
U.S. Direct Investment Abroad: Operations of U.S. Parent Companies and Their Foreign Affiliates, Preliminary 1995 Estimates. (1997) Provides revised results for 1995 from bea's annual survey of the worldwide operations of U.S. multinational companies. Contains information on the financial structure and operations of U.S. parent companies and their foreign affiliates. Data are classified by country and industry of affiliate and by industry of U.S. parent. (116 pages) $\$ 9.00$, stock no. 003-010-00270-1.

## Schedule of Upcoming bea News Releases

| Subject | Release |
| :--- | :--- | :--- |
| Date |  |

[^54]
[^0]:    1. Quarterly estimates in the nIPA's are expressed at seasonally adjusted annual rates unless otherwise specified. Quarter-to-quarter dollar changes are differences between published estimates. Quarter-to-quarter percent changes are annualized and are calculated from unrounded index numbers. Real estimates are expressed in chained (1992) dollars. Price indexes are chain-type measures.
[^1]:    NOTE. - See nole to table 1 for an explanation of chained (1992) doliar series. Chained (1992) dollar levels and residuals are found in NIPA tables 5.5. 8.5 (autos), and 8.7 (trucks). Percent changes in major aggregates are in NIPA table 8.1

[^2]:    4. The structures at the Elk Hills Naval Petroleum Reserve were sold for $\$ 0.8$ billion, or $\$ 3.2$ billion at an annual rate. In the NIPA's, this transaction is recorded as offsetting entries in government gross investment and in private nonresidential structures. The remaining value of the sale, which consists of land and subsoil assets, is treated as the sale of nonproduced assets and is excluded from the NIPA's. Because gDP is measured on an accrual basis, the sale-which was closed in February 1998 but was made retroactive to October 1, 1997 -was recorded in the fourth quarter in the nipa's.
    5. "Other" residential investment includes home improvements, new mobile home sales, brokers' commissions on home sales, residential equipment, and other residential structures (which consists primarily of dormitories, fraternity and sorority houses, and nurses' homes).
[^3]:    7. Exports and imports of nonautomotive capital goods include both parts and equipment. However, parts are not included either in the producers' durable equipment component of business fixed investment or in the equipment component of government investment.
[^4]:    NOTE-See note to table 1 for an explanation of chained (1992) dollar series. Chained (1992)
    dollar levels and residuals are found in NIPA table 4.4. Percent changes in major aggregates
    are found in NIPA table 8.1.

[^5]:    Nlar levels ate to table 1 for an explanation of chained (1992) dollar series. Chained (1992)

[^6]:    1. Estimates of the Budget of the United States Government are presented on a fiscal year basis. See Executive Office of the President, Office of Management and Budget, Budget of the United States Government, Fiscal Year 1999 (Washington, dc: U.S. Government Printing Office, 1998).
    2. Estimates of the administration's proposed legislation and program changes are derived by bea as the difference between the "current-services" estimates included in the budget and the total budget. The current-services estimates, which are based on the economic assumptions underlying the budget, are designed to show what Federal receipts and outlays would be if no changes are made to the laws that are already enacted. In concept, these estimates are neither recommended amounts nor forecasts; they form a baseline with which administration or congressional proposals can be analyzed.
[^7]:    3. General government includes such activities as tax collection; administration of the public debt; and personnel, general property, and administrative management.
[^8]:    4. For a detailed discussion of the reconciliation, see Government Transactions, Methodology Paper No. 5 (November 1988). (This paper is available from the National Technical Information Service, accession no. PB 90-118480, and at bea's Web site, [http://www.bea.doc.gov](http://www.bea.doc.gov).)

    In addition, as part of the comprehensive NIPA revision released in January 1996, several changes were made to the definitions and classifications used to measure the Federal sector. For a discussion of these changes, see "Preview of the Comprehensive Revision of the National Income and Product Accounts: Recognition of Government Investment and Incorporation of a New Methodology for Calculating Depreciation," Survey of Current BusiNESS 75 (September 1995): 33-41; and "Improved Estimates of the National Income and Product Accounts for 1959-95: Results of the Comprehensive Revision," Survey 76 (January/February 1996): 1-31.

[^9]:    1. Consists largely of the Federal Communication Commission Universal Service Fund receipts and contributions for social insurance by residents of U.S. territories and Puetto Rico. 2. Taxes received from the rest of the world are included in the budget and netted against 3 .
    2. Consists largely of proprietary receipts that are netted against outlays in the budget and 4. Consists largely of Treasury receipts from sales of foreign currencies to Government agen4. Co
    cies.
    Sourc
    of Economic Analysis. MIPA National insis.
    NIPA National income and product accounts
[^10]:    5. Most of the proceeds of the sale of the naval petroleum reserve in Elk Hills, California, was classified as the sale of a nonproduced asset and was excluded from the nipa's. For more information on this sale, see the "Business Situation" in this issue.
[^11]:    1. Gross investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in Federal Government consumption expendi-
    tures.
    Sources: The Budget of the United States Government, Fiscal Year 1999 and the Bureau of Economic Analysis.
[^12]:    1. See Sherlene K.S. Lum and Robert E. Yuskavage, "Gross Product by Industry, 1947-96," Survey of Current Business 77 (November 1997): 20-34
[^13]:    1. For additional information on the accuracy of the two measures, see the box "Statistical Discrepancy" in Robert P. Parker and Eugene P. Seskin, "Annual Revision of the National Income and Product Accounts," Survey of Current Business 77 (August 1997): 19.
[^14]:    2. See "Note on Alternative Measures of Gross Product by Industry," Survey 77 (November 1997): 84.
    3. For information about the computation of the real Gpo estimates, see the box "Computation of the Chain-Type Quantity Indexes for Double-Deflated Industries" in Robert E. Yuskavage, "Improved Estimates of Gross Product by Industry, 1959-94," Survey 76 (August 1996): 142.
[^15]:    2. For more information on the double-deflation method, see Robert E. Yuskavage, "Improved Estimates of Gross Product by Industry, 1959-94," Survey 76 (August 1996): 142-145.
[^16]:    3. For a list of the sources for current-dollar product detail and price indexes for gross output, see Yuskavage, "Improved Estimates," table 8.
    4. Ann M. Lawson, "Benchmark Input-Output Accounts for the U.S. Economy, 1992: Make, Use, and Supplementary Tables," Survey 77 (November 1997): 36-82.
    5. For a list of the sources for the price indexes for intermediate inputs, see Yuskavage, "Improved Estimates," table 9.
[^17]:    6. The direction and magnitude of the effect on the gro price index depends on interactions among the gross output price index, the intermediate inputs price index, and the input-output ratio.
[^18]:    7. In the GPO estimates, the gross output of the wholesale trade and retail trade industries primarily consists of margin, which is defined as sales minus the cost of goods sold. Because price indexes for margin are not available, sales by detailed type of business are deflated, and the margin rate is assumed to be constant. Such assumptions are not required for the deflation of NIPA final expenditures.
    8. Current-dollar cost per unit of real Gpo equals the GPO price index divided by 100 .
[^19]:    9. For purposes of this analysis, property-type income is defined as the sum of corporate profits, proprietors' income, rental income of persons, net interest, capital consumption allowances, business transfer payments, and the current surplus of government enterprises less subsidies. However, a substantial portion of proprietors' income represents the labor share of production.
[^20]:    10. For a description of the calculation of these contributions, see "Note on Computing Alternative Chained Dollar Indexes and Contributions to Growth" in J. Steven Landefeld and Robert P. Parker, "bea's Chain Indexes, Time Series, and Measures of Long-Term Economic Growth," Survey 77 (May 1997): 63. The procedure described in the note was modified to replace the chain-type quantity index with the chain-type price index.
[^21]:    1. Average annual rate.
[^22]:    1. For more information on the concepts underlying the accounts, see Allan H. Young and Helen Stone Tice, An Introduction to National Economic Accounting, nipa Methodology Paper No. 1 (1985); and Carol S. Carson, gnp: An Overview of Source Data and Estimating Methods, nipn Methodology Paper No. 4 (1987). For information on the availability of these papers, see the box "Information About niPA Methodology."
[^23]:    1. For information on the methodology used to prepare the national estimates of personal income, which provide the basis for the State estimates of personal income, see State Personal Income, 1959-93 (Washington, dc: U.S. Government Printing Office, 1995).
    2. See "Gross Domestic Product as a Measure of U.S. Production," Survey 71 (August 1991): 8; and "Preview of the Comprehensive Revision of the National Income and Product Accounts: Recognition of Government Investment and Incorporation of a New Methodology for Calculating Depreciation," Survey 75 (September 1995): 33-41.
[^24]:    See note at end of table.

[^25]:    NOTE.-Numbers in parentheses indicate accounts and items of counterentry in the accounts. For example, line 3 of account 1 is shown as "Disbursements (2.7)"; the counterentry is shown in account 2 , line 7.

[^26]:    2. Purchases of fixed assets, including residential structures by individuals and by nonprofit institutions that primarily serve individuals, are classified as gross private domestic investment.
[^27]:    4. Because the source data available for most components of GDP are measured in dollars rather than in units, the quantities of most of the detailed components used to calculate percent changes are obtained by deflation. For deflation, quantities are approximated by real values (expressed at present with 1992 as the base period) that are calculated by dividing the current-dollar value of the component by its price index, where the price index uses 1992 as the base period.

    Two other methods, quantity extrapolation and direct base-year valuation, are also used to calculate the real values for a small number of the most detailed gdP components. For quantity extrapolation, the real values are obtained by extrapolating the base-year current-dollar estimates in both directions from the base period (1992) by quantity indicators; for example, the real values for mining exploration, shafts, and wells structures are extrapolated using oilwell footage drilled. For direct-base-year valuation, the real values are obtained by multiplying base-year prices by quantity data for each period; for example, the real values of natural gas inventories are calculated using quantities and prices of natural gas stocks.
    5. For a discussion of the advantages of the Fisher index, see Jack E. Triplett, "Economic Theory and bea's Alternative Quantity and Price Indexes," Survey 72 (April 1992): 49-52; and J. Steven Landefeld and Robert P. Parker, "ben's Chain Indexes, Time Series, and Measures of Long-Term Economic Growth," Survey 77 (May 1997): 58-68.

[^28]:    6. For the annual estimates of NIPA aggregates that include the components "change in business inventories" and "change in Commodity Credit Corporation inventories," this relationship does not hold exactly, because of the price-data conventions used to calculate those components. In addition, for the quarterly estimates, all quarterly chain-type quantities and prices are adjusted to average to the corresponding annual estimates. For details on quarterly calculations, see the box "Basic Formulas for Calculating Chain-Type Quantity and Price Indexes."
    7. Indexes are not presented for change in inventories, for net exports, and for most of the "net" series in tables $7.5,7.7,7.11,7.13$, and 7.20 . Indexes for these series are not meaningful.
    8. For change in business inventories (in tables 1.2, 1.4, 1.6, 5.3, 5.11, 8.5, 8.7 , and 8.9 ), real values are calculated as the difference between end-of-period and beginning-of-period chain-weighted stocks of inventories.

    The following "real" series are calculated as the current-dollar value of the series divided by an appropriate implicit price deflator: The chained-dollar values of gross national income and gross domestic income (in table 1.10), of command-basis exports of goods and services and receipts of factor income (in table 1.11), of gross and net domestic product of nonfinancial corporate business (in table 1.16), and of disposable personal income (in tables 2.1 and 2.9).

    For the following series, real values are calculated as the sum of, or the difference between, chained-dollar series: Net exports (in tables 1.2, 8.5, and 8.7); command-basis gross national product (in table 1.11), foreign travel and other, net (in table 2.5); net foreign travel (in table 2.7); Federal consumption expenditures for durable goods, for nondurable goods, and for Commodity Credit Corporation inventory change (in table 3.8); net investment by major type (in table 5.3); and Federal defense and nondefense net purchases of used structures (in table 5.15).

[^29]:    9. See Landefeld and Parker, "bea's Chain Indexes," 63-66; and J. Steven Landefeld and Robert P. Parker, "Preview of the Comprehensive Revision of the National Income and Product Accounts: bea's New Featured Measures of Output and Prices," Survey 75 (July 1995): 31-38.
[^30]:    1. The formulas must be modified for other quarters and for the most recent year because for these periods, chained output is calculated in a slightly different manner.
[^31]:    10. The two measures of the price level differ only because of the factors cited in footnote 6.
[^32]:    11. These certain goods are classified as services only for exports and imports.
    12. For more detail on government enterprises, see the section "Legal form of organization."
[^33]:    13. Gross product of financial and of nonfinancial corporations are also shown in the NIPA tables. They are calculated as the costs incurred and the incomes earned from production.
[^34]:    14. An industrial distribution of fixed investment based on data collected from establishments is prepared as part of the procedure used to estimate capital stock.

    Industrial distributions of gross product are also prepared; for further information, see Sherlene K.S. Lum and Robert E. Yuskavage, "Gross Product by Industry, 1947-96," SURvey 77 (November 1997): 20-34.
    15. Office of Management and Budget, Statistical Policy Division, Standard Industrial Classification Manual, 1987 (Washington, dC: U.S. Government Printing Office (GPO), 1988); Office of Management and Budget, Statistical Policy Division, Standard Industrial Classification Manual, 1972 (Washington, DC: Gpo, 1972); and Bureau of the Budget, Standard Industrial Classification Manual, 1942 (Washington, DC: GPO, 1942).

[^35]:    16. Regulated investment companies, small business investment companies, and real estate investment trusts are included in the sIc classification "holding and other investment offices" and are not shown separately in the nipa tables.
[^36]:    17. The nIPA estimates appear first in news releases, which are available to the general public in a variety of forms (see the box "Data Availability").
[^37]:    18. In this category, the first table shows year-to-year and quarter-toquarter percent changes in the major nIPA aggregates, and the second table shows contributions of the major expenditure components to the percent change in real gDp. The other tables show the following: Selected per capita series; auto and truck output, farm and housing sector accounts; detail on several components of gross national income (consumption of fixed capital, capital consumption adjustment, business transfer payments, supplements to wages and salaries, rental income of persons, dividends, and interest); NIPA imputations and the components affected; and reconciliations of several NIPA measures with the source data (for example, tax return tabulations) from which they are derived or to which they are closely related. The last table shows fixed (1992) weighted quantity indexes for selected series.
[^38]:    19. Additional information about source data and assumptions is also available online through stat-usa's Economic Bulletin Board and on the Internet (see the box "Data Availability").
[^39]:    20. BEA has prepared a series of papers that provide detailed descriptions of NIPA concepts and methodologies. See the box "Information About NIPA Methodology."
    21. See Parker and Seskin, "Annual Revision," 6-32.
    22. For additional details on the release schedule for the NIPA estimates, see the section "Presentation of the NIPA's" in the text.
[^40]:    23. For additional information, see the box "Data Availability."
[^41]:    24. For a few components, the final quarterly estimates are based on newly available source data that replace judgmental trends.
    25. For additional information on the commodity-flow method, see U.S. Department of Commerce, Bureau of Economic Analysis, Personal Consumption Expenditures, Methodology Paper Series mp-6 (Washington, dC: U.S. Government Printing Office, 1990): 31-34; and U.S. Department of Commerce, Bureau of Economic Analysis, gnp: An Overview of Source Data and Estimating Methods, Methodology Paper Series mp-4 (Washington, DC: U.S. Government Printing Office, 1987): 16-17.
    26. For additional information, see Personal Consumption Expenditures, 41-54; and gnp: An Overview, 17.
    27. For additional information on the perpetual-inventory method, see U.S. Department of Commerce, Bureau of Economic Analysis, Fixed Re-
[^42]:    producible Tangible Wealth in the United States, 1925-89 (Washington, dC: U.S. Government Printing Office, January 1993): M-2-M-15; and GNP: An Overview, 17-18. For additional information on the geometric depreciation formula, see "Improved Estimates of Fixed Reproducible Tangible Wealth, 1929-95," Survey 77 (May 1997): 69-92.
    28. For additional information and an illustration of the fiscal year-analysis method, see U.S. Department of Commerce, Bureau of Economic Analysis, Government Transactions, Methodology Paper Series mp-5 (Washington, DC: U.S. Government Printing Office, 1988): 19-20.
    29. See U.S. Department of Commerce, Bureau of Economic Analysis, The Balance of Payments of the United States: Concepts, Data Sources, and Estimating Procedures, (Washington, dc: U.S. Government Printing Office, 1990). (The methodologies described in this publication are subject to periodic improvements, which are typically introduced as part of the annual revision of the bPA's; these improvements are described in the Survey articles that cover the annual BPA revisions, most recently in "U.S. International Transactions, Revised Estimates for 1974-96," Survey 77 (July 1997): 43-55.)
    30. These adjustments are described in U.S. Department of Commerce, Bureau of Economic Analysis, Foreign Transactions, Methodology Paper Series $\mathrm{mp}^{\mathrm{M}} \mathbf{3}$ (Washington, DC: U.S. Government Printing Office, 1987): 15-25.

[^43]:    31. For additional information on the calculation of real GDP, see the section "Real output and related measures" in the text.
[^44]:    32. For the real estimates, the distinction between annual and quarterly methodologies is far less important than it is for the current-dollar estimates. For the relatively few cases in which the annual and quarterly source data differ, the major differences are noted in the entry.
[^45]:    1. Consists of aid to families with dependent children and, beginning with 1996, assistance programs operating Under the Personal Responsibility and Work Opportuniy Reconciliation Act of 1996.
    2. Equals disposabie personal income defiated by the impicitit price deftator ior personal consumption expendiures.
    Note.-Percent changes trom preceding period for selected items in this table are shown in table 8.1
[^46]:    1. Includes new computers and peripheral equipment only.
[^47]:    1. Equals the number of full-time equivalent employees (table 6.5) plus the number of self-employed persons (table 6.7). Unpaid family workers are not included. 2. Consists of museums, botanical, zoological gardens; engineering and management services; and services, not elsewhere classified.
[^48]:    U.S. Department of Commerce, Bureau of Economic Analysis

[^49]:    ${ }^{\rho}$ Preliminary.
    Revised.

    1. Represents gains or losses on foreign-currency-denominated assets due to their revaluation at current exchange rates.
    2. Includes changes in coverage, statistical discrepancies, and other adjustments to the value 3. Refle
    3. Reflects changes in the value of the official gold stock due to fluctuations in the market
    4. Also includes paid-in capital subscriplions to international financial institutions and outstanding
[^50]:    U.S. Department of Commerce, Bureau of Economic Analysis

[^51]:    1. The personal income level shown for the United States is derived as the sum of the county estimates; it differs from the nationad income and product accounts (NPPA) estimate of personal income because, by definition, it omits the eamings of Federal civilian and military personnel stationed abroad and of U.S. residents employed
    abroad temporarily by private U.S. firms. It can also differ from the NIPA estimate because of difierent data sources and revision schedules.
    2. Percent change was calculated from unrounded data.
[^52]:    U.S. Department of Commerce, Bureau of Economic Analysis

[^53]:    U.S. Department of Commerce, Bureau of Economic Analysis
