## 8 Annual Revision of the National Income and Product Accounts: Annual Estimates, 1993-95, and Quarterly Estimates, 1993:I-1996:I

The revisions to the major aggregate NIPA measures of product, income, and prices that resulted from this year's annual revision were small. For example, the annual growth rate of real GDP was revised up 0.1 percentage point to 2.3 percent for 1993 and was unrevised at 3.5 percent for 1994 and 2.0 percent for 1995. This year's revision was limited to the updating of the annual weights used in the calculation of the chain-type measures of real output and prices, the incorporation of the results of this year's annual revision of the balance of payments accounts, and the incorporation of newly available data on wages and salaries from the Bureau of Labor Statistics.

133 Improved Estimates of Gross Product by Industry, 1959-94
BEA's estimates of gross product by industry have been revised, beginning with 1959 for the current-dollar estimates and with 1977 for the real estimates, to incorporate the results of the recent comprehensive revision of the NIPA's and several statistical improvements specific to the GPO estimates. For 1977-94, the growth rates of real gross product by industry ranged from 4.9 percent for wholesale trade to 0.9 percent for mining. For 1959-94, the share of current-dollar GDP accounted for by private services-producing industries increased from 48.8 percent to 62.0 percent, while the share accounted for by private goods-producing industries declined from 38.8 percent to 24.2 percent.

## Regular features

## 1 Business Situation

Economic growth picked up in the second quarter of 1996: Real GDP increased 4.2 percent after increasing 2.0 percent in the first quarter. Inflation remained moderate: The price index for gross domestic purchases increased 2.0 percent after increasing 2.3 percent.

127 Federal Personal Income Tax Liabilities and Payments, 1959-94
beA's estimates of Federal personal income tax liabilities and payments have been revised, beginning with 1959, to incorporate the results of the recent comprehensive revision of the NIPA's, as well as newly available tax return information. As is typical for most years, taxpayer payments of Federal income taxes for 1994 exceeded their tax liabilities by $\$ 5.3$ billion; the excess in payments for 1994 was largely attributable to deferred payments of 1993 liabilities.

156 Personal Income by State and Region, First Quarter 1996
Personal income in the Nation increased 1.2 percent in the first quarter of 1996, the same rate of increase as in the fourth quarter of 1995. In the first quarter, personal income increased in all but two States: In Delaware, personal income was unchanged, and in Michigan, it declined. Of the 13 fastest growing States, 9 were in the western United States; Idaho had the fastest growth.

This article was prepared by Daniel Larkins, Larry R. Moran, Ralph W. Morris, and Deborah Y. Sieff.

U.s. ECONOMIC growth accelerated in the second quarter of 1996, according to the "advance" estimates of the national income and product accounts (NIPA's), as real gross domestic product (GDP) increased 4.2 percent after increasing 2.0 percent in the first quarter (chart 1 and table 1). ${ }^{1}$ Real final sales of domestic productGDP less the change in business inventoriesaccelerated substantially less; it increased 3.5 percent after increasing 3.0 percent. The price index for gross domestic purchases increased 2.0 percent after increasing 2.3 percent.
The acceleration in real GDP reflected an upturn in the output of motor vehicles, which partly reflected a rebound from a strike at a major

manufacturer in March. Excluding motor vehicles, GDP increased 3.1 percent after increasing 3.2 percent.
By major component, the acceleration in real GDP was mainly attributable to upturns in inventory investment and in State and local government spending. Most of the other major components registered small to moderate step-ups; an exception was business fixed investment, which increased little after a sharp rise.
Inventory investment increased $\$ 13.3$ billion in the second quarter, as stocks increased $\$ 10.3$ billion after being reduced $\$ 3.0$ billion; in the first

quarter, inventory investment had decreased \$17.6 billion. The upturn in inventory investment was more than accounted for by motor vehicles. Excluding motor vehicles, inventory investment decreased $\$ 13.5$ billion, as stocks increased $\$ 12.3$ billion after increasing $\$ 25.8$ billion; in the first quarter, inventory investment excluding motor vehicles had increased $\$ 4.3$ billion.
State and local government consumption expenditures and gross investment increased 6.3
percent after decreasing 0.9 percent. Most of the upturn was accounted for by services of employees. In the first quarter, the Blizzard of 1996 had caused many schools and government offices on the East Coast to close for several days; as a result, a substantial amount of employee services was lost. In the second quarter, many of the education services that had been lost were made up.

## Second-Quarter 1996 Advance gdp Estimate: Source Data and Assumptions

The "advance" GDP estimate for the second quarter is based on preliminary and incomplete source data; as more and better data become available, the estimate will be revised. The advance estimate is based on the following major source data. (The number of months for which data were available at the time the estimates were made is shown in parentheses.)

Personal consumption expenditures: Sales of retail stores (3) and unit auto and truck sales (3);

Nonresidential fixed investment: Unit auto and truck sales (3), construction put in place (2), manufacturers' shipments of machinery and equipment other than aircraft (3), aircraft shipments (2), and exports and imports of machinery and equipment (2);
Residential investment: Construction put in place (2) and single-family housing starts (3);

Change in business inventories: Manufacturing and trade inventories (2) and unit auto and truck inventories (3);

Net exports of goods and services: Exports and imports of goods and services (2);
Government consumption expenditures and gross investment: Department of Defense outlays (3), other Federal outlays (3), State and local construction put in place (2), and State and local employment (3);

GDP prices: Consumer Price Index (3), Producer Price Index (3), price indexes for nonpetroleum merchandise exports and imports (3), and values and quantities of petroleum imports (2).
bea made assumptions for source data that were not available. Table A shows the assumptions for key series; a more comprehensive list of assumptions is available on the Department of Commerce's Economic Bulletin Board or from bea.

## Motor vehicles

Real motor vehicle output jumped 40.7 percent in the second quarter after decreasing 27.6 percent in the first; the jump was largely accounted for by autos (table 2). According to data on units, domestic auto production increased to 6.4 million (seasonally adjusted annual rate) from 5.4 million.
Motor vehicle inventory investment increased substantially in the second quarter; the increase reflected a sharp slowdown in the liquidation of auto inventories and a swing from liquidation to accumulation in truck inventories, as motor vehicle production recovered from the strike. For new domestic autos, the inventory-sales ratio calculated from units data decreased from 2.1 at the end of the first quarter to 2.0 at the end of the second, the lowest level in almost 10 years; the traditional industry target is 2.4 .

Final sales of motor vehicles to domestic purchasers increased 1.0 percent after increasing 5.9 percent; an increase in auto sales was largely offset by a decrease in truck sales.

An increase in motor vehicle sales to consumers was more than accounted for by used autos. ${ }^{2}$ Factors frequently considered in anal-

[^2]yses of overall consumer spending were mixed in the second quarter: The unemployment rate decreased to 5.4 percent from 5.6 percent, but growth of real disposable personal income slowed to 1.5 percent from 2.0 percent; the Index of Consumer Sentiment (prepared by the University of Michigan's Survey Research Center) showed little change. Among factors specific to motor vehicle purchases, interest rates on new-vehicle loans decreased for the fourth consecutive quarter, and manufacturers' sales-incentive programs remained about as attractive as in the first quarter.

Sales to businesses increased slightly in the second quarter; new autos more than accounted for the increase. Sales to government decreased; both autos and trucks contributed.

## Prices

As noted earlier, the price index for gross domestic purchases, which measures the prices paid for goods and services purchased by U.S. residents, increased 2.0 percent in the second quarter after increasing 2.3 percent in the first (chart 2 and table 3). Prices of gross domestic purchases excluding the relatively volatile food and energy components increased 1.2 percent after increasing 1.8 percent; however, excluding the price effects

index and the 1992 current-dollar value of the corresponding series, divided by 100 . Because the formula for the chain-type quantity indexes uses weights of more than one period, the correspond-
ing chained-dolar estimates usually are not additive. Chained (1992) dollar levels for motor vehicle table, are found in NIPA tables 1.4, 8.5, and 8.7
of the government closings caused by the blizzard, discussed below, this measure of prices accelerated slightly.
Prices of personal consumption expenditures (PCE) increased 3.1 percent after increasing 2.4 percent. Energy prices increased 18.7 percent after increasing 12.9 percent; a sharp step-up in the price of gasoline and oil and a smaller step-up in the price of electricity and gas more than offset a deceleration in the price of fuel oil and coal. Food prices increased 3.7 percent after increasing 2.4 percent, as prices of fresh fruit and vegetables turned up; prices of beef and veal decreased more than in the first quarter, and poultry prices increased less than in the first quarter. "Other" PCE prices increased 2.1 percent after increasing 1.7 percent; prices of most services contributed to the small step-up, but prices of durable goods and of clothing and shoes turned down.
Prices of nonresidential fixed investment changed little for the third consecutive quarter. Prices of structures increased 2.0 percent after increasing 1.2 percent, and prices of producers' durable equipment (PDE) decreased 0.5 percentabout the same as in the first quarter. In PDe, prices of transportation equipment increased after no change, but prices of industrial equipment and of "other" equipment increased less than in the first quarter; prices of information processing equipment decreased a little more than in the first quarter. Prices of residential investment increased 1.5 percent after no change.
Prices of government consumption expenditures and gross investment decreased 0.5 percent after increasing 4.1 percent. The large first-

quarter increase had reflected the impact of the Blizzard of 1996: As a result of the school and government closings caused by the storm, the hours worked by government employees were reduced but their compensation was not; therefore, the price of government employee services increased. Prices paid by the Federal Government decreased 1.3 percent after increasing 2.0 percent. In addition to the impact of the blizzard, the first-quarter increase had reflected a government shutdown (associated with budget negotiations) and a pay raise for civilian and military employees; in the second quarter, national defense prices decelerated, and nondefense prices decreased after little change. Prices paid by State and local governments were unchanged after increasing 5.4 percent; a decrease in the price of employee services-partly reflecting an increase in employee services to makeup for services lost because of the blizzard-was offset by increases in the prices of other goods and services.

The GDP price index, which measures the prices paid for goods and services produced in the United States, increased 2.1 percent after increasing 2.3 percent. The GDP price index, unlike the price index for gross domestic purchases, includes the prices of exports and excludes the prices of imports. Export prices increased 1.6 percent after increasing o.2 percent. Import prices increased 1.1 percent after increasing 0.1 percent; excluding im-

ported petroleum prices, which increased more than 50 percent in both quarters, import prices decreased in both quarters.

## Personal income

Real disposable personal income (DPI) increased 1.5 percent in the second quarter after increasing 2.0 percent in the first (chart 3). Current-dollar DPI increased 4.5 percent after increasing 4.2 percent. The personal saving rate (saving as a percentage of current-dollar DPI) decreased to 4.3 percent from 4.8 percent.

Personal income increased $\$ 102.8$ billion after increasing $\$ 74.0$ billion (table 4). The step-up was accounted for by wage and salary disbursements, which increased $\$ 68.1$ billion after increasing $\$ 38.0$ billion. Disbursements in commodity-producing industries (primarily manufacturing) and in service industries stepped up sharply; in the distributive industries, they

stepped up modestly. The step-up in manufacturing partly reflected a rebound from the effects of the blizzard and the strike in the motor vehicle industry; manufacturing average weekly hours, average hourly earnings, and employment all increased in the second quarter. Government wage and salary disbursements increased less than in the first quarter, when they had been boosted by the pay raise for Federal civilian and military employees.

Other labor income increased $\$ 4.9$ billion after decreasing $\$ 1.1$ billion. The first-quarter decrease had reflected a return to more-normal levels of private employer contributions to pension funds from unusually high levels in 1995.

Personal interest income increased $\$ 7.0$ billion after decreasing $\$ 1.1$ billion. The step-up reflected generally higher interest rates.
Proprietors' income increased $\$ 16.3$ billion after increasing $\$ 12.8$ billion. Nonfarm proprietors' income accounted for most of the step-up.

Transfer payments to persons increased $\$ 13.0$ billion after increasing $\$ 21.6$ billion. The large first-quarter increase reflected 2.6 -percent cost-of-living adjustments that became effective January 1 for social security benefits and for several other transfer payment programs; the first-quarter increase also reflected changes in the Earned Income Credit program (a program administered through the Federal income tax system that provides payments to low-income workers).

Personal contributions for social insurance, which is subtracted in the calculation of personal income, increased $\$ 4.8$ billion after increasing $\$ 2.2$ billion.

Personal tax and nontax payments increased $\$ 42.5$ billion after increasing $\$ 17.7$ billion. The step-up was largely accounted for by provisions of the Omnibus Budget Reconciliation Act of 1993 that retroactively increased tax rates for highincome taxpayers for tax year 1993 but allowed them to pay the additional tax in three annual installments, the last of which was due in the second quarter of 1996. Two other factors also contributed to the step-up in personal tax and nontax payments: The tax base increased more in the second quarter than in the first, and changes in Federal income tax law had reduced payments in the first quarter. mel

# Annual Revision of the National Income and Product Accounts 

\author{

- Annual Estimates, 1993-95 <br> - Quarterly Estimates, 1993:I-1996:I
}

The nipa estimates were prepared by the National Income and Wealth Division and the
Government Division.

$q$n this issue of the Survey of Current Business, the Bureau of Economic Analysis (bea) presents revised estimates of the national income and product accounts (NIPA's) for 1993-95 and the first quarter of 1996. Annual NIPA revisions usually incorporate a wide range of source data. However, as previously announced, this year's annual revision of the NIPA's has been limited in scope as a result of bea's decision following the Federal Government shutdowns to focus its resources on getting the release of the current estimates back on schedule and then on completing the remaining estimates from the comprehensive NIPA revision. ${ }^{1}$ The next annual

[^4]revision, which is scheduled for release in the summer of 1997, will incorporate the full range of annual source data and the results of key source data improvement projects.
This article describes the scope of this year's limited annual revision, the results of the revision, and the NIPA tables included in this issue.

## Scope of the revision

The revised estimates reflect the following three factors:

- Annual weights for 1995 have been incorporated into the calculation of the chain-type measures of real output and price indexes.

The availability of 1995 weights permits the recalculation of the quarterly changes from the third quarter of 1994 to the second quarter of 1995 and the annual change for 1995 using the weights of the 2 adjacent years1994 and 1995; previously, these changes were calculated using only 1994 weights. In addition, the changes for the first two quarters of 1994 have been revised to make the sum of the quarterly estimates conform to the revised 1994 annual estimate. The quarterly changes beginning with the third quarter of 1995 continue to be based on a single year's weights, but they have been recalculated using 1995 weights in place of 1994 weights. ${ }^{2}$

- The annual revision of the balance of payments accounts (bpa's) that was released in June 1996 has been incorporated into the NIPA estimates beginning with $1993 .{ }^{3}$ The major aggregates affected are gross domestic product (GDP), gross national product (GNP), national income, personal income, and Federal Government expenditures. The NIPA components affected are exports and imports of goods and services; personal consumption expenditures (specifically, foreign travel and other expenditures abroad by U.S. residents and expenditures in the United States by nonresidents and personal remittances in kind to nonresidents); Federal Government current consumption expenditures, net transfer payments to the rest of the world,

2. See table B on page 33 of "Alternative Measures of Change in Real Output and Prices, Quarterly Estimates for 1959-92," Survey of Current Business 73 (March 1993).
3. For a description of the BPA revision, see "U.S. International Transactions, Revised Estimates for 1986-95," Survey 76 (July 1996); 56-60.
and net interest payments to the rest of the world; receipts of factor income from the rest of the world and payments of factor income to the rest of the world; wage and salary accruals and disbursements; corporate profits; business transfer payments; and net interest and personal interest income. ${ }^{4}$ Where appropriate, the corresponding real output and price measures for these aggregates and components have also been revised.

- Newly available data from the Bureau of Labor Statistics (bls) have been incorporated into the NIPA estimates of wage and salary accruals and disbursements. These data consist of annual tabulations for 1994 and 1995 of wages and salaries of private employees covered by unemployment insurance and revised monthly data on employment, average weekly hours, and average hourly earnings beginning with 1994; the monthly data are used to interpolate between, and to extrapolate from, the annual tabulations. The incorporation of this revision ensures greater comparability between the NIPA's and the estimates of personal income by State and region, the most recent of which are published in this issue of the Survey. (The incorporation of the bls data does not affect the product-side measure of GDP.)

4. Revisions to Federal Government current consumption expenditures reflect revised data from the BPA's on expenditures for military assistance programs, for services of foreign nationals at overseas military installations, and for other installation-support services at these facilities. In net interest and personal interest income for 1993 and 1994, only the rest-of-the-world components are affected. For 1995 , both the domestic and rest-of-the-world components are affected because monetary interest received by persons, which is the sum of domestic and rest-of-the-world interest received, is used to estimate both net interest and personal interest income, by extrapolating from 1994.

## Results of the revisions

The revisions to the NIPA estimates are small (tables 1 and 2). The annual percentage changes in current-dollar GDP are unrevised at 4.9 percent for 1993 and 5.8 percent for 1994; the percent change is revised up 0.1 percentage point to 4.6 percent for 1995 , reflecting an upward revision to exports of services.
The annual rate of growth of real GDP for 1993 is revised up 0.1 percentage point, from 2.2 percent to 2.3 percent; the upward revision is more than accounted for by a downward revision to imports of services. The growth rates of real GDP

weights into the calculation of the chain-type measures of real GDP.

The revision to real GNP for 1993 mirrors the revision to real GDP. GNP is revised up 0.1 percentage point to 2.3 percent. Real GNP is revised up 0.1 percentage point to 3.3 percent for 1994 and down 0.1 percentage point to 2.0 percent for 1995; both revisions reflect revisions to net receipts of factor income from the rest of the world, which are included in GNP but not in GDP.

For quarterly percentage changes in real GDP, none of the revisions is larger than 0.2 percentage point (in absolute value), and there are an equal number of upward and downward revisions (table 4). The average annual rate of growth in real GDp from the recession trough in the first quarter of 1991 to the first quarter of 1996 is unrevised at 2.4 percent.
The annual rates of growth in the price index for gross domestic purchases are unrevised at 2.5 percent for 1993 and 2.2 percent for 1994. The growth rate for 1995 is revised down 0.1 percentage point to 2.4 percent (table 5). For the quarterly percentage changes, there are slight downward revisions in 6 of the 13 quarters subject to revision. The revisions to the price indexes result from the incorporation of quantity weights for 1995.

Personal income is revised up \$0.9 billion (less than 0.1 percent) for 1993, $\$ 2.9$ billion (less
than 0.1 percent) for 1994 , and $\$ 13.4$ billion ( 0.2 percent) for 1995. The revisions for 1993 and 1994 primarily reflect revisions to personal interest income that result from the incorporation of the annual bPA revision. The revision for 1995 primarily reflects the revision to wage and salary disbursements that results from the incorporation of the bls data.

The annual growth rates of real disposable personal income are revised up for all 3 years: o. 1 percentage point to 1.2 percent for 1993, o.1 percentage point to 2.4 percent for 1994, and 0.2 percentage point to 3.5 percent for 1995 . The average annual growth rate from the recession trough in the first quarter of 1991 to the first quarter of 1996 is revised up 0.1 percentage point to 2.5 percent. These revisions largely reflect the revisions to current-dollar personal income.

Personal saving as a percentage of disposable personal income is unrevised at 4.5 percent for 1993 and 3.8 percent for 1994, and it is revised up 0.2 percentage point to 4.7 percent for 1995 .

The revisions to national income mirror those to personal income.

## Data Availability

Estimates shown in the NIPA tables beginning on page 18, along with estimates for earlier periods (for most tables, back to 1959), are available in electronic form to stat-usa subscribers (Economic Bulletin Board and Internet site). To subscribe, call stat-usa on (202) 482-1986.

Estimates are also available on diskette. To obtain an order form indicating their cost and the schedule and cost of related material, write to the National Income and Wealth Division (be-54), Bureau of Economic Analysis, U.S. Department of Commerce, Washington DC 20230, or call (202) 606-9700.

The remaining information related to the NIPA comprehensive revision estimates will be released as work is completed. The listing below provides approximate schedules for the release of the remaining estimates.
Fall 1996: NIPA estimates for $1929-58$, including annual estimates of real gross domestic product from 1929 and quarterly estimates from 1947. Summary NIPA tables will be published in the Survey.
Late 1996: National Income and Product Accounts of the United States, volume 2, 1959-92. This volume (and volume 1 below) will contain the complete set of Nipa tables as well as definitions, classifications, and conventions underlying the NIPA's.

nual estimates for the years 1992-95 and quarterly estimates for 1992:IV-1996:II; a number of "annual only" tables, which present estimates for 1992-95; and the "annual and monthly" tables, which present annual estimates for 1992-95 and monthly estimates for January 1992-June 1996.
As indicated in the introduction to the list of tables, "annual only" tables covering 1991-94 were previously published in the January/February 1996, April 1996, and June 1996 issues of the Survey. The following tables will not be published again until the August 1997 issue: Tables 3.4-3.6, $3.12-3.2 \mathrm{O}, 6.2 \mathrm{c}-6.15 \mathrm{C}, 6.17 \mathrm{c}-6.22 \mathrm{C}, 8.8-8.24,8.26$, and $9.1-9.6$. For most of these tables, the estimates published earlier this year have not been revised. Exceptions are the line items in the industry tables in part 6 that are affected by the incorporation of the BPA revision and of the
newly available bls data; estimates for these items for 1992-94 appear in the tables beginning on the next page.
The five-account "Summary National Income and Product Accounts Table," which incorporates the revised estimates for 1995 , is shown as table A following the complete list of NIPA tables.
For other nIPA-related information in this issue, see the following:

- "Gross Product by Industry, 1959-94," and
- "Updated Summary Methodologies," which reflects the major source data and methods used in the recent comprehensive revision of the NIPA's.

# NATIONAL INCOME AND PRODUCTACCOUNTS 

## National Income and Product Accounts Tables

This section presents revised annual estimates for the annual revision of the national income and product accounts (NIPA's) for 1993 through 1995 and quarterly estimates for the first quarter of 1993 through the first quarter of 1996, as described in the article beginning on page 8. (Estimates are shown for the year and fourth quarter of 1992 in this section, but they are not revised.) In addition, this section presents the "advance" estimates for the second quarter of 1996.

The section includes the following tables: The 54 tables that are usually published as the "Selected NIPA Tables," which contain quarterly estimates and which appear every month (tables $1.1-1.11,1.14,1.16,2.1-2.3$, $3.1-3.3,3.7$ в, $3.8 \mathrm{~B}, 3.10,3.11,4.1-4.4,5.1,5.4,5.5,5.10-5.13,6.1 \mathrm{C}, 6.16 \mathrm{c}, 7.1-7.4,7.6,7.9,7.10,7.11 \mathrm{~B}, 7.14-7.16$, and 8.1-8.7); the tables that contain both annual and monthly estimates (tables 2.8-2.11); and most of the "annual only" tables that contain estimates that are revised (tables 1.12, 1.15, 2.4-2.7, 4.5, 5.6-5.9, 5.14, 5.15, 7.5, 7.7, 7.8, $7.12,7.13$, and 7.16 ). (Chained (1992) dollar estimates and price indexes for government enterprise gross fixed investment-lines 53-59 of tables 5.15 and 7.13 , respectively-appear for the first time in this issue.)

Tables containing the estimates for the comprehensive revision of the NIPA's (other than the 54 "Selected nipa Tables" shown every month) were published in the following issues of the Survey: January/February 1996, April 1996, and June 1996. Errata appeared in the March 1996 issue, and additional errata appear in this issue.

Two tables- 1.13 and 5.3 -have not yet been published and will appear in a future issue. In addition, estimates for some of the lines in tables $1.10,1.16,8.9$, and 8.11 are not yet available; leaders are shown on those lines in this issue. These tables will be repeated when the missing estimates are available.

The NIPA estimates back to 1959 for most tables are available in electronic form from sTAT-USA and on diskettes from bea (see the box "Data Availability" on page n1).

The tables contain annual, quarterly, and monthly estimates, indicated as follows:

| A | Only annual estimates |
| :--- | :--- |
| Q | Only quarterly estimates |
| QA | Quarterly and annual estimates |
| MA | Monthly and annual estimates |

NOTE-Chained (1992) dollar series are calculated as the product of the chain-type quantity index and the 1992 current-dollar value of the corresponding series, divided by 100 . Because the formula for the chain-type quantity The residual line is the difference between the first line and the sum of the most detailed lines.

NOTE-Chained (1992) dollar series are calculated as the product of the chain-type quantity index and the 1992 current-dollar value of the corresponding series, divided by 100 . Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line following change in business inventories is the difference between gross domestic product and
the sum of final sales of domestic product and of change in business inventories; the residual line following structures is the difference between gross domestic product and the sum of the detailed lines of goods, of services, and of structures.

1. Gross domestic business product equals gross domestic product less gross product of households and institu tions and of general govemment. Nonfarm product equals gross domestic business product less gross farm product 2. Equals compensation of general government employees plus general government consumption of fixed capital as shown in table 3.8 B .

NOTE.-Chained (1992) dolar series are calculated as the product of the chain-type quantity index and the 1992 urrent-dollar value of the corresponding series, divided by 100 . Because he formula for the chain-type quantity idexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive The residual line is the difference between the first line and the sum of the most detailed lines

NOTE.-Chained (1992) dollar series are calculated as the product of the chain-type quantity index and the 1992 current-dollar value of the corresponding series, divided by 100 . Because the formula for the chain-type quantity ndexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive.
Percent changes from preceding period for selected items in this table are shown in table 8.1.

| NOTE-Chained (1992) dollar series are calculated as the product of the chain-type quantity index and the 1992 current-dollar value of the corresponding series, divided by 100 . Because the formula for the chain-type quantity |  |  |  |  |  |  | indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive The residual line is the difference between the first line and the sum of the most detailed lines. |  |  |  |  |  |  |  |  |  |  |  |  |  |

Estimates of foreign travel by U.S residents (line 108) expenditures were $\$ 0.3$ billion in 1981. Beginning with 1984, estimates of foreign travel by U.S. residents include substantially improved estimates of U.S. residents' foreign travel and passenger fare expenditures. Estimates of expenditures in the United States by nonresidents (line 110) include, beginning with 1981, nonresidents' student and medical care expenditures in the United States. Student expenditures were $\$ 2.2$ billion, and medical expenditures were $\$ 0.4$ billion in 1981. Beginning with 1984, estimates
of expenditures in the United States by nonresidents include substantially improved estimates of nonresidents' travel expenditures. Expenditures in the United States by nonresidents are subtracted from total personal consumption expenditures (line 110) because they are included in detailed type of expenditure estimates elsewhere in personal consumption expenditures.

NOTES.-Chained (1992) dollar series are calculated as the product of the chain-type quantity index and the 1992 current-dolar value of the corresponding series, divided by 100 . Because the formula for the chain-type quantity indexes weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

See note to table 2.4 for information on discontinuities in estimates of foreign travel by U.S. residents (line 97 ) and expenditures in the United States by nonresidents (line 98)
The figures in parentheses are the line numbers of the corresponding items in table 2.4.

1. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures
2. Consumption expenditures for durable goods excludes expenditures classified as investment, except for goods transferred to foreign countries by the Federal Govemment
3. Compensation of government employees engaged in new force-account construction and related expenditures
for goods and services are classified as investment in structures. The compensation of all general government employees is shown in the addenda.
4. Consumption of fixed capital, or depreciation, is included in government consumption expenditures as a partial measure of the value of the services of general government fixed assets; use of depreciation assumes a zero net return on these assets.

1. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.
2. Consumption expenditures for durable goods excludes expenditures classified as investment, except for goods transferred to foreign countries.
3. Compensation of government employees engaged in new force-account construction and related expenditures
for goods and services are classified as investment in structures. The compensation of all general government employees is shown in the addendum.
4. Consumption of fixed capital, or depreciation, is included in government consumption expenditures as a partial measure of the value of the services of general government fixed assets; use of depreciation assumes a zero net return on these assets.

1. Beginning with 1967, the treatment of net exports of gold in the NIPA's differs from that in the BPAs. BPA gold exports (line 2) and imports (line 13) are excluded from the NIPAs. Imports of gold in the NIPA's (line 16) is the excess of the value of gold in tinal sales of domestic
product plus the change in business inventories over the value of U.S production of gold. Prior to 1967, the treatment of net exports of gold in the NIPA's and in the BPA's is identical and is the same as the present NIPA treatment.
2. BPA capital gains and losses included in U.S. direct investment income abroad (line 3) and in foreign direct investment income in the United States (line 14) are removed from the NIPA's beginning with 1974 for imports and with 1977 for exports. Beginning with 1982, U.S. direct investment income abroad in the BPA's excludes capital gains and losses associated with currency translation adjustments
3. Transfers of goods and services under military grant programs, net, are classified as exports in the BPA's. In the NIPA's, these transactions are excluded from exports and included in Federal Government consumption expenditures. Beginning in 1988, the BPA's classify certain items as military grants that the NIPA's do not.
4. Consists of statistical revisions in the BPA's that have not yet been incorporated in the NIPA's.
5. Consists of arms shipments to Israel financed under the Emergency Security Act of 1973. In the NIPA's, these arms shipments are classified as military grants, which are included in the defense consumption expenditure component of GDP at the time they are acquired by the U.S. Govsify certain items as military grants that the NPPA's do not 6 Consists of transactions between the United States and
Northem Mariana Islands. The treatment of US teritories Puerto Rico, and Puerto Rico, and the Islands in the NIPA's differs from that in the BPA's. In the NIPA's they are included in the rest of the world; in the BPA's they are treated as part of the United States. The adjustments to exports and imports of goods and services and to receipts and payments of factor income are shown in lines 7 and 17, respectively. The adjustment to unilateral transfers, net (line 35) consists
only of transfer payments from persons because transfer payments, subsidies, and grants-in-aid from the Federal Government to residents of U.S. territories, Puerto Rico, and
ana islands are excluded from NIPA transfer payments to the rest of the world. 7. In the BPA's, income transactions between parents and affiliates are recorded on a net payments by U.S. parents to foreign affiliates. In BPA imports, U.S. affiliates' payments to foreign parents for interest are net of such receipts by U.S. affiliates from foreign parents. In the NIPA's, these transactions are recorded on a gross basis beginning with 1974. The amount of adjustment is identical in payments and in receipts of factor income and, thus, does not affect NIPA net receipts of factor income or net foreign investment. In addition, for 1974 through 1981, royalties and license fees and other private services are recorded on a net basis in the BPA's but on a gross basis in the NIPA's. Starting with 1982, these transactions are recorded on a gross basis in both the BPA's and the NIPA's. The amount of adjustment is identical in exports and in imports of services and, thus, doe not affect NIPA net exports of goods and services or net foreign investment.
6. For 1946 through 1959, includes shipments to the United States from Alaska and Hawaii. These are added to imports for 1946 to adjust to geographic coverage of imports to the 48-State coverage used in the NIPA's prior to 1960 . From 1947 through 1959, such shipments are negligible. Beginning with 1960, the adjustment is not required because Alaska and Hawaii gained statehood in lises and license fees other private services and income transactions. In the NIPA's, these royaties and license fees, other private services, and income transactions. In the NIPA's, these transact BPA's the componding flows are recorded before the deduction of nonresident taves withheld beginning with 1982 . 9 Consists of financing pros.
1973; a U.S. Government payment to India under the Agricultural Trade Development and Assistance Act: less write-offs of loan principal owed to the U.S. Government, which are a type of financial transaction that is excluded from the NIPA's.

NOTE.-Chained (1992) dollar series are calculated as the product of the chain-type quantity index and the 1992 current-dollar value of the corresponding series, divided by 100 . Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive.
The residual line is the difference between the first line and the sum of the most detailed lines.

[^8]NOTE.-Chained (1992) dollar series are calculated as the product of the chain-type quantity index and the 1992 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. n.e.c. Not elsewhere classified

| 1. Inventories are as of the end of the quarter. The quarter-to-quarter change in inventories calculated from cur-rent-dollar inventories in this table is not the current-dollar change in business inventories (CBI) component of GDP. The former is the difference between two inventory stocks, each valued at their respective end-of-quarter prices. The latter is the change in the physical volume of inventories valued at average prices of the quarter. In addition, changes calculated from this table are at quarterly rates; whereas, CBI is stated at annual rates. |  |  | 2. Quarterly totals at monthly rates. Final sales of domestic business equals final sales of domestic product less gross product of households and institutions and of general government and includes a small amount of final sales by farm. |  |  |  |  |  |  |  |  |  |  |  |  |  |

by farm.
NOTE-Chained (1992) dollar series are calculated as the product of the chain-type quantity index and the 1992 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity
indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive.
The residual line is the difference between the first line and the sum of the most detailed lines for inventories.

NOTE.-Chained (1992) dollar series are calculated as the product of the chain-type quantity index and the 1992 current-dollar value of the corresponding series, divided by 100 . Because the formula for the chain-type quantity ndexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines, excluding the lines
in the addenda.

| NOTE-Except for disposable personal income, the quantity and price indexes are calculated from weighted averages of the detailed output and prices used to prepare each aggregate and component. Prior to the third quarter of 1994, these indexes use the geometric mean of weights that reflect the composition of output for the preceding and current years. Beginning with the third quarter of 1994, these indexes use weights that reflect the compostion <br> of output in 1994. Implicit price deflators are weighted averages of the detailed price indexes used to prepare each <br> aggregate and component and are calcualted as the ratio of current- to chained-dollar output multiplied by 100 <br> (Contributions to the percent change in real gross domestic product are shown in table 8.2.) |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

current-dollar value of the corresponding senes, divided by 100 . Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines, excluding the lines in the addenda.

1. Total annual wages of workers covered by State unemployment insurance (UI) laws and by the Unemployment Compensation for Federal Employees program.
2. Consists of unreported wages and salanes paid by employers and of unreported tips.
3. Consists of voluntary contributions by employees. Prior to 1985, employers were not required to report these contributions. In 1985, reporting requirements were enacted by over one-half of the States; by 1990, the requirement had been enacted by almost all States.
4. For the following industries, consists of the difference between estimates from more comprehensive source data (excluding the adjustments in lines 2 and 3) and BLS wages and salaries: Agriculture, forestry, and fishing; railroad transportation; health services; educational services; social services; membership organizations; private households; and the Federal Government.
5. Consists of wages and salaries for insurance agents classifed as statutory employees, for students and their spouses employed by public colleges or universities, for nonprofit organizations not participating in the UI program (in industries not listed in footnote 4), and of other coverage adjustments.

## Errata

## National Income and Product Accounts

Table 5.8 in the "National Income and Product Accounts" section of the January/February 1996 Survey of Current Business contained errors. The corrected estimates are provided below.

Several tables in the "Comprehensive nipa Revision: Newly Available Tables" section of the June 1996 Survey contained errors. The corrected estimates for tables $3.15,3.16$, and 3.17 are provided below. For tables 3.15 and 3.17, the errors were offsetting and therefore did not affect any lines other than those shown. For table 3.16, some of the data for one line item were shown in the incorrect columns; in addition, the title of the table was incorrect. For tables 3.18 B and 3.19 , the entire tables are shown. The data presented in these tables were correct, but the lines for "Consumption of fixed capital" (line 25 in table 3.18 B and line 27 in 3.19 ) were incorrectly classified under "Netting and grossing differences." In the tables shown below, "Consumption of fixed capital" has been separated from "Netting and grossing differences," resulting in changes in line numbers.

[^10]
# Updated Summary Methodologies 

table 1 identifies the principal source data and estimating methods used to prepare the product- and income-side components of current-dollar GDP, and table 2 identifies the source data and estimating methods used to prepare the chain-type measures of real output and prices for the product-side components of GDP. These tables have been updated to reflect the methodological improvements introduced in the comprehensive revision of the national income and product accounts (NIPA's) that was released in January $1996 .{ }^{1}$

## Current-dollar estimates

The list of the components of current-dollar GDP shown in table 1 starts with the components on the product side and proceeds to those on the income side. The subcomponents, with their dollar values for 1994, are grouped according to the methodology used to prepare them.

The column in table 1 for annual estimates covers the revision cycle for those estimates and notes the major differences in methodology as the estimates move through the three annual revisions to a benchmark revision. ${ }^{2}$ For example, for "most goods" in personal consumption expenditures (the first item on the product side), the table indicates one methodology for benchmark years and another for all other years.

The column for the quarterly estimates covers only the advance estimate for the current quarter-that is, the estimate prepared about a month following the end of the quarter. That one estimate, rather than all three of the current quarterly estimates, is described because more attention focuses on the "first look" at the quarter. In addition, the column lists only the source data and methods; it does not indicate how many months of source data are available or whether the data are subject to revision by the source agency. Information on the key monthly source data appears each month in the "Business Situation" in the Survey of Current Business (for example, see page 2 of this issue ). Additional information on monthly source data used for the advance estimate is available on-

[^11]line from the Department of Commerce's Economic Bulletin Board. ${ }^{3}$

The source data listed comprise a variety of economic measures, such as wages and salaries, insurance premiums, expenses, interest rates, mortgage debt, tax collections, unit sales, housing stock, and employment. For most components, the source data are "value data"; that is, they embody both the quantity and price dimensions that are required for currentdollar estimates. In these cases, the methodology indicated in table 1 covers only the adjustment of the value data to derive estimates consistent with NIPA definitions and coverage.

For those estimates not derived from value data, the table indicates the combination of data with separate quantity and price dimensions that is used to derive the required value estimate, as well as the major adjustments needed to derive estimates consistent with NIPA definitions and coverage. On the product side, a "physical quantity times price" method is used for several components. For example, the estimate for new autos is prepared as unit sales times expenditure per auto (the average list price with options, adjusted for transportation charges, sales tax, dealer discounts, and rebates). An "employment times earnings times hours" method and variations of a "stock of assets/liabilities times an effective interest rate" method also are used for several components.

Some of the source data shown in table 1 for the annual estimates are used as indicators to interpolate and extrapolate the levels established by source data that are more comprehensive, and all of the source data shown for the advance quarterly estimates are used to extrapolate the level of the preceding quarter. In addition, extrapolation and interpolation may be based on trends, as is the case when "judgmental trend" is listed in the table.

Estimating methods.-Table 1 refers to four methodscommodity flow, retail control, perpetual inventory, and fiscal year analysis-used by BEA for estimating specific components.

The "commodity-flow method" is used to obtain the value of final users' purchases of goods and services (that is, commodities) for BEA's benchmark input-output accounts. These values serve as the benchmark for the NIPA estimates of personal consumption expenditures (PCE), of producers' durable

[^12]equipment (PDE), and of the commodity detail for State and local government consumption expenditures and gross investment. ${ }^{4}$ The method is also used for PDE in nonbenchmark years, but it is implemented in an abbreviated form. An even more abbreviated commodity-flow method is used for current quarterly estimates of PDE.

The "retail-control method" is used to estimate over one-third of the value of PCE for periods other than benchmark years. The method provides the indicator series used in extrapolating and interpolating the total of "most goods" and the "control" total to which the PCE categories and residential PDE included in this group must sum. The PCE categories covered by the "retail-control group" consist of all goods except autos and trucks, food furnished to employees, food and fuel produced and consumed on farms, standard clothing issued to military personnel, school lunches, and net foreign remittances. ${ }^{5}$

The "perpetual-inventory" method is used to derive estimates of fixed capital stock, which in turn form the basis for the estimates of consumption of fixed capital. The perpetual-inventory method is based on investment flows and a geometric depreciation formula; it is used instead of direct measurement of the capital stock because direct measurement is seldom statistically feasible on a comprehensive basis. ${ }^{6}$

The "fiscal year analysis" method provides the framework for the annual and quarterly estimates of Federal Government consumption expenditures and gross investment. The estimates of expenditures are prepared by program-that is, by activity for a group of line items or for an individual line item in the Budget of the U.S. Government. For most programs, the fiscal year analysis begins by adjusting budget outlays for coverage and for netting and grossing differences between these outlays and nIPA expenditures. The expenditures total (as adjusted) for a program is then classified by type of NIPA expenditure-for example, transfer payments and interest paid-with nondefense consumption expenditures and gross in-

[^13]vestment determined residually. When a fiscal year analysis is completed, the detailed array of NIPA expenditures by program and by type of expenditure serves as a set of control totals for the quarterly estimates. ${ }^{7}$

Balance of payments accounts.-The source data for the foreign transactions reflected in most nIPA components-for example, net exports of goods and services and rest-of-the-world corporate profits-are the balance of payments accounts (BPA's), which are also prepared by bea. ${ }^{8}$ As noted in table 1 , for some NIPA components, the BPA estimates are adjusted to conform to NIPA concepts and definitions. ${ }^{9}$ Annual estimates of these adjustments and their definitions are shown in NIPA table 4.5 , which appears in the NIPA tables in this issue; summary quarterly estimates are shown in the "Reconciliation and Other Special Tables" section of those Survey issues that contain the quarterly bPA estimates, most recently in the July 1996 issue.
Other information.-In preparing annual estimates of several of the income-side components, bEA adjusts the source data for various coverage and conceptual differences. For each subcomponent listed below, an annual NIPA table reconciles the value published by the source agency with the NIPA value published by bea and identifies the bea adjustments. The following is a list of the subcomponents and their corresponding reconciliation tables, which were published in the January/February 1996 Survey: For wages and salaries, table 8.25 (which appears in the NIPA tables in this issue); for farm proprietors' income, table 8.22; for nonfarm proprietors' income, table 8.21; for corporate profits, table 8.23 ; for net interest, table 8.24 ; and for consumption of fixed capital, table 8.20.

[^14]
## Real estimates

Table 2 shows which one of three methodsdeflation, quantity extrapolation, and direct base-year valuation-is used to prepare the quantity index for each detailed product-side component and identifies the source data with which the method is implemented. ${ }^{10}$ Deflation is used for most of the detailed components. In deflation, the quantity index is obtained by dividing the current-dollar index by an appropriate price index, with the base year-at present 1992 -equal to 100 , and then multiplying by 100.

The quantity extrapolation and direct base-year valuation methods are similar in that they both use explicit quantity data. For quantity extrapolation, quantity indexes are obtained by using a quantity indi-

[^15]cator to extrapolate from the base-year value of 100 in both directions. For direct base-year valuation, quantity indexes are obtained by multiplying the base-year price by actual quantity data for the index period and then expressing the result as an index with the base year equal to 100 .

The subcomponents in table 2 are the same as those shown in table 1, except that more detail is needed to highlight the differences in methodology for the real estimates. ${ }^{11}$ For additional information on the preparation of the estimates of government consumption expenditures and gross investment, see Government Transactions; for additional information on the preparation of the estimates of PCE, see Personal Consumption Expenditures.

Based on Dept. of Agriculture data on net income, obtained by deriving gross income (cash receipts from marketing, inventory change, government payments, other cash income, and nonmoney income) and subtracting production expenses, adjusted to exclude corporate income from Internal Revenue Service tabulations of business tax returns and adjusted to a NIPA basis.

See entry for CCAdj under consumption of fixed capital.
Years except most recent-Income from Internal Revenue Service tabulations of business tax returns, adjusted for understatement of income on tax returns and for several conceptual differences.
Most recent year-For construction, trade, and services, indicators of activity (such as value of housing put in place); for most others, judgmental trend.
See entry for IVA under corporate profits with IVA and CCAdj.
See entry for CCAdj under consumption of fixed capital.

Benchmark years-Derived as space rent-see entry for nonfarm dwellings under personal consumption expendituresless related expenses, including maintenance and repair from Bureau of Labor Statistics quarterly consumer expenditure survey, mortgage interest from Census Bureau decennial survey of residential finance, and property taxes from Census Bureau quarterly surveys of State and local tax collections.
Other years-Same as benchmark years, except mortgage interest, which is based on mortgage debt from the Federal Reserve Board times a BEA interest rate.
Same as described under owner-occupied housing, adjusted to cover only rental income accruing to persons not primarily engaged in the real estate business.
Prepared in conjunction with farm proprietors' income; see entry for farm income with IVA.

Years through 1983-Rents paid and received by business and government, adjusted for expenses associated with property (mainly depreciation, taxes, interest, and repairs) from Internal Revenue Service tabulations of business tax returns, Census Bureau surveys, and the Budget of the United States prepared by the Office of Management and Budget.
Other years-Judgmental trend.
Years except most recent-Internal Revenue Service tabulations of royalties reported on individual income tax returns.
Most recent year-Oil production and prices from the Dept. of Energy.
See entry for CCAdj under consumption of fixed capital.

For crops, BEA quarterly allocation of Dept. of Agriculture annual projections of crop output; for livestock, Dept. of Agriculture quarterly projections of cash receipts and inventories; for both crops and livestock, quarterly allocation of Dept. of Agriculture annual projections of government subsidy payments and production expenses.

Same as annual for most recent year.

For owner-occupied space rent, same as annual; for depreciation, interest, and taxes, based on NIPA estimates of those components; for other expenses, judgmental trend.

Same as annual.

Judgmental trend.

Judgmental trend.

Same as annual for most recent year.

# Federal Personal Income Tax Liabilities and Payments, 1959-94 

Thae S. Park

$\tau$his article presents revised estimates of Federal personal income tax liabilities on a national income and product accounts (NIPA) basis for 1959-93 and new estimates for 1994 (table 1). ${ }^{1}$ The revised bea estimates incorporate the results of the comprehensive revision of the NIPA's released in January 1996, newly available tax return data from the Internal Revenue Service, and a methodological improvement. Revised estimates of Federal personal income taxes on a payments basis for 1959-94 were released as part of the comprehensive NIPA revision.
The article first presents an overview of the tax liabilities and payments series, including a methodological change that improves the comparability of the two series. It then discusses how differences between tax liabilities and payments arise, the sources of the differences for 1994, and the sources of revisions to the estimates for 1959-93.

## Overview

In the NIPA's, personal income taxes are recorded on a payments basis - that is, at the time tax payments are made by, or on behalf of, persons. ${ }^{2}$ If one assumes, however, that consumers base their consumption decisions on income net of tax liabilities rather than on income net of tax payments, it can be argued that the liabilities basis is the more appropriate one for analyzing the impact of taxes on consumption and on fiscal policy.
The Federal personal income tax payments series, which appears in NIPA tables 3.2 and 3.4, has three components: Withheld income taxes; declarations and settlements, or "nonwithheld taxes"; and refunds. ${ }^{3}$ Withheld income taxes are

[^19]those withheld at the income source. Declarations are estimated taxes usually paid quarterly, largely on income not subject to withholding, and settlements are additional taxes paid either when tax returns are filed or as the result of audits. Refunds of excess payments, including excess social security taxes, are recorded as negatives in the payments series when refunds are made.
The nipa payments series is derived primarily from financial statements for the Federal Government and from tabulations of employment tax returns from the Social Security Administration. ${ }^{4}$ The three components of the payments series are estimated separately.
The NIPA estimate of withheld income taxes is based on data on withheld taxes from the Monthly Treasury Statement of Receipts and Outlays of the United States Government (mTs) and from other Treasury Department sources. The Treasury Department's withheld taxes are on a collections (when-received) basis and are the combination of withheld individual income taxes and withheld social security taxes (including employer taxes). The Bureau of Economic Analysis (bea) makes quarterly adjustments to the Treasury Department's data to account for the time lag between the date of the payment of taxes by individuals (payday) and the date of the payment received by the Treasury from employers. The NIPA estimate of withheld income taxes is derived from the adjusted data by subtracting (1) estimates of withheld social security taxes from Social Security Administration tabulations of employment tax returns filed by employers, (2) estimates of interest charges on late taxes from the Internal Revenue Service (IRS), and (3) estimates of withheld taxes paid by nonresidents of the United States from bea's balance of payments accounts.

1. This series is derived by the Bureau of Economic Analysis, based on data from Statistics of income, Individual
[^21]The nIPA estimate of nonwithheld income taxes is based on mTS data on the collections of "other" individual income taxes, contributions to presidential election campaign funds, and social security taxes under the Self-Employment Contributions Act (seca). (No timing adjustment is made for nonwithheld taxes, because it is assumed that they are paid when received by the Treasury.) The nIPA estimate of nonwithheld income taxes is derived from this total by subtracting (1) estimates of SECA taxes from the Social Security Administration, (2) estimates of interest charges on late taxes from IRs, and (3) estimates of nonwithheld taxes paid by nonresidents of the United States from bea's balance of payments accounts and by adding a small amount of "excise" taxes paid by exempt organizations. The nIPA estimate of refunds is also based on MTS data.

The bea Federal personal income tax liabilities series is derived primarily from Statistics of Income (soi) estimates of total income tax, which are based on a sample of individual income tax returns before audits. ${ }^{5}$ The sor estimates are adjusted as follows to make the coverage of the bea liabilities series comparable with that of the NIPA payments series (table 2).

First, recapture taxes, penalties and other taxes (related to retirement plans, to the underpayment of estimated tax, to uncollected employee social security tax on tips and on group-term life insurance, and to excess "golden parachute payments"), and exempt organizations excise taxes are added; excess social security taxes and the earned income credit (EIC) that is used to
5. The latest sor estimate of total income tax is for tax year 1994. See Internal Revenue Service, Statistics of Income Bulletin (Spring 1996).

[^22]offset nonincome taxes are subtracted. ${ }^{6}$ Second, fiduciary income taxes are added. These taxes are included in the payments series because personal income includes fiduciary income. Third, additional assessments from audits, net of refunds on amended returns (Form 1040x), are added because they are excluded from the sor estimates. Fourth, income taxes paid by U.S. citizens living abroad for more than a year are subtracted. These taxes are excluded from the payments series because, for nIpa purposes, these citizens are considered nonresidents of the United States. The sor estimates include these taxes, because these citizens are generally taxed on their worldwide income regardless of the geographic sources of their income and regardless of how long they have been living abroad. Fifth, a tax rebate made in 1975 under the Tax Reduction Act of 1975 is subtracted, because the sor estimates do not account for the rebate. ${ }^{7}$

## Reasons for the differences

As a result of the coverage adjustments reflected in the liabilities series, the differences between the liabilities series and the payments series primarily reflect the timing basis used for recording tax receipts; differences due to source data are believed to be small. For taxes withheld on wages and salaries, differences between the two series arise for several reasons. First, overwithholding is built into the withholding tables that are issued by IRS and that are used by employers to calculate amounts to be withheld on wages and salaries (the withholding tables introduced in 1992 reduced the extent of overwithholding). The withholding tables are constructed under the assumption that taxpayers use the standard deduction in calculating their income tax liabilities. Consequently, overwithholding results when taxpayers who itemize their deductions do not request enough exemptions for withholding purposes.
Second, withholding is based on the assumption that wages are constant during the year; when wages vary widely within the year, they

[^23]will be subject to varying withholding rates, and overwithholding is likely to result.
Third, the withholding tables may not always be updated to coincide with changes in liabilities; tax law provisions usually are effective on January 1 , but the update of the tables sometimes occurs later. In addition, the tables are usually updated to reflect changes in the standard deduction, exemptions, and tax rates, but they are usually not updated to reflect changes in provisions affecting itemized deductions or exclusions from gross income.

Fourth, for certain payments, withholding is based on flat rates instead of on the withholdingtable rates. At the option of the employer, withholding may be based on a flat 28 percent for supplemental wages (such as bonuses, commissions, and overtime pay) and on a flat 20 percent for taxable fringe benefits. Withholding must be at a flat 28 percent for certain gambling winnings in excess of $\$ 5,000$.

For some types of taxable income subject to withholding, differences arise because taxes withheld have no direct relationship to the corresponding liabilities. For interest, dividends, and certain other types of income, an arbitrary 31 percent is withheld if the recipient fails to furnish an accurate taxpayer identification number (this withholding was initiated in 1984 as a compliance measure). For pensions and annuities and for sick pay from other than an employer, withholding is at the option of the taxpayer.

For income not subject to withholding (such as self-employment income, capital gains, taxable social security benefits, and most interest, dividends, and pensions and annuities), differences arise for two reasons. First, the proportion of the current year's liabilities that must be paid in estimated taxes to avoid a penalty is less than 100 percent. Second, settlements and the last installment of quarterly estimated taxes are due in the year after the liabilities were incurred. Refunds are made in the year after the liabilities were incurred. Quarterly estimated taxes, settlements, and refunds are recorded in the payments series in the calendar quarter they are received or paid by the Treasury Department. As a result, payments of nonwithheld taxes during a year may not reflect that year's income.

Differences between the liabilities series and the payments series that may arise from measurement errors cannot be isolated from the timingbasis differences just discussed. The measurement errors include sampling and nonsampling errors with the sor sample, reporting and
processing errors with the financial statements for the Federal Government and with employment tax return tabulations from the Social Security Administration, and estimating errors with the NIPA payments series and with the bea liabilities series.

## Differences for 1994

In the absence of major changes in Federal tax laws, tax payments usually exceed tax liabilities primarily because overwithholding is built into the withholding tables and because incomes subject to withholding are much larger than incomes subject to estimated tax.
For 1994, tax payments exceeded tax liabilities by $\$ 5.3$ billion (table 1 ). ${ }^{8}$ The excess in payments in 1994 was largely attributable to about $\$ 4$ billion of deferred payments of 1993 liabilities. The Omnibus Budget Reconciliation Act of 1993 increased marginal tax rates for high-income individuals retroactive to January 1, 1993. These individuals were given the option to pay their additional 1993 income taxes in three annual installments: The first payment was due April 15, 1994; the second, April

[^24]17, 1995; and the third, April 15, 1996. ${ }^{9}$ Many elected to pay their additional 1993 income taxes in installments. Data from the 1993 sor show that about $\$ 4$ billion of the 1993 income taxes were deferred to each of the years 1994,1995 , and 1996.

The excess in payments in 1994 was partly offset by an excess in liabilities that arose from a tax law change that increased taxes on social security and tier 1 railroad retirement benefits. For some beneficiaries, the portion of their benefits includable in taxable income was increased from 50 percent to 85 percent, effective in 1994. Because these benefits are not subject to withholding, most of the increased income taxes were expected to be paid when tax returns were filed in 1995.

## Sources of revisions for 1959-93

The revisions to the liabilities series for 1959-92 reflect the inclusion of additional coverage adjustments (table 2) and the revised treatment of the refundable portion of the EIC as a transfer payment (table 3). The previously published

liabilities series excluded the coverage adjustments for penalty and other taxes, for the eic used to offset nonincome taxes, for exempt organizations excise taxes, for excess social security taxes withheld, and for taxes paid by U.S. citizens abroad; in addition, the refundable portion of the EIC was treated as a negative income tax.
The coverage adjustments in table 2 are largely offsetting, so that most of the revisions to the liabilities series for 1975-92 in table 3 are accounted for by the revised treatment of the refundable eic (the EIC was enacted in 1974).

Most of the revision to the liabilities series for 1993 is accounted for by the incorporation of the newly available soi data for 1993. The previously published liabilities for 1993 were estimated from published and unpublished irs data on individual income tax collections, because soi data for 1993 were not yet available.

The revisions to the payments series for 198393 reflect the incorporation of revised data from the comprehensive revision of the NIPA's. ${ }^{10} \mathrm{mel}$

# Improved Estimates of Gross Product by Industry, 1959-94 

By Robert E. Yuskavage

In this article, the Bureau of Economic Analysis (bea) presents new estimates of gross product, or gross product originating (GPO), by industry for 1994 and revised estimates for 1959-93. ${ }^{1}$ The estimates reflect the results of the recent comprehensive revision of the national income and product accounts (NIPA's), and

[^27]they incorporate newly available source data and methodological changes for GPo by industry. ${ }^{2}$
The following major improvements are incorporated into this GPO revision and were also incorporated into the comprehensive NIPA revision: Improved chain-type measures of real GPo that eliminate the overstatement of real growth for periods after the base year and the under-

[^28]
## Gross Product Originating: Definition and Relationship to Gross Domestic Product

Gross product, or gross product originating (GPo), by industry is the contribution of each private industry and government to gross domestic product (GDP). An industry's GPO, often referred to as its "value added," is equal to its gross output (sales or receipts and other operating income, commodity taxes, and inventory change) minus its intermediate inputs (consumption of goods and services purchased from other industries or imported).

In concept, GDP measured as the sum of GPo in all industries is the same as GDP measured in two other ways: As the sum of expenditures (consumer spending, investment, net exports, and government consumption expenditures and gross investment) and as the sum of the costs incurred (such as compensation of employees, net interest, and indirect business taxes) and the profits earned in production. In practice, bea uses only the latter two ways to estimate GDP, but because of less than perfectly consistent source data, the resulting totals are not the same.

The current-dollar estimate of GDP is defined as the sum of the expenditure components, and gross domestic income is defined as the sum of costs incurred and profits earned; the difference between GDP and gross domestic income is the statistical discrepancy. Because the current-dollar GPO estimates are measured as the sum of distributions by industry of the components of gross domestic income, the sum of the current-dollar GPO estimates also differs from current-dollar GDP by the statistical discrepancy.

Real GDP is also measured as the sum of the expenditure components, using the formula for calculating chain-type measures. However, estimates of real gross domestic income are not prepared, because price indexes cannot be associated with income measures as they can be with the goods and services that make up the expenditure measures. Real gro estimates for most industries are derived using the formula for calculating chain-type measures with separate estimates of gross output and intermediate inputs. (See the
box "Computation of the Chain-Type Quantity Indexes for DoubleDeflated Industries" on page 142 for information on how output and inputs are combined in these calculations.)

The sum of the chain-dollar gpo estimates differs from chaindollar GDP by the chain-dollar statistical discrepancy, which is shown as part of private industry GPO, and by the discrepancy entitled "not allocated by industry," which is the difference between chain-dollar GDP and the sum of chain-dollar GPO for the detailed industries and the statistical discrepancy. The value of the category "not allocated by industry" reflects the lack of additivity of detailed chain-dollar GPO estimates because of the formula used to calculate chain-type measures of real output and because of the use of the expenditures measure of real GDP.

The statistical discrepancy is included in the GPO of private industries partly because of bea's judgement that the current-dollar expenditure components used to measure GDP are more accurate than the current-dollar estimates of gross domestic income and that most of the measurement problems affect the GPO of private industries. For example, the adjustments to source data to account for tax-return misreporting, which are based on periodic IRS audit studies and rough estimates of the amounts of income not detected by these audits, are larger for the cost components of gross domestic income than for the expenditure components of GDP. In addition, it is bes's judgement that the real expenditure components used to measure GDP are more accurate than the real gPo estimates. The amount of detailed expenditures data that are available for weighting the price indexes used in calculating GDP is greater than that for gross outputs and intermediate inputs used in calculating GPO, and little information is collected annually on the composition of inputs or of nonmanufacturing outputs. For some industries, no source data are available to measure gross output, and the resulting GPO estimates are prepared using less reliable methodologies.
statement of real growth for periods before the base year, a new treatment of government investment that provides a more complete picture of investment through the consistent treatment of fixed assets whether purchased by the public or the private sector, and a quality-adjusted beA price index for selected semiconductor products. ${ }^{3}$ Other major improvements include the following: An improved industry allocation of commodity taxes, a newly available 1987 employment matrix for the estimation of profits and capital consumption on an establishment basis, and newly available information on the composition of inputs from the 1987 benchmark input-output table and the 1992 Economic Censuses. In addition, new and redesigned tables are introduced to update the presentation of the GPO estimates to reflect the improved measures of real output and to provide detail on the cost components of GPo.
The release of the new and improved gro estimates is the latest step in a continuous gro improvement program that beA initiated in $1988 .{ }^{4}$ Earlier improvements included improved estimation techniques for most services-producing industries, the incorporation of services prices and import prices into the estimation of real inputs, and the resumption of an annual publication schedule. ## Acknowledgments

Robert E. Yuskavage, Chief of the GDP by Industry Branch of the Industry Economics Division (IED), supervised the preparation of the estimates. Ann M. Lawson and Robert P. Parker provided overall guidance. Felicia V. Candela, Sherlene K.S. Lum, Brian C. Moyer, Timothy F. Slaper, John Sporing, and Robert A. Sylvester prepared the estimates. A. Vanessa Clark, Sonia R. Jones, and Karen A. Newman provided support services. Other IED staff prepared tabulations from the preliminary 1992 benchmark input-output table.

Members of the staffs of the National Income and Wealth Division and the Government Divisionparticularly Sherman Hammack, M. Greg Key, Leonard J. Loebach, Brooks B. Robinson, and David B. Wasshausen-prepared special tabulations from the NIPA's and contributed to the development of the estimates. Stephanie L. Howell in the Office of the Director prepared the estimates of industry contributions to the growth in real GDP.
will focus on integrating the GPO series with the benchmark input-output accounts and with other bea industry estimates. ${ }^{5}$
The first part of this article discusses the relative performance of various industries in terms of growth rates and industry shares. The second part discusses the revisions to the GPo estimates, and the third part describes the methodology used to prepare the GPo estimates. Detailed tables following the text present the current-dollar GPO estimates for 1959-94 and the real estimates for 1977-94.

## Industry Growth Rates and Shares

Comparisons of gross product growth rates and shares of gross domestic product (GDP) across industries provide indications of the relative performance of particular industries or industry groups. For example, a comparison of the growth rate of real gross product for an industry with the growth rate of real GDP indicates whether that industry is adding to (or is reducing) the economy's growth and whether that industry is becoming a larger (or a smaller) part of the total economy. A comparison of the share of current-dollar GDP accounted for by the gross product of an industry over time indicates whether that industry's claim on the economy's resources is increasing (or decreasing).

## Real growth rates

Real GDP increased at an average annual rate of 2.6 percent for 1977-94 (chart 1 and table 1). The gross product of all industry groups increased over this period; the increases ranged from 4.9 percent for wholesale trade to 0.9 percent for mining. Manufacturing increased 2.3 percent, 0.3 percentage point less than the increase in GDP; durable goods increased 2.5 percent, 0.1 percentage point less than GDP.
Growth rates for 1977-94 for more detailed industry groups are shown in table $15 .{ }^{6}$ Among

[^30]industries with comparable definitions over the entire period, nine recorded average annual increases in real gross product of 5 percent or more. The two fastest growing industries were security and commodity brokers, which increased 10.5 percent, and agricultural services, forestry, and fishing, which increased 7.2 percent. Other fast growing industries included coal mining, industrial machinery and equipment, rubber and miscellaneous plastics products, transportation by

air, transportation services, motion pictures, and social services. ${ }^{7}$ Increases of more than 5 percent were also recorded in two industry combinations: Communications (which consists of the telephone and telegraph and the radio and television industries) and "business, miscellaneous professional, and other services."

The growth rates of nine industries decreased for 1977-94. The three largest decreases were in manufacturing: Tobacco products, down 5.1 percent; leather and leather products, down 2.4 percent; and primary metal industries, down 1.1 percent. The decreases in the remaining six industries-two in manufacturing, two in transportation and public utilities, one in mining, and one in services-were all less than 1 percent.
Average annual growth rates for the subperiods 1977-87 and 1987-94 are also shown in table $15 .{ }^{8}$ For 1977-87, real GDP increased at an average annual rate of 2.8 percent. The growth rates of all industry groups increased during this period; the largest increase was in wholesale trade ( 4.8 percent). Manufacturing increased 2.7 percent, 0.1 percentage point less than the increase in GDP.

For 1987-94, real GDP increased 2.3 percent. The growth rates of all industry groups increased; the largest increase was in wholesale trade (4.9 percent). Manufacturing increased 1.6 percent, 0.7 percentage point less than the increase in GDP. Nondurable goods increased 0.9 percent, largely reflecting a decline in petroleum and coal products; durable goods increased 2.2 percent. In contrast, for 1992-94, manufacturing grew at an annual rate of 4.8 percent, compared with a 2.8 percent increase in GDP; durable goods increased 7.1 percent.

Contributions to real GDP growth.-Differences in growth rates alone do not indicate the extent to which industries contribute to the growth of real GDP; their contribution also depends on the industry's size in the first year of the period being measured. Table 2 shows contributions by industry groups to real GDP growth for each year in 1978-94. ${ }^{9}$ For example, real GPO for mining increased 6.6 percent in 1994, 3.1 percentage points

[^31]more than the increase in GDP. However, because mining is a relatively small industry group, it contributed only 0.1 percentage point to the growth in GDP.

## Shares of current-dollar GDP

For 1959-94, the share of current-dollar GDP accounted for by private services-producing industries increased from 48.8 percent to 62.0 percent, while the share accounted for by private goods-producing industries declined from 38.8 percent to 24.2 percent (table 3 and chart 2). ${ }^{10}$ The increase in the share for the private servicesproducing industries is the result of both aboveaverage real growth and above-average growth in prices. The increase was more than accounted for by "services" and by finance, insurance, and real estate (FIRE), whose shares rose 9.9 percentage points and 4.8 percentage points, respectively. Among the industries in these groups, the increase was broad-based, but is particularly noticeable in banking, business services, and health services (table 11).

The decline in the share of goods-producing industries was concentrated in manufacturing. Manufacturing's share fell 10.4 percentage points, from 27.7 percent to 17.3 percent. Within manu-

[^32]facturing, the share of durable goods declined 6.4 percentage points, and the share of nondurable goods declined 4.0 percentage points.
The share of government increased from 12.8 percent to 13.4 percent. The increase was more than accounted for by State and local government; the share of the Federal Government declined.

Composition of current-dollar GPO.-Currentdollar GPO is measured as the incomes and profits earned in production in each industry; it is equal to gross domestic income, whose components can be divided into categories that approximate returns to labor and returns to capital. Differences over time and among industry groups in returns to labor and capital can thus be observed using these approximations. The return to labor from production can be approximated using compensation of employees. The return to capital from production can be approximated using the remaining components of GPO except indirect business tax and nontax liability, which is excluded because it can be viewed as a part of the pre-tax return to capital that accrues to government rather than to business. ${ }^{\text {.1 }}$
For the economy as a whole, compensation of employees as a share of GDP increased slightly, from nearly 56 percent in 1959 to nearly 58 percent in 1994, while the share of "other" gPo

declined (table 12). Labor and capital shares varied among industry groups. The labor share of GPO in manufacturing consistently exceeded the average for the total economy, but it declined slightly over the period, largely because the share in nondurable goods declined. The labor share of GPo in both fire and "services" increased substantially, while the capital share, mainly proprietors' income, in those industries fell.

## Revisions to the Gpo Estimates

The first section in this part of the article discusses the impact of the revisions to the GPo estimates. The second section discusses the major sources of the revisions, and the third section discusses the changes in the presentation of the GPO estimates.

## Impact of the revisions

Current-dollar estimates.-The pattern of the revisions to current-dollar GPO largely reflects the pattern of the comprehensive NIPA revisions to GDP and of the revisions by industry to the components of gross domestic income. Table 4 presents revisions to current-dollar GDP by industry group for selected years.

For 1959-82, the GPO of most private industries was revised very little. The exceptions are the revisions to nondurable goods manufacturing (mainly petroleum and coal products) and to wholesale trade, which resulted from the improved treatment of commodity taxes. For 1983-93, the largest upward revision was to fire (mainly due to nonfarm housing services) beginning in 1984. Other large upward revisions were to mining (mainly to oil and gas extraction) for each year 1984-92 and to wholesale trade, beginning in 1991. The largest downward revisions were to agriculture, forestry, and fishing

(mainly to farms) beginning in 1988; to retail trade beginning in 1986; and to nondurable goods manufacturing (mainly to petroleum and coal products) for most years.
For government, revisions were relatively large for all years, reflecting the new treatment of government investment and, beginning in 1984, the new definitions for the Federal Government retirement programs. General government GPO was revised up for each year during 1959-93.

Real growth rates.-For 1977-93, revisions to the rates of growth in real gro did not alter the picture of growth by industry that was shown by the previously published estimates (table 5). After revision, wholesale trade remains the fastest growing industry group. Previously, construction was the slowest growing industry group; now, construction and mining are tied for the slowest.
The average annual growth rate for manufacturing was revised down 0.1 percentage point for 1977-93, the same as the revision for GDP. ${ }^{12}$ For durable goods, the real growth rate was revised down 0.5 percentage point. For 1977-87,

[^34]the growth rate for manufacturing was revised up 0.3 percentage point, and for $1987-93$, it was revised down 0.9 percentage point. This downward revision is largely attributable to revisions to the preliminary estimates for 1993, which were based on incomplete source data, and to the use of the chain-type measure of real growth for manufacturing, beginning with 1988.
Chain-type measures of real growth are more appropriate than fixed-weighted measures because they avoid the substitution bias that results from changes in relative prices as one moves farther from a fixed base year. This substitution bias is especially apparent in manufacturing, because the continuous decline in computer prices has had a major impact on relative prices in manufacturing. In the previously published estimates, the use of the benchmark-years-weighted measure for manufacturing had a significant effect on the estimate of the growth in real manufacturing GPO for 1977-87. ${ }^{13}$ In the revised estimates, as previously noted, the use of the chain-type measure in place of the fixed-weighted measure for 1987-93 was a major factor in the downward revision of the growth rate in manufacturing for that period.

Shares of current-dollar gDP.-The industry shares of current-dollar GDP were not much affected by the revisions. However, government's share was raised each year during 1959-94; the amount of the revision ranged from a high of 2.3 percentage points in 1959 to a low of 1.4 percentage points in 1993. For each year during 1959-75, manufacturing's share was revised down by about 1 percentage point; during $1976-93$, it was revised down by smaller amounts, but by no less than 0.4 percentage point. The drop in the manufacturing share was primarily due to downward revisions to the share of petroleum and coal products.

## Major definitional and statistical changes

The revisions to the gro estimates arise from incorporating the definitional and statistical changes introduced in January 1996 in the comprehensive NIPA revision and from statistical changes introduced in this GPo revision.
NIPA revisions.-The comprehensive NIPA revision released in January included definitional, statistical, and other changes that affect the GPo estimates. The most important of these changes was the introduction of the annual chain-type quantity index as the featured measure of real growth. In the GPO revision, chain-type measures were introduced for each of the 51 GPO industries for which the "double-deflation" method
is used to compute real GPo. ${ }^{14}$ For the 15 industries for which real GPO is computed using other methods, real GPo was calculated by linking two fixed-weighted quantity indexes; 1987 weights were used for 1977-87, and 1992 weights were used beginning with 1988.

The revised gro series also incorporates the new nIPA treatment of government investment and the definitional change to Federal Government compensation of employees. Recognition of government expenditures for structures and equipment as fixed investment results in the inclusion of the services of government fixed assets-measured as depreciation, or consumption of fixed capital-in GDP and general government GPo for all years. ${ }^{15}$ In the previously published estimates, general government GPO was defined to consist only of compensation of employees.
14. For an explanation of this method, see the section "Real (chaineddollar) estimates" in "Methodology."
15. This change does not affect the GPO of government enterprises, because the inclusion of the consumption of fixed capital in the gross product of government enterprises is offset by a corresponding reduction in the surplus of government enterprises. It should be noted that the new treatment of investment still does not provide an estimate of the full value of the services of general government fixed assets, the new component that enters GDP. These services, which are now recorded as current-account purchases, are measured using the convention that these services equal the estimate of general government consumption of fixed capital; that is, the net rate of return on general government fixed assets is assumed to be zero.

[^36]The definitional change to Federal Government compensation of employees affects GPO for both general government and government enterprises. For civilian retirement programs, contributions beginning with 1969 now include payments to the Civil Service Retirement Fund for interest and unfunded liability. For military retirement programs, contributions beginning with 1984 will now be the actual contributions to the fund. Previously, the value of these contributions had been "imputed" to equal the value of the benefits paid.
Several other major statistical changes to the nIPA's also affected the gro estimates. The incorporation of the newly available data from the 1991 Residential Finance Survey on rental payments and on the value of tenant- and owner-occupied units led to large upward revisions to both gross output and GPO of nonfarm housing services, and the improved adjustments for misreporting on tax returns substantially increased the GPO of several services industries. Other nIPA changes that affected the gross output estimates used in the double-deflation method of estimating real gPO included the following: Revised estimates of petroleum and natural gas exploration, which affected the oil and gas extraction industry; revised estimates of both residential and nonresidential construction, which affected the construction industry; and revised estimates of personal consumption expenditures, which affected several financial and services industries.
gro statistical changes.-A number of statistical changes specific to the GPO estimates were also introduced.

Commodity taxes.-The most important of the statistical changes incorporated into the GPo estimates was the improved treatment of commodity taxes beginning with 1959. Commodity taxeswhich are taxes that vary with the consumption,

## Data Availability

The estimates shown in tables $10,11,13$, and 14 , along with estimates for years not shown, are available in electronic form to stat-UsA subscribers (Economic Bulletin Board and Internet site). To subscribe, call stat-usa on (202) 482-1986.
The estimates are also available on diskette and printout. To obtain an order form with their cost and schedule, and the cost of related material, write to the Industry Economics Division (BE-51), Bureau of Economic Analysis, U.S. Department of Commerce, Washington DC 20230, or call (202) $606-5307$.
production, or sale of products-are included in industry gross output. These taxes are part of the "indirect business tax and nontax liability" component of GPO.
The most important change in the treatment of commodity taxes, which affected both currentdollar and real industry GPO measures, was the improved industry assignment of specific Federal Government excise taxes. The new assignments more closely reflect the regulations and practices that determine which industry is liable for tax collection during the periods the taxes were imposed. Of these new assignments, the one with the largest impact is the shift of the Federal excise tax on gasoline and gasohol from petroleum and coal products in manufacturing to wholesale trade, beginning with $1959 .{ }^{16}$ This change in industry assignment recognizes that the tax is due when fuel is withdrawn from the terminals, which are classified in wholesale trade, whether the terminals are owned independently or by an integrated petroleum company.
The real measures of ad valorem commodity taxes assigned to manufacturing industries were improved by holding constant both commodity prices and tax rates from the base period. In the previously published estimates, the procedure held constant only tax rates and yielded the correct result only for quantity-based commodity taxes.

Semiconductor prices.-For the comprehensive NIPA revision, beA prepared quality-adjusted annual price indexes for memory and for microprocessor metal-oxide semiconductor integrated circuits (chips) for 1974-94. These indexes, which were incorporated into the NIPA estimates of exports and imports of semiconductors, have also been incorporated into the gro estimates of real industry gross output and real intermediate inputs, beginning with 1977.
For gross output, the new price indexes were weighted together with appropriate producer price indexes from the Bureau of Labor Statistics to develop a composite deflator to cover all products of the semiconductor manufacturing industry. For intermediate inputs, the same composite index was used for the purchases by other industries of domestically produced semi-

[^37]conductors; the nIPA import price index was used for imported inputs. The incorporation of these new price indexes resulted in upward revisions to the growth rates for both semiconductor output and inputs, especially after 1992; the most noticeable effect was to raise real gross output and real GPO in the electronic and other electric equipment industry for 1992-93.
Employment matrix.-For the current-dollar GPO estimates, a newly available Census Bureau employment matrix for 1987 that converts the NIPA industry estimates of corporate profits and capital consumption allowances from a company basis to an establishment basis was introduced. The new matrix is based on data from the 1987 Economic Censuses and covers all private nonfarm industries except private households. A matrix based on 1982 Economic Census data had been used in the previously published estimates. The new matrix was used to revise the profits and depreciation estimates beginning with 1983.

Changes affecting real gro.-Revisions to the estimates of real gro reflect the previously discussed changes to current-dollar gro and to real gross output and intermediate inputs, as well as the shift from benchmark-years-weighted and fixed-weighted measures to chain-type measures. In addition, the revisions reflect other changes to gross output and intermediate inputs and changes in the methods used for estimating the composition of inputs.
Revisions to gross output primarily resulted from benchmarking to the final-rather than to the preliminary-levels of the 1987 input-output ( $\mathrm{I}-\mathrm{o}$ ) table and from incorporating the preliminary gross output levels from the 1992 I-O table, which are largely based on data from the 1992 Economic Censuses. Benchmarking to the 1987 I-o table also affected the estimates of gross output for 1983-86. In addition, beginning with 1988, new and revised annual survey data from the Census Bureau were used to interpolate between 1987 and 1992 and to extrapolate from 1992.

New and improved estimates of the composition of inputs were introduced for all "doubledeflated" industries. The revised estimates incorporate the input composition from the final 1987 benchmark I-O table, which affects input compositions beginning with 1983, and data from the 1992 Economic Censuses on the cost of materials, fuels, and energy for selected industries. In the previously published estimates, input compositions for 1987 were from a preliminary I-o table.

The revised estimates for 1983-86 are primarily interpolations based on the 1982 and 1987 input compositions; for the revised estimates for 198894 , the input composition for all double-deflated industries is generally assumed to be the same as that for $1987 .{ }^{17}$

## Presentational changes

The following changes have been made to the presentation of the GPO estimates: Chain-type measures of real gro are shown in chained dollars and as quantity indexes; the industry group contributions to the annual percent changes in real GDP are shown; a new table is added presenting information on the composition of current-dollar GPO; the definition of "private industries" is changed to include the statistical discrepancy; the definition of the category "not allocated by industry" is changed to reflect the introduction of chained-dollar estimates; and the tables showing industry shares of real GDP and the fixedweighted measures of real GDP are dropped. ${ }^{18}$ Each of these changes is discussed below.

In the previously published estimates, real gpo for $1977-87$ was shown in two tables: One table showed benchmark-years-weighted indexes for GDP and for all manufacturing industries and fixed (1987) weighted indexes for all other industries; and the other table showed constant-dollar GPO for all industries calculated using fixed (1987) weights. (Beginning with 1988, both the indexes and the constant-dollar estimates were shown using fixed (1987) weights.) In the revised presentation, the table of indexes (table 13) shows chain-type indexes for selected years from 197794 , and the table of real dollars (table 14) shows chained dollars for all years 1987-94.

A new table (table 12) shows the composition of current-dollar GPO, which is measured as the sum of industry distributions of the components of gross domestic income. (Previously this detail was available only by request.)
The definition of "private industries" was changed to include the statistical discrepancy, which is the difference between GDP and gross

[^38]domestic income. Previously, the statistical discrepancy was treated as a separate "industry," and current-dollar GPo was equal to the sum of gro for private industries, GPo for government, and the statistical discrepancy. The change reflects bea's judgement that the gro of private industries is affected by most of the measurement problems that cause the current-dollar expenditure components used to measure gdp to be more accurate than the current-dollar estimates of gross domestic income.
The definition of the category "not allocated by industry" was changed to reflect the introduction of chained-dollar estimates. Previously, this category consisted of the following: The "residual," or the statistical discrepancy in constant dollars; the difference between constant-dollar

GDP and the sum of the estimates of constantdollar GPO; and, for 1977-86, the effect of using the benchmark-years-weighted formula for calculating real GDP and real manufacturing GPo. In the new presentation, "not allocated by industry" consists of the difference between chain-dollar gDP and the sum of chain-dollar gro for the detailed industries-private and government-and the statistical discrepancy. The value of "not allocated by industry" reflects the lack of additivity of the detailed chain-dollar gro estimates because of the formula used to calculate chaintype measures of real output and the use of the expenditures measure of real GDP.
The table showing industry shares of real GDP has been replaced because of bea's judgement that, for most analytical uses, shares in current

## Computation of the Chain-Type Quantity Indexes for Double-Deflated Industries

For this comprehensive revision, BEA introduces annual chaintype quantity indexes as the measure of real gross output, intermediate inputs, and Gpo for industries and industry groups. Each link in the chain-type quantity index is a Fisher quantity index for two adjacent years. Each annual Fisher quantity index, in turn, is the geometric mean of Laspeyeres and Paasche quantity indexes for the two adjacent years.

The formulas below summarize the computation of the Fisher chain-type quantity indexes of real gross output, intermediate inputs, and GPo for an industry or industry group. In the notation, $L$ refers to the Laspeyeres quantity index; $P$ refers to the Paasche quantity index; $F$ refers to the Fisher quantity index; and $C$ refers to the Fisher chain-type quantity index. The subscripts indicate time periods; $L_{t-1, t}$ is the Laspeyeres quantity index for the two adjacent years, $t-1$ and $t$. The superscript $G O$ refers to gross output; $I I$ refers to intermediate inputs; and GPO refers to gross product originating. Lowercase $p$ and $q$ refer to detailed prices and quantities, respectively.

Laspeyeres quantity indexes for gross output, intermediate inputs, and GPO, respectively, are

$$
\begin{gathered}
L_{t-1, t}^{G O}=\frac{\sum p_{t-1}^{G O} q_{t}^{G O}}{\sum p_{t-1}^{G O} q_{t-1}^{G O}} \\
L_{t-1, t}^{I I}=\frac{\sum p_{t-1}^{I I} q_{t}^{I I}}{\sum p_{t-1}^{I I} q_{t-1}^{I I}}, \text { and } \\
L_{t-1, t}^{G P O}=\frac{\left(\sum p_{t-1}^{G O} q_{t}^{G O}\right)-\left(\sum p_{t-1}^{I I} q_{t}^{I I}\right)}{\left(\sum p_{t-1}^{G O} q_{t-1}^{G O}\right)-\left(\sum p_{t-1}^{I I} q_{t-1}^{I I}\right)} .
\end{gathered}
$$

Paasche quantity indexes for gross output, intermediate inputs, and GPo are

$$
P_{t-1, t}^{G O}=\frac{\sum p_{t}^{G O} q_{t}^{G O}}{\sum p_{t}^{G O} q_{t-1}^{G O}}
$$

$$
\begin{gathered}
P_{t-1, t}^{I I}=\frac{\sum p_{t}^{I I} q_{t}^{I I}}{\sum p_{t}^{I I} q_{t-1}^{I I}} \text {, and } \\
P_{t-1, t}^{G P O}=\frac{\left(\sum p_{t}^{G O} q_{t}^{G O}\right)-\left(\sum p_{t}^{I I} q_{t}^{I I}\right)}{\left(\sum p_{t}^{G O} q_{t-1}^{G O}\right)-\left(\sum p_{t}^{I I} q_{t-1}^{I I}\right)} .
\end{gathered}
$$

Fisher quantity indexes for gross output, intermediate inputs, and GPo are

$$
\begin{gathered}
F_{t-1, t}^{G O}=\sqrt{L_{t-1, t}^{G O} \times P_{t-1, t}^{G O}}, \\
F_{t-1, t}^{I I}=\sqrt{L_{t-1, t}^{I I} \times P_{t-1, t}^{I I}}, \text { and } \\
F_{t-1, t}^{G P O}=\sqrt{L_{t-1, t}^{G P O} \times P_{t-1, t}^{G P O}} .
\end{gathered}
$$

Fisher chain-type quantity indexes for gross output, intermediate inputs, and GPo for years following the base year are

$$
\begin{gathered}
C_{t}^{G O}=C_{t-1}^{G O} \times F_{t-1, t}^{G O} \\
C_{t}^{I I}=C_{t-1}^{I I} \times F_{t-1, t}^{I I}, \text { and } \\
C_{t}^{G P O}=C_{t-1}^{G P O} \times F_{t-1, t}^{G P O}
\end{gathered}
$$

In the base year (1992 for this comprehensive revision),

$$
C_{t}^{G O}=C_{t}^{I I}=C_{t}^{G P O}=100
$$

The above formulas are applied to GPO industries, to industry groups such as durable goods manufacturing, and to aggregates such as private industries.
dollars (as shown in table 11) are a better indicator of an industry's relative size in the economy in any one period. Industry shares in real dollars, whether measured in chained dollars or in constant dollars, are dependent on the choice of the base period and therefore are not good indicators of relative size.

## Methodology

This part of the article discusses the methodolo-gies-that is, the source data and estimating procedures-used to prepare the estimates of current-dollar and real GPo. Previously published tables that summarize the methodology have been updated to incorporate the major changes introduced in this revision of the GPO estimates.

## Current-dollar estimates

As noted in the box "Gross Product Originating: Definition and Relationship to Gross Domestic Product" on page 133, the current-dollar GPo estimates are prepared as the sum of the distributions by industry of the components of gross domestic income. This section describes the methodology for distributing the current-dollar estimates of these components.

For most components of gross domestic income, the estimates are based on source data that provide industry distributions on either a company basis or an establishment basis. Only the estimates with distributions based on establishment data can be used directly to calculate industry GPo. For those components that are estimated from Internal Revenue Service (irs) tabulations of business tax returns, which have company-based distributions, the industry distributions may need to be converted to an establishment basis. This conversion is particularly necessary for large multi-establishment companies that typically have establishments classified in different Standard Industrial Classification (sic) industries. For the components of gross domestic income for which the source data provide no industry distribution, bea has developed establishment-based industry distributions from related sources. Table 6 shows the major source data for each component of gross domestic income, the availability and type of industrial distribution in the source data, and the data or assumptions used, when necessary, to develop establishment-based industry distributions. ${ }^{19}$

[^39]The methodology used to convert corporate profits before tax and corporate capital consumption allowances is based primarily on special Census Bureau matrices of the employment of establishments of corporations. These matrices present employment of these establishments cross-classified by (1) the company-industry classification assigned by ins in preparing the tabulations of corporate tax returns and (2) the establishment-industry classification assigned by the Census Bureau in the economic censuses. For integrated petroleum companies, the results of applying this matrix are supplemented by information from Department of Energy tabulations of the net income and depreciation of energy companies on an establishment basis. Adjustments to the matrix also are made, when necessary, to reflect publicly available information about large mergers, acquisitions, or changes in company diversification that have occurred since 1987, the year covered by the latest matrix.

## Real (chained-dollar) estimates

The real, or chained-dollar, GPo estimates for each industry, industry group, and for all private industries are derived as the product of the chain-type quantity index (divided by 100 ) and the corresponding 1992 current-dollar value. As in the previously published real GPO estimates, which were calculated using both benchmark-years-weighted and fixed-weighted indexes, three methods are used to calculate quantity indexes: Double deflation, extrapolation, and direct deflation. ${ }^{20}$ The method chosen depends on the availability and reliability of source data.

- In the double-deflation method, real Gpo is calculated using the chain-type formula, as shown in the box "Computation of the Chain-Type Quantity Indexes for DoubleDeflated Industries" on page 142. For this method, separate estimates of gross output and of intermediate inputs enter into the calculation of real gro. For farms and for nonfarm housing services, complete and consistent current-dollar series are available for gross output and for intermediate inputs. For most other industries, suitable intermediate input series are not available; instead they are obtained by subtracting current-dollar GPO from current-dollar gross output.

[^40] "Gross Product by Industry, 1977-90," 43-46.

- In the extrapolation method, real GPo is calculated by extrapolating the current-dollar value of GPO for 1992 (the present base period) in both directions by the quantity indicator. In most industries for which this method is used, the quantity indicator is usually the number of persons engaged in production or the number of hours worked.
- In the direct-deflation method, real gpo is derived by deflating current-dollar GPO, usually by a chain-type measure of gross output prices or by earnings.

Table 7 identifies which of the three methods for calculating real gro is used for each industry. For industries for which the double-deflation
method is not used, the table also shows the key source data used in the preparation of real gro.

Real GPo calculated using the double-deflation method requires detailed information on gross output and intermediate inputs. Table 8 provides a summary description of the principal source data used to prepare the gross output estimates.
The current-dollar intermediate input estimates are derived in four steps: (1) The input compositions for 1977, 1982, and 1987 are derived from bea's benchmark 1 -O tables; (2) the input compositions for 1978-81 and for 1983-86 are estimated by interpolating the detailed compositions from 1977, 1982, and 1987; (3) the imported and domestically produced shares of each detailed input for 1977-87 are estimated; and (4) the input compositions for 1988-94 are estimated,

primarily based on the 1987 composition and on information from the 1992 Economic Censuses.

Real intermediate inputs are prepared by deflating each of the detailed current-dollar inputs; imports and domestic production are deflated separately. Prices for domestically produced intermediate inputs are largely based on the prices used to prepare the estimates of real gross output, as shown in table 8 . For services prices, additional detail is shown in table 9. The import
prices are developed from a variety of sources, primarily from Bureau of Labor Statistics (bls) import price series, and are the same as those used for the NIPA estimates of imports. (For years before 1981, however, many of the detailed bLs import prices are not available, and the prices used reflect rates of change of more aggregate bls import prices or of corresponding domestic prices based on the producer price indexes.)

1. For this table, services consist of the primary output of (1) private businesses in the agricultural services, transportation and public utilities, trade, finance, insurance, and real estate, and services industries as defined by the 1987 Standard Industrial Classification, and (2) similar services provided by government enterpnses. Prices for imported services are shown separately at the end of the table if they differ from pricer
domestic services. Prices for inputs of manufactured goods are primarily PPI's and IPI's.
2. Sources of price indexes for gross output IPD's are shown in table 8, except for other transportation, other real estate, business services and other services. The IPD's for the gross output of these industries were estimated from the IPD's for GPO for these industries and from information on inputs from the input-output tables. 1. Equals GDP measured as the sum of expenditures less gross domestic income.

NOTE-Estimates for the year 1987 are shown on the basis of both the 1972 and 1987 Standard Industrial Classi-
fication (SIC). The estimate based on the 1972 SIC is shown first and is comparable with estimates back to 1977
the estimate based on the 1987 SIC is shown second and is comparable with estimates after 1987.

## Personal Income by State and Region, First Quarter 1996

This article was written by Duke Tran. The quarterly estimates of State personal income were prepared by the Regional Economic Measurement Division.

$P$ersonal income in the Nation in the first quarter of 1996 increased 1.2 percent, the same rate as in the fourth quarter of $1995 .{ }^{1}$ The first-quarter increase in personal income was double the o.6-percent increase in the prices paid by U.S. consumers (as measured by the chain-type price index for personal consumption expenditures). By State, the increase in personal income exceeded the increase in U.S. prices in 43 States.
Tables 1 and 2 at the end of this article present the quarterly estimates of total and nonfarm State

[^43]personal income, beginning with the first quarter of 1993 .

## Fastest growing States

In 13 States, personal income in the first quarter increased at least 0.6 percentage point more than the U.S. average (table A and chart 1). Nine of these States are in the western United States: The Rocky Mountain States of Idaho, Utah, Wyoming, and Montana; the Far West States of Washington, Nevada, and Oregon; and the Southwest States of Arizona and New Mexico. The other four States are the Plains States of

turing, and retail trade (table B). ${ }^{2}$ Earnings also increased at above-average rates in the following industries and States: In mining in Nevada, Oregon, New Mexico, and Wyoming; in nondurable goods manufacturing in Idaho, Washington, and Wyoming; in transportation and public utilities in Utah, Oregon, and Montana; in wholesale trade in Oregon, New Mexico, Wyoming, and Montana; in finance, insurance, and real estate in Wyoming; in services in Arizona, Oregon, and New Mexico; and in government in Montana. In addition, Nevada, New Mexico, and Wyoming had above-average increases in transfer payments.

In Kansas, Georgia, and Nebraska, the increases in earnings were above average in farming. In Kansas and Georgia, the increases were above average in construction; in Georgia, the increase partly reflected the preparation for the 1996 Summer Olympic Games. In addition, earnings increased at above-average rates in mining and durable goods manufacturing in Kansas, in retail trade in Georgia, and in government in Nebraska. Nebraska also had an above-average increase in transfer payments.

In Kansas and Washington, the above-average increases in earnings in durable goods manufacturing reflected a rebound from the effects of a strike in the aircraft industry in the fourth quarter of 1995 .

In Florida, the growth in personal income was boosted by above-average increases in transfer payments and in dividend, interest, and rental income. The increase in rental income reflected a rebound from the effects of the property damage caused by Hurricane Opal in the fourth quarter of 1995. In addition, the increases in earnings were above average in farming, mining, construction, retail trade, and government.

## Slowest growing States

In Pennsylvania, Hawaii, Massachusetts, New Jersey, and Ohio, personal income increased at least 0.6 percentage point less than the U.S. average. In Delaware, personal income was unchanged, and in Michigan, personal income declined.

In Michigan, Delaware, Ohio, and New Jersey, the growth in personal income was dampened by
declines in earnings in both durable goods and nondurable goods manufacturing; the declines in durable goods manufacturing partly reflected the effects of a strike in the motor vehicle industry late in the first quarter. In addition, earnings either declined or increased at below-average rates in mining in Delaware and New Jersey, in transportation and public utilities in Ohio and New Jersey, in construction and wholesale trade in New Jersey, and in finance, insurance, and real estate in Delaware. In Michigan, Ohio, and New Jersey, dividend, interest, and rental income either changed little or increased at below-average rates.
In Pennsylvania, Hawaii, and Massachusetts, earnings declined in durable goods manufacturing. Earnings declined, were unchanged, or increased at below-average rates in nondurable goods manufacturing in Pennsylvania and Hawaii, in transportation and public utilities in Pennsylvania and Massachusetts, in finance, insurance, and real estate in Hawaii and Massachusetts, in farming in Massachusetts, and in construction and wholesale trade in Hawaii. In all three States, dividend, interest, and rental income either declined or increased at below-average rates.

# Regional Economic Information System CD-ROM 

## Containing Over 25 Years of Economic Data For All U.S. States, Counties, and Metro Areas

Need to analyze your region's economic health? Locate a plant? Evaluate target markets?
BEA's new 1996 Windows edition REIS CD-ROM is loaded with just-released regional economic data, including:

- county-level personal income by major source through 1994
- per capita personal income
- state quarterly personal income through 1995
- projections to 2045 of gross state product and
- projections to 2045 of personal income, employment, and population by state, by metropolitan area, and by BEA economic area

For over 3,100 U.S. counties, for 330 metropolitan areas, and for 172 BEA economic areas, the REIS CD-ROM contains estimates for 1969-94:

- personal income by major source
- earnings by two-digit SIC industry
- employment by one-digit SIC industry
- farm income and expenses
- regional economic profiles
- transfer payments by major program
- BEARFACTS (BEA Regional Fact Sheets)
- commuter income flows

And much more...

- new Windows retrieval software you can use to display, print or copy tables, with easy-to-use help menus
- Spring '96 User's Guide to BEA information and BEA
 telephone contacts
- list of metropolitan areas and BEA economic areas, and their corresponding counties

(1994) Presents the estimates of personal income and per capita personal income for 1969-92 for the United States, regions, States, counties, and metropolitan areas. Also presents the Census Bureau's estimates of population that were used in the derivation of per capita personal income. Provides information about the sources and methods used to prepare the estimates for 1987-92 and samples of all the detailed tables of personal income and employment that are available for regions, States, counties, and metropolitan areas. 784 Pp . $\$ 41.00$ (GPO stock No. oo3-010-00249-2).
bea Regional Projections to 2045: Volume 1, States. (1995) Presents regional projections for selected economic and population variables for the Nation and States for 1998, 2000, 2005, 2010, 2015, 2025, and 2045. Includes projections for gross state product, employment, and earnings by industry, for personal income by component, and for population for three major age groups. Also includes a statement of methodology. 212 pp. $\$ 13.00$ (GPO STOCK No. 003-010-00256-5).

Foreign Direct Investment in the United States: 1992 Benchmark Survey, Final Results. (1995) Presents detailed data on the financial structure and operations of U.S. affiliates of foreign direct investors, on the foreign
direct investment position in the United States, and on balance-of-payments transactions between U.S. affiliates and their foreign parent companies in 1992. Includes data for items, such as employment covered by collective bargaining agreements and merchandise trade by product and country of destination and origin, that are only collected in benchmark surveys. Benchmark surveys are conducted every 5 years and are bea's most comprehensive surveys in terms of both the number of companies covered and the amount of information gathered. The data are classified by industry of affiliate and by country of ultimate beneficial owner, and selected data are classified by State. Provides information about the coverage, concepts and definitions, and classifications used in the survey. 312 pp. $\$ 20.00$ ( GPO stock No. 003-010-00259-0).

Foreign Direct Investment in the United States: Operations of U.S. Affiliates of Foreign Companies, Preliminary 1993 Estimates. (1995) Presents preliminary results for 1993 from bea's annual survey covering the financial structure and operations of nonbank U.S. affiliates of foreign direct investors. Data are classified by industry of U.S. affiliate, by country and industry of ultimate beneficial owner, and, for selected data, by State. $104 \mathrm{Pp} . \$ 6.50$ (GPO stock no. 003-010-00255-7).

Foreign Direct Investment in the United States: Establishment Data for Manufacturing, 1991. (1994) A joint effort by bea and the Bureau of the Census, this is the latest in a series of publications that present new data for foreign-owned U.S. manufacturing establishments (plants), including data on their number, value added, shipments, employment, total employee compensation, employee benefits, hourly wage rates of production workers, cost of materials and energy used, inventories by stage of fabrication, and expenditures for new plant and equipment. The data are disaggregated by detailed industry (up to 459 industries), by State, and by country of investor. 220 pp . $\$ 14.00$ (GPO stock no. o03-010-00250-6).
U.S. Direct Investment Abroad: Operations of U.S. Parent Companies and Their Foreign Affiliates. (1995) Two publications containing results for 1992 and 1993 from bea's annual survey of the worldwide operations of U.S. multinational companies. Contains information on the financial structure and operations of U.S. parent companies and their foreign affiliates. Data are classified by country and industry of affiliate and by industry of U.S. parent. 100 pp. $\$ 6.50$ each. [^1]:    1. Quarterly estimates in the NIPA's are expressed at seasonally adjusted annual rates, and quarterly changes are differences between these rates. Quarter-to-quarter percent changes are annualized. Real estimates are expressed in chained (1992) dollars. Price indexes are chain-type indexes.

    Estimates for the first quarter of 1993 through the first quarter of 1996 have been revised as part of a "limited" annual revision of the NIPA's; see "Annual Revision of the National Income and Product Accounts" in this issue.

[^2]:    2. Used autos in personal consumption expenditures (PCE) reflect dealers' margins on used autos and net transactions with other sectors. Dealers' margins are the difference between retail prices and wholesale prices. Net transactions, which are valued at wholesale prices, represent the difference between sales of used autos by consumers to business and government, on the one hand, and purchases of used autos by consumers from business and government on the other. In GDP, changes in net transactions in PCE
[^3]:    are offset by changes in the opposite direction in nonresidential producers' durable equipment, the change in business inventories, and government gross investment.

[^10]:    1. The Bureau of the Census measures of State and local government receipts and expenditures (lines 1 and 18) represent a combination of fiscal years. Virtually all States and many localities use July 1 -June 30 fiscal years; the rest use varying fiscal years. The national income and product account measures shown in this table are for he fiscal year ending June 30. The differences that arise from restating the Census data to a year ending June 20 are included in lines 13,14 , and 15 (receipts) and line 28 (expenditures).
    Prior to 1985, capital gains, net of losses, of retirement systems is included in line 5.
    2. Prior to 1968, dividends received is included in interest received (lines 9 and 23).
[^11]:    1. The "limited" annual revision of the NIPA's presented in this issue incorporates the methodological improvements introduced in the annual revision of the balance of payments accounts (bpA's). (For a discussion of the bpA revision, see "U.S. International Transactions, Revised Estimates for 1986-95," Survey of Current Business 76 (July 1996): 56-60.) The only other methodological change that is introduced in this year's limited annual revision is a change in the source data for the estimates of gold used to adjust the BPA estimates of trade in goods to a NIPA basis.

    EIC Earned income credit
[^23]:    6. The eIc is available to low-income workers whose earned income and adjusted gross income are both less than certain threshold levels ( $\$ 23,755$ with one qualifying child and $\$ 25,296$ with more than one qualifying child for 1994); the EIC is intended primarily to offset the social security taxes on these workers. The eIc is used first to reduce income taxes and then, if it is large enough, to reduce nonincome taxes. Any eic in excess of total tax liability is refundable, and the refundable portion is included in the transfer payments component of personal income rather than as a negative income tax in the payments series.
    7. The rebate is assumed to affect liabilities and payments for tax year 1975. Although the rebate was based on the 1974 total tax liability less the self-employment tax, the rebate was enacted and paid in 1975.

The previously published estimates of gross product by industry for 1947-90 appeared in the November 1993 issue of the Survey of Current Business, and the estimates for 1991-93, in the April 1995 issue. Revised GPO estimates for $1947-58$ will be released after the release of the revised NIPA estimates for $1929-58$ in the fall of 1996 .
[^28]:    2. The GPO and the gross domestic product (GDP) estimates in this article do not reflect the results of the recently released annual NIPA revision, which is presented in this issue of the Surver. The effect of not incorporating these results is small. The growth rate of real GDP for 1993 is revised up 0.1 percentage point to 2.3 percent, and the growth rate for 1994 is unrevised.
[^29]:    3. For a description of the results of the comprehensive nIPA revision, see "Improved Estimates of the National Income and Product Accounts for 195995: Results of the Comprehensive Revision," Survey 76 (January/February 1996): $1-27$.

For a summary of BEA's progress in implementing the plan, see "BEA's Mid-Decade Strategic Plan: A Progress Report," Survey 76 (June 1996): 52-55.
    6. As in the previously published series, estimates for 1959-86 are classified according to the 1972 Standard Industrial Classification (sic), estimates for 1988 -94 are classified according to the 1987 SIC, and estimates for 1987 are classified according to both the 1972 SIC and the 1987 sIc. The detailed data needed for an sic conversion are not available. Consequently, directly comparable estimates for 7 of the 66 detailed industries cannot be computed for the entire period; combinations among these seven industries that are comparable over time are shown in the addenda to table 15 . For all other industries, the definitions are comparable before and after 1987.

    Growth rates for industries and industry groups are computed from the chain- type quantity indexes shown in table 13.

[^31]:    7. For the industrial machinery and equipment industry, the growth rate for 1977-94 was computed using the 1977 value for the 1972 SIC "machinery, except electrical" industry, which is roughly comparable in definition to the 1987 SIC "industrial machinery and equipment" industry.
    8. The selection of 1987 as a breakpoint reflects that it was the base year for the previously published estimates and that it was also the year of a major updating of the sic.
    9. For these calculations, current-dollar estimates for GDP, and for GPO for each industry group, are extrapolated for each year by the industry's chain-type quantity index to derive an estimate of change for the period in the prices of the initial year. Dollar-based contributions are then computed as a percentage of the total change in GDP for the period. These contributions are then used to estimate the percentage-point contributions of industry
[^32]:    groups to the growth in real GDP. For years in which relative prices changed significantly, the detail may not add to the corresponding totals.
    10. For this comparison, private services-producing industries are defined to consist of the following industry groups: Transportation and public utilities; wholesale trade; retail trade; finance, insurance, and real estate; and "services." Private goods-producing industries are defined to consist of agriculture, forestry, and fishing; mining; construction; and manufacturing.

[^33]:    11. "Other" GPO is the sum of proprietors' income, corporate profits, net interest, capital consumption allowances, business transfer payments, and the current surplus of government enterprises less subsidies. Proprietors' income is included in "other" GPO as a return to capital from production; however, an unknown portion of proprietors' income represents a return to labor.
[^34]:    12. For $1977-87$, the previously published rates of change for GDP and for manufacturing were calculated using benchmark-years-weighted quantity indexes. These quantity indexes differ from the chain-type indexes because the price weights are for adjacent benchmark years. For 1987-93, the fixed (1987) weighted quantity indexes that were used for nonmanufacturing industries for all periods were also used for GDP and for manufacturing.
[^35]:    13. See the box "The Measurement of Change in Real gro by Industry" in Parker, "Gross Product by Industry, 1977-90," $36-37$. The use of the chaintype measure in place of the benchmark-years-weighted measure resulted in a minimal revision of the growth rate in manufacturing for the 1977-87 period.
[^36]:    1. Previously published rates of change are based on benchmark-years-weighted measures for GDP and for man-
    facturing for 1977-87, 1977-82, and for 1982-87. Fixed-weighted measures are used for all industry groups for
    1987-93, and for nonmanufacturing industries and for private industries for all periods. A combination of the two
    measures is used for GDP and for manufacturing for 1977-93.
[^37]:    16. The following Federal excise taxes were also affected by the reassignments: The diesel and special motor fuels taxes, which were shifted from retail trade to wholesale trade, beginning with 1988; the heavy-duty truck tax, which was shifted from motor vehicles and equipment manufacturing to wholesale trade, beginning with 1983; the imported petroleum products tax, which was shifted from petroleum and coal products to wholesale trade, beginning with 1990; and the imported chemical products tax, which was shifted from chemical and allied products manufacturing to wholesale trade, beginning with 1990.
[^38]:    17. In the previously published estimates, real inputs for three industries construction, fabricated metal products, and industrial machinery and equipment-were estimated beginning with 1988 by assuming no change from the 1987 relationship between real inputs and real gross output. The special procedure was used for these industries because their input compositions were judged to have changed since 1987 in ways that would result in significant errors in industry real inputs; in the current revision, based on the new information from the final 1987 benchmark I-O table and 1992 Economic Censuses, this special procedure has been dropped.
    18. In addition to these changes, the industry "social services and membership organizations," shown in the previously published estimates, has been split into a "social services" industry and a "membership organizations" industry.
