Reliability of the Quarterly and Annual Estimates of GDP and Gross Domestic Income
Investment in New Structures and Equipment in 1992 by Using Industries

# SURVEY of Current Business 

Survey of Current Business (issn 0039-6222). Published monthly by the Bureau of Economic Analysis of the U.S. Department of Commerce. Editorial correspondence should be addressed to the Editor-in-Chief, Survey of Current Business, Bureau of Economic Analysis, U.S. Department of Commerce, Washington, DC 20230.

Subscriptions to the Survey of Current Business are maintained, and their prices set, by the Government Printing Office, an agency of the U.S. Congress. Postmaster: Send address changes to:

Superintendent of Documents, U.S. Government Printing Office,

Washington, DC 20402.
The GPO order desk number is (202) 5121800. The subscription complaint desk number is (202) 512-1806.

Subscription and single-copy prices:

| Periodicals: | $\$ 39.00$ domestic, |
| :--- | :--- |
| First-class mail: | $\$ 88.75$ foreign. |
| Single copy: | $\$ 14.00$ domestic, |
|  | $\$ 17.50$ foreign. |

Make checks payable to the Superinten-dent of Documents.

Periodicals postage paid at Washington, DC and at additional mailing offices. (UsPs 337790).

The Secretary of Commerce has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department.

## $\mathcal{S}_{\text {pecial in this issue }}$

12 Reliability of the Quarterly and Annual Estimates of GDP and Gross
Domestic Income
An analysis of the reliability of the current quarterly estimates of real GDP. since 1983 shows that they almost always provide the correct indication of the direction of change in U.S. economic activity. About three-fourths of the time, the current quarterly estimates correctly indicate whether the pace of U.S. economic activity is picking up or slowing down and whether it is deviating from its long-term growth trend. More than two-thirds of the time, the current quarterly estimates correctly identify the cyclical turning points in U.S. economic activity, and when they have "missed," it has never been by more than one quarter.

## 26 Investment in New Structures and Equipment in 1992 by Using Industries

The 1992 capital flow table is a supplementary table to the 1992 benchmark input-output (I-O) accounts that shows the flows of new structures and equipment to the private industries that purchased or leased them in 1992. The capital flow table can be used in conjunction with tables from the I-O accounts to identify the markets for new structures and equipment, and it can be used to estimate the output by commodity that is required to support a change in new investment or to estimate the effects of an industry's purchase of new structures and equipment on the outputs of all industries.

## Regular features

## 1 Business Situation

Real GDP increased 3.9 percent in the third quarter of 1998 after increasing 1.8 percent in the second quarter; the price index for gross domestic purchases increased 0.5 percent after increasing 0.4 percent. Corporate profits increased $\$ 3.3$ billion in the third quarter after decreasing $\$ 8.6$ billion in the second. The Federal Government current surplus increased $\$ 18.7$ billion, to $\$ 93.1$ billion, in the third quarter, and the State and local government current surplus increased $\$ 8.7$ billion, to $\$ 150.0$ billion.

# 22 Federal Personal Income Tax Liabilities and Payments, 1995-96 <br> According to newly available bea estimates of Federal personal income tax liabilities, liabilities exceeded payments by $\$ 5.0$ billion in 1995, and payments - exceeded liabilities by $\$ 1.1$ billion in 1996. These estimates incorporate the results of the annual NIPA revision that was released in July and newly available tax return data from the Internal Revenue Service.

## B U S I N E S S

This article was prepared by Larry R. Moran, Daniel Larkins, Ralph W. Morris, Deborah Y. Sieff, Melissa C. Wilson, and Laura M. Bilenki.

$R$EAL GROSS domestic product (GDP) increased 3.9 percent in the third quarter of 1998, according to the "preliminary" estimates of the national income and product accounts (NIPA's), after increasing 1.8 percent in the second quarter (table 1 and chart 1 ); the "advance" third-quarter estimate of real GDP, reported in the November "Business Situation," had shown a 3.3percent increase. ${ }^{1}$ The upward revision to real GDP reflected a downward revision to imports,

Note--Chained (1992) dollar series are calculated as the product of the chain-type quantity index and the 1992 current-dollar value of the corresponding series, divided by 100 . Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-doliar estimates usually are not additive. Chained (1992) dollar evels and residuals,
which measure the extent of nonadditivity in each table, are in NIPA tables 1.2, 1.4, and 1.6. Percent changes are calculated from unrounded data. Percent changes in major aggregates are in NIPA table 8.1.

Bllion chained (1992) \$

which are subtracted in the calculation of GDP, and an upward revision to personal consumption expenditures for durable goods; these revisions were partly offset by a downward revision to business investment in producers' durable equipment. (The sources of the revisions are discussed in the section "Revisions.")

The 3.9 -percent increase in the third quarter is higher than the 3.0-percent average annual growth rate for real GDP over the current expansion that began in the second quarter of 1991. The picture of the economy in the third quarter presented by the preliminary estimates is little changed from that presented by the advance estimates. Like the advance estimates, the preliminary estimates showed the following:

- Real gdp growth accelerated in the third quarter.
- This acceleration was more than accounted for by an upturn in inventory investment; real final sales of domestic product increased less than in the second quarter. ${ }^{2}$
- Real gross domestic purchases accelerated much less than GDP; the slowdown in the

increase in imports was larger than the slowdown in the decrease in exports. ${ }^{3}$

- The largest contributors to the third-quarter increase in real GDP were PCE for services and inventory investment, primarily investment in motor vehicle inventories (table 2). The increase in GDP was moderated by decreases in Federal nondefense spending and in exports of services and by an increase in imports of goods.

The price index for gross domestic purchases increased 0.5 percent in the third quarter after increasing 0.4 percent in the second (table 3); over the past four quarters, prices increased 0.4 percent, the lowest four-quarter increase during the current expansion. The price index for GDP increased 0.8 percent in the third quarter after increasing 0.9 percent in the second. The larger increases in GDP prices than in gross domestic purchases prices in the past two quarters were due to larger decreases in the prices of imports than in the prices of exports. ${ }^{4}$
Real disposable personal income (DPI) increased 3.1 percent in the third quarter after increasing 2.6 percent in the second. The personal saving rate was 0.2 percent in the third quarter, down from 0.4 percent in the second; these quarters are the only ones in which the saving rate has been below 1.0 percent since the quarterly series began in 1946.

## Personal consumption expenditures

Real PCE increased 4.1 percent in the third quarter after increasing 6.1 percent in the second (table 4). Expenditures for both durable and nondurable goods slowed; expenditures for services increased at the same rate as in the second quarter.

Many of the factors usually considered in analyses of PCE remained strong in the third quarter (chart 2). As mentioned above, real DPI accelerated. The Index of Consumer Sentiment (prepared by the University of Michigan's Survey Research Center) was only slightly below its near-record high in the second quarter. The unemployment rate edged up to 4.5 percent from 4.4 percent-its lowest rate in more than 25 years.

Expenditures for durable goods increased 2.4 percent after increasing 11.2 percent. A downturn in motor vehicles and parts was more than accounted for by downturns in purchases of new autos and trucks; net purchases of used autos turned up. ${ }^{5}$ Furniture and household equipment accelerated; most of this acceleration was in consumer electronics, which includes computers.
5. Net purchases of used autos in PCE is defined as consumer purchases of used autos from business, government, and foreigners less consumer sales of used autos to these sectors. PCE for used autos has two components: Net transactions, which is consumer purchases less sales valued at wholesale prices, and dealers' margins, which is the difference between the retail and wholesale value of purchases by consumers from dealers. The sum of the net transactions of all sectors is zero and does not affect total GDP; dealers' margins do affect total gDP.

NOTE.-See note to table 1 for an explanation of chained (1992) dollar series. Chained (1992) dollar levels and residuals are in NIPA tables 2.3. 8.5 (autos), and 8.7 (trucks). Percent changes in major aggregates are in NIPA table 8.1.

Expenditures for nondurable goods increased 2.1 percent after increasing 5.3 percent. Most of the deceleration was accounted for by a slowdown in food and by a downturn in clothing and shoes.
Expenditures for services increased 5.4 percent in both the second and third quarters. Transportation changed little after increasing, and medical care and household operation decelerated. "Other" services stepped up, reflecting an upturn in net foreign travel, which primarily resulted from a downturn in foreign residents' travel in the United States.

## Nonresidential fixed investment

Real private nonresidential fixed investment decreased 1.2 percent in the third quarter after increasing 12.8 percent in the second (table 5). The downturn was more than accounted for by a downturn in producers' durable equipment ( PDE ); structures decreased less than in the second quarter.
The downturn in nonresidential fixed investment may have reflected a weakening in some of the factors that affect investment spending (chart 3). Over the past four quarters, the capacity utilization rate declined to 81.5 percent from 83.1 percent, and domestic corporate profits decreased 2.6 percent. However, other factors remained strong. Real final sales of domestic product increased 3.5 percent, and long-term interest rates decreased-for example, the yield
on high-grade corporate bonds decreased to 6.32 percent from 7.26 percent.
PDE decreased 1.1 percent-the first decrease since the fourth quarter of 1991-after jumping 18.8 percent in the second quarter. Transportation and related equipment turned down sharply in the third quarter; all components except ships and boats contributed to the downturn, but trucks, buses, and trailers contributed the most. "Other" PDe and information processing and related equipment each increased less than in the second quarter.
Structures decreased 1.5 percent after decreasing 2.3 percent; structures have decreased in the last three quarters. In the third quarter, "other" structures turned up, and mining exploration, shafts, and wells decreased less than in the second quarter. In contrast, nonresidential buildings decreased more than in the second quarter.

## Residential investment

Real residential investment increased 8.6 percent in the third quarter after increasing 15.0 percent in the second (table 5). The slowdown was accounted for by single-family structures and by "other" residential investment, both of which increased less than in the second quarter. Multifamily construction decreased less than in the second quarter.

Single-family structures increased 12.8 percent after increasing 17.8 percent. Multifamily

NOTE.-See note to table 1 tor an explanation of chained (1992) dollar series. Chained (1992) dollar levels and residuals are in NIPA tables 5.5, 8.5 (autos), and 8.7 (trucks). Percent changes in major aggregates are in NIPA table 8.1.
"Other" residential investment includes home improvements, new mobile home sales, brokers' commissions on home sales, residential equipment, and other residential structures (which
consists primarily of dormitories and fraternity and sorority houses). consists primarily of dormitories and fraternity and sorority houses).
structures decreased 8.3 percent after falling 23.6 percent.
"Other" residential investment increased 6.3 percent after jumping 19.4 percent. ${ }^{6}$ A downturn in brokers' commissions more than offset an acceleration in home improvements. The downturn in brokers' commissions reflected a decrease in home sales of 68,000 units (seasonally adjusted annual rate) in the third quarter after an increase of 316,000 units in the second. The downturn in home sales occurred despite a decrease in the commitment rate on 30 -year,
6. "Other" residential investment includes home improvements, new mobile home sales, brokers' commissions on home sales, residential equipment, and other residential structures (which consists primarily of dormitories and fraternity and sorority houses)

## CHART 3

## Selected Factors Affecting Nonresidential Investment

fixed-rate mortgages from 7.10 percent to 6.90 percent (chart 4).

## Inventory investment

Real inventory investment-that is, the change in business inventories-increased $\$ 18.4$ billion in the third quarter, as inventory accumulation stepped up to $\$ 56.6$ billion from $\$ 38.2$ billion in the second quarter (table 6). ${ }^{7}$ Inventory investment had decreased sharply in the second quarter, as accumulation slowed from \$91.4 billion in the first quarter.
Wholesale trade inventories increased $\$ 29.2$ billion after increasing $\$ 7.6$ billion. Inventories of both durable goods and nondurable goods increased more than in the second quarter. The step-up in durable goods mainly reflected inventories of motor vehicles held by merchant wholesalers. The step-up in nondurable goods mainly reflected inventories of farm products.
Retail trade inventories decreased $\$ 4.5$ billion after decreasing $\$ 11.9$ billion. Inventories of durable goods decreased less than in the second quarter, largely reflecting the pattern of
7. Inventory accumulation in the third quarter was affected by the Federal Government's privatization in late July of the United States Enrichment Corporation, which performs commercial nuclear enrichment activities. Proceeds of the sale totaled $\$ 3.1$ billion (current dollars). Of this total, $\$ 1.6$ billion ( $\$ 6.4$ billion at an annual rate) was the market value of uranium inventories and of machinery and equipment. (The remaining $\$ 1.5$ billion was treated as a sale of financial assets and, consequently, excluded from GDP.) The inventory portion was deducted from government consumption expenditures and added to the change in business inventories; the machinery and equipment portion was deducted from government gross investment and was added to gross private domestic fixed investment.

## CHART 4

Selected Interest Rates

[^3]U.S. Department of Commerce, Bureau of Economic Analysis
inventories of motor vehicle dealers. Inventories of nondurable goods increased less than in the second quarter; the slowdown largely reflected inventories of food stores and apparel stores.

Manufacturing inventories increased $\$ 21.1$ billion after increasing $\$ 23.9$ billion. Inventories of durable goods industries increased less than in the second quarter, and inventories of nondurable goods industries increased more. In the durable goods industries, inventories of transportation equipment (mainly aircraft) increased moderately after increasing sharply. In the nondurable goods industries, the step-up mainly reflected inventories of chemical manufacturers.
"Other" nonfarm inventories increased $\$ 3.1$ billion after increasing $\$ 10.4$ billion. ${ }^{8}$ The slowdown was mainly accounted for by nondurable goods.

Farm inventories increased $\$ 8.7$ billion, the same as in the second quarter. Crop inventories increased more than in the second quarter, but livestock inventories decreased somewhat after little change.
The ratio of real nonfarm inventories to real final sales of domestic businesses edged up to 2.27 in the third quarter from 2.26 in the second. The ratio that limits final sales to goods and struc-

tures increased to 4.06 from 4.03. For both ratios, the third-quarter levels are somewhat higher than their averages since 1995.

## Exports and imports

Real exports of goods and services decreased 1.9 percent in the third quarter after decreasing 7.7 percent in the second (table 7). Real imports of goods and services increased 1.3 percent after increasing 9.3 percent.

Real exports of goods increased 0.3 percent after decreasing 11.3 percent; exports of nonagricultural goods turned up, and exports of agricultural goods decreased less than in the second quarter. The upturn in nonagricultural goods was mainly accounted for by a sharp upturn in civilian aircraft and engines and by a smaller decrease in "other" nonautomotive capital goods in the third quarter than in the second.
Real exports of services decreased 7.0 percent after increasing 1.7 percent. Downturns in travel and in passenger fares more than offset upturns in transfers under U.S. military agency sales contracts and in "other transportation."
Real imports of goods increased 2.3 percent after increasing 11.4 percent; imports of nonpetroleum goods slowed considerably, and imports of petroleum and products turned down. The slowdown in nonpetroleum imports was mainly in nonautomotive capital goods and in nonautomotive consumer goods.
Real imports of services decreased 3.7 percent after decreasing 0.6 percent. The larger decrease was accounted for by "other private services," which changed little after increasing, and by passenger fares, travel, and "other transportation," all of which turned down.

## Government spending

Real government consumption expenditures and gross investment increased 1.6 percent in the third quarter after increasing 3.7 percent in the second (table 8). A downturn in Federal Government spending more than offset an acceleration in State and local government spending.
Federal nondefense spending decreased 12.2 percent after increasing 2.6 percent. The thirdquarter decrease was more than accounted for by the privatization of the United States Enrichment Corporation (see footnote 7 for more information). Consumption expenditures decreased after increasing, largely reflecting the deduction in inventories that resulted from the sale of the United States Enrichment Corporation. Investment spending decreased considerably less than in the second quarter, reflecting a smaller decrease in equipment and an upturn in structures.
Federal defense spending increased 4.3 percent after increasing 9.9 percent. The slowdown was more than accounted for by a downturn in consumption spending that reflected a downturn in services other than compensation of employees. Investment increased substantially after decreasing, mainly reflecting an upturn in equipment-largely in aircraft and in "other" equipment.
State and local government spending increased 3.4 percent after increasing 1.8 percent. The stepup was accounted for by an upturn in investment spending, largely in structures; consumption expenditures increased about the same in each quarter. (For more information on government spending, see the section "Government Sector.")

NIPA table 8.1.

## Revisions

As noted earlier, the preliminary estimate of a 3.9percent increase in real GDP in the third quarter is 0.6 percentage point higher than the advance estimate (table 9); for 1978-97, the average revision, without regard to sign, from the advance estimate to the preliminary estimate was 0.5 percentage point.

The revision to GDP primarily reflected upward revisions to nonautomotive inventory investment and to nonresidential and residential structures. Revisions to imports and exports, to PCE for durable goods, to business investment in PDE,

1. Based on chained-type annual (1992) weights.

NOTE.-The preliminary estimates for the third quarter of 1998 incorporate the following revised or additional major source data that were not available when the advance estimates were prepared.
Personal consumption expendibures: Retail sales for August and September (revised), consumers' share of new-car purchases for September, average unit value for domestic new autos for September (revised), used car sales for July and August, consumers share of new-truck purchases for September, and residential electricity usage for July.
Nonresidential fixed investment: Construction put in place for July and August (revised) and September, manufacturers' shipments of machinery and equipment for August and September (revised), and exports and imports of machinery and equipment for August (revised) and September.
Residential fixed investment: Construction put in place for July and August (revised) and September
Change in business inventories: Manufacturing, retail trade, and wholesale trade inventories for August (revised) and September Exports and imports of goods and services: Exports and imports of goods for August (revised) and September. Government consumption expenoitures and gross investment: Monthly Treasury Statement detailed data for September, Department of Defense detailed financial reports for the quarter, and State and local government construction put in place for July and Augus Wages and salaries:
GDP prices: Detailed Employment, average hourly earnings, and average weekiy hours for August and September (revised). am imports for August (revised) and September and housing prices for July through September (revised), unit-value index for petroleum imports for August (revised) and September, and housing prices for the third quarter.
and to business investment in motor vehicle inventories were mostly offsetting.

The upward revision to nonautomotive inventory investment primarily reflected the incorporation of revised Census Bureau data on wholesale trade inventories for August and newly available data for September.
The upward revisions to nonresidential and residential structures primarily reflected the incorporation of revised Census Bureau data on the value of construction put in place for July and August and newly available data for September.

Imports were revised down, and exports were revised up; both revisions primarily reflected the incorporation of revised Census Bureau data for goods for August and newly available data for September. These revisions were primarily in capital goods (both equipment and parts). Because the imports and exports of capital equipment are also used to calculate PDE, PDE was revised down; in order to estimate PDE-that is, domestic business spending on equipmentimports are added to domestic manufacturers' shipments of business equipment, and exports are subtracted.

PCE for durable goods was revised up. The revision was mainly to trucks and to used autos, largely reflecting the incorporation of newly available September data on the consumer share of truck purchases and on used car sales and inventories. The incorporation of newly available data also contributed to downward revisions to PDE for trucks and to business investment in motor vehicle inventories.
The preliminary estimates of the increases in the price indexes for gross domestic purchases ( 0.5 percent) and for GDP ( 0.8 percent) were the same as the advance estimates.

The preliminary estimate of the increase in real dPI was 3.1 percent, 0.5 percentage point higher than the advance estimate. Current-dollar Dpi increased 4.1 percent, also 0.5 percentage point higher than the advance estimate. The upward revision to DPI was primarily accounted for by a downward revision to personal tax and nontax payments that reflected the incorporation of newly available Federal tax collection data from the Monthly Treasury Statement for September; current-dollar personal income was revised up only slightly. The preliminary estimate of the personal saving rate-personal savings as a percentage of current-dollar DPI-was 0.2 percent, 0.1 percentage point higher than the advance estimate.

## Corporate Profits

Profits from current production increased $\$ 3.3$ billion in the third quarter after decreasing $\$ 8.6$ billion in the second (table 10). ${ }^{9}$ An increase in profits of domestic corporations was largely offset by a decrease in profits from the rest of the world. Profits of domestic financial corporations increased $\$ 2.0$ billion after decreasing $\$ 1.2$ billion. Profits of domestic nonfinancial corporations increased $\$ 13.6$ billion after decreasing $\$ 6.1$ billion; in the third quarter, unit profits and real product increased. Profits from the rest of the world decreased $\$ 12.2$ billion after decreasing $\$ 1.3$ billion; the third-quarter decrease mainly reflected a drop in receipts of earnings from foreign affiliates. ${ }^{10}$

Cash flow from current production, a profitsrelated measure of internally generated funds

IVA Inventory valuation adjustment
CCAdj Capitai consumption adjustment
available for investment, increased $\$ 5.6$ billion after decreasing $\$ 5.8$ billion. The ratio of cash flow to nonresidential fixed investment, an indicator of the share of the current level of investment that could be financed by internally generated funds, increased to 86.5 percent from 84.8 percent; the increase followed four consecutive decreases. The average quarterly ratio for 1991-97 was 91.9 percent.

Industry profits and related measures.-Industry profits decreased $\$ 2.2$ billion after decreasing $\$ 13.0$ billion. ${ }^{11}$ Profits of domestic nonfinancial corporations increased $\$ 8.8$ billion after decreasing $\$ 9.9$ billion, partly reflecting upturns in the transportation and public utility group and in manufacturing. Profits of domestic financial corporations increased $\$ 1.3$ billion after decreasing $\$ 1.9$ billion. Profits from the rest of the world decreased $\$ 12.2$ billion after decreasing $\$ 1.3$ billion.

Profits before tax (PBT) decreased $\$ 6.5$ billion after increasing $\$ 4.4$ billion. About half of the difference between this decrease and the $\$ 3.3$ billion increase in profits from current production was accounted for by larger inventory losses, as reflected in a $\$ 4.3$ billion increase in the inventory valuation adjustment. ${ }^{12}$ The rest of the difference was accounted for by the capital consumption adjustment.

## Government Sector

The current surplus of the Federal Government and of State and local governments, the NIPA measure of net saving by government, grew $\$ 27.4$ billion, to $\$ 243.1$ billion, in the third quarter after increasing $\$ 16.7$ billion in the second (table 11). ${ }^{13}$ The step-up was accounted for by accelerations in the current surpluses of both the State and local governments and Federal Government. ${ }^{14}$

[^6]
## Federal

The Federal Government current surplus increased $\$ 18.7$ billion, to $\$ 93.1$ billion, in the third quarter after increasing $\$ 15.6$ billion in the second; the acceleration resulted from a sharper deceleration in current expenditures than in receipts.

Receipts.-Federal receipts increased $\$ 20.1$ billion in the third quarter after increasing $\$ 29.2$ billion in the second. The deceleration was accounted for by personal tax and nontax receipts, which

| Other ................................................................. | 82.6 | 7.1 | 5.1 | -1.1 | . 9 | 9.0 |

[^7]increased $\$ 7.8$ billion after increasing $\$ 19.2$ billion. In personal tax and nontax receipts, "estimated income tax payments and final settlements, less refunds" decreased $\$ 3.1$ billion after increasing $\$ 3.7$ billion, and net estate and gift taxes decreased $\$ 2.4$ billion after increasing $\$ 2.7$ billion. ${ }^{15}$

Indirect business tax and nontax accruals increased $\$ 2.7$ billion after increasing $\$ 1.3$ billion. The step-up was accounted for by customs duties, which increased $\$ 1.4$ billion after increasing $\$ 0.2$ billion.
Contributions for social insurance increased $\$ 7.9$ billion after increasing $\$ 7.3$ billion. The acceleration was mostly attributable to contributions for social security (old-age, survivors, disability, and health insurance), which increased $\$ 7.6$ billion after increasing $\$ 7.2$ billion, partly reflecting a step-up in wages and salaries.
Corporate profits tax accruals increased $\$ 1.8$ billion after increasing $\$ 1.4$ billion, reflecting the pattern of domestic corporate profits before tax.

Current expenditures.-Current expenditures increased $\$ 1.4$ billion in the third quarter after increasing $\$ 13.6$ billion in the second. ${ }^{16}$ The deceleration was more than accounted for by a downturn in consumption expenditures and by a larger decrease in net interest paid in the third quarter than in the second. In contrast, grants-in-aid to State and local governments turned up, and transfer payments accelerated.

Consumption expenditures decreased $\$ 5.8$ billion after increasing $\$ 13.1$ billion. The downturn was accounted for by both defense consumption expenditures, which decreased $\$ 0.3$ billion after increasing $\$ 9.7$ billion, and nondefense consumption expenditures, which decreased $\$ 5.5$ billion after increasing $\$ 3.3$ billion.

Within defense consumption expenditures, services turned down, mostly as a result of a deceleration in research and development services and a downturn in personnel support services. The downturn in services was partly offset by an upturn in nondurable goods, primarily in ammunition, and by a step-up in durable goods, mainly in missile parts.

The downturn in nondefense consumption expenditures was more than accounted for by a downturn in durable goods and by a decelera-

[^8]tion in services. Durable goods decreased $\$ 6.1$ billion after increasing $\$ 0.1$ billion; the downturn was attributable to the sale of the United States Enrichment Corporation, which reduced consumption expenditures $\$ 5.8$ billion in the third quarter (see footnote 7 for more information). The deceleration in services was primarily attributable to an upturn in sales of services; sales except those by government enterprises for goods and services that are similar to those provided by the private sector are treated as deductions from government consumption expenditures.

Net interest paid decreased $\$ 2.6$ billion after decreasing $\$ 0.5$ billion. The larger decrease was attributable to gross interest paid, which decreased $\$ 2.6$ billion after decreasing $\$ 0.1$ billion.

Grants-in-aid to State and local governments increased $\$ 4.5$ billion after decreasing $\$ 1.8$ billion. Grants for education, highways, and food and nutrition programs turned up, and grants for public assistance and the Environmental Protection Agency turned down.

Transfer payments (net) increased $\$ 5.0$ billion after increasing $\$ 2.6$ billion. The acceleration was attributable to transfer payments to the rest of the world, which increased $\$ 1.3$ billion after decreasing $\$ 0.9$ billion. Transfer payments to persons increased $\$ 3.7$ billion after increasing $\$ 3.5$ billion.

## State and local

The State and local government current surplus increased $\$ 8.7$ billion, to $\$ 150.0$ billion,
in the third quarter after increasing $\$ 1.1$ billion in the second. The acceleration was more than accounted for by an acceleration in receipts.

Receipts increased $\$ 18.4$ billion after increasing $\$ 10.5$ billion. The acceleration was mostly accounted for by the upturn in Federal grants-in-aid and by a step-up in indirect business tax and nontax accruals. Indirect business tax and nontax accruals increased $\$ 5.9$ billion after increasing $\$ 4.5$ billion; the acceleration was mostly accounted for by a step-up in "other tax and nontax accruals"; these accruals were boosted $\$ 1.7$ billion by payments from tobacco companies for out-of-court settlements with four States. The step-up in "other tax and nontax accruals" was partly offset by a deceleration in sales taxes.

Current expenditures increased $\$ 9.8$ billion after increasing $\$ 9.5$ billion; an acceleration in consumption expenditures and a deceleration in dividends received by government were partly offset by a deceleration in transfer payments. Consumption expenditures increased $\$ 8.4$ billion after increasing $\$ 8.0$ billion; the acceleration was primarily attributable to a step-up in services. Dividends received by government, which are recorded as a deduction to current expenditures in the derivation of the current surplus, were unchanged after increasing $\$ 0.3$ billion. Transfer payments to persons increased $\$ 2.6$ billion after increasing $\$ 3.0$ billion; the deceleration was the result of a deceleration in payments for medicaid.

# Reliability of the Quarterly and Annual Estimates of GDP and Gross Domestic Income 

By Bruce T. Grimm and Robert P. Parker

Kurt Kunze and Teresa L. Weadock contributed to the development of this article. Colleen Ryan provided secretarial support.

$\tau$he goal of the national income and product accounts (NIPA's) is to provide a comprehensive and reliable picture of the condition of the domestic economy. In particular, the current quarterly estimates of gross domestic product (GDP) are of crucial importance for the analysis of economic conditions that supports economic policy-making and business planning. ${ }^{1}$
The reliability of these current quarterly estimates can be evaluated by answering the following four questions.

- Do the estimates provide a reliable indication of the direction in which aggregate economic activity is moving?
- Do they provide a reliable indication of whether the change in aggregate economic activity is accelerating or decelerating?
- Do they provide a reliable indication of whether the change in aggregate economic activity differs significantly from the longer run trend?
- Do they provide a reliable indication of cyclical turning points?

[^9]Table 1.-Reliability of Current Quarterly Estimates of Real GDP, 1983-97
[Percent]

| Vintage of estimate | Percentage of estimates that provided the correct indication |  |  |
| :---: | :---: | :---: | :---: |
|  | Of the direction of change | Of the acceleration/ deceleration from the preceding quarter | Of the growth of trend rate ${ }^{2}$ |
| Advance ................................... | 98 | 78 | 78 |
| Preliminary ................................. | 98 | 73 | 73 |
| Final ......................................... | 98 | 78 | 73 |
| Number of quarters compared ......... | 60 | 60 | 37 |

[^10] mate to determine whether the current quanerly estimate provided a correctinstation.
2. Consists of the quarters in which the latest estimates increased at least 1.5 percent but no more than 4.5 percent.

The first three questions are addressed, with respect to the current quarterly estimates of real GDP for 1983-97, in table 1. The standards of comparison are the latest available estimates, which are assumed to provide the most accurate available measure of economic activity. The first column of the table shows that the three sets of current quarterly estimates each correctly indicated the direction of change 98 percent of the time (that is, in 59 of 60 quarters). The second column shows that the current quarterly estimates correctly indicated the acceleration or deceleration about three-fourths of the time. The final column examines the ability of the current quarterly estimates to indicate whether the economy was increasing at a rate near the trend rate of about 3 percent for 1983-97. It shows that the current quarterly estimates provide correct indications of near-trend rates of increase ( 1.5 percent to 4.5 percent) about three-fourths of the time.

1. Estimate was not made.
$\times$ Peak or trough correctly identified
y Peak or trough not correctly identified

The fourth question is addressed in table 2. One or more of the current quarterly estimates successfully identified four of the five cyclical peaks since the beginning of 1969 . The current quarterly estimates also successfully identified three of the five cyclical troughs. In all but one of the cases for which the peak or trough was not successfully identified, the "miss" was by a lag of one quarter; in the other case, the "miss" was by a lead of one quarter.

## Background

This article, which is based on a report recently submitted to the Office of Management and Budget (омв), updates bea's evaluation of the GDP estimates. ${ }^{2}$ It expands on previous articles by including an evaluation of the components of gross domestic income (GDI), an evaluation of annual estimates of GDP and GDI and their major components, and a review of the estimates of quarterly GDP at cyclical turning points.

The report to omb follows the requirements of Statistical Policy Directive No. 3, which mandates that for each principal Federal economic indicator, the agency that compiles that indicator must evaluate its performance every 3 years. ${ }^{3}$ It requires that the performance evaluation address the "accuracy and reliability of the series..." as well as some other standards for documentation, avoidance of premature disclosure, and promptness in releasing estimates.

As with previous evaluations, this article evaluates GDP performance using measures of revisions. It does not directly address the "accuracy" of GDP, because such an evaluation would require data on the total measurement error, which cannot be observed. This total error arises from errors in the source data and in the estimating procedures that use the source data. Assuming that later estimates are more accurate than earlier ones, the revisions reflect improvements in accuracy relative to earlier estimates, although the later estimates may contain unknown errors.

The measures of revisions presented in this article form the basis of the evaluation of the reliability of the estimates. Revisions are due to the following: (1) Replacement of preliminary source data with revised or more comprehensive data, (2) replacement of judgmental projections with source data, (3) changes in definitions or

[^11]estimating procedures, and (4) for real estimates, changes in the base year and changes in the index-number formulas used to calculate them. This last item covers a change from fixed-weight methodology to chain-weight methodology for calculating real economic measures. This change was introduced in the most recent comprehensive, or benchmark, revision of the nIPA's; shifts in the base year were incorporated in previous comprehensive NIPA revisions.

This article discusses the reliability of the estimates for $1983-97 .{ }^{4}$ Three groups of estimates were used to calculate the measures of reliability used in this article. The first group is the current quarterly estimates, which consist of the "advance," "preliminary," and "final" estimates. The second group is the annual revision estimates, which consist of the first, second, and third annual revision estimates that are released in late July except in the years of a comprehensive nipa revision. The third group is the "latest" estimates, which include the results of the comprehensive nIPA revision released in January 1996 as well as the most recent annual revisions of the nIPA's released in July 1997 and July 1998. ${ }^{5}$

The remainder of this article provides information that amplifies the initial findings presented in tables 1 and 2. First, it describes the three measures used in this performance evaluation of reliability. Second, it provides additional evaluations of the current quarterly estimates of GDP and GDI and their major components. Third, it presents additional information about performance at cyclical turning points. Fourth, it evaluates the annual estimates of GDP and of gdi and their major components. Finally, it describes revisions to the estimates of the level of current-dollar GDP.

## Measures of revisions: Bias, dispersion, and relative dispersion

GDP estimates are made using a large number of disparate data sources, including government and private surveys, censuses, and administrative records. As a result, it is not possible to calculate some traditional measures of accuracy, such as the coefficients of variation for monthly retail sales that are published by the Census Bureau. The measures used by bea are bias, dispersion,

[^12]and relative dispersion, which are calculated as follows.

Bias is the average of the revisions:

$$
\sum(P-L) / n
$$

where $P$ is the percentage change in the current quarterly (or annual) estimate, $L$ is the percentage change in the latest estimate, and $n$ is the number of quarterly changes.

Dispersion is the average of the absolute values of the revisions:

$$
\sum|P-L| / n
$$

Relative dispersion expresses the dispersion as a percentage of the average of the absolute values of the latest available estimates:

$$
\frac{\sum|P-L| / n}{\sum|L| / n}
$$

The two dispersion measures are emphasized in this article because the bias estimates are generally small, and small changes in the time period examined often result in substantial changes in the measures of bias. ${ }^{6}$

## Quarterly estimates

Table 3 shows dispersions and relative dispersions for current-dollar and real GDP and the major components for 1983-97. There is little or no tendency for improvements across the successive quarterly estimates: The revision measures
6. The previous article found that most bias estimates were generally not statistically significant; see Young, 37-38.

[^13]for current-dollar GDP all have about the same values, a dispersion of about 1 percentage point and a relative dispersion of 16 percent. The dispersions for real GDP are slightly larger, and the relative dispersions for real GDP are 31 to 33 percent. These larger relative dispersions reflect the larger average absolute rates of change for current-dollar GDP than for real gDP: For this period, the average absolute change for currentdollar GDP is 6.3 percent, and the average absolute rate of change for real GDP is 3.2 percent. ${ }^{\text {? }}$
The patterns for the GDP components are similar, but the disparities in the current-dollar and the real relative dispersions are not as dramatic. With the exception of personal consumption expenditures (PCE), the components' dispersions are considerably larger than the corresponding ones for GDP. The three components of PCE-durable goods, nondurable goods, and services-have dispersions larger than those for total PCE. Likewise, the components of fixed investment have dispersions larger than those for total fixed investment. In contrast, the dispersions for State and local government expenditures are much smaller than those for total government expenditures.

The dispersions for real private investment in producers' durable equipment and real Federal defense expenditures are about 1 percentage point higher, and the dispersions for real imports are more than 2 percentage points higher, than those for the corresponding current-dollar measures. The dispersions for real Federal nondefense expenditures are several percentage points lower.

Because change in business inventories is frequently negative, it is not possible to calculate percent changes or dispersion measures for this GDP component. However, the effects of revisions to change in business inventories can be approximated by comparing the dispersion measures for the three current quarterly estimates of gross private domestic investment (GPDI), which includes change in business inventories, with those for fixed investment, which does not. The dispersions for GPDI are more than double those for fixed investment, indicating that revisions to estimates of inventories contribute significantly to revisions to estimates of GPDI.

[^14]Another way to evaluate the effect of revisions to change in inventories is to compare the averages of the dispersion measures for the three current quarterly estimates of GDP with those for final sales of domestic product, which excludes inventories. The current-dollar dispersions and relative dispersions of final sales of domestic product are only slightly larger than those for gDP. Real dispersions average less than 0.2 percentage point higher, and real relative dispersions average less than 7 percent higher. Thus, on average, revisions to inventories tend to be offset by revisions to the other components of GDP.
Table 4 shows dispersions for current-dollar and real GDP and the major components for two shorter periods, 1983-89 and 1990-97. The presentation of two time periods allows a separate evaluation of the estimates for the later period, which reflect a change in the treatment of purchases and sales of agricultural goods by the Commodity Credit Corporation (ccc) and an improvement in the procedures for the processing of information about trade in goods; these two changes substantially affected quarterly changes in business inventories, government expenditures, and trade in goods. ${ }^{8}$
The effects of the first of these changes, the revised classification of ccc transactions, may be seen by comparing the dispersions for the estimates of GPDI and of fixed investment. The dispersions for GPDI are substantially smaller in 1990-97, but those for fixed investment are only slightly smaller. Likewise, the dispersions for Federal Government expenditures-and nondefense expenditures-are substantially smaller in 1990-97. (Because the revised treatment of CCC transactions produces offsetting revisions, current-dollar and real GDP are not affected.)

Improvements in the processing of data on trade in goods by the Census Bureau also have had a dramatic effect. In particular, the dispersions for current-dollar and real imports in 199097 are less than one-half of those in 1983-89. The improvements had smaller, but still noticeable, effects on exports.

Overall, the dispersions for current-dollar GDP and its components in 1990-97 are generally smaller than the corresponding dispersions in 1983-89. However, the smaller dispersions may not indicate improvements in reliability, because

[^15]the latest estimates for 1990-97 have been subject to fewer successive revisions.
The dispersions for real GDP are about the same size in the two periods, mainly because the revisions to the real GDP components did not offset each other as much as the revisions to the current-dollar GDP components. The dispersions for most of the real GDP components are smaller in 1990-97.

Table 5 shows the biases for current-dollar and real GDP and the major components. The biases for current-dollar and real GDP are small and negative. (A negative bias means that GDP tended to be revised up.) The biases for current-dollar and real PCE and for most of its major components are also negative, and those for pCE are larger than those for GDP. The biases for currentdollar and real GPDI and for current-dollar and
real nonresidential fixed investment are positive and larger than those for pCE. The biases for current-dollar and real exports are also large, but negative. The biases for imports are mixed. The biases for Federal Government nondefense expenditures are also large and positive, but the biases for all Federal Government expenditures are small and positive. The pattern for Federal nondefense expenditures partly reflects the changed classification of ccc transactions. The biases for current-dollar Federal defense expenditures are small, but those for real expenditures are substantial and negative.

Table 6 shows dispersions and relative dispersions for GDI and for national income and its major components for 1983-97. The dispersions and relative dispersions for GDI are somewhat larger than those for GDP, and the dispersions and

[^16]relative dispersions for national income are even larger. The larger dispersions for national income reflect the substantial dispersions for the components that are added and subtracted from GDI to obtain national income. It should be noted that the measures for these components were greatly affected by the incorporation of a new depreciation pattern into consumption of fixed capital and the new treatment of government investment introduced in the most recent comprehensive nipa revision. The new depreciation patterns result in revisions both to consumption of fixed capital and to the capital consumption adjust-
ment for the three types of business income; the new treatment of government investment results in the addition to GDI of consumption of fixed capital for government.
Among the components of GDI, only compensation of employees has dispersions and relative dispersions that are similar to those for the components of GDP. The other components of GDI have much larger dispersions and relative dispersions. The relative dispersions for proprietors' income with inventory valuation adjustment and capital consumption adjustment exceed 100 percent, reflecting the typically large revisions to

1. No preliminary estimates for 1994:IV, 1995:IV, 1996:IV, and 1997:IV.
2. Equals the consumption of fixed capital, plus indirect business tax and nontax liability, plus business transter payments, less subsidies less current surplus of government enterprises, and
farm proprietors' income; the relative dispersions for nonfarm proprietors' income are about 65 percent. The larger dispersions and relative dispersions reflect the limited availability of source data for all components of GDI except compensation of employees and corporate profits. For the quarterly estimates of the other components, very little current quarterly source data are available. For the annual estimates of these components, most of the final data are incorporated in the second annual revision. As with the product-side components of GDP, there is little or no tendency for improvements when progressing from advance to preliminary to final current quarterly estimates.

## Cyclical turning points

One of the more important aspects of the reliability of GDP estimates is how well they identify cyclical peaks and troughs. The advance estimates correctly identified the peaks for the first four cycles beginning with 1969 (top panel of table 2). With the exception of one of the second annual revision estimates, all the later estimates also correctly identified these peaks. For the most recent cycle, the peak in the second quarter of 1990 was not correctly identified until the second annual revision estimate.

The troughs were not identified as reliably as the peaks. The advance estimates correctly identified two of the five troughs, and the preliminary estimates identified an additional trough (bottom panel of table 2). The second annual revision identified the fourth trough, and the fifth trough was not identified until the most recent comprehensive nIPA revision. All of the estimates correctly identified the most recent recession's trough in the first quarter of 1991.

Revisions in the 1990-91 recession.-The beginning of the 1990-91 recession in the second quarter of 1990 was not correctly identified until the second annual revision; previously, the third quarter of 1990 had been identified as the peak. The latest estimate shows that real GDP declined 1.9 percent in the third quarter; the current quarterly estimates showed increases in real GDP ranging from 1.6 percent in the advance estimate to 0.7 percent in the final estimate. In addition to missing the peak, the current quarterly estimates underestimated the rate of decline in real GDP in the fourth quarter of 1990 by about 2 percentage points and overestimated the rate of decline in the first quarter of 1991 by about 1 percentage point (chart 1). The more rapid decline in GDP
in the fourth quarter of 1990 did not appear until the second annual revision (in July 1992), and the smaller decline in real GDP in the first quarter of 1991 did not appear until the third annual revision (in July 1994). The three current quarterly estimates, and all successive ones, correctly identified the beginning of the recovery in the second quarter of 1991 and roughly indicated the pace of the recovery.
Revisions to real change in business inventories (CBi) played a major role in the mis-estimation of changes in real GDP in all three recession quarters. Roughly half of the revision from an increase to a decline in real GDP in the third quarter of 1990 reflected a revision to CBI. Most of the downward revision to the change in real GDP in the fourth quarter of 1990 was due to the effects of very large upward revisions to the price indexes for fixed nonresidential investment and exports; in addition, real cbi was revised down much more sharply than current-dollar cbi. The modest upward revision (that is, reduction in the decline) to real GDP in the first quarter of 1991 was due to upward revisions to real fixed investment and to real CBi that more than offset a downward revision to real PCE.

## Annual estimates

Table 7 shows dispersions and relative dispersions for estimates of annual percent changes in current-dollar and real GDP and some of the major components. The measures marked "final" are the annual estimates published at the

## CHART 1

Selected Estimates of Changes in Real GDP, 1990:I-1991:II
Percent change at annual rates

time that the final current quarterly estimates for each year's fourth quarter were published. The three successive annual revision estimates shown in the table are those revisions that are typically published in late July for the 3 preceding years; these are labeled first annual, second annual, and third annual. These annual estimates incorporate the increasing amounts of source data that become available following the end of each year. ${ }^{9}$ Data that would allow a complete evaluation of the 1996 and 1997 estimates are not yet available.

The estimates of annual GDP and its components have much smaller dispersions and relative dispersions than those for the estimates of quarterly GDP and its components. In contrast to the successive current quarterly estimates, the sizes of dispersion and relative dispersion tend to decrease as the successive annual revision estimates are made. An exception is for Federal Government expenditures, which tends to register small increases in dispersion with the successive annual revisions, possibly reflecting the change in the classification of ccc purchases. Like the quarterly estimates, the relative dispersions for real GDP and its major components are usually considerably larger than those for current-dollar GDP and its ma-

[^17]jor components. Also like the quarterly estimates, the dispersions and relative dispersions for current-dollar and real GDP are generally smaller than those for most of their major components. Among the components, PCE has the smallest dispersions and relative dispersions, and Federal Government expenditures has the largest.

Table 8 shows dispersions and relative dispersions for the annual estimates of national income and its major components. As with GDP and its major components, the annual estimates have much smaller dispersions than the quarterly estimates for national income and for compensation of employees. The smallest values of dispersion and relative dispersion are for the second annual revision estimates; however, the higher dispersions for the third annual revision may be an accidental result of the small number of observations. The dispersions and relative dispersions for national income are larger than those for GDP, and with the exception of compensation of employees, those for the components of national income are larger than those for most components of GDP. The dispersions and relative dispersions for total proprietors' income and for nonfarm proprietors' income are about the same size, and they are much larger than those for compensation of employees but smaller than those for corporate profits.

Table 7.-Dispersion in Annual Changes in GDP and Its Components, 1983-95

[^18]Nore.-Final estimates were used for missing first annual estimates for 1984, 1990, and 1994. First annual estimates were used for missing second annual estimates for 1983, 1989, and 1993. Second annual estimates were used for missing third annual estimates for 1988 and 1992.

## Revisions in levels

Like bea's previous studies of revisions to GDP, this analysis of the reliability of the GDP estimates is primarily based on revisions in change, and the latest estimates are assumed to be the best. Analyses of revisions in the levels of GDP (and its components) are not featured, because the largest revisions in levels almost always occur in comprehensive nIPA revisions, which incorporate both definitional and statistical revisions. ${ }^{10}$ Definitional revisions are made to adapt the nipA's to a changing economy and have little to do with the reliability of earlier vintage estimates. Revisions to the current-dollar annual estimates are reviewed, but revisions to the real levels are not. Changes in reference periods that are incorporated as part of comprehensive nIPA revisions result in substantially different real levels: In an inflationary environment, the adoption of a later reference period produces lower levels of price indexes and higher levels of real GDP.
This section looks at revisions to the level of gDP in annual nipa revisions, revisions to the level of GDP in the latest comprehensive NIPA revision, and revisions to the average shares of GDP that are accounted for by its major components.
Annual revisions to the levels of GDP are similar in size to the dispersions of the three annual estimates (as measured by the latest estimates). For 1983-94, the annual revisions (without regard to sign) averaged 0.5 percent for the first annual, 0.4

[^19]percent for the second annual, and 0.2 percent for the third annual. ${ }^{11}$ The dispersions for these years were 0.4 percent for the first and second annual, and 0.3 percent for the third annual.
In the comprehensive NIPA revision released in January 1996, the level of GDP was revised up throughout $1982-94$, by amounts ranging from $\$ 93$ billion in 1982 to $\$ 224$ billion in 1992 (chart 2). On average, nearly two-thirds of the upward revisions were the result of definitional changes. ${ }^{12}$ The upward revisions due to definitional changes increase smoothly from $\$ 74$ billion in 1982 to $\$ 125$ billion in 1994 (chart 3). The upward revisions due to statistical changes, which are the net results of both positive and negative revisions of various GDP components, fluctuate considerably around a generally upward trend. ${ }^{13}$

It is possible to separate the effects of the definitional and statistical revisions on reliability by comparing the 1982-94 dispersions in annual

[^20]Table 8.-Dispersion in Annual Changes in National Income and Its Components, 1983-95

| Vintage of estimates | Dispersion (percentage points) | Relative dispersion (percent) | Vintage of estimates | Dispersion (percentage points) | Relative dispersion (percent) |

| First annual. | 0.44 | 7 | Final ...... | 4.49 | 74 |
| Second annual ......................................................... | 0.27 | 4 | First annual | 3.29 | 54 |
| Third annual ............................................................. | 0.33 | 5 | Second annual .......................................................... | 4.00 | 66 |
|  |  |  | Third annual ............................................................. | 2.74 | 45 |
| Proprietors' income with inventory valuation and capital consumption adjustments: |  |  | Addenda: |  |  |
| Final ................................................................. | 3.65 | 44 | Nonfarm proprietors' income with inventory valuation |  |  |
| First annual .............................................................. | 2.33 | 28 | and capital consumption adjustments: |  |  |
| Second annual ......................................................... | 2.62 | 32 | Final ........................................................................ | 3.92 | 47 |
| Third annual ............................................................. | 2.98 | 36 | First annual .............................................................. | 2.73 | 32 |
|  |  |  | Second annual | 3.16 | 38 |
| Rental income of persons with inventory valuation and capital consumption adjustments ${ }^{1}$ |  | .............. | Third annual ............................................................ | 3.21 | 38 |

percent changes for the estimates of GDP before and after the 1996 comprehensive NIPA revision.

| Standard | Dispersion (percentage point) |
| :---: | :---: |
| Revised GDP | 0.26 |
| Revised GDP less statistical revisions | 0.06 |
| Revised GOP less definitional revisions ............................................ | 0.25 |

The dispersions for the comprehensive revision GDP estimates and the revised GDP estimates less statistical revisions-that is, with only definitional revisions-differ by only 0.06 percentage point. In contrast, the dispersion for the revised GDP estimates without definitional revisionsthat is, with only statistical revisions-is about the same size as the dispersion for the revised gDP estimates. Thus, definitional revisions have little effect on the revisions to the changes in GDP though they account for most of the revisions to the levels of GDP.

The comprehensive NIPA revision resulted in revisions to the shares of GDP that are accounted for by the major components of GDP. The revi-
sions were small-all were less than 2 percentwith little trend for 1983-94. The revisions to the shares accounted for by PCE averaged 1.1 percent and ranged from 0.9 percent to 1.4 percent. The revisions to the shares accounted for by gross private domestic investment averaged 0.6 percent and ranged from 0.4 percent to 0.7 percent. The revisions to the shares accounted for by net exports averaged -0.1 percent and ranged from -0.1 percent to o.o percent. The revisions to the shares accounted for by government consumption expenditures and gross investment averaged -1.7 percent and ranged from -1.5 percent to -1.9 percent.

The comprehensive NIPA revision also resulted in only small revisions to the shares of national income that are accounted for by labor and capital. The revisions to the shares of national income accounted for by employee compensation, which approximates the share of labor, averaged -0.5 percent in 1983-94 and ranged from -0.1 percent to -0.8 percent. The share of the rest of national income, which approximates the share of capital, was revised up correspondingly.

# Federal Personal Income Tax Liabilities and Payments, 1995-96 

By Thae S. Park

This article presents new bea estimates for 1996 and revised estimates for 1995 of Federal personal income tax liabilities and revised estimates for 1995-96 of Federal personal income tax payments (table 1). ${ }^{1}$ The liabilities estimates for 1996 are derived from newly available tax return data from the Internal Revenue Service; the payments estimates are from the annual revision of the national income and product accounts (NIPA's) that was released last July. ${ }^{2}$

1. This series is derived by the Bureau of Economic Analysis and is based on data from Statistics of Income, Individual Income Tax Returns.
2. This series appears in NiPA table 3.2 in the section "BEA Current and Historical Data" of the SURvEY of CURRENT Business. The components of Federal personal income taxes are published annually in NIPA table 3.4, mostly recently on page 59 of the August 1998 SURVEY. 3. This series appears in NIPA table 2.1 in "BEA Current and Historical Data." Estimates for 1982-94 have been revised as a result of a redetinition of dividend payments in this year's annual revision of the NIPA's. The revised estimates for 1982-94 are in table 2.1 in the section "Annual NIPA Revision: Revised Estimates for 1982-94," on pages 128-131 in the August 1998 SURVEY, and the redefinition is described in Eugene P. Seskin, "Annual Revision of the National income and Product Accounts." on page 29 of that issue.
NIPA National income and product account

The first section of the article discusses the payments series, the derivation and the use of the estimates of tax liabilities, and the sources of the differences between liabilities and payments. The second section presents the estimates of tax liabilities for 1995-96 and discusses the sources of the differences for these years. The third section discusses the sources of the revisions to the estimates for 1995.

## Payments and liabilities

In the nipa's, Federal personal tax payments is defined as tax payments (net of refunds) to the Federal Government by U.S. residents that are not chargeable to business expense. Federal personal income taxes consist of all Federal taxes except estate and gift taxes, and they are recorded on a payments basis. As shown below, Federal personal income tax payments have three components: Withheld income taxes; declarations and settlements, or "nonwithheld" taxes; and refunds. ${ }^{3}$

Federal Personal Income Tax Payments, 1994-96
[Billions of dollars]

|  | 1994 | 1995 | 1996 |
| :---: | :---: | :---: | :---: |
| Federal personal income taxes ................................ | 545.3 | 589.0 | 666.9 |
| Withheld .................. | 466.4 | 501.5 | 548.9 |
| Declarations and settiements ............................ | 157.2 | 174.2 | 209.2 |
| Less: Refunds ................................................... | 78.3 | 86.7 | 91.1 |

Withheld income taxes are those withheld at the source of the income, mainly on wage and salary income. Declarations are estimated tax payments, mostly on income that is not subject to withholding, such as capital gains and selfemployment income; settlements are additional taxes that are paid when tax returns are filed or

[^22]as the result of audits. Refunds of excess payments, including excess social security taxes, are recorded as negatives in the payments series when the refunds are made.
For certain purposes, payments data may not be the most appropriate basis of measurement. For example, households may base their consumption decisions, especially about major purchases, on their disposable income calculated net of tax liabilities rather than net of tax payments. As a result, liabilities may be the more appropriate basis for analyzing the impact of taxes on consumption and for analyzing fiscal policy.
The bea estimates of Federal personal income tax liabilities are derived primarily from the estimates of "total income tax" from the Internal Revenue Service's Statistics of Income: Individual Income Tax Returns (sor). sor estimates of total income tax are the sum of income tax after credits and the alternative minimum tax and are on a liabilities basis. The sor estimates are adjusted so that the coverage of the liabilities series will be comparable with that of the NIPA payments series. ${ }^{4}$
The following paragraphs identify the sources of differences between liabilities and payments, both for income that is subject to withholding and for income that is not subject to withholding.

Income subject to withholding.-In the Internal Revenue Code, three types of withholding are provided-mandatory, optional, and backup.
Mandatory withholding applies to most wages and salaries, supplemental wages, and certain other incomes, such as gambling winnings. For wages and salaries, differences between liabilities and payments arise for several reasons. The most important reason is that the withholding tables that are issued by the irs and that are used by employers to calculate the amounts to be withheld on wages and salaries are based on two simplifying assumptions.
The first assumption is that taxpayers use the standard deduction in calculating their income tax liabilities. However, taxpayers who itemize their deductions may have overwithholding

[^23]if they underestimate the number of additional withholding allowances that are necessary to offset the excess of their estimated itemized deductions over the standard deduction. ${ }^{5}$ The second assumption is that wages are constant throughout the year, so overwithholding may result if wages vary widely within the year and are therefore subject to varying withholding rates.
In addition, overwithholding may result from the use of withholding for "forced savings" or from the failure to estimate growth in itemized deductions. Overwithholding may also occur because, for certain payments, withholding is based on flat rates rather than on the withholding-table rates. For example, at the option of an employer, withholding may be based on a flat 28 percent for supplemental wages (such as bonuses, commissions, and overtime pay) and on a flat 20 percent for taxable fringe benefits (such as company cars provided to employees and free or discounted commercial flights). For certain gambling winnings of more than $\$ 5,000$, withholding must be at a flat 28 percent.
Payments and liabilities may also differ because withholding tables may not always be updated to coincide with the changes in liabilities: Tax law provisions are usually effective on January 1 , but the tables are sometimes updated later. ${ }^{6}$ The tables are usually updated to reflect changes in the standard deduction, exemptions, and tax rates, but they are not usually updated to reflect changes in the provisions affecting itemized deductions or adjustments to gross income.
Differences may also arise when withholding is at the taxpayer's option, as is the case for pensions and annuities and for sick pay from other than an employer.
Backup withholding applies to all types of nonwage income that are subject to information reporting. For example, backup withholding is required if the recipient fails to furnish an accurate taxpayer identification number to the payor or if the recipient lacks certification that the income is not subject to backup withholding (this withholding was initiated in 1984 as a compliance measure). The backup withholding system

[^24]requires a payor to deduct and withhold income tax from reportable payments-such as interest or dividends-at a 31 -percent rate, which may result in overwithholding if the income is actually taxed at a lower rate.

The net result of all of these factors has been persistent overwithholding of taxes on income subject to withholding, despite an attempt to reduce overwithholding through the redesign of the withholding tables in $1992 .{ }^{7}$

Income not subject to withholding.-For income that is not subject to withholding (such as selfemployment income, capital gains, taxable social security benefits, and most interest, dividends, and pensions and annuities), differences between liabilities and payments arise for two reasons. First, the proportion of the current year's liabilities that must be paid in estimated taxes in order to avoid a penalty is less than 100 percent. Second, settlements and the last installment of quarterly estimated taxes are for liabilities that are incurred in one year but that are paid to the Treasury Department in the next year; refunds also are made in the year after the liabilities were incurred. (Settlements, quarterly estimated taxes, and refunds are recorded in the payments series in the calendar year in which they are received or paid by the Treasury Department.) As a result, net payments of nonwithheld taxes during a year may not reflect that year's income.

As a result of these factors, nonwithheld tax payments (declarations and settlements) tend to be less than liabilities. However, as noted earlier, overwithholding on wage and salary income tends to offset much of this shortfall, and the net difference between total payments and total liabilities is smaller than the difference that would be expected by an examination of either withheld income taxes or nonwithheld income taxes.
7. However, much of this overwithholding may not represent overwithholding on total income (that is, total payments in excess of total liabilities), because individuals may choose to withhold more from their wages in order to cover for tax liabilities of nonwage income, such as capital gains and other nonwithheld income.

In addition to the timing differences between payments and liabilities, there are measurement errors that cannot be isolated from the timingbasis differences. These errors include sampling and nonsampling errors with the sor sample data, reporting and processing errors with the financial statements for the Federal Government and with employment tax return tabulations from the Social Security Administration, and estimating errors in the nIPA payments series and in the coverage adjustments made to the soI data to derive the liabilities series.

## Tax liabilities for 1995-96

For 1995, tax liabilities exceeded tax payments by $\$ 5.0$ billion. The excess of liabilities was partly due to a large increase in nonwage income; in the sor data, nonwage income increased 11.9 percent in 1995, and wage income increased 5.8 percent. Because most of nonwage income is not subject to withholding, much of the increase in income tax liabilities on this income was paid when tax returns were filed in 1996. Tax payments for 1995 reflected the deferral of additional 1993 taxes that were paid in 1995. ${ }^{8}$ In the sor data, about $\$ 4$ billion of the 1993 taxes were deferred to 1995 and about $\$ 4$ billion to 1996. In the payments series, the additional 1993 taxes that were paid in 1995 were largely reflected in the second quarter of 1995 and resulted in an excess of payments over liabilities in that quarter.

For 1996, tax payments exceeded tax liabilities by $\$ 1.1$ billion. The tax payments included payments of the 1995 nonwage liabilities and of the final portion of the deferred 1993 taxes that were paid in 1996. (The excess of payments over liabilities in the second quarter reflected the payment of the final portion of the deferred 1993 taxes.) In the sor data, nonwage income continued to

[^25]Table 2.-Revisions to Federal Personal Income Tax Liabilities and Payments for 1995
[Billions of dollars; quarterly estimates are seasonally adjusted at annual rates]

|  | Liabilities basis |  |  | Payments basis |  |  | Difference |  |  |

| 1995:1 .............................................................................................. | 576.9 | 576.6 | -. 3 | 565.2 | 566.7 | 1.5 | 11.7 | 9.9 | -1.8 |
| II ........................................................................... | 587.3 | 586.2 | -1.1 | 592.0 | 593.3 | 1.3 | -4.7 | -7.1 | -2.4 |
| III .................................................................................. | 599.7 | 598.6 | -1.1 | 590.0 | 590.5 | . 5 | 9.7 | 8.1 | -1.6 |
| IV ........................................................................................... | 613.0 | 614.7 | 1.7 | 607.7 | 605.5 | -2.2 | 5.3 | 9.2 | 3.9 |

surge in 1996, increasing 16.8 percent, and wage income increased 5.5 percent. As usual, much of the tax liabilities on nonwage income that were incurred in 1996 were paid in 1997.

## Sources of revisions for 1995

The revisions to the annual series for liabilities and for payments for 1995 reflected the incorporation of the results of this year's annual revision of the NIPA's.' The annual tax liabilities for 1995

[^26]were revised down $\$ 0.2$ billion, and the annual tax payments were revised up $\$ 0.3$ billion, so the difference between the two series was revised down $\$ 0.5$ billion (table 2 ).
The revisions to the quarterly liabilities for 1995 reflected the pattern of the revisions to the quarterly NIPA estimates of personal income.
estimates using quarterly estimates of selected components of NIPA personal income, but the revisions are small. The revised quarterly estimates of the liabilities series are available on request; for information, write to the Government Division (aE-57), Bureau of Economic Analysis, U.S. Department of Commerce, Washington, DC 20230.

# Investment in New Structures and Equipment in 1992 by Using Industries 

By Belinda Bonds and Tim Aylor

This article presents the 1992 capital flow table (CFT) as a supplementary table to the 1992 benchmark input-output ( $\mathrm{I}-\mathrm{O}$ ) accounts. ${ }^{1}$ The cFT shows the flows of new structures and equipment to the private industries that purchased or leased them in 1992. The I-O accounts and the gross domestic product (GDP) estimates in the national income and product accounts (nIPA's) record investment by type, but they do not provide a breakdown of this investment by industry. The cFT provides a crosswalk from investment by type of structure and equipment to investment by type and by industry.

CFT's are used in a variety of analytical and statistical contexts, including analyses of the demand by industry for particular types of structures and equipment, analyses of the impact of changes in tax laws that affect investment across industries, and as a framework for constructing industry-by-industry capital stocks and other statistical series. The 1992 CFT is the sixth in a series of tables that have supplemented earlier benchmark 1-0 accounts in 1963, 1967, 1972, 1977, and 1982. ${ }^{2}$

The cFt shows the use of new structures and equipment by industries regardless of ownership. The use of new structures and equipment is assumed to be more stable than ownership, which is frequently based on institutional or financial considerations rather than on technical considerations.

The industries in the 1992 CFT are defined along the lines of the 1987 Standard Industrial Classification (sic) system. ${ }^{3}$ Much of the economic data available on an industry basis are classified on the sic basis. Traditionally, the 1-0 accounts

[^27]and capital flows are prepared using i-o classifications in which industries are redefined from a sIc basis to an I-O basis in order to better align inputs and outputs and to produce more homogeneous and consistent industries. ${ }^{4}$ However, for the 1992 CFT, a decision was made to classify the industries on an sic basis in order to facilitate comparisons of these industry estimates with other sic-based industry estimates prepared by the Bureau of Economic Analysis (bea) and other agencies. bea also prepared alternative I-O accounts for 1992 on an sIc basis. ${ }^{5}$
This article describes the 1992 CFT, illustrates how the CFT is used and discusses the valuations and classifications that underlie the CFT and the methods and data that were used to prepare it. The 1992 CFT provides estimates of the allocation of investment in 163 types of equipment and structures across 64 industries. ${ }^{6}$ The CFT also provides a companion allocation of investment in the 46 types of equipment and structures included in gross private fixed investment (GPFI) in the NIPA's across the same 64 industries.?

## Overview of the cft

The relationship between the CFT and the alternative I -O use table is illustrated in chart 1 . The use table is shown in the upper panel of the chart, and the CFt is shown in the lower panel. In the use table, the rows show the commodities-the raw materials, semifinished goods, and servicesthat are either consumed by industries or sold to final consumers shown in the columns. The structures and equipment purchased by industries are shown as sales to GPFI, a component of final uses. As the chart indicates, the CFT expands GPFI from the use table to show the

[^28]
## CHART 1

Relationship Between the Alternative Input-Output Use Table and the Capital Flow Table
USE TABLE: COMMODITIES USED BY INDUSTRIES AND FINAL USES

- The input-output ( $(-0)$ accounts use two classification systems, one for industries and anothar for commodities, but both generally use the same l-O mumbers and titles. "Other' consists of government
 enterprises and $1-0$ special industries; for more information see "Appendlx A. Industry Classification of the
Econony, 1992. Maka, Use, and Supplementary Tables,"Survey of Cument Business77 (November 1997).
Economy, 1982: Make, Use, and Supplementary Tables, "Survey of Cument Business77 (November 1997). transter payments, and subsidies less current surplus of government enterprises.
U.S. Department of Commerce, Bureau of Economic Analysis
flows of new structures and equipment to using industries. Each column of the CFT shows the use by the industry identified in the column header of new structures and equipment identified by the row header; the column sum represents the total use of new structures and equipment by the industry identified in the column header. Each row shows the distribution of new structures and equipment identified by the row header to using industries identified by the column header; the row sum represents the total value of new structures and equipment purchased by industries in 1992.

The cft and the grfi in the use table do not include all of the same items. The cFt shows only the new structures and new equipment by using industries and the real estate commissions on the sales of new structures; it does not include purchases of scrap, net purchases of used goods, and real estate commissions on the sales of used structures. GPFI includes new structures and equipment, purchases of scrap, net purchases of used goods, and real estate commissions on the sales of both new and used structures. ${ }^{8}$
8. Gross domestic product (GDP), of which GPFI is one component, is the market value of the goods and services produced by labor and property located in the United States. Transactions in used assets are excluded from gDP because they do not reflect current production activity; however, transactions in used assets between the business sector and persons, governments, and foreigners are added as purchases by the buying sector and subtracted from the selling sector.

Table A reconciles grfi in the use table with grFi in the cFt. It shows in the first column the value of GPFI for each type of structures and equipment category from the i-o use table. The second column shows the value of scrap, net purchases of used goods, and commissions on the sale of used structures that are included in the use table but excluded from the cFt. The third column shows, for each type of structures and equipment category, the value in the CFT.

The data in the CFT are presented in two tables: The value in producers' prices of each capital commodity by each using industry in table 1 ; and the value in purchasers' prices of the new structures and equipment by using industries in table 2. Transactions in commodities are valued at producers' prices in the $\mathrm{I}-\mathrm{O}$ accounts. These prices exclude distribution costs (wholesale and retail trade margins and transportation costs), but they include excise taxes collected by producers. Transportation costs and trade margins are shown as separate purchases by the users of the commodities. The sum of the producers' value, transportation cost, and trade margins equals the purchasers' value.

Table 1 shows in each row the I-o commodity in producers' prices by the using industry in each column. For example, $\$ 5.7$ billion of the commodity "construction machinery" (commodity

NOTE.-See "Table 5.6.-Private Purchases of Structures by Type" and "Table 5.8.~Private Purchases of Producers' Durable Equipment by Type" in the national income and product accounts.
3531) is acquired by the industry "construction" (industry 1567); other users of construction machinery are the mining industries and the petroleum industry. The cFt also shows, down the columns, the detail on the composition of capital commodities by using industries. For example, the agriculture industry (industry 102) acquired $\$ 13.9$ billion of capital commodities, of which $\$ 6.0$ billion was the commodity "farm machinery and equipment" (commodity 3523), $\$ 1.3$ billion was the commodity "motor vehicles and passenger car bodies" (commodity 3711 ), and $\$ 2.4$ billion was the commodity "farm service facilities."

Table 2 is shown in two parts: Equipment and structures. In the upper part, each row shows the capital equipment category in purchasers' prices by using industries in each column. For example, the capital commodity category "tractors" is acquired by the industries "agriculture" ( $\$ 2.8$ billion) and "agricultural services" ( $\$ 1.8$ billion). The total for each column shows total new equipment by each using industry. The total for each row shows total new equipment for each capital commodity category.

In the lower part of table 2, each row shows the capital structures commodity in purchasers' prices by using industries in each column. For example, the capital commodities category "educational buildings" is acquired by the industry "education services." The total for each column shows total new structures by each using industry. The total for each row shows total new structures for each capital commodity category.

## Uses of the CFT

Capital flow information has a variety of uses that include its use as an analytical tool for studying the market for capital commodities and its use as a statistical framework and data source for preparing other economic statistics. This section describes the uses of the CFT, and it describes some of the assumptions that analysts and statisticians must make when they use the CfT.

Analytical uses.-The CFT is an important analytical tool because it provides information that can be used to supplement the information in the grfi column of the i-o use table. For example, the CFT provides information on the markets for capital commodities because it disaggregates information in the grfi column of the I-O use table by showing the distribution of capital commodities to using private industries. Another use of the CFT is to show the entire distribution of a commodity to users. The use table shows the dis-
tribution of commodities to intermediate users and final users, and the CFT expands the GPFI column in the use table to show all users of capital commodities. The cFt can be used to analyze the impact of changes in tax laws affecting investment across industries. The presentation of the CFT on an approximate sic basis facilitates its use with other sic-based data, such as employment, gross product originating by industry, and capital stock data.

The cFT provides information that can be used to estimate the effects of a change in capital purchases by an industry on the commodity output of all industries. The CFT information on the types of capital commodities used by an industry is used to translate a specified change in the level of total investment by the industry into a distribution of changes in purchased capital by commodity. These changes can then be multiplied by the commodity-by-commodity total requirements coefficients to estimate the output by commodity that is required to support the change in investment. Similarly, the CFT-with appropriate adjustments-can be used with the I-O industry-by-commodity total requirements table to show the effects of a change in an industry's purchase of capital commodities on output by industry. ${ }^{9}$
9. The 1 -o industry-by-commodity total requirements table contains the input requirements coefficients for the output from each industry that is directly and indirectly required to deliver a dollar of a commodity to final users. However, for this analysis, the CFT must be converted to an 1 -o basis, or a total requirements table that is based on the alternative sic accounts must be prepared, because the crt and the i-o industry-by-commodity total requirements tables show industries defined on a different basis.

## Acknowledgments

Belinda L. Bonds, Chief of the Goods Branch of the Industry Economics Division, and David W. McCarthy, Goods Branch, supervised the preparation of the estimates. Sumiye Okubo, Associate Director for Industry Accounts, and Ann M. Lawson, Chief of the Industry Economics Division, provided overall guidance. Timothy D. Aylor, Alvin D. Blake, Sergio B. Delgado, Charlita R. Fickus, Alexandra E. Karaer, David W. McCarthy, Edward T. Morgan, Tara L. O'Brien, Amanda C. Roberts, Mary L. Roy, Darlene C. Robinson, Brian W. Sloboda, and Diane I. Young prepared the estimates. Mark A. Planting provided programming assistance. Myles J. Levin prepared the tables for publication.

Michael Glenn of the National Income and Wealth Division, under the direction of Shelby Herman, Chief, Capital Stock Branch, also contributed to the development of the estimates.

When the CFT and either the commodity-bycommodity total requirements coefficients or the industry-by-commodity total requirements coefficients are used to estimate the effects of changes in the purchase of capital commodities on industries and commodities, the underlying $\mathrm{I}-\mathrm{O}$ assumptions have to be kept in mind. For example, the CFT is based on information about industries' purchases of capital commodities in 1992. The patterns and levels of investment in 1992 may not reflect those of investment in other years.

Statistical uses.-The CFT is also used as a framework and data source for preparing other economic statistics. For example, information from the cFT is used to prepare bea's estimates of fixed reproducible tangible wealth by industry. ${ }^{10}$

## Definitions and conventions for classification and valuation

Classification.-The classification of industries in the CFT is based on the 1987 sic system, which classifies establishments into industries on the basis of the primary activity of the establishment. ${ }^{11}$

The cft shows the investment in 1992 by private industries in new structures and equipment on a user basis. Capital commodities are included as investment by the using industry whether they are purchased outright or leased, and regardless of the type of lease. For private establishments engaged in capital leasing-that is leases in which payments over the term of the lease cover the costs of the commodity and usually result in eventual ownership of the leased commodity by the lessee-or in other types of leasing, the CFT shows the commodity as being used by the industry of the lessee. However, if the lessee is a government agency or a person, the CFT shows the commodity as being used by the industry of the lessor.

[^29]Valuation.-The CFT is presented in producers' prices (table 1) and in purchasers' prices (table 2). Producers' prices exclude distribution costs (wholesale and retail trade margins and transportation costs), but they include excise taxes collected by producers.

In order to show the relationship between the production of capital commodities and their use by industries, the CfT shows commodities as if they moved directly to users. Wholesale and retail trade margins on commodities are shown as purchases by users and are included in the trade rows of table 1. All transportation costs are shown as a purchase by users and are included in the transportation row of table 1.

## Methodology

The CFT was prepared in four steps. First, information on total expenditures for capital commodities for each industry were compiled. The primary data source for total expenditures by industry was the 1992 economic census of the Bureau of the Census. Additional data were obtained from the Census Bureau's Annual Capital Expenditures Survey, which includes tabulations of investment in structures and equipment by nonfarm businesses, and from the Farm Costs and Returns Survey of the U.S. Department of Agriculture.

## Data Availability

The capital flow table (CFT) for the 1992 benchmark input-output ( $\mathrm{I}-\mathrm{O}$ ) accounts is available on a diskette as "Investment in New Structures and Equipment in 1992 by Using Industries," product number NDN-0224. The estimates are presented for four-digit commodity by two-digit industry and by NIPA category by two-digit industry. The alternative estimates for the 1992 make and use tables on an approximate 1987 SIC basis are also available: At the summary level, product number NDN-0180, and at the detailed level, product number NDN-0179.

These products and the 1982 CFT are available as free downloadable files on BEA's Web site at <www.bea.doc.gov>; the products are also available as diskettes for $\$ 20$ each from bea. To access the files on the Web site, click on Catalog of Products and look under National Accounts Products, Other Products. To order the diskettes using MasterCard or Visa, call the bea Order Desk at 1-800-704-0415 (outside the United States, 202-606-9666). To order by mail, send a check or money order payable to "Bureau of Economic Analysis, BE-53" to bea Order Desk, BE-53, Bureau of Economic Analysis, U.S. Department of Commerce, Washington, DC 20230.

In addition, several adjustments were made to the expenditures data:

- An adjustment for the establishments that were not covered by the economic censuses, ${ }^{12}$
- An adjustment for misreported tax return information, ${ }^{13}$
- An adjustment for conformance to national economic accounting conventions for expensed motor vehicles, for petroleum and natural gas well drilling, exploration, and other mining exploration, and for nonfarm business use of personal motor vehicles, and ${ }^{14}$
- An adjustment for force-account new construction. ${ }^{15}$

Second, expenditures for new structures and equipment were distributed to using industries. Because most types of equipment and some types of structures are used by more than one industry, most of the distributions were made in proportion to an occupational-employment-by-industry

[^30]matrix from the Bureau of Labor Statistics. ${ }^{16}$ The use of this matrix assumes that the use of a type of equipment or structure is correlated with the related occupational employment; for example, anesthesia apparatus and blood transfusion equipment was distributed by industry on the basis of the number of health technicians and technologists and of surgical technologists that were employed by various industries in 1992.
The use of these employment-by-industry ratios to allocate capital commodities works best when capital-labor ratios across industries are relatively stable and when the types of capital and labor included in the associated types of equipment and structures and occupational employment categories are relatively homogeneous. Unfortunately, detailed data on purchases or leases by type of capital and by industry are not available to adequately assess the extent to which the estimates based on employment information approximate actual purchases or leases.
Third, expenditures for equipment and structures were summed to industry totals. These totals were then compared with the initial estimates of total industry expenditures in order to evaluate the industry controls. Then, the sum of the industry controls was adjusted to the total value of new structures and equipment from grfi. An iterative balancing procedure was used to insure that all column sums and row sums added to their respective control totals.
Fourth, transportation costs and trade margins were estimated in order to determine CFT values in producers' values. The structures and equipment estimates were aggregated to approximately a four-digit sIC commodity level and to a GPFI category level.
Appendixes $A$ and $B$ and tables 1 and 2 follow. fef

## BENCHMARK INPUT-OUTPUT ACCOUNTS OF THE UNITED STATES, 1992

Presents the detailed 1992 benchmark input-output accounts, including estimates for 97 industry groups and for 498 industries.

Trace the flows of industry production

- The production, or make, of goods and services, or commodities, by industry
- The consumption, or use, of commodities by industry and by the final consumer

Estimate the effects of demand on industries and commodities

- The output of each industry or commodity that is directly and indirectly required to deliver a dollar of a commodity to final users

Get a microperspective of the national income and product accounts

- The commodity composition of gross domestic product
- The commodity composition of personal consumption expenditures by type
- The commodity composition of the private purchases of producers' durable equipment by
 type
- The industry distribution of value added

This publication also includes

- The concepts underlying the accounts
- The methods used to prepare the accounts
- The input-output industry classification system used in the accounts

To order this publication for $\$ 40$ (stock number 003-010-00275-1), call the Superintendent of Documents of the U.S. Government Printing Office at 202-512-1800, fax your order to 202-512-2250, send Email to orders@gpo.gov, or go to <www.access.gpo.gov/su_docs/sale/prf/prf.html>.

Business leaders, Researchers, Economists, Marketers, Policymakers Get a comprehensive view of the worldwide operations of U.S. multinational companies!

## U.S. DIRECT INVESTMENT ABROAD

Operations of U.S. Parent Companies and their Foreign Affiliates Revised 1995 Estimates and Preliminary 1996 Estimates

Presents the data from the annual surveys of U.S. direct investment abroad for 1995 and for 1996. The data are presented by industry of the parent and by industry and country of the affiliate.

## Find out about

- The financial structure and operations of the parent companies and their affiliates

Get the details on multinational companies'

- Balance sheets and income statements
- Property, plant, and equipment
- Gross product
- Employment and employee compensation
- Trade in goods
- Sales of goods and services
- Research and development expenditures

Order your copies now for $\$ 11.00$ each from the Superintendent of Documents of the U.S. Government Printing Office (GPO).
Call 202-5123-1800, fax your order to 202-512-2250,
send E-mail to orders@gpo.gov, or go to <www.access.gpo.gov/su_docs/sale/prf/prf.html>. For the revised 1995 estimates, specify stock number 003-010-00276-0, and for the preliminary 1996 estimates, specify stock number 003-010-00277-8.

## An Ownership-Based Disaggregation of the U.S. Current Account, 1982-96

this report updates bea's presentation of an ownership-based disaggregation of the currentaccount portion of the U.S. international transactions accounts (balance of payments). ${ }^{1}$ The estimates for 1985-93 have been revised to incorporate the latest estimates of U.S. international transactions, and the estimates for 1993 have been revised to incorporate the latest estimates of the financial and operating data of foreign-owned affiliates in the United States and U.S.owned affiliates abroad; new estimates are presented for 1994-96.

In the standard current-account presentation, U.S. sales to foreigners include only the goods and services delivered to foreign markets directly from the United States (shown in line 3 of table 1). In the ownership-based presentation, a more comprehensive measure of international "sales" (line 2) includes the income received by U.S. companies from the sale of goods and services by their subsidiaries abroad (line 8). Similarly, a comparable measure of U.S. international "purchases" (line 21) includes the income paid by foreign-owned firms in the United States to their foreign owners as well as the goods and services delivered to the U.S. market from abroad. These additions raise the value of total U.S. sales and purchases and provide an improved basis for assessing the impact of net "overseas" sales on the U.S. economy.

In the table, the balance on goods, services, and net receipts from sales by affiliates (line 41) shows the net result of the active participation of U.S. companies in international markets. In every year since 1985, this balance has been more favorable than the balances shown in the standard presentation; in 1996, the most recent year for which data are available, this balance was $-\$ 42.4$ billion, compared with $-\$ 108.6$ billion for the balance on goods and services.

Unlike the standard presentation, the ownershipbased presentation (using exports as an example)

[^37]Note.-This report was prepared by Jeffrey H. Lowe.
includes subtotals that group shipments of goods from U.S. plants and sales of services from U.S.-based providers with income received by U.S. companies as a result of sales by their overseas affiliates. However, like the standard presentation, the ownership-based presentation distinguishes between these two methods of servicing international markets on the basis of their impacts on the domestic economy. For example, given the high labor content in professional services, the U.S. economy is affected by whether a U.S. accounting or engineering firm decides to serve its European clients from offices located in the United States or from those of a locally established affiliate. Specifically, if the client is served from the U.S. office, the entire value of the service is recorded as a U.S export; if the client is served by the locally established affiliate, then only the net U.S. receipt of investment income resulting from the sale is recorded.

In the table, trade is initially broken down into goods and services, each of which is then disaggregated into trade between affiliated parties and trade between unaffiliated parties. Trade within multinational companies is further disaggregated into trade between U.S. parent companies and their foreign affiliates and trade between U.S. affiliates of foreign companies and their foreign parent groups. The table also provides details on receipts and payments of direct investment income, showing how the income is derived from the production and sales of affiliates. ${ }^{2}$ To highlight the links between the income and the activities that produce it, the income is designated "net receipts or payments of direct investment income resulting from sales by affiliates."

Information on the U.S. or foreign origin of affiliates' output is provided in the addenda to the table. (These estimates are not part of the current account, but they complement the data that are used to derive receipts and payments resulting from sales by affiliates.) For both foreign and U.S. affiliates, output sold (or added to inventory) is broken down between U.S. content and foreign content; the source of the content is further broken down between the affiliates' own value added and other content.

# SUBJECT GUIDE <br> volume 78 (1998) 

This guide lists articles by subject—giving the title, the month of the issue, and the beginning page number.

## National

## Comparison of bea personal income and IRS adjusted gross income

New Estimates for 1996 and Revised Estimates for 1982-95 (November):13

## Federal budget estimates

Fiscal Year 1999 (March):8

## Federal personal income tax liabilities and payments

Estimates for 1995-96 (December):22

## Fixed reproducible tangible wealth in the United States

Revised Estimates for 1995-97 and Summary Estimates for 1925-97 (September):36

## Gross product by industry

Estimates for 1995-97 (November):20
Price Measures for 1977~96 (March):17

## Input-output accounts

Investment in New Structures and Equipment in 1992 by Using Industries (December):26

## Measurement of real output and prices

Price Indexes for Selected Semiconductors, 1974-96 (February):8

## Motor vehicles

Model Year 1998 (November):6
National income and product accounts (NIPA's)
Annual Revision of the National Income and Product Accounts
Estimates for 1995-97 and 1995:I-1998:I (August):7
Business Situation
Advance Estimates
Fourth Quarter 1997 (February):1

First Quarter 1998 (May):1
Second Quarter 1998 (August):1
Third Quarter 1998 (November):1
Preliminary Estimates
Fourth Quarter 1997 (March):1
First Quarter 1998 (June):1
Second Quarter 1998 (September):1
Third Quarter 1998 (December):1
Final Estimates
Third Quarter 1997 (January):1
Fourth Quarter 1997 (April):1
First Quarter 1998 (July):1
Second Quarter 1998 (October):1
A Guide to the NIPA's (March):26
Updated Summary nipa Methodologies (September):14

## Other information

Reliability of the Quarterly and Annual Estimates of gDP and Gross Domestic Income (December):12

## Satellite accounts

U.S. Transportation Satellite Accounts for 1992 (April):16
U.S. Travel and Tourism Satellite Accounts for 1992 (July):8

State and local government fiscal position
In 1997 (April):10

## International

Direct investment positions: Country and industry detail
For 1997 (July):35
Foreign direct investment in the United States
Detail for Historical-Cost Position and Related Capital and Income Flows

In 1997 (September):74
The Domestic Orientation of Production and Sales by U.S. Manufacturing Affiliates of Foreign Companies (April):29

## New Investment and Affiliate Operations

New Investment in 1997 and Affiliate Operations in 1996 (June):39

## Other information

An Ownership-Based Disaggregation of the U.S. Current Account, 1982-96 (December):54

## Reconciliation of the U.S.-Canadian current account

Estimates for 1996 and 1997 (November):41

# BEA CURRENTAND HISTORICAL DATA 

## National, International, and Regional Estimates

This section presents an extensive selection of economic statistics prepared by the Bureau of Economic Analysis and a much briefer selection of collateral statistics prepared by other Government agencies and private organizations. Series originating in Government agencies are not copyrighted and may be reprinted freely. Series from private sources are provided through the courtesy of the compilers and are subject to their copyrights.
bea makes its economic information available on three World Wide Web sites. The bea Web site <www.bea.doc.gov> contains data, articles, and news releases from bea's national, international, and regional programs. The Federal Statistical Briefing Room (fsbr) on the White House Web site <www.whitehouse.gov/fsbr> provides summary statistics for gDp and a handful of other nipa aggregates. The Commerce Department's stat-usa Web site <www.stat-usa.gov> provides detailed databases and news releases from bea and from other Federal Government agencies by subscription; information about stat-usa's Economic Bulletin Board (ebb) and Internet services may be obtained at the Web site or by calling (202) 482-1986.
The tables listed below present annual, quarterly, and monthly estimates, indicated as follows: [A] Annual estimates only; [Q] quarterly estimates only; [QA] quarterly and annual estimates; [MA] monthly and annual estimates.

## National Data

## A. Selected nIPA Tables: [QA]

1. National product and income.......................D-2
2. Personal income and outlays.......................D-6
3. Government receipts, current expenditures, and gross investment..............................D-7
4. Foreign transactions.................................D-11
5. Saving and investment ............................ D-13
6. Income and employment by industry ........... D-16
7. Quantity and price indexes........................D-17
8. Supplementary tables..............................D-24
B. Other NIPA and nipa-related tables:

Monthly estimates: [MA]
B.1. Personal income...................................D-27
B.2. Disposition of personal income ................. D-27

Annual estimates: [A]
B.3. GDP by industry..................................D-28
B.4. Personal consumption expenditures by type of expenditure.........................................D-29
B.5. Private purchases of structures by type ....... D-30
B.6. Private purchases of producers' durable
equipment by type .............................. D-30
B.7. Compensation and wage and salary accruals by industry.

D-31
B.8. Employment by industry.............................D-32
B.9. Wage and salary accruals and employment by industry per full-time equivalent.............D-33
B.10. Farm sector output, gross product,
and national income ............................D-34
B.11. Housing sector output, gross product, and national income .............................D-34
B.12. Net stock of fixed private capital, by type ... D-35
C. Historical tables: [A]
C.i. Historical estimates for major nipa
aggregates................................................ 66
C.2.-C.7. Growth rates of selected components of real GDP..........................................D-39
D. Domestic perspectives $[\mathrm{MA}, \mathrm{QA}] \ldots \ldots \ldots \ldots . . \mathrm{D}-41$
E. Charts:

Selected nIPA series....................................D-43
Other indicators of the domestic economy ........ D-49

## International Data

## F. Transactions tables:

F.1. U.S. international transactions in goods and services [MA] .............................. D-51
F.2. U.S. international transactions [QA]...........D-52
F.3. Selected U.S. international transactions,
by area [Q] ......................................-53
F.4. Private service transactions [A] .............D-56
G. Investment tables:
G.1. International investment position of the United States [A]. D-57
G.2. usdia: Selected items [A]......................D-58
G.3. Selected financial and operating data for nonbank foreign affiliates of U.S. companies [A].........D-59
G.4. Fdius: Selected items [A] ...................... D-60
G.5. Selected financial and operating data of nonbank U.S. affiliates of foreign companies [A]......... D-61
H. International perspectives [MA, QA] .......... D-62
I. Charts...................................................D-64

## Regional Data

J. State and regional tables:
J.1. Total and nonfarm personal income [QA] .... D-65
J.2. Percent of personal income for selected components [A] ................................. D-66
J.3. Per capita personal income and disposable personal income [A] ................. D-67
J.4. Gross state product [A]...........................D-68
K. Local area table ..................................... D-69
L. Charts ............................................... D-71

## Appendixes

Appendix A: Additional information about bea's nipa estimates:
Statistical conventions................................D-73
Reconciliation tables [QA] ............................. D-74
Appendix B: Suggested reading..................... D-75

## National Data

## A. Selected NIPA Tables

The tables in this section include the most recent estimates of gross domestic product and its components; these estimates were released on November 24, 1998 and include the "preliminary" estimates for the third quarter of 1998.

The selected set of NIPA tables shown in this section presents quarterly estimates, which are updated monthly. In most tables, the annual estimates are also shown. Most of the "annual only" nipa tables were presented in the August 1998 Survey of Current Business; table 8.26 was presented in the September 1998 Survey; and the remaining "annual only" tables-tables 3.15-3.20 and 9.1-9.6-were presented in the October 1998 Survey.

The news release on gross domestic product (GDP) is available at the time of release, and the "Selected nIPA Tables" are available later that day, on stat-usa's Economic Bulletin Board and Internet services; for information, call STAT-USA on 202-482-1986. In addition, the GDP news release is available the afternoon of the day of the release, and the "Selected nipa Tables" a day or two later, on bea's Web site <www.bea.doc.gov>.

The "Selected nipa Tables" are also available on printouts or diskettes from bea. To order nipa subscription products using Visa or MasterCard, call the bea Order Desk at 1-800-704-0415 (outside the United States, 202-606-9666).

| Residual. | -1.5 | -7.3 | -6.7 | -8.9 | -8.9 | -14.2 | -8.4 | -6.5 |

NoTE-Chained (1992) dollar series are calcuiated as the product of the chain-type quantity index and the 1992 curfent-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dolar estimates are usually not additive.
The residual line is the difference between the first line and the sum of the most detailed lines.
Percent changes from preceding period for selected items in this table are shown in table 8.1; contributions to
the percent change in real gross domestic product are shown in table 8.2.

NOTE-Chained (1992) dollar series are calculated as the product of the chain-type quantity index and the 1992 currentidollar value of the corresponding series, divided by 100 . Because the formula too the chain-tpee quantioy indexes uses weights of more than one period, the corresponding chainede-bolara estimates are usualy not adoditive The residual line following change in business inventories is the difference between gross domestic product and the sum of final sales of domestic product and of change in business inventories; the residual line following structures is the difference between gross domestic product and the sum of the detailed lines of goods, of services, and of structures.
ercent changes from preceding period for selected items in this table are shown in table 8.1
Chain-lype quantily indexes for the series in this table appear in tabie 7.17.
Table 1.6.-Relation of Real Gross Domestic Product, Real Gross Domestic Purchases, and Real Final Sales to Domestic Purchasers [Bilions of chained (1992) dollars]

| Gross domestic product | 6,994.8 | 7,269.8 | 7,236.5 | 7,311.2 | 7,364.6 | 7,464.7 | 7,498.6 | 7,570.0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Less: Exports of goods and services | 860.0 | 970.0 | 963.6 | 988.1 | 998.8 | 991.9 | 972.1 | 967.4 |
| Plus: Imports of goods and services $\qquad$ | 971.2 | 1,106.1 | 1,095.2 | 1,130.5 | 1,147.8 | 1,190.4 | 1,217.3 |  |
| Equals: Gross domestic purchases $\qquad$ | 7,101.1 | 7,396.5 | 7,359.4 | 7,443.1 | 7,502.1 | 7,644.9 | 7,718.6 | 7,798.1 |
| Less: Change in business inventories $\qquad$ | 30.0 | 63.2 | 79.0 | 51.0 | 66.5 | 91.4 | 38.2 | 56.6 |
| Equals: Final sales to domestic purchasers | 7,068.0 | 7,330.2 | 7,278.3 | 7,388.0 | 7,432.1 | 7,552.2 | 7,676.4 | 7,738.2 |

NOTE--Chained (1992) dollar series are calculated as the product of the chain-type quantity index and the 1992 indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. Percent changes from preceding period for selocted tems in this chained-doliar estimates are usually not additive Chain-type quantity indexes for the series in this table appear in table 7.2.

## Table 1.8.-Real Gross Domestic Product by Sector

[Billions of chained (1992) dollars]

| Gross |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| usiness ' | 5,903.5 | 6,164.9 | 6,133.3 | 6,203.0 | 6,255.6 | 6,352.3 | 6,382.6 | 6,449.2 |
| Nonfarm ${ }^{1}$ | 5,824.3 | 6,074.3 | 6,042.3 | 6,109.2 | 6,165.8 | 6,260.4 | 6,290.5 | 6,355.2 |
| Nonfarm | 5,236.0 | 5,470.5 | 5,438.9 | 5,504. | 5,559.6 | 5,655. | 5,680. | 739.5 |
|  | 588.7 | 604.5 | 604.0 | 605.6 | 607.3 | 606.2 | 611 | 7.3 |
| Farm | 78.6 | 90.3 | 90. | 93.7 | 88. | 91. | 91. | 93.3 |
| ouseholds and instit | 311.8 | 321.5 | 320.2 | 323.1 | 325.1 | 326.7 | 327.7 | 329.3 |
| Private households | 10.5 | 10.2 | 10.3 | 10.2 | 10.0 | , | 9.9 | 10.0 |
| Nonprofit :nstuations | 301.3 | 31 | 310 | 313.0 | 315. | 316.9 | 317 | 319.4 |
| General government ${ }^{2}$ | 781.2 | 786.2 | 785 | 788 | 787. | 789. | 792 | 795.8 |
| Federal | 240.7 | 235.4 | 236.3 | 235.5 | 232.5 | 232. | 231.9 | 232.3 |
| State and local | 540.8 | 551.3 | 549.9 | 553.2 | 555.5 | 557.9 | 561. | 564.2 |
| Residual | -1.8 | -3. | -3.6 | -4.4 | -4.2 | -5.5 | -5.6 | -6. |

1. Gross domestic business product equals gross domestic product less gross product of households and institutions and of general govermment. Gross nonfarm product equals gross domestic business product less gross farm product.
2. Equals compensation of general government employees plus general government consumption of fixed capital as shown in table 3.8 .
NOTE-Chained (1992) dollar series are calculated as the product of the chain-type quantity index and the 1992 current-dollar value of the corresponding series, divided by 100 . Because the formula tor the chain-type quantity indexes uses weights of more than one period, the corresponding chained-doliar estimates are usually not additive.
The residual line is the difference between the first line and the sum of the most detailed lines.
Chain-type quantity indexes for the series in this table appear in table 7.14.

- Gross comestic income deliated by the implicit price deliator for gross domestic product

Gross national income dellated by the impicir price denlator for gross national product.
NOTE.-Except as noted in tootnotes 1 and 2, chained (1992) doliar series are calculated as the product of the chain-type quantily index and the 1992 current-doliar value of the corresponding series, divided by 100 . Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-
dollar estimates are usually not additive.

Chain-type quantity indexes for the series in this table appear in table 7.3
Table 1.11.-Command-Basis Real Gross National Product
[Bililions of chained (1992) dollars]

| Gross national product | 7,008.4 | 7,266.2 | 7,239.3 | 7,307.0 | 7,350.7 | 7,455.2 | 7,485.9 | 7,546.3 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Less: Exports of goods and services and receipts of factor income from the rest of the world | 1,075.2 | 1,208.2 | 1,205.2 | 1,234.2 | 1,235.8 | 1,232.8 | 1,213.7 | 1,199.1 |

| Addendum: Terms of trade ${ }^{2}$ | 101.9 | 103.2 | 103.4 | 103.5 | 103.6 | 105.2 | 105.7 | 106.2 |

1. Exports of goods and sevvices and receipts of factor income deflated by the implicit price deflator for imports goods and services and payments of factor income

Raio the impicit price deflator for exports of goods and services and receipts of factor income to the orresponding impicit pice dellator for imports whin the dechal point shated wo places to ve right.
urent-chained (g92) doilar series are calculated as the product of the chain-type quanity hiex and the 1992 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. Percent changes from preceding period for selected items in this table are shown in table 8.1.
Chain-lype quantity indexes for the series in this table appear in table 7.3 .

Table 1.14.-National Income by Type of Income [Billions of dollars]

Table 1.16.-Gross Domestic Product of Corporate Business in Current Dollars and Gross Domestic Product of Nonfinancial Corporate Business in Current and Chained Dollars

Gross domestic product

 Net domestic product ${ }^{3}$

1. Chained-dollar gross domestic product of nontinancial corporate business equals the curren-dollar product deflated by the implicit price deflator for goods and structures in gross domestic product. 2. Chained-dollar consumption of ixied capital of non innancial corporate business is calculated as the product of the chain-type quantity index and the 1992 current-dollar value of the corresponding series, divided by 100 . 3. Chained-dollar net domestic product of nonfinancial corporate business is the difference between the gross
product and the consumption of fixed capial.

## 2. Personal Income and Outlays

Table 2.1.-Personal Income and Its Disposition [Billions of dollars]

1. Consists of aid to families with dependent children and, beginning with 1996, assistance programs operating under the Personal Responsibility and Work Opportunity Reconciliation Act of 1996.
2. Equals disposable personal income deflated by the implicit price deflator for personal consumption expenditures.
NOTE--Percent changes from preceding period for selected items in this table are shown in table 8.1.

Table 2.2.-Personal Consumption Expenditures by Major Type of Product

Table 3.7.-Government Consumption Expenditures and Gross Investment by Type
[Billions of dollars]

1. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.
2. Consumption expenditures for durable goods excludes expenditures classified as investment, except for goods transferred to foreign countries by the Federal Government.
3. Compensation of government employees engaged in new force-account construction and related expenditures for goods and services are classified as investment in structures. The compensation of all general goversment em4. Consumption of fixed capital
measure of the value of the services of general is included in government consumption expenditures as a partia net return on these assets.

NOTE.-Chained (1992) doliar series are calculated as the product of the chain-type quantity index and the 1992 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity hdexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. lines in the addenda
Chain-type quartity indexes for the series in this table appear in table 7.11.
See footnotes to table 3.7.

1. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.
2. Consumption expenditures for durable goods excludes expenditures classified as invesiment, except for goods ansferred to foreign countries.
to coods and services are classified as investment in structures. The compensation of all and related expenditures ployees is shown in the addendum.
3. Consumption of fixed capital, or depreciation, is included in government consumption expenditures as a partial measure of the value of the services of general govemment fixed assets; use of depreciation assumes a zero net return on these assets.

NOTE--Chained (1992) dollar series are calculated as the product of the chain-type quantity index and the 1992 current-dollar value of the corresponding series, divided by too. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines, excluding the line in the addendum.

Chaintype indexes for the series in the table appear in table 7.12.
See footnotes to table 3.10 .

NoTE--Chained (1992) dollar series are calculated as the product of the chain-type quantity index and the 1992 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity The residual line following the detail for exports is the difference between the aggregate "exports of goods and services" and the sum of the detailed lines for exports of goods and export of services. The residual line following the detail for imports is the difference between the aggregate "imports of goods and services" and the detailed
fines for imports of goods and imports of services.
Chain-type quantity indexes for the series in this table appear in table 7.10.
See footnotes to table 4.3 .

[^40]NOTE.-Chained (1992) dollar series are calculated as the product of the chain-type quantity index and the 1992 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-lype quartity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. cesidual line is the difference between the first line and the sum of the most detailed lines.

1. Beginning with 1982, this series is derived from the Census Bureau series "current cost inventories." For earlier periods, it is derived from the Census Bureau "book value inventories" series. The series differ in the treatment of inventories reported on a last-in, first-out (LIFO) basis: The series prior to 1982 is a mix of LIFO and non-Lifo inventories; the series beginning with ase is enirely on a non-LIF
adjusts business incomes. The NA in this table reflects the mix of methods (first-in, first-out; last-in, first-out; etc.) adjusts business incomes. The Nrim in mistable reflects the mix of methoos (first-in, inirst-out; last-in, first-out; etc.) underlying inventories derived primarily from Census Bureau statistics (see footnote 1). This mix oifiers from that
underlying business income derived primarily from internal Revenue Service statistics. Prior to 1973, the two IVA's are the same because information required for separate estimates is not available.
2. Prior to 1981 , inventories of auto and home supply stores are includied in motor vehicle dealers. Beginning with 1981, these inventories are inciuded in "other durable goods."

Note--Chained (1992) dollar series for real change in business inventories are calculated as the period-to-period change in chained-dollar end-of-period inventories. Quarterly changes in end-of-period inventories are stated at annual rates. Because the formula for the chain-ype quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first
line and the sum of the most dexailed lines.

1. Inventories are as of the end of the quarter. The quarter-to-quarter change in inventories calculated from cur-
rent-dallar inventories in this table is not the current-dollar change in business inventories (CBI) component of GDP. The former is the difference between two inventory stocks, each valued at their respective end-of-quarter prices. The latter is the change in the physical volume of inventories valued at average prices of the quarter. In addition, changes calculated trom this table are at quarterly rates; whereas, CBI is stated at annual rates.
2. Quarterly totals at monthly rates. Final sales of domestic business equals final sales of domestic product less gross product of households and institutions and of general government and includes a small amount of final sales
by farm.

gross product of households and institutions and of general government and includes a small amount of final less gross product of households and institutions and of general government and includes a small amount of final sales
NOTE.
the average of the end-ot-year inventory series are calculated as the product of the chain-type quantity index and final sales series are calculated as the product of the chain-ype index and the 1992 current-dollar value of the corresponding series, divided by 100. Because the formula tor the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines for inventories.

Note- - Chain-type quantity and price indexes are calculated trom weighted averages of the detailed output and dollar output multiplied by 100 . Percent changes from preceding period for items in this table are shown in table prices used to prepare each aggregate and component. Implicit price deflators are weighted averages of the detailed
price indexes used to prepare each aggregate and component and are calculated as the ratio of current- to chained-

| Residual ................................................. | -. 2 | -. 2 | -. 2 | 5 | 0 | -. 1 | -. 7 | -. 4 |

1. Includes new trucks only.

NOTE.-Chained (1992) dollar series are calculated as the product of the chain-lype quantity index and the 1992 current-dollar value of the corresponding series, divided by 100 . Because the formula tor the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.
Chain-type quantity indexes for the series in this table appear in table 7.19.

## B. Other nipa and nipa-Related Tables

## Monthly Estimates:

Tables B. 1 and B. 2 include the most recent estimates of personal income and its components; these estimates were released on November 25, 1998 and include "preliminary" estimates for October 1998 and "revised" estimates for July, August, and September 1998.

Table B.2.-The Disposition of Personal Income
[Monthly estimales seasonally adjusted at annual rates]

## ${ }^{p}$ Preliminan.

1. Disposable personal income in chained (1992) dollars equals the current-dollar figure divided by the implicit
price deflator for personal consumption expenditures.

## Annual Estimates:

Except as noted, these tables are derived from the nipa tables published in the August 1998 Survey of Current Business; they are consistent with the most recent comprehensive and annual revisions.

1. The current-dollar statistical discrepancy equals gross domestic product (GDP) measured as the sum of ex-
penditures less gross domestic income-that is, GDP measured as the costs incurred and profits earned in domestic penditures less gross domestic income-that is, GDP measured as the costs incurred and proits earned in domestic implicit price deflator for gross domestic business product.
2. Equals GDP in chained (1992) dollars less the statistical discrepancy and the sum of GPO of the detailed industries.
NoTE-Estimates are based on the 1987 Standard Industrial Classification. The table is derived from tables 10 and 13 in "Gross Product by Industry, 1995-97" in the November 1998 SURVEY.

1. Consists of purchases (including tips) of meals and beverages from retail, service, and amusement establishments, hotels, dining and buffet cars, schools, school fraternities, institutions, clubs, and industrial lunchrooms. In-
cludes meals and beverages consumed both and off-premise. cludes meals and beverages consumed both on- and off-premise.
2. Incuudes fuggage.
3. Consists of watch, clock, and jewelry repairs, costume and dress suit rental, and miscellaneous personal serv-
4. Consists of rent for space and for heating and plumbing facilities, water heaters, lighting fixtures, kitchen cabinets, linoleum, storm windows and doors, window screens, and screen doors, but excludes rent for appliances and furniture and purchases of fuel and electricity.
5. Consists of space rent (see footnote 4) and rent for appliances, furnishings, and furniture.
6. Consists of transient hotels, motels, clubs, schools, and other group housing.
7. Consists of refrigerators and freezers, cooking ranges, dishwashers, laundry equipment, stoves, room air conditioners, sewing machines, vacuum cleaners, and other appliances.
8. Includes such house furnishings as floor coverings, comforters, quilts, blankets, pillows, picture frames, mirrors,
art products, portable lamps, and clocks. Also includes writing equipment and hand power and garden tools art products, portable lamps, and clocks. Also includes writing equipment and hand, power, and garden tools.
9. Consists largely of textile house furnishings, including piece goods allocated to house furnishing use. Also includes lamp shades, brooms, and brushes.
10. Consists of maintenance services for appliances and house furnishings, moving and warehouse expenses, postage and express charges, premiums for fire and theft insurance on personal property less benefits and divi11. Excludes drug preoarations and related products
ices.
11. Consists of osteopathic physicians, chiropractors, private duty nurses, chiropodists, podiatrists, and others providing health and allied services, not elsewhere classified.
12. Consists of (1) current expenditures (including consumption of fixed capital) of nomprofit hospitals and nursing
homes, and (2) payments by patients to proprietary and government hospitals and nursing homes. 14. Consists of (1) premiums, less benefits and dividends, for health, hospitalization, and accidental death and dismemberment insurance provided by commercial insurance carriers, and (2) administrative expenses (including consumption of fixed capital) of nonprofit and selfinsured health plans.
13. Consists of premiums, less benefits and dividends, for income loss insurance.
14. Consists of premiums, less benefits and dividends, for privately administered workers' compensation.
15. Consists of (1) operating expenses of life insurance cartiers and private noninsured pension plans, and (2) premiums, less benefits and dividends, of fraternal benefit societies. Excludes expenses allocated by commercial cariers to accident and health insurance.
ciations, employment agency fees, money order feess, spending for classified advertisements, tax protessional assoservices, and other personal business services.
16. Consists of premiums, less benefits and dividends, for motor vehicle insurance.
17. Consists of baggage charges, coastal and inland wateway fares, travel agents' fees, and airport bus fares. 21. Consists of admissions to professional and amateur athletic events and to racetracks.
18. Consists of dues and fees excluding insurance premiums.
19. Consists of billiard parlors; bowling aileys; dancing, riding, shooting, skating, and swimming places; amusement devices and parks; golf courses; sightseeing buses and guides; private flying operations; casino gambling; and other commercial participant amusements.
TV ${ }^{24}$. Consists of net receipts of lotteries and expenditures for purchases of pets and pet care services, cable TV, film processing, photographic studios, sporting and recreation camps, video cassette rentals, and recreational services, not eisewhere classified.
such as those from meals, rooms and enterpenditures (including consumption of fixed capital) less receiptsless expenditures for research and development financed under contracts or grants. For government institutions equals student payments of tuition.
20. For private institutions, equals current expenditures (including consumption of fixed capital) less receiptssuch as those from meals, rooms, and entertainments-accounted for separately in consumer expenditures. For government institutions, equals student payments of tuition. Excludes child day care services, which are included in religious and welfare activities.
21. Consists of (1) fees paid to commercial, business, trade, and correspondence schools and for educational services, not elsewhere classified, and (2) current expenditures (including consumption of fixed capital) by research organizations and foundations for education and research.
22. For nonprofit institutions, equals current expencitures (including consumption of fixed capital) of religious, social welfare, foreign relief, and political organizations, museums, fibraries, and foundations. The expenditures are net of receipts-such as those from meals, rooms, and entertainments-accounted for separately in consumer expenditures, and excludes relief payments within the United States and expenditures by foundations for education and research. For proprietary and government institutions, equals receipts from users.
23. Beginning with 1981, indudes U.S. students' expenditures abroad; these expenditures were $\$ 0.3$ billion in 30. Beginning with 1981, inciudes nonresidents' student and medical care expenditures in the United States; student expenditures were $\$ 2.2$ billion and medical expenditures were $\$ 0.4$ bilion in 1981.
NoTE.-Consumer durable goods are designated (d.), nondurable goods (n.d.), and sevices (s.).
Chained (1992) dollar series are calculated as the product of the chain-type quantity index and the 1992 currentdollar value of the corresponding series, divided by 100 . Because the formula for the chain-rype quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The
residual line is the difference between the first line and the sum of the most detailed lines.

Table B.5.-Private Purchases of Structures by Type

1. Consists of office buildings, except those constructed at industrial sites and those constructed by utilities for their Cown use.
2. Consists of stores, restaurants, garages, service stations, warehouses, mobile structures, and other buildings used for commercial purposes.
3. Consists of hotels and motels, buildings used primarily for social and recreational activities, and buildings not eisewhere classified, such as passenger terminals, greenhouses, and animal hospitals.
4. Consists primarily of streets, dams and reservoirs, sewer, and water facilities, parks, and airfields.
5. Consists primarily of dormitories and fraternity and sorority houses.

NoTE-Chained (1992) dollar series are calculated as the product of the chain-type quantity index and the 1992 current-dollar value of the corresponding series, divided by 100 . Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive.
The residual line is the difference between the first line and the sum of the most detailed lines.

[^43]3. Consists of buildings not elsewhere classified, such as passenger terminals, greerhouses, and animal hospitals
4. Consists primarily of streets, dams, resevoirs, sewer and water facilities, parks, and airfields.
5. Consists primarily of dormitories and fraternity and sorority houses.

## C. Historical Tables

The tables in this section are derived from the "Summary National Income and Product Series" tables that were published in the August 1998 issue of the Survey of Current Business and from the "Selected nipa Tables" that are published in this issue. (Changes in prices are calculated from indexes expressed to three decimal places.)

Table C.1.-Historical Measures of Real Gross Domestic Product, Real Gross National Product, and Real Gross Domestic Purchases
[Quarterly estimates are seasonaliy adjusted at annual rates]

| Year and quarter | Billions of chaired (1992) collars |  |  | Percent change from preceding period |  | Chain-type price indexes |  | Implicit price deflators |  | Percent change from preceding period |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Gross domesticproduct | Final sales of domestic produc | Gross national product |  |  | Gross domestic product | Gross domestic purchases | Gross domestic product | Gross national product | Chain-type price index |  | Implicit price deflators |  |

[^45]3. Includes some goods: Mainly military equipment in line 4; major equipment, other materials, suppoies, and petroleum products purchased abroad by U.S. military agencies in line 18; and fuels purchased by airine and steamship operators in ines 7 and 21.
. Incluces transiers or goods and sevvices under U.S. miltary grant programs. U.S. parents' payments to foreign affiliates and to include U.S. affiliates' receipts from foreign parents. The definition of imports is revised to include U.S. parents' payments to foreign affiliates and to exclude U.S. affiliales' receipts
from toreign parentis.
6. Beinning in 1982 , the "other transiers" component inciudes taxes paid by U.S. private residents to foreign
ind governments and taxes paid by private nonresidents to the U.S. Government
7. For all areas, amounts outstanding June 30, 1998, were as follows in millions of dollars: Line 34, 71,162; line $35,11,047$; line $36,10,001$; line 37 , 18,946 ; line $38,31,169$. Data are preliminary.

## ${ }^{\rho}$ Preliminary.

Revised.

1. Represents gains or losses on foreign-currency-denominated assets due to their revaluation at current exchange rates.
2. Includes changes in coverage, statistical discrepancies, and other adjustments to the value of assets.
3. Reflects changes in the value of the official gold stock due to fuctuations in the market price of gold.
4. Rellectis changes in gold slock from U.S. Treasury sales of gold medallions and commemorative and bullion coins; also refiects replenishment through open market purchases. These de-
monetizations/monetizations are not included in international transactions capital flows.
5. Also includes paid-in capital subscriptions to international financial institutions and outstanding amounts of miscelianeous claims that have been setted through international agreements to be payable to the U.S. Government over periods in excess of 1 year. Excludes World War I debts that are not being servicec.
6. Includes indebtedness that the borrower may contractually, or at its option, repay with its currency, with a third country's currency, or by delivery of materials or transter of services.
7. Primarily U.S. Government liabilities associated with military sales contracts and other transactions arranged with or through foreign official agencies.
NOTE.-The data in this table are from table 1 in "International Investment Position of the United States in 1997 " in the July 1998 issue of the SURVEY of CURRENT Business.

1. Index of weighted average exchange value of U.S. dollar against cunencies of other G-10 countries. March 1973 1010. Weights are 1972-76 global trade of each of the 10 countries. Series revised as of August 1978 . For description and back data, see: "ndex of the weighted-average exchange value of the U.S. dollar: Revision" on page 700 of the August 1978 Federal Reserve Bulietin.

Nore.-All exchange rates are from the Board of Governors of the Federal Reserve System. U.S. interest rates unemployment rates, and GDP growth rates are from the Federal Reserve, the Bureau of Labor Slatistics, and BEA, respectively. All other data (including U.S. consumer prices and U.S. share prices, both of which have been rebased to 1990 to facilitate comparison) are © OECD, November 1998, OECD Main Economic indicators and are reproduced with permission of the $O E C D$.

NoTE.-The personal income level shown for the United States is derived as the sum of the State estimates
it differs from the national income and product accounts (NIPA) estimate of personal income because, by definition,
abroad temporarily by private U.S. firms. It can also differ from the NIPA estimate because of different data sources

[^50]Table J.2.-Annual Personal Income and Disposable Personal Income for States and Regions

| Area name | Personal income |  |  |  |  | Disposable personal income |  |  |  |  |

1. Per capita personal income and per capita disposable personal income were computed using midyear population estimates from the Bureau of the Census.
NoTE.-The personal income level shown for the United States is derived as the sum of the sonal income because, by definition, it omits the earnings of Federal civilian and military personnel
stationed abroad and of U.S. residents employed abroad temporarily by private U.S. firms. It can
also differ from the NIPA estimate because of different data sources and revision schedules. also differ from the NIPA estimate because of different data sources and revision schedules. October 1998 issue of the SURVEY.

Table J.4.-Gross State Product for States and Regions by Industry, 1996
[Millions of dollars]

1. The GSP estimates for transportation and public utilities and for finance, insurance, and real estate differ from BEA's November 1997 estimates of gross product originating (GPO) for the Nation for these industries because of the incorporation of source data that were not available when the GPO estimates were published
mes. product (GDP) bave GSP is drived trom aros domatio incom which difters from GDP by gross
tical discrepancy in addition GSP excludes and GDP includes the compensation of Federal civilian and military
personnel stationed abroad and government consumption of fixed capital for military structures located abroad and for military equipment, except office equipment. Also, GSP and GDP have difterent revision schedules.

## Additional Information About bea's nipa Estimates

## Statistical Conventions

Changes in current-dollar GDP measure changes in the market value of goods and services produced in the economy in a particular period. For many purposes, it is necessary to decompose these changes into quantity and price components. To compute the quantity indexes, changes in the quantities of individual goods and services are weighted by their prices. (Quantity changes for GDP are often referred to as changes in "real GDP.") For the price indexes, changes in the prices for individual goods and services are weighted by quantities produced. (In practice, the current-dollar value and price indexes for most GDP components are determined largely using data from Federal Government surveys, and the real values of these components are calculated by deflation at the most detailed level for which all the required data are available.)

The annual changes in quantities and prices are calculated using a Fisher formula that incorporates weights from 2 adjacent years. (Similar formulas are used to calculate the quarterly indexes for the most recent quarters, called the "tail" period, and for the indexes for the other quarters, called the "historical period.") For example, the 1996-97 annual percent change in real GDP uses prices for 1996 and 1997 as weights, and the 1996-97 annual percent change in price uses quantities for 1996 and 1997 as weights. These annual changes are "chained" (multiplied) together to form time series of quantity and price. Because the Fisher formula allows for the effects of changes in relative prices and in the compostion of output over time, the resulting quantity or price changes are not affected by the substitution bias that is associated with changes in quantities and prices calculated using a fixed-weighted formula. The Fisher formula also produces changes in quantites and prices that are not affected by the choice of base periods. In addition, because the changes in quantities and prices calculated in this way are symmetric, the product of a quantity index and the corresponding price index is generally equal to the current-dollar index.

In addition, bea prepares measures of real gDp and its components in a dollar-denominated form, designated "chained (1992) dollar estimates." These estimates are computed by multiplying the 1992 currentdollar value of GDP, or of a GDP component, by the corresponding quantity index number. For example, if a current-dollar GDP component equaled $\$ 100$ in 1992 and if real output for this component increased by 10 percent in 1993, then the "chained (1992) dollar" value of this component in 1993 would be $\$ 110$ ( $\$ 100$ $\times 1.10$ ). Note that percentage changes in the chained
(1992) dollar estimates and the percentage changes calculated from the quantity indexes are identical, except for small differences due to rounding.

Because of the formula used for calculating real GDP, the chained (1992) dollar estimates for detailed GDP components do not add to the chained-dollar value of GDP or to any intermediate aggregates. A "residual" line is shown as the difference between GDP and the sum of the most detailed components shown in each table. The residual generally is small close to the base period but tends to become larger as one moves further from it. NIPA table 8.2 provides accurate measures of the contributions of the major components to the percentage change in real GDP for all periods.
bea also publishes the "implicit price deflator (IPD)," which is calculated as the ratio of currentdollar value to the corresponding chained-dollar value, multiplied by 100; the values of the IPD and of the corresponding "chain-type" price index are very close.

For quarters and months, the estimates are presented at annual rates, which show the value that would be registered if the rate of activity measured for a quarter or a month were maintained for a full year. Annual rates are used so that time periods of different lengths-for example, quarters and years-may be compared easily. These annual rates are determined simply by multiplying the estimated rate of activity by 4 (for quarterly data) or 12 (for monthly data).

Percent changes in the estimates are also expressed at annual rates. Calculating these changes requires a variant of the compound interest formula:

$$
r=\left[\left(\frac{X_{t}}{X_{o}}\right)^{m / n}-1\right] \times 100
$$

where $r$ is the percent change at an annual rate;
$X_{t}$ is the level of activity in the later period; $X_{o}$ is the level of activity in the earlier period; $m$ is the yearly periodicity of the data (for example, 1 for annual data, 4 for quarterly, or 12 for monthly); and
$n$ is the number of periods between the earlier and later periods (that is, $t-o$ ).

Quarterly and monthly nIPA estimates are seasonally adjusted, if necessary. Seasonal adjustment removes from the time series the average impact of variations that normally occur at about the same time and in about the same magnitude each year-for example, weather, holidays, and tax payment dates. After seasonal adjustment, cyclical and other short-term changes in the economy stand out more clearly.

## Reconciliation Tables

Table 1.-Reconciliation of Changes in BEA-Derived Compensation Per Hour with BLS Average Hourly Earnings [Percent change from preceding period]

| Addendum: <br> BLS estimates of compensation per hour in the nonfarm business sector ${ }^{2}$ $\qquad$ | 2.4 | 3.5 | 3.7 | 3.9 | 4.9 | 4.6 | 4.0 | 4.0 |

p Preliminary.

1. Inciudes BEA use of non-BLS data and differences in detailed weighting. Annual estimates also include differences in BEA and BLS benchmark procedures; quarterly estimates also include
differences in seasonal adjustment procedures
2. These estimates differ from the BEA-derived estimates (first line) because the BLS estimates include compensation and hours of tenant-occupied housing.

## Appendix B

Suggested Reading

## Mid-Decade Strategic Plan

bea has published the following articles in the Survey of Current Business on the development and implementation of its strategic plan for improving the accuracy, reliability, and relevance of the national, regional, and international accounts.
"Mid-Decade Strategic Review of bea's Economic
Accounts: Maintaining and Improving Their Performance" (February 1995)
"Mid-Decade Strategic Review of bea's Economic Accounts: An Update" (April 1995)
"bea's Mid-Decade Strategic Plan: A Progress Report" (June 1996)
Mid-Decade Strategic Review of bea's Economic Accounts: Background Papers (1995) presents seven background papers that evaluate the state of the U.S. economic accounts and that identify the problems and the prospects for improving the accounts.

## Methodology

BEA has published a wealth of information about the methodology used to prepare its national, regional, and international estimates.

## National

National income and product accounts (NIPA's)
nipa Methodology Papers: This series documents the conceptual framework of the NIPA's and the methodology used to prepare the estimates.

An Introduction to National Economic Accounting (Nipa Methodology Paper No. 1, 1985) [Also appeared in the March 1985 issue of the Survey] Corporate Profits: Profits Before Tax, Profits Tax Liability, and Dividends (nipa Methodology Paper No. 2, 1985)
Foreign Transactions (nipa Methodology Paper No. 3, 1987) [Revised version forthcoming] gnp: An Overview of Source Data and Estimating Methods (nipa Methodology Paper No. 4, 1987) [Largely superseded by "A Guide to the NIPA's" (March 1998 SURVEy)]
Government Transactions (nIPA Methodology Paper No. 5, 1988)
Personal Consumption Expenditures (nipa Methodology Paper No. 6, 1990)
The methodologies described in these papers are subject to periodic improvements that are typically introduced as part of the annual and comprehensive revisions of the NIPA's; these improvements are
described in the Survey articles that cover these revisions.
"Annual Revision of the U.S. National Income and Product Accounts": This series of Survey articles, the latest of which was published in the August 1998 issue, describes the annual nIPA revisions and the improvements in methodology.
"Completion of the Comprehensive Revision of the National Income and Product Accounts, 1929-96" (May 1997) is the last in a series of Survey articles that describe the most recent comprehensive revision of the NIPA's.
"A Guide to the nipa's" (March 1998 SURVEy) provides the definitions of the major NIPA aggregates and components; discusses the measures of real output and prices; explains how production is classified and how the NIPA's are presented; describes the statistical conventions that are used; and lists the principal source data and methods used to prepare the estimates of gross domestic product (GDP).
Information on the sources and methods used to prepare the national estimates of personal income, which provide the basis for the State estimates of personal income, can be found in State Personal Income, 1929-93 (1995).
"Gross Domestic Product as a Measure of U.S. Production" (August 1991 Survey) briefly explains the difference between GDP and gross national product.
"bea's Chain Indexes, Time Series, and Measures of Long-Term Economic Growth" (May 1997) is the most recent in a series of Survey articles that describe the conceptual basis for the chain-type measures of real output and prices used in the nipa's.
"Reliability of the Quarterly and Annual Estimates of GDP and Gross Domestic Income" (December 1998 Survey) evaluates the reliability of these estimates by examining the record of revisions to them.

## Availability

Most of the items listed here are available on bea's Web site at <www.bea.doc.gov>. In addition, see the inside back cover of this issue for the availability of some of the publications.

The Catalog of beA Products is available on bea's Web site; a printed copy can be obtained by writing to the Public Information Office, be-53, Bureau of Economic Analysis, U.S. Department of Commerce, Washington, DC 20230, or by calling 202-606-9900.

## Wealth and related estimates

"Improved Estimates of Fixed Reproducible Tangible Wealth, 1929-95" (May 1997 Survey) describes the most recent comprehensive revision of the estimates of fixed reproducible tangible wealth.

## Gross product by industry

"Improved Estimates of Gross Product by Industry, 1959-94" (August 1996 Survey) describes the most recent comprehensive revision of the estimates of gross product by industry.
"Gross Product by Industry, 1947-96" (November 1997 Survey) and "Gross Product by Industry, 1995-97" (November 1998 Survey) present the most recent revisions to the estimates of gross product by industry and briefly describe changes in methodology.

## Input-output accounts

"Benchmark Input-Output Accounts for the U.S. Economy, 1992" (November 1997 SURVEY) describes the preparation of the 1992 input-output accounts and the concepts and methods underlying the U.S. input-output accounts.

## Satellite accounts

Satellite accounts that extend the analytical capacity of the national accounts by focusing on a particular aspect of activity are presented in the following Survey articles.
"Integrated Economic and Environmental Satellite Accounts" and "Accounting for Mineral Resources: Issues and bea's Initial Estimates" (April 1994)
"A Satellite Account for Research and Development" (November 1994)
"U.S. Transportation Satellite Accounts for 1992" (April 1998)
"U.S. Travel and Tourism Satellite Accounts for 1992" (July 1998)

## International

## Balance of payments accounts (bPA's)

The Balance of Payments of the United States: Concepts, Data Sources, and Estimating Procedures (1990) describes the methodologies used in preparing the estimates in the bPA's and of the international investment position of the United States. These methodologies are subject to periodic improvements that are typically introduced as part of the annual revisions of the bPa's.
"U.S. International Transactions, Revised Estimates": This series of Survey articles, the latest of which was published in the July 1998 issue, describes
the annual bPa revisions and the improvements in methodology.

## Direct investment

The coverage, concepts, definitions, and classifications used in the benchmark surveys of U.S. direct investment abroad and of foreign direct investment in the United States are presented in the publications of the final results of the following benchmark surveys.
U.S. Direct Investment Abroad: 1994 Benchmark Survey, Final Results (1998)
Foreign Direct Investment in the United States: 1992 Benchmark Survey, Final Results (1995)

The types of data on direct investment that are collected and published by BEA and the clarifications of the differences between the data sets are presented in the following Survey articles.
"A Guide to bea Statistics on U.S. Multinational Companies" (March 1995)
"A Guide to bea Statistics on Foreign Direct Investment in the United States" (February 1990)

## Surveys of international services

U.S. International Transactions in Private Services: A Guide to the Surveys Conducted by the Bureau of Economic Analysis (1998) provides information on the 11 surveys that bea conducts on these transactionsincluding classifications, definitions, release schedules, and methods used to prepare the estimates-and samples of the survey forms.

## Regional

## Personal income

State Personal Income, 1929-93 (1995) includes a description of the methodology used to prepare the estimates of State personal income. [Also available on the cd-rom State Personal Income, 1929-97]

Local Area Personal Income, 1969-92 (1994) includes a description of the methodology used to prepare the estimates of local area personal income. [Also available on the CD-ROM Regional Economic Information System, 1969-96]

## Gross state product

"Comprehensive Revision of Gross State Product by Industry, 1977-94" (June 1997 Survey) summarizes the sources and methods for bea's estimates of gross state product.
"Gross State Product by Industry, 1977-96" (June 1998 SURVEY) presents the most recent revision to the estimates of gross state product by industry and briefly describes changes in methodology.

## BEA INFORMATION

The economic information prepared by the Bureau of Economic Analysis (BEA) is available in news releases, in publications, on diskettes, on CD-ROM's, and on the Internet. For a description of these products in the free Catalog of Products, write to the Public Information Office, BE-53, Bureau of Economic Analysis, U.S. Department of Commerce, Washington, DC 20230, or call 202-606-9900. The catalog and other information are also available on BEA's Web site at <www.bea.doc.gov>.

The free publication U.S. International Transactions in Private Services: A Guide to the Surveys Conducted by the Bureau of Economic Analysis provides information about 11 surveys. For each survey, it details the frequency of the survey, the transactions covered, and the methods used to prepare the estimates that are derived from the survey data; it includes a sample of each survey. To receive your copy, write to Sylvia Bargas, be-50, Bureau of Economic Analysis, U.S. Department of Commerce, Washington, DC 20230, or call 202-606-9804.

In addition, the following publications are available from the Superintendent of Documents of the Government Printing Office (GPO). To order, write to Superintendent of Documents, p.o. Box 371954, Pittsburgh, PA 15250-7954, call 202-512-1800 or fax 202-512-2250. Pay by check to the Superintendent of Documents or charge to a GPo deposit account, to Visa, or to MasterCard.

National Income and Product Accounts of the United States, 1929-94. (1998) This two-volume set presents the estimates of the national income and product accounts (NIPA's) that reflect the most recent comprehensive revision and the 1997 annual revision. The text describes the definitions and classifications that underlie the NIPA's and the statistical conventions used in the NIPA's; an appendix lists the principal source data and methods that are used in preparing the estimates. $\$ 58.00$, stock no. 003-010-00272-7.

Benchmark Input-Output Accounts of the United States, 1992. (1998) This publication presents the summary and detailed make and use tables for industries and commodities and the total output multipliers for 1992 for the U.S. economy. It includes a discussion of the concepts and classifications underlying the accounts, the methods used to prepare the accounts, and the uses of the accounts. It also includes appendixes that present the measures of output and of the commodity composition of personal consumption expenditures by type and of purchases of producers' durable equipment by type in the national income and product accounts. \$40.00, stock no. 003-010-00275-1.

Regional Multipliers: A User Handbook for the Regional Input-Output Modeling System (rims II), Third Edition. (1997) This handbook describes the five types of rims in multipliers that are available for nearly 500 industries and for any county or for any group of counties. It details the information that the users need in order to effectively use the rims in multipliers to analyze the economic and industrial impact of public and private projects and programs on State and local areas. The handbook also includes case studies that illustrate the uses of the RIms in multipliers and a description of the methodology that the Bureau of Economic Analysis uses to estimate the multipliers. $\$ 6.00$, stock no. 003 -010-00264-6.

Foreign Direct Investment in the United States: 1992 Benchmark Survey, Final Results. (1995) Presents detailed data on the financial structure and operations of U.S. affiliates of foreign direct investors, on the foreign direct investment position in the United States, and on the bal-ance-of-payments transactions between U.S. affiliates and their foreign parent companies in 1992. Includes data for items, such as employment covered by collective bargaining agreements and merchandise trade by product and country of destination and origin, that are only collected in comprehensive benchmark surveys. The data are classified by industry of affiliate and by country of ultimate beneficial owner, and selected data are classified by State. The text describes the coverage, the concepts and definitions, and the classifications used in the survey. $\$ 20.00$, stock no. 003-010-00259-0.

Foreign Direct Investment in the United States: Operations of U.S. Affiliates of Foreign Companies. (1998) Two publications: One presents the revised estimates for 1995 , and the other, the preliminary estimates for 1996 from beA's annual surveys of the financial structure and operations of nonbank U.S. affiliates of foreign direct investors. The estimates are presented by industry of the U.S. affiliate and by country of the ultimate beneficial owner (UBO) and for selected estimates, by industry of UBo and by State. Revised 1995 Estimates, $\$ 9.50$, stock no. 003-010-00274-3; Preliminary 1996 Estimates, $\$ 9.50$, stock no. 003-010-00273-5.

Foreign Direct Investment in the United States: Establishment Data for 1992. (1997) This publication, which presents the results of a project by bea and the Bureau of the Census, provides the most recently available data on the number, employment, payroll, and shipments or sales of foreign-owned U.S. establishments in more than 800 industries at the Standard Industrial Classification fourdigit level and by State and by country of owner. Presents additional information-such as data on value added, employee benefits, hourly wage rates of production workers, and expenditures for plant and equipment-for manufacturing establishments. $\$ 28.00$, stock no. 003-010-00265-4.
U.S. Direct Investment Abroad: 1994 Benchmark Survey, Final Results. (1998) This publication presents the data on the worldwide operations of U.S. multinational companies in 1994 from the most recent comprehensive survey of U.S. direct investment abroad. It contains 243 tables that present data on the financial structure and operations of U.S. parent companies and their foreign affiliates and data on the direct investment position and balance of payments between the parents and their affiliates. The data are presented by industry of the parent and by industry and country of the affiliate. The text describes the coverage, the definitions and concepts, and the classifications used in the survey. $\$ 37.00$, stock no. 003-010-00271-9.
U.S. Direct Investment Abroad; Operations of U.S. Parent Companies and Their Foreign Affiliates. (1998) Two publications: One presents the revised estimates for 1995, and the other, the preliminary estimates for 1996 from the annual surveys of the worldwide operations of U.S. multinational companies. Each publication presents data on the financial structure and operations of U.S. parent companies and their foreign affiliates by industry of the parent and by industry and country of the affiliate. Revised 1995 Estimates, $\$ 11.00$, stock no. 003-010-00276-0; Preliminary 1996 Estimates, \$11.00, stock no. 003-010-00277-8.

* Joint release by the Bureau of the Census and bea.

For information, call (202) 606-9900, Bureau of Economic Analysis, U.S. Department of Commerce.

[^0]:    1. Quarterly estimates in the NIPA's are expressed at seasonally adjusted annual rates unless otherwise specified. Quarter-to-quarter dollar changes are the differences between the published estimates. Quarter-to-quarter percent changes are annualized and are calculated from unrounded data.

    Real estimates are calculated using a chain-type Fisher formula with annual weights for all years and quarters except those in the most recent year, which are calculated using quarterly weights; real estimates are expressed both as index numbers (1992=100) and as chained (1992) dollars. Price indexes ( $1992=100$ ) are also calculated using a chain-type Fisher formula.

[^1]:    2. Final sales of domestic product is calculated as GDP less the change in business inventories.
[^2]:    3. Gross domestic purchases-a measure of purchases by U.S. residents regardless of where the purchased goods and services were produced-is calculated as GDP less exports of goods and services plus imports of goods and services.
    4. Import prices are included in gross domestic purchases prices but not in GDP prices, and export prices are included in GDP prices but not in gross domestic purchases prices.
[^3]:    Data: Federal Reserve Board, Federal Home Loan Mortgage Corporation

[^4]:    8. "Other" nonfarm inventories includes inventories held by the following industries: Mining; construction; public utilities; transportation; communication; finance, insurance, and real estate; and services.
[^5]:    9. Profits from current production is estimated as the sum of profits before tax, the inventory valuation adjustment, and the capital consumption adjustment; it is shown in NIPA tables 1.9, 1.14, 1.16, and 6.16C (which are part of the "Selected NIPA Tables"; see page D-2 of this issue) as corporate profits with inventory valuation and capital consumption adjustments.
    10. Profits from the rest of the world is calculated as (1) receipts by U.S. residents of earnings from their foreign affiliates plus dividends received by U.S. residents from unaffiliated foreign corporations minus (2) payments by U.S. affiliates of earnings to their foreign parents plus dividends paid by U.S. corporations to unaffiliated foreign residents. These estimates are derived from ben's international transactions accounts.
[^6]:    11. Industry profits are estimated as the sum of corporate profits before tax and the inventory valuation adjustment; they are shown in NIPA table 6.16 C (on page $\mathrm{D}-16$ of this issue). Estimates of the capital consumption adjustment do not exist at a detailed industry level; they are available only for total financial and total nonfinancial industries.
    12. As prices change, companies that value inventory withdrawals at original acquisition (historical) costs may realize inventory profits or losses. Inventory profits-a capital-gains-like element in profits-result from an increase in inventory prices, and inventory losses-a capital-loss-like element in profits--result from a decrease in inventory prices. In the NIPA's, inventory profits or losses are shown as adjustments to business income (corporate profits and proprietors' income). Inventory profits are shown as the inventory valuation adjustment with the sign reversed.
    13. Net saving equals gross saving less consumption of fixed capital (CFC). Estimates of government gross saving, CFC, and net saving are shown in NIPA table 5.1.
    14. The NIPA estimates for the government sector are based on financial statements for the Federal Government and for State and local governments, but they differ from them in several respects. The major differences are shown in NIPA tables 3.18 B and 3.19 , which reconcile the NIPA estimates with government financial statements; these tables were most recently published on pages 10 and 11 of the October 1998 Survey of current Business.
[^7]:    NOTE.-Levels of these series are in NIPA tables 3.1-3.3

[^8]:    15. "Estimated income tax payments and final settlements, less refunds" reflects data on collections of Federal nonwithheld income taxes through September, which include the final payment of quarterly estimated taxes in the calendar year. For information on recent changes in the methodology for these estimates, see Eugene P. Seskin, "Annual Revision of the National Income and Product Accounts," Survey 78 (August 1998): 29-31.
    16. For information on the definition of current expenditures as well as of other major nipa components, see "A Guide to the nipa's," SURVEY 78 (March 1998): 26-68.
[^9]:    1. The current quarterly estimates consist of the "advance," "preliminary," and "final" estimates that are released near the end of the first, second, and third months, respectively, after the end of each quarter.
[^10]:    1. For each quarter, the current quarterly estimate is compared with the latest available
    mate to determine whether the current quarterly estimate provided a "correct indication."
[^11]:    2. See Allan H. Young, "Reliability and Accuracy of the Quarterly Estimates of gdp," Survey of Current Business 73 (October 1993): 29-43
    3. "Statistical Policy Directive No. 3," Federal Register, Vol. 50, No. 186 (September 25, 1985): 38, 932-34.
[^12]:    4. Estimates for years before 1983 were benchmarked to the 1982 inputoutput table, which was released in July 1991, and were reviewed in the previous evaluation article. In the most recent comprehensive NIPA revision, the revisions to those current-dollar GDP estimates were small.
    5. For additional information about the various vintages of estimates and how they are prepared, see "Updated Summary nipa Methodologies," Surver 78 (September 1998): 14-35.
[^13]:    1. Negative values in some quarters make the calculation of percent changes impossible. 2. Prior to the fourth quarter of 1995, this component was defined as "government purchases" and thus excluded consumption of fixed capital.
[^14]:    7. A 1-percentage-point revision to the change in current-dollar GDP, with no revision to prices or weights, will result in a 1 -percentage-point revision to the change in real gop. Thus, the effect on relative dispersion will be larger for real GDP simply because its denominator-the absolute average rate of change-will be smaller than the denominator for current-dollar GDP. In addition, the revisions to prices generally have only relatively small effects on the revisions to real measures in comparison with the effects of revisions to current-dollar estimates.
[^15]:    8. The reclassification of purchases and sales of the ccc from the government sector to the business sector is described in "The Comprehensive Revision of the U.S. National Income and Product Accounts: A Review of Revisions and Major Statistical Changes," Survey 71 (December 1991): 30-31. The improvements in the trade in goods estimates are described in "An Advance Overview of the Comprehensive Revision of the National Income and Product Accounts," Survey 65 (October 1985): 24-25.
[^16]:    1. Negative values in some quarters make the calculation of percent changes impossible.
    2. Negative values in some quarters make the calculation of percent changes impossibie.
    3. Priof to the fourth quarter of 1995 , this component was defined as "government purchases" and thus excluded consumption of fixed capital.
[^17]:    9. Annual revisions were not made in the years of comprehensive NIPA revisions-1985, 1991, and 1995.
[^18]:    1. Negative values in some years make the calculation of percent changes impossible.

    解
    and thus excludes consumption of capital.

[^19]:    10. Statistical revisions generally reflect incorporation of better data, but it is sometimes difficult to separate revisions that are due to better data from those that are due to methodological improvements. For example, the comprehensive NIPA revision released in January 1996 incorporated a better methodology for calculating depreciation that also incorporated new and revised source data on investment.
[^20]:    11. Revisions to annual levels of GDP were not made in the years of a comprehensive NIPA revision. Thus, the following years are excluded from the calculations: 1984, 1990, and 1994 for the first annual revisions, 1983, 1989, and 1993 for the second annual, and 1988 and 1992 for the third annual.
    12. The definitional changes that affected GDP were in "government consumption expenditures and gross investment." One change recognized government investment and resulted in a change in name from "government purchases." The other changed the treatment of Federal Government contributions to military and civilian retirement programs. For a more complete description of the definitional and statistical revisions, see Robert P. Parker and Eugene P. Seskin, "Improved Estimates of the National Income and Product Accounts for 1959-95: Results of the Comprehensive Revision," Survey 76 (January/February 1996): 1-27.
    13. In the comprehensive NIPA revision that was released in December 1991, the effects of definitional revisions were small in comparison with the statistical revisions. The two largest definitional revisions resulted in largely offsetting revisions to components of GDP and so had almost no effect on gdp. One of these, a redefinition of government sales and nontaxes, lowered government purchases and raised PCE. The other, a reclassification of ccc loans, resulted in corresponding revisions of opposite sign to change in business inventories and to government purchases.
[^21]:    1. The estimates for 1992-94 are in Thae S. Park, "Federal Personal In come Tax Liabilities and Payments, 1992-95," Survey of Current Business 77 (December 1997): 17-21; and those for 1959-91 are in Thae S. Park, "Federal Personal Income Tax Liabilities and Payments, 1959-94," Survey 76 (August 1996): 127-132.
    2. For tax return data for 1996, see Internal Revenue Service, Statistics of Income Bulletin (Washington, DC: U.S. Government Printing Office, Summer 1998).
[^22]:    For a detailed discussion of the annual revisions to personal income and Federal personal income tax payments for 1995-97, see Eugene P. Seskin, "Annual Revision of the National Income and Product Accounts," Survey 78 (August 1998): 21-22.
    3. The estimates of these components are published annually in NIPA table 3.4 , most recently on page 59 of the August 1998 Survey. Quarterly estimates of Federal personal income taxes are published monthly in NIPA table 3.2 in the section "bea Current and Historical Data" of the Survey.

[^23]:    4. The adjustments consist of the following. First, recapture taxes, penalties and other taxes, and exempt organizations excise taxes are added to the sor estimates. Second, fiduciary income taxes are added, because personal income includes fiduciary income. Third, additional assessments from audits, net of refunds on amended returns (Form 1040x), are added because they are excluded from the sor estimates. Fourth, excess social security taxes and the earned income credit that is used to offset nonincome taxes are subtracted. Fifth, income taxes paid by U.S. citizens living abroad for more than a year are subtracted, because, in the NIPA's, these citizens are considered nonresidents of the United States; the sol estimates include these taxes, because these citizens are generally taxed on their worldwide income regardless of how long they have been living abroad.

    For more information, see "Appendix: Estimating Methods," in Park, "Liabilities and Payments, 1992-95," 20-21.

[^24]:    5. Employees must fill out "Employee's Withholding Allowance Certifcate" (Form W-4) so that their employers can withhold the correct amount of Federal income tax from their pay. Employees determine the number of withholding allowances based on estimated itemized deductions, on estimated adjustments to gross income, on the number of personal and dependency exemptions, and on filing status. Employees may submit new Form W-4's at any time to change the number of withholding allowances. These options provide them with some discretion over the effective rates at which taxes are withheld from their incomes.
    6. For example, in August 1993, the Omnibus Budget Reconciliation Act of 1993 created two new tax brackets of 36 percent and 39.6 percent, which applied to all income in the whole year. The withholding tables reflecting these new rates were made available to employers in January 1994.
[^25]:    8. The provisions of the Omnibus Budget Reconciliation Act of 1993 increased the marginal tax rates for high-income individuals. These individuals were given an option to defer payments of two-thirds of the additional taxes that resulted from the tax-rate increases; those who elected this deferral option paid half of their deferred taxes by April 17,1995 , and the other half by April 15, 1996.
[^26]:    9. As part of the 1998 annual NIPA revision, personal income was revised back to 1982 to exclude the capital gains distributions of regulated investment companies from personal dividend income. The revisions to personal income for 1982-94 do not affect the annual estimates of the payments or liabilities series for this period. Only the quarterly estimates of the liabilities series are affected because they are derived by the interpolation of the annual

Lawson, "Benchmark Input-Output Accounts for the U.S. Economy, 1992: Make, Use, and Supplementary Tables," Survey of Current Business 77 (November 1997): 36-82; and "Benchmark lnput-Output Accounts for the U.S. Economy, 1992: Requirements Tables," Surver 77 (December 1997): 22-47.
    2. The tables for 1963, 1967, 1972, and 1977 were presented in the August 1972, September 1975, July 1980, and November 1985 issues of the SURver respectively. The 1982 table was not published, but it is available on request (see the box "Data Availability" on page 30). No table was prepared for 1987
    3. See "Appendix A.-Classification of Industries in the 1992 Capital Flow Table."
[^28]:    4. The 1997 I-o accounts will be prepared using the new North American Industry Classification System, which replaces the sic.
    5. See Benchmark Input-Output Accounts of the United States, 1992 (Washington dC: U.S. Government Printing Office, September 1998). See also the box "Data Availability."
    6. See "Appendix B.-Classification of Commodities in the 1992 Capital Flow Table."
    7. In the NIPA's, structures are shown in table 5.6 , and producers' durable equipment is shown in table 5.8.
[^29]:    10. The cFt provides information on the investment flows that are needed for perpetual inventory estimates used to derive estimates of fixed private capital by industry, which is based on the 1987 SIC. However, the CFT estimates differ from the fixed private capital estimates because the CFT estimates are on a using-industry basis, and the fixed private capital estimates are on an ownership basis. See Bureau of Economic Analysis (bea), Fixed Reproducible Tangible Wealth in the United States, 1925-96 [CD-ROM) (Washington, DC: BEA, 1998, product number NCN-0136); and "Fixed Reproducible Tangible Wealth in the United States: Revised Estimates for 1995-97 and Summary Estimates for $1925-97$," Survey 78 (September 1998): 36-46. For an explanation of the methodology used, see Arnold J. Katz and Shelby W. Herman, "Improved Estimates of Fixed Reproducible Tangible Wealth, 1929-95," Survey 77 (May 1997): 70-76.
    11. Establishments are defined as economic units that are typically at a single location where business is conducted or where services or industrial operations are performed.
[^30]:    12. This adjustment includes estimates for nonpayroll firms in mining, manufacturing, and wholesale trade; for auxiliary establishments in mining and manufacturing; for capital expenditures not collected in the economic censuses for transportation, communications, utilities, finance, insurance, real estate, and some services; and for agriculture and agriculture services.
    13. This adjustment is made, because, in some cases, the Census Bureau data reflect tax return records. The tax return data must be adjusted to account for nonfilers and for filers who misreport information to the Internal Revenue Service. Capital expenditures based on Census Bureau data are similarly adjusted to account for the expenditures of nonfilers and filers who misreport. See Robert P. Parker, "Improved Adjustments for Misreporting of Tax Return Information Used to Estimate the National Income and Product Accounts, 1977," Survey 64 (June 1984): 17-25.
    14. Expensed new motor vehicles that are retained for less than a full accounting period by the auto rental industry and expenditures for petroleum and natural gas well drilling, exploration, and other mining exploration are not reported as investment to the Census Bureau. The expenditures are recorded as investment items in the construction industry in the cft. Nonfarm business use of personal motor vehicles represents personally owned motor vehicles used for business purposes; in national economic accounting, purchases of these "mixed-use" vehicles are allocated between consumer and business purchasers on the basis of the mileage driven for business purposes.
    15. Force-account new construction is new construction work performed by and for establishments classified according to the sic in nonconstruction industries. In both the alternative $1-\mathrm{O}$ and in the CfT, the value of such work is included in the output of the construction industry rather than in the industry in which the work is performed.
