This issue went to the printer on December 16, 2003. It incorporates data from the following monthly BEA news releases:

Personal Income and Outlays (Nov. 26), and
Gross Domestic Product (Dec. 10), and
U.S. International Trade in Goods Services (Dec. 12).

BEA Advisory Committee

The BEA Advisory Committee advises the Director of BEA on matters related to the development and improvement of BEA's national, regional, industry, and international economic accounts, especially in areas of new and rapidly growing economic activities arising from innovative and advancing technologies, and it provides recommendations from the perspective of businessmen, academicians, researchers, and experts in government and international affairs.

SURVEY OF CURRENT BUSINESS

December 2003

Volume 83 • Number 12

1 Initial Results of the 2003 Comprehensive Revision of the National Income and Product Accounts

On December 10, 2003, BEA released revised estimates for 1929–2002 from the 12th comprehensive revision of the accounts. According to the revised estimates, between 1992 and 2002, real GDP grew at an average annual rate of 3.2 percent, the same rate as previously estimated. Consumer spending and residential investment increased slightly more than previously estimated, but exports and government spending increased slightly less. The pace of the current expansion was revised down slightly: From the third quarter of 2001 to the second quarter of 2003, the growth rate of real GDP was revised from 2.7 percent to 2.6 percent.

43 The Effects of Revisions to Seasonal Factors on Revisions to Seasonally Adjusted Estimates: The Case of Exports and Imports

Seasonal adjustments are used to remove the effects of recurring patterns of economic activity, such as increased consumer spending during the holidays. This study examines the importance of revisions to the underlying seasonally unadjusted data for the exports and imports of goods and services in BEA's international transactions accounts, relative to the effects of revisions to seasonal factors.

52 The Reliability of the State Personal Income Estimates

A recent study by BEA found that the quarterly estimates of state personal income are reliable indicators of whether a state's economy is expanding or contracting, whether a state's economy is accelerating or decelerating, and whether a state's economy is growing at rates that are above, below, or near long-term trend. As a result, the estimates present a consistent picture of a state's economic growth.

LOOKING AHEAD

Improved NIPA Estimates for 1929–2003. The January 2004 SURVEY will include an article that describes the comprehensive revision in detail and an extensive set of tables that will present the revised estimates.

On December 10, 2003, the Bureau of Economic Analysis released the initial results of the comprehensive revision of the national income and product accounts. The news release is reprinted below with minor editorial corrections.

Comprehensive Revision of the National Income and Product Accounts

1929 Through Second Quarter 2003

Today, BEA is releasing revised estimates of gross domestic product (GDP) and other national income and product accounts (NIPAs) series from 1929 through the second quarter of 2003. Comprehensive revisions, which are carried out about every 4 to 5 years, are an important part of BEA's regular process for improving and modernizing its accounts to keep pace with the ever-changing U.S. economy.

Most of the tables in this release present revised estimates beginning with 1992; estimates beginning with 1929 are available on the BEA Web site <www.bea.gov> and will be published in the January 2004 issue of BEA's monthly journal, the SURVEY OF CURRENT BUSINESS.

The picture of the economy shown in the revised estimates is very similar in broad outline to the picture shown in the previously published estimates. The similarity in outline and some of the differences in detail can be seen in the following:

- For 1992–2002, the average growth rate of real GDP is 3.2 percent, the same as in the previously published estimates. Consumer spending and residential investment increased a little more than in the previously published estimates, but exports and government spending increased a little less. For the subperiod 1994–2000, the rate of growth is also the same as in the previously published estimates (3.8 percent).
- Similarly, for 1992–2002, the average rate of change

in prices paid by U.S. residents is the same as in the previously published estimates (1.8 percent).

- From the fourth quarter of 2000 to the third quarter of 2001, real GDP decreased 0.5 percent; in the previously published estimates, it decreased 0.6 percent. In the revised estimates, real GDP decreased slightly in the third quarter of 2000; in the previously published estimates, it had increased throughout the year.
- The pace of the current expansion has been revised down slightly; from the third quarter of 2001 to the second quarter of 2003, the average growth rate of real GDP is revised from 2.7 percent to 2.6 percent.
- Corporate profits is revised up substantially for 2002; profits of domestic industries as a percentage of gross domestic income is revised up from 6.3 percent to 7.1 percent.

Improvements Incorporated in This Comprehensive Revision

Comprehensive revisions incorporate three major types of improvements:

- Changes in definitions and classifications that update the accounts to more accurately portray the evolving U.S. economy,
- Presentational changes that make the NIPA tables more informative and easier to use, and
- Statistical changes that introduce new and improved methodologies and that bring in newly available

NOTE. Quarterly estimates are expressed at seasonally adjusted annual rates, unless otherwise specified. Quarter-to-quarter dollar changes are differences between these published estimates. Percent changes are calculated from unrounded data and annualized. "Real" estimates are in chained (2000) dollars. Price indexes are chain-type measures.

and revised source data.

The improvements incorporated in the estimates being released today have been previewed in a series of articles in the *SURVEY* and are available on BEA's Web site at <www.bea.gov/bea/dn/2003benchmark/CR2003.htm>.

Changes in definitions and classifications

The changes in definitions and classifications introduced in this comprehensive revision include the following:

- The implicit services provided by property and casualty insurance are recognized, and the treatment of insured losses is improved; as a result, large swings in measured insurance services associated with catastrophic losses such as those of September 11th and of Hurricane Andrew are eliminated.
- A portion of the implicit services of commercial banks is allocated to borrowers, thereby recognizing that both borrowers and depositors receive these services.
- The definition of national income is broadened to include all net incomes (net of consumption of fixed capital) earned in production. For example, under the new definition, national income will include taxes on production and imports (formerly, indirect business taxes).

Presentational changes

Noteworthy changes in presentation include the following:

- The reference year for chain-type quantity and price indexes and for chained-dollar estimates has been updated from 1996 to 2000.
- Many new tables show percent changes in GDP components, contributions to percent change, and relative shares of GDP and of gross domestic income.
- A new organization and numbering system is introduced for the NIPA tables that groups together the different measures for a given set of components and that allows the addition of new tables more easily.
- Industry estimates are based on the North American Industrial Classification System (NAICS), which deals well with new and emerging industries.

Statistical changes

Improved methodologies. Several important methodology changes are also incorporated in this revision and include the following:

- The estimates of used motor vehicles reflect new methods and source data for estimating net transactions and total dealers' margins.

- The estimates of personal consumption expenditures for hotels and motels reflect new source data on U.S. residents' lodging expenditures by sector and nonresidents' spending on lodging.
- The estimates of real nonresidential structures and of photocopy equipment reflect the use of new quality-adjusted price indexes.
- The estimates of corporate profits for recent periods for which Internal Revenue Service tabulations of corporate tax returns are unavailable reflect a new adjustment for the exercise of stock options.

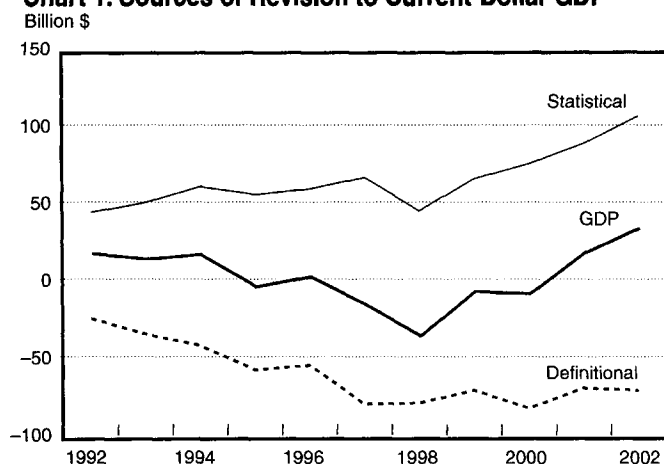

New and revised data. The revised estimates also reflect the incorporation of newly available and revised source data. The most important source data that affect the current-dollar and "real" estimates prior to 2000 are the following: BEA's benchmark 1997 input-output (I-O) accounts; data on inventories, on receipts and expenses of business establishments and of governments, on sales by detailed commodity and by merchandise line, and on final industry and product shipments from the 1997 Economic Census, and on trade margins from both the 1997 Economic Census and the 1997 annual surveys of merchant wholesale and retail trade; and data on housing units from the 2000 decennial Census of Housing. In addition, estimates that are based on BEA's international transactions accounts (ITAs)—primarily net exports of goods and services and rest-of-the-world income receipts and payments—reflect improvements to the ITAs that have been introduced since 1999. Estimates of private structures reflect Census Bureau revisions to the surveys of value of construction put-in-place data that go back to 1978. Other data that were incorporated include the following: Data on expenditures and receipts of state and local governments for fiscal years 1997–99 from the Census Bureau; final data on employer pension and profit-sharing plans for 1995–98 from the Department of Labor; revised data on mortgage debt outstanding, beginning with 1982, and on consumer debt outstanding and the effective rate of interest on consumer debt outstanding, beginning with 1980, from the Federal Reserve Board; and new Census Bureau "exact-match" files based on tabulations of Internal Revenue Service (IRS) individual tax returns for 1996 and 1999.

The revised estimates for 2000 forward also reflect the incorporation of newly available and revised source data that became available since the last annual NIPA revision in July 2002. The most important of these data are the following: Census Bureau data from annual surveys of state and local governments (for fiscal years 2000 (final) and 2001 (preliminary)), of manufactures, of merchant wholesale trade, and of retail trade (for 2000 (revised) and 2001 (preliminary));

Census Bureau data from the services annual survey and from the surveys of the value of construction put-in-place for 2001 and 2002; Census Bureau data from the American Housing Survey for 2001; Federal Government budget data (for fiscal years 2002 and 2003); ITA data for 2000–2002 (revised); Bureau of Labor Statistics (BLS) tabulations of wages and salaries of employees covered by state unemployment insurance for 2001 and 2002 (revised); newly available IRS tabulations of corporate tax returns for 2000 (final) and 2001 (preliminary); U.S. Department of Agriculture (USDA) farm statistics for 2002; and newly available IRS tabulations of sole proprietorship and partnership tax returns for 2001.

In the aggregate, changes in definitions and classifications lowered current-dollar GDP, and statistical changes (improved data and methodologies) raised GDP, as shown in chart 1 for 1992–2002.

Chart 1. Sources of Revision to Current-Dollar GDP

News release tables

This release includes most of the tables that will regularly be shown in future GDP news releases; in addition, special tables have been included to highlight the effects of the comprehensive revision. The special tables are

- Tables 1A, 2A, and 4A, which show revised and previously published estimates for percent changes in real GDP, contributions to percent change in real GDP, and percent changes in price indexes, respectively;
- Table 1B, which shows revisions to current-dollar GDP and selected income components; and
- Tables 7A–7C, which show annual levels, percent changes, and revisions to percent changes for current-dollar GDP, for real GDP, and for price indexes for GDP, respectively.

Most of the tables show annual estimates beginning with 1992; quarterly estimates (if shown) begin with

the first quarter of 1998. Three of the regular tables—tables 3, 11, and 12—are split into A and B segments in this release in order to accommodate this longer-than-usual time span. The regular news release tables on real GDP percent change from quarter a year ago (table 8) and on gross value added of nonfinancial corporate business (table 13), as well as appendix table A, are not yet available; they will be posted on BEA's Web site in a few days as part of the regular NIPA tables.

Revisions to Real Gross Domestic Product (GDP), Prices, and Income

For this comprehensive revision, most current-dollar series are revised back to 1993, and many are revised back to 1929, the earliest year for which the NIPA estimates are available.

Real GDP growth

For 1929–2002, the average annual rate of growth of real GDP is 3.4 percent, the same as in the previously published estimates. Over the shorter period, 1992–2002, the growth rate is 3.2 percent in both the revised and previously published estimates. For the 1994–2000 subperiod, the growth rate is also the same in both the revised and previously published estimates (3.8 percent). Since 1992, personal consumption expenditures (PCE) and residential fixed investment grew somewhat faster in the revised estimates, and exports of goods and services and government consumption expenditures and gross investment grew somewhat slower.

The revisions to year-to-year real GDP growth are generally less than 0.1 percentage point between 1959 and 1971, but they are more sizable thereafter. The largest upward revision before 1959 is 0.3 percentage point for 1940; downward revisions of 0.2 percentage point are recorded for 3 years (1937, 1947, and 1952). The largest upward revision after 1959 is 0.4 percentage point for 1999, and upward revisions of 0.3 percentage point are recorded for 1985, 1991, and 1992; the largest downward revision after 1959 is 0.3 percentage point recorded for 1976. For the 3 most recent years, growth is revised as follows:

- Down from 3.8 percent to 3.7 percent for 2000,
- Up from 0.3 percent to 0.5 percent for 2001, and
- Down from 2.4 percent to 2.2 percent for 2002.

Business cycles

From the fourth quarter of 2000 to the third quarter of 2001, real GDP decreased 0.5 percent; in the previously published estimates, it decreased 0.6 percent. In the revised estimates, real GDP also decreased slightly in the third quarter of 2000. The pace of the current expansion has been revised down slightly; from the third

quarter of 2001 to the second quarter of 2003, the growth rate of real GDP is revised from 2.7 percent to 2.6 percent. Earlier business cycles show very little revision.

Price changes

For 1929–2002, the average annual increases in both the price index for gross domestic purchases and the price index for GDP are 3.0 percent, the same as in the previously published estimates. For 1992–2002, the average annual increase in the price index for gross domestic purchases is 1.8 percent, the same as in the previously published estimates; the price index for GDP is 1.9 percent, also the same as in the previously published estimates.

Real disposable personal income (DPI) growth

For 1929–2002, the average annual increase in real DPI is 3.3 percent, the same as in the previously published estimates. For 1992–2002, the average annual increase in real DPI is 3.2 percent, 0.1 percentage point more than in the previously published estimates.

Personal saving

The revisions are relatively small through 1986. Beginning with 1987, the revisions are larger and all downward. The downward revisions reflect upward revisions to PCE and downward revisions to personal income (discussed below). The downward revisions to personal saving result in corresponding downward revisions to the personal saving rate—personal saving as a percentage of DPI—that range from 0.2 percentage point for 1999 to 1.4 percentage points for 2002.

Revisions to Current-Dollar Estimates

The revisions to current-dollar GDP and to selected measures of income are shown in table 1B. This table shows the “revisions in level”—that is, the revised estimates less the previously published estimates—and the revisions as a percent of the previously published estimates for selected years.

Direction of Revisions to Current-Dollar GDP

<u>Downward</u>	<u>Upward</u>
1959–1974	1975–1976
1977–1982	1983–1986
1987–1990	1991–1994
1995	1996
1997–2000	2001–2002

Gross domestic product (GDP)

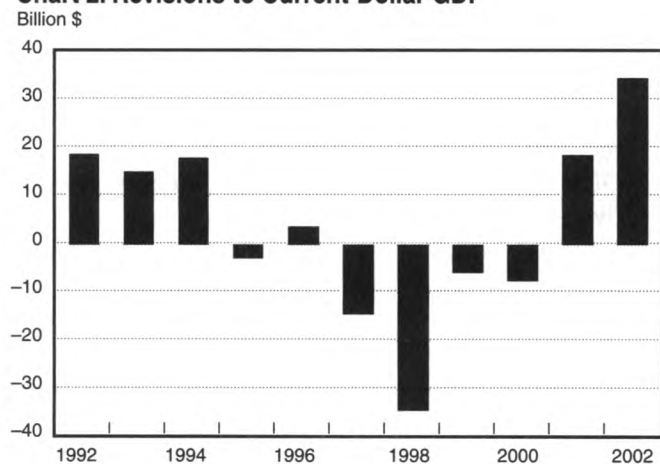

Since 1959, GDP is revised down for 31 years and is revised up for 13 years. (See also chart 2.) Over the entire period, GDP is generally reduced by the reallocation of a portion of the implicit services of commercial banks from depositors to borrowers; relatively large reductions begin with 1987. (Services imputed to business borrowers are treated as intermediate purchases and, therefore, are not part of GDP.) In contrast, GDP is raised by the recognition of the implicit services provided by the investment income of property and casualty insurance companies. Generally, the reduction in GDP resulting from the new treatment of banking services outweighs the increase in GDP resulting from the new treatment of insurance services.

Excluding all the changes in definitions and classifications, current-dollar GDP is revised down by small amounts for 1959–80 (except for 1979 when there is a small upward revision), and it is revised up beginning with 1981. The revisions tend to increase over time; the largest is an upward revision of about 1 percent of GDP for 2002.

Personal consumption expenditures (PCE)

Revisions to PCE are relatively small through 1988; PCE for services is generally the main source of the revisions. From 1989 forward, PCE is revised up. PCE for durable goods is the main source of the upward revisions through 1999; for 1995–99, there are partly offsetting downward revisions to PCE for nondurable goods. For 2000–2002, upward revisions to durable goods and to services are partly offset by downward revisions to nondurable goods. For the entire period, the revisions reflect changes in definitions and classifications; until 1982, the revisions attributable to new source data and methodologies are small.

Chart 2. Revisions to Current-Dollar GDP

Services. For 1978 forward, downward revisions to services resulting from the new treatment of banking services more than offset upward revisions resulting from the new treatment of insurance services. Banking and insurance are not the only notable sources of revision to PCE for services. Beginning with 1960, PCE for religious and welfare activities is revised down, reflecting the improved allocations to PCE commodity categories made possible by NAICS. Beginning with the 1980s, PCE for housing is revised up, reflecting, in part, improved data on lodging at hotels and motels. Also beginning with the 1980s, PCE for transportation services is revised up, reflecting, in part, the new treatment of motor vehicle insurance services. PCE for medical services is revised up (and the revisions increase over time), reflecting the recognition of the implicit services provided by health insurance companies, the improved allocations made possible by NAICS, as well as the incorporation of newly available and revised source data.

Durable goods. Notable upward revisions to PCE for durable goods begin with 1987. For 1987–90, the revisions mainly reflect improved estimates of net transactions in used light trucks. (The improvement involves the use of average auction prices to value the change in unit stocks.) For 1991 forward, a similar methodology has been applied to the estimation of net transactions in used autos. Beginning with 1994, upward revisions to furniture and equipment primarily reflect the incorporation of results from the 1997 I-O table.

Nondurable goods. Upward revisions for 1988–93 largely reflect revisions to gasoline and oil. Beginning with 1995, downward revisions are more than accounted for by food and by clothing and shoes; the revisions mainly reflect the incorporation of results from the 1997 I-O table.

Private fixed investment

The revisions begin with 1978 and are relatively small through 1996, as downward revisions to nonresidential fixed investment are generally offset by upward revisions to residential fixed investment. For 1997–2000, the downward revisions to nonresidential outweigh the upward revisions to residential. For 2001 and 2002, the revisions are almost offsetting. The downward revisions to nonresidential fixed investment primarily reflect revisions to equipment and software; revisions to nonresidential structures are generally smaller.

Nonresidential structures. Upward revisions occur for 1978–92 and downward revisions occur for 1993 forward (except for 1995). The revisions (except for 1997 and 1998) are relatively small and primarily re-

flect revisions to Census Bureau estimates of the value of construction put-in-place and the incorporation of data from the 1997 I-O accounts.

Equipment and software. Downward revisions for 1978 forward start out very small but become large. For 1978–86, the revisions mainly reflect improvements to the measurement of computer software that were introduced in the 1997 I-O accounts. For 1987–2002, the revisions reflect improvements to the measurement of used trucks and of computer software.

Residential fixed investment. Upward revisions for 1983 forward start out very small but become large and reflect an improved methodology for estimating residential improvements and revised Census Bureau data on the value of construction put-in place.

Change in private inventories

The revisions begin with 1991 and are small through 1996, primarily reflecting the inclusion of farm materials and supplies in the definition of private farm inventories. Beginning with 1997, a mixed pattern of revisions continues, but the magnitudes are generally larger; nonfarm inventories dominate these revisions, though for 2002, an upward revision to nonfarm inventories is largely offset by a downward revision to farm inventories. The revisions to nonfarm inventories primarily reflect newly available and revised Census Bureau data on inventory book values, the incorporation of new commodity price weights from the 1997 I-O accounts, and revised producer prices.

Exports and imports of goods and services

Revisions to net exports of goods and services are small through 1987—at first upward and then downward. Thereafter, revisions are downward for all years; they tend to grow larger over time, but the revision for 2002 is small.

Exports. Through 1988, revisions are relatively small and generally upward; thereafter, larger downward revisions occur. For most years, the revisions are mainly accounted for by services (2002 is an exception, in that goods account for most of the revision). The revisions to exports of services mainly reflect the new treatments of insurance and of banking services, as well as a reclassification of military grants from Federal Government consumption expenditures to exports of services.

Imports. Upward revisions begin with 1986 and tend to be small through 1997; imports is revised down slightly for 1998. Larger upward revisions occur for 1999–2001, and a downward revision occurs for 2002. The new treatment of insurance services contributes to the upward revisions throughout the period; for 2002,

the incorporation of revised estimates from the ITAs more than offsets the contribution from this definitional change.

Government consumption expenditures and gross investment

Revisions prior to 1959 are very small. Beginning with 1959, the revisions for all but 5 years are downward. Through 1996, the revisions generally remain small (except for 1986, when the new treatment of banking services more than accounts for a large upward revision); for 1997–2002, the revisions are much larger. Downward revisions for 1959–84 are primarily accounted for by the Federal Government, although state and local government also contributes. Through 1975, the revisions to Federal spending primarily reflect the reclassification of military grants. Beginning with 1972, new source data and methodologies become important and contribute to the downward revisions; these revisions are mainly to consumption of general government fixed capital, reflecting improved price estimates for military equipment and, beginning with the 1990s, revised estimates of software investment. As noted, the new treatment of banking services also contributes to the revisions, most notably beginning with 1985, sometimes raising spending, other times reducing spending. Beginning with 1997, state and local spending accounts for most of the downward revisions; the revisions for 1997 and 1998 primarily reflect the incorporation of newly available medical insurance data for government employees, and the revisions for 1999–2002 primarily reflect the incorporation of *Government Finances* data.

Personal income

For 1929–81, downward revisions to personal income mainly reflect revisions to personal interest income;

Chart 3. Revisions to Personal Income

through 1977, the revisions are small—proprietors' income contributes to the downward revisions, and rental income of persons moderates them. (See also chart 3.) For 1982–86, the revisions to personal income are upward, and again personal interest income is the main contributor. For 1987–97, downward revisions to personal income are accounted for by downward revisions to personal interest income, to supplements to wages and salaries, and to proprietors' income; they are moderated by upward revisions to rental income of persons.

For the 5 most recent years, the revisions to personal income can be summarized as follows:

- 1998: A small downward revision is accounted for by personal interest income and by wages and salaries; it is moderated by supplements.
- 1999: An upward revision is mainly accounted for by supplements and by personal dividend income; it is moderated by personal interest income and by wages and salaries.
- 2000: An upward revision is mainly accounted for by supplements, by personal current transfer receipts, and by proprietors' income; it is moderated by personal interest income and by wages and salaries.
- 2001: An upward revision is mainly accounted for by supplements, by proprietors' income, by rental income, and by personal current transfer receipts; it is moderated by personal interest income, by dividend income, and by wages and salaries.
- 2002: A downward revision is mainly accounted for by personal interest income, by personal dividend income, and by wages and salaries; it is moderated by supplements, by proprietors' income, and by rental income.

The revisions to the components of personal income are discussed below.

Wage and salary disbursements. Through 1988, revisions are upward and small. Beginning with 1989, the revisions are downward and become more notable beginning with 1994, reflecting downward revisions to private wages and salaries that are partly offset by upward revisions to government wages and salaries. A large downward revision for 2002 primarily reflects the more complete incorporation of tabulations of wage and salary data from the BLS for private and state and local government employees who are covered by state unemployment insurance.

Supplements to wages and salaries. Through 1986, revisions are small and downward; they remain downward but become larger through 1995. Beginning with 1996, the revisions are upward, becoming large beginning with 1997. The revisions reflect the pattern of re-

visions to employer contributions for pension and insurance funds. Upward revisions to employer contributions for pensions begin with 1989, reflecting methodology improvements and more complete source data, including more complete pension data from the Department of Labor for 1988–98. Downward revisions to employer contributions for health insurance for 1987–96 reflect an improved methodology that incorporates the results of the annual medical expenditure panel survey; beginning with 1998, upward revisions reflect newly available source data.

Proprietors' income. Through 1997, most revisions are downward. For 1998, a small upward revision occurs, and for 1999, a slight downward revision occurs, followed by large upward revisions for 2000–2002. Through 1983, the revisions generally reflect downward revisions to both farm and nonfarm proprietors' income. Beginning with 1984, the revisions primarily reflect the pattern of revisions to nonfarm proprietors' income. The revisions to farm proprietors' income reflect the reclassification of farm housing services from proprietors' income to rental income of persons and, for recent years, newly available data from the USDA. Prior to 2001, the revisions to nonfarm proprietors' income primarily reflect a number of statistical improvements. The large revisions for 2001 and 2002 also reflect the incorporation of newly available IRS tabulations of sole proprietorship and partnership tax returns for 2001.

Rental income of persons. Through 1977, the revisions are upward and small, after which the pattern of revisions is mixed although the magnitudes remain relatively small through 1991. Beginning with 1992, the revisions are mostly upward with particularly large upward revisions for 2001 and 2002. The reclassification of farm housing services contributes to the upward revisions throughout the period. In addition, the revisions for 2001 and 2002 reflect the incorporation of newly available source data from the Census Bureau's American Housing Survey.

Personal interest income. The revisions are relatively small and mostly downward through 1977. Beginning with 1978, the revisions become larger and remain downward (except for 1982–86). For most years, the revisions reflect generally downward revisions attributed to the new treatment of banking services that are partly offset by upward revisions attributed to the new treatment of insurance services. The revisions also reflect the incorporation of revised and newly available source data for estimating net interest and miscellaneous payments (see below) and data on consumer debt outstanding from the Federal Reserve Board.

Personal dividend income. The revisions are rela-

tively small through 2000 (except for 1999, which shows a notable upward revision); the revisions primarily reflect newly incorporated data from the ITAs on dividends from the rest of the world. For 2001 and 2002, large downward revisions primarily reflect the incorporation of newly available IRS tabulations of corporate tax return data for 2001 and data from company financial statements.

Personal current transfer receipts. Through 1990, the revisions are generally small and upward. For 1991–98, the revisions are downward, and for 1999–2002, they are upward. The revisions mostly reflect the pattern of revisions to “other current transfer receipts, from business (net)” (formerly “business transfer payments”). For 2002, the revision also reflects an upward revision to old-age, survivors, disability, and health insurance benefits, reflecting newly available data on Medicare benefits, and downward revisions to government unemployment insurance benefits and to state and local Medicaid benefits.

Contributions for government social insurance. The revisions for contributions for government social insurance (which is deducted in the calculation of personal income) are small throughout the period.

Personal current taxes. This component consists of tax components that were included in the former aggregate “personal tax and nontax payments”; however, the nontax components are reclassified as personal current transfer payment to government. Therefore, the pattern for the new series is similar to that of the previously published series, although the revised levels are somewhat lower.

Disposable personal income (DPI). The pattern of revisions to disposable personal income reflects the revisions to personal income and to personal current taxes. Through 1974, the revisions to DPI are very small; beginning with 1975, there is a mixed pattern: Upward revisions for 1975 and 1976, downward revisions for 1977–81, upward revisions for 1982–86, downward revisions for 1987–95 (except for 1989), and upward revisions for 1996–2002.

Personal outlays. This series now consists of PCE, personal interest payments, and personal current transfer payments. The revision to personal outlays, primarily reflects the revisions to PCE that were previously described. In addition, the revised levels of the series reflect the inclusion of personal current transfer payments to government, which was formerly classified as personal nontaxes.

National income

The revisions are upward for all years and grow progressively larger over time. They mainly reflect the redefinition of national income to include nonfactor

incomes, notably taxes on production and imports, which grew from \$6.8 billion for 1929 to \$760.1 billion for 2002.

Corporate profits with inventory valuation and capital consumption adjustments

Revisions are generally upward and small through 1980, growing larger thereafter; the revision for 2002 is very large. (See also chart 4.) Through 1999, the revisions largely reflect the pattern of revisions to the capital consumption adjustment. The revisions for 2000–2002 reflect revised 2000 and newly available 2001 IRS tabulations of corporate tax returns. In addition, the revision for 2002 reflects a new stock-options adjustment that offsets a timing problem between the treatment of nonqualified stock options in reported wages and salaries and the treatment of exercised stock options in the corporate profits data. Profits from the rest of the world are revised beginning with 1982; the revisions are relatively small and generally upward through 2000, with larger upward revisions for 2001 and 2002.

Net interest and miscellaneous payments

The revisions are very small until the mid-1970s, when they become more notable. The pattern of revisions is

mixed through 1986; beginning with 1987, the revisions are downward and generally become larger. The overall revisions reflect mostly downward revisions attributable to the new treatment of banking services that are partly offset by upward revisions attributable to the new treatment of insurance services. The revisions also reflect the incorporation of revised and newly available source data from the Federal Reserve Board on mortgage debt outstanding, from BEA's ITAs, and, beginning with 2000, from IRS tabulations of business tax returns.

Consumption of fixed capital (CFC)

The revisions to the NIPA measure of depreciation are downward for most years. They are generally small through 1980 and become larger thereafter. The revisions reflect revised investment estimates and three statistical improvements: The incorporation of new service lives for private aircraft, separate estimation of CFC for light trucks, and a revised depreciation schedule for autos.

Statistical discrepancy

For 1959–77, revisions to GDP and to gross domestic income (GDI) are in the same direction and of similar magnitude; thus, there is little effect on the statistical

Chart 4. Revisions to Corporate Profits with IVA and CCAAdj

Availability of Revised Estimates and Related Information

Revised estimates for selected NIPA tables, beginning with 1929, are available without charge on BEA's Web site <www.bea.gov>.

The comprehensive revision was previewed in a series of articles in the *SURVEY OF CURRENT BUSINESS* in June, August, and September 2003 issues. The articles are also available on BEA's Web site at <www.bea.gov/bea/dn/2003benchmark/CR2003Articles.htm>.

An article in the January 2004 *SURVEY* will discuss the sources and impacts of the revision. The January issue will also contain tables for GDP and other major aggregates, beginning with 1929, and most of the NIPA tables (including "annual-only" tables), beginning with 1999.

discrepancy, which is the difference between GDP and GDI. (In theory, GDP should equal GDI; in practice, they differ because their components are estimated using largely independent and less-than-perfect source data.) For 1978–86, the revisions to GDP and to GDI continue to be in the same direction but the magnitudes differ more; thus, for some of these years, the statistical discrepancy is revised up, and for others, it is

revised down (the revisions to the discrepancy remain relatively small). Beginning with 1987, the statistical discrepancy is revised up (becoming more positive or less negative): For 1987–90, GDI is revised down more than GDP; for 1991–94, GDP is revised up, and GDI is revised down; for 1995–2000 (except for 1996), GDI is again revised down more than GDP; and for 2001 and 2002, GDP is revised up more than GDI.

Explanatory Note: NIPA Measures of Quantities and Prices

Current-dollar GDP is a measure of the market value of goods, services, and structures produced in the economy in a particular period. Changes in current-dollar GDP can be decomposed into quantity and price components. Quantities, or “real” measures, and prices are expressed as index numbers with the reference year—at present, the year 2000—equal to 100.

Annual changes in quantities and prices are calculated using a Fisher formula that incorporates weights from 2 adjacent years.¹ (Quarterly changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent quarters; quarterly indexes are adjusted for consistency to the annual indexes before percent changes are calculated.) For example, the 2001–2002 annual percent change in real GDP uses prices for 2001 and 2002 as weights, and the 2001–2002 annual percent change in GDP prices uses quantities for 2001 and 2002 as weights. These annual changes are “chained” (multiplied) together to form time series of quantity and price indexes. Percent changes in Fisher indexes are not affected by the choice of reference year. (BEA also publishes a measure of the price level known as the implicit price deflator (IPD), which is calculated as the ratio of the current-dollar value to the corresponding chained-dollar value, multiplied by 100. The values of the IPD are very close to the values of the corresponding “chain-type” price index.)

Index numbers of quantity and price indexes for GDP and its major components are presented in this release in tables 5 and 6. Percent changes from the preceding period are presented in tables 1, 4, and 7. Contributions by major components to changes in real GDP are presented in table 2.

Measures of real GDP and its major components are also presented in dollar-denominated form, designated “chained (2000) dollar estimates.” For most series, these estimates, which are presented in table 3, are computed by multiplying the current-dollar value in 2000 by a corresponding quantity index number and then dividing by 100. For example, if a current-dollar GDP component equaled \$100 in 2000 and if real output for this component increased 10 percent in 2001, then the chained (2000) dollar value of this component in 2001 would be \$110 ($= \$100 \times 110/100$). Percent changes calculated from chained-dollar estimates and from chain-type quantity indexes are the same; any differences will be small and due to rounding.

Chained-dollar values for the detailed GDP components will not necessarily sum to the chained-dollar estimate of GDP (or to any intermediate aggregate). This is because the relative prices used as weights for any period other than the reference year differ from those of the reference year. A measure of the extent of such differences is provided by a “residual” line, which indicates the difference between GDP (or other major aggregates) and the sum of the most detailed components in the table. For periods close to the reference year, when there usually has not been much change in the relative prices that are used as weights, the residuals tend to be small, and the chained-dollar estimates can be used to approximate the contributions to growth and to aggregate the detailed estimates. For periods further from the reference year, the residuals tend to be larger, and the chained-dollar estimates are less useful for analyses of contributions to growth. Thus, the contributions to percent change shown in table 2 provide a better measure of the composition of GDP growth. In particular, for components for which relative prices are changing rapidly, calculation of contributions using chained-dollar estimates may be misleading even just a few years from the reference year.

1. For a further discussion, see J. Steven Landefeld, Brent Moulton, and Cindy Vojtech, “Chained-Dollar Indexes: Issues, Tips on Their Use, and Upcoming Changes,” *SURVEY OF CURRENT BUSINESS* 83 (November 2003): 8–16.

Net domestic product											

NOTE: Users are cautioned that particularly for components that exhibit rapid change in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series. For accurate estimates of the contributions

to percent changes in real gross domestic product, use table 2. See "Explanatory Note" at the end of the text.

1. Government consumption expenditures and gross investment.

2. Revised percent change less the previously published percent change.

NOTE: Users are cautioned that particularly for components that exhibit rapid change in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series. For accurate estimates of the contributions to percent changes in real GDP, use table 2.

See "Explanatory Note" at the end of the text.

Table 7C. Chain-Type Price Indexes for Gross Domestic Product, Percent Change from Preceding Year, and Revision to Percent Change

Year	Chain-type price indexes, 2000=100							Percent change from preceding year							Revision to percent change from preceding year ²						
	Gross domestic product	Personal consumption expenditures	Gross private domestic investment	Exports of goods and services	Imports of goods and services	Government ¹	Gross domestic purchases	Gross domestic product	Personal consumption expenditures	Gross private domestic investment	Exports of goods and services	Imports of goods and services	Government ¹	Gross domestic purchases	Gross domestic product	Personal consumption expenditures	Gross private domestic investment	Exports of goods and services	Imports of goods and services	Government ¹	Gross domestic purchases

1. Personal income is also equal to national income less corporate profits with inventory valuation and capital consumption adjustments, taxes on production and imports less subsidies, contributions for government social insurance, net interest and miscellaneous payments, business current transfer payments, current surplus of government enterprises, and wage accruals less disbursements, plus personal income receipts on assets and personal current

transfer receipts.

2. Equals disposable personal income deflated by the implicit price deflator for personal consumption expenditures.

The Effects of Revisions to Seasonal Factors on Revisions to Seasonally Adjusted Estimates

The Case of Exports and Imports

By Dennis J. Fixler, Bruce T. Grimm, and Anne E. Lee

MUCH of BEA's source data contains monthly or quarterly patterns that approximately recur each year. In order to determine what is new or distinctive about economic activity in a particular month or quarter, seasonal adjustments are used to remove the effects of these recurring patterns. Previous BEA studies of revisions to seasonal adjustment factors found that the revisions are relatively large sources of the revisions to gross domestic product (GDP) and its components.¹

This article focuses on the effects of the revisions to the seasonal adjustment factors and the revisions to seasonally unadjusted estimates.² In particular, it looks at the exports and imports recorded in BEA's international transaction accounts—where the use of preliminary source data results in large revisions to the early estimates—and it examines the relative importance of revisions to the underlying seasonally unadjusted data relative to the effects of revisions to seasonal factors.

Seasonal adjustment is a statistical procedure that is used to distinguish seasonal fluctuations from changes in trend growth. It is used, for example to look at the fourth-quarter jump in sales that occurs every year around Christmas and to determine if the increase in any given year is more than the normal Christmas increase and thereby indicative of a strengthening in the economy.

The concept of a “normal” increase is a relative one and can only be judged by reference to some average over recent periods. A string of stronger-than-normal

Christmas sales will therefore change the average used to judge what is normal and the associated seasonal adjustment factors. As a result, one can observe large revisions to seasonally adjusted estimates as they are updated each year to reflect changing seasonal patterns, even if there are no substantial changes in the underlying seasonally unadjusted estimates.

For most components of exports and imports, seasonal factors are calculated by a process that is centered on the year being seasonally adjusted. As a result, the ultimate estimates of seasonal factors depend on both the patterns of the seasonal fluctuations in past years and on the patterns of seasonal fluctuations in future years when the early vintage seasonally adjusted estimates are prepared. Seasonal factors for year y will ultimately depend on both the seasonal patterns in years $y-n$ to y and the seasonal patterns in years $y+1$ to $y+n$. Because future seasonal patterns are unknown—and unforecastable—when the early vintage estimates are prepared, large revisions to seasonal factors that result from the incorporation of data for later years are unavoidable. Finally, the revisions to seasonal factors are not errors, and they can occur with the passage of time, even if no revisions to seasonally unadjusted estimates for a given year—or for preceding years—are made; for example, as seasonal patterns evolve over time, estimates of seasonal factors for year y will change from their initial values.

The principal findings of this article include

- Mean (average) revisions to seasonal adjustment factors for exports and imports of goods and services are of the opposite sign of the revisions to seasonally unadjusted estimates, and they tend to be offsetting.
- Mean absolute revisions to seasonal factors are the principal determinants of the mean absolute revisions to the seasonally adjusted estimates of exports and imports of goods and services.
- Mean absolute revisions to seasonal factors for exports and imports of goods and services can be considerably larger than the revisions to the seasonally unadjusted estimates.

1. Young (1996) reported that “the average absolute revision in quarterly changes in the seasonal factors in the period 1983 to 1988 ... is about one half the size of the total revision (seasonally adjusted) from the current estimates to the latest available estimate of GDP.” Fixler and Grimm (2002) found that mean absolute revisions in seasonal factors in 1987–97 were roughly the same sizes as the corresponding revisions to seasonally adjusted estimates of GDP and seven major components, including exports and imports of goods and services; the revisions examined were from the first annual revision vintage estimates to the third annual revision vintage national income and product accounts (NIPAs).

2. Seasonally unadjusted estimates are also described by BEA as “not seasonally adjusted.”

Anne E. Lee was an intern in the Joint Program on Survey Methodology at BEA in the summer of 2002.

The revisions to seasonally unadjusted estimates reflect the incorporation of somewhat different types of data than the revisions to seasonal factors. The revisions to seasonally unadjusted estimates reflect the incorporation of source data that become available after the earlier vintage estimates for a given period are prepared, and they may use new types of source data. In addition, the revisions may incorporate changes in definitions, classifications, and statistical methodology that adapt the economic accounts to changing economic conditions. At more detailed levels, large revisions to seasonally unadjusted estimates may reflect the limitations of the earlier available source data. These types of revisions are all due to improvements in the economic accounts and do not indicate difficulties such as biases or other unreliability. The revisions to seasonal factors may also reflect revisions to the seasonally unadjusted estimates; in this case, revisions to the seasonal factors tend to offset the revisions to seasonally unadjusted estimates and thus hold down the sizes of revisions to seasonally adjusted estimates.

The revisions to seasonally adjusted estimates are driven by the interactions between the two types of revisions—the revisions to the seasonally unadjusted estimates and the revisions to the seasonal factors. If the seasonal factors are unchanged, the revisions to the seasonally adjusted estimates would be entirely due to the revisions to the seasonally unadjusted estimates. Conversely, if the seasonally unadjusted estimates are unchanged, the revisions to the seasonally adjusted estimates would be entirely due to revisions to the seasonal factors. When both the seasonal factors and the seasonally unadjusted estimates are revised, the mean absolute revisions for the seasonally adjusted estimates may be smaller than the mean absolute revisions for either type of revision, may be in between the sizes of the two types, or may be larger than those for either type. The extent to which the revisions to the two types of estimates offset each other or reinforce each other depends on the complex way in which they interact over time.

The revisions to the seasonally adjusted estimates may be disaggregated into revisions to seasonally unadjusted estimates, revisions to seasonal factors, and the interaction term between revisions to the two. In this study, the interaction term is included in the revisions to seasonal factors; that is, the effects of the revisions to the seasonal factors are measured as

Revisions to seasonal factors = revisions to seasonally adjusted estimates less revisions to seasonally unadjusted estimates.

This treatment of the interaction term is arbitrary, but it may be justified on the grounds that without revisions to seasonal factors, the interaction term would be zero. Separate calculations using selected components of exports and imports—not shown here—suggest that the interaction term is generally small relative to the effects of revisions to the seasonal factors alone.³

The measures of imports and exports examined in this article are from the international transactions accounts (ITAs), which are published quarterly by BEA. The estimates are published both on a seasonally adjusted basis and on a seasonally unadjusted basis. They differ somewhat from those published in the NIPAs because of differences in geographical coverage, in the treatment of international flows of gold, and in the definitional treatment of a few components and because of statistical differences due to differences in the timing of the revisions in the ITAs and the NIPAs.⁴

Preparing the Estimates of Exports and Imports of Goods and Services

Timing of the estimates

In the ITAs, two vintages of estimates for a quarter are prepared—the “preliminary” estimates and the “revised” estimates. The preliminary estimates of the ITAs, including those of exports and imports of goods and services, are released in the 3rd month after the end of each quarter. The revised estimates are released 3 months later when the preliminary estimates for the next quarter are released. Each June, revised annual estimates are released along with the revised estimates for the fourth quarter of the previous year and preliminary estimates for the first quarter of the current year. The revised annual estimates incorporate new and revised source data, updated seasonal factors, and the changes in definitions and in estimating procedures that are part of a continuing process to adapt the ITAs to changing economic circumstances and to improve the quality of the estimates. The estimates are revised back as far as is needed to incorporate all of the various types of revisions; for example, as part of the revision

3. For example, the revision (in percent change at annual rate) to the estimate of seasonally adjusted exports of services for the first quarter of 2001 from the revised vintage to the latest estimate is -5.99 percentage points, reflecting revisions of -4.33 percentage points for the seasonally unadjusted estimate and of -1.66 percentage points for the effects of the seasonal factor as calculated here. An alternative calculation using the revision to the seasonal adjustment factor times the value of the revised estimate indicates that its direct effect is -1.27 percentage points, and the interaction term accounts for the remaining -0.39 percentage point.

4. The two sets of estimates are reconciled on an annual basis in NIPA table 4.5 (this table is now table 4.3 in the 2003 comprehensive revision of the NIPAs). Footnotes to that table provide additional descriptions of differences in the two sets of accounts. The ITAs are also referred to as the “balance-of-payments accounts.”

released in June 2002, some portions of the ITAs for 1995–2001 were revised, and other portions were revised for shorter periods; the exports and imports of goods for 1995–2001 were revised, and the exports and imports of services for 1999–2001 were revised.

The data underlying the ITAs come from four major sources: Census Bureau tabulations of merchandise trade flows, BEA surveys, Treasury Department tabulations of reports on international capital movements, and reports by U.S. Government agencies to BEA.⁵ The data are also obtained from a variety of other public and private sources. The Census Bureau tabulates data from administrative documents that exporters and importers are required to file with the U.S. Customs Service; in addition, it provides data that are used as quantity indicators by BEA to estimate freight and port expenditures that are part of “other” transportation services. Data from BEA’s surveys are used to estimate receipts and payments of income on direct investment, “other” services receipts and payments, and private remittances and other transfers. The Treasury Department tabulations are primarily used to estimate financial flows that are not part of goods and services flows. The reports from other U.S. Government agencies engaged in international transactions are required under Office of Management and Budget Statistical Policy Directive Number 19, and the data from these reports are used to estimate foreign military sales and direct defense expenditures, receipts and payments for various services, and some other financial flows. The variety of other sources provide data that is primarily related to “other” services, reconciliation items, and the preparation of real flows.

Seasonal adjustments

Most exports and imports of goods and services in the ITAs are seasonally adjusted. The exceptions for measures in this study are noted below.

BEA and the Census Bureau work together to seasonally adjust the estimates of exports and imports of goods at the five-digit-end-use-commodity category level, which is the most detailed level of end-use classification available. BEA adjusts the estimates of most components services for seasonality at the most detailed level available by type of service; the exports and imports of royalties and license fees and the exports and imports of “other” services are adjusted at the aggregate levels.

Two seasonal adjustment strategies are commonly used by various government agencies. Regular seasonal adjustments use seasonal factors that are based on sea-

sonal factors for prior years, and for adjusting the estimates for the current year, the seasonal adjustments use either the seasonal factors for the previous year or an average of the seasonal factors for the 2 previous years. Concurrent seasonal adjustments are redone each period (quarter or month), using all the estimates up to and including the current period to calculate the seasonal factor for the current period. Ultimately, the seasonal factors for a given year use data for a number of years before and after the year for which the seasonal factors are being estimated.

Seasonal patterns change gradually.⁶ Thus, rather complex methods have been developed to deal with these changes and other complicating factors. At present, the most widely used seasonal adjustment method is the X–12 ARIMA program developed at the Census Bureau.⁷ This method uses a statistical analysis to calculate how the seasonal pattern of a time series has changed recently and how it might be expected to change further over the coming year. Thus, in contrast to the revisions to seasonally unadjusted estimates, which are revised in response to changes in the measures for each quarter, revisions to seasonal factors result from changes in measures for quarters over a number of years.

BEA’s seasonal adjustment methodology typically projects seasonal factors for the current year that are based on data for prior years and using the X–12 ARIMA program. To adjust the estimates for the current year, BEA estimates the seasonal factors each spring, incorporating the most recent seasonally unadjusted data for the period that extends to the end of the previous year.

Seasonal factors continue to be revised as additional data become available. Ultimately, seasonal factors for each year are calculated from seasonally unadjusted data for a period that is centered on that year, and seasonally unadjusted estimates for a number of preceding years and subsequent years are used to calculate the seasonal factors; the number of years depends on the strategy followed by the agency doing the seasonal adjustment. In addition to the revisions to the seasonal factors generated by this process, the seasonal factors for the exports and imports at the levels examined in this article may also change because of changes in the relative weights of more detailed components if these components have different seasonal patterns. Finally, the seasonally adjusted estimates for each year are ad-

5. For a more extensive discussion of the data sources, see U.S. Bureau of Economic Analysis (1990).

6. As seasonal factors change, their effects sum to 100 percent for each year for which the estimates are being seasonally adjusted.

7. In addition to X–12 ARIMA, similar programs—such as X–11 and X–11 ARIMA—are sometimes used. They all are designed to take into account special factors that affect seasonal patterns, such as the number of business days in a period or the date of Easter.

justed to match the annual totals for the seasonally unadjusted estimates.

Estimates and their sources

The estimates used in this article are from two ITA tables: "Table 1. U.S. International Transactions" and "Table 2. U.S. Trade in Goods."⁸ In addition to the measures examined in this study, these tables contain more detailed estimates. The latest estimates are available on BEA's Web site at <www.bea.gov>.

This article examines the revisions to the quarterly estimates of exports, and imports of goods and services for the period 1990–2000. The revisions to the estimates of exports and imports of goods and their six major components are also examined for 1990–2000. The revisions to exports and imports of services and their seven major components are examined for 1992–2000. The beginning years were chosen because the latest estimates for earlier years have not been subject to the same sets of revisions as the estimates for later years.⁹ However, the latest estimates for years in the sample periods do not always incorporate the same source data or methodologies. The ending year, 2000, was chosen to balance the desirability of large sample sizes against the likelihood of further revisions to the seasonal factors.

Revisions to Seasonal Factors and to Seasonally Adjusted and Seasonally Unadjusted Estimates

The revisions evaluated in this study are the revisions from the preliminary and revised current quarterly estimates to the latest estimates. In order to avoid the distortions associated with the increasing size of exports and imports over time, the estimates are expressed in percent changes at annual rates, and the revisions are measured in percentage points. The use of annual rates means that the estimates are about four times larger than the changes at quarterly rates.

The examination of the revisions uses two summary statistics—mean revision and mean absolute revision. In addition, mean absolute changes for the latest seasonally adjusted estimates are shown in order to allow the reader to compare the summary statistics with these average changes. The mean revision is the average of the revisions:

$$MR = \frac{\sum(L - E)}{n}$$

where E is the percentage change in the earlier quarterly estimate, L is the percentage change in the later

estimate—typically the latest estimate—and n is the number of quarters in the sample period for which the summary statistic is calculated.

Because revisions can be positive or negative and thus may offset each other, it is useful to also look at the mean absolute revision (that is, the mean revision without regard to sign). The mean absolute revision is the average of the absolute values of the revisions:

$$MAR = \frac{\sum|L - E|}{n}$$

Exports and imports of goods and services

Mean revisions and mean absolute revisions for exports and imports of both goods and services for 1990–2000 are shown in table 1. In addition, in the last column of the table, mean absolute changes in the latest estimates of the seasonally adjusted flows are shown so that the sizes of the average revisions can be compared with the sizes of the average changes. The mean revisions for all three types of estimates—seasonally adjusted, seasonally unadjusted, and (the effects of) seasonal factors for both vintages—are small in comparison with the mean absolute changes in the latest seasonally adjusted estimates. All the mean revisions for the seasonally unadjusted estimates of both exports and imports are positive, but all the mean revisions due to seasonal factors are negative. Thus, the two types of revisions tend to offset each other. The net effect of the revisions to the two types of estimates is that the mean revisions for the seasonally adjusted estimates are positive for exports and negative for imports. (The mean revisions for the seasonally unadjusted estimates and those for the seasonal factors are additive in deriving mean revisions to the seasonally adjusted estimates.)

The mean absolute revisions for the seasonally adjusted estimates of both exports and imports are larger than the mean absolute revisions for either the

Table 1. Revisions From Preliminary and Revised Estimates to Latest Estimates of Quarterly Changes in Exports and Imports of Goods and Services, 1990–2000

[Percentage points at annual rates]

	Mean revision		Mean absolute revision		Mean absolute change ¹
	Preliminary	Revised	Preliminary	Revised	Latest
Exports of goods and services					
Seasonally adjusted	0.38	0.26	3.47	3.23	8.96
Seasonally unadjusted	0.81	0.38	1.94	1.57
Seasonal factors	-0.44	-0.12	3.42	3.07
Imports of goods and services

Seasonally unadjusted	0.10	0.02	1.75	1.57
Seasonal factors	-0.17	-0.19	2.00	1.88

1. Mean of the absolute values of changes from quarter to quarter.

8. Ten other ITA tables provide additional information.

9. The latest estimates in this study are those available in March 2003.

seasonally unadjusted estimates or the seasonal factors. The mean absolute revisions for the seasonal factors are larger than those for the seasonally unadjusted estimates. Thus, the revisions to the seasonally unadjusted estimates augment the revisions to seasonal factors in determining the revisions to the seasonally adjusted estimates.¹⁰

The mean absolute revisions for the revised seasonally adjusted estimates of exports and imports are both about 0.2 percentage point smaller than those for the preliminary estimates; this result suggests that the revised estimates are more accurate. In addition, the mean absolute revisions for both the revised seasonally unadjusted estimates and the revised seasonal factors are also smaller than the preliminary estimates.

Exports and imports of goods

The mean revisions and mean absolute revisions for exports and imports of goods for 1990–2000 are shown in table 2. The results are broadly similar to those shown in table 1. The mean revisions are small in comparison with the mean absolute changes; the mean absolute revisions for seasonally adjusted estimates are larger than those for either the seasonally unadjusted estimates or the seasonal factors, and the mean absolute revisions for the revised estimates are smaller than those for the preliminary estimates. However, the mean revisions for the seasonal factors are nearly as large as the mean revisions for the seasonally adjusted estimates of exports of goods and larger than the mean revisions for the seasonally adjusted estimates of imports of goods. Similarly, the mean absolute revisions for the seasonal factors are about four times as large as those for the seasonally unadjusted estimates. Thus,

10. In contrast, Fixler and Grimm (2002, 19) found that the revisions to seasonal factors were found to offset the effects of the revisions to seasonally unadjusted estimates of GDP and most of its major components, and the mean absolute revisions to the seasonally adjusted estimates were smaller than those to either the seasonally unadjusted estimates or the seasonal factors for all GDP components except imports.

Table 2. Revisions From Preliminary and Revised Estimates to Latest Estimates of Quarterly Changes in Exports and Imports of Goods, 1990–2000

[Percentage points at annual rates]

	Mean revision		Mean absolute revision		Mean absolute change ¹
	Preliminary	Revised	Preliminary	Revised	Latest

Seasonally unadjusted	0.03	0.09	0.90	0.67	
Seasonal factors	-0.19	-0.36	2.30	2.18	

1. Mean of the absolute values of changes from quarter to quarter.

the revisions to seasonal factors contribute heavily to revisions to the seasonally adjusted estimates.

The revisions for exports of goods disaggregated into five components and a residual “not elsewhere classified” are shown in table 3.¹¹ The mean revisions are generally small and negative and are primarily due to the revisions to the seasonal factors. An exception is a positive mean revision for the revised estimates of exports of automotive vehicles, engines, and parts; for these estimates, a positive mean revision for the seasonally unadjusted estimates more than offsets the negative mean revision for seasonal factors. Like the revisions to total exports of goods, the mean absolute revisions for the seasonally adjusted estimates of the exports of the five components are larger than those for either the seasonally unadjusted estimates or the seasonal factors, which augment each other. The mean absolute revisions for the seasonal factors are also much larger than those for the seasonally unadjusted estimates.

The revisions for imports of goods disaggregated into the same five components as for exports are shown in table 4. The mean revisions—which again are small—are negative for most of the seasonally adjusted estimates and for all of the seasonal factors, and

11. The “not elsewhere classified” grouping is a catchall that is small, and its components have changed over time. As a result, it is not included in the discussion of either exports or imports of goods.

Table 3. Revisions From Preliminary and Revised Estimates to Latest Estimates of Quarterly Changes in Exports of Goods by Major Component, 1990–2000

Seasonal factors	-0.58	-0.49	7.2	7.08	
Not elsewhere classified					
Seasonally adjusted	1.32	-7.59	26.16	23.29	19.96
Seasonally unadjusted	3.56	-5.95	26.55	23.99	
Seasonal factors	-2.24	-1.64	5.13	5.19	

they are positive for most of the seasonally unadjusted estimates. The mean absolute revisions for the seasonally adjusted estimates are larger than those for all of the seasonally unadjusted estimates and larger than those for the seasonal factors for three of the five components. The mean absolute revisions for the seasonal factors are substantially larger than those for the seasonally unadjusted estimates for four components, but for industrial supplies and materials, the revisions for the seasonal factors are about the same size as those for the unadjusted estimates.

For both the exports and imports of goods, the mean absolute revisions for the revised estimates of all the components and for all three types of estimates are smaller than the revisions for the preliminary estimates. This result suggests that the revised estimates are more accurate. In addition, the finding that the mean absolute revisions for the seasonal factors are considerably larger than those for the seasonally unadjusted estimates—and typically nearly as large as those for the seasonally adjusted estimates—indicates that the incorporation of additional years of data in determining the seasonal factors plays a major role in the revisions to the seasonally adjusted estimates.

Exports and imports of services

The revisions for exports and imports of services for 1992–2000 are shown in table 5. The mean revisions for the seasonally adjusted estimates are positive, but

small relative to the mean absolute changes; however they are larger than those for the exports and imports of goods (table 2). These positive mean revisions are primarily due to upward revisions to the seasonally unadjusted estimates.

The mean absolute revisions for the seasonally adjusted estimates are smaller than those for the seasonally unadjusted estimates but are larger than those for the seasonal factors. Thus, in contrast to the seasonally adjusted estimates exports and imports of goods, the revisions for the seasonal factors partly offset those for the unadjusted estimates. The mean absolute revisions for the seasonally adjusted estimates of the exports of services are roughly the same size as those for exports of goods, but those for the imports of services are about twice the size of those for the imports of goods. The mean absolute revisions for seasonally unadjusted estimates of exports and imports of services are both much larger than those of exports and imports of goods.

The revisions to exports of services disaggregated into seven components are shown in table 6. Two of the components—transfers under U.S. military agency sales contracts and miscellaneous U.S. Government services—are judged to not have seasonal patterns and are not seasonally adjusted. Both the mean revisions and the mean absolute revisions for these components are large in comparison with those for all exports of services, but the components are quite small relative to all the exports of services and are not further discussed.

The mean revisions for most estimates of the other five components are small relative to the mean absolute changes. The mean revision for the preliminary estimates of royalties and license fees, however, is more than half the size of the mean absolute change. The mean absolute revisions for the seasonally adjusted estimates are nearly as large as the mean absolute changes, and the mean absolute revision for the preliminary estimates for passenger fares is slightly larger.

Table 5. Revisions From Preliminary and Revised Estimates to Latest Estimates of Quarterly Changes in Exports and Imports of Services, 1992–2000
[Percentage points at annual rates]

	Mean revision		Mean absolute revision		Mean absolute change
	Preliminary	Revised	Preliminary	Revised	
Exports					
Seasonally adjusted.....	1.75	1.11	4.39	4.22	6.71
Seasonally unadjusted.....	1.75	0.68	4.87	4.94	
Seasonal factors.....	0.00	0.43	2.14	2.07	
Imports					
Seasonally adjusted.....	0.69	0.70	4.89	4.61	7.76
Seasonally unadjusted.....	1.21	0.54	6.38	6.38	
Seasonal factors.....	-0.52	0.16	3.98	3.80	

For most of the components, the mean absolute revisions for the seasonally adjusted estimates are smaller than those for the seasonally unadjusted estimates and larger than those for the seasonal factors; thus, the revisions to the seasonal factors partly offset the revisions to the seasonally unadjusted estimates. However, the two vintages of estimates of royalties and license fees have mean absolute revisions for the seasonally adjusted estimates that are slightly larger than those for the other two types.

The revisions for imports of services disaggregated into seven components are shown in table 7. Like exports of services, two components—direct defense expenditures and miscellaneous U.S. Government services—are not seasonally adjusted. The mean revisions for the two components are similar in size to those for all the imports of services, but the mean absolute revisions are considerably larger. These components are small relative to all the imports of services, and they are not further discussed. The mean revisions for the other five components are small relative to the corresponding mean absolute changes.

A closer examination of two components—travel and passenger fares—illustrates one of the complex ways that the revisions to seasonally unadjusted estimates interact with the revisions to seasonal factors. The mean revisions for seasonally unadjusted estimates of travel have large negative values, while the mean revisions for the seasonal factors for travel have large positive revisions, illustrating an offsetting relationship.

Table 6. Revisions From Preliminary and Revised Estimates to Latest Estimates of Quarterly Changes in Exports of Services by Major Component, 1992–2000

relationship. Yet, while the seasonally unadjusted passenger fares have large positive values, it is only the mean revision for the seasonal factors for the preliminary estimates of passenger fares that has an opposite sign. The mean revision for the revised estimates of the seasonal factors for passenger fares is positive, and it adds to the positive mean revision for the seasonally unadjusted estimates.

The mean absolute revisions for the seasonally adjusted estimates of four components are roughly as large as the mean absolute changes. For most components, the mean absolute revisions for the seasonally unadjusted estimates are smaller than those for the seasonal factors; like the exports of services, the revisions to the seasonal factors partly offset the revisions to the seasonally unadjusted estimates. However, the mean absolute revisions for the seasonally adjusted estimates for the two vintages of estimates of "other transportation" and for the revised estimates of royalties and license fees are slightly larger than those for the unadjusted estimates.

As with goods, the mean absolute revisions for the revised estimates of both exports and imports of services and their components are all smaller than those for the preliminary estimates. This result also may be interpreted as the increase in accuracy. In addition, the mean absolute revisions for the seasonally unadjusted services components are all larger than those for the seasonal factors, in contrast to those for the goods components.

The meaning of the sizes of revisions

Each year, BEA revises its estimates to incorporate statistical and methodological changes and changes in definitions and classifications. BEA implements these improvements as part of a continuing effort to address gaps in coverage, to refine estimation techniques, and to conform more closely with international classification guidelines.¹²

The effect of improvements increases the sizes of revisions. As explained by Young (1996),

An improvement in the current estimates results in a permanent decrease in revision size. Improvement in both the current and latest available estimates results in little change. Improvement that is introduced...into the (then) latest available estimates as is often the case, results in an increase in revision size for a period of years until the improvement is also reflected in the current estimates.

Thus, the ongoing process of introducing improvements into the estimates of exports and imports of services is likely to be a major source of revision to the seasonally unadjusted estimates. As a result, the relatively large mean absolute revisions for services reflect the improvements to the estimates. An example of the effects of improvements in the services flows may be seen by comparing the mean revisions for the seasonally unadjusted estimates of exports of services in table 5 with the mean revisions for the seasonally unadjusted estimates of exports of goods in table 2; the mean revisions for services are much larger (and of the opposite sign) than the mean revisions for goods.

Conclusions

In general, the effects of the revisions to seasonal factors on mean absolute revisions for the seasonally adjusted estimates of exports and imports generally do not simply add to the effects of the revisions to the seasonally unadjusted estimates. The revisions to the seasonally unadjusted estimates result from revisions to the estimates for a quarter, whereas revisions to the seasonal factors result from revisions to the seasonally unadjusted estimates for many quarters that are spread over a number of years. Revisions, however, may also result from improvements to the estimating process. As a result, large revisions do not necessarily indicate poor reliability, and small revisions do not necessarily indicate good reliability.

12. The improvements are described in an article about revisions to the international transactions accounts that is published each July in the *SURVEY OF CURRENT BUSINESS*. For a summary of the many improvements to BEA's data on international services, see Whichard and Borga (2002, 54–56).

The mean absolute revisions for seasonally adjusted estimates of the exports and imports of all goods and services and of goods alone are larger than those for either the seasonally unadjusted estimates or the seasonal factors. The mean absolute revisions for the seasonal factors are typically larger than those for the seasonally unadjusted estimates and are nearly as large as those for the seasonally adjusted estimates. A review of the revisions to the components of exports and imports of goods reinforces this finding. The revisions to seasonal factors are the principal determinants of the revisions to the seasonally adjusted estimates and are about half as large as those to the seasonally adjusted estimates of exports and two-thirds as large as those to imports.

The mean absolute revisions for seasonally adjusted estimates of both exports and imports of services are generally larger than those for seasonal factors but are smaller than those for seasonally unadjusted estimates. The effects of the revisions to seasonal factors are nearly as large as the revisions to seasonally adjusted estimates of exports and imports of goods and services. The mean revisions of the two types of revisions are of the opposite sign, and the revisions tend to offset one another.

Revisions to seasonal factors thus play a mixed role. They play a major role in revisions to exports and imports of goods, and they augment the effects of revisions to the seasonally unadjusted estimates. The revisions play a somewhat smaller role in revisions to exports and imports of services, and they tend to offset the effects of revisions to the seasonally unadjusted estimates.

The Reliability of the State Personal Income Estimates

By Robert L. Brown, Bruce T. Grimm, and Marian B. Sacks

THE estimates of state personal income and its components measure and track the levels and the types of incomes that are received by the people who live and work in each state. The estimates provide a framework for the analysis of each state's economy, and the reliability of the estimates is critical to the quality of such analyses and to their usefulness as bases for decisionmaking.

"Reliability" refers to the magnitudes of the revisions to the estimates or to the changes from the first estimates to the latest estimates, so reliability is defined as the ability of the successive vintages of the estimates of state personal income to present a consistent picture of a state's economy; reliable estimates consistently show the direction and the change in a state's economic growth.¹ The most recent estimates that have been revised to incorporate the increasingly comprehensive and improved data are used as the standards for reliability because they are presumed to be the best estimates.

The preliminary estimates of personal income for states

- Successfully indicated the direction of change in state personal income 95 percent of the time,
- Successfully indicated whether state personal income was accelerating or decelerating 77 percent of the time, and
- Successfully indicated whether state personal income growth was near its trend rate 86 percent of the time.

The estimates are revised largely in order to incorpo-

1. This definition differs from that used in statistics to analyze survey results and quality control. Reliability also differs from accuracy, which refers to total measurement error and is never observed in the state personal income estimates. In particular, the latest estimates contain errors that result from causes, such as data gaps and nonsampling errors, that are not quantifiable.

For a previous study of the revisions for 1980–87, see Robert L. Brown and James P. Stehle, "Evaluation of the State Personal Income Estimates," *SURVEY OF CURRENT BUSINESS* 70 (December 1990): 20–29.

Matthew A. von Kerczek, James M. Zavrel, and Scott A. Killian also contributed to the preparation of this article. Scott Killian was an intern in the Joint Program on Survey Methodology at BEA in the summer of 2003.

rate new or more complete source data, to reflect changes to conceptual definitions and classifications that adapt the economic accounts to a changing economy, to use the improvements in statistical techniques, and to update the seasonal factors that are used to seasonally adjust the estimates, not in order to correct errors in the preliminary estimates.² Seasonal factors are revised largely to incorporate additional years of data that were not available—or forecastable—when the earlier estimates were prepared.³ Thus, most revisions are primarily due to improvements that were impossible to make when the earlier estimates were prepared.

This study provides information that will be useful for readers to determine the suitability of the estimates released at different stages of the estimating process. The successive releases of revised estimates are referred to as "vintages." The first, or preliminary, quarterly estimates of state personal income, the second quarterly estimates, and the first, or preliminary, annual estimates are featured. The estimates that are used as the standard-of-accuracy estimates are the latest estimates that were released in April 2003.

In this article, the quarterly estimates for the second quarter of 1991 through the fourth quarter of 2001 are analyzed. This period covers one complete business cycle: The second quarter of 1991 is the first quarter of positive growth in real GDP after a cyclical trough, and the fourth quarter of 2001 is the first quarter of positive growth in real GDP after a cyclical downturn that started in the first quarter of 2001. The annual estimates for 1991–2001 are analyzed, and because this period ends in 2001, all of the revisions include at least two annual-vintage revisions.

This study presents an overview of the source data and the methods that are used to prepare the estimates of state personal income. It then examines the principal measures of revisions that are used to evaluate the reliability of the estimates and presents some

2. The revisions also reflect the use of the national totals and the annual state estimates as controls. See also the box "Meaning of Revisions" in Dennis J. Fixler and Bruce T. Grimm, "Reliability of GDP and Related NIPA Estimates," *SURVEY* 82 (January 2002): 9–27.

3. See also Dennis J. Fixler, Bruce T. Grimm, and Anne E. Lee, "The Effects of Revisions to Seasonal Factors on Revisions to Seasonally Adjusted Estimates: The Case of Exports and Imports," *SURVEY* 83 (December 2003): 43–50.

additional measures of revisions—including measures of the revisions to the preliminary annual estimates. In conclusion, this study outlines some recent developments that affect the revisions to the estimates.

Overview of the Sources and Methods

The quarterly and annual estimates of state personal income are revised to incorporate source data that are more complete, more detailed, or otherwise more appropriate than the data that were previously available. These source data are incorporated at specific stages in the estimating process, and successive estimates are released according to a schedule.

The quarterly state estimates are tied to the annual state estimates, which incorporate more detailed and more reliable source data than the quarterly estimates. The quarterly estimates of all the components of state personal income are based on the growth rates of quarterly state source data that are controlled to the annual state estimates of the components. In addition, the quarterly state estimates are controlled to personal income in the national income and product accounts (NIPAs).⁴

Revision schedule for the state estimates

The preliminary quarterly estimates of state personal income are released 4 months after the close of the quarter. The second quarterly estimates are released 3 months later. In October and again in the following April, the quarterly estimates for the preceding 3 years are revised to reflect revisions to the annual estimates.

The preliminary annual estimates of state personal income for the previous year, which are based on the current quarterly estimates, are released in April, 4 months after the end of the year. Revised annual estimates, which are developed independently and are prepared in greater component detail than the quarterly estimates, are released in September. For several succeeding years, the annual estimates are revised again in April and in September when additional data become available.

Sources of the revisions

Personal income is the income that is received by persons from participation in production. It is calculated

4. The state quarterly estimates of wages and salaries are controlled to—that is, they are made to add to—the NIPA estimates of wages and salaries after adjusting for coverage differences, such as the exclusion of wages and salaries of U.S. citizens stationed abroad. See the box “Personal Income in the NIPAs and State Personal Income” in “State Personal Income: Revised Estimates for 1999–2001,” *SURVEY* (October 2002).

In addition, the detailed methodology that is used to prepare the annual and quarterly state personal income estimates is available on BEA's Web site at <www.bea.gov> and in *State Personal Income 1929–97*.

as the sum of wage and salary disbursements, other labor income, proprietors' income with inventory valuation and capital consumption adjustments, rental income of persons with capital consumption adjustment, personal dividend income, personal interest income, and transfer payments to persons, less personal contributions for social insurance. A summary of the major sources of state data for the preliminary quarterly estimates, the second quarterly estimates, and the detailed annual state estimates of personal income are presented in table 1. The sources and methods used to produce wage and salary disbursements, farm proprietors' income, the components that are based on wage and salary estimates, and the components that are based on trends are discussed, and the sources of the revisions are described.

Wage and salary disbursements. The preliminary national and state estimates are based on a sample of employment and, where available, on average weekly earnings from the Current Employment Statistics (CES) program of the Bureau of Labor Statistics (BLS).⁵ The information from this survey is subject to sampling errors. In addition, the state source data only has earnings information for manufacturing. The national data includes earnings information for all private industries, but the national and state data are only for production and nonsupervisory workers, and the earnings do not include lump-sum payments, such as exercised stock options or bonus payments. These gaps in the coverage of the earnings data have become more significant as the number of production workers relative to nonproduction workers has declined and as wage payments based on profit-sharing programs have become more common in all industries, including manufacturing.⁶ The preliminary quarterly estimates of wages and salaries are subject to more revision than the second estimates because of the use of less comprehensive source data.

The second state estimates of most of wages and salaries are based on tabulations of wages and salaries from the Covered Employment and Wage (CEW) program of the BLS that account for 95 percent of total

5. The CES survey collects monthly data on employment, on average weekly hours, and on average hourly earnings on Form BLS 790; this survey, which is collected for the pay periods that include the 12th of the month, is conducted in cooperation with the state employment security agencies. The monthly data are from a sample of more than 390,000 nonagricultural establishments and are benchmarked annually to the Covered Employment and Wage employment data.

Information from a variety of other sources—for example, the Department of Agriculture for farm workers and the Department of Defense for military personnel—is also used. These sources account for about 5 percent of wages and salaries.

6. Nationally, the employment and earnings of production workers from the CES survey account for approximately 55 percent of the NIPA private wage and salary estimate.

wages.⁷ The state estimates are based on a nearly

7. Quarterly CEW data, or ES-202 reports, on wages and salaries are tabulations from state employment security agencies of employers' reports of their unemployment insurance (UI) contributions that are required from all employers covered by state UI laws and by the unemployment compensation program for Federal employees. The reported wages and salaries, which are released 5 months after the end of the quarter, include lump-sum payments, but they are not separately identifiable.

complete census of wages, but they are still subject to revisions because of updates to the quarterly data, the revisions to seasonal factors, the incorporation of additional source data in the quarterly national and annual state control totals, and the changes to the classifications of wages and salaries or the statistical methods used to produce the estimates. For example,

1. The data used for the extrapolation of the second quarterly estimates are also used to interpolate the revised annual estimates to quarters in the preparation of the revised quarterly estimates

2. The quarterly estimates of wages and salaries, other labor income, and proprietors' income are prepared at the sector level of the North American Industrial Classification System and the annual state estimates are prepared at the subsector level.

3. The trend extrapolation is based on the relationship between the annual state estimates and the annual NIPA estimates.

4. The CES is a monthly survey conducted by the state employment security agencies; the CES program is coordinated by BLS, and the data are published in *Employment and Earnings*.

5. *County Business Patterns* is published annually by the Census Bureau. This series was not used for the

annual state estimates of proprietors' income released in May 2000, because more current data were available from the IRS.

6. The use of the estimates of wages and salaries in the estimation of quarterly and annual other labor income and personal contributions for social insurance by employees incorporates the state relative changes and distributions of the source data used for wages and salaries into the estimates for the other components, for which more direct source data are unavailable.

7. For the quarterly estimates of proprietors' income in the construction industry, the quarterly relative changes in the estimates of wages and salaries are used instead of the annual trends in proprietors' income because the annual trend does not capture well the rapid and irregular fluctuations in the activity of this industry.

8. The residence adjustment is not a component of personal income.

until July 2002, the second quarterly state estimates were controlled to the same NIPA estimates of wages and salaries as the preliminary quarterly estimates, and the second quarterly state estimates were based on data that were more complete than the data for the published national control total; as a result, the second quarterly state estimates were subject to further revision when the national total incorporated the CEW data.⁸

As noted above, the second estimates of wages and salaries are also subject to revision due to revisions to the seasonal factors produced by BEA. The quarterly CEW wage and salary data are adjusted to remove seasonal patterns by using the Census X-11 ARIMA seasonal adjustment program. The seasonal patterns are usually stable, but they sometimes change rapidly, and these changes lead to substantial revisions to the seasonal factors when they are updated to reflect the data for the latest year. In addition, large revisions to the seasonal factors have resulted from lump-sum payments, such as exercised stock options that are included in wages and salaries, because of the unpredictable timing of the exercise of the options.

Farm proprietors' income. The largest sources of revisions to the estimates of farm proprietors' income are due to the lack of quarterly data for farm production expenses and for the change in inventories and to the change in the statistical method used to prepare quarterly estimates of government subsidy payments to farmers.

The quarterly state estimates of farm proprietors' income are prepared in two parts: Government subsidy payments to farmers and farm proprietors' income excluding subsidies.

The annual state estimates of all components of farm proprietors' income are based on source data from the U.S. Department of Agriculture (USDA). The quarterly state estimates for government subsidy payments to farmers are based on annual trends. The quarterly estimates of farm proprietors' income excluding subsidies are based on the growth rates of USDA data on cash receipts from the sale of farm products that are controlled to quarterly national and annual state control totals.

Farm proprietors' income excluding government subsidies is a highly volatile estimate. Quarterly state data are available for income, but no quarterly data are available for production expenses and for the change in inventories. The annual estimates are affected by the

very large swings in the value of change in inventories due to the impact of highly volatile natural and economic conditions on levels of crop production at the state level.

In addition, before the comprehensive NIPA revision that was released in October 1999, the statistical method for producing quarterly national and state estimates of government subsidies to farmers was based on USDA administrative data on subsidy payments to farmers. Therefore, the preliminary and second quarterly state estimates that were produced before June 2000, when the comprehensive state revision was released, do not follow the current method of basing the quarters on the trends of the annual estimates. The preliminary and second quarterly state estimates for farm subsidies for the quarters up through the second quarter of 1999 will have large revisions to the latest estimates, which are produced by a different methodology.

Components based on wages and salaries. The estimates of wages and salaries are used to produce the quarterly estimates of other labor income, construction proprietors' income, personal contributions for social insurance, and the residence adjustment. Because these quarterly estimates are based on wages and salaries, the revisions to the estimates reflect the revisions to the quarterly estimates of wages and salaries and to the incorporation of annual source data.

The annual estimates for these components are based on annual source data from a variety of agencies. For the preliminary quarterly estimates, the second quarterly estimates, and the subsequently revised quarterly estimates, the state estimates of wages and salaries are used as the indicators for the residence adjustment and for the three components that are closely related to wages and salaries. For personal contributions, total wages and salaries are used as the quarterly indicator; for construction proprietors' income, construction wages and salaries are used; for the residence adjustment and for other labor income, wages and salaries by industry are used.

Components based on annual trends. Quarterly state data that can be used as indicators for the following components of personal income are unavailable: Dividends, interest, and rent; transfer payments excluding unemployment insurance benefits; farm wages; pay of military reserves; and nonfarm proprietors' income excluding construction proprietors' income. These components account for about 39 percent of personal income for the Nation. The annual estimates are based on annual source data from a variety of agencies. The quarterly state estimates are based on the changes in the trend in the state shares of the national total; the trend is determined from annual state

8. In July 2002, the estimating procedure for the NIPA quarterly estimates of private wages and salaries was changed to incorporate the quarterly CEW wage data 6 months after the close of the reference quarter. For a discussion of this change and its effect on the revisions to the estimates of wages and salaries, see the section on recent developments.

and national estimates. These estimates are mostly subject to revision from the incorporation of annual national and state source data.

Dividends, interest, and rent account for about 19 percent of national personal income; about two-thirds of this component is interest payments. Because the largest capital markets are national, fluctuations in the rates of return generally are determined more by national economic conditions than by local economic conditions. Moreover, residents of a state may not invest their savings locally. Thus, the state shares of national dividends, interest, and rent are unlikely to change sharply from quarter to quarter in response to local economic conditions.⁹

Transfer payments excluding unemployment insurance benefits account for about 13 percent of national personal income. More than 50 percent of these transfers are social security benefits, other Federal retirement-related transfers, and Medicare payments, and the state shares do not vary much from quarter to quarter. Public assistance payments (for example, supplemental security income, temporary assistance for needy families, Medicaid, and food stamps) are more sensitive to local economic conditions, so the extrapolations of the quarterly estimates of these payments are subject to greater errors than the extrapolations of retirement-related transfer payments.

Farm wages account for 0.2 percent of national personal income, pay of military reserves accounts for 0.1 percent, and nonfarm proprietors' income excluding construction accounts for about 7 percent. Almost half of nonfarm proprietors' income consists of professional and other services, which are likely to have reasonably stable trends in the state shares of national nonfarm proprietors' income; however, proprietors are also important in a number of industries—such as mining, forestry and fisheries, and real estate—that can be quite volatile and that can vary substantially from state to state.

Measures of Revisions

Some straightforward measures of reliability can be developed by enumerating how frequently the revisions of state personal income estimates meet various criteria. Table 2 presents counts of how often the preliminary and second quarterly estimates of personal income for the Nation, for the various regions, and for the states meet reliability criteria. (For ease of exposition, the District of Columbia is treated as if it were a state.)

9. However, quarterly state estimates of rent can be greatly affected by disasters, such as hurricanes. Rent, as defined by BEA, includes the expense of destroyed residential properties in excess of insurance coverage. Special, state-specific adjustments are estimated for each of these disasters and included in the appropriate quarter.

From the second quarter of 1991 through the fourth quarter of 2001, the preliminary estimates of state personal income correctly indicated the direction of change 98 percent of the time for the Nation, from 93 to 100 percent of the time for the regions, and from 70 to 98 percent of the time for the states. The median share of correct indications for the states is 95 percent.¹⁰ The second quarterly income estimates are about as reliable in indicating the direction of change. The median share for the states is 93 percent.

The two vintages of quarterly estimates correctly indicated the acceleration or deceleration of personal income from the previous quarter somewhat more than three-fourths of the time. The preliminary estimates correctly indicated the acceleration or deceleration a median share of 77 percent of the time, and the second estimates did so 81 percent of the time. For the two vintages, the shares of correct indications for the various states range from 67 to 93 percent.

The quarterly estimates correctly indicated whether state personal incomes were increasing at rates near the national trend rate of 1.3 percent per quarter in the period (near-trend is defined as being within one standard deviation, or 0.83 percentage point, of this trend rate).¹¹ As measured by median shares, the preliminary quarterly estimates correctly indicated increases near the trend 76 percent of the time, and the second quarterly estimates did so 82 percent of the time. The shares of correct indications for the various states ranged from 56 to 96 percent of the time.

The principal measures of reliability featured in this article include mean revisions and mean absolute revisions. The mean revision is calculated as the average of the revisions:

$$MR = \Sigma(L - E)/n,$$

where E is the percent change in the earlier quarterly (or annual) estimate, L is the percentage change in the later estimate—usually the latest estimate—and n is the number of observations in the sample period over which the mean is calculated. Percent changes in quarterly estimates are at quarterly rates, corresponding to the convention generally used for the published estimates.

Because revisions can be positive or negative and

10. The median share is emphasized because of the difficulty of comparing the results for all the states, whose economies are different in size and whose volatility varies considerably. The use of medians also reduces the risk that outliers—particularly low outliers—would distort summaries that cover the 50 states and the District of Columbia.

11. Not all of the preliminary and second quarterly estimates were within one standard deviation from the national trend. Out of 43 quarters, the number in the range for individual states varies from 8 to 41, with medians of 36 for the preliminary estimates and 29 for the second estimates. Because of the generally small number of observations above, or below, the range for many states, the success rates for the estimates in the high and low ranges are not evaluated.

thus may be offsetting, it is useful to look at the mean absolute revisions (that is, the mean revisions without regard to sign). The mean absolute revision is the average of the absolute values of the revisions:

$$MAR = \Sigma|L - E|/n.$$

The mean absolute revisions for quarterly personal income, nonfarm personal income, and wages and salaries for the Nation, for the regions, and for the states are presented in table 3. The revisions are from the preliminary quarterly estimates to the latest estimates and from the second quarterly estimates to the latest estimates.

The mean absolute revision for the preliminary estimates of personal income for the United States is smaller than the mean absolute revisions for any state or region because the revisions among the states (and regions) tend to be offsetting. Similarly, the mean absolute revisions for the regions are generally smaller than the mean absolute revisions for the states in the regions; only nine states have smaller mean absolute revisions than mean absolute revisions for their regions. The unweighted average of the mean absolute revisions for the preliminary state estimates is 0.71 percentage point.

The mean absolute revisions for the preliminary

estimates of state personal income are less than 1 percentage point for all but six states in which farm income is important—Iowa, Idaho, Montana, Nebraska, North Dakota, and South Dakota; removing farm income yields mean absolute revisions that are substantially less than 1 percentage point for these states. Removing farm income also substantially lowers the mean absolute revision for Kansas, but it has little effect on the mean absolute revisions for the other states.

As noted earlier, the measurement of quarterly farm income is especially problematic due to a lack of current, detailed source data on farm expenses and due to the volatility of the change in farm inventories. The

farm sector relies heavily on the manipulation of commodity inventories to mitigate the effects of wide swings in prices and production that occur with little discernable pattern or predictability. Therefore, the incorporation of state data on the value of inventory change in the detailed annual estimates often results in substantial revisions to personal income in states with relatively large agricultural economies.

The mean absolute revisions for the second estimates of personal income are slightly smaller than the mean absolute revisions for the preliminary estimates for the Nation, for 6 of the 8 regions, and for 31 states. An unweighted average of the reductions for the states is 0.04 percentage point, and the differences range from a reduction of 0.40 percentage point to an increase of 0.28 percentage point.

The mean absolute revisions for both the preliminary estimates and the second estimates of wages and salaries are larger than those for the estimates of nonfarm personal income for all states and of personal income for most states. The unweighted average of the mean absolute revisions for the state estimates of wages and salaries is 0.85 percentage point for the preliminary estimates and 0.73 percentage point for the second estimates. The mean absolute revisions for the second estimates are smaller than those for the preliminary estimates for 6 regions and 39 states.

The mean revisions from the preliminary estimates to the latest estimates and the second estimates to the latest estimates of personal income, nonfarm personal income, and wages and salaries are shown in table 4. The mean revisions for the Nation and for the regions are small and generally positive. The positive revisions are consistent with the comprehensive revisions of national measures of economic activity, which have tended to raise both the levels and the rates of growth of income, because definitions were changed to adapt the economic accounts to a changing economy. The signs for the mean revisions for the states are more mixed; the revisions from the preliminary estimates to the latest estimates of personal income are negative for 18 states, and the revisions from the second estimates to the latest estimates are negative for 24 states. In general, the revisions for the second estimates are smaller than those for the preliminary estimates. The largest mean revisions were to the preliminary estimates for most of the New England states, Arizona, and Colorado; these revisions reflect large positive revisions to wages and salaries.

When the assumption of a normal distribution for the revisions cannot be rejected statistically, the statistical significance of the mean revisions can be tested. Using this criterion, the statistical significance of the mean revisions for the preliminary estimates of

personal income for 32 states can be tested. The mean revisions are significant at a P-value of less than .05 for three states—Arizona, Colorado, and Mississippi—about double what would be expected by chance. Similarly, the statistical significance of the mean revisions for the preliminary estimates of nonfarm income for 27 states can be tested, and the revisions are significant for three states—Colorado, Vermont, and Wyoming. The mean revisions for wages and salaries for 33 states can be tested, and the revisions are significant for three states—Arizona, Colorado, and Alaska.

For these three state measures, the hypothesis that the mean revisions were zero is rejected somewhat less than twice as often as would be expected by chance.

Excluding the rejections for Colorado, the number of rejections is about what would be expected by chance. About three-fifths of the mean revisions for the second estimates of the three income measures were also tested, and none of the mean revisions are statistically significantly different from zero.

The mean revisions and the mean absolute revisions from the preliminary estimates to the second estimates for the three income measures are shown in table 5. The mean absolute revisions for the states and regions are typically nearly as large as those from these vintages of quarterly estimates to the latest estimates. The unweighted numerical average of mean absolute

revisions between the preliminary and second estimates of personal income for the states is 0.54 percentage point, or roughly 0.15 percentage point smaller than those from the two vintages of estimates to the latest estimates.

The mean revisions are generally positive and are as large as those from the preliminary estimates to the latest estimates for the states. The largest revisions are for the New England states, Arizona, Colorado, and Alaska. The large revisions may be attributed to the replacement of the CES state employment data with the CEW tabulations of wages and salaries.

Additional Measures of Revisions

Range of revisions

The mean range of nine-tenths of the revisions to the state estimates from the preliminary estimates to the latest estimates is 2.9 percentage points, and it extends from -1.4 percentage points to 1.5 percentage points (chart 1). Of the seven states in which the spread between the lower bound and the upper bound is more than 3.5 percentage points, four states are in the Plains region, two are in the Rocky Mountain region, and one is in the Far West. Removing farm income lowers the

Chart 1. Range of Revisions to Personal Income: Two-Thirds and Nine-Tenths of Revisions, Latest Estimates Less Preliminary Estimates, 1991:II–2001:IV

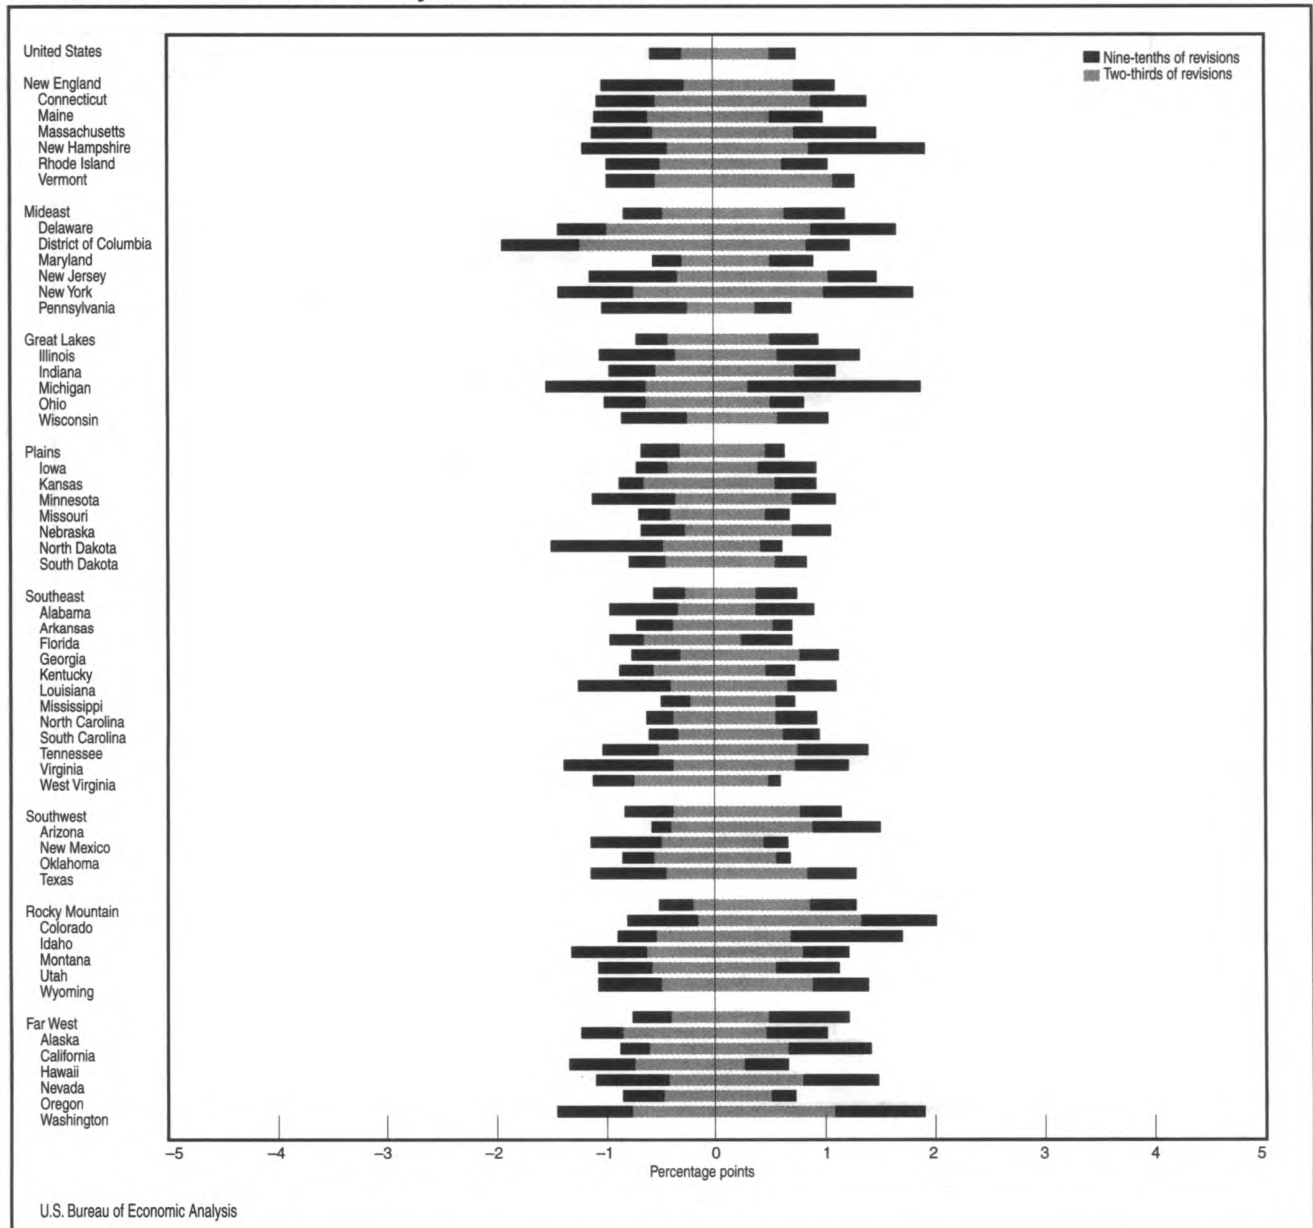

mean range to 2.3 percentage points, from -1.1 percentage points to 1.2 percentage points, and no states register a range as large as 3.5 percentage points (chart 2).

The ranges of revisions to wages and salaries are generally larger than the ranges of revisions to personal income (chart 3). The mean range of nine-tenths of the revisions to the state estimates from the preliminary estimates to the latest estimates is 3.4 percentage points, and it extends from -1.6 percentage points to 1.8 percentage points. Only eight states have larger ranges for personal income than for wages and salaries,

and none has larger ranges for nonfarm personal income than for wages and salaries. In all, 18 states have ranges for wages and salaries greater than 3.5 percentage points, but only 2—Montana and Washington—have ranges greater than 3.5 percentage points for both personal income and wages and salaries.

The effects of the revisions to farm income on the revisions to personal income may be examined indirectly by comparing the revisions to nonfarm personal income with those to total personal income. For the Nation, the quarter-by-quarter revisions to the two personal income measures differ modestly, and the

Chart 2. Range of Revisions to Nonfarm Personal Income: Two-Thirds and Nine-Tenths of Revisions, Latest Estimates Less Preliminary Estimates, 1991:II-2001:IV

largest differences occur in 1992–94 (panel 1 of chart 4). The correlation between the two sets of revisions to the two income measures is 0.9669. However, the differences between the revisions to the two measures vary widely by region and by state. For the New England region, the differences between the two measures are the smallest of those for any region; the lines indicating the revisions to the measures are almost identical, and their correlation is 0.9997 (panel 2). In contrast, the revisions to the measures for the Plains region are the largest of any region; there is little corre-

spondence between the two revisions measures, and their correlation is just 0.2745 (panel 3).

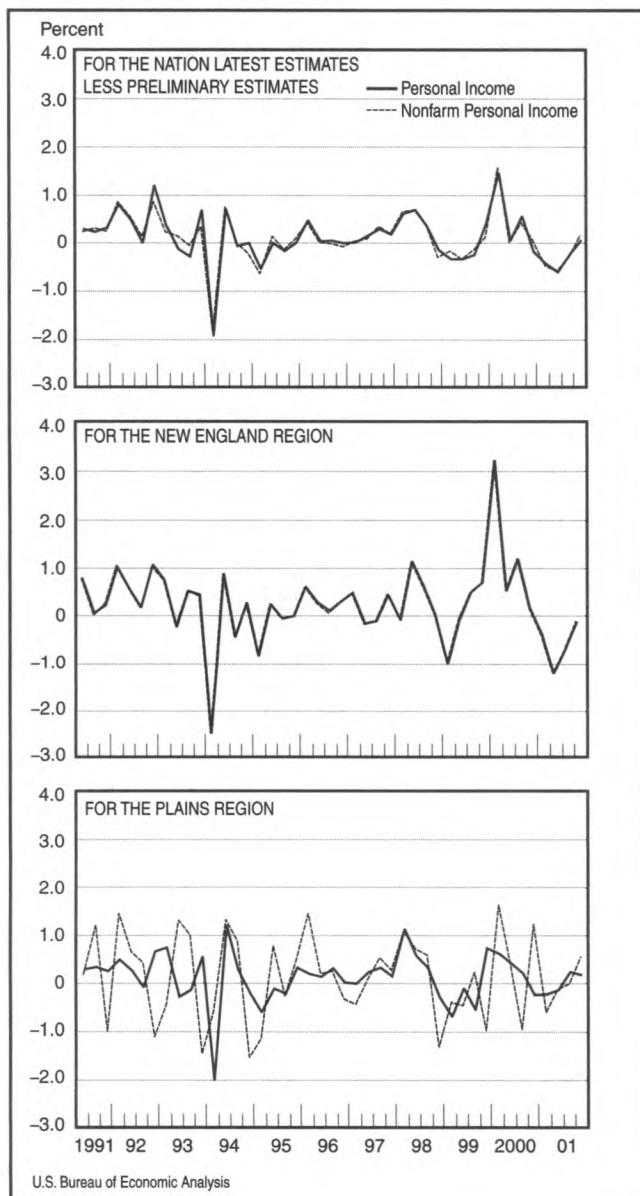

A major factor in determining the effects of the revisions to farm income on personal income is the relative size of the share of farm income in personal income. The share of farm income in U.S. personal averages 1.04 percent in 1991–2001. The share for the New England region averages 0.26 percent, but the share in the Plains region averages 3.10 percent. Differences in the types of agricultural output that are important in the regions also help to explain the

Chart 3. Range of Revisions to Wages and Salaries: Two-Thirds and Nine-Tenths of Revisions, Latest Estimates Less Preliminary Estimates, 1991:II–2001:IV

differences in revisions to the two income measures because different products have different price and quantity volatilities. Based on the values of marketings, the most important agricultural products in New England include greenhouse products, dairy products and eggs, fruit, and sweet corn. In contrast, in the Plains states, the most important products include cattle, grains and oil seeds, and hogs; stocks of these large-scale-of-production commodities are more likely to be moved in and out of farm inventories rather than taken to market, which creates the type of estimation problems described earlier in this article.

Chart 4. Revisions to Personal Income and Nonfarm Personal Income

Revisions by the quarters of the year

It is interesting to examine the mean absolute revisions of personal income separately for the four quarters of years. The mean absolute revisions—from the preliminary estimates to the latest estimates for the three income measures—are disaggregated into the revisions for the first quarters, those for the second quarters, those for the third quarters, and those for the fourth quarters in table 6. For the Nation and for most states and regions, the first-quarter mean absolute revisions for all three measures are larger than those for the other three quarters. This difference may be the result of the use of source data for the preliminary estimates that do not include lump-sum payments, which can be deferred or accelerated at the end of the calendar year to take advantage of changes in Federal income tax laws. In addition, the first quarter is typically when changes in unemployment insurance tax laws become effective, and changes in coverage of employees and in the definition of wages would first appear in the CEW wage reports for the first quarter.

The mean absolute revisions for personal income for the first quarters are larger than 1.00 percentage point for 20 states; these states are in all of the regions except the Southeast. In contrast, the revisions for only six states are larger than 1.00 percentage point when all the revisions for the quarters are grouped (see table 3), and these states are all in the Plains region or in the Rocky Mountain region. The mean absolute revisions are larger than 1.00 percentage point for only four states for the second quarters, for only three states for the third quarter, and for only eight states for the fourth quarter.

The mean absolute revisions for the first-quarter estimates of wages and salaries are generally larger than the revisions for the estimates of personal income; for 27 states, the mean absolute revisions are larger than

For additional analyses of the revisions to the estimates of state personal income, see the more detailed paper that is available on BEA's Web site at <www.bea.gov>, in the "Working Papers" portion of the "Papers and Presentations" section. The additional analyses indicate that revisions tend to move the state estimates toward longer run trends for each state. They indicate a weaker tendency to revise toward national total estimates. They also indicate that states with larger populations tend to have smaller revisions and that states where farm income is relatively important tend to have larger revisions.

1.00 percentage point. The mean absolute revisions for estimates of wages and salaries are larger than 1.00 percentage point in other quarters; for 12 states for the second quarters, for 6 states for the third quarters, and for 7 states for the fourth quarters.

The mean absolute revisions for nonfarm personal income are larger than 1.00 percentage point only in the first two quarters; for 11 states in the first quarters and for 1 state in the second quarters. In all of these states except Wyoming, the mean absolute revisions for wages and salaries are more than 1.00 percentage point for the same quarters. As a result of the introduction of farm-related income, the number of states with mean absolute revisions for personal income greater

than 1.00 percentage point in the four quarters increased by 23 states—9 states in the first quarters, 3 states each in the second and third quarters, and 8 states in the fourth quarters.

The sizes of mean absolute revisions for personal income for the four quarters can also be evaluated by tabulating the number of states that have the largest mean absolute revisions in the first quarter, the number that have the second largest revisions, and the third and fourth largest revisions. For 42 states, the largest revisions to personal income are in the first quarters and 9 of the second largest, but none of the third or fourth largest. Conversely, none of the states have the largest revisions in the third quarters.

Revisions to preliminary annual estimates

Many applications of the state personal income estimates are based on the annual-frequency estimates. The preliminary annual estimates are derived as sums of the quarterly estimates. The mean absolute revisions from the preliminary annual estimates to the latest annual estimates for 1991–2001 are shown in table 7. In order to make these revisions statistics comparable with those for the quarterly estimates (tables 3 and 4), the mean absolute revisions are expressed in terms of percentage points at quarterly rates, so they are about a

fourth of the size that they would be if they were expressed at annual rates.¹²

The mean absolute revision for the preliminary estimates of annual personal income for the Nation is 0.31 percentage point, slightly smaller than the revision for the preliminary quarterly estimate of 0.35 percentage point and the revision for the second quarterly estimate of 0.33 percentage point. The mean absolute revisions for the preliminary annual estimates are smaller than the quarterly revisions for almost all of the regions: An unweighted average of these revisions for the regions is 0.34 percentage point, compared with values of 0.53 percentage point for the preliminary quarterly estimates and 0.49 percentage point for the second quarterly estimates. The mean absolute revisions for the preliminary annual estimates for the individual states are also generally smaller than the revisions for the preliminary quarterly estimates; only those for Alabama, Hawaii, Nevada, and Oregon are larger.

Similarly, the mean absolute revisions for the preliminary annual estimates of nonfarm personal income of only 8 states are larger than the corresponding preliminary quarterly estimates, and those of 13 states are larger than the corresponding second quarterly estimates. Also, the mean absolute revisions for the annual estimates of wages and salaries are smaller than those for personal income; the reverse is true for the quarterly estimates.

In contrast, the mean absolute revisions for the preliminary annual estimates of wages and salaries for all of the states are much smaller than those for the two vintages of quarterly estimates. The median for the revisions for the annual estimates for the states is 0.20 percentage point, the median for the preliminary quarterly estimates is 0.79 percentage point, and the median for the second quarterly estimates is 0.67 percentage point.

The mean absolute revisions for the preliminary annual estimates are smaller than those for the quarterly estimates for three main reasons. First, CEW wage and salary data for the Nation and for the states are incorporated into the preliminary annual estimates for most of the period. Second, state-level annual data on farm proprietors' income are incorporated into the preliminary annual estimates. Third, annual estimates are not affected by seasonal adjustments, which are subject to large revisions.

The differences of mean revisions for the preliminary annual estimates and those for the quarterly

12. The formula for converting a percent change at annual rate, C, to a percentage change at quarterly rate is $((1+(C/100))^{1/4}-1)*100$. With this formula, a positive C will yield a quarterly value slightly less than a fourth its size, and a negative C will yield a quarterly value slightly more than a fourth its size.

estimates are much smaller, reflecting the means' small sizes. The mean revisions for the annual estimates of total personal income, nonfarm personal income, and wages and salaries are negative for all states.

Recent Developments

The seasonal adjustment procedure for quarterly state estimates of wages and salaries has been improved in the past decade by implementing several new procedures. Adjustments have been made to the quarterly estimates for 1992–94, which were affected by tax legislation, and for the quarters with irregular pay patterns that contain more or fewer than 13 Fridays. The Census X–11 ARIMA program is run twice a year when BEA prepares historical revisions of quarterly state personal income. These revisions incorporate the latest available quarterly CEW wage data. As a result, the projected seasonal factors used for the second quarterly estimates have produced a smoother series, and the extrapolation for the most current quarter produces better estimates.

Since July 2002, the NIPA quarterly wage and salary estimates have been revised 6 months after the end of each quarter to incorporate the most recent CEW data. Now, the second quarterly state estimates of wages and salaries, which incorporate the state CEW data, are controlled to the revised NIPA national estimates, which also incorporate CEW data. In the future, the revisions to the second quarterly state estimates should be smaller because of this change in the national estimating methodology to match the state methodology.

In July 2003, BEA presented for the first time estimates of quarterly state personal income on the basis of the North American Industry Classification System (NAICS). The estimates at the NAICS-based sector level provide greater industry detail than the division-level basis of the Standard Industrial Classification (SIC) system. Personal income, nonfarm personal in-

come, and total wages and salaries are the same under both the SIC and NAICS, but the conversion of the estimates of quarterly state personal income by industry to NAICS will affect the revisions of state personal income for several reasons. The NAICS classification system substantially differs from the SIC industry classification system, so accurate time-series editing of the source data will be difficult until enough observations are available. In addition, establishments in new sectors, such as the management of companies and enterprises, may be subject to more reclassifications by the source data agencies than establishments in such little changed sectors as construction. Finally, until enough quarters of data become available, seasonal factors for the estimates of wages and salaries will be significantly revised.

The revisions to the quarterly estimates of state personal income continue to be affected by lump-sum payments. Exercised stock options may have diminished as a compensation tool after the collapse of the information-technology-related sector, but they are still used by many companies. The lack of data for these and other lump-sum payments to employees in the preliminary estimate will continue to cause larger revisions to the preliminary estimates of wages and salaries than to the second estimates, which have these payments included in the source data.

The incorporation of comprehensive revisions will continue to affect the ability to effectively study some revisions of the estimates of state personal income. Both definitional changes and statistical changes that are incorporated into the comprehensive 2003 NIPA revision may change the quarterly growth rates in estimates of state personal income that will be released in April 2004. The latest estimates may therefore differ significantly from the preliminary estimates and the second estimates because of the different methodologies or definitions used when the estimates are prepared.

BEA is hiring.

Economists, accountants, and information technology specialists, the Bureau of Economic Analysis (BEA) has a role for you.

Come work for a top-notch Federal statistical agency:

- A recent Federal employee survey named BEA as an “employer of choice,” ranking us among the top five agencies
- A recent Government-wide assessment of program effectiveness ranked BEA in the top 1 percent of the programs assessed

BEA’s work makes a difference. It is a world leader in producing vital economic statistics that influence decisions by government officials, business leaders, and households.

Gross domestic product (GDP)
Personal income, spending, and saving
Industry input and output
International transactions
and investment
State and local area personal income

BEA has immediate openings for both entry-level and advanced positions. For more information, visit our Web site.

*Joint release by Bureau of the Census and the Bureau of Economic Analysis.

Statement of Ownership, Management, and Circulation

1. Publication Title Survey of Current Business		2. Publication Number 3 3 7 - 7 9 0		3. Filing Date Dec. 10, 2003	
4. Issue Frequency Monthly		5. Number of Issues Published Annually		6. Annual Subscription Price Domestic: \$63.00 Foreign: \$88.20	
7. Complete Mailing Address of Known Office of Publication (Not printer) (Street, city, county, state, and ZIP+4) U.S. Bureau of Economic Analysis, Department of Commerce 1441 L Street, N.W., Washington, DC 20230				Contact Person M. Gretchen Gibson Telephone 202-606-9685	
8. Complete Mailing Address of Headquarters or General Business Office of Publisher (Not printer) U.S. Bureau of Economic Analysis, Department of Commerce 1441 L Street, N.W., Washington, DC 20230					
9. Full Names and Complete Mailing Addresses of Publisher, Editor, and Managing Editor (Do not leave blank)					
Publisher (Name and complete mailing address) J. Steven Landefeld, Director, U.S. Bureau of Economic Analysis 1441 L Street, N.W., Washington, DC 20230					
Editor (Name and complete mailing address) M. Gretchen Gibson 1441 L Street, N.W., Washington, DC 20230					
Managing Editor (Name and complete mailing address)					
10. Owner (Do not leave blank. If the publication is owned by a corporation, give the name and address of the corporation immediately followed by the names and addresses of all stockholders owning or holding 1 percent or more of the total amount of stock. If not owned by a corporation, give the names and addresses of the individual owners. If owned by a partnership or other unincorporated firm, give its name and address as well as those of each individual owner. If the publication is published by a nonprofit organization, give its name and address.)					
Full Name N/A		Complete Mailing Address			
11. Known Bondholders, Mortgagees, and Other Security Holders Owning or Holding 1 Percent or More of Total Amount of Bonds, Mortgages, or Other Securities. If none, check box <input checked="" type="checkbox"/> None					
Full Name		Complete Mailing Address			
12. Tax Status (For completion by nonprofit organizations authorized to mail at nonprofit rates) (Check one) The purpose, function, and nonprofit status of this organization and the exempt status for federal income tax purposes: <input type="checkbox"/> Has Not Changed During Preceding 12 Months <input type="checkbox"/> Has Changed During Preceding 12 Months (Publisher must submit explanation of change with this statement)					

13. Publication Title Survey of Current Business		14. Issue Date for Circulation Data Below November 2003	
15. Extent and Nature of Circulation		Average No. Copies Each Issue During Preceding 12 Months	No. Copies of Single Issue Published Nearest to Filing Date
a. Total Number of Copies (Net press run)		5,287	5,149
b. Paid and/or Requested Circulation	(1) Paid/Requested Outside-County Mail Subscriptions Stated on Form 3541. (Include advertiser's proof and exchange copies)	3,124	2,880
	(2) Paid In-County Subscriptions Stated on Form 3541 (Include advertiser's proof and exchange copies)	NA	NA
	(3) Sales Through Dealers and Carriers, Street Vendors, Counter Sales, and Other Non-USPS Paid Distribution	555	635
	(4) Other Classes Mailed Through the USPS	NA	NA
c. Total Paid and/or Requested Circulation (Sum of 15b. (1), (2), (3), and (4))		3,679	3,515
d. Free Distribution by Mail (Samples, complimentary, and other free)	(1) Outside-County as Stated on Form 3541	NA	NA
	(2) In-County as Stated on Form 3541	NA	NA
	(3) Other Classes Mailed Through the USPS	NA	NA
e. Free Distribution Outside the Mail (Carriers or other means)		1,000	1,000
f. Total Free Distribution (Sum of 15d. and 15e.)		1,000	1,000
g. Total Distribution (Sum of 15c. and 15f.)		4,679	4,515
h. Copies not Distributed		608	634
i. Total (Sum of 15g. and h.)		5,287	5,149
j. Percent Paid and/or Requested Circulation (15c. divided by 15g. times 100)		79%	78%
16. Publication of Statement of Ownership <input checked="" type="checkbox"/> Publication required. Will be printed in the December 2003 issue of this publication. <input type="checkbox"/> Publication not required.			
17. Signature and Title of Editor, Publisher, Business Manager, or Owner M. Gretchen Gibson, Acting Editor-in-Chief <i>M. Gretchen Gibson</i>			Date Dec. 10, 2003
I certify that all information furnished on this form is true and complete. I understand that anyone who furnishes false or misleading information on this form or who omits material or information requested on the form may be subject to criminal sanctions (including fines and imprisonment) and/or civil sanctions (including civil penalties).			

Instructions to Publishers

- Complete and file one copy of this form with your postmaster annually on or before October 1. Keep a copy of the completed form for your records.
- In cases where the stockholder or security holder is a trustee, include in items 10 and 11 the name of the person or corporation for whom the trustee is acting. Also include the names and addresses of individuals who are stockholders who own or hold 1 percent or more of the total amount of bonds, mortgages, or other securities of the publishing corporation. In item 11, if none, check the box. Use blank sheets if more space is required.
- Be sure to furnish all circulation information called for in item 15. Free circulation must be shown in items 15d, e, and f.
- Item 15h, Copies not Distributed, must include (1) newsstand copies originally stated on Form 3541, and returned to the publisher (2) estimated returns from news agents, and (3), copies for office use, leftovers, spoiled, and all other copies not distributed.
- If the publication had Periodicals authorization as a general or requester publication, this Statement of Ownership, Management, and Circulation must be published; it must be printed in any issue in October or, if the publication is not published during October, the first issue printed after October.
- In item 16, indicate the date of the issue in which this Statement of Ownership will be published.
- Item 17 must be signed.

Failure to file or publish a statement of ownership may lead to suspension of Periodicals authorization.

BEA Current and Historical Data

National, International, and Regional Data

This section presents an extensive selection of economic statistics prepared by the Bureau of Economic Analysis (BEA) and a brief selection of collateral statistics prepared by other Government agencies and private organizations. Series that originate in Government agencies are not copyrighted and may be reprinted freely. Series from private sources are provided through the courtesy of the compilers and are subject to their copyrights.

BEA's economic statistics are available on BEA's Web site at <www.bea.gov>. The site contains data, articles, news releases, and other information from BEA's national, industry, international, and regional programs.

The tables present annual [A], quarterly [Q], and monthly [M] data

National Data

- A. Selected NIPA tables [A, Q] *
- B. Other NIPA and NIPA-related tables *
- C. Historical measures *
- D. Domestic perspectives [A, Q, M] D-2
- E. Charts
 - Selected NIPA series *
 - Other indicators of the domestic economy D-4

International Data

- F. Transactions tables
 - F.1 U.S. international transactions in goods and services [A, M] D-6
 - F.2 U.S. international transactions [A, Q] D-7
 - F.3 U.S. international transactions by area [Q] D-8
 - F.4 Private services transactions [A] D-11
- G. Investment tables [A]
 - G.1 U.S. international investment position D-12
 - G.2 USDIA: Selected items D-13
 - G.3 Selected financial and operating data of foreign affiliates of U.S. companies D-14
 - G.4 FDIUS: Selected items D-15
 - G.5 Selected financial and operating data of U.S. affiliates of foreign companies D-16
- H. International perspectives [A, Q, M] D-17
- I. Charts
 - The United States in the international economy D-18

Regional Data

- J. State and regional tables
 - J.1 Personal income [Q] D-19
 - J.2 Personal income and per capita personal income [A] D-20
 - J.3 Disposable personal income and per capita disposable personal income [A] D-21
 - J.4 Gross state product [A] D-22
- K. Local area table
 - K.1 Personal income and per capita personal income by metropolitan area [A] D-23
- L. Charts
 - Selected regional estimates D-25

Appendixes

- A: Additional information about the NIPA estimates
 - Statistical conventions D-27
 - Reconciliation tables [A, Q] D-28
- B: Suggested reading D-29

* As a result of the release of the comprehensive revision of the NIPAs, sections A, B, C, and the NIPA charts in section E are not included in this issue. The December 10, 2003, news release of the initial results of the revision is reprinted in this issue (see page 1). The estimates for 1929 forward are available on BEA's Web site at <www.bea.gov>, and they will be published in the January 2004 SURVEY OF CURRENT BUSINESS.

D. Domestic Perspectives

This table presents data collected from other government agencies and private organizations, as noted.
Quarterly data are shown in the middle month of the quarter.

Table D.1. Domestic Perspectives

	2001	2002	2002			2003									
			Oct.	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.

^p Preliminary.

^r Revised.

1. Includes royalties, license fees, and other fees associated with the use of intangible assets, including patents, trade secrets, and other proprietary rights, that are used in connection with the production of goods.

2. Includes royalties, license fees, and other fees associated with the use of copyrights, trademarks, franchises, rights to broadcast live events, software license fees, and other intangible property rights.

3. Other unaffiliated services receipts (exports) include mainly expenditures of foreign governments and international organiza-

tions in the United States and film and television tape rentals. Payments (imports) include mainly expenditures of U.S. residents temporarily working abroad and film and television tape rentals.

4. Includes charges for auxiliary insurance services.

5. Beginning in 1992, the net result of (line 51 - line 52) - (line 55 - line 56) is recorded in "private remittances and other transfers" (table F.2, line 38).

Source: Table 3 in "U.S. International Transactions, Second Quarter 2003" in the October 2003 issue of the Survey of Current Business.

Footnotes to Tables F.2. and F.3.

1. Credits, +; Exports of goods and services and income receipts, unilateral current transfers to the United States; capital account transactions receipts; financial inflows—increase in foreign-owned assets (U.S. liabilities) or decrease in U.S.-owned assets (U.S. claims).

2. Excludes exports of goods under U.S. military agency sales contracts identified in Census export documents, excludes imports of goods under direct defense expenditures identified in Census import documents, and reflects various other adjustments (for valuation, coverage, and timing) of Census statistics to balance of payments basis; see table 2 in "U.S. International Transactions, Second Quarter 2003" in the October 2003 issue of the Survey of Current Business.

3. Includes some goods: Mainly military equipment in line 5; major equipment, other materials, supplies, and petroleum products purchased abroad by U.S. military agencies in line 22; and fuels purchased by airline and steamship operators in lines 8 and 25.

4. Includes transfers of goods and services under U.S. military grant programs.

5. Beginning in 1992, these lines are presented on a gross basis. The definition of exports is revised to exclude U.S. parents' payments to foreign affiliates and to include U.S. affiliates' receipts from foreign parents. The definition of imports is revised to include U.S. parents' payments to foreign affiliates and to exclude U.S. affiliates' receipts from foreign parents.

6. Beginning in 1992, the "other transfers" component includes taxes paid by U.S. private residents to foreign governments and taxes paid by private nonresidents to the U.S. Government.

7. At the present time, all U.S. Treasury-owned gold is held in the United States.

8. Includes sales of foreign obligations to foreigners.

9. Consists of bills, certificates, marketable bonds and notes, and nonmarketable convertible and nonconvertible bonds and notes.

10. Consists of U.S. Treasury and Export-Import Bank obligations, not included elsewhere, and of debt securities of U.S. Government corporations and agencies.

11. Includes, primarily, U.S. Government liabilities associated with military agency sales contracts and other transactions arranged with or through foreign official agencies; see table 4 in "U.S. International Transactions, Second Quarter 2003" in the October 2003 issue of the Survey.

12. Consists of investments in U.S. corporate stocks and in debt securities of private corporations and State and local governments.

13. Conceptually, line 76 is equal to "net foreign investment" in the national income and product accounts (NIPAs). However, the foreign transactions account in the NIPAs (a) includes adjustments to the international transactions accounts for the treatment of gold, (b) includes adjustments for the different geographical treatment of transactions with U.S. territories and Puerto Rico, and (c) includes services furnished without payment by financial pension plans except life insurance carriers and private noninsured pension plans. A reconciliation of the balance on goods and services from the international accounts and the NIPA net exports appears in reconciliation table 2 in appendix A in this issue of the Survey. A reconciliation of the other foreign transactions in the two sets of accounts appears in table 4.5 of the full set of NIPA tables.

Additional footnotes to Table F.3:

14. The "European Union" includes the "European Union (6)," United Kingdom, Denmark, Ireland, Greece, Spain, and Portugal. Beginning with the first quarter of 1995, the "European Union" also includes Austria, Finland, and Sweden.

15. The "European Union (6)" includes Belgium, France, Germany (includes the former German Democratic Republic (East Germany) beginning in the fourth quarter of 1990), Italy, Luxembourg, Netherlands, European Atomic Energy Community, European Coal and Steel Community, and European Investment Bank.

16. Includes, as part of international and unallocated

G. Investment Tables

^p Preliminary.^r Revised.

1. Represents gains or losses on foreign-currency-denominated assets due to their revaluation at current exchange rates.

2. Includes changes in coverage, capital gains and losses of direct investment affiliates, and other statistical adjustments to the value of assets.

3. Reflects changes in the value of the official gold stock due to fluctuations in the market price of gold.

4. Reflects changes in gold stock from U.S. Treasury sales of gold medallions and commemorative and bullion coins; also reflects replenishment through open market purchases. These demonetizations/monetizations are not included in international transactions financial flows.

5. Also includes paid-in capital subscriptions to international financial institutions and resources provided to foreigners under foreign assistance programs requiring repayment over several years. Excludes World War I debts that are not being serviced.

6. Includes indebtedness that the borrower may contractually, or at its option, repay with its currency, with a third country's currency, or by delivery of materials or transfer of services.

7. Primarily U.S. Government liabilities associated with military sales contracts and other transactions arranged with or through foreign official agencies.

Note. In this table, unlike in the international transactions accounts, income and capital outflows are shown without a current-cost adjustment, and income is shown net of withholding taxes. In addition, unlike in the international investment position, the direct investment position is valued at historical cost.

The data in this table are from tables 16 and 17 in "U.S. Direct Investment Abroad: Detail for Historical-Cost Position and Related Capital and Income Flows, 2002" in the September 2003 issue of the Survey of Current Business.

NOTE: In this table, unlike in the international transactions accounts, income and capital inflows are shown without a current-cost adjustment, and income is shown net of withholding taxes. In addition, unlike in the international investment position, the direct investment position is valued at historical cost.

The data in this table are from tables 16 and 17 in "Foreign Direct Investment in the United States: Detail for Historical-Cost Position and Related Capital and Income Flows, 2002" in the September 2003 issue of the Survey of Current Business.

Table G.5. Selected Financial and Operating Data of Nonbank U.S. Affiliates of Foreign Companies by Country of Ultimate Beneficial Owner and by Industry of Affiliate, 2001

	All nonbank affiliates							Majority-owned nonbank affiliates						
	Millions of dollars				Thousands of employees	Millions of dollars		Millions of dollars				Thousands of employees	Millions of dollars	
	Total assets	Sales	Net income	Gross product		U.S. exports of goods shipped by affiliates	U.S. imports of goods shipped to affiliates	Total assets	Sales	Net income	Gross product		U.S. exports of goods shipped by affiliates	U.S. imports of goods shipped to affiliates

D Suppressed to avoid disclosure of data of individual companies.
* Less than \$500,000.

1. The industry classification system used to classify data for U.S. affiliates is based on the North American Industry Classification System. Prior to 1997, the affiliate data were classified using an industry classification system based on the Standard Industrial Classification system.

NOTES: The data in this table are from BEA's annual survey of the operations of U.S. affiliates of foreign companies; see "U.S. Affiliates of Foreign Companies: Operations in 2001," in the August 2003 issue of the SURVEY OF CURRENT BUSINESS. Size ranges are given in employment cells that are suppressed. The size ranges are: A—1 to 499; F—500 to 999; G—1,000 to 2,499; H—2,500 to 4,999; I—5,000 to 9,999; J—10,000 to 24,999; K—25,000 to 49,999; L—50,000 to 99,999; M—100,000 or more.

H. International Perspectives

The quarterly data in this table are shown in the middle month of the quarter.

1. Figures for the euro area and for the United Kingdom are in U.S. dollars per euro and per pound sterling, respectively. The rate for the United States is a weighted average of the nominal foreign exchange value of the U.S. dollar against the currencies of a broad index group of major U.S. trading partners from a base of January=100. For other countries, figures are in currency units per U.S. dollar.

Sources: Exchange rates are from the Board of Governors of the Federal Reserve System. Indexes of stock market prices are calculated from data taken from finance oriented web sites and are rebased

to 2000=100 to facilitate comparisons. Other series are drawn from the web sites of the statistical agencies of the countries shown.

Note: In 2002, the countries in this table accounted for 62 percent of the value of U.S. imports of goods and 70 percent of the value of U.S. exports of goods. The euro area consists of Austria, Belgium, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, Netherlands, Portugal, and Spain.

THE U.S. IN THE INTERNATIONAL ECONOMY

U.S. Bureau of Economic Analysis

Regional Data

J. State and Regional Tables

The tables in this section include the most recent estimates of state personal income and gross state product. The sources of these estimates are noted.

The quarterly and annual estimates of state personal income and the estimates of gross state product are available on CD-ROM. For information on state personal income, e-mail reis.remd@bea.gov; write to the Regional Economic Information System, BE-55, Bureau of Economic Analysis, U.S. Department of Commerce, Washington, DC 20230; or call 202-606-5360. For information on gross state product, e-mail gspread@bea.gov; write to the Regional Economic Information System, BE-61, Bureau of Economic Analysis, U.S. Department of Commerce, Washington, DC 20230; or call 202-606-5340.

1. Per capita personal income was computed using midyear population estimates of the Bureau of the Census.

2. Percent change was calculated from unrounded data.

Note: The personal income level shown for the United States is derived as the sum of the state estimates. It differs from the estimate of personal income in the national income and product accounts (NIPAs) because of differences in coverage,

in the methodologies used to prepare the estimates, and in the timing of the availability of source data. In particular, it differs from the NIPA estimate because, by definition, it omits the earnings of Federal civilian and military personnel stationed abroad and of U.S. residents employed abroad temporarily by private U.S. firms.

Source: Table 1 in "Personal Income by State: First Quarter 2003 and Revised 2002" in the August 2003 issue of the SURVEY OF CURRENT BUSINESS.

Note: Totals shown for the United States differ from the national income and product account estimates of gross domestic product (GDP) because GSP is derived from gross domestic income, which differs from GDP by the statistical discrepancy. In addition, GSP excludes and GDP includes the compensation of Federal civilian and military personnel stationed abroad and government consumption of fixed capital for military structures located abroad and for military equip-

ment, except office equipment. Also, GSP and GDP have different revision schedules.

Source: This table reflects the GSP estimates for 2001 that were released on May 22, 2003. Detailed estimates are available on BEA's Web site at <www.bea.gov> under "State and local area data."

K. Local Area Table

Additional Information About the NIPA Estimates

Statistical Conventions

Changes in current-dollar GDP measure changes in the market value of goods and services produced in the economy in a particular period. For many purposes, it is necessary to decompose these changes into quantity and price components. To compute the quantity indexes, changes in the quantities of individual goods and services are weighted by their prices. (Quantity changes for GDP are often referred to as changes in “real GDP.”) For the price indexes, changes in the prices for individual goods and services are weighted by quantities produced. (In practice, the current-dollar value and price indexes for most GDP components are determined largely using data from Federal Government surveys, and the real values of these components are calculated by deflation at the most detailed level for which all the required data are available.)

The annual changes in quantities and prices are calculated using a Fisher formula that incorporates weights from 2 adjacent years. For example, the annual percent change in real GDP in 1997–98 uses prices for 1997 and 1998 as weights, and the 1997–98 annual percent change in the GDP price index uses quantities for 1997 and 1998 as weights. Because the Fisher formula allows for the effects of changes in relative prices and in the composition of output over time, the resulting quantity or price changes are not affected by the substitution bias that is associated with changes in quantities and prices calculated using a fixed-weighted formula.¹ These annual changes are “chained” (multiplied) together to form time series of quantity and price; the percent changes that are calculated from these time series are not affected by the choice of reference period.

The quarterly changes in quantities and prices are calculated with weights from two adjacent quarters. As part of an annual or comprehensive revision, the quarterly indexes through the most recent complete year are adjusted to ensure that the average of the quarterly indexes conforms to the corresponding annual index.

In addition, BEA prepares measures of real GDP and its components in a dollar-denominated form, designated “chained (1996) dollar estimates.” These estimates are computed by multiplying the 1996 current-dollar value of GDP, or of a GDP component, by the corresponding quantity index number. For example, if a current-dollar GDP component equaled \$100 in 1996 and if real output for this component increased by 10 percent in 1997, then the “chained (1996) dollar” value of this com-

ponent in 1997 would be \$110 ($\100×1.10). Note that percentage changes in the chained (1996) dollar estimates and the percentage changes calculated from the quantity indexes are identical, except for small differences due to rounding.

Because of the formula used for calculating real GDP, the chained (1996) dollar estimates for detailed GDP components do not add to the chained-dollar value of GDP or to any intermediate aggregates. A “residual” line is shown as the difference between GDP and the sum of the most detailed components shown in each table. The residual generally is small close to the base period but tends to become larger as one moves further from it. Accurate measures of component contributions to the percentage changes in real GDP and its major components are shown in NIPA tables 8.2–8.6.

BEA also publishes the “implicit price deflator” (IPD), which is calculated as the ratio of current-dollar value to the corresponding chained-dollar value, multiplied by 100; the values of the IPD and of the corresponding “chain-type” price index are very close.

For quarters and months, the estimates are presented at annual rates, which show the value that would be registered if the rate of activity measured for a quarter or a month were maintained for a full year. Annual rates are used so that time periods of different lengths—for example, quarters and years—may be compared easily. These annual rates are determined simply by multiplying the estimated rate of activity by 4 (for quarterly data) or by 12 (for monthly data).

Percent changes in the estimates are also expressed at annual rates. Calculating these changes requires a variant of the compound interest formula:

$$r = \left[\left(\frac{x_t}{x_o} \right)^{m/n} - 1 \right] \times 100,$$

where r is the percent change at an annual rate; x_t is the level of activity in the later period; x_o is the level of activity in the earlier period; m is the periodicity of the data (for example, 1 for annual data, 4 for quarterly, or 12 for monthly); and n is the number of periods between the earlier and later periods (that is, $t - o$).

Quarterly and monthly NIPA estimates are seasonally adjusted, if necessary. Seasonal adjustment removes from the time series the average impact of variations that normally occur at about the same time and in about the same magnitude each year—for example, weather, holidays, and tax payment dates. After seasonal adjustment, cyclical and other short-term changes in the economy stand out more clearly.

1. In addition, because the changes in quantities and prices calculated using these weights are symmetric, the product of a quantity index and the corresponding price index is generally equal to the current-dollar index.

Reconciliation Tables

Table 1. Reconciliation of Changes in BEA-Derived Compensation Per Hour with BLS Average Hourly Earnings
[Percent change from preceding period]

	2001	2002	Seasonally adjusted at annual rates					
			2002			2003		
			II	III	IV	I	II	III
BEA-derived compensation per hour of all persons in the nonfarm business sector (less housing) ¹	3.7	2.8	3.9	2.0	1.6	2.6	3.6	3.2
Less: Contribution of supplements to wages and salaries per hour	0.3	0.6	0.8	0.8	0.9	0.4	0.3	0.0
Plus: Contribution of wages and salaries per hour of persons in housing and in nonprofit institutions	-0.1	-0.1	0.3	0.4	0.4	0.2	-0.5	0.1
Less: Contribution of wages and salaries per hour of persons in government enterprises, unpaid family workers, and self-employed	0.0	0.0	0.1	0.5	0.0	0.3	-0.2	0.1
Equals: BEA-derived wages and salaries per hour of all employees in the private nonfarm sector	3.4	2.1	3.2	1.1	1.1	2.1	3.2	3.1
Less: Contribution of wages and salaries per hour of nonproduction workers in manufacturing	-0.1	0.0	0.2	-0.4	0.2	-0.2	0.4	0.0
Less: Other differences ²	-0.3	-0.9	0.4	-2.6	-2.7	-0.9	0.8	0.5
Equals: BLS average hourly earnings of production or nonsupervisory workers on private nonfarm payrolls	3.8	2.9	2.6	4.0	3.6	3.2	2.0	2.6
Addendum:								
BLS estimates of compensation per hour in the nonfarm business sector ³	3.6	2.8	3.9	2.0	1.6	2.6	3.6	3.1

1. Includes BLS data on compensation and hours of nonfarm proprietors and hours worked of unpaid family workers.

2. Includes BEA use of non-BLS data and differences in detailed weighting. Annual estimates also include differences in BEA and BLS benchmark procedures; quarterly estimates also include differences in seasonal adjustment procedures.

3. These estimates differ from the BEA-derived estimates (first line) because the BLS estimates include compensation and hours of tenant-occupied housing.
BLS Bureau of Labor Statistics.

Table 2. Relation of Net Exports of Goods and Services and Net Receipts of Income in the NIPAs to Balance on Goods and Services and Income in the ITAs

[Billions of dollars]

	Line	2001	2002	Seasonally adjusted at annual rates					
				2002			2003		
				I	II	III	IV	I	II
Exports of goods and services and income receipts, ITAs	1	1,284.9	1,229.6	1,188.3	1,230.5	1,255.8	1,244.1	1,241.1	1,244.0

1. Consists of statistical revisions in the NIPAs that have not yet been incorporated into the ITAs (2003:II) and statistical revisions in the ITAs that have not yet been incorporated into the NIPAs (2001:1-2003:II).

ITAs International transactions accounts
NIPAs National income and product accounts

Appendix B

Suggested Reading

The Bureau of Economic Analysis (BEA) has published a wealth of information about the methodologies that are used to prepare its national, industry, international, and regional accounts. In addition, most of this information is available on BEA's Web site at <www.bea.gov>. Look under "Methodologies"; for articles from the SURVEY OF CURRENT BUSINESS, look under "Publications."

National accounts

The national accounts encompass the detailed estimates in the national income and product accounts (including gross domestic product) and the estimates of wealth and related estimates.

National income and product accounts (NIPAs). This series of papers documents the conceptual framework of the NIPAs and the methodologies that have been used to prepare the estimates.

An Introduction to National Economic Accounting (1985) [also in the March 1985 SURVEY]

Corporate Profits: Profits Before Tax, Profits Tax Liability, and Dividends (2002)

Government Transactions (1988)

Personal Consumption Expenditures (1990)

The methodologies described in these papers have been updated and improved, typically as part of the comprehensive and annual revisions of the NIPAs. For more information, see the following.

National Income and Product Accounts of the United States, 1929-97 (2001) provides the definitions of the major NIPA aggregates and components, discusses the measures of real output and prices, explains how production is classified and how the NIPAs are presented, describes the statistical conventions that are used, and lists the principal source data and methods that are used to prepare the estimates of gross domestic product (GDP). [Go to <www.bea.gov/bea/an/nipaguid.htm>.]

The following SURVEY articles describe the comprehensive revision of the NIPAs.

"Preview of the Revised NIPA Estimates for 1997: Effects of Incorporating the 1997 Benchmark I-O Accounts and Proposed Definitional and Statistical Changes" (January 2003)

"Preview of the 2003 Comprehensive Revision of the National Income and Product Accounts: Changes in Definitions and Classifications" (June 2003)

"Preview of the 2003 Comprehensive Revision of the National Income and Product Accounts: New and Redesign Tables" (August 2003)

"Preview of the 2003 Comprehensive Revision of the National Income and Product Accounts: Statistical Changes" (September 2003)

In addition, see the following articles.

"Updated Summary NIPA Methodologies" (October 2002) briefly describes the principal source data and methods used to prepare the current-dollar and real estimates of GDP.

"Annual Revision of the National Income and Product Accounts" (August 2002).

"BEA's Chain Indexes, Time Series, and Measures of Long-Term Economic Growth" (May 1997) describes the conceptual basis for the chain-type measures of real output and prices that are used in the NIPAs.

"Reliability of GDP and Related NIPA Estimates" (January 2002) evaluates the principal NIPA estimates by examining the record of revisions to them.

Fixed assets and consumer durable goods. *Fixed Assets and Consumer Durable Goods in the United States, 1925-97* (2003) discusses the concepts and statistical considerations that underlie the estimates and their derivation.

"Fixed Assets and Consumer Durable Goods for 1925-98" (April 2000) describes the definitional and statistical improvements that were incorporated in the comprehensive revision of the estimates.

Industry accounts

The industry accounts consist of the estimates of gross domestic product by industry, the input-output accounts, and two satellite accounts.

Mission Statement and Strategic Plan

The mission statement of the Bureau of Economic Analysis and the latest update to its strategic plan for improving the accuracy, reliability, and relevance of the national, industry, regional, and international accounts are available on BEA's Web site at <www.bea.gov>; look under "About BEA."

Gross product by industry. “Improved Estimates of Gross Product by Industry for 1947–98” (June 2000) describes the most recent comprehensive revision of these estimates.

“Gross Domestic Product by Industry for 1999–2001” (November 2002) describes the most recent annual revision of the these estimates.

Input-output accounts. “Benchmark Input-Output Accounts for the U.S. Economy, 1997” (December 2002) presents the 1997 accounts and describes the improvements that were incorporated.

Satellite accounts. These accounts extend the analytical capacity of the input-output accounts by focusing on a particular aspect of economic activity.

“U.S. Transportation Satellite Accounts”

For 1992 (April 1998)

For 1996 (May 2000)

“U.S. Travel and Tourism Satellite Accounts”

For 1992 (July 1998)

For 1996 and 1997 (July 2000)

International accounts

The international accounts encompass the international transactions accounts, direct investment, and international transactions in services.

International transactions accounts (ITAs). *The Balance of Payments of the United States: Concepts, Data Sources, and Estimating Procedures* (1990) describes the methodologies used to prepare the estimates in the ITAs and the international investment position of the United States. These methodologies are usually updated and improved as part of the annual revisions of the ITAs.

The annual revisions of the ITAs are described in a series of articles, the latest of which was published in the July 2003 SURVEY.

Direct investment. *International Direct Investment: Studies by the Bureau of Economic Analysis* (1999) is a collection of previously published articles on U.S. direct investment abroad and foreign direct investment in the United States. It also includes the following information.

The “Methodology for U.S. Direct Investment Abroad,” which is also available in *U.S. Direct Investment Abroad: 1994 Benchmark Survey, Final Results* (1998)

“A Guide to BEA Statistics on U.S. Multinational Companies,” which is also available in the March 1995 SURVEY

“A Guide to BEA Statistics on Foreign Direct Investment in the United States,” which is also available in the February 1990 SURVEY

In addition, the updated methodology for foreign direct investment in the United States is available in *Foreign Direct Investment in the United States: Final Results From the 1997 Benchmark Survey* (2001).

International services. *U.S. International Transactions in Private Services: A Guide to the Surveys Conducted by the Bureau of Economic Analysis* (1998) describes 11 surveys. It includes classifications, definitions, release schedules, the methods used to prepare the estimates, and samples of the survey forms.

“Selected Issues in the Measurement of U.S. International Services” (June 2002) describes key issues in defining and measuring insurance, wholesale and retail trade, finance, construction, and utilities services and explores possible actions to address these issues.

Regional accounts

The regional accounts include estimates of personal income and gross state product.

Personal income. Estimates of personal income are prepared for States and for local areas.

“Comprehensive Revision of State Personal Income for 1969–99” (June 2000) summarizes the changes in the methodology that is used to prepare the estimates. The detailed methodology is available on the CD-ROM *State Personal Income, 1929–2000*.

“State Personal Income: Revised Estimates for 1999–2001” (October 2002) presents the most recent annual revision of these estimates.

“The Reliability of the State Personal Income Estimates” (December 2003) evaluates the estimates of state personal income and of selected components by examining the revisions of these estimates.

“Comprehensive Revision of Local Area Personal Income for 1969–98” (July 2000) summarizes the changes in the methodology that is used to prepare the estimates for counties and metropolitan areas. The detailed methodology is available on the CD-ROM *Regional Economic Information System, 1969–2001*.

“Local Area Personal Income, 1999–2001” (May 2003) presents the most recent annual revision of these estimates.

Gross state product. “Comprehensive Revision of Gross State Product by Industry, 1977–94” (June 1997) summarizes the sources and the methods that are used to prepare the estimates. “Gross State Product by Industry, 1977–98” (October 2000) describes the most recent comprehensive revision of these estimates.

“Gross State Product by Industry, 1999–2001” (June 2003) presents the most recent annual revision of these estimates.
