BEA Advisory Committee

The BEA Advisory Committee advises the Director of BEA on matters related to the development and improvement of BEA's national, regional, industry, and international economic accounts, especially in areas of new and rapidly growing economic activities arising from innovative and advancing technologies, and it provides recommendations from the perspective of business economists, academicians, researchers, and experts in government and international affairs.

The SURVEY OF CURRENT BUSINESS (ISSN 0039-6222) is published monthly by the Bureau of Economic Analysis of the U.S. Department of Commerce. Send editorial correspondence to <customerservice@bea.gov>.

Subscriptions to the SURVEY OF CURRENT BUSINESS are maintained, and the prices are set, by the U.S. Government Printing Office,

an agency of the U.S. Congress. To subscribe call 202–512–1800 to, or go to

bookstore.gpo.gov>.

Subscription and single-copy prices Second-class mail: \$63.00 domestic, \$88.20 foreign, First-class mail: \$105.00 Single copy: \$25.00 domestic, \$35.00 foreign

The information in this journal is in the public domain and may be reprinted without the permission of the Bureau of Economic Analysis. Citation of the SURVEY OF CURRENT BUSINESS as the source is appreciated.

The Secretary of Commerce has determined that the publication of this periodical is necessary in the transaction of the public business required by law of the Department.

SURVEY OF CURRENT BUSINESS

February 2006

Volume 86 • Number 2

1 Business Situation: Advance Estimates for the Fourth Quarter of 2005 and for 2005

Real GDP increased 1.1 percent after increasing 4.1 percent. Real disposable personal income increased 7.0 percent after decreasing 2.0 percent. In 2005, real GDP increased 3.5 percent after increasing 4.2 percent in 2004.

6 The Monthly Treasury Statement and BEA's Estimates of Federal Government Spending

11 Gross Domestic Product: Revisions and Source Data

BEA uses a variety of source data to prepare its widely followed quarterly estimates of GDP. Each of the early estimates incorporates progessively more up-to-date source data. Overall, the picture of the economy shown by these estimates is little changed by later revisions.

16 Research Spotlight: Taxation and Multinational Activity: New Evidence, New Interpretations

Using data made available through a BEA program for outside researchers, three economists have produced a number of studies, summarized for the Survey, exploring the effect of various taxes on multinational firms' behavior.

BEA Web Site and BEA Contacts (inside back cover)

Schedule of Upcoming News Releases (back cover)

Looking Ahead . . .

Federal Budget Estimates for Fiscal Year 2007. The March Survey will feature estimates of government receipts and outlays from the the *Budget of the United States Government* that are translated to a NIPA basis.

Correction

In the state personal income article in the January Survey, the slow growth in Alaska's personal dividend income was mistakenly attributed to a decline in Alaska Permanent Fund Benefits. These benefits are actually classified as a transfer receipt in state personal income, not as dividends. The information should have been "Alaska's dividends grew only 1.9 percent, slower than those for any other state except Vermont and West Virginia."

Director's Message

BEA's quarterly and annual estimates of gross domestic product (GDP) are among the most widely followed of all economic indicators. These measures are obviously important to the American public, and BEA is committed to making the process by which we measure GDP as clear and readily understandable as possible.

iii

This month, I am pleased to present an article that explains the differences in the source data incorporated by the advance, preliminary, and final quarterly estimates of GDP. Another article details how BEA uses data from the Treasury Department's *Monthly Treasury Statement* to derive its estimate of Federal Government spending.

In this issue, you will also find a Research Spotlight on multinational corporations and tax issues. The article summarizes an impressive body of research by three professors on a wide range of topical issues. The research was based largely on BEA's firm-level international data, which was made available through a program allowing researchers to work as unpaid special sworn employees of BEA. These special employees are granted access, for research purposes, to the rich store of microdata that BEA collects under the International Investment and Trade in Services Survey Act.

In general, explaining how we operate is a major priority at BEA. A concerted effort has been made to provide more explanatory material in the Survey of Current Business and on the BEA Web site about our methodologies and related information. For example, a methodology paper on state personal income was recently made available on our Web site.

At BEA, we are always looking for ways to make our data and estimates more accessible to our users, and we welcome your suggestions for further improvements.

J. Steven Landefeld

Director, Bureau of Economic Analysis

Taking Account...

Vertical Production Networks in MNCs

In recent decades, growth in world trade has been driven largely by the rapid growth of trade in intermediate inputs, which are the goods and services used to produce final goods and services. Most of this trade is between parent companies and foreign affiliates of multinational companies (MNCs) that have established global vertical production networks. The MNCs use these networks to spread the activities they perform (such as input production, assembly, and research and development) across different locations.

Though most foreign direct investment is still oriented toward traditional horizontal production operations, vertical production networks are becoming more common. For example, Canada and Mexico—both partners with the United States in the North American Free Trade Agreement (NAFTA)—have automobile production facilities with extensive intrafirm links with their U.S. counterparts. In other countries, such as Brazil, auto production facilities are characterized by relatively light intrafirm trade.

What accounts for the variation? In an article published in the November 2005 *The Review of Economics and Statistics*, Gordon H. Hanson, of the Uni-

versity of California, San Diego; Matthew J. Slaughter, of the Tuck Business School at Dartmouth College (and currently of the Council of Economic Advisors); and Raymond J. Mataloni, an economist at BEA, examined relevant issues and concluded the following:

- MNCs tend to focus foreign affiliate operations on processing imported intermediate inputs in countries with lower trade costs, such as tariffs.
- The location of foreign operations in vertical production networks is sensitive to other aspects of the host country's business environment. In particular, foreign affiliates' demand for imported inputs tends to be higher in countries with trade friendly polices (such as export processing zones) and in countries with lower corporate tax rates.
- The location of foreign operations in vertical production networks is also sensitive to labor costs. Foreign affiliates tend to process imported intermediate inputs in countries with relatively low wages for lower skilled workers.

The analysis of firm-level data reported in this study was conducted at BEA using data collected in BEA surveys of U.S. MNCs. The work was done under arrangements that maintained legal confidentiality requirements.

Prototype Satellite Account for Household Production

The Bureau of Labor Statistics' American Time Use Survey (ATUS) offers a comprehensive time series of labor time use in the United States, a critical input for nonmarket and market production. In keeping with BEA's long-term interest in nonmarket accounts, BEA economists J. Steven Landefeld and Cindy M. Vojtech and former BEA Chief Economist Barbara Fraumeni used the ATUS data to update earlier satellite account estimates of household production.

Their paper highlights how information from ATUS—which measures the amount of time spent doing various activities, including paid work, childcare, volunteering, commuting, and socializing—can add to economists' understanding of such issues as the impact on overall economic growth of increasing women's labor force participation, household production's role in investment and other spending, and the role of household production over the business cycle.

The paper is available by clicking "Papers and Working Papers" on the BEA home page at <www.bea.gov>.

February 2006

Business Situation

Advance Estimates for the Fourth Quarter of 2005 and for 2005

In the fourth quarter of 2005, real gross domestic product (GDP) decelerated sharply, increasing 1.1 percent—3.0 percentage points less than in the third quarter. Inflation also decelerated (chart 1). In 2005, real GDP increased 3.5 percent; real GDP had increased 4.2 percent in 2004 (table 1). Inflation accelerated in 2005, but excluding food and energy, the pace was about the same as in 2004. (See "Real GDP for 2005.")

The Fourth Quarter of 2005

The advance estimates for the fourth quarter of 2005 show the following:

• Real GDP increased 1.1 percent after increasing 4.1 percent in the third quarter (table 1). The decelera-

Christopher Swann prepared this article.

Nors. Percent changes are from NIPA table 1.1.1, and contributions to percent change are from NIPA table 1.1.2. Shares are from NIPA table 1.1.10.

^{1.} Three sequential GDP estimates for each quarter are prepared—advance, preliminary, and final estimates. E ach incorporates increasingly comprehensive and improved source data. Detailed information on BEA estimates, revisions, and accuracy can be found on BEA's Web site at <www.bea.gov/bea/about/infoqual.htm> and at <www.bea.gov/bea/faq/national/gdp_accuracy.htm>. Quarterly estimates in the NIPAs are expressed at seasonally adjusted annual rates, unless otherwise specified. Quarter-to-quarter dollar changes are differences between these published estimates. Percent changes are calculated from unrounded data and annualized.

^{2. &}quot;Real" estimates are in chained (2000) dollars, and price indexes are chain-type measures.

tion primarily reflected a deceleration in consumer spending, an acceleration in imports, a downturn in Federal Government spending, and decelerations in investment in equipment and software and in residential fixed investment that were partly offset by an upturn in inventory investment.³

• Prices of goods and services purchased by U.S. residents increased 3.3 percent after increasing 4.2 percent in the third quarter and 3.3 percent in the second quarter. The deceleration in the fourth quarter (and the acceleration in the third quarter)

mainly reflected the quarterly pattern of energy prices.

• Real disposable personal income (DPI) increased 7.0 percent after decreasing 2.0 percent in the third quarter. The upturn primarily reflected a sharp acceleration in current-dollar DPI and a deceleration in the implicit price deflator for personal consumption expenditures used to deflate current-dollar DPI.

The hurricanes that struck the Gulf states in the third quarter and early in the fourth quarter, like other natural disasters, exacted economic losses that have had consequences for the national economy and for the economies of certain regions. (See "Effects of the hurricane.")

Among the contributors to the deceleration in real

Fourth-Quarter 2005 Advance NIPA Estimates: Source Data and Assumptions

The "advance" estimates for the fourth quarter are based on the following major source data; as more and better data become available, the estimates will be revised. (The number of months for which data were available is shown in parentheses.)

Personal consumption expenditures: Sales of retail stores (3), unit auto and truck sales (3), and consumers' shares of auto and truck sales (2);

Nonresidential fixed investment: Unit auto and truck sales (3), construction put in place (2), manufacturers' shipments of machinery and equipment other than aircraft (3), shipments of civilian aircraft (2), and exports and imports of machinery and equipment (2);

Residential investment: Construction put in place (2), single-family housing starts (3), sales of new homes (2), and sales of existing houses (3);

Change in private inventories: Trade and nondurable-goods manufacturing inventories (2), durable-goods manufacturing inventories (3), and unit auto and truck inventories (3);

Net exports of goods and services: Exports and imports of goods and services (2);

Government consumption expenditures and gross investment: Federal outlays (3), state and local construction put in place (2), and state and local employment (3);

GDP prices: Consumer price indexes (3), producer price indexes (3), U.S. import and export price indexes (3), and values and quantities of petroleum imports (2).

BEA made assumption for source data that were not available. Table A shows the assumptions for key series; a more comprehensive list is available on BEA's Web site at www.bea.gov/bea/dn/home/gdp.htm.

Table A. Summary of Major Source Data and Assumptions for Advance Estimates, 2005:IV
[Billions of dollars, seasonally adjusted at annual rates]

^{2.} Nonmonetary gold is included in balance-of-payments exports and imports but is not used directly in the estimation of national income and product account exports and imports.

^{3.} In this article, "consumer spending" is shorthand for "personal consumption expenditures," "Federal government spending" is shorthand for "Federal government consumption expenditures and gross investment," and "inventory investment" is shorthand for the NIPA series "change in private inventories."

GDP growth in the fourth quarter, consumer spending increased 1.1 percent and added 0.79 percentage point after increasing 4.1 percent and adding 2.85 percentage points. The sharp deceleration reflected a downturn in spending on durable goods that was partly offset by an acceleration in spending on nondurable goods. Spending on durable goods decreased 17.5 percent and subtracted 1.56 percentage points from real GDP growth after two consecutive quarters of accelerating growth. The downturn was driven primarily by a sharp downturn in motor vehicles and parts. Spending on nondurable goods increased 5.1 percent and contributed 1.04 percentage points to real GDP after increasing 3.5 percent and contributing 0.73 percentage point. The acceleration reflected an acceleration in clothing and shoes and an upturn in gasoline, fuel oil, and other energy goods. Spending on services increased 3.2 percent and contributed 1.32 percentage points to real GDP growth after increasing 3.3 percent and contributing 1.36 percentage points.

Real imports of goods and services accelerated, increasing 9.1 percent and subtracting 1.42 percentage points from real GDP growth after increasing 2.4 percent and subtracting 0.38 percentage point. Goods imports increased 10.0 percent and subtracted 1.32 percentage points from real GDP growth after increasing 3.5 percent and subtracting 0.46 percentage point. Contributing to the acceleration in goods imports were upturns in imports of petroleum and products, of nonpetroleum industrial supplies and materials, and of nonautomotive consumer goods that were partly offset by a downturn in "other" goods imports. Services imports turned up, increasing 4.2 percent and subtracting 0.11 percentage point from real GDP growth after decreasing 3.2 percent and adding 0.09 percentage point.

Federal Government spending decreased 7.0 percent, subtracting 0.50 percentage point from real GDP growth after increasing 7.4 percent and adding 0.52 percentage point. The downturn was primarily due to a downturn in defense spending that was partly offset by an acceleration in nondefense spending. BEA recorded a downturn in defense spending even though the *Monthly Treasury Statement*, which BEA mainly uses to estimate defense spending, showed relatively strong spending in the quarter.⁴ (See the box "The

Monthly Treasury Statement and BEA's Estimates of Federal Government Spending.") In general, BEA adjusts the MTS data to conform to NIPA concepts.

Business investment in equipment and software increased 3.5 percent and contributed 0.28 percentage point to real GDP growth after increasing 10.6 percent and contributing 0.82 percentage point. The deceleration was primarily due to downturns in transportation equipment and in "other" information processing equipment and software that were partly offset by accelerations in computers and peripheral equipment and in "other" equipment.

Residential fixed investment increased 3.5 percent and contributed 0.21 percentage point to real GDP growth after increasing 7.3 percent and contributing 0.43 percentage point. The deceleration was mainly due to a downturn in brokers' commissions that was partly offset by an acceleration in single-family housing.

Inventory investment added 1.45 percentage points to real GDP growth after subtracting 0.43 percentage point. Businesses increased real inventories \$25.7 billion in the fourth quarter after two consecutive quarters of inventory reduction. The inventory accumulation primarily reflected increased inventory investment by retail motor vehicle and parts dealers. Manufacturing industries liquidated inventories for the third consecutive quarter.

The advance estimates for the third quarter also show the following:

- Real spending for private investment in nonresidential structures decelerated, increasing 0.7 percent and contributing 0.02 percentage point to real GDP growth after increasing 2.2 percent and contributing 0.06 percentage point. The deceleration was primarily due to a downturn in investment in commercial and health care structures that was partly offset by an upturn in investment in manufacturing structures.
- Real exports of goods and services increased 2.4 percent and contributed 0.25 percentage point to real GDP, about the same as in the third quarter. Real exports of goods increased 3.8 percent and contributed 0.27 percentage point in real GDP growth after increasing 3.2 percent. The step-up was mainly due to an upturn in civilian aircraft, engines, and parts and an acceleration in "other" nonautomotive capital goods that were partly offset by a larger decrease in industrial supplies and materials and by a down-

^{4.} See the "Technical Note," at <www.bea.gov/bea/newsrelarchive/2006/tech405a.htm>.

- turn in "other" exports. Services exports turned down. The deceleration in exports of goods and services in the third and fourth quarters of 2005 followed accelerations in real exports in both the first and second quarters of 2005.
- Real state and local government spending increased 0.4 percent and contributed 0.05 percentage point to real GDP growth after increasing 0.2 percent and contributing 0.03 percentage point.
- Real final sales of domestic product (real GDP less the change in private inventories) decreased 0.3 percent—the first decrease since the third quarter of 2001—after increasing 4.6 percent in the third quarter.
- Real gross domestic purchases (GDP less net exports) increased 2.2 percent after increasing 4.0 percent in the third quarter.
- The production of goods, of services, and of structures decelerated (table 2).
- Motor vehicle output turned down, decreasing 15.9 percent and subtracting 0.58 percentage point from

- real GDP growth after increasing 17.6 percent and adding 0.56 percentage point.
- Final sales of computers increased 46.4 percent and added 0.33 percentage point to real GDP growth after increasing 20.3 percent and adding 0.16 percentage point.
- •Real disposable personal income (DPI) increased 7.0 percent in contrast to a decrease of 2.0 percent in the third quarter. Current-dollar DPI increased 9.8 percent after increasing 1.6 percent. The current-dollar acceleration reflected a strong acceleration in personal income that was somewhat offset by an acceleration in personal current taxes.
- The personal saving rate was a negative 0.4 percent in the fourth quarter; the saving rate was a negative 1.8 percent in the third quarter.⁵

Table 2. Real Gross Domestic Product by Type of Product

[Seasonally adjusted at annual rates]

	Change from preceding period (percent)					Contribution to percent change in real GDP (percentage points)						Share of current-dollar GDP (percent)

Note. Percent changes are from NIPA table 1.2.1, and contributions to percent change are from NIPA table 1.2.2. Shares are calculated from NIPA table 1.2.5.

^{5.} The personal saving rate is measured as personal saving as a percentage of current-dollar disposable personal income. An estimate of the national saving rate (measured as gross saving as a percentage of gross national income), along with the "final" NIPA estimates for the fourth quarter, will be available at the end of March.

Effects of the hurricane

Hurricanes, like other natural disasters, have a twofold effect on economic activity: They destroy property and thus reduce the stock of fixed assets, and they change the volume and pattern of current economic activity.

Destruction of property. The BEA measure of capital depreciation, the consumption of fixed capital (CFC), captures the reduction in the stock of fixed assets. A rise in CFC results in an equal decline in national income and net domestic product. In the fourth quarter, the hurricane added \$27.5 billion (at an annual rate) to CFC, much less than the hurricanes added in the third quarter (\$383.8 billion).

The destruction of property also affected personal and business income and triggered payments of insurance benefits. BEA estimates of the affected net income flows are included in its estimates of proprietors' income, rental income, corporate profits, and business current transfer payments (net) (table 3).6 The estimates reflect both the uninsured losses resulting from the hurricane and the treatment of insurance services that BEA introduced as part of its 2003 comprehensive revision of the NIPAs.⁷

Changed economic activity. Natural disasters have myriad economic consequences, as normal production and activities are curtailed or terminated. In the case of hurricanes, for example, the reduction in incomes and tourism could adversely affect consumer and business spending. Also, damages to commercial assets could adversely affect industrial production in the area.

However, as assets are restored, the effects of construction will be reflected in investment spending.

These kinds of changes in the current level and pattern of activity are not separately identifiable in the GDP estimates, because they cannot be identified in the source data that are used to calculate the NIPA aggregates.

Includes only explicit adjustments to source data for write-offs of nonrepairable damage and for insurance. Excludes impacts that are assumed to be reflected in source data.
 The estimates of the actual damages and insurance settlements (not at an annual rate) can be

^{6.} See the box "The Impact of the Third-Quarter Hurricanes on the NIPAs," SURVEY OF CURRENT BUSINESS 85 (December 2005): 4. For a broader explanation of the effects of disasters on the NIPAs, see <www.bea.gov/bea/faq/national/FAQ.htm>.

^{7.} See Brent R. Moulton and Eugene P. Seskin, "Preview of the 2003 Comprehensive Revision of the National Income and Product Accounts: Changes in Definitions and Classifications," SURVEY 83 (June 2003): 17–34; and Baoline Chen and Dennis J. Fixler, "Measuring the Services of Property-Casualty Insurance in the NIPAs: Changes in Concepts and Methods," SURVEY 83 (October 2003): 10–26.

The estimates of the actual damages and insurance settlements (not at an annual rate) can be derived by dividing the numbers shown in the table by 4; actual damages to fixed assets in personal income, for example, are estimated to be \$4.8 billion (\$19.0 billion at an annual rate).

^{3.} Includes business interruption insurance

Includes benefits paid to persons for the loss of personal property, such as motor vehicles and household furnishings and equipment.

Note. The estimates reflect the "advance" GDP release on January 27, 2006

The Monthly Treasury Statement and BEA's Estimates of Federal Government Spending

The Treasury Department's Monthly Treasury Statement (MTS) is an important source of data that the Bureau of Economic Analysis (BEA) relies on to calculate its estimates of Federal Government spending in the national income and product accounts (NIPAs). Many users of BEA's data use the MTS to get an early indication of BEA's quarterly estimates. While the MTS can be a useful tool for tracking Federal Government spending, there are critical differences between the two. The MTS is a financial accounting statement for the Federal Government; BEA's estimates of Federal spending in GDP are a measure of economic output derived from production.

Only about a third of the Federal budget constitutes spending on production activities. For example, \$1,475 billion in Federal current transfer payments for 2005, an important component of the Federal budget, are not counted as production and are therefore excluded from GDP. GDP also excludes Federal payments from the National Flood Insurance Program and transfers to states, individuals, and businesses for hurricane-related disaster relief. BEA's calculation of GDP also includes methods to ensure consistent accounting so that changes in government accounting procedures over time do not affect the measures of economic output from production.

The differences between the two measures can be large in absolute size and timing. For example, in calendar year 2005, Federal spending as measured in the *MTS* increased 8.1 percent, while Federal Government spending included in GDP increased 5.7 percent.

In the fourth quarter of 2005, key differences between the two measures were apparent: The NIPA data showed a significant drop in Federal Government defense spending, but the MTS data showed an increase in Federal military outlays, boosted by a significant rise in military personnel outlays in October. The difference stemmed mainly from the differing treatment of contributions to the Medicare-eligible retiree health care fund. The MTS for October captured a large annual payment of \$10.8 billion (\$43.1 billion at an annual rate) to this fund, recording it as a military personnel outlay. As a result, the October outlays for military personnel were the highest monthly outlay ever recorded by the MTS. In the NIPAs, payment to the Medicare-eligible retiree health care fund is treated as compensation, and the payment is spread over the course of the fiscal year on an accrual basis.

Military personnel spending in the MTS rose to historical highs even though the normal military pay usually disbursed at the beginning of the month was not included. Military pay typically is paid on the first day of the month. When the first day of the month falls on a weekend or a Federal holiday, the Department of Defense

disburses military pay on the last working day of the previous month. Because October 1, 2005, was a Sunday, the monthly pay measure was included in the September MTS. In December, the MTS recorded an extra pay day because January 1, 2006, was a holiday. In the NIPAs, military compensation is shown on an accrual basis and reflects the same number of pay days in each quarter. BEA makes the necessary pay day adjustments monthly and sums them for the quarter.

In general, *MTS* data can be useful for tracking BEA's defense consumption expenditures and gross investment, provided that users are aware of BEA's adjustments to the *MTS* data and key methodological differences.

However, the MTS is less effective for tracking NIPA measures of nondefense consumption expenditures and gross investment. The MTS reports on all types of Federal spending—unemployment insurance payments, Medicaid grants to state and local governments, subsidy payments to farmers, and spending for a multitude of other Federal programs. NIPA estimates of nondefense consumption expenditures and gross investment represent a small fraction of this other spending. The result is that growth in the two measures often differs significantly. In 2005, for example, the MTS data show that nondefense spending rose 7.8 percent, but the NIPA measure of nondefense Federal Government spending grew 5.3 percent.

BEA research reveals that trends in total MTS outlays or even department-level outlays will not accurately predict the estimates for nondefense consumption expenditures, because the volatility in these outlays typically is unrelated to spending for nondefense consumption expenditures and gross investment, which primarily reflect routine administrative costs and the pattern of investment in structures and equipment.

Every year, BEA publishes a table that reconciles the Federal NIPA estimates on a not seasonally adjusted basis to the *MTS* data in "Table 3.18B. Relation of Federal Government Current Receipts and Expenditures in the National Income and Product Accounts to the Budget, Fiscal Years and Quarters," which is published in the October Survey and is available at <www.bea.gov>.

This table itemizes the types of transactions included in the MTS that are not included in the Federal NIPA estimates and vice versa. It shows transactions that are recorded as negative outlays in the MTS but that are recorded as receipts in the NIPAs. It also delineates the types of timing adjustments needed to put the data on an accounting basis consistent with the NIPAs. In addition to these adjustments, other techniques are used to spread various once-a-year payments over the year and to account for the early payment of military compensation.

Pamela A. Kelly

Prices

Inflation as measured by the price index for gross domestic purchases decelerated to 3.3 percent in the fourth quarter from 4.2 percent in the third quarter (table 4). Energy prices decelerated in the fourth quarter, and food prices accelerated. Excluding prices for food and energy, gross domestic purchases prices increased 2.9 percent after increasing 2.5 percent (chart 2).

Prices of goods and services purchased by consumers increased 2.6 percent after increasing 3.7 percent. The prices paid for durable goods decreased for the third consecutive quarter, decreasing 1.0 percent in the fourth quarter after decreasing 3.0 percent in the third quarter. The smaller decrease primarily reflected an upturn in prices paid for motor vehicles and parts. Prices paid for nondurable goods decelerated sharply, increasing 0.7 percent after increasing 7.9 percent, mainly because of a downturn in prices of gasoline, fuel oil, and other energy goods. Prices paid for services accelerated, increasing 4.4 percent after increasing 3.1 percent, primarily reflecting an acceleration in prices paid for household energy services.

The prices paid by consumers for energy goods and services decelerated in the fourth quarter. The price index for consumer purchases excluding food and energy, which is sometimes viewed as an indicator of the

Note. Most percent changes are from NIPA table 1.6.7; percent changes for personal consumption expenditures on food and on energy goods and services and for personal consumption expenditures excluding food and energy are calculated from index numbers in NIPA table 2.3.4. Contributions to percent change are from NIPA table 1.6.8.

underlying core rate of inflation, increased 2.2 percent after increasing 1.4 percent.

Prices of private nonresidential fixed investment increased 3.7 percent after increasing 2.5 percent. Prices of structures accelerated, increasing 19.5 percent after increasing 16.5 percent, but prices of equipment and software decreased 1.2 percent after decreasing 1.8 percent. Prices of residential fixed investment increased 7.1 percent after increasing 6.5 percent and have accelerated for three successive quarters.

Prices paid by government increased 4.9 percent after increasing 6.7 percent. Prices paid by the Federal Government for defense goods and services decelerated; prices paid for nondefense goods and services turned down. Prices paid by state and local governments also decelerated.

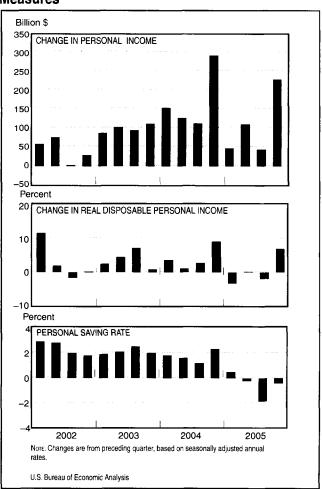

The GDP price index increased 3.0 percent in the fourth quarter, 0.3 percentage point less than the price index for gross domestic purchases.⁸ The smaller increase in the GDP price index reflected a smaller increase in export prices (which are included in the GDP price index) than in import prices (which are included in the price index for gross domestic purchases).

Personal Income

Real disposable personal income (DPI) rebounded in the fourth quarter, increasing 7.0 percent after decreasing 2.0 percent in the third quarter (chart 3). The upturn reflected a sharp acceleration in current-dollar DPI and a deceleration in the implicit price deflator for personal consumption expenditures (PCE). Current-dollar DPI increased 9.8 percent after increasing 1.6 percent, primarily because of a strong acceleration in personal income that was somewhat offset by an acceleration in personal current taxes (table 5).9 The PCE implicit price deflator (which is used to deflate DPI) increased 2.6 percent after increasing 3.7 percent.

Personal income, which is only measured in current dollars, increased \$231.6 billion (or 9.4 percent) after increasing \$45.3 billion (or 1.8 percent) in the second quarter. The acceleration primarily reflected a sharp upturn in rental income of persons, an upturn in non-

Chart 3. Selected Personal Income and Saving Measures

^{8.} The GDP price index measures the prices paid for goods and services produced in the United States. The price index for gross domestic purchases measures the prices paid for goods and services purchased by U.S. residents, regardless of where those goods and services were produced.

^{9.} Current-dollar DPI is defined as personal income less personal current taxes.

^{10.} Quarterly NIPA estimates are presented at annual rates, which show the value that would be registered if the rate of activity that is measured for a quarter were maintained for a full year. The annual rates are determined simply by multiplying the estimated rate of activity by 4.

farm proprietors' income, and accelerations in government social benefits and in personal interest income. Changes in these components were partly offset by a sharp downturn in "other" current transfer receipts from business and by decelerations in wages and salaries and in employer contributions for employee pension and insurance funds.

The upturns in rental income and in nonfarm proprietors' income primarily reflected rebounds from the uninsured losses from the third-quarter hurricanes. The acceleration in government social benefits primarily reflected an upturn in state and local Medicaid payments that are part of current personal transfer receipts. The acceleration in personal interest income was mainly due to an increase in interest rates.

The downturn in "other" current transfer receipts

from business reflected the third-quarter net settlements that had been paid to persons for hurricane losses. The deceleration in wages and salaries primarily reflected data on employment, hours, and earnings from the Bureau of Labor Statistics. The deceleration in employer contributions for employee pension and insurance funds primarily reflected a deceleration in health insurance contributions. Employer contributions government social insurance also decelerated.¹¹

Personal dividend income accelerated for the third consecutive quarter, increasing \$15.3 billion after increasing \$13.8 billion in the third quarter.

Real GDP for 2005

Real GDP increased 3.5 percent in 2005 after increasing 4.2 percent in 2004 (table 1). Real gross domestic purchases increased 3.6 percent after increasing 4.7 percent.

The deceleration in real GDP primarily reflected a downturn in private inventory investment and decelerations in consumer spending and in Federal Government spending that were partly offset by a deceleration in imports.

Businesses reduced inventory investment in 2005 by \$34.8 billion. The reduction subtracted 0.32 percentage point from real GDP growth in contrast to the inventory accumulation in 2004 that added 0.35 percentage point to real growth.

Consumer spending increased 3.6 percent and contributed 2.49 percentage points to real GDP growth after increasing 3.9 percent in 2004 and adding 2.71 percentage points. The deceleration was primarily due to a downturn in spending for motor vehicles and parts and to a deceleration in spending for furniture and household equipment.

Federal Government spending increased 2.0 percent and contributed 0.14 percentage point to real GDP growth in 2005 after increasing 5.2 percent and contributing 0.36 percentage point. Partly offsetting this deceleration, state and local spending increased 1.5 percent and contributed 0.18 percentage point to real GDP growth after increasing 0.4 percent and contributing 0.05 percentage point.

Imports decelerated in 2005, increasing 6.2 percent after increasing 10.7 percent. Imports subtracted 0.96 percentage point from real GDP growth in 2005 after subtracting 1.53 percentage points. The deceleration was widespread across imports of goods and of services.

The price index for gross domestic purchases increased 3.2 percent, compared with an increase of 2.9 percent in 2004, mainly reflecting an acceleration in energy prices; food prices decelerated (table 4). The price index for gross domestic purchases excluding food and energy remained roughly constant over 2004, increasing 2.5 percent in 2005 after increasing 2.4 percent

Real DPI increased 1.4 percent after increasing 3.4 percent. The deceleration reflected a deceleration in current-dollar personal income that was reinforced by an acceleration in personal current taxes.

February 2006

Gross Domestic Product

Revisions and Source Data

By Bruce T. Grimm and Teresa L. Weadock

THE Bureau of Economic Analysis (BEA) estimates of gross domestic product (GDP) are among the most widely scrutinized indicators of U.S. economic activity. In particular, BEA's first quarterly estimates of GDP draw wide attention from policymakers, academics, investment professionals, the media, and others. These first quarterly estimates provide an early estimate of broad economic activity and are produced using a wide mix of source data—preliminary survey results, various indicators, trade industry data, and more—that are later revised to reflect more complete information.

The goal of this article is to explain the relationship between the first three quarterly GDP estimates and the source data that each of these estimates incorporates. This article also illustrates that the differences between the quarterly GDP estimates and the first annual revision estimate, which incorporates higher quality source data, are relatively small. Thus, the earliest quarterly estimates of GDP present a general picture of the economy—growth, trends, and component activity—that changes relatively little through subsequent revisions.

The estimates of GDP for each quarter are published in a series of releases (table 1). For any given quarter, the "advance" estimate of GDP is released toward the end of the first month after the quarter ends. The "preliminary" estimate is released toward the end of the second month after the quarter ends. And the "final" estimate is released toward the end of the third month.

Table 1. Release Schedule for the Successive Estimates of Gross Domestic Product for the Fourth Quarter of 2004

Advance estimate Preliminary estimate Final estimate First annual estimate Second annual estimate Third annual estimate	February 2005 March 2005
Third annual estimate	July 2006 July 2007

The two later estimates incorporate progressively more up-to-date source data. These three quarterly estimates are referred to by BEA as the "current quarterly" estimates and attract the most attention from the public. Previous BEA studies of revisions have indicated that the current quarterly estimates of GDP are reliable.¹

In addition, BEA releases "annual revision estimates" of GDP in series. These revisions revise quarterly and annual GDP estimates for the previous 3 years. The first annual revision estimate is usually released in July of the following year.² The first annual revision estimate for the year 2005, for example, will be released in July 2006. The first annual revision incorporates revised monthly or quarterly source data and new annual data. The second and third annual revision estimates follow in successive years. These revisions incorporate newly available and revised annual data.

After the third annual revision estimate, the estimates of GDP—both quarterly and annual—are generally not revised until the next comprehensive revision. Comprehensive revisions, which occur about every 5 years, incorporate even more detailed source data from various economic censuses.

Source data types

To calculate GDP and other measures in the national income and product accounts (NIPAs), BEA relies on a wide range of source data, including measures of retail sales, manufacturers' shipments, inventories, value of construction put in place, employment, international trade flows of goods and services, revenue of services industries, and estimates of government outlays. These

^{1.} For example, see Dennis J. Fixler and Bruce T. Grimm, "Reliability of the NIPA Estimates of U.S. Economic Activity" Survey of Current Business 85 (February 2005): 8–19; <www.bea.gov/bea/articles/2005/02February/0205 NIPAs.pdf>.

^{2.} The first annual revision estimate follows the early annual estimate for a given year. This estimate is an average of the year's four quarters. It is released with the "advance" quarterly estimate of GDP for the fourth quarter, usually in January of the following year, and it is revised with the release of the preliminary and final estimates for the fourth quarter.

source data are available at different frequencies—for example, inventory data are available monthly and annually.

To derive the quarterly estimates of most GDP components, BEA relies on "expenditure data" in current dollars. Typically, these data are then adjusted to conform with NIPA concepts and definitions, using one of four methods: Commodity flow, retail control, perpetual inventory, or fiscal year analysis.³

In some cases, BEA relies on other methods to derive appropriate expenditure data, including a straightforward "physical quantity times price" method. For example, to derive personal consumption expenditures for gasoline, the number of gallons and the average prices from the Energy Information Administration (EIA) are multiplied to obtain current-dollar estimates. In other cases, if the monthly or quarterly data are available but are not as comprehensive or as reliable as annual source data, BEA uses the annual data to extrapolate or interpolate an estimate of expenditures. In some cases, the extrapolation and interpolation are based on trends.

Estimates of imports and exports of goods and services (as well as some other foreign transactions) are based on the international transactions accounts.

Source data categories and successive estimates

In this article, BEA categorizes the source data used for GDP and NIPA estimates according to quality, availability, and use (table 2) The four categories are as follows:

- **Revised data.** These data are based on revised estimates of monthly or quarterly source data; they are presumed to be more accurate than preliminary data.
- Monthly or quarterly data. These data include either monthly data for all 3 months of a quarter or data for a complete quarter.
- Monthly and trend-based data. These data typically include 2 months of source data but limited or no data for the third month, necessitating a calculation for the third month.⁴

• Trend-based data. These data are typically calculated by BEA from previous estimates and trends, using moving averages of various lengths, regressions, and judgment by BEA economists.

The advance estimates are based on source data in the last three categories. The most common types of source data are "monthly or quarterly data" and "monthly and trend-based data." These two categories account for about 75 percent of the source data used to calculate the advance estimates (table 3 and chart 1). Trend-based data account for the remainder.

Table 3. Shares of Sources for the Successive GDP Estimates for the Third Quarter of 2003

[Percent]

Sources		Preliminary estimates	Final estimates	First annual estimates
Trend-based data	25.1	22.6	20.9	5.6
Monthly data and trend-based data	29.7	1.7	1.2	
Monthly or quarterly data	45.3	6.6	8.4	
Revised data		69.2	69.5	47.2
Annual data		***************************************		47.2

The preliminary and final estimates are based on source data in all four categories. However, most of the "monthly and trend-based data" are replaced by revised data, which are generally considered more accurate. About 77 percent of the source data for the final estimates are revised data or "monthly or quarterly data." About 21 percent of the source data for the final estimate is trend-based data, down from 25 percent for the advance estimates.

The estimate of new residential structures offers an example of source data changes from the advance estimate to the final quarterly estimate. The advance estimate of new residential structures incorporates 2 months of source data and an assumption for the third month; the source data is categorized as "monthly and trend-based data." The preliminary estimate is based on revised data for the first and second months and newly available data for the third month; the source data are categorized as revised data. The final estimate is based on data for the second and third months that are further revised; the source data is also categorized as revised data.

Annual revisions

The first annual revision estimate of GDP includes revisions to the quarterly estimates for the previous year in addition to new annual estimates. By the time the first annual revision estimates are calculated and released, much of the data used to calculate the advance quarterly estimates have been replaced with higher quality data.

^{3.} For more details, see "Updated Summary Methodologies," SURVEY 85 (November 2005): 11–28; <www.bea.gov/articles/2005/11November/1105_NIPAMeth.pdf>.

^{4.} Information on the assumptions used for unavailable source data is provided in a technical note that is on BEA's Web site <www.bea.gov> as part of the advance GDP release. In addition, on the day of the release of personal income and outlays after the release of the advance estimates, more detailed information is posted on BEA's Web site; under "Gross Domestic Product" and "Supplemental Estimates," see "Key source data and assumptions for advance estimates."

Many of the quarterly estimates in the first annual revision are based on source data that cover a full year (annual data) and are then either interpolated or extrapolated using source data that cover either months or quarters. The monthly or quarterly source data are often the same as those used to calculate the current quarterly estimates, with revisions, if necessary, to make them consistent with the annual data and with updated seasonal adjustments.

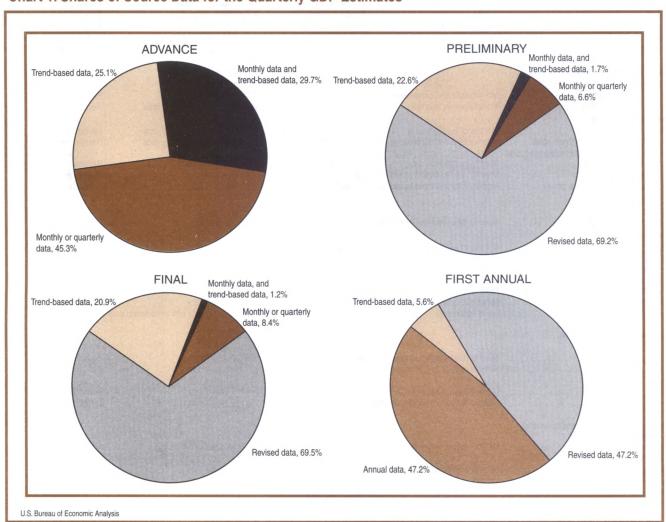

Annual source data often contain additional or more complete information than the quarterly or monthly source data. For example, the first annual revision estimates for personal consumption expenditures for electricity are based on 3 months of source data for each quarter as well as on annual estimates from the EIA.

Nearly half of the first annual revision estimates are based on source data that are not available when the final quarterly estimates are prepared. Another 25 percent of the source data are revised data. Only about 6 percent of the source data used for the first annual estimates are either trend-based data or are unrevised monthly or quarterly source data.

The second and third annual revision estimates incorporate more new or revised annual source data as well as some further revised monthly and quarterly data. These annual revision estimates also incorporate revised seasonal adjustment factors, which depend on seasonal patterns that change over time.

In addition, BEA releases a comprehensive revision

Chart 1. Shares of Source Data for the Quarterly GDP Estimates

^{5.} In the interpolation process, the annual estimates are interpolated using quarterly or monthly source data that generally retain patterns of the annual source data; the quarterly estimates are interpolated in ways that retain the annual totals.

about every 5 years.⁶ In years when comprehensive revisions are published, no annual revision is published.

Current quarterly and first annual revision comparison

The current quarterly estimates receive the most attention from policymakers and business analysts because they are the first estimates published for a specific quarter and are thus considered highly topical. In 1983–2002, the current quarterly estimates of GDP growth in current dollars ranged from –1.2 percent to 13.9 percent.

To assess the magnitude of revisions to current-dollar GDP growth estimates, one can compare the three current quarterly estimates among themselves and compare the three current quarterly growth estimates to the first annual revision growth estimate. These comparisons allow one to assess the impact of the source data flow because the first annual revision estimate reflects higher quality source data, mainly more up-to-date annual data and revised quarterly data. This estimate also features revisions to seasonal adjustments that are typically smaller than the revisions to the later estimates. In addition, the effects of revisions due to changes in definitions or methodologies are smaller than the revisions to the later estimates.

Overall, the magnitude of revisions to these growth rates is small. What's more, the revisions from the current quarterly estimates to the latest estimates, which are considered the most accurate, are similar to the revisions from the three annual estimates to the latest estimates.⁸

Mean revisions. Even though the source data used for the advance estimates are updated with more timely and more reliable data for the preliminary and final estimates, the average revisions from the advance estimate to the later estimates are rather modest. The mean revisions from the advance estimate to both the preliminary and final estimates of current-dollar GDP are 0.15 percentage point (table 4). The mean revision from the preliminary estimate to the final estimate of current-dollar GDP is negligible.

The mean revision from the advance estimate to the first annual estimate of GDP is 0.21 percentage point. The mean revisions of the preliminary and final esti-

mates to the first annual revision estimate of GDP are both just 0.06 percentage point. The 0.06-percentage-point mean revisions reflect the incorporation of comprehensive revisions into some of the first annual estimates; the comprehensive revisions have historically raised both the levels and the rates of growth of GDP. There are no significant biases; none of the mean revisions is statistically significantly different from zero.

Mean absolute revision (MAR). The mean revision without regard to sign of the advance estimate to the preliminary estimate of GDP is 0.54 percentage point. The MAR from the advance estimate to the final estimate is 0.70 percentage point. The MAR from the preliminary estimate to the final estimate is 0.28 percentage point.

The MARs from the current quarterly estimates to the first annual estimates of GDP range from 0.86 to 1.08 percentage points. In comparison, the MARs of the current quarterly estimates to the second and third annual revisions range from 1.12 to 1.18 percentage points. Thus, the MARs of revisions from the current quarterly estimates to the later estimates that incorporate annual source data (as well as comprehensive revisions in some instances) are substantially larger than the MARS from the earlier to the later current quarterly estimates.⁹

Previous BEA studies of GDP estimates have found that the current quarterly estimates are reliable. An analysis of GDP estimates for 1983–2002, for example, found that 98 percent of the time, these estimates successfully indicated the direction of change in real GDP; that 74 percent of the time, these estimates indicated whether real GDP was accelerating or decelerating; and that more than 60 percent of the time, when the estimates were more than one standard deviation higher or lower than the mean, later estimates found they remained similarly removed from the mean.

Table 4. Mean and Mean Absolute Revisions to the Successive Estimates of Current-Dollar GDP for 1983–2002

[Percentage points]

	Preliminary estimates	Final estimates	First annual estimates

Research Spotlight

Taxation and Multinational Activity: New Evidence, New Interpretations

ARIFF reductions, falling transport costs, and re-▲ duced barriers to international capital flows have created extensive opportunities for multinational firms operating in increasingly integrated global markets. In the midst of rapid integration and globalization, firms still face tax systems that differ among countries, and these differences have the potential to affect major investment and financing decisions. Indeed, high-profile examples of countries such as Ireland that use tax policy to attract multinational firms highlight the role of taxation in attracting foreign direct investment, which in turn contributes to economic growth. Governments anxious to attract foreign direct investment often consider the use of tax incentives to lure multinational firms. Similarly, governments of foreign direct investment source countries, including the United States, often wonder whether their tax treatment of foreign income is appropriate. Scholarship on the effect of taxation on foreign direct investment, however, has been limited by an inability to observe how decisionmaking within firms reflects tax considerations.

A number of our recent studies have investigated the extent to which taxation influences the activities of U.S. multinational firms. U.S. multinational firms serve as particularly powerful subjects of study because they simultaneously operate in many distinct tax jurisdictions and their actions therefore reflect the impact of tax differences, controlling for any firm-specific effects. Our research covers a wide range of topics, including the impact of indirect taxes as well as of

Mihir A. Desai is an Associate Professor at Harvard Business School, C. Fritz Foley is an Assistant Professor at Harvard Business School, and James R. Hines, Jr. is a Professor of Economics at the University of Michigan. Statistical work for the studies described here was performed at BEA under a special program for outside researchers. (See the box "BEA Program for Outside Researchers.") The views expressed in this article represent the views of the authors.

corporate income taxes, the sensitivity of financing decisions to tax rates, the effects of taxes on repatriation policies, the demand for, and impact of, tax havens, and the use of indirect ownership as a means of avoiding taxes. This body of work is summarized in this research spotlight.

This research is based in large part on work conducted at the Bureau of Economic Analysis (BEA) through a special program that gave us access to the agency's rich store of confidential firm-level data on multinational companies for analytical purposes (see the box "BEA Program for Outside Researchers"). The firm-level data, which are collected in BEA's surveys of international direct investment, are used by BEA to produce aggregated tabular data on multinational-company operations for release to the general public.

In its benchmark and annual surveys of U.S. direct investment abroad, BEA collects the most comprehensive and reliable available data on the activities of U.S. multinational firms.¹ These data are particularly valuable for investigating the impact of international taxation on the activities of U.S.-owned businesses because they include a large amount of tax and operating information that has been collected on a consistent basis on foreign affiliates located around the world.

Several notable features of BEA's direct investment abroad surveys distinguish them from other data sources. First, the BEA data on the foreign operations of U.S. multinational firms are drawn from all foreign affiliates—foreign branches as well as separately incorporated foreign subsidiaries. Because the tax treatments of these two types of foreign affiliates differ, comparisons of the behavior of incorporated and unincorporated affiliates provide useful indicators of the

^{1.} For a discussion of the most recent data collected, see Raymond J. Mataloni Jr., "U.S. Multinational Companies: Operations in 2003," SURVEY OF CURRENT BUSINESS 85 (July 2005): 9–29. For general information on the statistics that are available on U.S. multinational firms, see Raymond J. Mataloni Jr., "A Guide to BEA Statistics on U.S. Multinational Companies," SURVEY 65 (March 1995): 38–55.

impact of taxation. Second, in contrast to some of the data provided to tax authorities, the BEA filings are not contingent on repatriations (which is usually the taxable event from the U.S. perspective) and include operating information. Thus, the BEA filings profile all of a firm's activity abroad every year. Third, the BEA data provide information not only on income taxes, but also on indirect taxes (such as excise taxes and value added taxes) paid by the foreign affiliates of U.S. multinational firms. Finally, reporting in the BEA data follows generally accepted U.S. accounting principles, and the financial information collected is filed through U.S. entities familiar with such practices; therefore, it is not necessary to make the problematic assumptions that are normally required in order to analyze financial information collected in different countries. The rich variety of operating information for parents and their affiliates also allows for analysis that controls for a variety of confounding factors.

In addition to providing a rich source for financial and operating data for multinational firms, the BEA data also provide a unique window on tax rates around the world. Typically, measures of tax rates rely on statutory rates or rates calculated based on aggregate tax data. The BEA data allow for the measurement of tax burdens as experienced by multinational firms in their operations around the world. As such, they offer a

more accurate measure of effective tax burdens.2

The remainder of this research spotlight summarizes our research on the effects of taxation on multinational firms in the following areas:

- Foreign business activity by multinational firms,
- Financing foreign affiliates,
- Profit repatriation from foreign affiliates,
- Tax havens, and
- Ownership structures.

Income Taxation, Indirect Taxation, and Multinational Activity

Governments have the ability to impose an array of taxes on foreign entities, including personal and corporate income taxes, sales taxes, value-added taxes, property taxes, excise taxes, and numerous others. It is not uncommon for a country to impose all of these taxes simultaneously. Obviously, these taxes have important implications for investment and economic activity, including foreign direct investment.

BEA Program for Outside Researchers

The statistical work underpinning the studies described in this article was conducted at the Bureau of Economic Analysis under a program that permits outside researchers to work on site as unpaid special sworn employees of the Bureau for the purpose of conducting analytical and statistical studies using the microdata that it collects under the International Investment and Trade in Services Survey Act. The program was established in the early 1990s, partly as a response to a recommendation by a National Academy of Sciences study panel that "nongovernment users should be given greater access to trade and other international economic data compiled by the federal government." Similar programs have been established at the Census Bureau and the Bureau of Labor Statistics. These programs recognize that some research

requires data at a more detailed level than that provided in publicly disseminated tabulations, and they help to ensure that the data are fully utilized and that the expertise and analytical perspectives of leading economic researchers are brought to bear in their analysis.

At BEA, this work is conducted under strict guidelines and procedures that protect the confidentiality of company-specific data, as required by law. Because the program exists for the express purpose of advancing scientific knowledge and because of legal requirements that limit the use of the data to analytical and statistical purposes, appointment to special-sworn-employee status under this program is limited to researchers. Appointments are not extended to persons affiliated with organizations that collect taxes, enforce regulations, or make policy. BEA screens research outputs before publication to ensure that confidential information is not disclosed, but the views expressed represent those of the researchers.

^{2.} In the papers discussed in this article, income tax rates are defined as ratios of income tax payments to pretax income and are calculated using data for affiliates that report positive after-tax income. Indirect tax rates are defined as ratios of tax payments other than income taxes and payroll taxes to affiliate value added. Payroll taxes are reported as an indistinguishable component of employee compensation. The data are based on U.S. financial accounting rules, which differ from tax accounting rules.

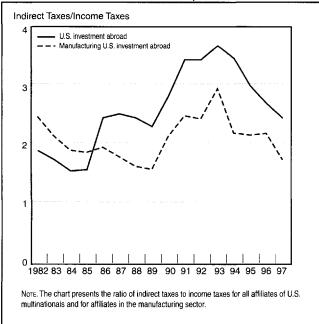

^{1.} Anne Y. Kester, ed., Behind the Numbers: U.S. Trade in the World Economy, National Research Council, Panel on Foreign Trade Statistics (Washington, DC: National Academy Press, 1992): 73.

Previous economic studies have investigated the influence of corporate income taxes on international direct investment. However, the existing literature has considerably less to say about the relationship between direct investment and other types of taxation or about the possibility that the documented relationships may reflect indirect taxes as well as income taxes. Indirect taxes, which are defined as taxes other than corporate income taxes, have grown rapidly over the last several decades and may have a comparable, or greater, impact on investment decisionmaking than do income taxes.

In our paper "Foreign Direct Investment in a World of Multiple Taxes," we compare the effect of corporate income taxes on investment by U.S. multinational firms with the effect of indirect taxes. Foreign indirect tax obligations of U.S. multinational firms are significant, exceeding 1.5 times their direct tax obligations (chart 1). In addition, many countries, including the United States, permit multinational firms to claim foreign tax credits for corporate income taxes paid to foreign governments, but they do not allow credits for indirect taxes. As a result, taxes for which firms are ineligible to claim credits may well have a greater impact on decisionmaking than (creditable) income taxes.

This study compares the sensitivity of foreign direct investment to indirect taxation with its sensitivity to corporate income taxation. This comparison serves

Chart 1. The Ratio of Indirect Taxes to Income Taxes for U.S. Multinational Affiliates, 1982–1997

two functions; the first is to identify the impact of these quantitatively important indirect taxes, and the second is to refine our understanding of the channels through which high rates of corporate income taxation discourage foreign direct investment.

The evidence indicates that higher tax rates in host countries are indeed associated with lower direct investment by U.S. multinational firms and that this association is apparent for both indirect taxes and corporate income taxes. Indirect tax rates are negatively correlated with investment levels as measured by assets to about the same degree as are corporate income tax rates. Our estimates suggest that U.S.-owned affiliates in countries with 10-percent higher indirect tax rates have 7.1-percent fewer assets, and those in countries with 10-percent higher corporate income tax rates have 6.6-percent fewer assets. These effects on investment levels are mirrored in effects on output: 10percent higher indirect tax rates are associated with 2.9-percent less output, and 10-percent higher income tax rates are associated with 1.9-percent less output.

There are reasons to believe that indirect taxes and corporate income taxes influence overall levels of multinational affiliate activity through distinct channels. Indirect tax obligations are not functions of reported income and therefore are little, if at all, affected by the financing of foreign affiliates and by the prices used for intrafirm transfers. For any given level of output, high corporate income taxes have a depressing effect on the use of capital because the taxation of the return to capital encourages firms to substitute away from capital inputs and towards tax deductible inputs such as labor. As a consequence, corporate income taxes encourage firms to reduce their capital-labor ratios, while indirect taxes do so to a much lesser degree. The evidence is consistent with these predictions, in that high corporate income tax rates depress affiliate capital-labor ratios and profit rates, while high indirect tax rates have no discernible effects on these variables.

Thus, high corporate income tax rates are associated with reduced levels of foreign direct investment because they increase the costs of using capital, they encourage taxpayers to substitute labor for capital, and they affect the returns to reallocating taxable income. High indirect tax rates reduce foreign direct investment through just one of these channels, that of greater costs, but the magnitude of their impact is comparable with that of income taxes, partly reflecting the fact that tax credits are not available for indirect tax payments.

Taxation and the Financing of Foreign Direct Investment

Tax systems generally permit corporations to deduct interest expenses in calculating taxable income, but they do not permit corresponding deductions for dividend payments to shareholders. Such systems encourage the use of debt at the expense of equity, an incentive that is stronger at higher tax rates. While it is widely appreciated that tax systems create such incentives, estimating the sensitivity of capital structure to corporate income tax rates has proven to be difficult. Countries typically subject similar corporations to similar tax rates, thus limiting tax-rate differences and making it difficult to identify the effects of taxation using data drawn from firms in the same country. Recent efforts using cross-country samples exploit the rich variations that international comparisons offer, but these efforts frequently face problems associated with nonstandardized measurement across countries and small sample sizes. Consequently, it is hardly surprising that several studies report no effects or unexpected relationships between tax incentives and the use of debt.

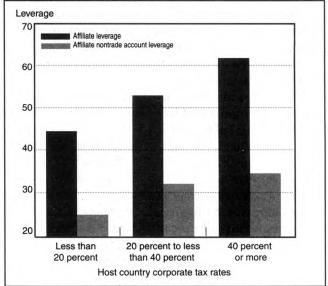

In our paper "A Multinational Perspective on Capital Structure Choice and Internal Capital Markets," we examine the impact of local corporate income taxes on the extent to which multinationals finance their foreign operations with debt, including the use of borrowing from related parties abroad. U.S. multinational firms face different tax rates and therefore different incentives to use debt in the countries in which they operate. The BEA affiliate-level data makes it possible to distinguish the behavior of foreign affiliates of the same parent companies operating in markets with differing corporate income tax rates, and that makes it possible to infer the effects of tax rates on external borrowing and on borrowing from parent companies. The analysis thereby controls for the determinants of capital structure that are common to all affiliates of the same parent company. It also illuminates the extent to which firms use internal capital markets to reduce worldwide tax obligations and to substitute for costly external financing.

The evidence indicates that higher corporate tax rates are robustly associated with increased use of debt. Chart 2 displays the relationship between country tax rates and two measures of U.S. affiliate leverage in 1994. The first measure is the ratio of affiliate current liabilities and long-term debt to total affiliate assets. The median of this ratio for each group of tax rates is depicted by the darker shaded bars. In countries with

tax rates of less than 20 percent, the median ratio is about 45 percent. The median ratio exceeds 60 percent for affiliates in countries with tax rates that are greater than, or equal, to 40 percent. The second measure of leverage that we analyze removes the potential impact of trade credit because trade credit is often noninterest bearing; it is the ratio of affiliate current liabilities and long-term debt, less trade accounts and trade notes payable, to total affiliate assets. The median of this ratio for distinct groups of host country tax rates is depicted by the lighter shaded bars; it also increases substantially with tax rates.

Further analysis reveals that borrowing from parent firms responds more sharply to tax-rate differences than borrowing from external sources. According to our estimates, 1-percent higher tax rates are associated with 0.19-percent higher external borrowing but 0.35percent higher borrowing from parent companies. Thus, it appears that multinationals opportunistically use their internal capital markets to structure financing in response to tax-rate differences around the world. In addition to measuring the impact of tax-rate differences, the study also considers the effects of external financing costs on proclivities to finance investments with external and internal funds. Specifically, the paper demonstrates that multinational firms face higher borrowing costs in countries with less well developed capital markets, and affiliates in those countries are relatively heavily financed by loans from their parent companies.

Chart 2. Affiliate Capital Structure and Host Country Tax Rates, 1994

Taxation and Repatriation Policies

The U.S. system of taxing foreign income has attracted a great deal of scholarly and legislative attention in recent years. For example, the *American Jobs Creation Act of 2004* featured temporarily reduced taxes on repatriations from abroad in order to encourage firms to repatriate foreign profits that could then be used to finance domestic investment. This rationale relies on the idea that dividend repatriations from foreign affiliates of U.S. multinational firms are significantly affected by repatriation taxes, a proposition tested in our paper "Repatriation Taxes and Dividend Distortions."

The United States taxes the foreign incomes of U.S. companies, grants credits for foreign income taxes paid, and defers taxes due on the unrepatriated earnings of affiliates that are separately incorporated abroad. This system thus effectively imposes repatriation taxes that inversely vary with foreign tax rates and that differ for affiliates organized as separate corporations and branches because the profits of foreign branches are taxed as they are earned and therefore do not trigger additional tax liabilities upon repatriation. Some observers suggest that the taxation of repatriated profits imposes an undue burden on U.S. companies and that a territorial tax system, in which income earned abroad by U.S. multinational companies would not be subject to U.S. taxation, would improve efficiency and would enhance the competitive positions of U.S. companies in the world marketplace. Others believe that the failure to tax foreign income would create too strong an incentive for U.S. companies to invest in foreign countries rather than in the United States.

Our study measures the effects of repatriation taxes by comparing the behavior of foreign subsidiaries that are subject to different tax rates and by comparing the behavior of foreign incorporated (or "subsidiary") affiliates with the behavior of unincorporated (or "branch") affiliates. The evidence indicates that dividend payouts are determined by gradual adjustment to desired long-run dividends conditional on earnings. Highly taxed foreign affiliates have higher payout rates than do more lightly taxed subsidiaries, reflecting the lower net repatriation taxes associated with receiving dividends from heavily taxed affiliates, whose dividends come with large foreign tax credits. Unincorporated foreign affiliates, from whom the receipt of distributions from earnings do not trigger repatriation taxes, do not exhibit the same large and significant association between tax rates and dividend payout ratios.

These effects would disappear if the United States were to exempt foreign income from taxation. The re-

sults imply that holding foreign investment levels constant, the existence of repatriation taxes reduces aggregate dividend payouts by 12.8 percent and in the process generates annual efficiency losses equal to 2.5 percent of dividends. Because repatriation taxes also reduce U.S. direct investment abroad, the total economic effects are larger still.

The Demand for and Uses of Tax Havens

Tax havens are low-tax jurisdictions that provide opportunities for tax avoidance. Popular tax havens typically include Ireland and Luxembourg in Europe, Hong Kong and Singapore in Asia, and various Caribbean island nations in the Americas. Low-tax jurisdictions also exist within countries. Examples include special economic zones in China, low-tax states and enterprise zones in the United States, and historically tax-favored regions such as eastern Germany, southern Italy, and eastern Canada.

U.S. multinational firms make extensive use of foreign tax havens. As of 1999, nearly 60 percent of U.S. firms with significant foreign operations had an affiliate presence in tax-haven countries. In our study "The Demand for Tax Haven Operations," we use the BEA affiliate-level data to identify the characteristics of firms that use tax havens and the purposes that tax-haven operations serve. The results of the paper's empirical tests indicate that tax-haven operations facilitate tax avoidance both by permitting firms to allocate tax-able income away from high-tax jurisdictions and by reducing the burden of home country taxation of foreign income.

The data suggest that large multinational firms with extensive foreign operations are the most likely to operate in tax havens and that this pattern reflects global tax-avoidance strategies. U.S. multinational firms are more likely to establish new tax-haven operations if their nontax-haven investments are growing rapidly, which generally confirms the notion that more foreign investment increases the potential return to using tax havens. The analysis shows that 1-percent greater sales and investment growth in nearby nontax-haven countries is associated with a 1.5-to-2-percent greater likelihood of establishing a tax-haven operation.

Larger tax-haven countries support a broad range of business activities and thereby afford companies the greatest opportunities to locate taxable profits. The evidence is that multinational parents in industries in which firms typically face high foreign tax rates, in industries that are technology intensive, and in industries characterized by extensive intrafirm trade are the most likely to operate in large, rather than small, tax havens. The data also show that ownership of an affiliate in a large tax-haven country is associated with reduced tax payments elsewhere in the same region. These results are consistent with the notion that multinational firms have become adept at using financial transactions, intrafirm trade, and transfers of intangible property to reallocate taxable income to low-tax jurisdictions.

U.S. multinational parents in industries in which firms typically face low foreign tax rates also have particularly strong reasons to operate in tax havens. The U.S. policy of taxing foreign profits from foreign subsidiaries only when repatriated, together with the system of granting credits for foreign tax payments, implies that the profits earned in low-tax foreign countries are more likely to generate U.S. tax liabilities when repatriated than are profits earned in high-tax foreign countries. U.S. multinationals can defer repatriation taxes by investing foreign profits in other foreign operations, a process that is facilitated by indirectly owning foreign operations through holding companies located in tax havens. These arrangements must be carefully structured in order to avoid immediate U.S. taxation of certain passive types of income, but they can nonetheless offer benefits to investors with significant potential exposure to U.S. taxation of lightly taxed foreign income. Firms appear to make extensive use of affiliates located in small tax-haven countries for this purpose.

Our related study, "Do Tax Havens Divert Economic Activity?" notes that this evidence suggests that tax havens may serve to increase economic activity in nearby high-tax countries. Tax havens serve this function by indirectly reducing tax burdens on income earned in high-tax countries and by attracting investment that may enhance the profitability of operations in those countries. Proximity allows firms to split up production processes and increases the extent to which firms can avoid taxes through transfer pricing. Evidence that firms with extensive investments in nearby countries find it profitable to establish tax-haven operations likewise implies that the availability of tax haven opportunities increases the attractiveness of investments in high-tax locations. While it is common to worry about the role of nearby tax havens in diverting economic activity, these results indicate that the opposite may well be the case, as the ability to reduce tax obligations through the judicious use of tax-haven operations may stimulate greater investment in their high-tax neighbors.

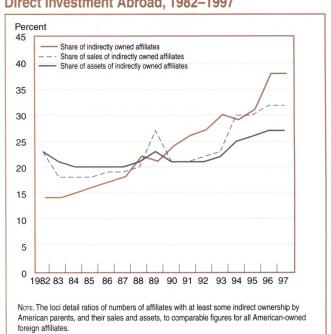

Taxation and Ownership Structure

U.S. multinational firms often structure the ownership of their foreign operations in tiers, so that the parent company might own a holding company in the Netherlands, for example, which in turn owns each of the firm's many other foreign subsidiaries. Such chains of ownership are becoming increasingly popular, with indirectly owned foreign affiliates now accounting for more than 30 percent of the aggregate foreign assets and sales of U.S. multinational firms (chart 3). The use of indirect ownership is described in our study "Chains of Ownership, Regional Tax Competition, and Foreign Direct Investment."

The ability to use indirect ownership, in which affiliates are owned indirectly through other affiliates rather than directly by a parent, can make investors from home countries that tax worldwide incomes and that grant foreign tax credits considerably more sensitive to foreign tax-rate differences than they would be otherwise. Indirect ownership has this effect by reducing the burden of home country taxes. In doing so, indirect ownership mitigates the feature of foreign tax credit systems that provides investors with limited incentives to avoid foreign taxes, because they are entitled to claim credits against home country taxes.

Indirect ownership can arise as a consequence of

Chart 3. The Role of Chains of Ownership in U.S. Direct Investment Abroad, 1982–1997

two strategies commonly suggested by lawyers that specialize in international tax planning. In the first, foreign earnings that would otherwise be repatriated are used to purchase equity in other existing foreign affiliates. This triangular strategy (so called because ownership of the indirectly held affiliate is split between the parent and one of its affiliates, producing a triangular ownership chart) adds to, or replaces, the original equity from the parent in the indirectly held affiliate with earnings from the operations of another foreign affiliate. In the second indirect ownership strategy, a multinational firm uses retained earnings from foreign operations to capitalize its initial investments in new foreign affiliates. The parent firm then has no direct ownership stake in the new foreign affiliate; instead, it owns it indirectly through one or more tiers of other foreign affiliates. The function of this strategy is similar to that of the triangular strategy; it also reduces the cost of taxes due upon repatriation by deferring repatriation.

Comparing the behavior of indirectly owned affiliates with directly owned affiliates allows one to measure the extent to which tax effects change when U.S. parent companies avoid the U.S. tax consequences of immediate repatriation. This comparison also offers an indication of the extent to which tax incentives might differ for multinationals that are based in countries that do not tax the foreign incomes of domestically incorporated firms. In particular, the foreign tax credit system used by the United States is likely to make American investors less sensitive to tax-rate differences than investors from many other countries.

Our findings indicate that indirectly owned foreign affiliates exhibit stronger tax effects than directly owned affiliates. For indirectly owned affiliates, 10percent higher tax rates in the host country are associated with a 12.0-percent reduction in affiliate assets and a 1.4-percent lower after-tax returns on assets. The comparable effects for directly owned affiliates are a 2.6-percent reduction in assets and a 0.7-percent lower return on assets. Because many countries other than the United States utilize territorial tax systems that do not impose taxes on earnings upon repatriation, granting credits for taxes earned abroad, multinational firms based in many parts of the world face tax environments similar to those faced by indirectly owned affiliates of U.S. companies. As a consequence, our findings suggest that previous evidence for the United States on the impact of taxation may, if anything, underestimate the effect of taxation on the behavior of multinational firms around the world. Similarly, the results illustrate the likely reaction of U.S. multinational firms to the adoption of a territorial tax system in place of the current worldwide tax system with foreign tax credits.

Conclusion

The behavior of U.S. multinational firms as revealed by the evidence collected by the BEA surveys consistently demonstrates that taxes play a critical role in shaping the volume and location of foreign investment, the financing of foreign investment, and the organizational structures of multinationals firms. As the scope of international business operations increases and as governments grapple with proposals for tax reforms, BEA's work in collecting and compiling data on multinational firms, along with its efforts to facilitate scholarly research using these data, only grows in importance.

BEA Current and Historical Data

National, International, and Regional Data

A selection of estimates from the national, industry, international, and regional accounts of the Bureau of Economic Analysis (BEA) are presented in this section. BEA's estimates are not copyrighted and may be reprinted without BEA's permission, and citing the Survey of Current Business and BEA as the source is appreciated.

More detailed estimates from BEA's accounts are available on BEA's Web site at <www.bea.gov>. These estimates are available in a variety of formats, including interactive access. In addition, news releases, articles, and other information, including methodologies and working papers, are available.

The tables present annual [A], quarterly [Q], and monthly [M] data.

National Data

A. Selected NIPA Tables

The selected set of NIPA tables presents the most recent estimates of gross domestic product (GDP) and its components that were released on January 27, 2006. These estimates include the "advance" estimates for the fourth quarter of 2005.

The selected set presents quarterly estimates

that are updated monthly. Annual estimates are presented in most of the tables.

The GDP news release is available on BEA's Web site within minutes after the release. To receive an e-mail notification of the release, go to <www.bea.gov>, and subscribe. The "Selected NIPA Tables" are available later that day.

Residual	. 25	-5.1	-16.3	-11.2	-12.4	-17.7	-23.8	-11.1

Nore. Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

Classification (Siry), later estimates for infost indicated the control (NAICS).

2. Includes government consumption expenditures, which are for services (such as education and national defense) produced by government. In current dollars, these services are valued at their cost of production.

3. For some components of final sales of computers, includes computer parts.

trial Classification (SIC); later estimates for these industries are pased on the rooted particles and additional defense).

2. Includes government in current dollars, these services are valued at their cost of production.

3. For some components of final sales of computers, includes computer parts.

Nore. Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line following change in private inventories is the difference between gross domestic product and the sum of final sales of domestic product and of change in private inventories, the residual line following structures is the difference between gross domestic product and the sum of the detailed lines of goods, of services, and of structures.

Equals gross domestic product excluding gross value added of households and institutions and of general government.
 Equals gross domestic business value added excluding gross farm value added.
 Equals compensation of employees of nonprofit institutions, the rental value of nonresidential fixed assets owned and used by nonprofit institutions serving households, and rental income of persons for tenant-occupied housing owned by nonprofit institutions.
 Equals compensation of general government employees plus general government consumption of fixed capital.

Equals gross domestic product excluding gross value added of households and institutions and of general government.
 Equals gross domestic business value added excluding gross farm value added.
 Guals compensation of employees of nonprofit institutions, the rental value of nonresidential fixed assets owned and used by nonprofit institutions serving households, and rental income of persons for tenant-occupied housing owned by nonprofit institutions.

Equals gross domestic product excluding gross value added of households and institutions and of general government.
 Equals gross domestic business value added excluding gross farm value added.
 Equals compensation of employees of nonprofit institutions, the rental value of nonresidential fixed assets owned and used by nonprofit institutions serving households, and rental income of persons for tenant-occupied housing owned by nonprofit institutions.
 Equals compensation of general government employees plus general government consumption of fixed capital.

Equals gross domestic product excluding gross value added of households and institutions and of general government.
 Equals gross domestic business value added excluding gross farm value added.
 Equals compensation of employees of nonprofit institutions, the rental value of nonresidential fixed assets owned and used by nonprofit institutions serving households, and rental income of persons for tenant-occupied housing owned by nonprofit institutions.
 Equals compensation of general government employees plus general government consumption of fixed capital.

^{3.} Equals compensation of employees of nonprofit institutions, the rental value of nonresidential fixed assets owned and used by nonprofit institutions serving nouseholds, and rental income of persons for tenant-occupied housing owned by nonprofit institutions.

^{4.} Equals compensation of general government employees plus general government consumption of fixed capital.

Nore: Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

The quantity index for computers can be used to accurately measure the real growth of this component. However, because computers exhibit rapid changes in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the components relative importance or its contribution to the growth rate of more aggregate series; accurate estimates of these contributions are shown in table 1.5.2 and real growth rates are shown in table 1.5.1.

2. Excludes software 'embedded,' or bundled, in computers and other equipment.

Note. The residual line is the difference between the first line and the sum of the most detailed lines.

^{1.} Exports of goods and services and income receipts deflated by the implicit price deflator for imports of goods and

Gross domestic income deflated by the implicit price deflator for gross domestic product.
 Gross national income deflated by the implicit price deflator for gross national product.
 Note domestic income deflated by the implicit price deflator for net domestic product.
 Note Except as noted in footnotes 1, 2 and 3, chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. additivé

Exports of goods and services and income receipts definated by the impact place of the corresponding implicit price deflator for exports of goods and services and income receipts to the corresponding implicit price deflator for imports divided by 100.

Note: Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive.

^{1.} The implicit price deflator for gross value added of nonfinancial corporate business divided by 100. Estimates for nonfinancial corporate business for 2000 and earlier periods are based on the 1987 Standard Industrial Classification (SIC); later estimates for these industries are based on the North American Industry Classification System (NAICS).

Nore. The current-dollar gross value added is deflated using the gross value added chain-type price index for nonfinancial industries from the GDP-by-industry accounts. For periods when this price index is not available, the chain-type price index for GDP goods and structures is used.

IVA Inventory valuation adjustment

CCAdj Capital consumption adjustment

Estimates for financial corporate business and nonfinancial corporate business for 2000 and earlier periods are based on the 1987 Standard Industrial Classification (SIC); later estimates for these industries are based on the North American Industry Classification System (NAICS).
 The current-dollar gross value added is deliated using the gross value added chain-type price index for nonfinancial industries from the GDP-by-industry accounts. For periods when this price index is not available, the chain-type price index for GDP goods and structures is used.
 Chained-dollar consumption of fixed capital of nonfinancial corporate business is calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by

Chained-dollar consumption of lixed capital or normal and composate business is the difference between the gross product and the consumption of fixed capital. IVA Inventory valuation adjustment CCAdj Capital consumption adjustment

1. Consists of gasoline, fuel oil, and other energy goods and of electricity and gas.

Note. Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-follar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

 Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

⁽construction and software).

2. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

Nore: Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software in table 3.9.5.

Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software in table 3.9.5.

^{1.} Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).
2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.
3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.
4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software in table 3.9.5.

None: Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the sum of the most detailed lines.

National defense consumption expenditures are defense services produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).
 Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.
 Includes general government intermediate inputs for goods and services sold to other sectors and for own-account invest-

National defense consumption expenditures are defense services produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).
 Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.
 Includes general government intermediate inputs for goods and services sold to other sectors and for own-account invest-

ment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software.

5. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

^{4.} Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software.

5. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

National defense consumption expenditures are defense services produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).
 Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero not return on these assets.
 Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

National defense consumption expenditures are defense services produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).
 Consumption of fixed capital, or depredation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depredation assumes a zero net return on these assets.
 Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

^{3.} Includes general government intermediation in the state of the sta

Table 3.11.6. Real National Defense Consumption Expenditures and Gross Investment by Type, Chained Dollars

^{3.} Includes general government intermediate inputs for goods and services sold to drive sections and not continued.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software.

5. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

Nore. Chained (2000) dollar series are calculated as the product of the chain-type quantity indexes uses weights of more than one period, the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

4. Foreign Transactions _____

Exports and imports of certain goods, primarily military equipment purchased and sold by the Federal Government, are included in services. Beginning with 1986, repairs and alterations of equipment are reclassified from goods to services.
 Consists of capital transfers and the acquisition and disposal of nonproduced nonfinancial assets.

Exports and imports of certain goods, primarily military equipment purchased and sold by the Federal Government, are included in services. Beginning with 1986, repairs and alterations of equipment are reclassified from goods to services.
 Clinctudes parts of foods, leeds, and beverages, of nondurable industrial supplies and materials, and of nondurable nonautomotive consumer goods.

Exports and imports of certain goods, primarily military equipment purchased and sold by the Federal Government, are included in services. Beginning with 1986, repairs and alterations of equipment are reclassified from goods to services.

2. The quantity index for computers can be used to accurately measure the real growth of this component. However, because computers exhibit rapid changes in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series; accurate estimates of these contributions are shown in table 4.2.1. and real growth rates abown in table 4.2.1.

3. Includes parts of foods, feeds, and beverages, of nondurable industrial supplies and materials, and of nondurable nonautomotive consumer goods.

^{3.} Includes parts of toods, feeds, and neverages, or nonuncine must read advantage and magnetic, and or the content consumer goods. Note: Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. For exports and for imports, the residual line is the difference between the aggregate line and the sum of the most detailed lines.

^{1.} Consists primarily of religious, educational, vocational, lodging, railroads, farm, and amusement and recreational structures, net purchases of used structures, and brokers' commissions on the sale of structures.

2. The quantity index for computers can be used to accurately measure the real growth rate of this component. However, because computers exhibit rapid changes in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate senes; accurate estimates of these contributions are shown in table 5.3.2 and real growth rates are shown in table 5.3.1.

3. Excludes software "bmbedded" or bundled, in computers and other equipment.

4. Includes communication equipment, nonmedical instruments, medical equipment and instruments, photocopy and related equipment, and fice and accounting equipment.

5. Consists primarily of furniture and fixtures, agricultural machinery, construction machinery, mining and oilfield machinery, service industry machinery, and electrical equipment not elsewhere classified.

6. Consists primarily of manufactured homes, improvements, dormitories, net purchases of used structures, and brokers' commissions on the sale of residential structures.

7. Excludes net purchases of used structures and brokers' commissions on the sale of structures.

commissions on the sale of residential structures.

7. Excludes net purchases of used structures and brokers' commissions on the sale of structures.

Note. Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-follar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

This series is derived from the Census Bureau series "current cost inventories."
 The inventory valuation adjustment (IVA) shown in this table differs from the IVA that adjusts business incomes. The IVA in this table reflects the mix of methods (such as first-in, first-out and last-in, first-out) underlying inventories derived primarily from Census Bureau statistics (see footnote 1). This mix differs from that underlying business income derived primarily from

Internal Revenue Service statistics.

Note. Estimates in this table are based on the North American Industry Classification System (NAICS).

Nore. Estimates in this table are based on the North American Industry Classification System (NAICS).

Chained (2000) dollar series for real change in private inventories are calculated as the period-to-period change in chained-dollar end-of-period inventories. Quarterly changes in end-of-period inventories are stated at annual rates. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-folder estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

structures	29	3.72	3.73	3.64	3.63	3.72

 ^{1.} Inventories are as of the end of the quarter. The quarter-to-quarter change in inventories calculated from current-dollar inventories in this table is not the current-dollar change in private inventories component of GDP. The former is the difference between two inventory stocks, each valued at its respective end-of-quarter prices. The latter is the change in the physical volume of inventories valued at average prices of the quarter. In addition, changes calculated from this table are at quarterly rates, whereas, the change in private inventories is stated at annual rates.

2. Quarterly totals at monthly rates. Final sales of domestic business equals final sales of domestic product less gross output of general government, gross value added of nonprofit institutions, compensation paid to domestic workers, and space rent for owner-occupied housing. It includes a small amount of final sales by farm and by government enterprises.

Note. Estimates in this table are based on the North American Industry Classification System (NAICS).

weighted and fixed-weighted inventories are equal.

^{1.} Inventories are as of the end of the quarter. The quarter-to-quarter changes calculated from this table are at quarterly rates, whereas the change in private inventories component of GDP is stated at annual rates.
2. Quarterly totals at monthly rates. Final sales of domestic business equals final sales of domestic product less gross output of general government, gross value added of nonprofit institutions, compensation paid to domestic workers, and space rent for owner-occupied housing. It includes a small amount of final sales by farm and by government enterprises.

Nort. Estimates in this table are based on the North American Industry Classification System (NAICS)

Chained (2000) dollar inventory series are calculated to ensure that the chained (2000) dollar change in inventories for 2000 equals the current-dollar change in inventories for 2000 and that the average of the 1999 and 2000 end-of-year chain-weinthert and fixed-weinbrid inventories are equal.

Consists of used light trucks only.
 Consists of final sales and change in private inventories of new autos assembled in the United States.
 Consists of personal consumption expenditures, private fixed investment, and gross government investment.

Consists of used light trucks only.
 Consists of final sales and change in private inventories of new autos assembled in the United States.
 Consists of personal consumption expenditures, private fixed investment, and gross government investment.
 Nore: Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines, excluding the lines in the addenda.

B. Other NIPA and NIPA-Related Tables

Table B.1 presents the most recent estimates of personal income and its components and the disposition of personal income. These estimates were released on January 30, 2006.

p Preliminary r Revised CCAdj Capital consumption adjustment IVA Inventory valuation adjustment 1. Consists of nonmortgage interest paid by households.

Equals disposable personal income deflated by the implicit price deflator for personal consumption expenditures.
 Population is the total population of the United States, including the Armed Forces overseas and the institutionalized population. The monthly estimate is the average of estimates for the first of the month and the first of the following month, the annual estimate is the average of the monthly estimates.

^{1.} Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The value of not allocated by industry reflects the difference between the first line and the sum of the most detailed lines, as well as the differences in source data used to estimate GDP by industry and the expenditures measure of real GDP.

2. Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.

^{3.} Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services, educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.

4. Consists of computer and electronic products; publishing industries (includes software); information and data processing services; and computer systems design and related services.

Note. Estimates in this table are based on the 1997 North American Industry Classification System (NAICS).

D–48 February 2006

C. Historical Measures

This table is derived from the "Selected NIPA Tables" that are published in this issue and from the "GDP and Other Major NIPA Series" tables that were published in the August 2005 issue. (The changes in prices are calculated from indexes expressed to three decimal places.)

Table C.1. GDP and Other Major NIPA Aggregates—Continues

r Revised

1. Includes royalties, license fees, and other fees associated with the use of intangible assets, including patents, trade secrets, and other proprietary rights, that are used in connection with the production of goods.
2. Includes royalties, license fees, and other fees associated with the use of copyrights, trademarks, franchises, rights to broadcast live events, software licensing fees, and other intangible property rights.

3. Other unaffiliated services receipts (exports) include mainly film and television tape rentals and expenditures of foreign residents temporarily working in the United States. Payments (imports) include mainly expenditures of U.S. residents temporarily working abroad and film and television tape rentals.

4. These reflect the premiums explicitly charged by, or paid to, insurers and reinsurers.

Source: Table 3 in "U.S. International Transactions: Third Quarter of 2005" in the January 2006 Survey of Curriers Business.

Footnotes to Tables E.2. and E.3.

- 1. Credits, +: Exports of goods and services and income receipts; unilateral current transfers to the United States; capital account transactions receipts; financial inflows—increase in foreign-owned assets (U.S. liabilities) or decrease in U.S.-owned
- assets (U.S. claims).

 Debits, -- Imports of goods and services and income payments; unilateral current transfers to foreigners, capital account transactions payments; tinancial outflows—decrease in foreign-owned assets (U.S. liabilities) or increase in U.S.-owned assets (U.S.
- actions payments; rinarcial outlines—uecrease in oreign-twined assets to 5. Nationals or increase in 0.5. owner assets to 5. Claims).

 2. Excludes exports of goods under U.S. military agency sales contracts identified in Census export documents, excludes imports of goods under direct defense expenditures identified in Census import documents, and reflects various other adjustments (for valuation, coverage, and timing) of Census statistics to balance of payments basis; see table 2 in "U.S. International Transactions: Third Quarter of 2005 in the January 2006 Survey or Cursery Business.

 3. Includes some goods: Mainly military equipment in line 5; major equipment, other materials, supplies, and petroleum products purchased abroad by U.S. military agencies in line 22; and fuels purchased by airline and steamship operators in lines 8 and 55.

- 25.

 4. Includes transfers of goods and services under U.S. military grant programs.

 5. Beginning in 1982, these lines are presented on a gross basis. The definition of exports is revised to exclude U.S. parents' payments to foreign affiliates and to include U.S. affiliates' recepts from foreign parents. The definition of imports is revised to include U.S. parents' payments to loreign affiliates and to exclude U.S. affiliates receipts from foreign parents.

 6. Beginning in 1982, the "other transfers" component includes taxes paid by U.S. private residents to foreign governments and taxes paid by Pivate nonresidents to the U.S. Government.

 7. At the present time, all U.S. Treasury-owned gold is held in the United States.

 8. Includes sales of foreign obligations to tworeigners.

 9. Consists of bills, certificates, marketable bonds and notes, and nonmarketable convertible and nonconvertible bonds and notes.

- notes.

 10. Consists of U.S. Treasury and Export-Import Bank obligations, not included elsewhere, and of debt securities of U.S.
- Government corporations and agencies.

 11. Includes, primarily, U.S. Government liabilities associated with military agency sales contracts and other transactions

- arranged with or through foreign official agencies; see table 5 in "U.S. International Transactions: Third Quarter of 2005" in the
- 12. Consists of investments in U.S. corporate stocks and in debt securities of private corporations and State and local govern-
- ments.

 13. Conceptually, the sum of line 76 and line 39 is equal to "net lending or net borrowing" in the national income and product accounts (NIPAs). However, the foreign transactions account in the NIPAs (a) includes adjustments to the international transactions accounts for the treatment of gold, (b) includes adjustments for the different geographical treatment of transactions with U.S. territories and Puerto Rico, and (c) includes services furnished without payment by financial pension plans except life insurance carriers and private noninsured pension plans. A reconciliation of the balance on goods and services from the international accounts and the NIPA net exports appears in reconciliation table 2 in appendix A in the Survey. A reconciliation of the other foreign transactions in the two sets of accounts appears in table 4.38 of the full set of NIPA tables.

 Additional footnotes to Table E.3:

 14. The "Evengean Unico" includes Relation Departer, France German (includes Bet to MIPA tables).
- Additional floothories to Table E.3:

 14. The "European Union" includes Belgium, Denmark, France, Germany (includes the former German Democratic Republic (East Germany) beginning in the fourth quarter of 1990, Greece, Ireland, Italy, Luxembourg, Netherlands, Portugal, Spain, United Kingdom; beginning with the first quarter of 1995, also includes Austria. Finland, and Sweden; and beginning with the second quarter of 2004, also includes Cyprus, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Matta, Poland, Slovakia, and Slovenia. The "European Union" also includes the European Atomic Energy Community, the European Coal and Seel Community (through the third quarter of 2002), and the European Investment Bank.

 15. Quarterly estimates for Mexico are available, beginning with 2004.

 16. Includes, as part of international and unallocated, taxes withheld; current-cost adjustments associated with U.S. and foreign direct investment, and net U.S. currency flows. Before 1999, also includes the estimated direct investment in foreign affeit also engaged in international shipping, in operating oil and gas drilling equipment internationally, and in petroleum trading. Before 1996, also includes small transactions in business services that are not reported by country.

 17. Details are not shown separately; see totals in lines 56 and 63.

 18. Details not shown separately are included in line 69.

p Preliminary
r Revised
1. Represents gains or losses on foreign-currency-denominated assets and liabilities due to their revaluation at current
exchange rates.
2. Includes changes in coverage, capital gains and losses of direct investment affiliates, and other adjustments to the
value of assets and liabilities.
3. Reflects changes in the value of the official gold stock due to fluctuations in the market price of gold.
4. Reflects changes in gold stock from U.S. Treasury sales of gold medallions and commemorative and bullion coins;
also reflects replenishment through open market purchases. These demonetizations/monetizations are not included in
international transactions financial flows.

^{5.} Also includes paid-in capital subscriptions to international financial institutions and resources provided to foreigners under foreign assistance programs requiring repayment over several years. Excludes World War I debts that are not being sequired:

under foreign assistance programs requiring repayment over several years. Excludes world war't dents that are not being serviced.

6. Includes indebtedness that the borrower may contractually, or at its option, repay with its currency, with a third country's currency, or by delivery of materials or transfer of services.

7. Primarity U.S. Government liabilities associated with military sales contracts and other transactions arranged with or through foreign official agencies.

Regional Data

H. State and Regional Tables

The tables in this section include the most recent estimates of state personal income and gross state product. The sources of these estimates are noted.

The quarterly and annual estimates of state personal income are available on CD–ROM. For information on state personal income, e-mail reis.remd@bea.gov; write to the Regional Economic Information System, BE–55, Bureau of Economic Analysis, U.S. Department of Commerce, Washington, DC 20230; or call 202–606–5360. For information on gross state product, e-mail gspread@bea.gov; write to the Regional Economic Analysis Division, BE–61, Bureau of Economic Analysis, U.S. Department of Commerce, Washington, DC 20230; or call 202–606–5340.

Percent change was calculated from unrounded data.
 Note. The personal income level shown for the United States is derived as the sum of the state estimates. It differs from the estimate of personal income in the national income and product accounts (NIPA's) because of differences in

coverage, in the methodologies used to prepare the estimates, and in the timing of the availability of source data.

methodologies used to prepare the estimates, and in the timing of the availability of source data.

Source: Table 2 "State Personal Income: Second Quarter of 2005 and Revised Estimates for 2002–2005." in the October 2005 issue of the Survey of Current Business.

Per capita personal income was computed using midyear population estimates of the Bureau of the Census.
 Percent change was calculated from unrounded data.
 Nors. The personal income level shown for the United States is derived as the sum of the state estimates. It differs from the estimate of personal income in the national income and product accounts because of differences in coverage, in the

Per capita disposable personal income was computed using midyear population estimates of the Bureau of the Census.
 Percent change was calculated from unrounded data.
 Note. The personal income level shown for the United States is derived as the sum of the state estimates. It differs from

the estimate of personal income in the national income and product accounts because of differences in coverage, in the methodologies used to prepare the estimates, and in the timing of the availability of source data. Source: Table 3 "State Personal Income: Second Quarter of 2005 and Revised Estimates for 2002–2005:1" in the October 2005 issue of the Survey of Current Business.

Note. Totals shown for the United States differ from the national income and product account estimates of gross domestic product (GDP) because GSP excludes and GDP includes the compensation of Federal civilian and military personnel stationed abroad and government consumption of fixed capital for military structures located abroad and for mili-

tary equipment, except office equipment. Also, GSP and GDP have different revision schedules.
Source: This table reflects the GSP estimates for 2004 that were released on October 26, 2005. Detailed estimates are available on BEA's Web site at <www.bea.gov.>

Per capita personal income was computed using Census Bureau midyear population estimates.
 Percent change calculated from unrounded data.
 The personal income level shown for the United States is derived as the sum of the county estimates. It differs from the estimate of personal income in the national income and product accounts because of differences in coverage, in the methodologies used to prepare the estimates, and in the timing of the availability of source data.

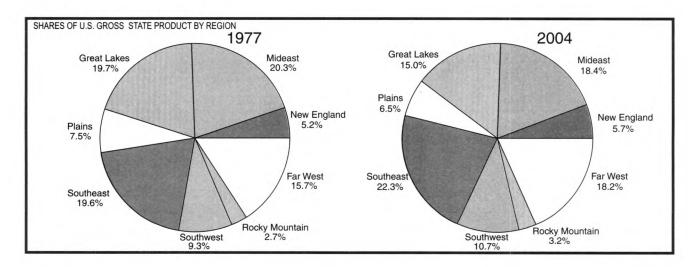

^{4.} The metropolitan area definitions used by BEA for its personal income estimates are the new county-based definitions issued by the Office of Management and Budget in June 2003 (with revisions released February 2004 and February 2005) for Federal statistical purposes.

Additional Information About the NIPA Estimates

Statistical Conventions

Current-dollar GDP is a measure of the market value of goods, services, and structures that are produced in the economy in a particular period. The changes in current-dollar GDP can be decomposed into quantity and price components. Quantities, or "real" measures, and prices are expressed as index numbers with the reference year—at present, the year 2000—equal to 100.1

The annual changes in quantities and prices are calculated using a Fisher formula that incorporates weights from 2 adjacent years. For example, the annual percent change in real GDP for 2001-2002 uses prices for 2001 and 2002 as weights, and the 2001–2002 annual percent change in the GDP price index uses quantities for 2001 and 2002 as weights. Because the Fisher formula allows for the effects of changes in relative prices and in the composition of output over time, the resulting quantity or price changes are not affected by the substitution bias that is associated with changes in quantities and prices calculated using a fixed-weighted formula. These annual changes are "chained" (multiplied) together to form time series of quantity and price indexes. The percent changes in the Fisher indexes are not affected by the choice of the reference year.

BEA also publishes implicit price deflators (IPDs), which are calculated as the ratio of the current-dollar value of a component to the chained-dollar value of the component, multiplied by 100. The values of an IPD are very close to the values of the corresponding "chain-type" price index.

The measures of real GDP and its major components are also presented in dollar-denominated form, designated "chained (2000) dollar estimates." For most series, these estimates are computed by multiplying the current-dollar value in 2000 by a corresponding quantity index number and then dividing by 100. For example, if a current-dollar GDP component equaled \$100 in 2000 and if real output for this component increased by 10 percent in 2001, then the chained (2000) dollar value of this component in 2001 would be \$110 (\$100 \times 1.10). The percent changes calculated from the chained (2000) dollar estimates and from the quantity indexes are the same; any differences will be small and due to rounding.

The chained-dollar values for the detailed GDP components will not necessarily sum to the chained-dollar estimate of GDP (or to any intermediate aggregate) in a table, because the relative prices that are used as weights for any period other than the reference year differ from those of the reference year. A measure of the effect of such

differences is provided by a "residual" line—the difference between the chained-dollar value of the main aggregate in the table and the sum of the most detailed components in the table. For periods close to the reference year, when the relative prices that are used as weights have usually not changed much, the residuals tend to be small, and the chained-dollar estimates can be used to approximate the contributions to growth and to aggregate the detailed estimates. For periods further from the reference year, the residuals tend to be larger, and the chained-dollar estimates are less useful for analyses of contributions to growth. In particular, for components for which relative prices are changing rapidly, the calculation of contributions based on chained-dollar estimates may be misleading even just a few years from the reference year. Thus, contributions derived from quantity indexes provide a better measure than contributions derived from chained-dollar estimates; contributions based on quantity indexes are shown in selected NIPA tables 1.1.2, 1.2.2, 1.5.2, 2.3.2, 3.9.2, 4.2.2, and 5.3.2.

For quarters and months, NIPA estimates are presented at annual rates, which show the value that would be registered if the rate of activity that is measured for a quarter or for a month were maintained for a full year. Annual rates are used so that periods of different lengths—for example, quarters and years—may be more easily compared. These annual rates are determined simply by multiplying the estimated rate of activity by 4 (for quarterly data) or by 12 (for monthly data).

For most quarterly NIPA estimates, *percent changes* in the estimates are also expressed at annual rates. Calculating these *changes* requires a variant of the compound interest formula:

$$r = \left[\left(\frac{x_t}{x_0} \right)^{m/n} - 1 \right] \times 100$$

where r is the percent change at an annual rate; x_t is the level of activity in the later period; x_o is the level of activity in the earlier period; m is the periodicity of the data (for example, 1 for annual data, 4 for quarterly data, or 12 for monthly data); and n is the number of periods between the earlier periods and the later periods (that is, t-0).

Quarterly and monthly NIPA estimates are seasonally adjusted if necessary. Seasonal adjustment removes from the time series the average effects of variations that normally occur at about the same time and in about the same magnitude each year—for example, weather, holidays, and tax payment dates. After seasonal adjustment, cyclical and other short-term changes in the economy stand out more clearly.

^{1.} See J. Steven Landefeld, Brent R. Moulton, and Cindy M. Vojtech, "Chained-Dollar Indexes: Issues, Tips on Their Use, and Upcoming Changes," SURVEY OF CURRENT BUSINESS (November 2003): 8–16.

Reconciliation Tables

"Table 1. Reconciliation of Changes in BEA-Derived Compensation Per Hour With BLS Average Hourly Earnings" is being discontinued. As a result of the ongoing work by BEA and the Bureau of Labor Statistics to reconcile these estimates, the need for this table has been reduced.

The Bureau of Economic Analysis (BEA) has published a wealth of information about the methodologies that are used to prepare its national, industry, international, and regional accounts. In addition, most of this information is available on BEA's Web site at <www.bea.gov>. Look under "Methodologies"; for articles from the Survey of Current Business, look under "Publications."

National accounts

The national accounts encompass the detailed estimates in the national income and product accounts (including gross domestic product) and the estimates of wealth and related estimates.

National income and product accounts (NIPAs). This series of papers documents the conceptual framework of the NIPAs and the methodologies that have been used to prepare the estimates.

An Introduction to National Economic Accounting (1985) [also in the March 1985 Survey]

Corporate Profits: Profits Before Tax, Profits Tax Liability, and Dividends (2002)

Government Transactions (1988)

Personal Consumption Expenditures (1990)

The methodologies described in these papers have been updated and improved, typically as part of the comprehensive and annual revisions of the NIPAs.

The following Survey articles describe the most recent comprehensive revision of the NIPAs.

"Improved Estimates of the National Income and Product Accounts for 1929–2002: Results of the Comprehensive Revision" (February 2004)

"Preview of the Revised NIPA Estimates for 1997 Effects of Incorporating the 1997 Benchmark I-O Accounts and Proposed Definitional and Statistical Changes" (January 2003)

"Preview of the 2003 Comprehensive Revision of the National Income and Product Accounts"

Changes in Definitions and Classifications (June 2003)

New and Redesigned Tables (August 2003) Statistical Changes (September 2003) In addition, see the following articles.

"Annual Revision of the National Income and Product Accounts" (August 2005)

"Updated Summary NIPA Methodologies" (November 2004) describes the source data and the methods that are used to prepare the current-dollar and real estimates of GDP.

"Chained-Dollar Indexes: Issues, Tips on Their Use, and Upcoming Changes" (November 2003) discusses the advantages of using chain-weighted indexes and the challenges of using chained dollars.

"Measuring the Services of Commercial Banks in the NIPAs: Changes in Concepts and Methods" (September 2003)

"Measuring the Services of Property-Casualty Insurance in the NIPAs: Changes in Concepts and Methods" (October 2003)

"Reliability of the NIPA Estimates of U.S. Economic Activity" (February 2005) evaluates the principal NIPA estimates by examining the record of revisions to them.

Fixed assets and consumer durable goods. Fixed Assets and Consumer Durable Goods in the United States, 1925–97 (2003) discusses the concepts and statistical considerations that underlie the estimates and their derivation.

"Fixed Assets and Consumer Durable Goods for 1925–2002" (May 2004) describes the improvements that were incorporated into these estimates as part of the comprehensive NIPA revision. "Fixed Assets and Consumer Durable Goods for 1993–2003" (September 2004) describes additional improvements that were incorporated into these estimates as part of the annual NIPA revision.

Mission Statement and Strategic Plan

The mission statement of the Bureau of Economic Analysis and the latest update to its strategic plan for improving the accuracy, reliability, and relevance of the national, industry, regional, and international accounts are available on BEA's Web site at <www.bea.gov> under "About BEA."

Industry accounts

The industry accounts consist of the input-output accounts, the gross-domestic-product-by-industry accounts, and one satellite account.

"Improved Annual Industry Accounts for 1998–2003" (June 2004) describes the comprehensive revision of the annual input-output accounts and the GDP-by-industry accounts that features the integration of the two sets of accounts.

In addition, see the following articles.

"Preview of the Benchmark Input-Output Accounts for 2002" (September 2005) includes the proposed new sectors that are based on the 2002 North American Industry Classification System.

"Preview of the Comprehensive Revision of the Annual Industry Accounts: Integrating the Annual Input-Output Accounts and the Gross-Domestic-Product-by-Industry Accounts" (March 2004) provides the details about the comprehensive revision.

"Annual Industry Accounts" (December 2005)

"Benchmark Input-Output Accounts for the U.S. Economy, 1997" (December 2002)

Satellite accounts. These accounts extend the analytical capacity of the input-output accounts by focusing on a particular aspect of economic activity.

"U.S. Travel and Tourism Satellite Accounts"

For 1996 and 1997 (July 2000)

For 1998–2003 (September 2004)

For 2001-2004 (June 2005)

International accounts

The international accounts encompass the international transactions accounts, direct investment, and international transactions in services.

International transactions accounts (ITAs). The Balance of Payments of the United States: Concepts, Data Sources, and Estimating Procedures (1990) describes the methodologies used to prepare the estimates in the ITAs and the international investment position of the United States. These methodologies are usually updated and improved as part of the annual revisions of the ITAs.

The annual revisions of the ITAs are described in a series of articles, the latest of which was published in the July 2005 Survey.

Direct investment. International Direct Investment: Studies by the Bureau of Economic Analysis (1999) is a collection of previously published articles on U.S. direct investment abroad and foreign direct investment in the United States. It also includes the following information.

The "Methodology for U.S. Direct Investment Abroad," which is also available in U.S. Direct

Investment Abroad: 1994 Benchmark Survey, Final Results (1998)

"A Guide to BEA Statistics on U.S. Multinational Companies," which is also available in the March 1995 Survey

"A Guide to BEA Statistics on Foreign Direct Investment in the United States," which is also available in the February 1990 SURVEY

In addition, the updated methodology for foreign direct investment in the United States is available in Foreign Direct Investment in the United States: Final Results From the 1997 Benchmark Survey (2001).

International services. U.S. International Transactions in Private Services: A Guide to the Surveys Conducted by the Bureau of Economic Analysis (1998) describes 11 surveys. It includes classifications, definitions, release schedules, the methods used to prepare the estimates, and samples of the survey forms.

"Selected Issues in the Measurement of U.S. International Services" (June 2002) describes key issues in defining and measuring insurance, wholesale and retail trade, finance, construction, and utilities services and explores possible actions to address these issues.

Regional accounts

The regional accounts include estimates of personal income and gross state product.

Personal income. Estimates of personal income are prepared for states and for local areas.

"Comprehensive Revision of State Personal Income for 1969–2003" (May 2004) describes the improvements in the methodology that are used to prepare the estimates and that are part of a comprehensive revision.

"The Reliability of the State Personal Income Estimates" (December 2003) evaluates the estimates of state personal income and of selected components by examining the revisions of these estimates.

"Comprehensive Revision of Local Area Personal Income for 1969–2002" (June 2004) summarizes the improvements in the methodology that is used to prepare the estimates for counties and metropolitan areas. The detailed methodology is available on the CD-DOM Regional Economic Information System, 1969–2003.

Gross State product. "Comprehensive Revision of Gross State Product" (January 2005) summarizes the sources and the methods that are used to prepare the estimates.

"Gross State Product by Industry for 1997–2004" (July 2005) presents the most recent annual revision of these estimates.

Finding information on BEA's Web site just got easier...

BEA's Web site now includes a powerful new search engine that can help you locate information quickly and efficiently.

Its features include the following:

Clustered Searching

Search results are automatically grouped into a unique set of meaningful categories that can be further explored.

Clustered Results # gdp (61) | Industry (13) | Industry (13) | Industry (13) | Industry (13) | Industry (13) | Industry (13) | Industry (13) | Industry (13) | Industry (13) | Industry (14) | Industry (14) | Industry (15) | Industry (15) | Industry (16) | Industry (16) | Industry (16) | Industry (17) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18) | Industry (18)

Search within a Search Alternative all search, which is the specific terms search results. Find in clusters: Enter Keywords
