### BEA Advisory Committee

The BEA Advisory Committee advises the Director of BEA on matters related to the development and improvement of BEA's national, regional, industry, and international economic accounts, especially in areas of new and rapidly growing economic activities arising from innovative and advancing technologies, and it provides recommendations from the perspective of business economists, academicians, researchers, and experts in government and international affairs.

December 2007

Volume 87 • Number 12

**1 GDP and the Economy: Preliminary Estimates for the Third Quarter of 2007**

Real GDP increased 4.9 percent after increasing 3.8 percent in the second quarter. The acceleration reflected accelerations in exports, consumer spending, and inventory investment. Investment in nonresidential structures slowed, and residential investment continued to decline.

**11 Government Receipts and Expenditures: Third Quarter of 2007**

Net government saving decreased \$43.4 billion to -\$236.8 billion. Net Federal Government saving decreased \$22.4 billion to -\$229.2 billion. Net state and local government saving decreased \$21.1 billion to -\$7.7 billion.

**14 BEA Briefing: Integrating the 2002 Benchmark Input-Output Accounts and the 2002 Annual Industry Accounts**

Better integration of these two accounts has long been a goal of BEA. For the 2002 accounts, a new model was implemented. This BEA Briefing is the first in a series of articles that will explain important aspects of BEA's accounts in less technical language.

**24 Subject Guide for 2007**

This guide lists the articles that were published in the SURVEY in 2007.

## Director's Message

This month's SURVEY OF CURRENT BUSINESS presents the first of what we expect to become a series of BEA Briefings. These articles will concisely explain important aspects of our economic accounts in clear, nontechnical language. We welcome ideas about future topics.

This month's Briefing describes the model that the Bureau of Economic Analysis developed recently to "reconcile" the 2002 benchmark input-output (I-O) accounts with the 2002 annual industry accounts. Integrating our economic accounts has been a goal of ours for many years, to help us present a more consistent view of the economy. And harmonizing the 2002 benchmark and 2002 annual industry accounts was a solid step forward. We're also moving to integrate our statistics more closely with statistics from other Federal agencies.

Elsewhere in this issue, you'll find summaries of the most recent gross domestic product and government receipts and expenditures statistics in an easy-to-read format. We're planning to use the same format to present other recurring statistics soon.

As the new year approaches, I'd like to reiterate our goal of discussing the U.S. national account statistics in straightforward language and easy-to-read formats as well as in more technical presentations. In that spirit, we will roll out several improvements to the SURVEY, both the printed version and the online version, which is available at <[www.bea.gov/scb/index.htm](http://www.bea.gov/scb/index.htm)>.

As always, we welcome your comments and suggestions.

J. Steven Landefeld  
Director, Bureau of Economic Analysis

## Taking Account...

### **An Industry Framework for an R&D Account**

In a broad effort to better measure the effects of research and development (R&D) on the economy, the Bureau of Economic Analysis (BEA) has moved forward on several fronts. In September, for example, it released an updated R&D satellite account that explored the effect of R&D on the economy. BEA economists are also working on a wide range of papers that analyze various issues related to R&D and the national economic accounts.

One of these papers—"A Framework for an Industry-based R&D Satellite Account," by economist Sumiye Okubo, Associate Director of Industry Accounts at BEA—provides a framework for creating an R&D account based on BEA's annual input-output (I-O) accounts.

The industry-based framework uses the I-O approach to present a more detailed view of R&D in the economy. It creates a new industry and commodity, R&D, and shows the sources of R&D output and value added as well as the distribution of R&D output across investment, exports, consumption and other final use components.

This framework also provides a way to examine the composition of R&D funding and performance across industries

and allows for improved R&D price measures.

In addition, the framework serves as a guide for using available data to provide reasonable approximations of the R&D investments by industry, nonprofits, and government and for collecting the additional data needed to produce a complete industry R&D satellite account. Over time, such an account could be used as the basis for incorporating R&D into gross domestic product and other statistics.

The paper is available on the BEA Web site by visiting <[www.bea.gov](http://www.bea.gov)> and clicking on "Papers and Working Papers."

### **Annual Industry Accounts Update Coming in January**

The release of the annual industry accounts update has been rescheduled from December 13, 2007, to January 29, 2008.

This new schedule will allow BEA to incorporate data from the Census Bureau's 2006 Annual Survey of Manufactures (ASM). According to the previous release schedule, the ASM data, which provide the most accurate picture of manufacturing production, would not have been incorporated into the accounts until December 2008.

The accelerated incorporation was made possible by improved processing by the Census

Bureau, which enabled it to accelerate the 2006 ASM release to November 6, 2007.

Several tables included in the annual industry accounts will be expanded in order to distinguish the effect of the ASM data. These table changes will be described in advance of the January 29, 2008, release on BEA's Web site.

The updated annual industry accounts will cover 2004–2006 and will be described in the SURVEY OF CURRENT BUSINESS early next year.

### **Loan Losses and NIPA Corporate Profits**

Longtime users of BEA's accounts are aware of the differences between corporate profits as calculated by the NIPAs and corporate profits as calculated for financial statements.

The distinct treatments of bad-debt expenses, asset write downs, and loan-loss provisions by financial companies offers a telling example of the differences. The NIPAs treat these items as capital losses that reduce the value of assets on the balance sheet. Financial statements from corporations, however, treat such items as current-period expenses that cut profits.

A more detailed discussion is available via BEA's FAQ feature. Please visit <[www.bea.gov](http://www.bea.gov)> and click on FAQ. Enter "loan losses" as keywords.

# GDP and the Economy

## Preliminary Estimates for the Third Quarter of 2007

REAL gross domestic product (GDP) increased 4.9 percent in the third quarter, according to “preliminary” estimates of the national income and product accounts (NIPAs); it increased 3.8 percent in the second quarter (chart 1 and table 1).<sup>1</sup> The third-quarter growth rate was revised up 1.0 percentage point from the “advance” estimate (page 9).<sup>2</sup>

The acceleration in real GDP growth in the third quarter primarily reflected accelerations in exports, consumer spending, and inventory investment. In contrast, imports (which are subtracted in the calculation of GDP) turned up, residential fixed investment decreased by more than the second-quarter decrease, and nonresidential structures slowed.<sup>3</sup>

- Prices of goods and services purchased by U.S. residents increased 1.6 percent in the third quarter, following an increase of 3.8 percent in the second quarter (page 8). Energy prices turned down in the third quarter, and food prices increased at the same rate as in the second quarter. Excluding food and energy, prices increased 1.7 percent, following an increase of 1.5 percent in the second quarter.
- Real disposable personal income (DPI)—income adjusted for inflation and taxes—increased 4.4 percent in the third quarter after decreasing 0.8 percent (revised). The upturn reflected an acceleration in current-dollar DPI and a deceleration in inflation.
- The personal saving rate was 0.6 percent in the third quarter; in the second quarter, it was 0.3 percent (revised).
- Corporate profits decreased \$19.3 billion in the third quarter, following an increase of \$94.7 billion in the second quarter (page 10).

1. “Real” estimates are in chained (2000) dollars, and price indexes are chain-type measures.

2. Each GDP estimate for a quarter (advance, preliminary, and final) incorporates increasingly comprehensive and improved source data. More information can be found at <[www.bea.gov/bea/about/infoqual.htm](http://www.bea.gov/bea/about/infoqual.htm)> and <[www.bea.gov/bea/faq/national/gdp\\_accuracy.htm](http://www.bea.gov/bea/faq/national/gdp_accuracy.htm)>. Quarterly estimates are expressed at seasonally adjusted annual rates, which assume that a rate of activity for a quarter is maintained for a year.

3. In this article, “consumer spending” refers to the NIPA series “personal consumption expenditures,” “inventory investment” refers to “change in private inventories,” and “government spending” refers to “government consumption expenditures and gross investment.”

*Christopher Swann prepared this article.*

1. The estimates of GDP under the contribution columns are also percent changes.  
NOTE: Percent changes are from NIPA table 1.1.1, contributions are from NIPA table 1.1.2, and shares are from NIPA table 1.1.10.

Consumer spending accelerated, increasing 2.7 percent in the third quarter after increasing 1.4 percent. It added 1.88 percentage points to real GDP growth in the third quarter. Spending for nondurable goods turned up, and spending for both services and durable goods accelerated.

Nonresidential fixed investment slowed somewhat, increasing 9.4 percent in the third quarter after increasing 11.0 percent. The deceleration was primarily due to a pullback in structures.

Residential fixed investment fell for the seventh straight quarter, decreasing 19.7 percent and subtracting 1.03 percentage points from real GDP growth.

Inventory investment picked up substantially, adding 0.98 percentage point to real GDP growth after adding 0.22 percentage point.

Exports rose sharply, increasing 18.9 percent after increasing 7.5 percent. The third-quarter increase was the largest since the fourth quarter of 2003 and contributed 2.08 percentage points to real GDP growth. Goods exports picked up markedly; services exports slowed.

Imports turned up, increasing 4.3 percent after decreasing 2.7 percent. The turnabout, which was mainly due to an upturn in goods imports, subtracted 0.70 percentage point from real GDP growth.

Federal Government spending accelerated somewhat, reflecting an acceleration in national defense expenditures.

State and local government spending slowed in the third quarter

**Table 2. Real Gross Domestic Product (GDP) by Type of Product**  
[Seasonally adjusted at annual rates]

	Share of current-dollar GDP (percent)		Change from preceding period (percent)					Contribution to percent change in real GDP (percentage points)

GDP excluding motor vehicle output.....	97.0	2.9	0.4	3.9	4.6	2.84	0.42	3.79	4.49	
Final sales of computers.....	0.7	27.0	-1.3	35.7	47.8	0.16	-0.01	0.21	0.27	
GDP excluding final sales of computers.....	99.3	1.9	0.6	3.6	4.7	1.93	0.61	3.61	4.65	

1. The estimates of GDP under the contribution columns are also percent changes.  
NOTE: Percent changes are from NIPA table 1.2.1, contributions are from NIPA table 1.2.2, and shares are calculated from NIPA table 1.2.5.

Real final sales of domestic product, real GDP less inventory investment, increased 3.9 percent after increasing 3.6 percent in the second quarter.

Motor vehicle output accelerated sharply, increasing 15.4 percent after a 1.0-percent increase in the second quarter.

Final sales of computers stepped up, increasing 47.8 percent after increasing 35.7 percent.

## Consumer Spending

Transportation.....	3.7	4.2	2.6	4.4	3.2	0.16	0.10	0.16	0.12	
Medical care.....	17.3	2.8	3.9	2.3	2.3	0.49	0.68	0.40	0.40	
Recreation.....	4.1	10.8	2.1	0.9	3.8	0.43	0.09	0.04	0.16	
Other <sup>4</sup> .....	14.2	4.5	4.0	1.9	2.4	0.63	0.57	0.27	0.34	

1. The estimates under the contribution columns are also percent changes.  
 2. Includes jewelry and watches, ophthalmic products and orthopedic equipment, books and maps, bicycles and motorcycles, guns and sporting equipment, photographic equipment, boats, and pleasure aircraft.  
 3. Includes tobacco, toilet articles, drug preparations and sundries, stationery and writing supplies, toys, film, flowers, cleaning preparations and paper products, semidurable house furnishings, and magazines and newspapers.  
 4. Includes personal care, personal business, education and research, religious and welfare activities, and net foreign travel.  
 NOTE. Percent changes are from NIPA table 2.3.1, and contributions, from NIPA table 2.3.2; shares are calculated from NIPA table 2.3.5.

Spending for durable goods picked up in the third quarter and contributed 0.44 percentage point to the 2.7-percent growth in real consumer spending. The pickup reflected accelerations in furniture and household equipment and in "other" durable goods. In contrast, motor vehicles and parts decreased more than in the second quarter.

Spending for nondurable goods turned up in the third quarter, increasing 1.9 percent after a 0.5-percent decrease. It contributed 0.55 percentage point to the growth in real consumer spending. The turnabout was led by an upturn in spending for food. Spending for clothing and shoes picked up, and spending for gasoline, fuel oil, and other energy goods decreased less than in the second quarter. Spending for "other" nondurable goods also accelerated.

Spending for services increased 2.8 percent after increasing 2.3 percent. It contributed 1.66 percentage points to the growth in real consumer spending. The step-up primarily reflected accelerations in spending for electricity and gas and for recreation.

Nonresidential fixed investment slowed in the third quarter, mainly reflecting a deceleration in business investment in structures.

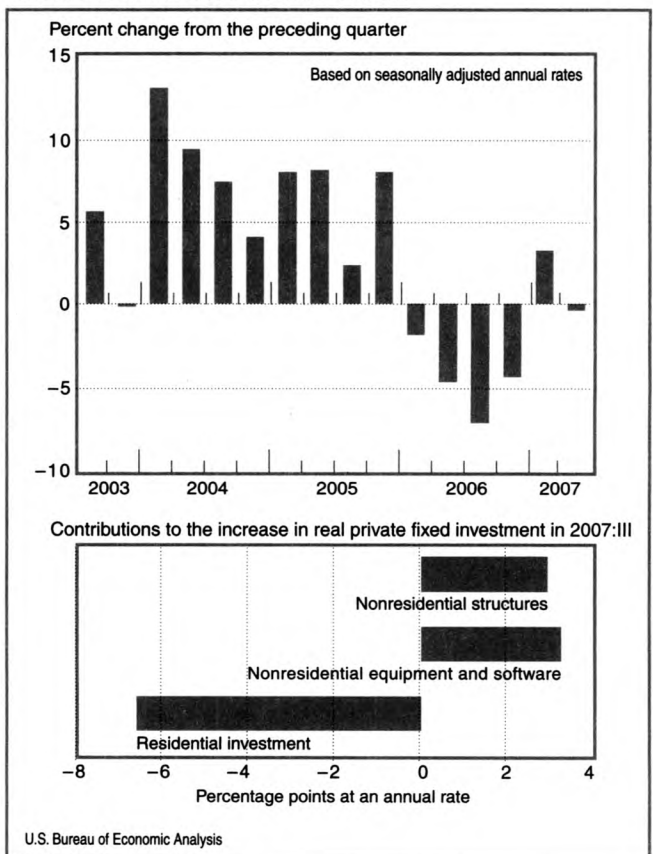

Investment in structures decelerated, mainly reflecting slowdowns in mining exploration, shafts, and wells and in power and communications structures. The deceleration was also attributable to a downturn in manufacturing structures and a deceleration in "other" structures.

Investment in equipment and software accelerated, mainly reflecting an upturn in transportation equipment.

The decrease in residential investment was larger than the second-quarter decrease. The third-quarter decrease was the seventh in a row. The main contributors were larger decreases in single-family structures and in "other" residential structures (mainly brokers' commissions).

1. The estimates of fixed investment under the contribution columns are also percent changes  
 2. Consists primarily of religious, educational, vocational, lodging, railroads, farm, and amusement and recreational structures, net purchases of used structures, and brokers' commissions on the sale of structures.  
 3. Excludes software "embedded," or bundled, in computers and other equipment.  
 4. Includes communication equipment, nonmedical instruments, medical equipment and instruments, photocopy and related equipment, and office and accounting equipment.  
 5. Consists primarily of furniture and fixtures, agricultural machinery, construction machinery, mining and oilfield machinery, service industry machinery, and electrical equipment not elsewhere classified.  
 6. Consists primarily of manufactured homes, improvements, dormitories, net purchases of used structures, and brokers' commissions on the sale of residential structures.  
 NOTE: Percent changes are from NIPA table 5.3.1, contributions are from NIPA table 5.3.2, and shares are calculated from NIPA table 5.3.5.

Nonfarm inventories to final sales of goods and structures.....	3.62	3.61	3.61	3.57	3.55	.....	.....	.....	.....

1. The levels are from NIPA table 5.6.6B.  
 2. The residual is the difference between the first line and the sum of the most detailed lines. It reflects that chained-dollar estimates are usually not additive, because they are based on quantity indexes that use weights of more than one period.  
 3. The ratios are from NIPA table 5.7.6B.

### Inventory Investment

The real change in private inventories, often called real private inventory investment, represents the change in the physical stock of goods held by businesses. It includes finished goods, goods at various stages of production, and raw materials.

The change in private inventories is a key component of gross domestic product (GDP), which aims to measure output derived from current production. To include the value of currently produced goods that are not yet sold and to exclude the value of goods produced in previous periods, change in private inventories must be included in the GDP calculation.

Thus, GDP can also be seen as the sum of final sales of domestic product and the change in private inventories (table 2).

For most industries, the estimates of change in private inventories are prepared by revaluing book-value estimates of inventories from the Census Bureau to a replacement-cost basis and calculating the change over a quarter or year. BEA does not always have complete data for every industry.

Real inventory investment increased \$27.1 billion in the third quarter after increasing \$5.7 billion in the second quarter. It added 0.98 percentage point to real GDP growth in the third quarter. The step-up mainly reflected an upturn in wholesale trade industries and an acceleration in manufacturing industries.

Inventory investment in the mining, utilities, and construction industries decreased more than in the second quarter; the level was negative.

Inventory investment in manufacturing industries accelerated, reflecting an upturn in durable-goods industries that more than offset a downturn in nondurable-goods industries.

Inventory investment in wholesale trade inventories turned up, reflecting a rebound in durable-goods industries.

Inventory investment in retail trade industries decelerated. Inventory investment by "other" retail stores and by general merchandise stores turned down, but motor vehicles and parts dealers picked up.

**Chart 4. Real Private Inventory Investment**

Exports and Imports

**Table 6. Real Exports and Imports of Goods and Services**  
[Seasonally adjusted at annual rates]

	Share of current-dollar exports and imports (percent)	Change from preceding period (percent)					Contribution to percent change in real exports and imports (percentage points)

<b>Imports of services<sup>2</sup></b>	<b>15.6</b>	<b>14.2</b>	<b>2.3</b>	<b>-1.7</b>	<b>0.9</b>	<b>2.15</b>	<b>0.38</b>	<b>-0.26</b>	<b>0.15</b>		
<b>Addenda:</b>											
Exports of agricultural goods <sup>3</sup>	6.1	-12.4	-4.1	35.5	53.4						
Exports of nonagricultural goods	64.6	11.5	1.3	4.6	23.6						
Imports of nonpetroleum goods	70.6	0.7	0.3	1.2	10.2						

Real exports picked up sharply in the third quarter, increasing 18.9 percent after increasing 7.5 percent in the second quarter.

Exports of goods accelerated robustly and contributed 17.60 percentage points to the growth in real exports; the pickup was widespread. Exports of nonautomotive capital goods led the acceleration, mainly reflecting an upturn in civilian aircraft, engines, and parts. Exports of industrial supplies and materials, nonautomotive consumer goods, and automotive vehicles, engines, and parts accelerated. "Other" exports of goods turned up, and exports of foods, feeds, and beverages picked up.

Exports of services slowed. The slowdown primarily reflected a downturn in "other private services"; travel services picked up somewhat.

Real imports turned up, increasing 4.3 percent after decreasing 2.7 percent. The upturn reflected rebounds in imports of both goods and services.

The rebound in goods imports was led by an upturn in imports of automotive vehicles, engines, and parts. Imports of "other" goods also turned up and nonautomotive capital goods accelerated. In contrast, industrial supplies and materials slowed, mainly because of a deceleration in nondurable-goods imports.

Imports of services turned up. "Other" transportation services rebounded, and travel by U.S. residents abroad decreased less in the third quarter than in the second. "Other" private services decelerated.

1. The estimates under the contribution columns are also percent changes.  
 2. Exports and imports of certain goods, primarily military equipment purchased and sold by the Federal Government, are included in services.  
 3. Includes parts of foods, feeds, and beverages, of nondurable industrial supplies and materials, and of nondurable nonautomotive consumer goods.  
 Note. Percent changes are from NIPA table 4.2.1, contributions are from NIPA table 4.2.2, and shares are calculated from NIPA table 4.2.5.

**Chart 5. Real Exports and Imports of Goods and Services**

## Government Spending

**Table 7. Real Government Consumption Expenditures and Gross Investment (CEGI)**  
[Seasonally adjusted at annual rates]

	Share of current-dollar CEGI (percent)	Change from preceding period (percent)					Contribution to percent change in real CEGI (percentage points)

<b>State and local.....</b>	<b>63.6</b>	<b>1.3</b>	<b>3.0</b>	<b>3.0</b>	<b>2.1</b>	<b>0.83</b>	<b>1.88</b>	<b>1.93</b>	<b>1.33</b>		
Consumption expenditures.....	50.6	1.9	2.0	2.0	1.4	0.99	1.02	1.01	0.71		
Gross investment.....	13.0	-1.3	7.1	7.2	4.8	-0.16	0.86	0.92	0.62		

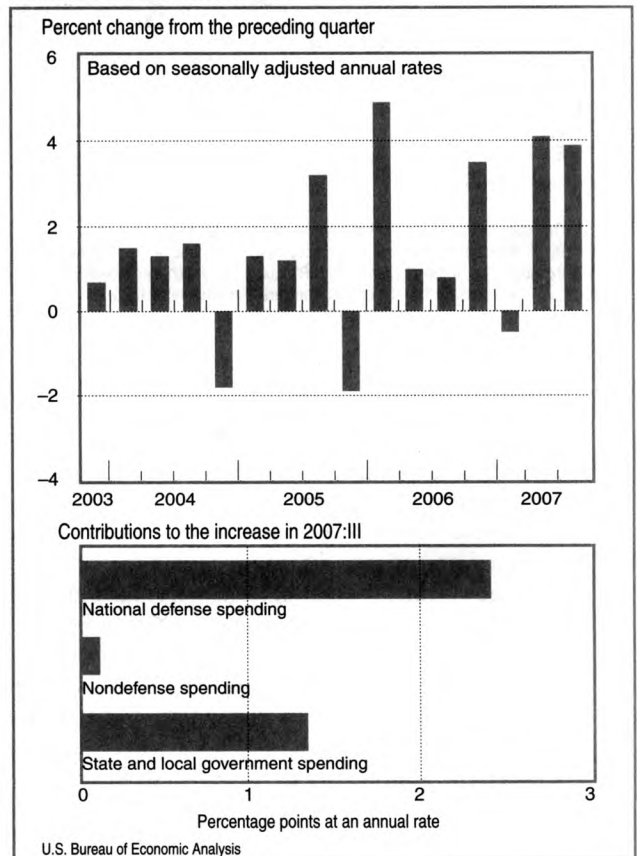

Real government spending decelerated slightly in the third quarter, increasing 3.9 percent after increasing 4.1 percent in the second quarter. The deceleration reflected a slowdown in state and local government spending that was partly offset by a pickup in Federal Government spending.

The pickup in Federal Government spending reflected an acceleration in national defense spending, which increased 10.1 percent after an increase of 8.5 percent. Nondefense spending grew at the same rate as in the second quarter.

State and local government spending slowed to 2.1 percent in the third quarter after increasing 3.0 percent in the second quarter.

1. The estimates under the contribution columns are also percent changes.  
NOTE: Percent changes are from NIPA table 3.9.1, contributions from NIPA table 3.9.2, and shares are calculated from NIPA table 3.9.5.

**Chart 6. Real Government Consumption Expenditures and Gross Investment**

### Government Spending

“Government consumption expenditures and gross investment,” or “government spending,” consists of two main components: (1) Consumption expenditures by Federal and by state and local governments and (2) gross investment by government and government-owned enterprises.

Government consumption expenditures consists of the goods and services that are produced by general government (less any sales to other sectors and investment goods produced by government itself). Governments generally provide services to the general public without charge. The value of government production—that is, government’s gross output—is measured as spending for labor and capital services and for intermediate goods and services.<sup>1</sup>

Gross investment consists of new and used structures (such as highways and dams) and equipment and software purchased or produced by government and government-owned enterprises.

Government consumption and gross investment excludes current transactions of government-owned enterprises, current transfer payments, interest payments, subsidies, and transactions in financial assets and nonproduced assets, such as land.

1. Capital services is also known as consumption of fixed capital (depreciation) and represents a partial measure of the services provided by government-owned fixed capital.

Prices

Excluding food and energy .....	1.6	2.4	1.2	1.6	.....	.....	.....	.....
Gross domestic product .....	1.7	4.2	2.6	0.9	.....	.....	.....	.....

1. The estimates under the contribution columns are also percent changes.

NOTE. All the percent changes except those for PCE for food and energy goods and services and for PCE excluding food and energy are from NIPA table 1.6.7; the changes for PCE are calculated from index numbers in NIPA table 2.3.4. The contributions are from NIPA table 1.6.8.

Prices paid by domestic purchasers increased 1.6 percent in the third quarter after increasing 3.8 percent in the second quarter. Energy prices turned down, and food prices increased at the same rate as in the second quarter. Excluding food and energy, gross domestic purchases prices increased 1.7 percent, following a 1.5-percent increase.

Consumer prices as measured by the PCE price index slowed, mainly reflecting downturns in prices paid for gasoline, fuel oil, and other energy goods.

Prices paid for nonresidential fixed investment turned down, mainly reflecting a downturn in prices paid for transportation equipment and a larger decrease in prices paid for computers and peripheral equipment.

Prices paid for residential investment decreased somewhat less than in the second quarter.

Prices paid by government slowed. The slowdown was widespread across Federal and state and local government goods and services.

Consumer prices excluding food and energy, a measure of the "core" rate of inflation, picked up somewhat, increasing 1.8 percent after increasing 1.4 percent.

The GDP price index increased 0.9 percent, 0.7 percentage point less than the increase in the price index for gross domestic purchases, reflecting a larger increase in import prices than in export prices.

**Note on Prices**

BEA's gross domestic purchases price index is the most comprehensive index of prices paid by U.S. residents for all goods and services purchased in the United States. It is derived from prices of consumer spending, private investment, government spending, and prices paid for imports.

The GDP price index measures the prices paid for all the goods and services produced in the United States, and it includes the prices of goods and services that are exported.

The difference between the gross domestic purchases price index and the GDP price index reflects the differences between the imports prices (included in the gross domestic purchases index) and the exports prices (included in the GDP price index).

**Chart 7. Gross Domestic Purchases Prices**

GDP price index .....	0.8	0.9	0.1			

1. The estimates for GDP under the contribution columns are also percent changes.

The 4.9-percent preliminary estimate of real GDP growth is 1.0 percentage point more than the advance estimate. The average revision (without regard to sign) between the "advance" and "preliminary" estimates is 0.5 percentage point. The upward revision to real GDP growth primarily reflected upward revisions to inventory investment and to exports of goods and a downward revision to imports of goods. In contrast, consumer spending for nondurable goods was revised down.

The downward revision to consumer spending for nondurable goods was widespread; the largest contributor was food.

The largest contributors to the upward revision to inventory investment were wholesale trade inventories and manufacturing inventories.

The upward revision to exports of goods was widespread; the largest contributor was automotive vehicles, engines, and parts.

The largest contributors to the downward revision to imports of goods were industrial supplies and materials and "other" goods.

**Source Data for the Preliminary Estimates**

*Personal consumption expenditures:* Retail sales for November and December (revised). Motor vehicle registrations for October and November (revised) and December (new). Retail electricity sales for November (new) and natural gas sales for October (revised) and November (new).

*Nonresidential fixed investment:* Construction put in place for October and November (revised) and December (new). Manufacturers' shipments of machinery and equipment for October–December (revised).

*Residential investment:* Construction put in place for October and November (revised) and December (new).

*Change in private inventories:* Manufacturers' inventories for November and December (revised) and trade inventories for November (revised) and December (new).

*Exports and imports of goods and services:* International transactions for October and November (revised) and December (new).

*Government consumption expenditures and gross investment:* State and local construction put in place for October and November (revised) and December (new).

**Personal Income for the Second Quarter**

With the release of the preliminary estimates of GDP, BEA also releases revised estimates of various income-related series for the previous quarter. This revision reflects the incorporation of newly available, third-quarter tabulations from the quarterly census of employment and wages from the Bureau of Labor Statistics.

Wages and salaries increased \$46.7 billion in the third quarter, a downward revision of \$26.9 billion. Personal current taxes increased \$1.5 billion, a downward revision of \$3.7 billion. Contributions for government social insurance—a subtraction in calculating personal income—increased \$6.4 billion, a downward revision of \$3.7 billion. As a result of these revisions

- Personal income increased \$132.1 billion, a downward revision of \$25.1 billion.
- Disposable personal income increased \$130.8 billion, a downward revision of \$21.3 billion.
- Personal saving decreased \$2.2 billion, a downward revision of \$21.3 billion.
- The personal saving rate was -1.4 percent, a downward revision of 0.2 percentage point.

IVA Inventory valuation adjustment  
CCAj Capital consumption adjustment

Profits from current production decreased \$19.3 billion, or 1.2 percent at a quarterly rate, in the third quarter, following an increase of \$94.7 billion in the second quarter.

Domestic profits of financial corporations decreased \$29.1 billion, or 5.6 percent, in contrast to a second-quarter increase of \$52.7 billion.

Domestic profits of nonfinancial institutions decreased \$12.1 billion, or 1.5 percent, in the third quarter, in contrast to a second-quarter increase of \$25.3 billion.

Profits from the rest of the world (net corporate profits earned abroad) increased \$21.9 billion, or 6.9 percent, after increasing \$16.7 billion. In the third quarter, receipts increased \$27.9 billion, and payments increased \$6.1 billion.

Taxes on corporate income decreased \$19.1 billion, or 3.9 percent, following an increase of \$37.6 billion.

Undistributed corporate profits decreased \$23.6 billion, or 6.4 percent, after increasing \$32.2 billion.

Net cash flow from current production, a profits-related measure of internally generated funds available for investment, decreased \$22.1 billion, or 1.7 percent, after increasing \$37.4 billion.

### Measuring Corporate Profits

Corporate profits is a widely followed economic indicator used to gauge corporate health, assess investment conditions, and analyze the effect on corporations of economic policies and conditions. In addition, corporate profits is an important component in key measures of income.

BEA's measure of corporate profits aims to capture the income earned by corporations from current production in a manner that is fully consistent with the national income and product accounts (NIPAs). The measure is defined as receipts arising from current production less associated expenses. Receipts exclude income in the form of dividends and capital gains, and expenses exclude bad debts, natural resource depletion, and capital losses.

Because direct estimates of NIPA-consistent corporate profits are unavailable, BEA derives these estimates in three steps.

First, BEA measures profits before taxes to reflect corporate income regardless of any redistributions of income through taxes. This measure is partly based on tax return

information from the Internal Revenue Service; BEA uses tax accounting measures as a source of information on profits for two reasons: They are based on well-specified accounting definitions, and they are comprehensive, covering all incorporated businesses—publicly traded and privately held—in all industries. BEA also uses other sources of information to estimate pretax profits, including information from the Census Bureau.

Second, to remove the effects of price changes on inventories valued at historical cost and of tax accounting for inventory withdrawals, BEA adds an inventory valuation adjustment that values inventories at current cost.

Third, to remove the effects of tax accounting on depreciation, BEA adds a capital consumption adjustment (CCAj). CCAj is defined as the difference between consumption of fixed capital (the decline in the value of the stock of assets due to wear and tear, obsolescence, accidental damage, and aging) and capital consumption allowances (tax return depreciation).

# Government Receipts and Expenditures

## Third Quarter of 2007

**N**ET government saving, the difference between current receipts and current expenditures of the Federal Government and state and local governments, was  $-\$236.8$  billion in the third quarter of 2007, decreasing  $\$43.4$  billion from  $-\$193.4$  billion in the second quarter, according to the “preliminary” estimates.<sup>1</sup>

Net Federal Government saving was  $-\$229.2$  billion in the third quarter, decreasing  $\$22.4$  billion from  $-\$206.8$  billion in the second quarter (see page 12). Current receipts decelerated, and current expenditures accelerated.

Net state and local government saving was  $-\$7.7$  billion in the third quarter, decreasing  $\$21.1$  billion from  $\$13.4$  billion in the second quarter (see page 13). Current receipts decelerated, and current expenditures accelerated.

Net borrowing was  $\$431.8$  billion in the third quarter, increasing  $\$58.2$  billion from  $\$373.6$  billion in the second quarter. Federal Government net borrowing was  $\$302.6$  billion in the third quarter, increasing  $\$37.5$  billion from  $\$265.1$  billion in the second quarter. State and local government net borrowing was  $\$129.2$  billion in the third quarter, increasing  $\$20.7$  billion from  $\$108.5$  billion in the second quarter.

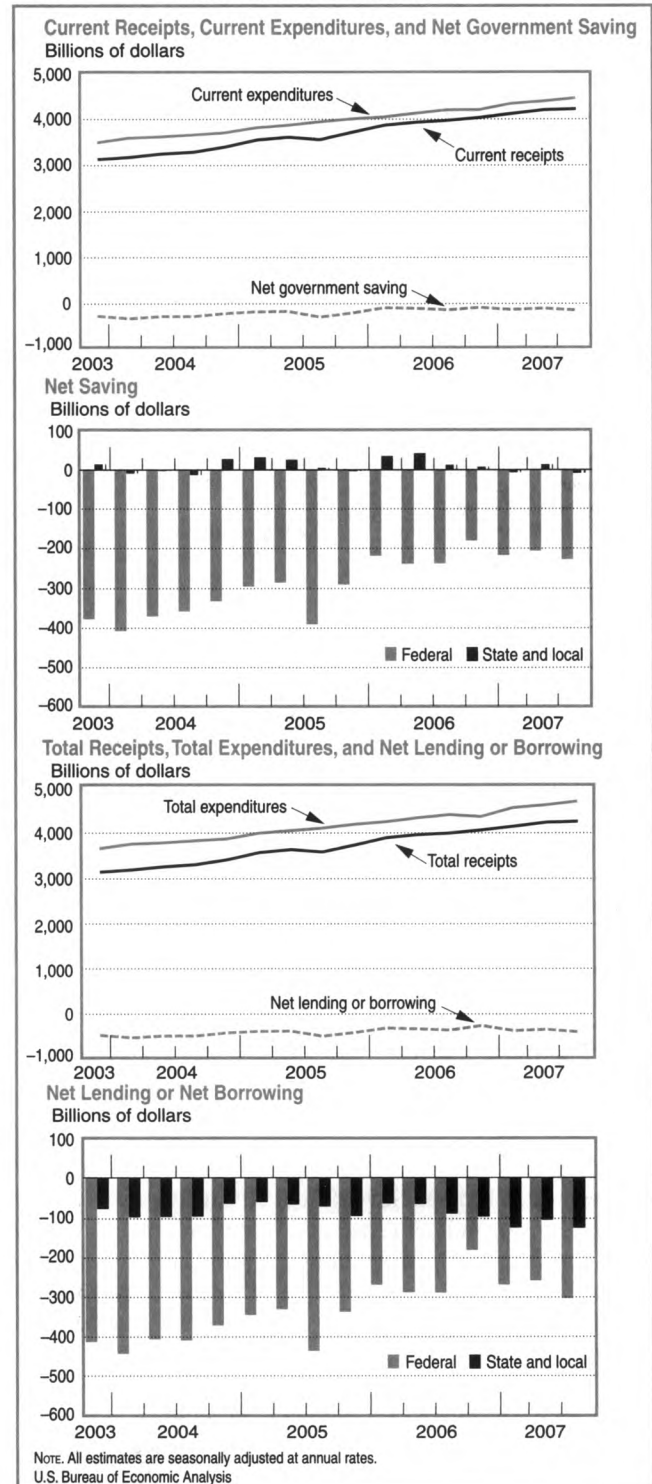

1. Revised estimates will be released with the final estimates of gross domestic product for the third quarter on December 20.

### Federal Government Estimates

Estimates of Federal Government current receipts, current expenditures, and net Federal Government saving are based on data from the Federal budget, from the *Monthly Treasury Statement* and other reports from the Department of the Treasury, and from other Federal Government agencies. Total receipts, total expenditures, and net lending or net borrowing, which are alternative measures of the Federal fiscal position, are based on these same sources.

Quarterly and annual estimates are published monthly in NIPA table 3.2. Detailed annual estimates of these transac-

tions by component are published annually in NIPA tables 3.4–3.8, 3.12, and 3.13. Detailed quarterly estimates are available in underlying NIPA tables at <[www.bea.gov/bea/dn/nipaweb/nipa\\_underlying/Index.asp](http://www.bea.gov/bea/dn/nipaweb/nipa_underlying/Index.asp)>.

Each year, BEA prepares an article that compares NIPA estimates and the Federal budget.<sup>1</sup> For a historical time series of this comparison, see NIPA table 3.18B.

1. See Mary L. Roy and Andrew P. Cairns, "Federal Budget Estimates for Fiscal Year 2008," *SURVEY OF CURRENT BUSINESS* 87 (March 2007): 10–21.

<b>Net lending or borrowing (-)</b> .....	<b>-129.2</b>	<b>-7.7</b>	<b>-28.8</b>	<b>20.4</b>	<b>-20.7</b>

Personal current taxes turned down, primarily reflecting a downturn in state personal income taxes.

Taxes on corporate income turned down, reflecting a downturn in corporate profits.

Consumption expenditures decelerated, reflecting a slowdown in spending for nondurable goods.

Government social benefits turned up, reflecting an upturn in benefit payments for Medicaid.

Gross government investment decelerated, reflecting a deceleration in investment for structures.

### Estimates of State and Local Government Receipts and Expenditures

The estimates of state and local government current receipts and expenditures and total receipts and expenditures are mainly based on compilations of data for state and local government finances. The Census Bureau produces the primary source data: The quinquennial census of governments in years that end in a 2 or a 7 and the Government Finances series of surveys for the other years. In addition, other sources of Census Bureau data are from the *Quarterly Summary of State and Local Government Tax Revenue* and the monthly *Value of Construction Put in Place*. Data sources from the Bureau of Labor Statistics include the Quarterly Census of Employment and Wages and the Employment Cost Index.

Quarterly and annual estimates are available monthly in NIPA table 3.3. Detailed annual estimates of state and local government transactions by component are available

annually in NIPA tables 3.4–3.8, 3.12, and 3.13. Detailed quarterly estimates are available in underlying NIPA tables at <[www.bea.gov/bea/dn/nipaweb/nipa\\_underlying/Index.asp](http://www.bea.gov/bea/dn/nipaweb/nipa_underlying/Index.asp)>. For a historical time series of reconciliations of the NIPA estimates with the Census Bureau data from Government Finances, see NIPA table 3.19.

BEA also prepares annual estimates of receipts and expenditures of state governments and of local governments.<sup>1</sup> These estimates are available annually in NIPA table 3.20 (state government receipts and expenditures) and in NIPA table 3.21 (local government receipts and expenditures); see “Newly Available NIPA Tables” in the October 2006 SURVEY.

1. Bruce E. Baker, “Receipts and Expenditures of State Governments and of Local Governments,” SURVEY 85 (October 2005): 5–10.

## BEA BRIEFING

# Integrating the 2002 Benchmark Input-Output Accounts and the 2002 Annual Industry Accounts

By Dylan G. Rassier, Thomas F. Howells III, Edward T. Morgan, Nicholas R. Empey, and Conrad E. Roesch

IN SEPTEMBER, the Bureau of Economic Analysis (BEA) released the 2002 benchmark input-output (I-O) accounts.<sup>1</sup> Benchmark I-O accounts are released every 5 years and provide a detailed picture of the economy, showing relationships among hundreds of industries and commodities. Estimates in the benchmark I-O accounts also serve as the statistical foundation for other BEA estimates, including gross domestic product (GDP). In addition, economists and government officials use the benchmark I-O accounts for a wide range of research.

One improvement in the 2002 benchmark I-O accounts was the enhanced integration with the 2002 annual industry accounts (chart 1).<sup>2</sup> These complementary accounts portray, for all industries, the

goods and services purchased, the incomes earned, and the distribution of sales.

However, there are notable differences between the two accounts, and the accounts are generally used for different purposes.

Because of their rich source data—mainly the every-5-year Economic Census—the benchmark I-O accounts paint a detailed picture of the economy at a point in time. The 2002 benchmark I-O accounts detail the flows of 428 commodities to 426 industries and to 13 categories of final uses. In contrast, the annual industry accounts, which are based primarily on data from the Internal Revenue Service (IRS), Census Bureau, and the Bureau of Labor Statistics, provide a time series of information about the flow of goods and services at a more aggregate level—65 industries and 65 commodities.

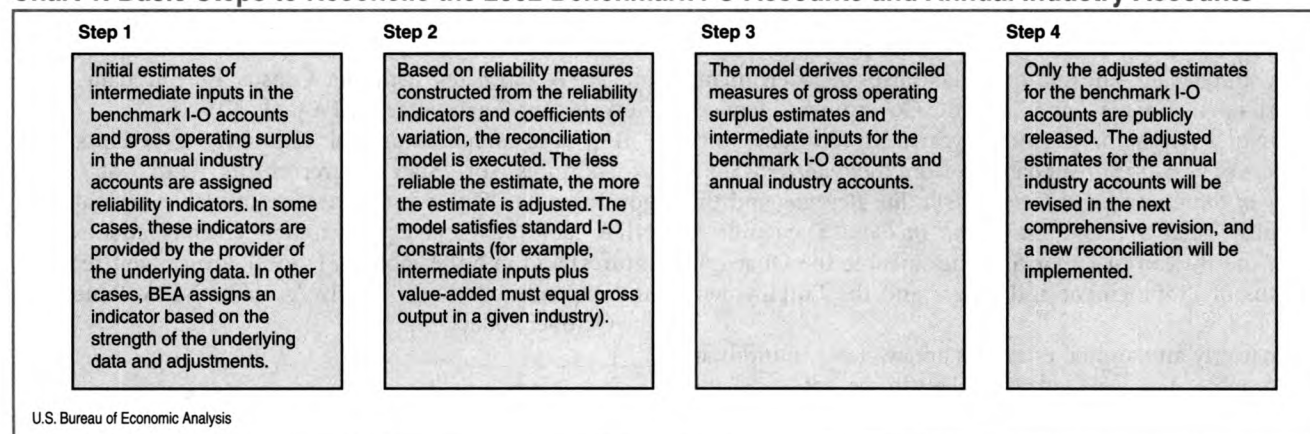

A long-standing goal of BEA has been to develop more consistency among its many accounts, including its benchmark I-O accounts and annual industry accounts, to provide a more useful view of the economy. For the 2002 benchmark I-O accounts, an improved model was used to “reconcile” the accounts with the 2002 annual industry accounts. The new model resulted in improved estimates of intermediate inputs and gross operating surplus for the 2002 benchmark

1. For more information regarding the 2002 benchmark I-O accounts, see Stewart et al. (2007).

2. For more information regarding BEA’s integration initiative, see Yuskavage (2000), Moyer et al. (2004a, 2004b), and Lawson et al. (2006). For this article, Baoline Chen, Karen Horowitz, Douglas S. Meade, Mark A. Planting, and George M. Smith provided early advice. Sumiye Okubo, Erich H. Strassner, Mary L. Streitwieser, and Robert E. Yuskavage also provided helpful comments.

*This BEA Briefing is the first in a new series of articles that aims to explain important aspects of BEA’s economic accounts in less technical language.*

**Chart 1. Basic Steps to Reconcile the 2002 Benchmark I-O Accounts and Annual Industry Accounts**

I-O accounts.

In theory, a reconciliation of the two accounts would adjust data in each account to make certain aggregates equal; for example, industry intermediate inputs in the 2002 benchmark I-O accounts would equal their counterparts in the 2002 annual industry accounts. In reality, only the published benchmark I-O accounts reflect adjusted data. The 2002 annual industry accounts, which were released in 2005, will not be adjusted until the next comprehensive revision of the annual industry accounts, scheduled for 2010. Thus, the published data from both accounts, which are available on BEA's Web site, will continue to differ.

However, there are several benefits from reconciling the two accounts, notably that the estimates in both are improved because the reconciliation takes into account the reliability of the underlying data. In addition, the reconciliation model provides a tool for balancing the benchmark use table, which means adjusting data so that all I-O identities are satisfied; for example, industry output equals commodity output.

More specifically, BEA's new reconciliation model—which is based on a generalized least squares frame-

work—offers four advantages over past models. First, the model is transparent. The technique has been widely researched and is familiar to national economic accounting and statistical agencies. Second, the framework provides a firm statistical foundation. In particular, the technique uses information on the reliabilities of initial underlying data to make adjustments to initial estimates. Third, the framework guarantees that adjustments to initial estimates are as small as necessary to remove discrepancies between the estimates subject to the model's accounting constraints. In this way, the technique yields final estimates that are consistent with the economic concepts on which the accounts are built. Finally, the framework yields a model that is replicable. If no changes are made to the data that are introduced to the model, the model yields a duplicate set of results. Alternatively, updated data can be introduced to the model without requiring any substantial changes to the model or efforts to run the model.

The new reconciliation model builds on a long history of scholarly work, much of which was pioneered by Richard Stone (see the box "History of the Reconcil-

#### History of the Reconciliation Model

In a series of papers that began in 1942, the economist Richard Stone advocated a framework to improve the accuracy of independent estimates of national income and expenditures based on the reliability of the data used to construct the statistics. The Bureau of Economic Analysis (BEA) has drawn upon this approach to reconcile its benchmark input-output (I-O) and annual industry accounts, culminating with the reconciliation of the 2002 accounts, which is presented in this article.

Researchers revised the Stone method to facilitate its implementation (Byron 1978; van der Ploeg 1982, 1984), but Federal agencies responsible for producing national economic accounts have generally not implemented the method. One reason for this has been a lack of technology that is typically required to solve the complex systems of equations faced by Federal agencies. Another reason has been a lack of information regarding the relative reliabilities of underlying data used to construct national accounting statistics.

While some agencies have resolved the latter challenge with subjective measures of relative reliabilities (Mantegazza and Pisani 2000; Moyer et al. 2004a, 2004b), a lack of adequate technology has until recently stymied implementation of the Stone method (Nicolardi 2000; Tuke and Aldin 2004). In a recent study, BEA economist Baoline Chen (2006) addressed both challenges by building an empirical model based on the Stone method and incorporating statistical measures of relative reliability in the model to reconcile and balance estimates.

BEA-assigned reliability indicators were first used to reconcile the 1997 accounts. For those accounts, value added in the benchmark I-O accounts was reconciled with value added in the annual industry accounts using a weighted average of the initial industry value-added estimates in each set of accounts. The weights were based partly on the reliability of the data from which value added was derived.

In particular, the weights in the benchmark I-O accounts were based on the percent of industry intermediate input estimates and industry gross output estimates that were derived from the 1997 Economic Census. The weights in the annual industry accounts were based on the reliability and size of the adjustments used to convert enterprise-based income data to an establishment basis and the percent of an industry's value added that is derived from proprietors' income. From these criteria, industry value-added reliability measures were calculated for each set of accounts, and these reliability measures were used to calculate the weights to adjust initial industry value-added estimates. Value-added estimates with smaller reliability measures had greater weights.

The reconciliation of the 2002 accounts built on the previous reconciliation. In particular, the new, more transparent reconciliation model relies on a generalized least squares framework that provides a solid statistical foundation for the adjusted estimates. The methodology to assign reliability weights has also been improved by drawing upon external data.

iation Model").<sup>3</sup> The model also builds on the work of BEA economist Baoline Chen (2006), who conducted a pilot study to build a reconciliation model for BEA's 1997 industry accounts.

The rest of this article includes a description of the benchmark I-O accounts and the annual industry accounts, focusing on the source data and adjustment methodologies that are relevant for the reconciliation. A nontechnical explanation of the reconciliation model follows, including a discussion of reliability measures, the technology used to solve the model, and the results. The article summarizes a more comprehensive paper by the authors that includes a mathematical description of the model. The paper is available at <[www.bea.gov/papers/index.htm](http://www.bea.gov/papers/index.htm)>.

### Benchmark Input-Output Accounts

The benchmark I-O accounts are prepared every 5 years and provide a comprehensive picture of the flows of goods and services across all industries and the final use categories that make up gross domestic product. The accounts are presented in a series of tables, including a use table and a make table.

The structure of the use table is the same in the benchmark I-O accounts and the annual industry accounts (chart 2). The difference is that the benchmark use table includes much more industry detail than the annual use table.

The use table for both accounts provides gross output estimates for industries and commodities and intermediate input and value-added estimates by industry.

The upper left part of the table shows intermediate inputs, which are commodities purchased by industries for the production of goods and services. Below the intermediate inputs are the value-added components, which include compensation of employees, taxes on production and imports, and gross operating surplus. To the right of the intermediate inputs are final use categories. Finally, the bottom row and the far right column show the gross output for industries and commodities, respectively, which come from the balanced benchmark make table.

### Intermediate inputs and gross operating surplus

The benchmark I-O accounts and annual industry accounts measure intermediate inputs and gross operat-

ing surplus differently. In the benchmark I-O accounts, gross operating surplus—a profits-like measure—is derived as a residual: Gross output less intermediate inputs, compensation of employees, and taxes on production and imports less subsidies.

Intermediate inputs for specific industries are derived mainly from Census Bureau expense data. Approximately 71 percent of the value of intermediate inputs comes from Census Bureau data, 22 percent from other data, and 7 percent from BEA adjustment methodologies. For the 2002 benchmark I-O accounts, Census Bureau data were more comprehensive than data available for previous benchmark I-O accounts. Within the manufacturing industries, 19 categories of expenses were available from the 2002 Economic Census. Within the service industries, 19 categories of expenses were available from the 2002 Business Expenses Survey. Given this depth of coverage, the gross operating surplus estimates in the benchmark I-O accounts were also improved in these industries before and after the reconciliation because gross operating surplus is calculated as a residual.

BEA adjusts the estimates in the benchmark I-O accounts to ensure they conform to established benchmark I-O concepts. In particular, adjustments are made for nonemployer expenses, misreporting and nonfiling, and auxiliary services.<sup>4</sup> The reconciliation model takes the reliabilities of these adjustments into account.

**Nonemployer expenses.** The Economic Census only covers establishments with employees and payroll. To capture the inputs and outputs of nonemployers, BEA makes an adjustment using information derived from administrative data calculated by the Census Bureau.<sup>5</sup> In part because these data are considered reliable, the nonemployer adjustments are considered more reliable than other adjustments in the benchmark I-O accounts but less reliable than estimates based on Economic Census data.

**Misreporting and nonfiling.** Unlike nonemployer establishments, small employers are included in estimates published for the Economic Census. The estimates for small employers are derived from administrative data gathered mainly by the IRS. Such data for nonemployers typically include individual

4. While other types of adjustments are made to source data for intermediate inputs, these three types of adjustments capture the majority of the dollar value of adjustments made in the benchmark I-O accounts.

5. The Census Bureau provides receipts for nonemployers at a more aggregate level than receipts for employer establishments. To distribute receipts for nonemployers to the appropriate industry level, BEA uses a ratio of receipts for small-employer establishments by industry to total receipts for all small employers from the Economic Census. However, these adjustments do not affect the data for the reconciliation because gross output is fixed in the reconciliation model.

3. In a series of papers beginning with Stone et al. (1942), Stone (1961, 1968, 1970, 1975, 1976, and 1984) advocates a GLS framework to improve the economic and statistical accuracy of independent estimates of national income and expenditures based on the reliabilities of underlying data used to construct the estimates.

income tax returns; administrative data for small employers typically include individual, partnership, and corporate income tax returns. Based on these administrative data, BEA adjusts estimates for nonemployers and small employers for misreporting and nonfiling.<sup>6</sup> A misreport results when a tax return is filed with incomplete or incorrect information. Nonfiling results when a business or individual who earns income fails entirely to file a return. An adjustment for misreporting is based on data from two IRS programs: the Taxpayer Compliance Measurement Program (TCMP) and the TCMP-Information Return Program (TCMP-IRP).<sup>7</sup> An adjustment for nonfilers is based on data from an exact-match study conducted by Census.<sup>8</sup> These adjustments are considered less reliable than other adjustments because of the infrequency with which the TCMP, TCMP-IRP, and exact-match studies are conducted and the need to approximate the industry distributions.

**Auxiliary services.** An auxiliary is an establishment that provides services that may not be part of a company's main industry. BEA adjusts the data to allocate the auxiliary's expenses into the proper industry. For example, in the benchmark I-O accounts, a management services establishment within a pharmaceutical company would be broken out of the pharmaceutical industry and added to management services. For a given auxiliary, the Census Bureau provides expense data tabulated for the sector of the auxiliary. For each industry, the ratio of industry-level payroll to sector-level payroll is assumed to be the same as industry-level expense to sector-level expense. Additions to intermediate inputs in a given industry served are offset by reductions to gross operating surplus in that industry. The adjustment for auxiliary services is considered more reliable than the misreporting and nonfiling adjustment but less reliable than the adjustment for nonemployer expenses because of the source data and the assumption regarding payroll and other expenses.

## Annual Industry Accounts

The annual industry accounts provide a time series of estimates for gross output, intermediate inputs, and value added by industry. Like the benchmark I-O ac-

counts, they also include make and use tables. Unlike the benchmark I-O accounts, intermediate inputs in the annual industry accounts are derived as a residual: Gross output less compensation of employees, taxes on production and imports less subsidies, and gross operating surplus.<sup>9</sup> Gross operating surplus in the annual industry accounts is derived from gross operating surplus estimates in the most recent benchmark I-O accounts, extrapolated forward using annual measures of gross operating surplus based on gross domestic income (GDI). These GDI-based estimates of gross operating surplus are also used as inputs for the new reconciliation model. Thus, estimates of 2002 gross operating surplus used in the reconciliation model are different from estimates of gross operating surplus published in the 2002 annual industry accounts.

GDI-based estimates of gross operating surplus for private, nonfarm industries are derived using data from the IRS, other data sources, and BEA adjustment methodologies.<sup>10</sup> Approximately 47 percent of private, nonfarm industries' gross operating surplus comes from IRS data, 14 percent from misreporting and nonfiling adjustments, 22 percent from concept and coverage adjustments, and 17 percent from other data and related adjustments.

**Misreporting and nonfiling.** Similar to the benchmark I-O accounts, BEA makes a misreporting and nonfiling adjustment for noncorporate business income-tax based source data in the annual industry accounts based on data from the TCMP, TCMP-IRP, and exact-match studies. Thus, the misreporting and nonfiling adjustment is considered less reliable than other types of adjustments. These adjustments are given the same reliability indicator as they are in the benchmark I-O accounts.

**Concepts and coverage.** Concept adjustments are designed to convert tax accounting-based concepts from IRS data to economic accounting-based concepts consistent with national accounts. Concept adjustments include the removal of capital gains and dividends from business income. Coverage adjustments are designed to include the activities of entities that contribute to gross domestic product but are not required to file a return with the IRS. Coverage adjustments include adding income earned by Federal Reserve banks and imputing net income for owner-

6. According to IRS compliance studies, three components contribute to a tax gap between the amount taxpayers should pay and the amount taxpayers actually pay in a timely manner: Nonfiled returns, underreported income, and underpaid taxes (Brown and Mazur 2003).

7. Discontinued in the early 1990s, the TCMP was an audit program designed to study compliance patterns and levels of misreporting among sole proprietors. The TCMP-IRP was designed to compare the results of the TCMP audits to information returns filed with the IRS in order to capture misreporting that TCMP auditors failed to find.

8. An exact-match study compares records from the Current Population Survey (CPS) to records from the IRS in order to identify and estimate nonfiled income for individuals who report income in the CPS but do not file a return with the IRS.

9. Gross output in the annual industry accounts is calculated using annual survey data to extrapolate gross output from the make table in the most recent benchmark I-O accounts. Estimates of the compensation and tax components of value added in the annual industry accounts are derived from the GDI components of the NIPAs.

10. Gross operating surplus estimates for farm and general government industries and the owner-occupied housing portion of gross operating surplus estimates in the real estate industry are not reconciled using the current model. Thus, a discussion of the data and methodologies used to prepare estimates for these industries is outside the scope of this article.

occupied housing. While concept and coverage adjustments are considered more reliable overall than the misreporting and nonfiling adjustment, reliability varies by specific adjustment. Adjustments based on administrative data are considered more reliable than other adjustments, except those based on Economic Census data. Adjustments based on survey data are considered less reliable than those based on administrative data.

**Company-establishment.** Because the tax data used to make some estimates are classified on a company basis, BEA makes an adjustment to convert these data to an establishment basis. A company may consist of several establishments, each of which operates in a different industry. This adjustment shifts gross operating surplus from one industry to another with no impact on total gross operating surplus.

The company-establishment adjustment is limited to three of the income components of gross operating surplus derived from corporate income tax data: profits before tax, the capital consumption allowance, and net interest. The adjustment is based on employment data from the Census Bureau that relates employment by industry on a company basis and an establishment basis. The adjustment assumes that profits before tax, capital consumption allowance, and net interest are the same per employee for all establishments performing the same activity, regardless of the company to which that establishment belongs. The company-establishment adjustment is considered less reliable than most concept and coverage adjustments but more reliable than misreporting and nonfiling adjustments.

### Reconciling Gross Operating Surplus in a Balanced Input-Output Framework

The objective of the reconciliation model is to adjust intermediate inputs in the benchmark I-O accounts and gross operating surplus in the annual industry accounts so that the industry gross operating surplus estimates of each are equal, subject to the accounting constraints of the I-O framework (chart 1, table 1). For the benchmark I-O accounts, the adjusted estimates

are published. For the annual industry accounts, recall the caveat that the adjusted estimates are not published. However, both accounts will be adjusted as part of the next comprehensive revision.

### Initial estimates and reliability measures

An essential feature of BEA's new model is that it adjusts estimates in a way that takes the reliability of each initial estimate into account, subject to the accounting constraints of the I-O framework.<sup>11</sup> A more detailed, mathematical description of the model is available in the BEA paper that was mentioned at the end of the introduction to this article. In particular, the reconciliation model makes adjustments to initial estimates based on the strengths and weaknesses of the data that underlie those estimates. Initial estimates that are considered relatively weak are adjusted more than initial estimates that are considered relatively reliable.

Specific adjustments are made to the following:

- **Intermediate inputs in the benchmark I-O accounts.** The improved estimates of intermediate inputs also improve the estimates of gross operating surplus because the gross operating surplus is derived as a residual: Gross output less intermediate inputs, compensation and taxes on production and imports less subsidies.
- **Gross operating surplus in the annual industry accounts.** The improved estimates of gross operating surplus will likewise improve the residual estimates of intermediate inputs.

In both cases, final intermediate input estimates and gross operating surplus estimates are informed by the reliability of the underlying data used to produce the initial estimates. In this way, the data from each account is used to improve estimates in the other.

To take reliability of the underlying data into account, the model requires reliability indicators for each initial estimate. These indicators gauge the strength of

11. While Chen's (2006) model adjusts gross output, intermediate inputs, and all components of value added in the benchmark I-O accounts, the current model only adjusts intermediate inputs and the gross operating surplus component of value added.

**Table 1. Effects of the Reconciliation Model on Benchmark I-O and Annual Industry Accounts**

	Gross output	Intermediate inputs	Compensation	Taxes	Gross operating surplus
Benchmark I-O accounts	No change	Each estimate is adjusted based on the reliability of the underlying data	No change	No change	Each estimate is derived as a residual, so each estimate is adjusted because intermediate inputs are adjusted
Annual industry accounts	No change	Each estimate is derived as a residual, so each is adjusted because gross operating surplus estimates were adjusted	No change	No change	Each estimate is adjusted based on the reliability of the underlying data

the underlying data and are used in part to weight the adjustment. Initial estimates are assigned a reliability indicator from two sources:

- **Source data providers.** Coefficients of variation, which measure sampling errors, are available for some source data provided by the Census Bureau and the IRS.<sup>12</sup> These coefficients range from 0 to 1, with 0 denoting the highest reliability and 1 denoting the lowest reliability. About 23 percent of the total value of benchmark intermediate inputs and about 47 percent of the total value of annual gross operating surplus estimates had coefficients of variation from the source data provider.
- **BEA.** For estimates that do not have coefficients of variation, BEA assigns reliability indicators (table 2). These reliability indicators also range from 0 to 1 according to a rubric developed by BEA economists. The rubric considers the data on which initial estimates are based and the adjustments to those estimates. The adjustments are designed to correct nonsampling errors in the underlying data (for example, misreporting). However, the adjustments are themselves subject to nonsampling errors, and the reliability of adjustments, as determined by BEA economists, vary widely.

12. Coefficients of variation are available for all IRS estimates. Because sampling errors apply to surveys and not censuses, coefficients of variation are available from the Census Bureau for the expense data from the Business Expenses Survey and purchased services from the Annual Survey of Manufactures portion of the Census of Manufactures. Purchased services include the following expense categories: Accounting, auditing, and book-keeping; advertising; communications; computer services; legal services; management, consulting, and administrative services; other expenses; refuse removal; repairs and maintenance of buildings and machinery; and taxes and license fees.

**Table 2. Rubric for Assigning Reliability Indicators to Initial Estimates**

Reliability indicator	Source of estimate
0	Economic Census data with no adjustments
0.10	Economic Census data with adjustments Survey data with no adjustments Concept and coverage adjustments based solely on administrative data Nonemployer adjustments
0.35	Survey data with adjustments Trade association data Concept and coverage adjustments based on survey data Auxiliary service adjustments
0.65	Company-establishment conversion adjustment Adjustments based on a combination of analyst judgment and external source data
1	Misreporting adjustments Adjustments based solely on analyst judgment

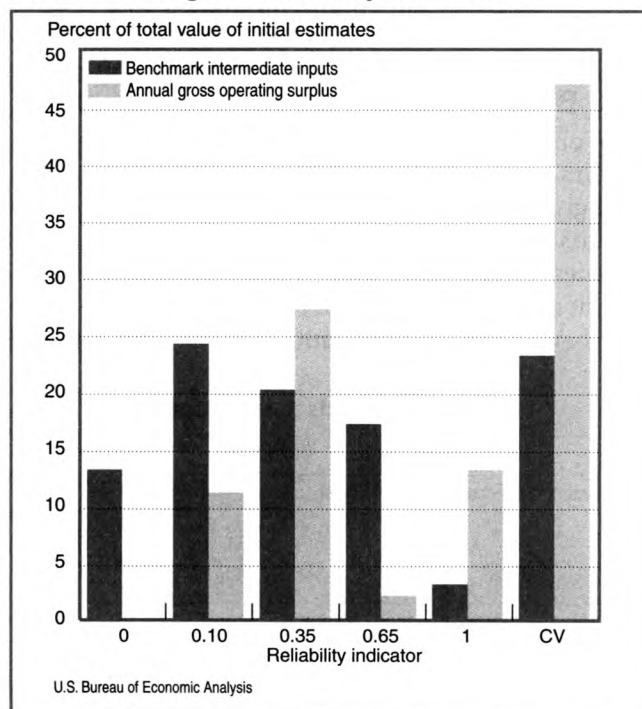

Chart 3 shows the distributions of BEA-assigned reliability indicators and coefficients of variation for all industries. According to the rubric, estimates based on Economic Census data with no adjustments are assigned a zero, which means they are considered the most reliable. Approximately 13 percent of the total value of intermediate input estimates receives this indicator. No gross operating surplus estimates are assigned a reliability indicator of zero because none were based on Economic Census data without adjustments. Estimates based on Economic Census data with adjustments are assigned an indicator of 0.10, the second most reliable ranking.

Of all estimates with BEA-assigned reliability indicators, almost 45 percent of the intermediate input value and 40 percent of the gross operating surplus value are assigned reliability indicators of 0.10 or 0.35. Reliability indicators of 1 are assigned to a higher percent of the gross operating surplus value because the misreporting adjustment plays a larger role in the annual industry accounts.

**Constraints**

The reconciliation model does not allow all estimates to adjust. Estimates of final uses, gross output, and the compensation and tax components of value added

**Chart 3. Distributions of Coefficients of Variation and BEA-Assigned Reliability Indicators**

from the benchmark I-O accounts are fixed.<sup>13</sup> The system of constraints also incorporates the accounting identities upon which the table is built. Thus, the system of constraints ensures that intermediate and final uses of each commodity equals the commodity's supply, the sum of each industry's intermediate inputs and value added equals the industry's gross output, and that total value added equals total GDP. In this way, the model provides a tool for balancing the benchmark use table.

**Technology**

In previous years, attempts to develop robust reconciliation models have been stymied partly because of a lack of adequate software. For the 2002 benchmark I-O accounts, the reconciliation model was executed using the CPLEX solver in the Generalized Algebraic Modeling System (GAMS). GAMS is a flexible optimization software package designed to handle large mathematical programming problems. CPLEX is a GAMS solver with solution algorithms for linear, quadratically constrained, and mixed-integer problems. The CPLEX solver automatically chooses the optimal combination of algorithms to efficiently solve the particular model specified. Alternatively, GAMS also allows users to adjust tuning parameters in order to set algorithmic options. The reconciliation model is solved with the combination of algorithms chosen by GAMS.

The scale of the model is suggested by the number of variables involved. At the most disaggregated industry level (987 industries and 8,910 items), the model in theory contains 8,795,157 variables to be solved and 9,963 constraints to be satisfied. However, in practice, the intermediate input portion of the benchmark use table is not fully populated, resulting in fewer variables to be solved.

**Results**

More than 50 percent of intermediate input estimates in the benchmark I-O accounts and gross operating surplus estimates in the annual industry accounts were adjusted less than 5 percent from their initial values (chart 4). As expected, the majority of these small adjustments were made to estimates derived from Economic Census data, survey data, and administrative data. Approximately 13 percent of intermediate input

estimates in the benchmark I-O accounts and approximately 6 percent of gross operating surplus estimates in the annual industry accounts were adjusted more than 50 percent from their initial values. As expected, the majority of these adjustments were made to estimates derived from adjustments based on analyst judgment and misreporting and nonfiling adjustments. In addition, the majority of these large adjustments were for small initial values.

To assess results at a more aggregate level, an aggregate industry reliability measure was calculated for initial intermediate input estimates in the benchmark I-O accounts and for initial gross operating surplus estimates in the annual industry accounts. The results of the reconciliation results in a given industry are expected to favor the initial value with the smaller aggregate reliability measure, and indeed, this pattern generally holds for all industries.

d. Free Distribution by Mail (Samples, complimentary, and other free)	(1) Outside-County as Stated on Form 3541	NA	NA
	(2) In-County as Stated on Form 3541	NA	NA
	(3) Other Classes Mailed Through the USPS	NA	NA
e. Free Distribution Outside the Mail (Carriers or other means)	90	90	
f. Total Free Distribution (Sum of 15d. and 15e.)	90	90	
g. Total Distribution (Sum of 15c. and 15f.)	2125	2113	
h. Copies not Distributed	986	998	
i. Total (Sum of 15g. and h.)	3111	3111	
j. Percent Paid and/or Requested Circulation (15c. divided by 15g. times 100)	95.7	95.7	

16. Publication of Statement of Ownership  
 Publication required. Will be printed in the \_\_\_\_\_ issue of this publication.  Publication not required.

17. Signature and Title of Editor, Publisher, Business Manager, or Owner  
**James Kim Editor-In-Chief**  Date **12/12/07**

I certify that all information furnished on this form is true and complete. I understand that anyone who furnishes false or misleading information on this form or who omits material or information requested on the form may be subject to criminal sanctions (including fines and imprisonment) and/or civil sanctions (including civil penalties).

- #### Instructions to Publishers
- Complete and file one copy of this form with your postmaster annually on or before October 1. Keep a copy of the completed form for your records.
  - In cases where the stockholder or security holder is a trustee, include in items 10 and 11 the name of the person or corporation for whom the trustee is acting. Also include the names and addresses of individuals who are stockholders who own or hold 1 percent or more of the total amount of bonds, mortgages, or other securities of the publishing corporation. In item 11, if none, check the box. Use blank sheets if more space is required.
  - Be sure to furnish all circulation information called for in item 15. Free circulation must be shown in items 15d, e, and f.
  - Item 15h., Copies not Distributed, must include (1) newsstand copies originally stated on Form 3541, and returned to the publisher, (2) estimated returns from news agents, and (3), copies for office use, leftovers, spoiled, and all other copies not distributed.
  - If the publication had Periodicals authorization as a general or requester publication, this Statement of Ownership, Management, and Circulation must be published; it must be printed in any issue in October or, if the publication is not published during October, the first issue printed after October.
  - In item 16, indicate the date of the issue in which this Statement of Ownership will be published.
  - Item 17 must be signed.  
**Failure to file or publish a statement of ownership may lead to suspension of Periodicals authorization.**

## BEA Current and Historical Data

A selection of estimates from the national, industry, international, and regional accounts of the Bureau of Economic Analysis (BEA) are presented in this section. BEA's estimates are not copyrighted and may be reprinted without BEA's permission. Citing the SURVEY OF CURRENT BUSINESS and BEA as the source is appreciated.

More detailed estimates from BEA's accounts are available on BEA's Web site at <[www.bea.gov](http://www.bea.gov)>. These estimates are available in a variety of formats. In addition, news releases, articles, and other information, including methodologies and working papers, are available.

The tables present annual [A], quarterly [Q], and monthly [M] data.

### National Data

#### A. Selected NIPA tables [A,Q]

- 1. Domestic product and income .....D-2
- 2. Personal income and outlays.....D-18
- 3. Government current receipts and expenditures ...D-21
- 4. Foreign transactions .....D-33
- 5. Saving and investment.....D-37
- 6. Income and employment by industry .....D-42
- 7. Supplemental tables.....D-43

#### B. NIPA-related table

- B.1 Personal income and its disposition [A, M] .....D-46

#### C. Historical measures [A, Q]

- C.1 GDP and other major NIPA aggregates.....D-47

#### D. Charts

- Selected NIPA series .....D-51

### Industry Data

#### E. Industry table

- E.1 Value added by industry [A] .....D-57

### International Data

#### F. Transactions tables

- F.1 U.S. international transactions in goods and services [A, M] .....D-58
- F.2 U.S. international transactions [A, Q] .....D-59
- F.3 U.S. international transactions by area [Q] .....D-60
- F.4 Private services transactions [A] .....D-63

### G. Investment tables [A]

- G.1 U.S. international investment position.....D-64
- G.2 USDIA: Selected items.....D-65
- G.3 Selected financial and operating data of foreign affiliates of U.S. companies.....D-66
- G.4 FDIUS: Selected items .....D-67
- G.5 Selected financial and operating data of U.S. affiliates of foreign companies.....D-68

### H. Charts

- The United States in the international economy .....D-69

### Regional Data

#### I. State and regional tables

- I.1 Personal income [Q] .....D-70
- I.2 Personal income and per capita personal income [A] .....D-71
- I.3 Disposable personal income and per capita disposable personal income [A] .....D-72
- I.4 Gross domestic product by state [A] .....D-73

#### J. Local area table

- J.1 Personal income and per capita personal income by metropolitan area [A] .....D-74

### K. Charts

- Selected regional estimates.....D-79

### Appendixes

#### A. Additional information about the NIPA estimates

- Statistical conventions .....D-81
- Reconciliation table [A, Q] .....D-82

#### B. Suggested reading .....D-83

## National Data

### A. Selected NIPA Tables

The selected set of NIPA tables presents the most recent estimates of gross domestic product (GDP) and its components which were released on November 29, 2007. These estimates include the "preliminary" estimates for the third quarter of 2007. Also included are revised estimates of wages and salaries and of affected income-side series for the second quarter of 2007.

The selected set presents quarterly estimates that are updated monthly. Annual estimates are presented in most of the tables.

The GDP news release is available on BEA's Web site within minutes after the release. To receive an e-mail notification of the release, go to <[www.bea.gov](http://www.bea.gov)> and subscribe. The "Selected NIPA Tables" are available later that day.

1. Estimates for durable goods and nondurable goods for 1996 and earlier periods are based on the 1987 Standard Industrial Classification (SIC); later estimates for these industries are based on the North American Industry Classification System (NAICS).  
2. Includes government consumption expenditures, which are for services (such as education and national defense) produced by government. In current dollars, these services are valued at their cost of production.  
3. Some components of final sales of computers include computer parts.

<b>Addendum:</b>								
Gross housing value added .....	12	841.2	883.3	889.3	888.9	895.4	902.2	909.6

1. Equals gross domestic product excluding gross value added of households and institutions and of general government.

2. Equals gross domestic business value added excluding gross farm value added.

3. Equals compensation of employees of nonprofit institutions, the rental value of nonresidential fixed assets owned and used by nonprofit institutions serving households, and rental income of persons for tenant-occupied housing owned by nonprofit institutions.

4. Equals compensation of general government employees plus general government consumption of fixed capital.

Note: Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

Note: Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive.

1. Gross domestic income deflated by the implicit price deflator for gross domestic product.  
2. Gross national income deflated by the implicit price deflator for gross national product.  
3. Net domestic income deflated by the implicit price deflator for net domestic product.  
Note: Except as noted in footnotes 1, 2 and 3, chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive.

1. Estimates for financial corporate business and nonfinancial corporate business for 2000 and earlier periods are based on the 1987 Standard Industrial Classification (SIC); later estimates for these industries are based on the North American Industry Classification System (NAICS).

2. The current-dollar gross value added is deflated using the gross value added chain-type price index for nonfinancial industries from the GDP-by-industry accounts. For periods when this price index is not available, the chain-type price index for GDP goods and structures is used.

3. Chained-dollar consumption of fixed capital of nonfinancial corporate business is calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100.

4. Chained-dollar net value added of nonfinancial corporate business is the difference between the gross product and the consumption of fixed capital.

1. Consists of gasoline, fuel oil, and other energy goods and of electricity and gas.  
NOTE: Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

2. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

Note: Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software in table 3.9.5.

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software in table 3.9.5.

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software in table 3.9.5.

Note. Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

1. National defense consumption expenditures are defense services produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software.

5. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

1. National defense consumption expenditures are defense services produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software.

5. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

1. National defense consumption expenditures are defense services produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software.

5. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

Note. Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

1. Exports and imports of certain goods, primarily military equipment purchased and sold by the Federal Government, are included in services. Beginning with 1986, repairs and alterations of equipment are reclassified from goods to services.

2. Consists of capital transfers and the acquisition and disposal of nonproduced nonfinancial assets.

1. Exports and imports of certain goods, primarily military equipment purchased and sold by the Federal Government, are included in services. Beginning with 1986, repairs and alterations of equipment are reclassified from goods to services.  
2. Includes parts of foods, feeds, and beverages, of nondurable industrial supplies and materials, and of nondurable nonautomotive consumer goods.

1. Exports and imports of certain goods, primarily military equipment purchased and sold by the Federal Government, are included in services. Beginning with 1986, repairs and alterations of equipment are reclassified from goods to services.  
2. The quantity index for computers can be used to accurately measure the real growth of this component. However, because computers exhibit rapid changes in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series; accurate estimates of these contributions are shown in table 4.2.2, and real growth rates are shown in

1. Consists primarily of religious, educational, vocational, lodging, railroads, farm, and amusement and recreational structures, net purchases of used structures, and brokers' commissions on the sale of structures.

2. Excludes software "embedded," or bundled, in computers and other equipment.

3. Includes communication equipment, nonmedical instruments, medical equipment and instruments, photocopy and related equipment, and office and accounting equipment.

4. Consists primarily of furniture and fixtures, agricultural machinery, construction machinery, mining and oilfield machinery, service industry machinery, and electrical equipment not elsewhere classified.

5. Consists primarily of manufactured homes, improvements, dormitories, net purchases of used structures, and brokers' commissions on the sale of residential structures.

6. Excludes net purchases of used structures and brokers' commissions on the sale of structures.

Residential structures.....	29	502.8	484.3	473.0	448.0	425.5	414.9	396.4

1. Consists primarily of religious, educational, vocational, lodging, railroads, farm, and amusement and recreational structures, net purchases of used structures, and brokers' commissions on the sale of structures.

2. The quantity index for computers can be used to accurately measure the real growth rate of this component. However, because computers exhibit rapid changes in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series; accurate estimates of these contributions are shown in table 5.3.2 and real growth rates are shown in table 5.3.1.

3. Excludes software "embedded" or bundled, in computers and other equipment.

4. Includes communication equipment, nonmedical instruments, medical equipment and instruments, photocopy and related equipment, and office and accounting equipment.

5. Consists primarily of furniture and fixtures, agricultural machinery, construction machinery, mining and oilfield machinery, service industry machinery, and electrical equipment not elsewhere classified.

6. Consists primarily of manufactured homes, improvements, dormitories, net purchases of used structures, and brokers' commissions on the sale of residential structures.

7. Excludes net purchases of used structures and brokers' commissions on the sale of structures.

Note. Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

1. This series is derived from the Census Bureau series "current cost inventories."

2. The inventory valuation adjustment (IVA) shown in this table differs from the IVA that adjusts business incomes. The IVA in this table reflects the mix of methods (such as first-in, first-out and last-in, first-out) underlying inventories derived primarily from Internal Revenue Service statistics (see footnote 1). This mix differs from that underlying business income derived primarily from Census Bureau statistics (see footnote 1). This mix differs from that underlying business income derived primarily from Internal Revenue Service statistics.

Note. Estimates in this table are based on the North American Industry Classification System (NAICS).

Note. Estimates in this table are based on the North American Industry Classification System (NAICS).

Chained (2000) dollar series for real change in private inventories are calculated as the period-to-period change in chained-dollar end-of-period inventories. Quarterly changes in end-of-period inventories are stated at annual rates. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

Nonfarm inventories to final sales of goods and structures.....	29	3.84	3.84	3.85	3.86	3.85

1. Inventories are as of the end of the quarter. The quarter-to-quarter change in inventories calculated from current-dollar inventories in this table is not the current-dollar change in private inventories component of GDP. The former is the difference between two inventory stocks, each valued at its respective end-of-quarter prices. The latter is the change in the physical volume of inventories valued at average prices of the quarter. In addition, changes calculated from this table are at quarterly rates, whereas, the change in private inventories is stated at annual rates.

2. Quarterly totals at monthly rates. Final sales of domestic business equals final sales of domestic product less gross output of general government, gross value added of nonprofit institutions, compensation paid to domestic workers, and space rent for owner-occupied housing. It includes a small amount of final sales by farm and by government enterprises.

NOTE: Estimates in this table are based on the North American Industry Classification System (NAICS).

Nonfarm inventories to final sales of goods and structures.....	30	3.62	3.61	3.61	3.57	3.55

1. Inventories are as of the end of the quarter. The quarter-to-quarter changes calculated from this table are at quarterly rates, whereas the change in private inventories component of GDP is stated at annual rates.

2. Quarterly totals at monthly rates. Final sales of domestic business equals final sales of domestic product less gross output of general government, gross value added of nonprofit institutions, compensation paid to domestic workers, and space rent for owner-occupied housing. It includes a small amount of final sales by farm and by government enterprises.

NOTE: Estimates in this table are based on the North American Industry Classification System (NAICS).

Chained (2000) dollar inventory series are calculated to ensure that the chained (2000) dollar change in inventories for 2000 equals the current-dollar change in inventories for 2000 and that the average of the 1999 and 2000 end-of-year chain-weighted and fixed-weighted inventories are equal.

Sales of imported new autos <sup>3</sup> .....	46	93.7	101.9	103.7	105.5	104.1	107.4	104.5

1. Consists of used light trucks only.
  2. Consists of final sales and change in private inventories of new autos assembled in the United States.
  3. Consists of personal consumption expenditures, private fixed investment, and gross government investment.
- NOTE: Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines, excluding the lines in the addenda.

## B. NIPA-Related Table

Table B.1 presents the most recent estimates of personal income and its components and the disposition of personal income. These estimates were released on November 30, 2007.

**Table B.1 Personal Income and Its Disposition**  
(Billions of dollars; monthly estimates seasonally adjusted at annual rates)

### C. Historical Measures

This table is derived from the "Selected NIPA Tables" that are published in this issue and from the "GDP and Other Major NIPA Series" tables that were published in the August 2007 issue. (The changes in prices are calculated from indexes expressed to three decimal places.)

**Table C.1. GDP and Other Major NIPA Aggregates—Continues**

[Quarterly estimates are seasonally adjusted at annual rates]

Year and quarter	Billions of chained (2000) dollars			Percent change from preceding period		Chain-type price indexes [2000=100]		Implicit price deflators [2000=100]		Percent change from preceding period			
	Gross domestic product	Final sales of domestic product	Gross national product	Gross domestic product	Final sales of domestic product	Gross domestic product	Gross domestic purchases	Gross domestic product	Gross national product	Chain-type price index		Implicit price deflators

p Preliminary

r Revised

1. Reflects adjustments necessary to bring the Census Bureau's component data in line with the concepts

and definitions used to prepare BEA's international and national accounts.

2. Contains goods that cannot be separately identified.

p Preliminary

r Revised

(\*) Transactions are less than \$500,000 (+/-)

1. Details not shown separately; see totals in lines 56 and 63.

2. Details not shown separately are included in line 69.

3. Estimates of financial derivatives for Mexico are included in Latin America and Other Western Hemisphere; and for China and India, in Asia and Pacific. Estimates for the Middle East are combined with estimates for Asia and Pacific.

Table F.3. U.S. International Transactions, by Area—Continues

(Millions of dollars)

p Preliminary  
r Revised  
1. Includes royalties, license fees, and other fees associated with the use of intangible assets, including patents, trade secrets, and other proprietary rights, that are used in connection with the production of goods.  
2. Includes royalties, license fees, and other fees associated with the use of copyrights, trademarks, franchises, rights to broadcast live events, software licensing fees, and other intangible property rights.  
3. Other unaffiliated services receipts (exports) include mainly film and television tape rentals and expenditures of foreign residents temporarily working in the United States. Payments (imports) include mainly expenditures of U.S. residents temporarily working abroad and film and television tape rentals.  
4. These reflect the amount of premiums explicitly charged by, or paid to, insurers and reinsurers.

## G. Investment Tables

<sup>p</sup> Preliminary  
<sup>r</sup> Revised

1. Represents gains or losses on foreign-currency-denominated assets and liabilities due to their revaluation at current exchange rates.

2. Includes changes in coverage, capital gains and losses of direct investment affiliates, and other adjustments to the value of assets and liabilities.

3. Financial flows and valuation adjustments for financial derivatives are available only on a net basis, which is shown on line 2; they are not separately available for gross positive fair values and gross negative fair values of financial derivatives. Consequently, columns (a) through (d) on lines 4, 5, and 24, 25 are not available.

4. Data are not separately available for the three types of valuation adjustments; therefore, the sum of all three types is shown in column (d). Price changes result from changes in the value of derivatives contracts due to changes in the value of their underlying assets or reference rates, which may arise from movements in interest rates, stock prices, commodity prices, or other variables. Exchange-rate changes result from the revaluation of foreign-currency-denominated derivatives contracts at current exchange rates. "Other changes" can result when

data on investment positions that had accumulated in prior periods are covered by a new or more complete survey.

5. Reflects changes in the value of the official gold stock due to fluctuations in the market price of gold.

6. Reflects changes in gold stock from U.S. Treasury sales of gold medallions and commemorative and bullion coins; also reflects replenishment through open market purchases. These demonetizations/monetizations are not included in international transactions financial flows.

7. Also includes paid-in capital subscriptions to international financial institutions and outstanding amounts of miscellaneous claims that have been settled through international agreements to be payable to the U.S. Government over periods in excess of 1 year. Excludes World War I debts that are not being serviced.

8. Includes indebtedness that the borrower may contractually, or at its option, repay with its currency, with a third country's currency, or by delivery of materials or transfer of services.

9. Primarily U.S. Government liabilities associated with military sales contracts and other transactions arranged with or through foreign official agencies.

D Suppressed to avoid disclosure of data of individual companies.

1. For 2003-2005, income without current-cost adjustment is presented net, or after deduction, of U.S. and foreign withholding taxes. For 2006, it is presented gross, or before deduction, of U.S. and foreign withholding taxes.

In 2006, income without current-cost adjustment and net of withholding taxes was \$290,291 million.

NOTE: The data in this table are from tables 16 and 17 in "U.S. Direct Investment Abroad: Detail for Historical-Cost Position and Related Capital and Income Flows, 2006" in the September 2007 SURVEY OF CURRENT BUSINESS.

D Suppressed to avoid disclosure of data of individual companies.

1. For 2003-2005, income without current-cost adjustment is presented net, or after deduction, of U.S. and foreign withholding taxes. For 2006, it is presented gross, or before deduction, of U.S. and foreign withholding taxes.

In 2006, income without current-cost adjustment and net of withholding taxes was \$128,405 million.

Note. The data in this table are from tables 16 and 17 in "Foreign Direct Investment in the United States: Detail for Historical-Cost Position and Related Capital and Income Flows, 2006" in the September 2007 Survey of Current Business.

# Regional Data

## I. State and Regional Tables

The tables in this section include the most recent estimates of state personal income and gross domestic product by state. The sources of these estimates are noted.

The quarterly and annual estimates of state personal income and the estimates of gross domestic product by state are available online at <www.bea.gov>. For information on state personal income, e-mail <reis.rem@d.bea.gov>; write to the Regional Economic Information System, BE-55, Bureau of Economic Analysis, U.S. Department of Commerce, Washington, DC 20230; or call 202-606-5360. For information on gross domestic product by state, e-mail <gsprad@bea.gov>; write to the Regional Economic Analysis Division, BE-61, Bureau of Economic Analysis, U.S. Department of Commerce, Washington, DC 20230; or call 202-606-5340.

1. Per capita personal income was computed using midyear population estimates of the Bureau of the Census.

2. Percent change was calculated from unrounded data.

Note: The personal income level shown for the United States is derived as the sum of the state estimates. It differs from the estimate of personal income in the national income and product accounts because of differences in coverage, in the

methodologies used to prepare the estimates, and in the timing of the availability of source data.

Source: Table 1 "State Personal Income: Second Quarter of 2007 and Revised Estimates for 2004-2007;" in the October 2007 issue of the Survey of Current Business.

Table I.3. Disposable Personal Income and Per Capita Disposable Personal Income by State and Region

Area name	Disposable personal income							Per capita disposable personal income <sup>1</sup>						Rank in United States	
	[Millions of dollars]							Percent change <sup>2</sup>	[Dollars]

1. Per capita disposable personal income was computed using midyear population estimates of the Bureau of the Census.

2. Percent change was calculated from unrounded data.

NOTE: The personal income level shown for the United States is derived as the sum of the state estimates. It differs from

the estimate of personal income in the national income and product accounts because of differences in coverage, in the methodologies used to prepare the estimates, and in the timing of the availability of source data.

Source: Table 1 "State Personal Income: Second Quarter of 2007 and Revised Estimates for 2004-2007;" in the October 2007 issue of the SURVEY OF CURRENT BUSINESS.

Table I.4. Gross Domestic Product (GDP) by State for Industries, 2006

[Millions of dollars]

State and region	Rank of total GDP by state	Total	Natural resources and mining	Construction	Durable-goods manufacturing	Nondurable-goods manufacturing	Trade	Transportation and utilities	Information	Financial activities	Professional and business services	Education and health services	Leisure and hospitality	Other services	Government

Note: Totals shown for the United States differ from the national income and product account estimates of gross domestic product (GDP) because GDP by state excludes and national GDP includes the compensation of Federal civilian and military personnel stationed abroad and government consumption of fixed capital for military structures located abroad and for military equipment, except office equipment. Also, GDP by state and national GDP have different revision sched-

ules.

Source: This table reflects the GDP by state estimates for 2006 that were released on June 7, 2007. Detailed estimates are available on BEA's Web site at <[www.bea.gov](http://www.bea.gov)>.

## J. Local Area Table

1. Per capita personal income was computed using Census Bureau midyear population estimates.

2. Percent change calculated from unrounded data.

3. The metropolitan area definitions used by BEA for its personal income estimates are the new county-

based definitions issued by the Office of Management and Budget in June 2003 (with revisions released in February 2004, March 2005, December 2005, and December 2006) for Federal statistical purposes.

### A. Additional Information About the NIPA Estimates

#### Statistical Conventions

Current-dollar GDP is a measure of the market value of goods, services, and structures that are produced in the economy in a particular period. The changes in current-dollar GDP can be decomposed into quantity and price components. Quantities, or “real” measures, and prices are expressed as index numbers with the reference year—at present, the year 2000—equal to 100.<sup>1</sup>

The annual changes in quantities and prices are calculated using a Fisher formula that incorporates weights from 2 adjacent years. For example, the annual percent change in real GDP for 2001–2002 uses prices for 2001 and 2002 as weights, and the 2001–2002 annual percent change in the GDP price index uses quantities for 2001 and 2002 as weights. Because the Fisher formula allows for the effects of changes in relative prices and in the composition of output over time, the resulting quantity or price changes are not affected by the substitution bias that is associated with changes in quantities and prices calculated using a fixed-weighted formula. These annual changes are “chained” (multiplied) together to form time series of quantity and price indexes. The percent changes in the Fisher indexes are not affected by the choice of the reference year.

BEA also publishes implicit price deflators (IPDs), which are calculated as the ratio of the current-dollar value of a component to the chained-dollar value of the component, multiplied by 100. The values of an IPD are very close to the values of the corresponding “chain-type” price index.

The measures of real GDP and its major components are also presented in dollar-denominated form, designated “chained (2000) dollar estimates.” For most series, these estimates are computed by multiplying the current-dollar value in 2000 by a corresponding quantity index number and then dividing by 100. For example, if a current-dollar GDP component equaled \$100 in 2000 and if real output for this component increased by 10 percent in 2001, then the chained (2000) dollar value of this component in 2001 would be \$110 (\$100 × 1.10). The percent changes calculated from the chained (2000) dollar estimates and from the quantity indexes are the same; any differences will be small and due to rounding.

The chained-dollar values for the detailed GDP components will not necessarily sum to the chained-dollar estimate of GDP (or to any intermediate aggregate) in a table, because the relative prices that are used as weights for any period other than the reference year differ from those of the reference year. A measure of the effect of such

differences is provided by a “residual” line—the difference between the chained-dollar value of the main aggregate in the table and the sum of the most detailed components in the table. For periods close to the reference year, when the relative prices that are used as weights have usually not changed much, the residuals tend to be small, and the chained-dollar estimates can be used to approximate the contributions to growth and to aggregate the detailed estimates. For periods further from the reference year, the residuals tend to be larger, and the chained-dollar estimates are less useful for analyses of contributions to growth. In particular, for components for which relative prices are changing rapidly, the calculation of contributions based on chained-dollar estimates may be misleading even just a few years from the reference year. Thus, contributions derived from quantity indexes provide a better measure than contributions derived from chained-dollar estimates; contributions based on quantity indexes are shown in selected NIPA tables 1.1.2, 1.2.2, 1.5.2, 2.3.2, 3.9.2, 4.2.2, and 5.3.2.

For quarters and months, NIPA estimates are presented at annual rates, which show the value that would be registered if the rate of activity that is measured for a quarter or for a month were maintained for a full year. Annual rates are used so that periods of different lengths—for example, quarters and years—may be more easily compared. These annual rates are determined simply by multiplying the estimated rate of activity by 4 (for quarterly data) or by 12 (for monthly data).

For most quarterly NIPA estimates, *percent changes* in the estimates are also expressed at annual rates. Calculating these *changes* requires a variant of the compound interest formula:

$$r = \left[ \left( \frac{x_t}{x_0} \right)^{m/n} - 1 \right] \times 100$$

where  $r$  is the percent change at an annual rate;  $x_t$  is the level of activity in the later period;  $x_0$  is the level of activity in the earlier period;  $m$  is the periodicity of the data (for example, 1 for annual data, 4 for quarterly data, or 12 for monthly data); and  $n$  is the number of periods between the earlier periods and the later periods (that is,  $t - 0$ ).

Quarterly and monthly NIPA estimates are seasonally adjusted if necessary. Seasonal adjustment removes from the time series the average effects of variations that normally occur at about the same time and in about the same magnitude each year—for example, weather, holidays, and tax payment dates. After seasonal adjustment, cyclical and other short-term changes in the economy stand out more clearly.

ITAs International transactions accounts

NIPAs National income and product accounts

## B. Suggested Reading

The Bureau of Economic Analysis (BEA) has published a wealth of information about the methodologies that are used to prepare its national, industry, international, and regional accounts. Most of this information is available on BEA's Web site at <[www.bea.gov](http://www.bea.gov)>; see "Methodology Papers" and the SURVEY OF CURRENT BUSINESS under "Publications."

### National accounts

The national accounts encompass the detailed estimates in the national income and product accounts (including gross domestic product) and the estimates of fixed assets and consumer durable goods.

**National income and product accounts (NIPAs).** This series of papers documents the conceptual framework of the NIPAs and the methodologies that have been used to prepare the estimates.

*An Introduction to National Income and Product Accounts* (2007)

*Corporate Profits: Profits Before Tax, Profits Tax Liability, and Dividends* (2002)

*Government Transactions* (1988)

*Measuring the Economy: A Primer on GDP and the National Income and Product Accounts* (2007)

*Personal Consumption Expenditures* (1990)

The methodologies described in these papers have been updated and improved, typically as part of the comprehensive and annual revisions of the NIPAs.

The following SURVEY articles describe the most recent comprehensive revision of the NIPAs.

"Improved Estimates of the National Income and Product Accounts for 1929–2002: Results of the Comprehensive Revision" (February 2004)

"Preview of the Revised NIPA Estimates for 1997 Effects of Incorporating the 1997 Benchmark I-O Accounts and Proposed Definitional and Statistical Changes" (January 2003)

"Preview of the 2003 Comprehensive Revision of the National Income and Product Accounts"

Changes in Definitions and Classifications  
(June 2003)

New and Redesigned Tables (August 2003)

Statistical Changes (September 2003)

"Measuring the Services of Commercial Banks in the NIPAs: Changes in Concepts and Methods" (September 2003)

"Measuring the Services of Property-Casualty Insurance in the NIPAs: Changes in Concepts and Methods" (October 2003)

In addition, see the following articles.

"Annual Revision of the National Income and Product Accounts" (August 2007) presents revisions and describes any changes in the data and the methods that are used to prepare the estimates.

"Updated Summary NIPA Methodologies" (November 2007) describes the source data and the methods that are used to prepare the current-dollar and real estimates of GDP.

"Chained-Dollar Indexes: Issues, Tips on Their Use, and Upcoming Changes" (November 2003) discusses the advantages of using chain-weighted indexes and the challenges of using chained dollars.

"Reliability of the NIPA Estimates of U.S. Economic Activity" (February 2005) evaluates the principal NIPA estimates by examining the record of revisions to them.

"Gross Domestic Product: Revisions and Source Data" (February 2006) describes the categories of data that are used for the advance, preliminary, and final quarterly estimates of GDP.

**Fixed assets and consumer durable goods.** *Fixed Assets and Consumer Durable Goods in the United States, 1925–97* (2003) discusses the concepts and statistical considerations that underlie the estimates and their derivation.

"Fixed Assets and Consumer Durable Goods for 1925–2002" (May 2004) describes the improvements that were incorporated into these estimates as part of the most recent comprehensive NIPA revision.

"Fixed Assets and Consumer Durable Goods for 1997–2006" (September 2007) provides estimates that reflect the incorporation of the most recent annual NIPA revision.

**Satellite accounts.** These accounts extend the analytical capacity of the NIPAs by focusing on the effects of a particular aspect of economic activity on GDP.

"Research and Development Satellite Account"

For 1959–2002 (December 2006)

For 1959–2003 (October 2007)

### Mission Statement and Strategic Plan

The mission statement of the Bureau of Economic Analysis and its most recently updated strategic plan for improving the accuracy, reliability, and relevance of the national, industry, regional, and international accounts are available on BEA's Web site at <[www.bea.gov](http://www.bea.gov)> under "About BEA."

### Industry accounts

The industry accounts consist of the annual industry accounts (the input-output accounts and the gross-domestic-product-by-industry accounts), the benchmark input-output accounts, and one satellite account.

**Annual industry accounts.** “Improved Annual Industry Accounts for 1998–2003” (June 2004) describes the comprehensive revision of the annual input-output accounts and the GDP-by-industry accounts that features the integration of the two sets of accounts.

“Annual Industry Accounts” (December 2006) presents the annual revision of these accounts and describes the source data and any changes in the methods that are used to prepare the estimates.

“Preview of the Comprehensive Revision of the Annual Industry Accounts: Integrating the Annual Input-Output Accounts and the Gross-Domestic-Product-by-Industry Accounts” (March 2004) provides the details about the comprehensive revision.

**Benchmark input-output accounts.** “Preview of the Benchmark Input-Output Accounts for 2002” (September 2005) includes the proposed new sectors that are based on the 2002 North American Industry Classification System.

“U.S. Benchmark Input-Output Accounts, 2002” (October 2007)

**Satellite accounts.** These accounts extend the analytical capacity of the Input-Output accounts by focusing on a particular aspect of economic activity.

“U.S. Travel and Tourism Satellite Accounts”

For 19981–2003 (September 2004)

For 2001–2004 (June 2005)

For 2002–2005 (June 2006)

For 1998–2006 (June 2007)

### International accounts

The international accounts encompass the international transactions accounts, direct investment, and international transactions in services.

**International transactions accounts.** *The Balance of Payments of the United States: Concepts, Data Sources, and Estimating Procedures* (1990) describes the methodologies used to prepare the estimates in the ITAs and the international investment position of the United States. These methodologies are usually updated and improved as part of the annual revisions of the international transactions accounts.

The annual revisions of the international transactions accounts are described in a series of articles, the latest of which was published in the July 2007 SURVEY.

**Direct investment.** *International Direct Investment: Studies by the Bureau of Economic Analysis* (1999) is a collection of previously published articles on U.S. direct investment abroad and foreign direct investment

in the United States. It includes “A Guide to BEA Statistics on U.S. Multinational Companies,” which is also available in the March 1995 SURVEY, and “A Guide to BEA Statistics on Foreign Direct Investment in the United States,” which is also available in the February 1990 SURVEY.

In addition, the updated methodologies are available in *U.S. Direct Investment Abroad: Final Results From the 1999 Benchmark Survey* (2004) and in *Foreign Direct Investment in the United States: Final Results From the 2002 Benchmark Survey* (2006).

**International services.** *U.S. International Transactions in Private Services: A Guide to the Surveys Conducted by the Bureau of Economic Analysis* (1998) describes 11 surveys. It includes classifications, definitions, release schedules, the methods used to prepare the estimates, and samples of the survey forms.

“Selected Issues in the Measurement of U.S. International Services” (June 2002) describes key issues in defining and measuring insurance, wholesale and retail trade, finance, construction, and utilities services and explores possible actions to address these issues.

### Regional accounts

The regional accounts include estimates of personal income and gross domestic product.

**Personal income.** Estimates of personal income are prepared for states and for local areas.

“Comprehensive Revision of State Personal Income for 1969–2003” (May 2004) describes the improvements in the methodology that are used to prepare the estimates and that are part of a comprehensive revision.

“Comprehensive Revision of Local Area Personal Income for 1969–2002” (June 2004) summarizes the improvements in the methodology that is used to prepare the estimates for counties and metropolitan areas. The detailed methodology is available on the DVD-ROM *Regional Economic Information System, 1969–2005*.

**Gross domestic product.** Estimates of gross domestic product (GDP) are prepared for states and metropolitan areas.

“Comprehensive Revision of Gross State Product” (January 2005) summarizes the sources and the methods that are used to prepare the estimates.

“Gross Domestic Product by State for 2003–2006” (July 2007) presents the most recent annual revision.

“Introducing New Measures of the Metropolitan Economy: Prototype GDP-by-Metropolitan-Area Estimates for 2001–2005” (November 2007) describes the potential uses of the estimates and the methodology used to prepare them.
