BEA Advisory Committee

The BEA Advisory Committee advises the Director of BEA on matters related to the development and improvement of BEA's national, regional, industry, and international economic accounts, especially in areas of new and rapidly growing economic activities arising from innovative and advancing technologies, and it provides recommendations from the perspective of business economists, academicians, researchers, and experts in government and international affairs.

SURVEY OF CURRENT BUSINESS

February 2008

Volume 88 • Number 2

1 GDP and the Economy: Advance Estimates for the Fourth Quarter of 2007

Real GDP grew 0.6 percent after growing 4.9 percent in the third quarter. Inventory investment turned down, while exports, consumer spending, and federal government decelerated. In 2007, real GDP increased 2.2 percent after increasing 2.9 percent in 2006.

7 BEA Briefing: Employee Stock Options and the National Economic Accounts

Stock options have become common as part of employee pay packages. This BEA Briefing discusses the national economic accounts' treatment of these options and plans for improvements.

16 The Reliability of the GDP and GDI Estimates

This analysis confirms that BEA's estimates provide an accurate picture of the economy, indicating among other things whether growth was positive or negative and whether it was accelerating or decelerating.

33 Annual Industry Accounts: Revised Statistics for 2004–2006

The services sector once again powered economic growth in 2006. Finance and insurance industries accounted for about 25 percent of economic growth; professional, scientific, and technical services industries accounted for 14 percent of growth.

Government Accounts. A nontechnical look at the BEA government accounts and how they fit in the national economic accounts.

Flexible Annual Revisions. A look at BEA's new flexible annual revision procedures, scheduled to begin in 2010.

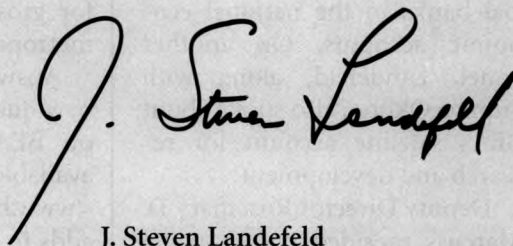

Director's Message

In this month's SURVEY OF CURRENT BUSINESS, we take a look at the reliability of our gross domestic product (GDP) and gross domestic income statistics. Every 2 to 3 years, we study the accuracy of these statistics, assessing how well they indicate high or low economic growth, accelerating or decelerating growth, and sector-specific contributions to growth. The results of our most recent study make clear that our users can continue to have confidence in our statistics, confirming previous studies by the Bureau of Economic Analysis (BEA) and others.

Also in this issue, we're pleased to present our annual update of the annual industry accounts. We rescheduled this article to February from December to incorporate updated data from the Census Bureau's Annual Survey of Manufactures (ASM). This is a significant improvement; in previous years, the ASM data would not have been incorporated until December of the following year.

In our latest *BEA Briefing*, we provide a nontechnical explanation of the treatment of stock options in the national income and product accounts. As the use of options as a compensation tool has grown among corporations, so too has interest in how they affect the national economic accounts, particularly personal income and corporate profits. We rolled out our new *BEA Briefing* feature this year as a vehicle for nontechnical discussions of relevant topics. We'll bring you more briefings soon.

As always, we welcome your comments and suggestions.

J. Steven Landefeld
Director, Bureau of Economic Analysis

Taking Account...

BEA Offers New Personal Income Chart Tool

The Bureau of Economic Analysis (BEA) now offers a free Web-based charting tool for personal income statistics. The tool allows users to generate high-quality bar graphs, line graphs, and pie charts on demand for use in papers, presentations, and analysis. The charting application is accessible from the regional economic accounts home page, <www.bea.gov/regional/>. It is available in two forms: a Quick Chart tool and an Advanced Chart tool.

The Quick Chart feature is fully integrated with BEA's state and local area personal income data tables and can be accessed whenever a data table is displayed. Users can select statistics and geographic areas to chart and view simultaneously with the data table. The chosen statistics are normalized to an initial value of 100, based on the first year chosen, to allow for easy comparison.

The Advanced Chart feature offers additional computations and display features. It is available at <www.bea.gov/regional/remdchart/>. This tool offers charting of the state and local area estimates by levels, percent change from preceding period, and percent of U.S. and average annual growth rate. Various display options are available with

the Advanced Chart feature, such as displaying data values and gridlines on the chart or pulling apart pieces of a pie chart. Both charting features allow for seamless integration into a report or presentation. Charts may be saved as images for use in a word processing document. Also, the data behind the chart is downloadable as a CSV file for further analysis. BEA plans to expand the charting tool to incorporate estimates of GDP by state and by metropolitan area early this spring.

BEA Staff Take Part in ASSA Discussions

BEA economists participated in various sessions in January at the 2008 annual meeting of the Allied Social Science Associations in New Orleans.

BEA Director Steve Landefeld presided over a panel discussion about banking and finance, in which Dennis J. Fixler, Marshall B. Reinsdorf, and George M. Smith discussed new measures of services of commercial banks in the national economic accounts. On another panel, Landefeld, along with Sumiye Okubo, also spoke about BEA's satellite account for research and development.

Deputy Director Rosemary D. Marcuss presided over a panel discussion on stock options and the national economic ac-

counts. For more information, see the *BEA Briefing* in this issue. Marcuss also presided over a panel on income and taxation. During this session, Robert L. Brown spoke about the feasibility of producing reconciliations of personal income and adjusted gross income on a state-by-state basis, and Mark A. Ledbetter provided an overview of these two widely used measures of personal income.

In addition, Nicole M. Mayerhauser and Denise A. McBride made a presentation about the treatment of housing in the national economic accounts. Adam M. Copeland presented his work on the dynamic expenditures on motor vehicles. And Ana Aizcorbe and Carol A. Robbins took part in a panel discussion about semiconductors.

New FAQs Available on BEA Web Site

How does BEA treat remittances? How does BEA calculate average annual growth? What data does BEA make available for gross domestic product for metropolitan regions?

Answers to these and other new questions are now available on BEA's FAQ tool, which is available on BEA's Web site at <www.bea.gov>. BEA regularly adds to the list of questions and answers, all of which are searchable by keywords and categories.

GDP and the Economy

Advance Estimates for the Fourth Quarter of 2007

ECONOMIC growth decelerated sharply in the fourth quarter of 2007, according to the “advance” estimates of the national income and product accounts.¹ For the year 2007, real gross domestic product (GDP) decelerated, increasing 2.2 percent after increasing 2.9 percent in 2006 (see page 6).

In the fourth quarter, real GDP increased 0.6 percent, following a 4.9 percent increase in the third quarter (chart 1 and table 1).² The slowdown primarily reflected a downturn in inventory investment and decelerations in exports, consumer spending, and federal government spending.³ In contrast, imports slowed, and state and local government spending accelerated.

- Prices of goods and services purchased by U.S. residents accelerated, increasing 3.8 percent after increasing 1.8 percent in the third quarter (see page 3). Energy prices turned up, and food prices slowed. Excluding food and energy, prices accelerated, increasing 2.5 percent after increasing 1.9 percent.
- Real disposable personal income (DPI) increased 0.3 percent in the fourth quarter, following an increase of 4.5 percent. The deceleration reflected a deceleration in current-dollar personal income, an acceleration in personal current taxes (page 4), and an acceleration in the personal consumption expenditures (PCE) implicit price deflator used to adjust current-dollar DPI.
- The personal saving rate, personal saving as a percentage of current-dollar DPI, was 0.2 percent in the fourth quarter; the rate was 0.6 percent in the third quarter.

1. Each GDP estimate for a quarter (advance, preliminary, and final) incorporates increasingly comprehensive and improved source data. More information can be found at <www.bea.gov/bea/about/infoqual.htm> and <www.bea.gov/bea/faq/national/gdp_accuracy.htm>. Quarterly estimates are expressed at seasonally adjusted annual rates, which assume that a rate of activity for a quarter is maintained for a year.

2. “Real” estimates are in chained (2000) dollars, and price indexes are chain-type measures.

3. In this article, “consumer spending” refers to the NIPA series “personal consumption expenditures,” “inventory investment” refers to “change in private inventories,” and “government spending” refers to “government consumption expenditures and gross investment.”

Christopher Swann prepared this article.

1. The estimates of GDP under the contribution columns are also percent changes.

NOTE. Percent changes are from NIPA table 1.1.1, contributions are from NIPA table 1.1.2, and shares are from NIPA table 1.1.10.

Consumer spending slowed in the fourth quarter, increasing 2.0 percent after increasing 2.8 percent in the third quarter. The deceleration mainly reflected a slowdown in spending for services, which was mostly due to downturns in spending for household electricity and gas and recreation and a deceleration in "other" services.

Nonresidential fixed investment slowed, reflecting a deceleration in equipment and software. Investment in industrial equipment and transportation equipment turned down.

Residential fixed investment fell for the eighth straight quarter, decreasing 23.9 percent after decreasing 20.5 percent. The fourth-quarter decrease subtracted 1.18 percentage points from real GDP growth.

Inventory investment turned down, mainly reflecting a downturn by retail motor vehicle and parts dealers. The downturn subtracted 1.25 percentage points from real GDP growth.

Exports slowed, mainly reflecting a sharp and widespread deceleration in exports of goods. Exports of services picked up.

Imports decelerated. Imports of goods slowed sharply despite a strong upturn in petroleum and products. Imports of services decelerated.

Federal government spending decelerated, mainly because of a downturn in national defense spending. State and local government spending picked up.

Table 2. Real Gross Domestic Product (GDP) by Type of Product

[Seasonally adjusted at annual rates]

	Share of current-dollar GDP (percent)	Change from preceding period (percent)					Contribution to percent change in real GDP (percentage points)				
		2007					2007				
	IV	I	II	III	IV	I	II	III	IV

GDP excluding motor vehicle output.....	97.3	0.4	3.9	4.7	1.6	0.42	3.79	4.54	1.54		
Final sales of computers.....	0.7	-1.3	35.7	49.8	30.2	-0.01	0.21	0.28	0.18		
GDP excluding final sales of computers.....	99.3	0.6	3.6	4.6	0.5	0.61	3.61	4.63	0.45		

1. The estimates of GDP under the contribution columns are also percent changes.

NOTE. Percent changes are from NIPA table 1.2.1, contributions are from NIPA table 1.2.2, and shares are calculated from NIPA table 1.2.5.

Real final sales of domestic product, real GDP less inventory investment, increased 1.9 percent after increasing 4.0 percent.

Motor vehicle output decreased 27.2 percent after increasing 13.1 percent. The decrease subtracted 0.90 percentage point from real GDP growth. Excluding motor vehicle output, real GDP increased 1.6 percent.

Final sales of computers increased 30.2 percent, following an increase of 49.8 percent. It added 0.18 percentage point to real GDP growth in the fourth quarter.

Prices

Table 3. Prices for Gross Domestic Purchases

[Percent change at annual rates; based on seasonally adjusted index numbers (2000=100)]

	Change from preceding period (percent)				Contribution to percent change in gross domestic purchases prices (percentage points)			
	2007				2007

National defense	5.0	4.1	1.9	3.1	0.23	0.18	0.09	0.14
Nondefense	5.9	3.3	1.1	1.3	0.13	0.07	0.02	0.03
State and local	7.0	6.5	4.2	7.2	0.80	0.74	0.48	0.84
Addenda:								
Gross domestic purchases:								
Food	5.0	4.8	4.8	3.8	0.47	0.44	0.44	0.36
Energy goods and services	14.9	49.6	-5.2	27.2	0.65	2.02	-0.27	1.27
Excluding food and energy	3.1	1.5	1.9	2.5	2.65	1.32	1.58	2.13
Personal consumption expenditures (PCE):								
Food	4.8	4.7	4.7	3.5				
Energy goods and services	16.1	51.3	-6.7	21.6				
Excluding food and energy	2.4	1.4	2.0	2.7				
"Market-based" PCE	3.6	4.7	1.4	3.8				
Excluding food and energy	2.4	1.2	1.5	2.4				
Gross domestic product	4.2	2.6	1.0	2.6				

1. The estimates under the contribution columns are also percent changes.

NOTE: Most percent changes are from NIPA table 1.6.7; percent changes for PCE for food and energy goods and services and for PCE excluding food and energy are calculated from index numbers in NIPA table 2.3.4. Contributions are from NIPA table 1.6.8.

Prices paid by U.S. residents, as measured by the gross domestic purchases price index, accelerated in the fourth quarter, increasing 3.8 percent after increasing 1.8 percent in the third quarter.

Consumer prices, as measured by the PCE price index, accelerated, increasing 3.9 percent after increasing 1.8 percent. Prices for nondurable goods and for services accelerated. The largest contributor to the acceleration in nondurable goods was gasoline, fuel oil, and other energy goods. The largest contributor to the acceleration in services was electricity and gas.

Prices of nonresidential fixed investment turned up, primarily reflecting an acceleration in prices paid for structures.

Prices paid for residential investment also turned up.

Prices paid by government accelerated, increasing 5.5 percent after increasing 3.2 percent. Prices paid by the federal government accelerated, primarily reflecting a step-up in prices paid for national defense. Prices paid by state and local governments accelerated.

Consumer prices excluding food and energy, a measure of the "core" rate of inflation, accelerated, increasing 2.7 percent after increasing 2.0 percent.

The GDP price index increased 2.6 percent, 1.2 percentage points less than the increase in the price index for gross domestic purchases, reflecting a larger increase in import prices than in export prices.

Note on Prices

BEA's gross domestic purchases price index is the most comprehensive index of prices paid by U.S. residents for all goods and services. It is derived from the prices of personal consumption expenditures (PCE), private investment, and government consumption and investment.

BEA also produces price indexes for all components of GDP. The PCE price index is a measure of the total cost of consumer goods and services, including durable goods, nondurable goods, and services. PCE prices for food, energy goods and services, and for all items except food and energy are also estimated and reported. However, because prices for food and energy can be volatile, the price measure that excludes food and energy is often used as a measure of underlying, or "core," inflation.

BEA also prepares a supplemental PCE price index, the "market-based" PCE price index, which is based on market transactions for which there are corresponding price measures. This index excludes many imputed expenditures, such as services furnished without charge by financial intermediaries, that are included in PCE and the PCE price index. BEA also prepares a market-based measure that excludes food and energy.

More information on these market-based measures is available on BEA's Web site at <www.bea.gov/bea/faq/national/markbsdPCE.htm>. See also "Comparing the Consumer Price Index and the Personal Consumption Expenditures Price Index" in the November 2007 SURVEY OF CURRENT BUSINESS.

Personal Income

CCAAdj Capital consumption adjustment

Personal income, which is only measured in current dollars, increased \$129.1 billion in the fourth quarter after increasing \$169.4 billion in the third quarter. The deceleration in personal income primarily reflected decelerations in personal interest income and government social benefits to persons.

Compensation increased \$84.8 billion, compared with an increase of \$90.8 billion, primarily because of a deceleration in wages and salaries. The deceleration was spread across private industries. Government wages and salaries accelerated slightly.

Proprietors' income slowed, increasing \$8.6 billion after increasing \$10.3 billion.

Personal interest income decelerated, primarily because of a broad decline in interest rates over the quarter.

Personal current transfers decelerated, increasing \$13.2 billion after increasing \$25.2 billion. The deceleration primarily reflected a downturn in Medicare prescription drug assistance that resulted from reduced federal payments to drug plans in the fourth quarter in order to compensate for overpayments that were made in 2006.

Personal current taxes accelerated, increasing \$22.3 billion after increasing \$11.6 billion. The acceleration primarily reflected an upturn in state and local income taxes.

Personal saving decreased \$31.6 billion after increasing \$26.2 billion. The downturn reflected a deceleration in current-dollar disposable personal income and a slight acceleration in personal outlays.

Saving

Personal saving—disposable personal income less personal outlays—was \$25.1 billion in the fourth quarter; it has been positive for five consecutive quarters. Saving from current income may be near zero or negative when outlays are financed by borrowing, by selling investments or other assets, or by using saving from previous periods. See “Alternative Measures of Personal Saving” in the February 2007 SURVEY OF CURRENT BUSINESS.

ports, but it is not used directly in estimating exports and imports in the national income and product accounts.

Summary of the Source Data for the Advance Estimates of GDP

The advance estimates of many components of GDP are based on 3 months of source data, but the estimates of some components are based on only 2 months of data. For the following items, the number of months for which data are available is shown in parentheses.

Personal consumption expenditures: Sales of retail stores (3), unit auto and truck sales (3), and consumers' shares of auto and truck sales (2);

Nonresidential fixed investment: Unit auto and truck sales (3), construction put in place (2), manufacturers' shipments of machinery and equipment other than aircraft (3), shipments of civilian aircraft (2), and exports and imports of machinery and equipment (2);

Residential investment: Construction put in place (2), single-family housing starts (3), sales of new homes (2), and sales of existing houses (3);

Change in private inventories: Trade and nondurable-goods manufacturing inventories (2), durable-goods manufacturing inventories (3), and unit auto and truck inventories (3);

Net exports of goods and services: Exports and imports of goods and services (2);

Government consumption expenditures and gross investment: Federal outlays (3), state and local government construction put in place (2), and state and local government employment (3);

Compensation: Employment, average hourly earnings, and average weekly hours (3);

GDP prices: Consumer price indexes (3), producer price indexes (3), and values and quantities of petroleum imports (2).

Unavailable source data

When source data were unavailable, BEA made various assumptions for December, including the following:

- An increase in nondurable-goods manufacturing inventories,
- An increase in nonmotor vehicle merchant wholesale and retail inventories, and
- An increase in exports of goods excluding gold and a small decrease in imports of goods excluding gold.

Table 5 shows the assumptions for key series; a more comprehensive list is available on BEA's Web site at <www.bea.gov/national/index.htm#supp>.

Real GDP for 2007

Table 6. Real Gross Domestic Product and Components
[Seasonally adjusted at annual rates]

1. The estimates of GDP under the contribution columns are also percent changes.
NOTE: Percent changes are from NIPA table 1.1.1, contributions are from NIPA table 1.1.2, and shares are from NIPA table 1.1.10.

Real GDP slowed, increasing 2.2 percent in 2007 after increasing 2.9 percent in 2006. The main contributors to the slowdown in real GDP growth were a larger decrease in residential fixed investment, a downturn in inventory investment, and slowdowns in nonresidential fixed investment and consumer spending.

Consumer spending slowed slightly in 2007, primarily reflecting a deceleration in nondurable goods that was mainly due to a slowdown in spending for food.

Nonresidential fixed investment decelerated, primarily reflecting a slowdown in equipment and software that was primarily due to downturns in transportation equipment and in "other" equipment. Structures investment accelerated, reflecting pickups in "other" structures, commercial and health care, and power and communication.

Residential investment declined throughout 2007 and was the largest contributor to the slowdown in real GDP growth, subtracting 0.97 percentage point from real GDP growth.

Inventory investment turned down and reduced real GDP growth by 0.30 percentage point.

Net exports contributed 0.55 percentage point to real GDP growth. Exports of goods decelerated, but exports of services picked up, primarily because of accelerations in travel and in royalties and license fees. Imports of both goods and services slowed.

BEA BRIEFING

Employee Stock Options and the National Economic Accounts

By Carol E. Moylan

STOCK options, once considered a “perk” for top executives, have become an increasingly common part of compensation packages for many employees.¹ As their importance in the economy has grown, so has their importance in the national income and product accounts (NIPAs), particularly personal income and corporate profits. This article reviews the current treatment of stock options in tax accounting, financial accounting, and the NIPAs, examines the major practical, conceptual, and timing issues involved in their measurement, and offers information on Bureau of Economic Analysis (BEA) plans for future improvements in how it accounts for options.

Definitions and treatment in tax accounting

Employee stock options provide employees with the right to purchase, within a specified time period (often 10 years), shares of their company’s stock at a “strike” price set by the company. For publicly traded stock, the “strike” price (also called the grant or exercise price) is usually the market price of the stock at the time the option is granted. There is usually a minimum waiting period—referred to as the “vesting” period—during which the employee must remain employed by the company before the individual may exercise the option (that is, purchase the stock). The average vesting period is usually 3 years after the time of grant.²

Employee stock options are granted as part of an overall compensation package. In some cases, employees accept lower current-period wages and salaries with the expectation that the growth in the market value of the company stock will more than offset the reduction to their wages. For other employees, stock options are an additional benefit that makes working for a particular company more attractive. From the employer’s perspective, options are often seen as a way to retain employees, as the options vest over several

years. Additionally, for key executives, stock options are used as an incentive tool designed to link individual pay to the company’s stock performance. The exercising of stock options has become a significant component of compensation for chief executive officers (chart 1).

In the United States, two major types of employee stock options have emerged: nonqualified stock options (NSOs) and incentive stock options (ISOs). The most prevalent stock option is the NSO. NSOs are often referred to as “compensatory” options because their use gives rise to compensation expenses on a company’s tax returns. When NSOs are exercised, the difference between the current market price at the time of exercise and the strike price is reported as wages on the tax returns of the employer and the employee. The employee incurs an associated tax liability, and the company receives a tax deduction for the difference between the current market price and the strike price. Despite this tax treatment, until 2005, companies were not required to record any stock option expenses on financial statements.

Chart 1. Average Executive Pay

1. In 2005, the National Center for Employee Ownership estimated that up to 20 percent of all public companies provide stock options to their employees.

2. For the average number of years and a percent distribution of employees by years needed for full vesting for stock option grants in 1999, see Beth Levin Crimmel and Jeffrey L. Schildkraut, “Stock Option Plans Surveyed by NCS,” in *Compensation and Working Conditions* (Spring 2001): table 8.

An ISO is a type of “statutory stock option.”³ Generally, statutory stock options are not reported as wages of the employee but as long-term capital gains. They are not deductible as an expense on the employer’s tax return when the option is granted or when it is exercised. If ISOs are sold either within 2 years of grant or within 1 year of exercise, they revert to NSO tax status. ISOs also require a 10-year time limit for exercising the options, a minimum strike price that is at least equal to the value of the stock at the time the option is granted, and a maximum value of \$100,000 (determined at time of grant) that may become exercisable in any year. When the stock is sold, the difference between the strike (or exercise) price the employee pays for the stock and the value of the stock when it is sold by the employee is reported as a long-term capital gain on the employee’s income tax return. From the employee’s perspective, this is an advantage over NSOs because the long-term capital gains tax rate is usually lower than the employee’s ordinary income tax rate. However, when an ISO is exercised, the difference between the market value at time of purchase and the strike price is a positive adjustment in calculating the Alternative Minimum Tax (AMT), and thus, the exercise of these options may still have significant tax implications for an employee.⁴ Because the business cannot deduct the option as compensation expenses in calculating taxable income and because the cap on the value of stock that may be exercised in any year limits its use in corporate executive compensation packages, this option is less beneficial to the company.

Treatment in corporate financial reports

In December 2004, the Financial Accounting Standards Board (FASB) issued a new standard—FAS-123R—for companies that requires them to value employee stock options (both NSOs and ISOs) using a fair-value-based method at the time they are granted and to record this value on financial reports as a compensation expense over the period of vesting.^{5,6} For example, if the vesting period is 3 years, one-third of the value calculated at time of grant is expensed for each of the next 3 years. The fair value of an option grant ide-

3. Another less common type of statutory stock option is the employee stock purchase plan option. See FASB, *Statement of Financial Accounting Standards No. 123: Accounting for Stock-Based Compensation*, 5.

4. If an employee pays an AMT on the exercise of these options, the employee may claim an AMT credit in future years.

5. The fair value of a stock option is the market value of the option. A fair-value-based method measures the stock option at time of grant as a compensation expense based on the value of the award and recognizes this value over the period of service, which is usually the vesting period.

6. Companies were required to record any stock option expenses on financial statements beginning with the first interim or annual reporting period that began after June 15, 2005 (December 15, 2005, for smaller filers).

ally would be based on the observable market price of the option or of one with similar terms and conditions. As the market price is not usually observable, fair value measurement techniques use option-pricing models—such as a Black-Scholes model, a Monte Carlo simulation technique, or a lattice model to determine a fair value of an option—that is, one that accounts for factors such as the stock price at the grant date, the strike price, the expected life of the option (that is, the expected period of time between the grant date and the exercise date), the volatility of the underlying stock and the expected dividends on it, and the risk-free interest rate over the expected life of the option.

Before this standard was issued, companies could choose between the fair-value-based method or the intrinsic-value method. The latter measures the value of the option as the current market price of the stock at the time of the grant less the strike price. This value is usually zero at the time of grant; therefore, it has no impact on company income in financial reports. For this reason, most companies chose the intrinsic-value method. Thus, accounting rules for financial statements allowed an understatement of compensation expenses and a corresponding overstatement of company profits.⁷

The 2004 requirement eliminated the use of the intrinsic-value-based method and thus improved comparability across firms. The ruling also makes the FASB requirement generally consistent with the International Accounting Standards Board (IASB) requirements on this issue.

While firms are required to record the value of employee stock options as an expense on financial reports, this information is usually not separately identifiable quarterly. Firms are required to report the option activity of the senior officers. However, for most corporations, the options for senior officers represent only a small portion of the vested options outstanding. Thus, the activity of these employees is not likely to be a good indicator of overall stock option activity.

Treatment in the NIPAs

In accounting for stock options, BEA faces several source data and estimation challenges that currently make the ideal conceptual treatment impossible to implement. In theory, the ideal treatment would be one based on the following principles:

- The option to purchase a stock does have value, and that value should be treated as employee

7. Before 1996, only the intrinsic-value method was used; it is described in APB *Opinion* 25. The fair-value method, originally described in FAS-123, was introduced in 1996, and until 2005, companies had their choice as to which standard to follow.

compensation. Although employee stock options are not mentioned explicitly in the section of the 1993 *System of National Accounts* (SNA) on compensation (paragraphs 7.21–7.47), they may be interpreted as implicitly covered in the section on “wages and salaries in kind” (paragraphs 7.37–7.42). For the upcoming revision to the SNA, employee stock option grants will explicitly be included as compensation. Moreover, BEA generally agreed that NSOs and ISOs should be treated consistently in the national economic accounts. Thus, the different treatment by companies of ISOs and NSOs for tax purposes is not relevant for deciding their treatment in the NIPAs.

- The value of an option, given the lack of a secondary market for observable prices, should be estimated using a fair-value pricing model. The FASB and IASB currently value options this way.
- The option should be valued at time of grant and accounted for as compensation over the vesting period. This value reflects the value of the employee’s labor in exchange for the stock option for the period of time between the grant date and the vesting date.
- The difference between the value of the option when recorded as compensation and the value at the time it is exercised should be recorded as a capital gain or loss by the employee.⁸

A treatment based on these principles would be conceptually consistent with the NIPA and SNA practice of recording transactions on an accrual basis and with the NIPA and SNA use of market values (or proxies thereof) for valuation.⁹ In essence, this treatment is also consistent with the accounting recommendations of FAS–123R.

Unfortunately, BEA is unable to implement this treatment at present because the detailed data required (such as the value of stock option grants expensed by companies over the vesting period and the value of stock options exercised, the number of grants, the timing of grants, the timing of the vesting of grants, the timing of exercise, and an industry distribution) are not available.

The current treatment of stock options in the NIPAs is determined by their tax treatment and the availability of source data on their value when exercised. So, the actual treatment in the NIPAs differs substantially

8. Capital gains and losses are excluded from the NIPAs, as they do not result from production. However, they are recorded in the flow of funds accounts produced by the Federal Reserve Board. The flow of funds accounts, the NIPAs, and the input-output accounts, also produced by BEA, provide an integrated and consistent set of U.S. national economic accounts.

9. The accrual method records revenues when they are earned and expenses when they are incurred, regardless of when cash is actually received or paid.

from the preferred treatment:

- NSOs are valued at time of exercise rather than over the vesting period. When NSOs are exercised, the NIPAs include the value of the difference between the market price at the time of exercise and the strike price as wages and salaries—a component of gross domestic income (GDI). A corresponding reduction is made to corporate profits, another component of GDI.
- ISOs are valued at the time they are sold as a long-term capital gain, which the NIPAs do not account for as compensation. The administrative source data that are currently used to estimate components of GDI exclude ISOs; they are not included as part of wages and salaries or as a deduction to corporate profits in the NIPAs. Although most companies offer NSOs rather than ISOs, this inconsistency is of increasing importance as both types of stock options become more commonplace.

Source data and methodologies

As noted, the current treatment of stock options in the NIPAs is determined in large part by the nature and availability of source data, and most of the issues related to their conceptual treatment in the NIPAs are explained by issues in the availability of source data.

Wages and salaries. The starting point for preparing the quarterly and annual estimates of wages and salaries in the NIPAs is the Bureau of Labor Statistics’ (BLS) Quarterly Census of Employment and Wages (QCEW) program, which provides tabulations of wages and salaries that are similar, in concept, to the NIPA definition. The QCEW program (also known as the ES–202 program) is a cooperative program involving BLS and the state employment security agencies (ESAs). The tabulations summarize the state quarterly unemployment insurance (UI) contribution reports that are filed by employers subject to that state’s UI laws.¹⁰ BEA makes adjustments to QCEW-reported wage and salary disbursements to account for nonreporting and underreporting of wages and salaries by employers. QCEW wages generally include the gain from exercising NSOs, but not the gain from exercising ISOs.

The exercising of stock options and other special compensation items are not separately identifiable in the QCEW wage and salary tabulations. Both a strength and a weakness of QCEW wage and salary

10. Under most state UI laws, wages and salaries include bonuses, tips, the cash value of meals and lodging provided by the employer, the gain on the employee exercise of certain stock options, and employee contributions to certain deferred compensation plans. Wages and salaries are measured before deductions, such as employee contributions to social insurance funds and union dues, and they reflect the amount of wages and salaries disbursed, but not necessarily accrued, during the year.

data is that these tabulations are derived from administrative tax records. Because virtually all private employers are covered by unemployment insurance, the UI-based data provide a near universal coverage of employment and payrolls of wage and salary workers. However, they also reflect somewhat differing state UI laws, so what constitutes wages and salaries may not be consistently defined or reported across states. Differences may occur in the definition of what are considered wages for some payments made by employers or by employees for deferred compensation and for certain types of trust funds.¹¹

Because QCEW-based data for a given quarter are first available with a lag of 5 months, they are incorporated into the current estimates of wages and salaries for a given quarter at the time of the “preliminary” estimate of the quarterly gross domestic product (GDP) for the next quarter.¹² Before the incorporation of the QCEW-based data, quarterly and monthly wages and salaries are extrapolated using data based on employment, hours, and earnings from the BLS monthly Current Employment Statistics (CES) program; these data are available about 1 week following the end of a particular month. However, these data are less comprehensive because they cover hours and earnings only for production workers (or for nonsupervisory workers in service industries) and because they do not include commissions, tips, bonuses, other nonregular payments (such as the exercise of stock options), and other pay not earned in the pay period concerned, such as retroactive pay. Thus, the monthly CES survey omits a substantial portion of the wage and salary compensation of high-wage workers. BEA adjusts the monthly extrapolator to account for the difference in coverage between the QCEW-based data and the CES-based data.

Corporate profits. In the NIPAs, the estimate of corporate profits is defined as receipts arising from current production less associated expenses. Most

11. To better understand possible differences across state contribution reports, BLS surveyed the state ESAs in 1998–99 to find out what items were treated as wages for their state tax reports. It appears that most, but not all, states define wages and salaries consistently. However, while it appears that large technology firms do report the employee gain from the exercise of stock options as wages, it is not clear that all firms are doing so. Because the annual tax base for UI wages and salaries is capped at \$7,000 per employee, states may have little incentive to follow up with firms to ensure correct reporting of special compensation items.

12. Before the 2002 annual revision of the NIPAs, only annual QCEW tabulations were incorporated into the estimation of NIPA wages and salaries because the quarterly QCEW tabulations were not available in time to be incorporated into the quarterly estimation. Effective with the 2002 annual revision, BEA began incorporating seasonally adjusted QCEW data when the data became available in time for the release of the “final” quarterly GDP estimate for the prior quarter. In 2004, BLS accelerated the tabulations of these data by a month, allowing BEA to incorporate these data into the “preliminary” estimate of GDP. For more information on the release cycle of NIPA estimates, see *A Guide to the National Income and Product Accounts*, 21.

businesses prepare profits information on a financial accounting basis and a tax-accounting basis, which each use different definitions of some receipts and expenses.

Tabulations of federal corporate income tax returns from the Internal Revenue Service (IRS) Statistics of Income (SOI) program provide the key source data for BEA’s detailed annual estimates of industry profits primarily because tax-accounting definitions are based on well-specified accounting definitions. In contrast, financial-accounting measures allow more flexibility in the way they are applied by corporations. In addition, the tax-accounting measures are more comprehensive, covering all incorporated businesses—both publicly traded and privately held—and all industries, while financial-accounting tabulations cover only a subset of the corporate universe. The tabulations of corporate income tax returns prepared by the IRS include annual receipt and expense items and tax liabilities. The expenses include, but do not separately identify, the value of employees’ gains from exercising stock options. However, the IRS now tabulates an informational return (the M–3) that reconciles the stock options expenses deducted in financial reports with the stock options deducted as expenses on corporate tax returns; this information supplements the source data and allows BEA to derive an annual estimate of the corporation’s compensation expenses resulting from the exercise of stock options.

While the tax measure is conceptually consistent with the wage and salary data from the QCEW, a shortcoming of the IRS data is their timeliness. Preliminary and final SOI estimates do not become available until 2 years after and 3 years after the year to which they refer, respectively. As a result, preliminary tax-based profits data are not incorporated into annual NIPA estimates until the second annual revision for a given year. Current estimates must be estimated using financial-accounting measures.

While financial data are less comprehensive than tax return data, they are available sooner, and they are prepared on a quarterly basis. However, financial accounts record the value of stock options over the period of vesting rather than when they are exercised, and the recorded value is the fair value rather than the difference between the strike price and the price at time of exercise.¹³ These inconsistencies between financial and tax-return-based data may cause discrepancies between the BEA extrapolated measure of profit growth (based on financial reports) and the tax-return based measure that becomes available later.

13. As noted in this article, the recording of a fair value for these options was not required until 2005. Before 2005, most firms chose to value stock options using an intrinsic-value method, which was usually zero at time of grant.

Timing of data and revisions

Problems in the source data used for measuring wages and salaries and for measuring profits may lead to several measurement and timing problems. These problems, some of which are noted above, may have important impacts on the accuracy of these components and thus on the statistical discrepancy, the difference between the measures of GDP and GDI.¹⁴

- The statistical discrepancy for the current time periods may be affected when the corporate profits expense and the wage and salary accrual from the exercise of options do not offset one another. Although option gains expensed on corporate tax returns and option gains included in wages and salaries probably largely offset once the full tax-based estimates are incorporated, an imbalance generally exists before then.
- There is a 2-year lag for the incorporation of tax return data into profits estimates. So, if the gain from exercising of stock options increases without a special adjustment to reduce profits, national income may be overstated until the tabulations based on tax returns become available. The NIPA profits extrapolator, which is based on financial accounting, is inconsistent with the tax-based portion of corporate expenses that result from the exercise of stock options. This can cause swings in the statistical discrepancy for the current period. To mitigate large revisions stemming from the exercise of stock options, BEA has been deriving annual estimates of these expenses for the most recent year as part of the annual revision process for corporations. These measures are based on information from the footnotes of individual corporate financial reports based on a sample of about 150 large corporations.
- Differences in the QCEW and CES data may affect revisions. Before the QCEW data become available, wages and salaries are extrapolated using the CES data. While QCEW data are assumed to reflect the exercise of NSOs, the CES data do not; the adjustment to the monthly extrapolator does not measure coverage differences precisely. As a result, the substitution of the QCEW tabulations when they become

14. QCEW tabulations may inconsistently include the exercising of some ISOs as wages and salaries. As noted above, BEA assumes that the gain from the exercise of NSOs is included in the wage and salary tabulations. A BLS survey of states on the composition of QCEW wages supports this assumption; most states responded that the exercising of NSOs is considered a part of wages and salaries in their UI contribution reports. However, some states also included the exercising of ISOs as wages and salaries. While the preferred treatment of stock options would include ISOs, the current treatment in the NIPAs does not; their inclusion by some states would impact the accuracy of the NIPA measures as currently defined. Another issue is how companies actually report this information. A state may list the exercising of ISOs as part of wages and salaries, but firms may not report them as wages and salaries for UI purposes, because they do not have to do so for income tax reporting.

available may result in appreciable revisions to the initial quarterly estimates. For the first quarter of 2006, the initial CES-based estimates of wages and salaries underestimated the actual QCEW wages and salaries by approximately \$80 billion, or 1.3 percent of wages and salaries (chart 2). Because first-quarter corporate profits were also not open for revision at that time, the apparently unusually large exercising of stock options distorted the GDI growth rate for both the first and second quarters of 2006; this distortion could not be corrected until the following annual revision. If reasonable quarterly estimates of the exercising of stock options could be derived before the incorporation of QCEW data, the revisions to wages and salaries could be reduced.

Chart 2. Difference Between initial CES-Based Wages and Later QCEW-Based Wages

BEA's plans for the future

In the long run, the preferred treatment is to measure the fair-market value of stock options (both NSOs and ISOs) at the time of grant and distribute that value as compensation over the vesting period, as noted. Unfortunately, the necessary data are not yet available to implement this treatment. For the short run, BEA will concentrate on improving the current treatment that measures the value of stock options at time of exercise.

To implement the preferred treatment, the current stock options measure must be removed from the estimates, and the preferred measure must be added. To accomplish this change, for both the estimation of corporate profits and wages and salaries, the following

source data are needed:

- The fair-market value of stock options at time of grant and recorded as compensation over the vesting period
- The exercise value and timing of NSOs

For national estimates, these data would need to be available by industry and on a quarterly basis. For regional estimates, they would need to be available by state at a minimum.

Beginning with 2006, the fair-market value of options granted is now available from financial data for publicly traded firms for corporate profits, although it is not separately identified quarterly. For annual estimates, the fair-market value of grants and the value of options exercised now are available by industry from the schedule M-3 tax informational form (Reconciliation of Net Income (Loss) per Income Statement of Includible Corporations With Taxable Income per Return—Expense/Deduction Items), but with an 18- to 30-month lag. Although company-based profits by industry will not match establishment-based wages by industry, in aggregate, the fair value of option grants for corporate profits and for wages and salaries should equal, and the value of options exercised in the tax-based profits data should conceptually equal the value of options exercised as measured in the QCEW wages and salaries.

While the option grants and exercises from the M-3 informational return could be used as a proxy for total wages and salaries, no information is available to distribute these totals by industry on an establishment level, by state, or by quarter. Without knowing the timing of options exercised, it would be very difficult to adjust earlier years. With a longer data time span, BEA could develop experimental annual estimates that show the impact on total wages and total corporate profits from the preferred treatment. One impact of these experimental estimates would be a change in the relative share of labor to total income; during periods of significant exercising of stock options, the share

would be reduced.

For the short run, BEA will focus its efforts on reducing revisions in the current treatment due to measurement and timing problems in the area of employee compensation. Research has been underway to improve the estimates of wages and salaries for the period before the incorporation of the QCEW tabulations. One project was to examine the relationship between wages and salaries and a proxy for the value of the exercise of NSOs. However, individuals exercise stock options based on many factors, including the price of the firm's stock, personal expenditure considerations, and investment diversification strategies. The relationships between movements in total private wages and salaries and in movements in stock market indexes have been generally poor. However, the relationships are somewhat stronger for selected technology industries and more targeted market indexes. Work will continue in this area.

In April 2007, BLS began releasing a new experimental series that provides gross monthly earnings at the national level. This new series includes irregular payments, providing an additional and more comprehensive measure of earnings for the whole month. At present, this series has been released with a lag of 3 months, and the time series is short. When the time series has a sufficient number of months and the availability improves, BEA plans to incorporate these monthly estimates that are based on the more comprehensive data. We expect that this series will eventually become an additional monthly and quarterly source for the estimation of wages and salaries prior to the incorporation of the QCEW.

BEA, in coordination with BLS, will continue to pursue the changing makeup of QCEW wage and salary tabulations so we may better adjust for differences in state reporting of various special compensation-type items. As resources permit, we plan to continue research on measuring alternative treatments of employee stock options.

The Reliability of the GDP and GDI Estimates

By Dennis J. Fixler and Bruce T. Grimm

THE NATIONAL income and product accounts (NIPAs) provide a timely, comprehensive, and reliable description of the condition of the U.S. economy. The two featured measures—gross domestic product (GDP) and gross domestic income (GDI)—are equally valid summary measures of economic activity. GDP measures activity as the sum of all final expenditures in the economy plus change in private inventories. It is detailed on the product side of the domestic income and product account. GDI measures the sum of all incomes generated in production, and it is detailed on the income side of the domestic income and product account. In principle, GDP and GDI give the same measure of economic activity, but in practice, they differ because each is estimated with different source data.

This study analyzes the reliability of the successive estimates of GDP and GDI and their components for 1983–2006. “Reliability” refers to the magnitudes of the revisions to the successive estimates of these mea-

asures and their major components.¹ The revisions are measured as the changes from an earlier vintage of the estimates to a later vintage, for example, from the advance estimate to the final estimate (see the box “Vintages and Timing of Revisions”). The latest available estimates are assumed to be the best estimates and are used as the standards for reliability.

This study concludes that Bureau of Economic Analysis (BEA) statistics are generally reliable and present useful pictures of the nation’s economic activity. In particular, the early quarterly estimates provide an accurate picture of the economy, indicating whether economic growth was positive or negative, whether it was accelerating or decelerating, whether it was high or low relative to trend, and where the economy was in relation to the business cycle.

1. This definition of reliability differs from that used in statistics to analyze survey results and quality control. Reliability is used as a guide to “accuracy” of the total measurement error, which in the NIPAs is never observed.

Vintages and Timing of Revisions

The Bureau of Economic Analysis (BEA) prepares quarterly and annual estimates of gross domestic product (GDP) and gross domestic income (GDI). It prepares three current quarterly vintages of GDP estimates—advance, preliminary, and final estimates. The advance estimates for a quarter are released about a month after the quarter ends. The preliminary estimates for the quarter are released 2 months after the quarter. And the final estimates are released 3 months after the quarter. In addition, as part of the annual NIPA revision release in July of each year, the quarterly estimates for the 3 preceding years are revised.

For GDI, BEA prepares a fourth vintage of quarterly estimates. These revised estimates—which incorporate data from the Quarterly Census of Employment and Wages—are released with the preliminary estimates of GDP for the succeeding quarter. These revised estimates are available beginning with the estimates for the first quarter of 2002.

BEA prepares four vintages of current annual estimates for a year—the sum of finals and the first, second, and third annual estimates. The sum of finals is an aver-

age of the final estimates for each quarter of the previous year; this estimate is prepared and released in March with the final estimate for the fourth quarter of the year. (In years with annual revisions, the quarterly estimate of the first quarter of the previous year is from the first current annual estimate released the previous summer.) The current annual estimates for 3 preceding years are revised as part of the annual NIPA revision. After the third annual revision of the estimates for a year is released, these estimates are not revised or released again until the next comprehensive benchmark NIPA revision.

Annual NIPA revisions are superseded by comprehensive NIPA revisions, which occur about every 5 years. These revisions incorporate changes in definitions and classifications as well as methodological changes. The most recent comprehensive benchmark revision was released in December 2003; it featured revised annual estimates for 1929–2002 and revised quarterly estimates for 1947–2003. The latest available quarterly estimates are the comprehensive benchmark estimates for 1947–99, third annual estimates for 2000–2004, second annual estimates for 2005, and first annual estimates for 2006.

There are three vintages of “current quarterly” estimates for the NIPAs: the advance, preliminary, and final estimates. Each vintage is produced using a wide mix of source data—preliminary survey results, such as the Census Bureau’s surveys of retail sales and manufacturers’ shipments, various indicators, trade industry data, and more—that are later revised to reflect more complete information.

The early quarterly estimates are replaced successively by three vintages of “current annual” estimates that are primarily based on increasingly comprehensive annual source data. For a description of source data and the revision process through the first annual revision estimates, see Grimm and Weadock (2006).

After the third current annual estimates, the estimates of GDP are typically not revised again until a comprehensive benchmark revision. Comprehensive benchmark revisions occur about every 5 years and incorporate even more detailed source data from various economic censuses. Comprehensive benchmark revisions also include changes in definitions that keep the NIPAs abreast of a changing economy. In addition, they include improvements in statistical methodologies.

The construction of confidence intervals for the estimates is not possible, because the data come from a wide range of sources, including random and nonrandom surveys, administrative records, and extrapolated and interpolated estimates. As a result, the only way to evaluate the reliability of early estimates is to compare them with later estimates.

Revisions are typically measured in percent changes at annual rates. This avoids distortions arising from the trend growth in economic activity that would otherwise make revisions to later year estimates seem relatively larger than those of much earlier estimates. For example, a 1.0-percentage-point revision to current-dollar personal consumption expenditures (PCE) for 2006 would be worth about four times as many dollars as a 1.0-percentage-point revision to PCE for 1983.

The mean absolute revisions (MARs) to the annual rates of change—without regard to sign—from the current quarterly estimates in 1983–2006 to the latest available estimates of current-dollar and real GDP have averaged slightly more than 1 percentage point. That represents a decline from about 3 percentage points from pre-1960 levels. It seems unlikely that the MARs will fall much more—for reasons that have to do with source data, seasonal adjustments, and comprehensive revisions (discussed below)—and that further reductions would not necessarily indicate increased reliability.

The MARs within the current quarterly estimates are smaller. The MAR from the advance estimates of

real GDP to the preliminary estimates is 0.5 percentage point and to the final estimates is 0.6 percentage point. The MAR from the preliminary estimates to the final estimates is 0.3 percentage point.

Mean revisions (MRs) indicate whether the revisions in bulk are positive or negative. Because revisions may be offsetting, the MRs are much smaller. The MRs from the advance to both the preliminary and final estimates are both 0.1 percentage point. The MR from the advance to the latest available estimates is 0.3 percentage point. Much of this MR reflects revisions that stem from comprehensive revisions of the NIPAs. The MRs from both the preliminary and final estimates to the latest available estimates are both 0.2 percentage point.

For 1983–2006, the mean growth rate of real GDP was 3.4 percent. The growth rates ranged from –3.0 to 9.3 percent with a standard deviation of 2.3 percentage points.

The three vintages of current quarterly estimates of real GDP successfully indicated the following:

- The direction of change 98 percent of the time
- The acceleration or deceleration of growth 76 percent of the time (75 percent for the advance estimates)
- The relative magnitude of growth—whether it was above, near, or below trend (one standard deviation from the mean)—more than four-fifths of the time
- The cyclical peaks in five of the six recessions in 1969–2006
- The cyclical troughs in four of the six recessions²

The remainder of this article discusses (1) revisions to quarterly frequency estimates of GDP, (2) revisions to annual estimates of GDP, (3) revisions to quarterly estimates of GDI, (4) revisions to annual estimates of GDI, and (5) a comparison of the estimates of GDP and GDI. These sections are followed by a brief summary and conclusions.

Revisions to Quarterly Estimates of GDP

The measures of reliability featured in much of this evaluation are MRs and MARs from the earlier estimates to the latest available estimates (see the box “Mean Revisions and Mean Absolute Revisions”). This section presents the MRs and MARs from the three current quarterly estimates to the latest available estimates.

In the 1983–2006 period, the MARs for both current-dollar and real GDP range from 1.0 to 1.2 percentage points for all three current quarterly vintages. For current-dollar GDP, the MAR from the advance to

2. The cyclical peaks and troughs as measured by GDP and GDI do not always coincide with the National Bureau of Economic Research’s determinations of monthly peaks and troughs. See Grimm (2005).

preliminary estimates decreases slightly and then increases even more slightly to the final estimates (table 1). The MARs decrease for most GDP components other than equipment and software investment and federal nondefense expenditures. These decreases occur as many of the trend-based projections and most preliminary monthly or quarterly estimates are replaced with revised source data (see Grimm and Weadock 2006). The MARs for GDP and about half of its components increase very slightly from the preliminary to the final estimates. These increases occur even though some additional revised source data are incorporated and some projections are replaced with source data.

For real GDP, the MAR from the advance to the preliminary estimates is unchanged. The MARs decrease for about half of the components, are unchanged for two components, and increase for the remaining components. From the preliminary to the final estimates, the MAR for GDP increases slightly. The MARs increase for about two-thirds of the components and decrease for the others.

The MARs for current-dollar and real GDP are smaller than those for any of their components and subcomponents. This reflects the effects of small or negative correlations between the revisions of the components. Table 2 shows the correlations between real GDP and its major components and the correlations between the major components.

Table 2. Correlation Coefficients of Revisions From Final to Latest Quarterly Estimates of Real GDP and Its Major Components in 1983–2006

	GDP	Personal consumption expenditures	Fixed investment	Exports	Imports	Federal government	State and local government
Personal consumption expenditures	0.51

1. Negative values in some quarters make the calculation of percentage changes impossible.

2. A 1991 change in the accounting treatment of purchases and sales of agricultural goods by the Commodity Credit

Corporation affected nondefense revisions, but not GDP revisions.

because there are a number of quarters when the values are negative. Because the revisions to inventories are large, the MARs for gross private domestic investment are larger than those for any of its fixed investment components.

The MARs for current-dollar and real federal government nondefense expenditures are very large because of a 1991 change in the accounting treatment of the Commodity Credit Corporation's commodity loan program; after this change, the MARs for these expenditures have been about an eighth of the size of the MARs in previous periods. Because this change also produced matching, but opposite, sign revisions to change in private farm inventories, there was no effect on revisions to GDP.

The MRs are much smaller, 0.4 percentage point for the advance estimates of current-dollar GDP and 0.3 percentage point for the advance estimate of real GDP. The MRs for both the preliminary and final estimates of both current-dollar and real GDP are about 0.2 percentage point, with the MRs for real GDP being slightly smaller. The MRs for most components are positive for both current-dollar measures and real measures. The principal exceptions are gross private domestic investment and fixed investment, which reflect the effects of negative MRs for their largest subcomponent, equipment and software investment.

An earlier BEA study found that the MRs for current-dollar and real GDP were not statistically significant (Fixler and Grimm 2005). It also reported that only the MRs for both current-dollar and real equipment and software investment were significant. This significance was the result of the recognition of soft-

ware as investment in 1999, which greatly increased the sizes and rates of growth in investment because business expenditures for software were previously counted as intermediate consumption. All other significant revisions were significant in current dollars or in real terms, but not both.

The MRs for GDP are not indications of bias. Most of these revisions reflect definitional and statistical changes that are part of comprehensive revisions that were made to improve the estimates (Fixler 2004). In particular, the definitional revisions were made to adapt the NIPAs to a changing economy. These definitional revisions have generally, but not universally, raised both the levels and rates of change of GDP.

Have revisions gotten smaller?

There has been ample evidence that over time the MARs of GDP have declined. BEA research supports this view. However, MARs may not significantly decline further in the future for three reasons discussed in this section: source data, seasonal adjustments, and comprehensive revisions.

In an earlier article, BEA reported that the MARs estimates of GDP and gross national product (GNP) had declined from about 3 percentage points in the years before 1960 to about 1 percentage point beginning in the early 1980s (Young 1993). This finding was based on five successive BEA studies that were published between 1965 and 1993. More recent BEA studies have also found that revisions from the current quarterly estimates to the latest available estimates have been about 1 percentage point in periods beginning in 1983.

The results of the studies are summarized in table 3.

Mean Revisions and Mean Absolute Revisions

The mean revision is calculated as the average of the revisions in the sample period:

$$MR = \Sigma(L - E) / n$$

Where *E* is the percent change in the earlier quarterly or annual estimate, *L* is the percent change in the later estimate, and *n* is the number of observations in the sample period. Percent changes in quarterly estimates are at annual rates, which corresponds to the convention generally used for the estimates.

The revisions can be positive or negative, so they may be offsetting. As a result, it is also useful to look at the mean absolute revision:

$$MAR = \Sigma |L - E| / n$$

The mean absolute revision is the average of the absolute values of the revisions.

Table 3. Absolute Revisions to Quarterly Estimates of Current-Dollar GDP

Study	Period	Mean absolute revisions (percentage points)
Jaszi (1965)	1947-52	3.3
	1953-56	2.1
	1957-61	1.2
Young (1974)	1947-63	3.1
	1964-71	1.0
Parker (1984)	1968-72	1.1
	1978-83	1.5
Young (1987)	1968-77	1.8
	1978-86	1.5
Young (1993)	1978-82	1.8
	1983-91	1.1
Grimm and Parker (1988)	1983-89	1.2
	1990-97	0.8
Fixler and Grimm (2002)	1983-92	1.1
	1993-00	0.9
Fixler and Grimm (2005)	1983-92	1.0
	1993-02	1.2
Fixler and Grimm (2008)	1983-92	1.0
	1993-06	1.0

The first four studies are for GNP; the others are for GDP. (The growth rates of the two measures rarely differ by more than 0.1 percentage point). The revisions are for the preliminary estimates to the latest available estimates at the time. These are shown because only estimates corresponding to the timing of the preliminary estimates were made in the earliest years. All the revisions are for percent changes in current dollars; publication of real current quarterly estimates of GNP began in 1957.

The first study found MARs for GNP ranging from 3.3 percentage points in 1947–52 to 1.2 percentage points in 1957–61 (Jaszi 1965). (See the box “The Reli-

ability of the First Estimates of GNP.”) Later studies found similar MARs for similar time periods. (Because of annual revisions and comprehensive revisions, the latest available estimates have changed over time.) Studies looking at revisions to GDP for periods beginning in 1983 or later have all found MARs of 0.8 percentage point to 1.2 percentage points, depending on the period examined. Although not shown in the table, the MARs for real GDP typically have been 0.1 to 0.2 percentage point larger than the current-dollar GDP MARs; by implication, revisions to prices have had little effect on the MARs of real estimates.

Earlier commentaries by BEA in its revisions studies

The Reliability of the First Estimates of GNP

Early in 1942, the first estimates of current-dollar gross national product (GNP) were published for 1929–41.¹ These estimates provided the first comprehensive report of the workings of the U.S. economy and facilitated war-time planning.

The first complete set of interrelated and consistent national income and product estimates was published in 1947.² The estimates contained improved concepts and definitions and clarified terminology and provided the first full system of national economic accounts that described each major sector of the economy.

Even by today’s standards, those estimates have proven to be generally reliable. The GNP estimates published in 1942 and the estimates published in 1947 both show essentially the same patterns of increases and decreases and of the sizes of the increases and decreases in what is a very volatile period for the economy (see the chart). And the estimates are not very different from the latest available estimates for the period.

The reliability of both sets of estimates may be examined more closely by looking at the mean revision (MR) and mean absolute revision (MAR) statistics used to judge the reliability of more recent estimates. The values of the MRs from the 1942 estimates to both the 1947 and the latest available estimates—published in 2003—are less than 0.1 percentage point, and the MR from the 1947 estimates to the latest available estimates is 0.1 percentage point (see the table). Those compare favorably to the MRs for the three vintages of current annual estimates, in the 1983–2006 period, of somewhat more than 0.1 percentage point.

1. A more complete report on these estimates may be found in Marcuss and Kane (2007). The publications providing the earliest estimates may be found in Gilbert (1942) and Gilbert and Bangs (1942).

2. The estimates for the period 1929–46 may be found in Gilbert (1947). This and other early publications about GNP and related estimates may be found at BEA’s Digital Library, available on BEA’s Web site at <www.bea.gov>.

The MARs for the 1942 estimates are about 1.5 percentage points compared with the 1947 estimates and 1.0 percentage point compared with the latest available estimates. The MAR for the 1947 estimates compared to the latest available estimates is 1.4 percentage points. Although these are larger than the 0.3 to 0.4 percentage point MARs for the current annual estimates in the 1983–2006 period, they are smaller when compared with the volatility of GNP in the two periods.

MRs and MARs of Current-Dollar GNP Estimates, 1942–2003

[Percentage points]

Date of earlier estimate	Date of later estimate	MR	MAR
1942	1947	0.04	1.49
1947	2003	0.10	1.38
1942	2003	0.07	0.96

Estimates of GNP Change Published in 1942, 1947, and 2003

suggested that reductions in MARs in later periods were at least a result of the estimates having been through fewer successive revisions. Later work, however, has not supported this suggestion, except for estimates for the most recent few years. As indicated in table 4, the MARs in 1983–2006 for the three current quarterly vintages of GDP peak with the third annual revision estimates and decrease slightly to the latest available estimates. Likewise, the MARs for the five major components of GDP also decrease or increase only slightly from the third current annual estimates to the latest available estimates because as discussed below, the MARs from the current quarterly estimates to the latest estimates show little tendency to increase with successive comprehensive revisions.

There are three reasons why the MARs of GDP may not decline substantially in the near future:

Source data. BEA has increasingly incorporated more timely and higher quality source data earlier in the estimation process. The use of higher quality source data is preferred because such data ultimately leads to more accurate estimates. However, the incorporation of better survey data, because they replace relatively smooth projections, also tends to raise MARs.

Currently, more than half of the source data used

for the advance quarterly estimates are based at least in part on projections (Grimm and Weadock 2006). As better data become available, projection-based data are replaced. In fact, for the preliminary and final estimates, more than two-thirds of the estimates are based on revised monthly or quarterly data. Only a bit more than one-twentieth of the first current annual estimates are trend based; other sources are split evenly between revised monthly or quarterly data and annual data.

BEA continues to incorporate improved source data as those data become available. For example, BEA now incorporates the Census Bureau's Quarterly Services Survey (QSS) to improve BEA estimates of service sector production, though it may raise MARs.

Beyond the QSS, the likelihood of major new surveys becoming available for the early quarterly estimates appears limited. However, the available surveys may lead to improved data through new methods and more suitable records among other things. Again, such improved source data can lead to higher MARs.

Seasonal adjustment factors. These adjustments derive from new or revised source data that reflect changing seasonal patterns even if there are no substantial revisions to the underlying seasonally unadjusted data. These revisions, which continue to be made from the first through the third annual revision, incorporate unpredictable changes in seasonal patterns.

It has been shown that revisions to seasonal adjustment factors will result in revisions to the estimates. One report was that "the average absolute revision in quarterly changes in the seasonal factors in the period 1983 to 1988 . . . is about one-half the size of the total revision (seasonally adjusted) from the current estimates to the latest available estimates of GDP" (Young 1996). A more recent BEA study found that the MARs from seasonal factors from the first to the third current quarterly estimates in 1987–97 were about the same sizes as the corresponding revisions to seasonally adjusted estimates of GDP and seven major components (Fixler and Grimm 2002).

Fixler and Grimm (2002) found that the MAR to GDP estimates that are accounted for by revisions to seasonal factors was 1.0 percentage point.³ This MAR is about the same size as the overall MARs for periods beginning in 1983. This reflects the fact that GDP revisions resulting from revisions to seasonal adjustment factors tend to be of the opposite sign to the revisions

Table 4. Mean Absolute Revisions to Quarterly Estimates of Current-Dollar GDP and Its Major Components in 1983–2006

Vintage of estimate	Vintage of revision

NOTE: The revised estimate is the standard for comparison in calculating the mean absolute revision. See the box "Mean Revisions and Mean Absolute Revisions."

1. Reflects a revised accounting treatment for Credit Commodity Corporation purchases and sales that had no effect on GDP.

3. This does not include any seasonal revisions from the current quarterly to the first current annual estimates. BEA does not compute these revisions and lacks the information to do so.

to seasonally unadjusted estimates. Thus, they tend to be offsetting.

Comprehensive revisions. To account for the evolving economy, BEA continues to make major methodological and definition changes via comprehensive revisions. For example, BEA is tentatively scheduled to capitalize research and development spending starting in 2013. Comprehensive revisions also incorporate high-quality Economic Census data. For these reasons, comprehensive revisions tend to raise MARs.

From 1983 to 2006, there have been five comprehensive benchmark revisions. The first, in December 1985, included only 11 quarters in this period and is not discussed here. The others occurred in late fall of 1991, 1999, and 2003, and—after a delay due to a shutdown of the federal government—in the beginning of 1996. Summary statistics for revisions of current-dollar GDP from the latest available estimates prior to the comprehensive revisions to the comprehensive revision estimates are shown in table 5.

Table 5. Average Revisions to Quarterly Estimates of Current-Dollar GDP in the Comprehensive Revisions
[Percentage points]

Year of comprehensive revision	Period	Mean revision	Mean absolute revision
1991.....	1983:I–1991:III	0.05	0.76
1996.....	1983:I–1995:III	–0.04	0.60
1999.....	1983:I–1999:II	0.16	0.54
2003.....	1983:I–2003:III	0.03	0.56
Average.....		0.05	0.63

The MARs are large in comparison with the MRs, as one would expect. The MARs range from 0.54 percentage point to 0.76 percentage point and average 0.63 percentage point. Although there are no comprehensive statistics, earlier and incomplete reviews of the MARs for the various revisions have suggested that the larger contributors to them are the definition changes rather than the statistical revisions. For example, an earlier BEA study reported that definition changes accounted for somewhat more than three-fifths of the average upward revision to current-dollar GDP in the 1999 comprehensive benchmark revision (Fixler and Grimm 2002).⁴

It does not appear that a zero MAR for GDP is an achievable goal for three reasons: (1) by the time of the first current annual estimates, the availability of source data to replace trend data, the availability of revised source data to replace preliminary data, and the availability of some annual data together result in MARs

approaching 1 percentage point; (2) by the time of the third annual revision estimates, the availability of source data for periods in the future to the period being seasonally adjusted also results in MARs of about 1.0 percentage point; and (3) the changes made in the accounts to adapt them to a changing economy, combined with improved statistical methodologies, result in MARs of more than 0.5 percentage point. Thus, three of these factors combined suggest that there is an asymptote of roughly 0.5 to 1.0 percentage point that is a limiting factor to the lowest possible average of revisions. This asymptote is consistent with the MARs of the estimates of GDP from the studies shown in table 3, which are rarely much below 1.0 percentage point after 1983.

Revisions to various vintages of estimates

In addition to the statistics for revisions to the latest available estimates, it is useful to look at the statistics for intermediate vintage estimates (for example, the revisions from the final current quarterly estimates to the first current annual estimates). Intermediate vintage MARs for current-dollar GDP and selected components are shown in table 4. MARs for the current quarterly estimates of GDP increase steadily, reaching their largest values when calculated using the third current annual estimates. The MARs decline slightly from the third annual to the latest estimates. The MAR from the advance estimates to the first annual estimates is about 0.2 percentage point larger than the MARs of the preliminary and final estimates to the first annual estimates and about 0.1 percentage point larger than the MAR from the preliminary and final estimates to all later estimates.

The MARs for PCE also increase steadily but remain somewhat below the corresponding MARs for GDP until the latest estimates, which are about 0.1 percentage point larger. The MARs for all of the other selected components are larger than those for GDP and PCE. They also increase as successively later vintages are used to measure revisions; somewhat fewer than half reach peak values with the third current annual estimates, and the rest reach peak values with the latest available estimates. As mentioned above, changes in the accounting for the Commodity Credit Corporation's loan program sharply increased the MARs for federal government expenditures; if the sample period is truncated to 1992 and later, these MARs are roughly halved.

The MRs for current-dollar GDP and the selected components are shown in table 6. They are small in comparison with the MARs and show little tendency to

4. Calculated from table 12.

increase when measured using successive later vintage estimates. As discussed above, the MRs to the latest available estimates for GDP include the effects of definitional revisions that have tended to raise the rates of growth. These definition changes also affect the MRs to the current annual vintage estimates; definition changes also tend to increase the rates of growth in MRs relative to the current quarterly vintage estimates until the new definitions were incorporated into the current quarterly estimates. As an example, about one-fifth of the first current annual estimates have definition changes that are not in the current quarterly estimates for the same periods. Two-fifths of the second current annual estimates and three-fifths of the third current annual estimates have such changes. These revisions are not errors, but represent the effects of changing definitions in the NIPAs.

The MRs for PCE from the three current quarterly vintages of estimates to the various subsequent vintages are similar in size to those for GDP. Through the second current annual estimates, the revisions are slightly smaller; for the third current annual estimate and the latest available estimate, they are somewhat

less than 0.1 percentage point larger. All the MRs are positive except the MR from the preliminary to the final current quarterly estimates.

The MRs both for fixed investment and for equipment and software investment are nearly all positive through the revisions to the first current annual estimates and are negative for revisions to subsequent vintages. These patterns reflect the patterns for equipment and software investment, which declined 2.0 percentage points to negative values from the first to the second current annual estimates. MRs to subsequent vintages are also negative.

MRs for the advance estimates of exports are positive. They are the largest for all components, peaking with the third current annual estimates and then declining slightly. MRs for the preliminary estimates follow pretty much the same pattern, but at lower values. MRs for the final estimates start at a small negative value and become increasingly positive through the third current annual estimates before declining.

MRs for the advance estimates of imports fluctuate from vintage to vintage, mostly at values just below 1.0 percentage point. MRs for the preliminary estimates fluctuate, primarily at small positive values. MRs for the final estimates fluctuate between -0.2 percentage point and -0.4 percentage point.

The MRs for the current quarterly estimates of federal government consumption expenditures and gross investment range from -0.3 to 0.5 percentage point, with no particular patterns, and most are positive. The MRs for state and local government are generally positive, with peak values of 0.4 to 0.6 percentage point with the third current annual estimates, and decline about 0.1 percentage point with the latest available estimates.

Relationships among various vintages

Some observers have found that revisions are sometimes related to other vintages of revisions. However, others—including Grimm and Parker (1998)—have found much less of a correlation. At least two sorts of revisions might be related: the relationship between revisions in adjacent periods and the relationship between revisions in adjacent vintages of estimates for the same periods.

Relationships between revisions in adjacent periods may be analyzed by regressions based on

$$Rev_t = a_0 + a_1 Rev_{t-1}$$

The upper panel of table 7 shows the results of these regressions for GDP and five of its six major components. Summary results are shown for each of the six

1. Negative values in some quarters make the calculation of percentage changes impossible.

vintages and components; the estimated coefficients a_1 , the p-value of the estimated a_1 coefficients, and the R-bar square for the estimated equation. No a_1 coefficients for the vintages of GDP or PCE estimates are significant at a value of $p \leq 0.05$. Fourteen of the coefficients of the other 24 components and vintages are significant, ranging from 2 for fixed investment to 5 for imports. The explanatory power of the equations, however, is very slight; 11 of the 14 equations with significant coefficients have R-bar squares of less than 0.10, and only 1 has an R-bar square of more than 0.40.

Relationships between revisions in adjacent vintages of estimates for the same periods may be analyzed by

regressions based on

$$Rev_v = b_0 + b_1 Rev_{v-1}$$

The lower panel of table 7 shows the results of the regressions. Two of the vintages of revisions of GDP are statistically significant. The R-bar squares of the two equations are small, however, at less than 0.10. None of the vintages of revisions of PCE or fixed investment have statistically significant b_1 coefficients. Five of the ten equations for exports and imports have significant b_1 coefficients, and three of the five have R-bar squares of more than 0.10. Two of the equations for government have significant coefficients, but their R-bar squares are well below 0.10.

Regression results for both equations suggest that revisions do have modest momentum across both sequential time periods and sequential vintages. The relatively large numbers of significant coefficients for exports and imports suggest that a closer examination of them at a finer level of detail might find some patterns that could be adjusted to yield improved estimates. However, the rather low R-bar squares of the equations with significant coefficients suggest that any improvements are likely to be modest.

Another way of measuring revisions

Studies of revisions to the NIPAs have typically featured revisions to percent changes to GDP and its components. Percent changes are used because the size of the economy has grown greatly over time. For example, GDP in 2006 is about four times the size of GDP in 1983, and a 1 dollar revision in 1983 is proportionally a much larger revision than a 1 dollar revision in 2006.

The use of percent changes has some disadvantages. First, percent changes cannot be used to measure changes in variables such as change in private inventories that have both positive and negative values; a percent change has no meaning, for example, when going from a negative value in one period to a positive one in the succeeding period. Second, the effects of percent changes in two components cannot be directly compared. A 1 percent revision in PCE, which accounts for roughly 66 percent of GDP, means much more to the overall economy than a 1 percent revision in fixed investment, which accounts for roughly 14 percent of GDP. Third, there is a well-known phenomenon that the revisions to larger aggregates, measured in percent-change terms, are typically smaller than those to their components because subcomponents' revisions tend to offset one another. With a percent-change formulation, however, the offsets cannot be examined directly.

An alternative approach is to use a trended series to

scale the revisions to produce dimensionless units so that a 1 unit revision at the end of the period of analysis means about the same thing as a 1 unit revision at the beginning of the period. Differences in the scaled measures can be used in the same way as percent changes are used.

The scaling is done by dividing the values of the revisions by trend GDP. A trend GDP series is constructed using a Hodrick-Prescott filter.⁵ This trend GDP is used as the denominator, and the GDP components are used as numerators, in calculating de-trended measures of revisions to the components.⁶ More specifically, the de-trended measure for the i^{th} component of GDP in period t is simply $DGDP_i(t) = GDP_i(t) / TGDP(t)$, where $TGDP$ is trend GDP. The results of the de-trending are scaled dimensionless units because both numerators and denominators are in dollars. (For ease of exposition, the de-trended measures also are multiplied by 100; this has no effect on the discussion of results.)

To illustrate how the scaling by trend GDP permits the calculation of revisions when estimates for successive periods are of the opposite sign, consider the final current quarterly estimates of change in private inventories, which were \$49.8 billion in the fourth quarter of 2000 and -\$26.1 billion in the first quarter of 2001 (table 8). Calculation of a percent change is impossible in this case. Similarly, a percent change cannot be calculated for the latest estimates of \$41.4 billion and -\$9 billion. Changes and revision in change, however, may be calculated for these values when divided by trend GDP.

Table 8. Change in Private Inventories

	Billions of dollars			De-trended units		
	Final	Latest	Revision	Final	Latest	Revision
2000:IV.....	49.8	41.4	-8.4	0.507	0.421	-0.086
2001:I.....	-26.1	-0.9	25.2	-26.3	-.01	-0.04
Change.....	-75.9	-42.3	33.6	-0.77	-0.521	0.249

The value in the lowest cell in the right column is the revision in change; note that it is the sum of the absolute value of the revisions across vintages (summing down the column "Revision"), and equivalently, the difference between the change in the latest and the change in the final over time (going across the bottom

5. The trend estimates here use a penalty (lambda) parameter of 1,600 and are not unique; a different lambda—or an alternative, such as a logarithmic trend—will yield somewhat different estimates of trend GDP. Also, the de-trending methodology is not ideal, because the longer term shares of the components in GDP change over time; in particular, the share of imports increases from about 10 percent in 1983 to more than 16 percent in 2006.

6. The values of trend GDP in the sample period vary between 98 percent and 102 percent of the latest estimates of GDP.

row of the right-hand vintage columns). Thus the revision in change can be viewed as either the revision in vintages for a point in time or the movement in the vintage estimates over time. The time series of the revision-in-change units may be used to calculate the MRs and MARs of the estimates from the final to the latest vintage. More specifically, using the right "Revision" column, the MR would be 0.038, and the MAR would be 0.124. The same methodology may be used for other combinations of vintages, for GDP, and for its components.

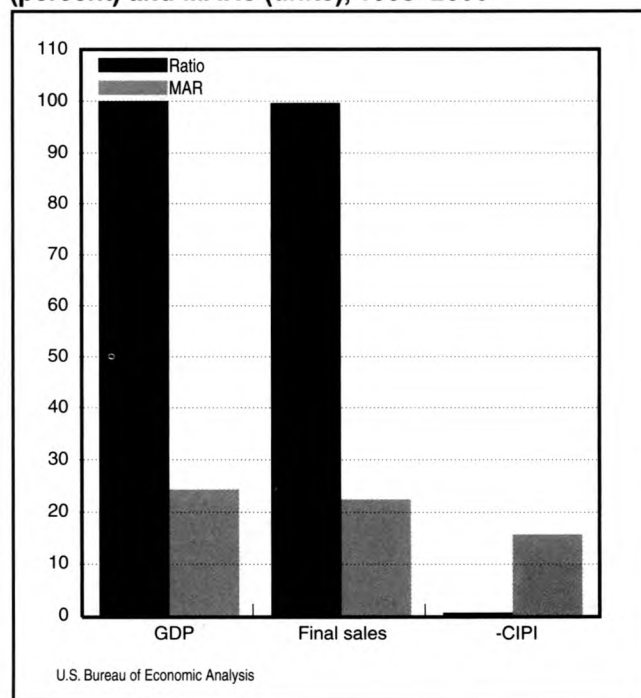

The results of this de-trending methodology are directly comparable among components as well as for aggregates like GDP.⁷ A 1 unit MAR in a component will, *ceteris paribus*, yield a 1 unit MAR in GDP. Similarly, a 1 unit revision in one component means the same as a 1 unit revision in another component.⁸

The scaling methodology both allows the calculation of revisions to estimates of change in private inventories (CIPI) and a direct evaluation of their impact on revisions to GDP. Chart 1 and table 9 show the MARs from the final current quarterly estimates to the

7. This methodology can only be used for current-dollar GDP. BEA estimates real GDP by chaining together its components. As a result, real GDP does not equal the sum of its components.

8. Because the constant-share assumption does not quite hold, the results of the scaled revisions for the components are not precisely additive; this has little effect on the qualitative results described in this section.

Chart 1. GDP and Components: Ratios to GDP (percent) and MARs (units), 1993–2006

latest estimates for GDP, CIPI, and final sales for the fourth quarter of 1993 to the fourth quarter of 2006, expressed as revisions to scaled first differences in their ratios to trend GDP (units).⁹ The MAR for final sales is nine-tenths the size of the MAR for GDP, but the MAR for CIPI is two-thirds the size of the MAR for GDP.¹⁰ The effects on GDP are not the sum of the two MARs, because the revisions to final sales and CIPI are negatively correlated, with a correlation coefficient of -0.17 , and the revisions partly offset one another. As a result, although MARs to CIPI are large relative to those to GDP and far more than in proportion to the share of CIPI in GDP, their effects are partly offset by revisions to final sales.

The methodology may be used to compare the revisions in all of the components of GDP. MARs and average ratios of all current quarterly estimates of components to trend GDP are shown in table 9. The ratio of PCE to trend GDP is slightly more than two-thirds. The ratios of the other components of final sales to trend GDP are very roughly similar to one another, ranging from about 10 percent to 20 percent.¹¹ The MAR for PCE is second only to the MAR for CIPI.

9. This period was chosen to avoid the large revisions in historical estimates of CIPI that were introduced in the December 1991 comprehensive NIPA revision. These revisions resulted from the reclassification of the highly volatile purchases and sales of the Commodity Credit Corporation from the government sector to the business sector, which had no effect on GDP. The period also incorporates the improvements in estimates of international trade in goods that were introduced in the December 1985 comprehensive NIPA revision.

10. The choice of trend methodology appears to make little qualitative difference. If a logarithmic trend fitted to GDP in the first quarter of 1983 and the fourth quarter of 2006 is used as the scaling variable, the MARs for GDP and its major components are modestly higher, but the same relative patterns are observable.

11. Because imports are subtracted and the other components are added to calculate GDP, the ratios for all components (including CIPI) sum to about 124 percent of GDP.

Table 9. Ratios to Trend GDP and Average Revisions to the Latest Estimates in 1993–2006

	Ratio	Mean absolute revisions			Mean revisions ¹		
		Advance	Preliminary	Final	Advance	Preliminary	Final
	(Percent)	(Units) ²					
Gross domestic product.....	100.0	26.3	23.6	24.1	5.9	1.7	-0.5
Personal consumption expenditures	67.2	15.5	13.3	13.7	1.0	0.5	-0.3
Fixed investment	15.6	9.6	9.3	9.2	4.2	1.9	-0.4
Change in private inventories	0.4	17.2	15.7	15.5	-0.7	-0.5	-0.2
Exports	9.7	12.7	10.5	10.7	3.8	1.0	0.9
Imports	12.3	14.4	8.3	7.9	3.7	0.5	1.1
Government consumption expenditures and gross investment	19.3	6.2	6.8	6.1	2.4	0.6	1.3
Final sales.....	99.6	25.7	23.6	22.3	7.0	-0.8	-0.8

Note: Final sales equals GDP less the change in private inventories.

1. Mean revision components do not sum to total because of approximation methodologies.

2. Units are current-dollar values divided by trend GDP.

But the ratio of PCE to trend GDP is smaller than that for the other components. The sum of the MARs for the final current quarterly estimates of the components of final demand is 47.6 units, somewhat more than twice the MAR for final demand because revisions in the components tend to offset one another.

The results are similar for the advance and final estimates (they are not shown in this study). The MARs for GDP, final sales, and all other components except government consumption expenditures and gross investment decline from the advance to the final estimates. The MARs for GDP, PCE, and exports increase modestly from the preliminary to the final estimates. The MARs for the other components decline.

Chart 2 shows the ratios of the latest estimates of the six major components of GDP to GDP. The ratio of PCE to GDP is by far the largest, and the ratio of CIPI to GDP is by far the smallest. The ratios of the other four components to GDP are roughly similar in size. The chart also shows the MARs of the final estimates of the scaled components. The MAR for CIPI is the largest, followed by PCE, exports, fixed investment, imports, and government. The revisions of the components tend to be offsetting, and as a result, the MAR for GDP is only moderately larger than that of final sales. In turn, as the result of offsets, the MAR for final sales is only moderately larger than the MARs for

Chart 2. GDP Components: Ratios to GDP (percent) and MARs (units); 1993–2006

its five components.

As indicated in table 9, the MRs are small in comparison with the MARs. For the advance estimates, the MRs are positive for GDP and all components except CIPI. These MRs reflect the same small positive biases on a percent-change basis that were noted above. For the preliminary estimates, the MR for GDP is much smaller, and the MR for final sales is negative. For the final estimates, the MRs for GDP, final sales, and three of the six GDP components are negative.

Regarding the MARs for GDP, the contribution of CIPI is the largest and is far out of proportion to CIPI's share. The contributions of the revisions to the major components of GDP tend to be offsetting, and the MAR for GDP is about half the size of the sum of the

MARs of its components.

In sum, the methodology shows that the direct impacts on GDP of revisions to CIPI are somewhat larger than those for any of the five major components of final sales and are about two-thirds as large as those for all of final sales. This approximate result cannot be revealed with the use of percent changes.

Revisions to Current Annual Estimates of GDP

MRs and MARs for the "sum of finals" and the three current annual estimates are shown in table 10.¹² The

12. The sum of finals is the average GDP level of the most recently available estimates for the quarters of the year. This average level is then used to calculate growth rates.

1. Negative values in some quarters make the calculation of percentage changes impossible.

2. A 1991 change in the accounting treatment of purchases and sales of agricultural goods by the

Commodity Credit Corporation affected nondefense revisions, but not GDP revisions.

estimates are in percent changes of annual estimates of current-dollar and real GDP and its major components.

The MARs for both current-dollar and real GDP are much smaller than the MARs for the three current quarterly vintages. The sizes of the MARs generally decrease as the annual estimates are revised. For current-dollar GDP, the largest decrease is between the first and second annual estimates. For real GDP, the decreases get slightly smaller with each successive vintage.

The results reflect two factors: (1) annual estimates are unaffected by revisions to seasonal adjustments, and (2) revisions, such as the replacements of quarterly extrapolations with interpolations, do not affect annual estimates.

Except for some vintages of estimates of current-dollar and real PCE, the MRs for GDP are smaller than the MRs for its major components. Among the components, PCE has the smallest MARs, and federal non-defense expenditures has the largest. The latter reflects the changes in treatment of the Commodity Credit Corporation's commodity loan program; if the sample period is truncated to 1992–2006, the MARs are one-half to one-tenth those shown in the table.

The MRs for the sum of final estimates of current-dollar GDP are about the same as the MRs for the current quarterly estimates; the MRs for the annual vintage estimates of real GDP have somewhat larger positive values. These patterns reflect similar patterns of MRs for current-dollar and real PCE. The MRs for current-dollar and real fixed investment are negative, reflecting increasingly negative MRs for equipment and software investment. Although the MRs for current-dollar imports are small positives, the MRs for real imports are negative; these differences reflect upward revisions in the price of imports. The MRs for most other components of GDP are generally small positives.

Revisions to Quarterly Estimates of GDI

Advance estimates of GDI are not prepared, and since 1995, preliminary estimates of fourth-quarter GDI have not been prepared. As a result, this discussion is mainly about revisions to the final estimates for 1983–2006. Net national factor income (similar to what was labeled national income prior to the 2003 comprehensive revision) has the same publication schedule.¹³ When advance and preliminary current

quarterly vintages of the estimates of components of GDI have been published, revisions statistics for these are shown (table 11). Generally, revisions to the components have the same general trend as the revisions to GDP components—including very small tendencies for downward movement in MARs.

Table 11. Average Revisions to Quarterly Estimates of GDI and Selected Components in 1983–2006

[Percentage points]

	Mean absolute revisions			Mean revisions		
	Advance	Preliminary	Final	Advance	Preliminary	Final

Net interest and miscellaneous payments		8.37	8.36		0.73	0.47

IVA inventory valuation adjustment

CCAAdj capital consumption adjustment

1. Excludes 1985:III because an extremely large value in this quarter distorts the results.

2. Equals national income plus subsidies less taxes on production and imports, business current transfer payments (net), and current surplus of government enterprises.

The MARs for the final estimates of GDI and net national factor income are similar to those for current-dollar GDP; MARs for GDI are very slightly smaller; and MARs for net national factor income are a bit larger. Among the components of net national factor income, only compensation of employees has MARs similar to those for most of the major components of GDP. For the other components, the MARs are much larger, reflecting the limited availability of quarterly source data. For example, corporate profits are estimated using sources such as corporate financial statements; beginning with the second annual revision estimates, tax return data are used for the estimates. Very large MARs for rental income result from small dollar-denominated revisions when the base period values are near zero; this results in large percentage-point revisions. The large MARs for proprietors' income reflect generally large revisions to farm proprietors' income; the MARs for nonfarm proprietors' income are half the size of those for the totals.

The MR for the final estimates of GDI is quite small and positive. This primarily reflects a positive MR for consumption of fixed capital. The MRs for the components of net national factor income are mostly negative and are largely offset by a positive MR for compensation of employees. Again, the large negative MR for

13. The present measure named "national income" has a somewhat different definition.

rental income translates from quite small dollar-denominated revisions.

Additional revisions to estimates of compensation of employees

Beginning with the first quarter of 2002, BEA has revised certain income-side estimates 2 months after the release of the final estimates of quarterly personal income. This has allowed the incorporation of private-sector data from the Bureau of Labor Statistics (BLS) Quarterly Census of Employment and Wages (QCEW); these data are tabulations that originate from the state unemployment insurance (UI) system and from the UI program for federal civilian employees. The QCEW data are from quarterly state UI contribution reports—also known as form ES-202—that are filed by employers in the industries that are covered by, and subject to, each state's UI laws and by federal agencies; these data are available 5 months after the end of each quarter. The QCEW data for almost all private industries, for federal government civilian employees, and for state and local government employees account for 95 percent of wages and salaries.

The QCEW data are used to replace the more limited information used in the current quarterly estimates. The advance, preliminary, and final estimates of wages and salaries incorporate data from the BLS monthly current employment statistics payroll survey of nonfarm employment, hours, and earnings. This survey covers hours and earnings only for production workers (or for nonsupervisory workers in service industries) and does not include commissions, tips, bonuses, or gains from exercising nonqualified stock options. Thus, the BLS monthly survey misses a substantial portion of the wage and salary compensation of high-wage workers.

In the sample period, there are just 20 quarters of

information on revisions to the QCEW estimates of compensation. First current annual revision estimates are used as the standard of comparison for the revisions in order to allow the longest possible sample period, 2002 to 2006, and to avoid an untidy mixture of revisions to first, second, and third annual estimates.

Table 12 shows the MARs for compensation for the final estimates and the QCEW estimates. The MAR for the 20 quarters preceding the first quarter of 2002 is also shown for comparison. The MAR for the final estimates increases 0.8 percentage point from the earlier to the later period. The MAR for the QCEW-based estimates is slightly lower than the MAR for 1997–2001.

Table 12. MARs for Compensation of Employees

[Percentage points]		
	First annual less final	First annual less QCEW
1997–2001	1.19	
2002–2005	2.03	1.13

Clearly, the incorporation of the QCEW data has improved the reliability of the estimates of compensation.

Revisions to Annual Estimates of GDI

The MAR for the sum of finals estimate of GDI is similar to the MAR for the “final” current quarterly estimate (table 13). The MARs for the three current annual estimates are half that size or less. The MARs for consumption of fixed capital and taxes on production and imports are generally less than half those for the current quarterly estimates.

The MARs for net national factor income are smaller than the MARs for the final current quarterly estimates. The MARs decline to a low with the second annual estimate and then increase slightly. The MARs for compensation of employees are generally smaller than the corresponding MARs for factor income but

Table 13. Average Revisions to Annual Estimates of GDI and Selected Components in 1983–2006

IVA inventory valuation adjustment

CCAj capital consumption adjustment

1. Sum of final estimates are for 1983–2006.

2. First annual estimates are for 1983–2005.

3. Second annual estimates are for 1983–2004.

4. Third annual estimates are for 1983–99.

5. Equals the present definition of national income plus subsidies, less taxes on production and imports, business current transfer payments (net), and current surplus of government enterprises.

6. Negative values in some years make the calculation of percent changes impossible.

follow a similar pattern. The pattern of MARs for proprietors' income follows a similar pattern, but they are considerably larger. The MARs for corporate profits and for net interest are very roughly twice the size of the MARs for proprietors' income, but they decline steadily with succeeding vintages of estimates.

The MRs for GDI, net national factor income, and compensation are generally positive and often smaller than most of the current quarterly estimates of the same measures. The MRs for corporate profits and for net interest show tendencies to be increasingly negative with successive vintages.

GDP Versus GDI

GDP measures activity as the sum of all final expenditures in the economy plus changes in private inventories. GDI measures the sum of all incomes generated in production. They differ in practice because all of the transactions underlying them are not recorded and because seasonal adjustments and interpolations and extrapolations are not made by identical methodologies. The difference between them is known as the statistical discrepancy.¹⁴

In the long run, GDP and GDI have similar levels and percent movements. In the 10 year period of 1997 to 2006, a graph of the latest values of the two measures would show two largely overlapping lines. Chart 3 shows percent changes of the final and latest estimates of the two measures. The upper panel shows changes in the final estimates of the two measures. Both measures are quite volatile with peaks and troughs appearing every few quarters and with peaks and troughs generally occurring in the same quarters. The lower panel shows changes in the latest estimates of the two measures. Again, peaks and troughs occur every few quarters, but the peaks and troughs of the two measures are less closely aligned.

A closer look at the distributions of the measures finds that for both vintages and measures, the hypothesis that the changes are normally distributed cannot be rejected even at the 50 percent level of confidence. The variances of the GDI estimates decline from 4.76 percentage points for the final estimates to 4.14 percentage points for the latest estimates. In contrast, the variances of the GDP estimates increase from 4.10 percentage points for the final estimates to 5.80 percentage points for the latest estimates.

14. For a more complete discussion of the statistical discrepancy and its causes, see Grimm (2007).

The correlations of GDP with GDI for the two vintages also show a weakening relationship for the latest vintage. The correlation of the two measures is 0.87 for the final estimates and 0.59 for the latest estimates. The correlation of the final GDP estimates with the latest GDI estimates is 0.70 higher than that of the latest estimates. As reported in Fixler and Grimm (2006), national income is statistically significant in regression equations, explaining GDP revisions from the final estimates to the latest estimates, but GDP is not significant in explaining revisions to either GDI or national income.

Summary and Conclusions

The results of this review are generally consistent with those of previous BEA studies:¹⁵

- The estimates of GDP and GDI are reliable; the MARs for the quarterly estimates of both measures are slightly more than 1.0 percentage point.

15. Although not included in this review, the reliability of real GDP estimates around the last five turning points is the same as that presented in a previous study (Fixler and Grimm 2005); the relevant estimates are unchanged since that study was made.

Chart 3. Estimates of GDP and GDI, 1997–2006

- The MRs for GDP and GDI are positive, primarily reflecting the improvements of measures of economic activity and expansions of the definition of economic activity that have been introduced in comprehensive NIPA revisions to adapt GDP and GDI to a changing economy.
- The quarterly estimates are reliable indicators of whether the economy is growing at rates above, near, or below the long-term trend.
- MARs for GDP/GNP have declined from somewhat more than 3.0 percentage points prior to the mid-1950s to somewhat more than 1.0 percentage point since the early 1980s. The MARs appear to be near an asymptote that results from several inevitable factors.
- MRs declined largely because of improvements in the source data available over time, improvements in methodologies, and definitional changes made to keep the accounts abreast of a changing economy. They are not due to corrections of errors.
- The MARs for all the annual estimates are less than half the corresponding quarterly estimates. The MARs decline modestly with each succeeding vintage of estimates from the sum of finals to the third current annual revisions.
- The use of an alternative methodology makes clear that revisions to inventories have an importance to GDP revisions that is nearly as large as that of final sales.
- The revisions to GDP and its major components appear to have some modest momentum, but using this information does not appear to be worthwhile.
- The revision of estimates of GDI and compensation of employees 5 months after the end of each quarter appears to have improved the reliability of these measures.

Annual Industry Accounts

Revised Statistics for 2004–2006

By Robert J. McCahill, Kevin B. Barefoot, and Robert J. Corea

IN 2006, economic growth was again powered by the private services industries. In particular, the finance and insurance industries accounted for one-fourth of real gross domestic product (GDP) growth, reflecting strong securities and credit intermediation industry activity, according to the annual update of the Bureau of Economic Analysis (BEA) annual industry accounts, which was released on January 29, 2008.

The updated statistics also show that the professional, scientific, and technical services industries accounted for 14 percent of real economic growth, while information-communication-technology-producing industries (ICT) accounted for 15 percent of economic growth. In addition, the effects of energy prices were felt across the economy. Notably, value-added price indexes—which measure changes in prices of labor and capital—decelerated in the oil and gas extraction mining industry and in the petroleum and coal products manufacturing industry; these decelerations helped slow growth in the value-added price index for the overall private goods-producing sector.

The updated annual industry accounts incorporate significantly more accurate and more detailed information on the industry composition of GDP growth than was available for the “advance” GDP-by-industry statistics released on April 24, 2007. In particular, this annual update incorporated revised 2005 and preliminary 2006 source data from the Census Bureau’s Annual Survey of Manufactures (ASM), which were released in November 2007 (see the box “The 2006 Annual Survey of Manufactures and the Annual Industry Accounts”); these data were included 10 months earlier than previous annual updates.

The revised annual industry accounts also incorporated Census Bureau annual survey data on industry and commodity output, Bureau of Labor Statistics data on producer prices, and BEA statistics on final demand and on industry returns to labor and capital from the 2007 annual revision of the national income and product accounts (NIPAs).

In addition, for 2006, these data were compiled within an input-output framework that balances and reconciles industry production and commodity usage. This framework provides information on value added

for 65 industries and information on gross output and intermediate inputs for 65 industries and commodities.¹ The previously published “advance” statistics for 2006 were prepared using a methodology developed from summary source data and were limited to showing value added for 21 industry groups.²

Highlights of the updated annual industry accounts include the following:

- Finance and insurance industries increased 9.8 percent, contributing more to GDP growth in 2006 than any other industry sector. These industries, which account for 8 percent of current-dollar GDP, accounted for about 25 percent (0.77 percentage point) of real GDP growth (2.9 percent).³ Within finance and insurance, growth was strongest in two industries: the securities, commodity contracts, and investments industry and the Federal Reserve banks, credit intermediation, and related services industry.
- Professional, scientific, and technical services industries increased 6.0 percent and contributed significantly to GDP growth in 2006. These industries, which accounted for 7 percent of overall production, accounted for 14 percent (0.41 percentage point) of real GDP growth.
- Durable-goods manufacturing industries increased 6.0 percent and contributed substantially to real GDP growth in 2006. These industries, which account for about 7 percent of overall production, accounted for 14 percent (0.40 percentage point) of real GDP growth. Growth was strongest in the computer and electronic products industry and the motor vehicles, bodies and trailers, and parts industry, which together accounted for about 2 percent of GDP but for 10 percent (0.29 percentage point) of real GDP growth.

1. For a discussion of the methodology used to revise the annual industry accounts, see Thomas F. Howells III, Kevin B. Barefoot, and Brian M. Lindberg, “Annual Industry Accounts: Revised Estimates for 2003–2005,” *SURVEY OF CURRENT BUSINESS* 86 (December 2006): 45–87.

2. See Thomas F. Howells III and Kevin B. Barefoot, “Annual Industry Accounts: Advance Estimates for 2006,” *SURVEY* 86 (May 2007): 11–25.

3. Industry shares of real GDP growth are approximated by dividing their contributions to real GDP growth by the percent change in real GDP.

- Real value added in the construction industry decreased 6.0 percent in 2006, reflecting the downturn in residential construction. New housing starts decreased in 2006.
- Faster growth in the value-added price index for the private services-producing sector, including utilities and transportation, partly offset the slower growth in the private goods-producing sector's price growth.

The remainder of this article is organized into three parts: first, a discussion of industry trends and developments; second, an analysis of the domestic output and domestic supply of commodities; and third, a look at revisions to the previously published estimates. The detailed industry and commodity estimates are presented in tables 1–26 following the article (see the box “Data Availability”).

Industry Trends and Developments

Real growth

Private services-producing sector. This sector continued its steady expansion in 2006; real value added grew

4.2 percent, following growth of 4.0 percent in 2005 and of 3.9 percent in 2004 (chart 1 and table A). In

1. Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.
 2. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.
 3. Consists of computer and electronic products; publishing industries (includes software); information and data processing services; and computer systems design and related services.

The 2006 Annual Survey of Manufactures and the Annual Industry Accounts

This release of the annual revision of the annual industry accounts was rescheduled from December 2007 in order to incorporate updated data from the 2006 Annual Survey of Manufactures (ASM). Under the previous schedule, these ASM data, which provide the most accurate estimates of manufacturing gross output, would not have been introduced until the December 2008 release of the annual industry accounts. The ASM data were made available by the Census Bureau on an accelerated basis in November 2007.

The ASM also provides key source data for two key components of gross domestic product in the national income and product accounts (NIPAs): nonresidential fixed investment and change in private inventories. The ASM data released in November 2007 were not available to be incorporated into the NIPA annual revision, which was released in July 2007. To maintain consistency with the annual industry accounts' revised estimates of manufacturing gross output, estimates of nonresidential fixed investment, the change in private inventories, and GDP were recalculated using the newly available ASM data. The annual industry accounts' estimates of industry value added are also consistent with the recalculated estimates of GDP.

These recalculated estimates are not part of the official NIPA statistics. They do not indicate the magnitude or direction of future revisions to GDP in the NIPAs, which will also reflect the incorporation of other key source data.

The annual industry accounts tables have been expanded, where applicable, to distinguish the effect of the new ASM data, which included revised data for 2005 and preliminary data for 2006. The effect is included in the addenda to these tables on a new line “NIPA reconciliation item.” As shown below, the difference between GDP as reported in the NIPAs and value added for all industries (which incorporate the new ASM data) is \$3.7 billion for 2005 and -\$10.7 billion for 2006.

Difference Between NIPA GDP and Value Added for All Industries
 [Billions of dollars]

	2004	2005	2006
Gross domestic product, NIPAs	11,685.9	12,433.9	13,194.7
Less: Value added, all industries	11,685.9	12,430.2	13,205.4
Equals: NIPA reconciliation item		3.7	-10.7

NIPAs National income and product accounts
 GDP Gross domestic product

Although the effect of the new ASM data on estimates of aggregate production is small, the effect on estimates of gross output for several industries is significant compared with the estimates based on the Manufacturers' Inventories, Shipments, and Orders (M3) data, which would have been incorporated in the December 2007 release if the ASM data had not been available.

2006, the expansion was widespread; 30 of the 36 services industries grew.

Growth in the services sector exceeded growth in

Chart 1. Annual Growth in Real GDP

Data Availability

The integrated annual GDP-by-industry and input-output estimates for 1998–2006 and historical estimates of GDP-by-industry for 1947–97 are available on BEA's Web site; go to <www.bea.gov> and click on "Annual Industry Accounts." For the GDP-by-industry tables, click on "Interactive Tables" under "Gross Domestic Product (GDP) by Industry." Online tools are available for users to customize tables so that they show data only for the industries and years of interest. Tools are also available for creating graphs of data and downloading tables to update spreadsheets. A guide to the interactive GDP-by-industry accounts tables is also available.

For I-O tables, from "Annual Industry Accounts," click on "Interactive Tables" under "Input-Output (I-O) Accounts." Online tools are available for users to create and store unique levels of aggregation of data for specific commodities and industries. Tools are also available for viewing and downloading entire I-O tables, including the "make" and "use" tables.

For a guide to the annual industry accounts tables, see Tameka R.L. Harris and Greg R. Linder, "Guide to the Annual Industry Accounts Tables," *SURVEY OF CURRENT BUSINESS* 85 (December 2005): 34–38.

real GDP by about 1 percentage point in 2006 and 2005.

This expansion is reflected in the services sector's share of current-dollar GDP, which increased to 68.1 percent in 2006 from 67.7 in 2005. More than 90 percent of 2006 real GDP growth of 2.9 percent was attributable to the private services-producing industries.

The finance and insurance industry, which accounted for 27 percent (0.77 percentage point) of real GDP growth in 2006, includes two of the three fastest growing services industries: the securities, commodity contracts, and investments industry and the Federal Reserve banks, credit intermediation, and related activities industry (table B).

Real value added by the securities, commodity contracts, and investments industry increased 23.2 percent in 2006, following 17.9 percent growth in 2005. The growth reflected a robust financial markets climate in 2006, featuring strong activity in mergers and acquisitions, debt and equities underwriting, and advisory services activity.

The Federal Reserve banks, credit intermediation, and related activities industry, which grew 8.1 percent in both 2006 and 2005, reflected strong demand for commercial real estate and industrial loans to support the strong real growth in nonresidential fixed investment and merger and acquisition activity.

The professional, scientific, and technical services industry group grew 6.0 percent in 2006 after growth of 4.4 percent in 2005 and 7.9 percent in 2004. Roughly two-thirds of this industry group is accounted for by the miscellaneous professional, scientific, and technical services industry, which accelerated to 7.5 percent in 2006 from 6.3 percent in 2005. This growth reflected strong contributions from the architectural, engineering, and related services industry and the management, scientific, and technical consulting services industry, amid strong growth in nonresidential fixed investment and continued domestic outsourcing.

Within the transportation and warehousing industry group, real growth in the rail transportation industry surged 27.8 percent in 2006 after decreasing 1.1 percent in 2005 (see the box "Industry Spotlight: Transportation Industries and Energy Prices"). Real growth in the air transportation industry decelerated from 12.5 percent in 2004 to 6.2 percent in 2005 and to 2.9 percent in 2006.

Private goods-producing sector. Real growth in this sector continued to slow, growing 0.8 percent in 2006, compared with 1.3 percent in 2005 and 4.0 percent in 2004. Growth in the goods sector lagged GDP growth by about 2.0 percentage points in 2006 and 2005. The goods sector, which accounts for about one-fifth of current-dollar GDP, accounted for 6 percent

(0.17 percentage point) of real GDP growth (2.9 percent) in 2006. This share was down from the 8 percent share (0.26 percentage point) in 2005 and the 22 percent share (0.78 percentage point) in 2004.

The 2006 deceleration in the goods sector overall reflected a downturn in housing, including a large downturn in the construction industry. Real value-added by the construction industry declined 6.0 percent in 2006, the industry's largest decline since 1991. The 2006 decline followed 2.7 percent growth in 2005. In 2006, the construction industry's real gross output contracted, as new housing starts decreased. Within the construction industry, real gross output for single-family residential construction, which accounts for about one-fourth of the industry, decreased. The 2006 downturn in housing restrained growth in real gross output in the non-metallic mineral products industry and the wood products manufacturing industry and led to downturns in the electrical equipment, appliances, and components industry and the furniture and related products industries. Gross output in the multifamily residential construction and nonresidential construction industries increased.

The agriculture, forestry, fishing, and hunting industry decelerated to 0.9 percent growth in 2006 after

increasing 4.9 percent in 2005 and 6.7 percent in 2004. This deceleration was due to the 2006 deceleration in real value-added growth for the farm industry, which reflected lower crop output, primarily corn, fruit, and cotton.

Real growth in the manufacturing industry group accelerated to 2.9 percent in 2006 after increasing 1.0 percent in 2005. Manufacturing real value added grew 5.6 percent in 2004. Within manufacturing, 10 of the 19 detailed manufacturing industries expanded in 2006, compared with 9 industries in 2005 and 13 industries in 2004.

Durable-goods manufacturing continued to grow faster than GDP. Growth in durable-goods manufacturing accelerated to 6.0 percent in 2006 from 4.9 percent in 2005 and 5.8 percent in 2004. In 2006, durable-goods manufacturing accounted for 14 percent (0.40 percentage point) of real GDP growth, even though it accounted for just 7 percent of current-dollar GDP. The growth in 2006 was led by the computer and electronic products industry, which experienced double-digit growth for the fourth consecutive year.

Real growth in nondurable-goods manufacturing declined 1.0 percent in 2006 after declining 3.9 percent in 2005. The 2006 decline was widespread, with

1. Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.

2. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance; insurance; real estate, rental, and leasing; professional and business services; educational services; health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.

3. Consists of computer and electronic products; publishing industries (includes software); information and

data processing services; and computer systems design and related services.

Note: Percentage-point contributions do not sum to the percent change in gross domestic product because the contribution of "not allocated by industry" is excluded. The industry estimates for 2005 and 2006 also incorporate data from the Census Bureau's accelerated November 2007 release of the Annual Survey of Manufactures (ASM). These data were not available to be incorporated in the national income and product account (NIPA) estimates of GDP which were released in July 2007.

declines in five of the eight detailed industries; declines were largest in the textile mills and textile product mills industry and the petroleum and coal products industry. Real growth in the textile mills and textile product mills industry declined for the fifth time in the past 6 years, while real growth in the apparel and leather and allied products industry declined for the sixth consecutive year. Gross output and employment has steadily declined in these two manufacturing industries. The chemical products industry's real value-added growth turned up in 2006, growing 1.3 percent

after declining 6.4 percent in 2005.

The mining industry group turned up in 2006, growing 6.1 percent after declining 2.4 percent in 2005. The upturn was largely due to an upturn in the oil and gas extraction industry, which grew 3.2 percent after declining 8.4 percent in 2005 and 3.2 percent in 2004. The 2006 upturn reflected an upturn in natural gas production that more than offset a small decrease in crude petroleum output.

ICT-producing industries. Real growth in the ICT-producing industries accelerated to 11.7 percent in

Industry Spotlight: Transportation Industries and Energy Prices

The transportation sector is an essential link among all industries.¹ This sector moves coal to produce electricity for homes and factories, facilitates travel around the globe, and transports commuters to cities via bus or train.

Transportation's share of total current-dollar GDP has remained stable at 2.9 percent from 2003 to 2006. Its contribution to real GDP growth has been higher. In 2004, transportation industries accounted for over 7 percent (0.26 percentage point) of real GDP growth, followed by a 4 percent contribution in 2005 and a 5 percent contribution in 2006.

As the annual industry accounts make clear, transportation industries are affected in different ways by energy price changes.

The rail transportation industry. This industry has flourished recently partly because of high energy prices. As the price of natural gas inputs rose to historic highs in 2005, electric utilities substituted less costly inputs, including coal. Natural gas is piped to utilities, but coal is almost always delivered by rail. The resulting increase in demand for rail service enabled rail carriers to increase production and rates. Coal shipments have historically been the largest source of railroads' income, accounting for 20 percent of total revenue in 2005. In 2005, freight rail rates jumped 7 percent—the largest increase in over 20 years. More recently the railroads' fuel surcharges have come under scrutiny.² Railroads also bear fuel costs. Since 2004, the diesel prices relevant to railroads have generally exceeded gasoline prices, given worldwide demand, environmental legislation, and higher federal taxes on diesel fuel compared with standard motor fuel.

Railroads were able to pass through these higher diesel inputs costs and charge historically high rates as other

industries demanded their services to avoid the higher costs of other fuels. Railroads' freight revenue rose 29 percent from 2004 to 2006. Real value-added growth for rail transportation in 2006 was 28 percent, surpassing all other industries.

The air transportation industry. This industry is more competitive than the rail industry, and the effect of rising energy prices on the airline industry was markedly different. The cost of fuel to airlines is significant, even though some airlines hedge against energy price spikes. Jet fuel prices hit a record in late 2005 after hurricanes hit the Gulf Coast. In response, several air carriers instituted fuel surcharges on their passenger flights but then rolled them back after their market shares declined.

Airlines also responded by reducing fuel usage in several ways. By replacing older planes with newer models, airlines maintained capacity but reduced fuel consumption. One carrier switched to lighter drink carts and saved thousands of gallons of fuel each day.

Moreover, federal authorities assisted airlines by reducing the Vertical Minimum Separation to allow passenger jets to fly at more efficient altitudes. Satellite navigation enabled carriers to fly routes that take better advantage of prevailing winds. Also, because it takes fuel to carry fuel, many carriers have been flying with reduced fuel loads. Airlines also reduced jet fuel consumption by simply flying fewer planes; most carriers have recently reduced their operations, providing additional price support as well. Carriers flew with 80 percent of their seats filled in 2006, compared with 70 percent in 2001.

Flying with a higher percentage of their seats filled, applying surcharges, and reducing fuel consumption helped boost air transportation's value-added price index. By raising unit output prices and reducing unit costs, the value-added price index for air transportation turned up in 2006, increasing nearly 7 percent after decreasing 16 percent in 2005 and 13 percent in 2004. Operating profits of airlines reported by the Air Transport Association improved from -\$1.5 billion in 2004 to \$7.5 billion by 2006.

1. Transportation consists of the following industries: air, rail, water, truck, transit and ground, pipeline, other transportation and support activities, and warehousing and storage.

2. In early 2007 the Surface Transportation Board (STB) ruled that it was unreasonable for railroads to "double-dip" by applying a fuel surcharge on top of a rate increase based on a cost index that included a fuel component.

2006 from 11.3 percent in 2005. These industries contributed significantly to overall GDP growth in 2006. While they accounted for only 4 percent of the economy in 2006, they accounted for 15 percent (0.43 percentage point) of real GDP growth. In particular, computer and electronic products manufacturing accounted for 7 percent of real GDP growth. Publishing industries (including software) was the only industry of the four ICT-producing industries that decelerated from 2005 to 2006, slowing to 4.5 percent growth from 9.0 percent growth.⁴

Value-added price growth

Changes in the value-added price index reflect changes in the prices of an industry’s labor and capital inputs, including changes in the industry’s unit profit margins.⁵ In general, an industry’s value-added price index will increase if the industry’s output prices increase more (or decrease less) than its intermediate input (energy, materials, and purchased services) prices. Alternatively, an industry’s value-added price index will decline if its intermediate input prices increase more (or decrease less) than its output prices. Other things being equal, a change in the value-added price index usually indicates a change in either unit profits or the wage rate.

Overall, the GDP chain-type price index increased 3.2 percent in both 2005 and 2006 despite strong increases in crude petroleum and natural gas prices in 2005 and a substantially smaller increase in crude petroleum prices and declining natural gas prices in 2006.

Private services-producing sector. Growth in the value-added price index for the services sector accelerated to 2.5 percent in 2006 from 2.2 percent in 2005 (chart 2 and table C). Price growth in the private services industries accounted for just over half (1.69 percentage points) of GDP price growth in 2006. Within the private services sector, the utilities industry and the real estate and rental and leasing industry were the largest contributors to GDP price growth in 2006, accounting for 18 percent (0.58 percentage point) (table D).

Value-added prices in the utilities industry accelerated, growing 12.1 percent in 2006, 6.2 percent in 2005, and 3.3 percent in 2004. This industry contributed 8 percent (0.24 percentage point) to total GDP price growth in 2006. In contrast, value-added prices

in the education services, health care, and social assistance industry group decelerated, growing 2.7 percent in 2006, 3.1 percent in 2005, and 3.5 percent in 2004.

In addition, the value-added price index for the information industry group continued to decrease, falling 2.1 percent in 2006 after falling 3.5 percent in 2005 and 2.9 percent in 2004.

Private goods-producing sector. The value-added price index for the goods sector decelerated in 2006,

1. Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.
 2. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.
 3. Consists of computer and electronic products; publishing industries (includes software); information and data processing services; and computer systems design and related services.

4. The ICT industry group consists of computer and electronic products, publishing industries (includes software), information and data processing services, and computer systems design and related services.

5. For more information on value-added price indexes, see the box “Interpreting the Value-Added Price Index” in Robert E. Yuskavage and Mahnaz Fahim-Nader, “Gross Domestic Product by Industry for 1947–86,” SURVEY 85 (December 2005): 77.

increasing 4.1 percent after increasing 5.9 percent in 2005 and 3.7 percent in 2004. Price growth in goods industries accounted for one-fourth (0.80 percentage point) of GDP price growth in 2006.

The price deceleration in the goods sector in 2006

reflected slowdowns in the mining industry and non-durable-goods manufacturing industries, primarily in the oil and gas extraction industry and the petroleum and coal products industry, both of which were affected by a smaller increase in petroleum prices and a

1. Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.

2. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.

3. Consists of computer and electronic products; publishing industries (includes software); information and

data processing services; and computer systems design and related services.

Note: Percentage-point contributions do not sum to the percent change in gross domestic product because the contribution of "not allocated by industry" is excluded. The industry estimates for 2005 and 2006 also incorporate data from the Census Bureau's accelerated November 2007 release of the Annual Survey of Manufacturers (ASM). These data were not available to be incorporated in the national income and product account (NIPA) estimates of GDP, which were released in July 2007.

Annual Industry Accounts and the 2002 Benchmark Input-Output Accounts

Annual Industry Accounts and the 2002 Benchmark Input-Output Accounts

Every 5 years, the benchmark input-output (I-O) accounts provide detailed commodity estimates of industries' outputs and intermediate inputs, of industries' value added, and of final expenditures for the U.S. economy. These estimates provide benchmarks used to estimate BEA's annual industry accounts time series of industry output, of intermediate uses, and of final uses.

On September 21, 2007, BEA released its benchmark input-output (I-O) accounts for 2002.¹ However, BEA's annual industry accounts, released on January 29, 2008, do not reflect the results of the 2002 benchmark I-O

accounts. The annual industry accounts will incorporate results from the 2002 benchmark I-O accounts in the upcoming comprehensive revision to the annual industry accounts, which is scheduled to be released in late 2009 or early 2010.

Integration of the 2002 benchmark I-O accounts into the annual industry accounts will take place in three steps. First, estimates from the 2002 benchmark I-O accounts will be incorporated into the comprehensive revision of the NIPAs, scheduled for release in mid-2009. Second, the 2002 benchmark I-O accounts will be revised to incorporate additional statistical revisions and changes in definition from the NIPA comprehensive revision. Third, the revised 2002 benchmark I-O accounts will be incorporated into the annual industry accounts, making them consistent with the NIPA comprehensive revision.

The effects of the 2002 benchmark I-O accounts on the NIPAs will be discussed in an upcoming issue of the SURVEY.

1. See Stewart, Ricky L., Stone, Jessica Brede, and Streitwieser, Mary L., "U.S. Benchmark Input-Output Accounts, 2002" SURVEY OF CURRENT BUSINESS 87 (October 2007): 19-48. Revisions to the benchmark accounts were released in January 2008.

decline in natural gas prices. The value-added price index for the mining industry group slowed, rising 9.6 percent after three consecutive years of double-digit increases. The value-added price index for the oil and gas extraction industry grew just 3.2 percent in 2006, compared with 42.9 percent in 2005. Value-added price growth in nondurable-goods manufacturing decelerated in 2006, rising 4.8 percent after increasing 7.9 percent in 2005; the deceleration reflected a sharp slowdown in the price growth in the petroleum and coal products industry, which increased 18.1 percent in 2006, compared with 60.4 percent in 2005.

In contrast, the value-added price index for the construction industry continued to accelerate in 2006, increasing 10.3 percent in 2006 after increasing 9.8 percent in 2005 and 8.4 percent in 2004. Construction accounted for 15 percent (0.48 percentage point) of GDP price growth in 2006.

ICT-producing industries. The value-added price index for ICT-producing industries decreased 3.8 percent in 2006 after decreasing 4.1 percent in 2005 and 6.1 percent in 2004. The steady decline reflected falling prices of computer systems and peripherals and other high-tech equipment. ICT-producing industries' value-added price index restrained GDP price growth in 2006, contributing -4.7 percent (-0.15 percentage point) in 2006 and -5.0 percent (-0.16 percentage point) in 2005.

Composition of value added

Value added measures an industry's returns to labor and capital from production—that is, to its primary inputs to production—as well as the industry's net return to government. The return to labor is approximated by the industry's compensation of employees, the return to capital by the industry's gross operating

surplus, and the industry's net return to government by its taxes on production and imports, less subsidies.⁶

Economywide, compensation as a share of value added has been trending down in recent years. Compensation accounted for 56.5 percent of value added in 2006, down from 59.0 percent in 2000. Meanwhile, gross operating surplus trended in the other direction, accounting for 36.5 percent in 2006, up from 34.3 percent in 2000 (table E).

In the goods sector in 2006, however, these trends did not hold. Compensation increased to 57.9 percent of value added in 2006, up from 57.6 percent in 2005. Gross operating surplus decreased to 39.1 percent of value added in 2006, down from 39.8 percent in 2005. These shifts were driven by the construction industry. In 2006, compensation in the construction industry increased to 67.5 percent of value added, up from 64.0 percent in 2005; gross operating surplus decreased to 31.2 percent in 2006, down from 34.7 percent in 2005.

Domestic Supply and Use of Commodities

Domestic goods output as a percentage of domestic goods supply fell for the fourth consecutive year, to 87.9 percent in 2006 from 88.3 percent in 2005 and 89.1 percent in 2004. Domestic supply is the value of goods and services available for domestic final and intermediate consumption; it is estimated as domestic output plus imports less exports less the change in private inventories.

Current-dollar domestic goods output increased 6.1 percent in 2006 after increasing 10.5 percent in 2005. Imports as a percentage of domestic supply increased for the fifth consecutive year, to 22.5 percent in 2006

6. Gross operating surplus includes proprietors' income, which mainly reflects the income of the unincorporated self-employed.

1. Includes noncomparable imports, scrap, used goods, inventory valuation adjustment, and rest-of-the-world adjustments.

2. Consists of commodities from agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.

3. Consists of services from utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.

In goods, the import share of manufactured commodities increased to 26.8 percent in 2006 from 25.8 percent in 2005, and the import share of mining commodities remained at 38.9 percent, unchanged from 2005.

In services, imports accounted for less than half of 1 percent of domestic supply in 2006; this measure has been stable since 1997.

In 2006, 20.7 percent of the domestic supply of goods was consumed by households and nonprofit institutions serving households (personal consumption expenditures), while 69.9 percent was consumed by

private business as fixed investment or intermediate consumption. Government consumption expenditures, gross investment, and intermediate consumption accounted for 9.4 percent of the domestic supply of goods. For services, 49.7 percent of domestic supply was consumed by households and nonprofit institutions serving households, 45.4 percent by private business, and the remaining 4.9 percent by government.

Revisions

The statistics of industry value added for 2006 were improved in several ways.

- The updated statistics were calculated using the integrated annual GDP-by-industry and input-output (I-O) accounts methodology. The integrated annual industry accounts methodology combines the source data within an I-O framework that balances and reconciles industry production with commodity usage.⁷ The previously published estimates for 2006 were prepared using an abbreviated methodology.
- The updated statistics incorporated more complete, more detailed, and more reliable source data. The newly incorporated source data for 2006 include Census Bureau annual survey data on gross output, Bureau of Labor Statistics data on producer prices, and BEA estimates of final demand and industry returns to labor and capital from the 2007 annual revision of the NIPAs. For 2004 and 2005, the

7. For more information, see the appendix in Thomas F. Howells III and Kevin B. Barefoot, "Annual Industry Accounts: Advance Estimates for 2006," SURVEY OF CURRENT BUSINESS 86 (May 2007): 11–25.

Acknowledgments

Robert J. McCahill and Kevin B. Barefoot of the Current Industry Analysis Division (CIAD) supervised the preparation of this year's annual revision of the annual industry accounts. Sumiye Okubo, Associate Director for Industry Accounts, George M. Smith, Chief of CIAD, Sherlene K. S. Lum, Chief of the Services Branch, and Nicole M. Mayerhauser, Chief of the Goods and Value Added Branch, provided overall guidance. Pat A. Wilkinson provided secretarial and program assistance.

Vincent A. Davis, Paul V. Kern, Amanda S. Lyndaker, Nicole M. Mayerhauser, Justin M. Monaldo, William H. Nicolls IV, and George M. Smith helped prepare this article. Felicia V. Candela, Thomas F. Howells III, Douglas B. Leung, and William H. Nicolls IV managed the computer systems used to process and review the estimates.

CIAD staff who prepared the estimates, and their areas of expertise, are listed below. Agriculture, business services, and personal services: Soo J. Kim, Robert J. Corea, Vincent A. Davis, and Brian M. Lindberg. Transporta-

tion, utilities, and government: Paul V. Kern, Greg R. Linder, Mariana Matias, and Sarah R. Mattingly. Mining, construction, manufacturing, and trade: Robert J. McCahill, Kevin B. Barefoot, Anna M. Jacobson, Amanda C. Roberts, and Shawn L. Snyder. Value added, real measures, and prices: Thomas F. Howells III, Kathleen M. Karlon, Amanda S. Lyndaker, and Justin M. Monaldo.

Staff of the National Economic Accounts Directorate—particularly Brent R. Moulton, Carol E. Moylan, Paul R. Lally, Jennifer A. Ribarsky, Enrico Tan, Jeffrey W. Crawford, Todd P. Siebeneck, Howard Krakower, and Michael J. Boehm—provided valuable guidance and estimates for this revision of the annual industry accounts.

Staff of the Office of the Chief Information Officer—particularly Stephen P. Holliday, Brian D. Kajutti, Paul A. Kilday, Douglas J. Klear, Janice E. Townsend, and Rajeshwari R. Bhosale—helped reengineer the data-processing applications that were used to prepare the estimates.

revised estimates incorporate revised NIPA estimates and, for 2005, newly available source data from the Annual Survey of Manufacturers (ASM). The previously published manufacturing estimates for 2005 reflected the use of Census Bureau Manufacturers' Shipments, Inventories, and Orders (M3) survey data.

- Revisions to value-added price indexes reflect the use of the integrated accounts double-deflation methodology rather than the single-deflation methodology used to prepare the advance estimates.⁸

GDP-by-industry accounts. Real growth for the private goods-producing industries was revised down 1.7 percentage points in 2006 (tables G and H). The largest source of the 2006 downward revision was a

8. Single deflation best approximates the results obtained through double deflation when an industry's inputs prices and output prices are growing at about the same rate.

downward 7.3 percentage point revision to real value added for the construction industry.

Real growth in the manufacturing industry group was revised down 0.4 percentage points in 2006 and 1.2 percentage points in 2005. Within manufacturing, growth in nondurable goods was revised down 0.1 percentage points in 2006 and 2.6 percentage points in 2005. Within nondurable-goods manufacturing in 2005, growth in six of the eight detailed industries were revised down in 2005.

In 2005, the downward revisions in the goods sector were partially offset by the upward revisions to growth in the mining, except oil and gas industry, and the support activities for mining industry.

In the services sector, growth in the finance and insurance industry group was revised up 5.5 percentage points in 2006 and 4.0 percentage points in 2005. Real growth in the transportation and warehousing

1. Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.

2. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.

3. Consists of computer and electronic products; publishing industries (includes software); information and

data processing services; and computer systems design and related services.

NOTE: Percent changes reflect differences in source data used to estimate GDP-by-industry and the expenditures measure of real GDP. For 2005 and 2006, the revised percent changes and the revisions to percent change reflect the incorporation in the industry estimates of data from the Census Bureau's accelerated November 2007 release of the Annual Survey of Manufacturers (ASM). These data were not available to be incorporated in the national income and product account (NIPA) estimates of GDP, which were released in July 2007.

industry group was revised up 3.3 percentage points in 2006.

Real growth in ICT-producing industries, which includes three industries from the services sector and one from the goods sector, was revised down for all 3 years.

Input-output (I-O) accounts. The revised I-O tables for 2004–2005 incorporate revised source data on gross output and value added by industry and on gross output and final uses of commodities. The effect of these revisions on intermediate and value-added inputs can be summarized by reviewing the revisions (in absolute value) to each industry's direct requirements coefficients.⁹

More than 80 percent of the 3,843 input coefficients

9. Direct requirements coefficients are calculated for an industry's intermediate inputs and value added by dividing the intermediate input or value added amounts by the industry's gross output.

calculated for each year were less than 0.01 (table I). Forty coefficients in 2005 and six in 2004 were revised in absolute value by more than 0.01. Of the revisions greater than 0.01, about 70 percent were less than 0.02 in 2005, and in 2004, all six revisions were less than 0.02. Only one coefficient in 2005 was revised by more than 0.04.

Table I. Revisions to Commodity Inputs to Industries

1. For 2005 and 2006, the sum of value added for all industries differs from GDP due to the incorporation in the industry estimates of data from the Census Bureau's accelerated November 2007 release of the Annual Survey of Manufactures (ASM). These data were not available to be incorporated in the NIPA estimates of GDP, which were released in July 2007. The NIPA reconciliation item shows the resulting differences between corresponding estimates in the Industry Accounts and the published NIPAs, but does not indicate future revisions to the NIPAs, which will reflect the incorporation of additional key source data.

2. Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.

3. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.

4. Consists of computer and electronic products; publishing industries (includes software); information and data processing services; and computer systems design and related services.

1. For 2005 and 2006, the sum of value added for all industries differs from GDP due to the incorporation in the industry estimates of data from the Census Bureau's accelerated November 2007 release of the Annual Survey of Manufactures (ASM). These data were not available to be incorporated in the NIPA estimates of GDP, which were released in July 2007. The NIPA reconciliation item shows the resulting differences between corresponding estimates in the Industry Accounts and the published NIPAs, but does not indicate future revisions to the NIPAs, which will reflect the incorporation of additional key source data.

2. Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.

3. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.

4. Consists of computer and electronic products; publishing industries (includes software); information and data processing services; and computer systems design and related services.

1. For 2005 and 2006, the sum of value added for all industries differs from GDP due to the incorporation in the industry estimates of data from the Census Bureau's accelerated November 2007 release of the Annual Survey of Manufactures (ASM). These data were not available to be incorporated in the NIPA estimates of GDP, which were released in July 2007. The NIPA reconciliation item shows the resulting differences between corresponding estimates in the Industry Accounts and the published NIPAs, but does not indicate future revisions to the NIPAs, which will reflect the incorporation of additional key source data.

2. Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.

3. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.

4. Consists of computer and electronic products; publishing industries (includes software); information and data processing services; and computer systems design and related services.

NIPA National income and product account

1. Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.

2. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.

3. Consists of computer and electronic products; publishing industries (includes software); information and data

processing services; and computer systems design and related services.

NOTE: The industry estimates for 2005 and 2006 incorporate data from the Census Bureau's accelerated November 2007 release of the Annual Survey of Manufactures (ASM). These data were not available to be incorporated in the national income and product account (NIPA) estimates of GDP, which were released in July 2007.

1. Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The value of not allocated by industry reflects the difference between the first line and the sum of the most detailed lines, as well as the differences in source data used to estimate GDP by industry and the expenditures measure of real GDP. For 2005 and 2006, the sum of value added for all industries also differs from GDP due to the incorporation in the industry estimates of data from the Census Bureau's accelerated November 2007 release of the Annual Survey of Manufacturers (ASM). These data were not available to be incorporated in the national income and product account (NIPA) estimates of GDP, which

were released in July 2007. Estimates of Not allocated by industry do not indicate future revisions to the NIPAs, which will reflect the incorporation of additional key source data.

2. Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.

3. Consists of utilities; wholesale trade, retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.

4. Consists of computer and electronic products; publishing industries (includes software); information and data processing services, and computer systems design and related services.

1. Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.

2. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.

3. Consists of computer and electronic products; publishing industries (includes software); information and data processing services; and computer systems design and related services.

processing services; and computer systems design and related services.

NOTE: The industry estimates for 2005 and 2006 incorporate data from the Census Bureau's accelerated November 2007 release of the Annual Survey of Manufactures (ASM). These data were not available to be incorporated in the national income and product account (NIPA) estimates of GDP which were released in July 2007.

1. Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.
 2. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.
 3. Consists of computer and electronic products; publishing industries (includes software); information and data

processing services; and computer systems design and related services.
 NOTE: The industry estimates for 2005 and 2006 incorporate data from the Census Bureau's accelerated November 2007 release of the Annual Survey of Manufactures (ASM). These data were not available to be incorporated in the national income and product account (NIPA) estimates of GDP, which were released in July 2007.

1. Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.

2. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.

3. Consists of computer and electronic products; publishing industries (includes software); information and data

processing services; and computer systems design and related services.

Note: The industry estimates for 2005 and 2006 incorporate data from the Census Bureau's accelerated November 2007 release of the Annual Survey of Manufacturers (ASM). These data were not available to be incorporated in the national income and product account (NIPA) estimates of GDP which were released in July 2007.

1. Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.

2. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.

3. Consists of computer and electronic products; publishing industries (includes software); information and data

processing services; and computer systems design and related services.

Note. The industry estimates for 2005 and 2006 incorporate data from the Census Bureau's accelerated November 2007 release of the Annual Survey of Manufactures (ASM). These data were not available to be incorporated in the national income and product account (NIPA) estimates of GDP, which were released in July 2007.

1. Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.

2. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.

3. Consists of computer and electronic products; publishing industries (includes software); information and data

processing services; and computer systems design and related services.

Note: The industry estimates for 2005 and 2006 incorporate data from the Census Bureau's accelerated November 2007 release of the Annual Survey of Manufactures (ASM). These data were not available to be incorporated in the national income and product account (NIPA) estimates of GDP, which were released in July 2007.

1. Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.
 2. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.
 3. Consists of computer and electronic products; publishing industries (includes software); information and data processing services; and computer systems design and related services.

Notes: These unit-cost measures differ from the unit-labor-cost and unit-nonlabor-cost series published by the Bureau of Labor Statistics (BLS). See BLS Handbook of Methods, Bulletin 2490 (Washington, DC: U.S. Government Printing Office, April 1997).
 The industry estimates for 2005 and 2006 incorporate data from the Census Bureau's accelerated November 2007 release of the Annual Survey of Manufactures (ASM). These data were not available to be incorporated in the national income and product account (NIPA) estimates of GDP, which were released in July 2007.

1. Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.

2. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.

3. Consists of computer and electronic products; publishing industries (includes software); information and data processing services; and computer systems design and related services.

Notes: These unit-cost measures differ from the unit-labor-cost and unit-nonlabor-cost series published by the Bureau of Labor Statistics (BLS). See BLS Handbook of Methods, Bulletin 2490 (Washington, DC: U.S. Government Printing Office, April 1997).

The industry estimates for 2005 and 2006 incorporate data from the Census Bureau's accelerated November 2007 release of the Annual Survey of Manufactures (ASM). These data were not available to be incorporated in the national income and product account (NIPA) estimates of GDP, which were released in July 2007.

1. Includes noncomparable imports, scrap, used goods, inventory valuation adjustment, and rest-of-the-world adjustments.

2. Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.

3. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.

NOTE: The industry estimates for 2005 and 2006 incorporate data from the Census Bureau's accelerated November 2007 release of the Annual Survey of Manufactures (ASM). These data were not available to be incorporated in the national income and product account (NIPA) estimates of GDP, which were released in July 2007.

1. Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.
 2. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.
 3. Consists of computer and electronic products; publishing industries (includes software); information and

data processing services; and computer systems design and related services.
 Note: Percentage-point contributions do not sum to the percent change in real gross domestic product because the contribution of "not allocated by industry" is excluded. The industry estimates for 2005 and 2006 also incorporate data from the Census Bureau's accelerated November 2007 release of the Annual Survey of Manufactures (ASM). These data were not available to be incorporated in the national income and product account (NIPA) estimates of GDP, which were released in July 2007.

1. For 2005 and 2006, the sum of value added for all industries differs from GDP due to the incorporation in the industry estimates of data from the Census Bureau's accelerated November 2007 release of the Annual Survey of Manufactures (ASM). These data were not available to be incorporated in the national income and product account (NIPA) estimates of GDP, which were released in July 2007. The differences between the sum of value added for all industries and NIPA estimates of GDP do not indicate future revisions to the NIPAs, which will reflect the incorporation of additional key source data.

2. Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.

3. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.

4. Consists of computer and electronic products; publishing industries (includes software); information and data processing services; and computer systems design and related services.

1. For 2005 and 2006, the sum of value added for all industries differs from GDP due to the incorporation in the industry estimates of data from the Census Bureau's accelerated November 2007 release of the Annual Survey of Manufactures (ASM). These data were not available to be incorporated in the national income and product account (NIPA) estimates of GDP, which were released in July 2007. The differences between the sum of value added for all industries and NIPA estimates of GDP do not indicate future revisions to the NIPAs, which will reflect the incorporation of additional key source data.

2. Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.

3. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance,

real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.

4. Consists of computer and electronic products; publishing industries (includes software); information and data processing services; and computer systems design and related services.

Note. The percent changes for each industry group are shown in bold. Below each industry group, the percentage-point contributions of value added and of intermediate inputs to the percent change are shown, the percentage-point contributions of the components of intermediate inputs are also shown.

1. For 2005 and 2006, the sum of value added for all industries differs from GDP due to the incorporation in the industry estimates of data from the Census Bureau's accelerated November 2007 release of the Annual Survey of Manufactures (ASM). These data were not available to be incorporated in the national income and product account (NIPA) estimates of GDP, which were released in July 2007. The differences between the sum of value added for all industries and NIPA estimates of GDP do not indicate future revisions to the NIPAs, which will reflect the incorporation of additional key source data.

2. Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.

3. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance,

real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.

4. Consists of computer and electronic products; publishing industries (includes software); information and data processing services; and computer systems design and related services.

Note. The percent changes for each industry group are shown in bold. Below each industry group, the percentage-point contributions of Value added and of intermediate inputs to the percent change are shown; the percentage-point contributions of the components of intermediate inputs are also shown.

Survey of Manufactures (ASM). These source data were not available to be incorporated in the NIPA estimates of GDP, which were released in July 2007. The NIPA reconciliation item shows the resulting differences between corresponding estimates in the Industry Accounts and the published NIPAs, but does not indicate future revisions to the NIPAs, which will reflect the incorporation of additional key source data.

BEA Current and Historical Data

A selection of estimates from the national, industry, international, and regional accounts of the Bureau of Economic Analysis (BEA) are presented in this section. BEA's estimates are not copyrighted and may be reprinted without BEA's permission. Citing the SURVEY OF CURRENT BUSINESS and BEA as the source is appreciated.

More detailed estimates from BEA's accounts are available on BEA's Web site at <www.bea.gov>. These estimates are available in a variety of formats. In addition, news releases, articles, and other information, including methodologies and working papers, are available.

The tables present annual [A], quarterly [Q], and monthly [M] data.

National Data

A. Selected NIPA tables [A,Q]

1. Domestic product and income D-2
2. Personal income and outlays.....D-18
3. Government current receipts and expenditures ...D-21

National Data

A. Selected NIPA Tables

The selected set of NIPA tables presents the most recent estimates of gross domestic product (GDP) and its components which were released on January 30, 2008. These estimates include the "advance" estimates for the fourth quarter of 2007 and the initial estimates of annual totals for 2007.

The selected set presents quarterly estimates that are updated monthly. Annual estimates are presented in most of the tables.

The GDP news release is available on BEA's Web site within minutes after the release. To receive an e-mail notification of the release, go to <www.bea.gov> and subscribe. The "Selected NIPA Tables" are available later that day.

1. Estimates for durable goods and nondurable goods for 1996 and earlier periods are based on the 1987 Standard Industrial Classification (SIC); later estimates for these industries are based on the North American Industry Classification System (NAICS).
2. Includes government consumption expenditures, which are for services (such as education and national defense) produced by government. In current dollars, these services are valued at their cost of production.
3. Some components of final sales of computers include computer parts.

1. Estimates for durable goods and nondurable goods for 1996 and earlier periods are based on the 1987 Standard Industrial Classification (SIC); later estimates for these industries are based on the North American Industry Classification System (NAICS).

2. Includes government consumption expenditures, which are for services (such as education and national defense) produced by government. In current dollars, these services are valued at their cost of production.

3. Some components of final sales of computers include computer parts.

Note: Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line following change in private inventories is the difference between gross domestic product and the sum of final sales of domestic product and of change in private inventories; the residual line following structures is the difference between gross domestic product and the sum of the detailed lines of goods, of services, and of structures.

Gross housing value added	11	5.0	2.5	-0.2	2.9	3.1	3.4	2.4

1. Equals gross domestic product excluding gross value added of households and institutions and of general government.

2. Equals gross domestic business value added excluding gross farm value added.

3. Equals compensation of employees of nonprofit institutions, the rental value of nonresidential fixed assets owned and used by nonprofit institutions serving households, and rental income of persons for tenant-occupied housing owned by nonprofit institutions.

4. Equals compensation of general government employees plus general government consumption of fixed capital.

Gross housing value added	11	111.201	114.015	111.915	112.725	113.583	114.528	115.222

1. Equals gross domestic product excluding gross value added of households and institutions and of general government.

2. Equals gross domestic business value added excluding gross farm value added.

3. Equals compensation of employees of nonprofit institutions, the rental value of nonresidential fixed assets owned and used by nonprofit institutions serving households, and rental income of persons for tenant-occupied housing owned by nonprofit institutions.

4. Equals compensation of general government employees plus general government consumption of fixed capital.

1. Equals gross domestic product excluding gross value added of households and institutions and of general government.
 2. Equals gross domestic business value added excluding gross farm value added.
 3. Equals compensation of employees of nonprofit institutions, the rental value of nonresidential fixed assets owned and used by nonprofit institutions serving households, and rental income of persons for tenant-occupied housing owned by nonprofit institutions.
 4. Equals compensation of general government employees plus general government consumption of fixed capital.
 Note: Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

1. Consists of compensation of employees, proprietors' income with inventory valuation adjustment (IVA) and capital consumption adjustment (CCAdj), rental income of persons with CCAAdj, corporate profits with IVA and CCAAdj, net interest and miscellaneous payments, and consumption of fixed capital.
2. Consists of gross national factor income less consumption of fixed capital.

Table 1.7.6. Relation of Real Gross Domestic Product, Real Gross National Product, and Real Net National Product, Chained Dollars

[Billions of chained (2000) dollars]

Line	2006	2007	Seasonally adjusted at annual rates				
			2006		2007		
			IV	I	II	III	IV
Gross domestic product	11,319.4	11,567.3	11,395.5	11,412.6	11,520.1	11,658.9	11,677.4
Plus: Income receipts from the rest of the world	595.0		628.3	638.2	684.3	716.3	
Less: Income payments to the rest of the world	543.6		575.1	583.2	623.5	629.6	
Equals: Gross national product	11,370.1		11,447.8	11,466.7	11,580.0	11,744.6	
Less: Consumption of fixed capital	1,447.7	1,488.6	1,469.3	1,477.2	1,484.9	1,492.5	1,499.9
Private	1,217.3	1,252.0	1,236.7	1,243.1	1,249.1	1,255.1	1,260.7
Government	230.2	236.6	232.6	234.1	235.7	237.3	239.0
General government	193.9	199.3	195.9	197.2	198.6	200.0	201.5
Government enterprises	36.4	37.3	36.7	36.9	37.1	37.4	37.6
Equals: Net national product	9,923.4		9,980.5	9,991.7	10,096.9	10,253.1	
Addenda:							
Gross domestic income ¹	11,335.0		11,435.2	11,468.5	11,554.2	11,596.5	
Gross national income ²	11,385.6		11,487.5	11,522.5	11,614.1	11,682.1	
Net domestic product	9,872.8	10,080.5	9,928.3	9,937.7	10,037.2	10,167.8	10,179.2
Net domestic income ³	9,888.2		9,967.7	9,993.1	10,071.0	10,105.8	

1. Gross domestic income deflated by the implicit price deflator for gross domestic product.
2. Gross national income deflated by the implicit price deflator for gross national product.
3. Net domestic income deflated by the implicit price deflator for net domestic product.
Note: Except as noted in footnotes 1, 2 and 3, chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive.

Table 1.8.3. Command-Basis Real Gross National Product, Quantity Indexes

[Index numbers, 2000=100]

Line	2006	2007	Seasonally adjusted				
			2006		2007		
			IV	I	II	III	IV
Gross national product	115.363		116.152	116.344	117.493	119.163	
Less: Exports of goods and services and income receipts from the rest of the world	128.748		134.187	135.127	139.988	146.346	
Plus: Command-basis exports of goods and services and income receipts from the rest of the world ¹	126.109		132.865	134.476	137.646	142.832	
Equals: Command-basis gross national product	114.967		115.954	116.246	117.141	118.636	
Addendum:							
Percent change from preceding period in command-basis real gross national product	2.6		3.7	1.0	3.1	5.2	

1. Exports of goods and services and income receipts deflated by the implicit price deflator for imports of goods and services and income payments.

Table 1.8.6. Command-Basis Real Gross National Product, Chained Dollars

[Billions of chained (2000) dollars]

Line	2006	2007	Seasonally adjusted at annual rates				
			2006		2007		
			IV	I	II	III	IV
Gross national product	11,370.1		11,447.8	11,466.7	11,580.0	11,744.6	
Less: Exports of goods and services and income receipts from the rest of the world	1,904.1		1,984.5	1,998.4	2,070.3	2,164.4	
Plus: Command-basis exports of goods and services and income receipts from the rest of the world ¹	1,865.1		1,965.1	1,988.9	2,035.8	2,112.5	
Equals: Command-basis gross national product	11,331.0		11,428.3	11,457.2	11,545.4	11,692.7	
Addendum:							
Terms of trade ²	97.951		99.018	99.521	98.331	97.602	

1. Exports of goods and services and income receipts deflated by the implicit price deflator for imports of goods and services and income payments.
2. Ratio of the implicit price deflator for exports of goods and services and income receipts to the corresponding implicit price deflator for imports divided by 100.
Note: Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive.

Net value added ⁴	42	5,325.3		5,378.1	5,387.9	5,428.3	5,493.8	

1. Estimates for financial corporate business and nonfinancial corporate business for 2000 and earlier periods are based on the 1987 Standard Industrial Classification (SIC); later estimates for these industries are based on the North American Industry Classification System (NAICS).

2. The current-dollar gross value added is deflated using the gross value added chain-type price index for nonfinancial industries from the GDP-by-industry accounts. For periods when this price index is not available, the chain-type price index for GDP goods and structures is used.

3. Chained-dollar consumption of fixed capital of nonfinancial corporate business is calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100.

4. Chained-dollar net value added of nonfinancial corporate business is the difference between the gross product and the consumption of fixed capital.

1. Consists of gasoline, fuel oil, and other energy goods and of electricity and gas.

Note: Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

3. Government Current Receipts and Expenditures

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

2. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

2. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

NOTE: Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software in table 3.9.5.

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software in table 3.9.5.

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software in table 3.9.5.

Note. Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

1. National defense consumption expenditures are defense services produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).
 2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.
 3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.
 4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software.
 5. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

1. National defense consumption expenditures are defense services produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software.

5. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

1. National defense consumption expenditures are defense services produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software.

5. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

Note. Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

4. Foreign Transactions

1. Exports and imports of certain goods, primarily military equipment purchased and sold by the Federal Government, are included in services. Beginning with 1986, repairs and alterations of equipment are reclassified from goods to services.

2. Consists of capital transfers and the acquisition and disposal of nonproduced nonfinancial assets.

1. Consists primarily of religious, educational, vocational, lodging, railroads, farm, and amusement and recreational structures, net purchases of used structures, and brokers' commissions on the sale of structures.

2. Excludes software "embedded" or bundled, in computers and other equipment.

3. Includes communication equipment, nonmedical instruments, medical equipment and instruments, photocopy and related equipment, and office and accounting equipment.

4. Consists primarily of furniture and fixtures, agricultural machinery, construction machinery, mining and oilfield machinery, service industry machinery, and electrical equipment not elsewhere classified.

5. Consists primarily of manufactured homes, improvements, dormitories, net purchases of used structures, and brokers' commissions on the sale of residential structures.

6. Excludes net purchases of used structures and brokers' commissions on the sale of structures.

1. Consists primarily of religious, educational, vocational, lodging, railroads, farm, and amusement and recreational structures, net purchases of used structures, and brokers' commissions on the sale of structures.

2. Excludes software "embedded," or bundled, in computers and other equipment.

3. Includes communication equipment, nonmedical instruments, medical equipment and instruments, photocopy and related equipment, and office and accounting equipment.

4. Consists primarily of furniture and fixtures, agricultural machinery, construction machinery, mining and oilfield machinery, service industry machinery, and electrical equipment not elsewhere classified.

5. Consists primarily of manufactured homes, improvements, dormitories, net purchases of used structures, and brokers' commissions on the sale of residential structures.

6. Excludes net purchases of used structures and brokers' commissions on the sale of structures.

Residential structures.....	29	484.3	401.0	448.0	425.5	414.9	395.0	368.7

1. Consists primarily of religious, educational, vocational, lodging, railroads, farm, and amusement and recreational structures, net purchases of used structures, and brokers' commissions on the sale of structures.
2. The quantity index for computers can be used to accurately measure the real growth rate of this component. However, because computers exhibit rapid changes in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series; accurate estimates of these contributions are shown in table 5.3.2 and real growth rates are shown in table 5.3.1.
3. Excludes software "embedded," or bundled, in computers and other equipment.
4. Includes communication equipment, nonmedical instruments, medical equipment and instruments, photocopy and related equipment, and office and accounting equipment.
5. Consists primarily of furniture and fixtures, agricultural machinery, construction machinery, mining and oilfield machinery, service industry machinery, and electrical equipment not elsewhere classified.
6. Consists primarily of manufactured homes, improvements, dormitories, net purchases of used structures, and brokers' commissions on the sale of residential structures.
7. Excludes net purchases of used structures and brokers' commissions on the sale of structures.

Note. Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

1. This series is derived from the Census Bureau series "current cost inventories."
 2. The inventory valuation adjustment (IVA) shown in this table differs from the IVA that adjusts business incomes. The IVA in this table reflects the mix of methods (such as first-in, first-out and last-in, first-out) underlying inventories derived primarily from Census Bureau statistics (see footnote 1). This mix differs from that underlying business income derived primarily from Internal Revenue Service statistics.
- Note. Estimates in this table are based on the North American Industry Classification System (NAICS).

- Note. Estimates in this table are based on the North American Industry Classification System (NAICS). Chained (2000) dollar series for real change in private inventories are calculated as the period-to-period change in chained-dollar end-of-period inventories. Quarterly changes in end-of-period inventories are stated at annual rates. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

Nonfarm inventories to final sales of goods and structures	29	3.84	3.85	3.86	3.85	3.95

1. Inventories are as of the end of the quarter. The quarter-to-quarter change in inventories calculated from current-dollar inventories in this table is not the current-dollar change in private inventories component of GDP. The former is the difference between two inventory stocks, each valued at its respective end-of-quarter prices. The latter is the change in the physical volume of inventories valued at average prices of the quarter. In addition, changes calculated from this table are at quarterly rates, whereas, the change in private inventories is stated at annual rates.

2. Quarterly totals at monthly rates. Final sales of domestic business equals final sales of domestic product less gross output of general government, gross value added of nonprofit institutions, compensation paid to domestic workers, and space rent for owner-occupied housing. It includes a small amount of final sales by farm and by government enterprises. Note. Estimates in this table are based on the North American Industry Classification System (NAICS).

Nonfarm inventories to final sales	29	2.24	2.24	2.21	2.20	2.19
Nonfarm inventories to final sales of goods and structures	30	3.61	3.61	3.57	3.54	3.52

1. Inventories are as of the end of the quarter. The quarter-to-quarter changes calculated from this table are at quarterly rates, whereas the change in private inventories component of GDP is stated at annual rates.

2. Quarterly totals at monthly rates. Final sales of domestic business equals final sales of domestic product less gross output of general government, gross value added of nonprofit institutions, compensation paid to domestic workers, and space rent for owner-occupied housing. It includes a small amount of final sales by farm and by government enterprises. Note. Estimates in this table are based on the North American Industry Classification System (NAICS).

Chained (2000) dollar inventory series are calculated to ensure that the chained (2000) dollar change in inventories for 2000 equals the current-dollar change in inventories for 2000 and that the average of the 1999 and 2000 end-of-year chain-weighted and fixed-weighted inventories are equal.

Addenda:								
Final sales of motor vehicles to domestic purchasers	43	530.0	513.2	532.1	525.9	510.5	507.0	509.6
Private fixed investment in new autos and new light trucks	44	183.0	183.5	182.7	181.6	178.1	190.0	184.2
Domestic output of new autos ²	45	104.5	100.1	101.9	99.5	97.3	102.5	101.3
Sales of imported new autos ³	46	101.9	105.6	105.5	104.1	107.4	104.5	106.6

1. Consists of used light trucks only.

2. Consists of final sales and change in private inventories of new autos assembled in the United States.

3. Consists of personal consumption expenditures, private fixed investment, and gross government investment.

NOTE: Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines, excluding the lines in the addenda.

C. Historical Measures

This table is derived from the "Selected NIPA Tables" that are published in this issue and from the "GDP and Other Major NIPA Series" tables that were published in the August 2007 issue. (The changes in prices are calculated from indexes expressed to three decimal places.)

Table C.1. GDP and Other Major NIPA Aggregates—Continues

1. Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.

2. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other

services, except government.

3. Consists of computer and electronic products; publishing industries (includes software); information and data processing services; and computer systems design and related services.

International Data

F. Transactions Tables

Selected U.S. international transactions tables are presented in this section. For BEA's full set of detailed estimates of U.S. international transactions, visit BEA's Web site at <www.bea.gov>.

Table F.1. U.S. International Transactions in Goods and Services

p Preliminary

r Revised

1. Represents gains or losses on foreign-currency-denominated assets and liabilities due to their revaluation at current exchange rates.

2. Includes changes in coverage, capital gains and losses of direct investment affiliates, and other adjustments to the value of assets and liabilities.

3. Financial flows and valuation adjustments for financial derivatives are available only on a net basis, which is shown on line 2; they are not separately available for gross positive fair values and gross negative fair values of financial derivatives. Consequently, columns (a) through (d) on lines 4, 5, and 24, 25 are not available.

4. Data are not separately available for the three types of valuation adjustments; therefore, the sum of all three types is shown in column (d). Price changes result from changes in the value of derivatives contracts due to changes in the value of their underlying assets or reference rates, which may arise from movements in interest rates, stock prices, commodity prices, or other variables. Exchange-rate changes result from the revaluation of foreign-currency-denominated derivatives contracts at current exchange rates. "Other changes" can result when

data on investment positions that had accumulated in prior periods are covered by a new or more complete survey.

5. Reflects changes in the value of the official gold stock due to fluctuations in the market price of gold.

6. Reflects changes in gold stock from U.S. Treasury sales of gold medallions and commemorative and bullion coins; also reflects replenishment through open market purchases. These demonetizations/monetizations are not included in international transactions financial flows.

7. Also includes paid-in capital subscriptions to international financial institutions and outstanding amounts of miscellaneous claims that have been settled through international agreements to be payable to the U.S. Government over periods in excess of 1 year. Excludes World War I debts that are not being serviced.

8. Includes indebtedness that the borrower may contractually, or at its option, repay with its currency, with a third country's currency, or by delivery of materials or transfer of services.

9. Primarily U.S. Government liabilities associated with military sales contracts and other transactions arranged with or through foreign official agencies.

D Suppressed to avoid disclosure of data of individual companies.

1. For 2003-2005, income without current-cost adjustment is presented net, or after deduction, of U.S. and foreign withholding taxes. For 2006, it is presented gross, or before deduction, of U.S. and foreign withholding taxes.

In 2006, income without current-cost adjustment and net of withholding taxes was \$290,291 million.

NOTE: The data in this table are from tables 16 and 17 in "U.S. Direct Investment Abroad: Detail for Historical-Cost Position and Related Capital and Income Flows, 2006" in the September 2007 SURVEY OF CURRENT BUSINESS.

D Suppressed to avoid disclosure of data of individual companies.

1. For 2003-2005, income without current-cost adjustment is presented net, or after deduction, of U.S. and foreign withholding taxes. For 2006, it is presented gross, or before deduction, of U.S. and foreign withholding taxes.

In 2006, income without current-cost adjustment and net of withholding taxes was \$128,405 million.

NOTE: The data in this table are from tables 16 and 17 in "Foreign Direct Investment in the United States: Detail for Historical-Cost Position and Related Capital and Income Flows, 2006" in the September 2007 SURVEY OF CURRENT BUSINESS.

Table I.3. Disposable Personal Income and Per Capita Disposable Personal Income by State and Region

Table with 14 columns: Area name, Disposable personal income (Millions of dollars) for years 2001-2006, Percent change (2005-2006), Per capita disposable personal income (Dollars) for years 2001-2006, and Rank in United States (2006). Rows include United States, New England, Midwest, Great Lakes, Plains, Southeast, Southwest, Rocky Mountain, and Far West.

1. Per capita disposable personal income was computed using midyear population estimates of the Census Bureau.
2. Percent change was calculated from unrounded data.

methodologies used to prepare the estimates, and in the timing of the availability of source data.
Source: Table 1 "State Personal Income: Second Quarter of 2007 and Revised Estimates for 2004-2007:" in the October 2007 SURVEY OF CURRENT BUSINESS.

NOTE: The personal income level shown for the United States is derived as the sum of the state estimates. It differs from the estimate of personal income in the national income and product accounts because of differences in coverage, in the

A. Additional Information About the NIPA Estimates

Statistical Conventions

Current-dollar GDP is a measure of the market value of goods, services, and structures that are produced in the economy in a particular period. The changes in current-dollar GDP can be decomposed into quantity and price components. Quantities, or “real” measures, and prices are expressed as index numbers with the reference year—at present, the year 2000—equal to 100.¹

The annual changes in quantities and prices are calculated using a Fisher formula that incorporates weights from 2 adjacent years. For example, the annual percent change in real GDP for 2001–2002 uses prices for 2001 and 2002 as weights, and the 2001–2002 annual percent change in the GDP price index uses quantities for 2001 and 2002 as weights. Because the Fisher formula allows for the effects of changes in relative prices and in the composition of output over time, the resulting quantity or price changes are not affected by the substitution bias that is associated with changes in quantities and prices calculated using a fixed-weighted formula. These annual changes are “chained” (multiplied) together to form time series of quantity and price indexes. The percent changes in the Fisher indexes are not affected by the choice of the reference year.

BEA also publishes implicit price deflators (IPDs), which are calculated as the ratio of the current-dollar value of a component to the chained-dollar value of the component, multiplied by 100. The values of an IPD are very close to the values of the corresponding “chain-type” price index.

The measures of real GDP and its major components are also presented in dollar-denominated form, designated “chained (2000) dollar estimates.” For most series, these estimates are computed by multiplying the current-dollar value in 2000 by a corresponding quantity index number and then dividing by 100. For example, if a current-dollar GDP component equaled \$100 in 2000 and if real output for this component increased by 10 percent in 2001, then the chained (2000) dollar value of this component in 2001 would be \$110 ($\100×1.10). The percent changes calculated from the chained (2000) dollar estimates and from the quantity indexes are the same; any differences will be small and due to rounding.

The chained-dollar values for the detailed GDP components will not necessarily sum to the chained-dollar estimate of GDP (or to any intermediate aggregate) in a table, because the relative prices that are used as weights for any period other than the reference year differ from those of the reference year. A measure of the effect of such

differences is provided by a “residual” line—the difference between the chained-dollar value of the main aggregate in the table and the sum of the most detailed components in the table. For periods close to the reference year, when the relative prices that are used as weights have usually not changed much, the residuals tend to be small, and the chained-dollar estimates can be used to approximate the contributions to growth and to aggregate the detailed estimates. For periods further from the reference year, the residuals tend to be larger, and the chained-dollar estimates are less useful for analyses of contributions to growth. In particular, for components for which relative prices are changing rapidly, the calculation of contributions based on chained-dollar estimates may be misleading even just a few years from the reference year. Thus, contributions derived from quantity indexes provide a better measure than contributions derived from chained-dollar estimates; contributions based on quantity indexes are shown in selected NIPA tables 1.1.2, 1.2.2, 1.5.2, 2.3.2, 3.9.2, 4.2.2, and 5.3.2.

For quarters and months, NIPA estimates are presented at annual rates, which show the value that would be registered if the rate of activity that is measured for a quarter or for a month were maintained for a full year. Annual rates are used so that periods of different lengths—for example, quarters and years—may be more easily compared. These annual rates are determined simply by multiplying the estimated rate of activity by 4 (for quarterly data) or by 12 (for monthly data).

For most quarterly NIPA estimates, *percent changes* in the estimates are also expressed at annual rates. Calculating these *changes* requires a variant of the compound interest formula:

$$r = \left[\left(\frac{x_t}{x_0} \right)^{m/n} - 1 \right] \times 100$$

where r is the percent change at an annual rate; x_t is the level of activity in the later period; x_0 is the level of activity in the earlier period; m is the periodicity of the data (for example, 1 for annual data, 4 for quarterly data, or 12 for monthly data); and n is the number of periods between the earlier periods and the later periods (that is, $t - 0$).

Quarterly and monthly NIPA estimates are seasonally adjusted if necessary. Seasonal adjustment removes from the time series the average effects of variations that normally occur at about the same time and in about the same magnitude each year—for example, weather, holidays, and tax payment dates. After seasonal adjustment, cyclical and other short-term changes in the economy stand out more clearly.

1. Consists of statistical revisions to the ITAs that have not yet been incorporated into the NIPAs.
 ITAs International transactions accounts
 NIPAs National income and product accounts

B. Suggested Reading

The Bureau of Economic Analysis (BEA) has published a wealth of information about the methodologies that are used to prepare its national, industry, international, and regional accounts. Most of this information is available on BEA's Web site at <www.bea.gov>; see "Methodology Papers" and the SURVEY OF CURRENT BUSINESS under "Publications."

National accounts

The national accounts encompass the detailed estimates in the national income and product accounts (including gross domestic product) and the estimates of fixed assets and consumer durable goods.

National income and product accounts (NIPAs). This series of papers documents the conceptual framework of the NIPAs and the methodologies that have been used to prepare the estimates.

An Introduction to National Income and Product Accounts (2007)

Corporate Profits: Profits Before Tax, Profits Tax Liability, and Dividends (2002)

Government Transactions (1988)

Measuring the Economy: A Primer on GDP and the National Income and Product Accounts (2007)

Personal Consumption Expenditures (1990)

The methodologies described in these papers have been updated and improved, typically as part of the comprehensive and annual revisions of the NIPAs.

The following SURVEY articles describe the most recent comprehensive revision of the NIPAs.

"Improved Estimates of the National Income and Product Accounts for 1929–2002: Results of the Comprehensive Revision" (February 2004)

"Preview of the Revised NIPA Estimates for 1997 Effects of Incorporating the 1997 Benchmark I-O Accounts and Proposed Definitional and Statistical Changes" (January 2003)

"Preview of the 2003 Comprehensive Revision of the National Income and Product Accounts"

Changes in Definitions and Classifications (June 2003)

New and Redesigned Tables (August 2003)

Statistical Changes (September 2003)

"Measuring the Services of Commercial Banks in the NIPAs: Changes in Concepts and Methods" (September 2003)

"Measuring the Services of Property-Casualty Insurance in the NIPAs: Changes in Concepts and Methods" (October 2003)

In addition, see the following articles.

"Annual Revision of the National Income and Product Accounts" (August 2007) presents revisions and describes any changes in the data and the methods that are used to prepare the estimates.

"Updated Summary NIPA Methodologies" (November 2007) describes the source data and the methods that are used to prepare the current-dollar and real estimates of GDP.

"Chained-Dollar Indexes: Issues, Tips on Their Use, and Upcoming Changes" (November 2003) discusses the advantages of using chain-weighted indexes and the challenges of using chained dollars.

"Reliability of the NIPA Estimates of U.S. Economic Activity" (February 2005) evaluates the principal NIPA estimates by examining the record of revisions to them.

"Gross Domestic Product: Revisions and Source Data" (February 2006) describes the categories of data that are used for the advance, preliminary, and final quarterly estimates of GDP.

Fixed assets and consumer durable goods. *Fixed Assets and Consumer Durable Goods in the United States, 1925–97* (2003) discusses the concepts and statistical considerations that underlie the estimates and their derivation.

"Fixed Assets and Consumer Durable Goods for 1925–2002" (May 2004) describes the improvements that were incorporated into these estimates as part of the most recent comprehensive NIPA revision.

"Fixed Assets and Consumer Durable Goods for 1997–2006" (September 2007) provides estimates that reflect the incorporation of the most recent annual NIPA revision.

Satellite accounts. These accounts extend the analytical capacity of the NIPAs by focusing on the effects of a particular aspect of economic activity on GDP.

"Research and Development Satellite Account"

For 1959–2002 (December 2006)

For 1959–2004 (October 2007)

Mission Statement and Strategic Plan

The mission statement of the Bureau of Economic Analysis and its most recently updated strategic plan for improving the accuracy, reliability, and relevance of the national, industry, regional, and international accounts are available on BEA's Web site at <www.bea.gov> under "About BEA."

Industry accounts

The industry accounts consist of the annual industry accounts (the input-output accounts and the gross-domestic-product-by-industry accounts), the benchmark input-output accounts, and one satellite account.

Annual industry accounts. “Improved Annual Industry Accounts for 1998–2003” (June 2004) describes the comprehensive revision of the annual input-output accounts and the GDP-by-industry accounts that features the integration of the two sets of accounts.

“Annual Industry Accounts” (December 2006) presents the annual revision of these accounts and describes the source data and any changes in the methods that are used to prepare the estimates.

“Preview of the Comprehensive Revision of the Annual Industry Accounts: Integrating the Annual Input-Output Accounts and the Gross-Domestic-Product-by-Industry Accounts” (March 2004) provides the details about the comprehensive revision.

Benchmark input-output accounts. “Preview of the Benchmark Input-Output Accounts for 2002” (September 2005) includes the proposed new sectors that are based on the 2002 North American Industry Classification System.

“U.S. Benchmark Input-Output Accounts, 2002” (October 2007)

Satellite accounts. These accounts extend the analytical capacity of the input-output accounts by focusing on a particular aspect of economic activity.

“U.S. Travel and Tourism Satellite Accounts”

For 1998–2003 (September 2004)

For 2001–2004 (June 2005)

For 2002–2005 (June 2006)

For 1998–2006 (June 2007)

International accounts

The international accounts encompass the international transactions accounts, direct investment, and international transactions in services.

International transactions accounts. *The Balance of Payments of the United States: Concepts, Data Sources, and Estimating Procedures* (1990) describes the methodologies used to prepare the estimates in the ITAs and the international investment position of the United States. These methodologies are usually updated and improved as part of the annual revisions of the international transactions accounts.

The annual revisions of the international transactions accounts are described in a series of articles, the latest of which was published in the July 2007 SURVEY.

Direct investment. *International Direct Investment: Studies by the Bureau of Economic Analysis* (1999) is a collection of previously published articles on U.S. di-

rect investment abroad and foreign direct investment in the United States. It includes “A Guide to BEA Statistics on U.S. Multinational Companies,” which is also available in the March 1995 SURVEY, and “A Guide to BEA Statistics on Foreign Direct Investment in the United States,” which is also available in the February 1990 SURVEY.

In addition, the updated methodologies are available in *U.S. Direct Investment Abroad: Final Results From the 1999 Benchmark Survey* (2004) and in *Foreign Direct Investment in the United States: Final Results From the 2002 Benchmark Survey* (2006).

International services. *U.S. International Transactions in Private Services: A Guide to the Surveys Conducted by the Bureau of Economic Analysis* (1998) describes 11 surveys. It includes classifications, definitions, release schedules, the methods used to prepare the estimates, and samples of the survey forms.

“Selected Issues in the Measurement of U.S. International Services” (June 2002) describes key issues in defining and measuring insurance, wholesale and retail trade, finance, construction, and utilities services and explores possible actions to address these issues.

Regional accounts

The regional accounts include estimates of personal income and gross domestic product. The following methodologies are available on BEA’s Web site at <www.bea.gov/regional/methods.cfm>.

Personal income. Estimates of personal income are prepared for states and for local areas.

State Personal Income (2007) describes the improvements in the methodology that are used to prepare the estimates.

Local Area Personal Income (2007) describes the detailed methodology that is used to prepare the estimates for counties, metropolitan divisions and areas, micropolitan areas, BEA economic areas and regions.

Gross domestic product. Estimates of gross domestic product (GDP) are prepared for states and metropolitan areas.

Gross Domestic Product by State (2006) describes the sources and the methods that are used to prepare the estimates.

“Gross Domestic Product by State for 2003–2006” (July 2007) presents the most recent annual revision.

“Introducing New Measures of the Metropolitan Economy: Prototype GDP-by-Metropolitan-Area Estimates for 2001–2005” (November 2007) describes the potential uses of the estimates and the methodology used to prepare them.
