### **BEA Advisory Committee**

The BEA Advisory Committee advises the Director of BEA on matters related to the development and improvement of BEA's national, regional, industry, and international economic accounts, especially in areas of new and rapidly growing economic activities arising from innovative and advancing technologies, and it provides recommendations from the perspective of business economists, academicians, researchers, and experts in government and international affairs.

June 2009

Volume 89 • Number 6

**1 GDP and the Economy: Preliminary Estimates for the First Quarter of 2009**

Real GDP fell 5.7 percent after falling 6.3 percent in the fourth quarter. Consumer spending turned up sharply, and business investment fell more than in the fourth quarter. Corporate profits increased \$42.6 billion after decreasing \$250.3 billion.

**11 Government Receipts and Expenditures: First Quarter of 2009**

Net government saving decreased \$231.5 billion to -\$904.6 billion. Net federal government saving decreased \$254.8 billion to -\$830.4 billion. Net state and local government saving increased \$23.2 billion to -\$74.2 billion.

**15 NIPA Translation of the Fiscal Year 2010 Federal Budget**

Each year BEA prepares federal government estimates that are based on the proposed budget of the U.S. government. This analysis is often used to gauge the effects of the federal budget on U.S. economic activity.

17 American Recovery and Reinvestment Act of 2009

22 Treatment of Financial Stabilization Programs

**25 U.S. Travel and Tourism Satellite Accounts for 2005–2008**

The travel and tourism industry in 2008 shrank for the first time in 7 years, decreasing 1.8 percent after increasing 1.7 percent in 2007 and 2.9 percent in 2006. Employment also declined.

**40 BEA Briefing: A Primer on BEA's Industry Accounts**

This introduction to the BEA industry accounts—which include the GDP by industry accounts and the benchmark and annual input-output accounts—looks at the computer and electronic products industry to show what kind of information is readily available.

---

[www.bea.gov](http://www.bea.gov)

**54 Foreign Direct Investment in the United States: New Investment in 2008**

Outlays by foreign investors to acquire or to establish U.S. businesses rose 3 percent to \$260.4 billion in 2008, the third largest on record after rising to \$251.9 billion in 2007. The 2008 increase occurred despite a falloff of worldwide mergers and acquisitions and amid a slowing U.S. economy.

**62 Gross Domestic Product by State for 2005–2008**

Real gross domestic product (GDP) slowed in 38 states and all 8 BEA regions in 2008. The economy was weakest in the Great Lakes region and strongest in the Rocky Mountain region.

## Director's Message

Our industry accounts provide a wealth of information about the economy and the industries that make up the economy. A familiarity with these accounts—which include the gross domestic product (GDP) by industry accounts and the benchmark and annual input-output accounts—provide a wealth of information for researchers and analysts. If only people knew about them! To provide an overview of these accounts and tell how they might be used, we're including a primer in this issue.

Elsewhere in this issue, we present our translation of the President's budget for fiscal year 2010 into a framework consistent with our national economic accounts. The annual translation, which researchers find useful, provides a tool to help gauge how proposed federal spending might affect gross domestic product and other measures.

Another article presents our annual update of our travel and tourism satellite accounts, which showed that real output in the industry declined in 2008—the first decline in 7 years. Employment also declined.

We also provide new statistics on real gross domestic product by state. In 2008, growth decelerated in 38 states and all 8 Bureau of Economic Analysis regions. We've pushed up the publication date of this article to June. Previously, it appeared in July.

Updated statistics on spending by foreign direct investors to acquire or establish U.S. businesses are discussed in another article. Such spending rose 3 percent in 2008 after rising 52 percent in 2007.

In addition, you'll find the most recent GDP statistics and government receipts and expenditures statistics in easy-to-read formats.

J. Steven Landefeld  
Director, Bureau of Economic Analysis

## Taking Account...

### Another look at the great moderation

Starting in roughly 1984, the volatility of annual economic growth began a noticeable decline—a phenomenon that some economists call the “great moderation.” Bruce T. Grimm and Brian K. Sliker, economists at the Bureau of Economic Analysis (BEA), have taken a new look at the great moderation, basing their analysis on specific states, regions, industries, and industry groups and how they affect the volatility of overall economic growth.

Specifically, they disaggregated gross domestic product (GDP) growth by states and economic regions as well as by 63 industries and 13 industry groups. A key finding of the study is that declines in covariances—between states and regions as well as industries and industry groups—are the key factors leading to a decline in the volatility for the whole economy.

These covariances measure the effects of the interactions between industries or states on the aggregate economy. A decline in the covariance between two industries suggests a decline in the tendency of the industries’ output to move in concert.

Some specific conclusions:

- Declines in the volatility of states, regions, industries, and industry groups do not account for much of the decline in the volatility of GDP growth. In fact, when disaggregating by regions and industry groups, less than one-eighth of the decline in the variance of GDP growth is due to declines in variances of the regions and industry groups. When disaggregating by states and individual industries, less than one-fiftieth of the decline is due to declines in their variances.
- Increases in the shares of services industries have been roughly offset by declines in the shares of even less volatile government industries. Thus, changes in shares, on net, have not been important components in the overall decline in volatility. This runs counter to the view of some analysts that an increased share of less volatile services industries and a decreased share of more volatile manufacturing industries have led to reduced volatility.
- Explanations of the decline in volatility suggested by some analysts—such as better inventory management, improved labor markets, and better technology in general—seem best suited for some specific industries or industry groups rather than for the entire economy.
- Declines in volatility are far from universal across regions and industries. Just under half of industries and nearly one-third of states experienced increases in volatility. In nearly one-fourth of economic regions and industry groups, there were increases

in the variance of GDP-by-state growth. These increases are not consistent with the general explanations that have been advanced for great moderation.

Grimm and Sliker’s paper also takes a brief look at an earlier, very large decline in volatility that occurred after the era of the Great Depression and World War II. The paper suggests that institutional factors have historically been important in determining volatility.

The paper is available at [www.bea.gov](http://www.bea.gov) by clicking on “Papers and Working Papers” and then on “Working Papers.”

### International research by special sworn employees

BEA maintains a program that permits outside researchers to work onsite as unpaid “special sworn employees,” allowing them to conduct analytical and statistical studies on approved projects using detailed data collected by BEA on multinational companies and international service transactions. This microdata is not publicly available.

The work in this special program is conducted under strict guidelines and procedures that protect the confidentiality of company-specific data, as required by law.

For a look at the research performed by program participants, see [www.bea.gov/papers/SSE\\_papers.htm](http://www.bea.gov/papers/SSE_papers.htm). Questions can be addressed to William Zeile at [william.zeile@bea.gov](mailto:william.zeile@bea.gov).

# GDP and the Economy

## Preliminary Estimates for the First Quarter of 2009

**R**EAL GROSS domestic product (GDP) decreased at an annual rate of 5.7 percent in the first quarter of 2009, according to the “preliminary” estimates of the national income and product accounts (NIPAs) (chart 1 and table 1).<sup>1</sup> In the advance estimate, it was 6.1 percent. In the fourth quarter, real GDP decreased 6.3 percent.

The smaller decrease in real GDP in the first quarter than in the fourth quarter reflected a larger decrease in imports and a notable upturn in consumer spending. In contrast, inventory investment and nonresidential structures both decreased more than in the fourth quarter, and federal government spending turned down.<sup>2</sup>

- Prices of goods and services purchased by U.S. residents decreased 1.0 percent after decreasing 3.9 percent (see page 8). Energy prices decreased less in the first quarter, and food prices decelerated. Excluding food and energy, gross domestic purchases prices increased 1.4 percent after increasing 1.2 percent. The federal pay raise for civilian and military personnel added 0.3 percentage point to the percent change in the gross domestic purchases price index in the first quarter.
- Real disposable personal income (DPI) increased 6.5 percent after increasing 2.9 percent (revised). The acceleration mainly reflected an upturn in current-dollar DPI, which was revised up 0.3 percentage point in the first quarter; it was 0.2 percentage point less negative in the fourth quarter.
- Profits from current production increased \$42.6 billion after decreasing \$250.3 billion (see page 10).
- The personal saving rate, personal saving as a percentage of current-dollar DPI, was 4.4 percent in the first quarter; in the fourth quarter, it was 3.2 percent (unrevised).

1. “Real” estimates are in chained (2000) dollars, and price indexes are chain-type measures. Each GDP estimate for a quarter (advance, preliminary, and final) incorporates increasingly comprehensive and improved source data. More information can be found at [www.bea.gov/about/infoqual.htm](http://www.bea.gov/about/infoqual.htm) and [www.bea.gov/faq/national/gdp\\_accuracy.htm](http://www.bea.gov/faq/national/gdp_accuracy.htm). Quarterly estimates are expressed at seasonally adjusted annual rates, which assumes that a rate of activity for a quarter is maintained for a year.

2. In this article, “consumer spending” refers to “personal consumption expenditures,” “inventory investment” refers to “change in private inventories,” and “government spending” refers to “government consumption expenditures and gross investment.”

*Christopher Swann prepared this article.*

**Chart 1. GDP, Prices, Disposable Personal Income (DPI)**

1. The estimates of GDP under the contribution columns are also percent changes.

NOTE. Percent changes are from NIPA table 1.2.1, contributions are from NIPA table 1.2.2, and shares are calculated from NIPA table 1.2.5.

Consumer spending rebounded in the first quarter of 2009, increasing 1.5 percent after decreasing 4.3 percent; consumer spending contributed 1.08 percentage points to the percent change in real GDP. Spending for durable goods turned up, and spending for nondurable goods decreased less than in the fourth quarter. Spending for services slowed slightly.

Nonresidential fixed investment decreased more than in the fourth quarter of 2008; it reduced the first-quarter percent change in real GDP by 4.54 percentage points.

Residential investment continued to decline, decreasing 38.7 percent, the largest decrease since the second quarter of 1980. The decrease reduced the first-quarter percent change in real GDP by 1.39 percentage points.

Inventory investment reduced the first-quarter percent change in real GDP by 2.34 percentage points.

Exports decreased more than in the fourth quarter and reduced the first-quarter percent change in real GDP by 3.86 percentage points.

Imports declined substantially more in the first quarter than in the fourth quarter. The larger first-quarter decrease added 6.05 percentage points to the percent change in real GDP; imports are subtracted in the calculation of GDP.

Federal government spending turned down, decreasing 4.3 percent after increasing 7.0 percent.

State and local government spending decreased 2.9 percent after decreasing 2.0 percent.

Real final sales of domestic product, real GDP less inventory investment, decreased 3.4 percent in the first quarter after decreasing 6.2 percent in the fourth quarter.

Motor vehicle output continued to decline, decreasing 56.5 percent after decreasing 62.8 percent.

Final sales of computers turned up, increasing 10.8 percent after decreasing 4.8 percent.

## Consumer Spending

Consumer spending for durable goods turned up sharply in the first quarter, increasing 9.6 percent after decreasing 22.1 percent. The upturn primarily reflected an upturn in motor vehicles and parts. Spending for "other" durable goods and for furniture and household equipment also turned up.

Spending for nondurable goods decreased less than in the fourth quarter. Spending for food decreased much less than in the fourth quarter. Spending for "other" nondurables and for clothing and shoes turned up.

Spending for services slowed slightly. Medical care services slowed, and housing turned down. In contrast, recreation turned up, and transportation decreased less than in the fourth quarter.

1. The estimates under the contribution columns are also percent changes.  
 2. Includes jewelry and watches, ophthalmic products and orthopedic equipment, books and maps, bicycles and motorcycles, guns and sporting equipment, photographic equipment, boats, and pleasure aircraft.  
 3. Includes tobacco, toilet articles, drug preparations and sundries, stationery and writing supplies, toys, film, flowers, cleaning preparations and paper products, semidurable house furnishings, and magazines and newspapers.  
 4. Includes personal care, personal business, education and research, religious and welfare activities, and net foreign travel.  
 NOTE. Percent changes are from NIPA table 2.3.1, and contributions, from NIPA table 2.3.2; shares are calculated from NIPA table 2.3.5.

1. The estimates of fixed investment under the contribution columns are also percent changes.  
 2. Consists primarily of religious, educational, vocational, lodging, railroads, farm, and amusement and recreational structures, net purchases of used structures, and brokers' commissions on the sale of structures.  
 3. Excludes software "embedded," or bundled, in computers and other equipment.  
 4. Includes communication equipment, nonmedical instruments, medical equipment and instruments, photocopy and related equipment, and office and accounting equipment.  
 5. Consists primarily of furniture and fixtures, agricultural machinery, construction machinery, mining and oilfield machinery, service industry machinery, and electrical equipment not elsewhere classified.  
 6. Consists primarily of manufactured homes, improvements, dormitories, net purchases of used structures, and brokers' commissions on the sale of residential structures.  
 NOTE: Percent changes are from NIPA table 5.3.1, contributions are from NIPA table 5.3.2, and shares are calculated from NIPA table 5.3.5.

Private fixed investment decreased more in the first quarter than in the fourth quarter, reflecting larger decreases in both nonresidential fixed investment and in residential investment.

Nonresidential fixed investment decreased 36.9 percent, the largest decrease on record, reflecting larger decreases in structures and in equipment and software.

Investment in structures decreased 42.3 percent after decreasing 9.4 percent. Mining exploration, shafts, and wells turned down sharply, and power and communication decreased more than in the fourth quarter. In contrast, investment in manufacturing structures accelerated.

Investment in equipment and software decreased more than in the fourth quarter, mainly reflecting a larger decrease in industrial equipment. In contrast, information processing equipment and software decreased less in the first quarter.

Residential investment decreased more than in the fourth quarter, mainly reflecting a larger decrease in single-family structures.

**Chart 3. Real Private Fixed Investment**

Contributions to the change in real private fixed investment in 2009:1

U.S. Bureau of Economic Analysis

**Private Investment in Structures**

Private investment in structures includes spending on structures by businesses, households and nonprofit institutions. Most structures are buildings; structures are classified as residential or nonresidential.

For more information, see the *BEA Briefing* "How BEA Accounts for Investment in Private Structures" in the February 2009 SURVEY.

Nonfarm inventories to final sales.....	2.19	2.14	2.15	2.19	2.18	.....	.....	.....	.....
Nonfarm inventories to final sales of goods and structures.....	3.56	3.45	3.48	3.64	3.66	.....	.....	.....	.....

1. The levels are from NIPA table 5.6.6B.  
 2. The residual is the difference between the first line and the sum of the most detailed lines. It reflects that chained-dollar estimates are usually not additive, because they are based on quantity indexes that use weights of more than one period.  
 3. The ratios are from NIPA table 5.7.6B.

### Inventory Investment

The real change in private inventories, often called real private inventory investment, represents the change in the physical stock of goods held by businesses. It includes finished goods, goods at various stages of production, and raw materials.

The change in private inventories is a key component of gross domestic product (GDP), which aims to measure output derived from current production. To include the value of currently produced goods that are not yet sold and to exclude the value of goods produced in previous periods, change in private inventories must be included in the GDP calculation.

Thus, GDP can also be seen as the sum of final sales of domestic product and the change in private inventories (table 2).

For most industries, the estimates of change in private inventories are prepared by revaluing book-value estimates of inventories from the Census Bureau to a replacement-cost basis and calculating the change over a quarter or a year. BEA does not always have complete data for every industry.

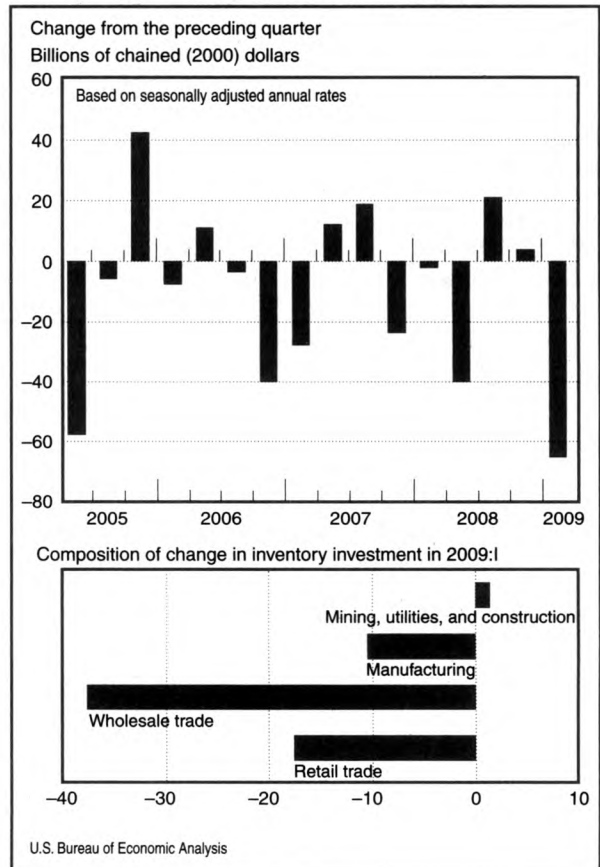

Real inventory investment decreased \$65.6 billion in the first quarter after increasing \$3.8 billion in the fourth quarter.

Inventory investment in manufacturing industries decreased \$10.5 billion after increasing \$24.9 billion. The decrease mainly resulted from a drawdown in durable-goods industries in the first quarter after a fourth-quarter accumulation. The drawdown in nondurable-goods industries was less than in the fourth quarter.

Inventory investment in wholesale trade industries decreased \$37.6 billion after decreasing \$5.7 billion. The larger first-quarter decrease mainly reflected a larger drawdown of durable-goods industries than in the fourth quarter.

Inventory investment in retail trade industries decreased \$17.6 billion after decreasing \$31.7 billion. A larger first-quarter liquidation of inventories by motor vehicle and parts dealers was partly offset by a smaller liquidation of inventories by other retail stores.

**Chart 4. Real Private Inventory Investment**

## Exports and Imports

<b>Imports of services<sup>2</sup></b> .....	<b>20.5</b>	<b>-8.0</b>	<b>3.3</b>	<b>-6.7</b>	<b>-4.3</b>	<b>-1.29</b>	<b>0.51</b>	<b>-1.07</b>	<b>-0.69</b>	
<b>Addenda:</b>										
Exports of agricultural goods <sup>3</sup> .....	6.3	10.5	-7.0	-15.2	-7.5					
Exports of nonagricultural goods .....	58.5	17.0	4.9	-33.5	-40.3					
Imports of nonpetroleum goods .....	68.5	4.0	-4.1	-30.5	-45.4					

1. The estimates under the contribution columns are also percent changes.

2. Exports and imports of certain goods, primarily military equipment purchased and sold by the Federal Government, are included in services.

3. Includes parts of foods, feeds, and beverages, of nondurable industrial supplies and materials, and of nondurable nonautomotive consumer goods.

NOTE. Percent changes are from NIPA table 4.2.1, contributions are from NIPA table 4.2.2, and shares are calculated from NIPA table 4.2.5.

Exports of goods and services decreased 28.7 percent after decreasing 23.6 percent. The first-quarter decrease was the largest since the fourth quarter of 1971.

Exports of goods decreased more than in the fourth quarter, mainly reflecting a larger decrease in automotive vehicles, engines, and parts and a downturn in exports of "other" goods. In contrast, exports of foods, feeds, and beverages and nonautomotive consumer goods decreased less than in the fourth quarter.

Exports of services decreased much more than in the fourth quarter. Exports of "other" services decelerated, and travel decreased more than in the fourth quarter. Other transportation and royalties and license fees both turned down, and other private services decreased more than in the fourth quarter.

Imports of goods and services decreased 34.1 percent after decreasing 17.5 percent. The first-quarter decrease was the largest since the first quarter of 1975.

Imports of goods decreased more than in the fourth quarter, primarily reflecting a sharp deceleration in petroleum and products and larger decreases in automotive vehicles, engines, and parts, in nonautomotive capital goods, and in nonpetroleum industrial supplies and materials.

Imports of services decreased less than in the fourth quarter, mainly reflecting a smaller decrease in royalties and license fees and a pickup in direct defense expenditures. In contrast, U.S. travel abroad turned down.

Gross investment.....	1.6	11.8	1.5	52.4	-26.2	0.17	0.02	0.67	-0.49	
<b>State and local</b>	<b>61.8</b>	<b>2.5</b>	<b>1.3</b>	<b>-2.0</b>	<b>-2.9</b>	<b>1.56</b>	<b>0.87</b>	<b>-1.26</b>	<b>-1.82</b>	
Consumption expenditures.....	49.5	1.2	1.1	0.0	-0.5	0.61	0.58	-0.02	-0.26	
Gross investment.....	12.3	7.8	2.3	-9.6	-12.0	0.95	0.29	-1.25	-1.55	

1. The estimates under the contribution columns are also percent changes. NOTE. Percent changes are from NIPA table 3.9.1, contributions from NIPA table 3.9.2, and shares are calculated from NIPA table 3.9.5.

Government spending turned down, decreasing 3.5 percent in the first quarter after increasing 1.3 percent in the fourth quarter. Federal government spending turned down, and state and local spending decreased more than in the fourth quarter.

The downturn in federal government spending reflected a downturn in defense spending and a slowdown in nondefense spending.

The downturn in defense spending was mainly due to a downturn in consumption expenditures.

The slowdown in nondefense spending was primarily due to a downturn in investment in equipment and software and a deceleration in consumption expenditures.

The larger decrease in state and local government spending mainly reflected larger decreases in investment in structures and in consumption expenditures.

### Government Spending

“Government consumption expenditures and gross investment,” or “government spending,” consists of two components: (1) consumption expenditures by federal government and by state and local governments and (2) gross investment by government and government-owned enterprises.

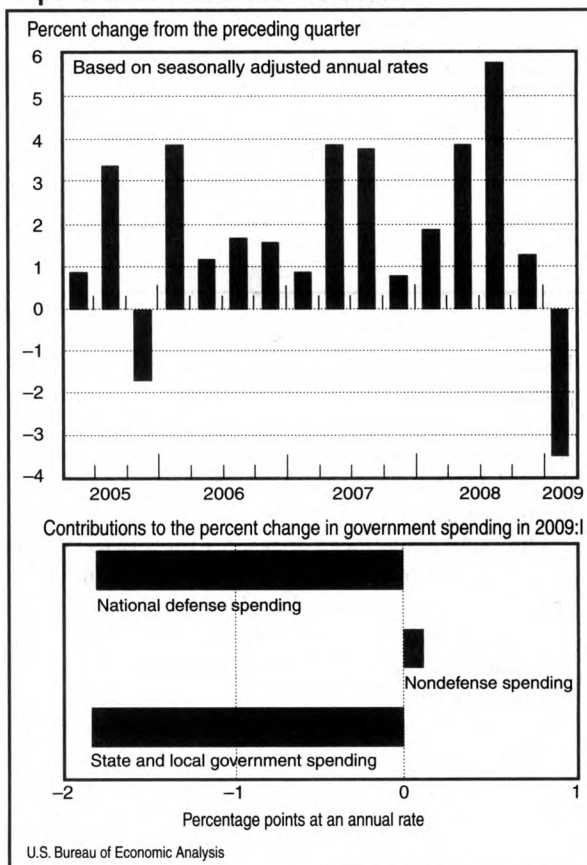

Government consumption expenditures consists of the goods and services that are produced by general government (less any sales to other sectors and investment goods produced by government itself). Governments generally provide services to the general public without charge. The value of government production—that is, government’s gross output—is measured as spending for labor and for intermediate goods and services and a charge for consumption of fixed capital.<sup>1</sup>

Gross investment consists of new and used structures (such as highways and dams) and of equipment and software purchased or produced by government and government-owned enterprises.

Government consumption expenditures and gross investment excludes current transactions of government-owned enterprises, current transfer payments, interest payments, subsidies, and transactions in financial assets and nonproduced assets, such as land.

1. Consumption of fixed capital represents a partial measure of the services provided by government-owned fixed capital.

**Chart 6. Real Government Consumption Expenditures and Gross Investment**

Excluding food and energy .....	1.8	2.5	1.0	1.6				
Gross domestic product .....	1.1	3.9	0.5	2.8				

1. The estimates under the contribution columns are also percent changes  
 Note. Most percent changes are from NIPA table 1.6.7; percent changes for PCE for food and energy goods and services and for PCE excluding food and energy are calculated from index numbers in NIPA table 2.3.4. Contributions are from NIPA table 1.6.8.

The price index for gross domestic purchases decreased 1.0 percent in the first quarter after decreasing 3.9 percent in the fourth quarter. The federal pay raise for civilian and military personnel added 0.3 percentage point to the first-quarter percent change; the pay raise is treated as an increase in the price of employee services purchased by the federal government.

Consumer prices decreased 1.0 percent after decreasing 4.9 percent. The smaller decrease was mainly due to a smaller decrease in prices paid for gasoline, fuel oil, and other energy goods; a deceleration in food prices also contributed.

Prices paid for nonresidential fixed investment turned down, mainly reflecting a downturn in prices paid for structures. The deceleration in equipment and software prices also contributed.

Prices paid for residential investment continued to decline but at a slower rate than in the fourth quarter, decreasing 4.6 percent after decreasing 9.4 percent.

Prices paid by government decreased less than in the fourth quarter. Prices paid by the federal government turned up, mainly reflecting the federal pay raise. Prices paid by state and local government decreased less than in the fourth quarter.

Consumer prices excluding food and energy, a measure of the "core" rate of inflation, accelerated, increasing 1.5 percent after increasing 0.9 percent.

The GDP price index increased 2.8 percent, 3.8 percentage points more than the percent decrease in the price index for gross domestic purchases, reflecting a much larger decrease in import prices than in export prices.

**Note on Prices**

BEA's gross domestic purchases price index is the most comprehensive index of prices paid by U.S. residents for all goods and services, regardless of whether those goods and services were produced domestically or imported. It is derived from prices of consumer spending, private investment, and government spending.

The GDP price index measures the prices of goods and services produced in the United States, including the prices of goods and services produced for export.

The difference between the gross domestic purchases price index and the GDP price index reflects the differences between the change in import prices (included in the gross domestic purchases index) and the change in export prices (included in the GDP price index). For other measures that are affected by import and export prices, see the dollar depreciation FAQ Answer ID 498 on BEA's Web site.

1. The estimates for GDP under the contribution columns are also percent changes.

Real GDP decreased 5.7 percent in the first-quarter preliminary estimate, 0.4 percentage point less of a decrease than the advance estimate. The average revision (without regard to sign) between the advance estimate and the preliminary estimate is 0.5 percentage point. The upward revision to the percent change in real GDP primarily reflected upward revisions to inventory investment and to exports that were partly offset by a downward revision to consumer spending for nondurable goods.

The largest contributor to the downward revision to consumer spending for nondurable goods was food.

The upward revision to inventory investment primarily reflected an upward revision to retail trade inventories.

The upward revision to exports was to both goods and services.

The largest contributors to the revision to exports of goods were nonautomotive consumer goods and industrial supplies and materials.

The largest contributor to the revision to exports of services was "other" private services.

**Source Data for the Preliminary Estimates**

*Personal consumption expenditures:* Retail sales for January, February, and March (revised) and the incorporation of the 2007 Annual Retail Trade Survey on a best-change basis. Motor vehicle registrations for March (new). Retail electricity sales for March (new) and natural gas sales for February (new).

*Nonresidential fixed investment:* Construction spending (value put in place) for January and February (revised) and March (new). Manufacturers' shipments (M3) of machinery and equipment for February and March (revised). Exports and imports for February (revised) and March (new).

*Residential investment:* Construction spending for January and February (revised) and March (new).

*Change in private inventories:* Manufacturers' inventories for February and March (revised) and trade inventories for February and March (revised).

*Exports and imports of goods and services:* International transactions for January and February (revised) and March (new).

*Government consumption expenditures and gross investment:* State and local construction spending for January and February (revised) and March (new).

**Personal Income for the Fourth Quarter of 2008**

With the release of the preliminary estimates of GDP, BEA also releases revised estimates of various income-related measures for the previous quarter. This revision reflects the incorporation of newly available fourth-quarter tabulations from the Quarterly Census of Employment and Wages from the Bureau of Labor Statistics.

Wage and salary disbursements decreased \$21.0 billion, a downward revision of \$8.6 billion. Personal current taxes increased \$6.7 billion, a downward revision of \$13.0 billion; the revision was primarily to nonwithheld taxes. Contributions for government social insurance, which are subtracted in calculating personal income, decreased \$4.8 billion, a downward revision of \$1.2 billion.

- Personal income decreased \$50.9 billion, a downward revision of \$8.0 billion.
- Disposable personal income decreased \$57.7 billion, an upward revision of \$4.9 billion.
- Personal saving increased \$202.5 billion, an upward revision of \$4.9 billion.
- The personal saving rate was 3.2 percent, unrevised from the previous estimate.

CCAAdj Capital consumption adjustment

Profits from current production increased \$42.6 billion, or 3.4 percent at a quarterly rate, in the first quarter after decreasing \$250.3 billion in the fourth quarter.

Domestic profits of financial corporations increased \$116.1 billion, or 94.9 percent, after decreasing \$178.7 billion.

Domestic profits of nonfinancial corporations decreased \$64.2 billion, or 8.6 percent, after decreasing \$89.1 billion.

Profits from the rest of the world decreased \$9.3 billion, or 2.4 percent, after increasing \$17.5 billion. Receipts decreased \$61.7 billion, and payments decreased \$52.4 billion in the first quarter.

After-tax profits increased \$11.1 billion, or 1.1 percent, after decreasing \$120.1 billion.

Net dividends decreased \$42.2 billion, or 5.2 percent, after decreasing \$32.8 billion.

Undistributed corporate profits (a measure of net saving that equals after-tax profits less dividends) increased \$53.3 billion, or 27.6 percent, after decreasing \$87.4 billion.

Net cash flow from current production, a profits-related measure of internally generated funds available for investment, increased \$59.0 billion, or 4.8 percent, after decreasing \$97.0 billion.

### Measuring Corporate Profits

Corporate profits is a widely followed economic indicator used to gauge corporate health, assess investment conditions, and analyze the effect on corporations of economic policies and conditions. In addition, corporate profits is an important component in key measures of income.

BEA's measure of corporate profits aims to capture the income earned by corporations from current production in a manner that is fully consistent with the national income and product accounts (NIPAs). The measure is defined as receipts arising from current production less associated expenses. Receipts exclude income in the form of dividends and capital gains, and expenses exclude bad debts, natural resource depletion, and capital losses.

Because direct estimates of NIPA-consistent corporate profits are unavailable, BEA derives these estimates in three steps.

First, BEA measures profits before taxes to reflect corporate income regardless of any redistributions of income through taxes. Estimates for the current quarter are based on corporate earnings reports from sources including Cen-

sus Bureau quarterly financial reports, Federal Deposit Insurance Corporation call reports, other regulatory reports, and tabulations from corporate financial reports. The estimates are benchmarked to Internal Revenue Service data when the data are available for two reasons: the data are based on well-specified accounting definitions, and they are comprehensive, covering all incorporated businesses—publicly traded and privately held—in all industries.

Second, to remove the effects of price changes on inventories valued at historical cost and of tax accounting for inventory withdrawals, BEA adds an inventory valuation adjustment that values inventories at current cost.

Third, to remove the effects of tax accounting on depreciation, BEA adds a capital consumption adjustment (CCAAdj). CCAAdj is defined as the difference between capital consumption allowances (tax return depreciation) and consumption of fixed capital (the decline in the value of the stock of assets due to wear and tear, obsolescence, accidental damage, and aging).

# Government Receipts and Expenditures

## First Quarter of 2009

**N**ET GOVERNMENT saving, the difference between current receipts and current expenditures of the federal government and state and local governments, was  $-904.6$  billion in the first quarter of 2009, decreasing  $\$231.5$  billion from  $-\$673.1$  billion in the fourth quarter of 2008.

Net federal government saving was  $-\$830.4$  billion in the first quarter, decreasing  $\$254.8$  billion from  $-\$575.6$  billion in the fourth quarter (see page 12). Current receipts decreased more than in the fourth quarter, while current expenditures turned up.

Net state and local government saving was  $-\$74.2$  billion in the first quarter, increasing  $\$23.2$  billion from  $-\$97.4$  billion in the fourth quarter (see page 13). Current receipts turned up, and current expenditures decreased less than in the fourth quarter.

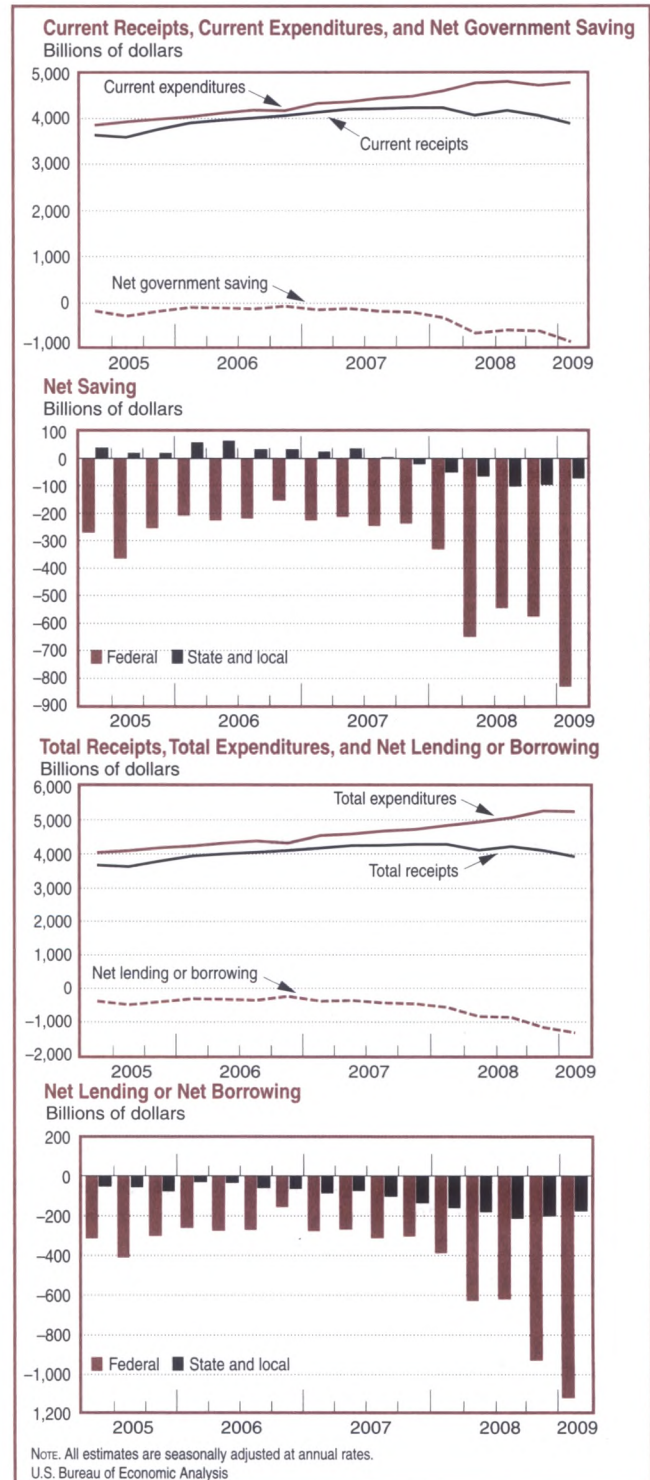

Net borrowing was  $\$1,315.0$  billion in the first quarter, increasing  $\$165.2$  billion from  $\$1,149.8$  billion in the fourth quarter. Federal government net borrowing was  $\$1,133.6$  billion in the first quarter, increasing  $\$191.7$  billion from  $\$941.9$  billion in the fourth quarter. State and local government net borrowing was  $\$181.4$  billion in the first quarter, decreasing  $\$26.5$  billion from  $\$207.9$  billion in the fourth quarter.

Government receipts and expenditures in the first quarter were affected by the American Recovery and Reinvestment Act of 2009 and by the continued capital injections into financial enterprises. (See the box on page 12.)

<b>Net lending or net borrowing (-)</b> .....	<b>-1,133.6</b>	<b>-242.0</b>	<b>8.4</b>	<b>-314.5</b>	<b>-191.7</b>	

Personal current taxes turned down, reflecting a downturn in nonwithheld income taxes and a larger decrease in withheld income taxes.

Taxes on production and imports turned down because of downturns in excise taxes and customs duties.

Taxes on corporate income turned up as a result of an upturn in corporate profits.

Current transfer receipts decelerated, reflecting a deceleration in current transfer receipts from business. Fourth-quarter receipts had been boosted by the insurance claim payments related to disasters in the third quarter and by fees from new guarantee programs that started in the fourth quarter.

Government social benefits to persons accelerated, reflecting an acceleration in benefits for social security and unemployment. A 5.8 percent cost-of-living adjustment boosted benefits for social security, veterans' pensions, supplemental security income and other programs by \$41.1 billion.

Grants-in-aid to state and local governments accelerated as a result of an acceleration in Medicaid grants due to the American Recovery and Reinvestment Act of 2009.

Other current transfer payments to the rest of the world turned down. Fourth-quarter transfers had been boosted \$1.2 billion (\$4.8 billion at an annual rate) in economic support payments to Israel.

Capital transfer payments turned down as a result of smaller capital injections in the financial industry. The federal government provided \$46.0 billion to Fannie Mae and Freddie Mac and \$41.2 billion to other financial institutions in the first quarter. Of these amounts, \$41.4 billion (\$165.6 billion at an annual rate) to Fannie Mae and Freddie Mac and \$14.4 billion (\$57.6 billion at an annual rate) to other financial institutions are treated as capital transfers.

### American Recovery and Reinvestment Act of 2009

On February 17, 2009, the American Recovery and Reinvestment Act (ARRA) was signed into law. Many ARRA-funded transactions are not directly included in gross domestic product (GDP); GDP only includes government spending on goods and services.

In the first quarter, federal grants-in-aid to state and local governments were boosted \$9.3 billion (\$37.3 billion at an annual rate), primarily by Medicaid grants.

Although another provision of ARRA—the “Making

Work Pay” tax credit—was not required to be fully implemented until April 1, BEA estimated that March federal withheld income taxes were reduced by \$0.9 billion (\$3.7 billion at an annual rate). The total impact of this provision is estimated to be \$38.3 billion for 2009.

For more information on the American Recovery and Reinvestment Act, see the box in the article “NIPA Translation of the Fiscal Year 2010 Federal Budget” in this issue of the SURVEY OF CURRENT BUSINESS.

Personal current taxes decreased more in the first quarter of 2009 as a result of a larger decrease in personal income taxes.

Taxes on production and imports decreased less than in the fourth quarter, reflecting a smaller decrease in sales taxes and an upturn in severance taxes.

Taxes on corporate income turned up as a result of an upturn in corporate profits.

Federal grants-in-aid accelerated, reflecting an acceleration in Medicaid grants due to the American Recovery and Reinvestment Act of 2009.

Consumption expenditures decreased less than in the fourth quarter because of a smaller decrease in spending for nondurable goods.

Capital transfer receipts turned down, reflecting a downturn in federal investment grants to state and local governments.

Gross government investment decreased more as a result of a larger decrease in investment for structures.

### Estimates of State and Local Government Receipts and Expenditures

The estimates of state and local government current receipts and expenditures and total receipts and expenditures are mainly based on compilations of data for state and local government finances. The Census Bureau produces the primary source data: the census of governments that is conducted in years that end in a 2 or a 7 and the Government Finances series of surveys for the other years. In addition, other sources of Census Bureau data are from the *Quarterly Summary of State and Local Government Tax Revenue* and the monthly *Value of Construction Put in Place*. Data sources from the Bureau of Labor Statistics include the Quarterly Census of Employment and Wages and the Employment Cost Index.

Quarterly and annual estimates are available monthly in NIPA table 3.3. Detailed annual estimates of state and local government transactions by component are available

annually in NIPA tables 3.4–3.8, 3.12, and 3.13. Detailed quarterly estimates are available in underlying NIPA tables at [www.bea.gov/national/nipaweb/nipa\\_underlying/Index.asp](http://www.bea.gov/national/nipaweb/nipa_underlying/Index.asp). For a historical time series of reconciliations of the NIPA estimates with the Census Bureau data from Government Finances, see NIPA table 3.19.

BEA also prepares annual estimates of receipts and expenditures of state governments and of local governments.<sup>1</sup> These estimates are available annually in NIPA table 3.20 (state government receipts and expenditures) and in NIPA table 3.21 (local government receipts and expenditures); see “Newly Available NIPA Tables” in the October 2008 SURVEY.

# REGIONAL ECONOMIC INFORMATION SYSTEM

1969–2007

The REIS DVD contains estimates for 1969–2007 for 3,111 counties, 366 metropolitan statistical areas, 574 micropolitan statistical areas, 124 combined statistical areas, 29 metropolitan divisions, and 179 BEA economic areas.

The following tables are on the DVD:

- Personal income by major source
- Earnings by industry
- Compensation of employees by industry
- Full-time and part-time employment by industry
- County income and employment summary
- Regional economic profiles
- Personal current transfer receipts
- Farm income and expenses
- BEA Regional Fact Sheets (BEARFACTS)

# NIPA Translation of the Fiscal Year 2010 Federal Budget

By Benjamin A. Mandel and Bryan A. Williams

ON MAY 7, 2009, the President submitted the *Budget of the United States Government, Fiscal Year 2010* to Congress; a budget overview, *A New Era of Responsibility: Renewing America's Promise*, was submitted earlier on February 26, 2009.<sup>1</sup> The *Analytical Perspectives* volume of the budget contains a chapter that presents the budget estimates on a national income and product accounts (NIPA) basis. These fiscal year NIPA estimates, which are prepared by the Bureau of Economic Analysis (BEA), are included in the budget to provide a way to gauge the impact of the federal budget on aggregate economic activity. BEA also provides historical NIPA statistics to the Office of Management and Budget (OMB) and the fiscal year gross domestic product (GDP) statistics shown in the *Historical Tables* volume of the budget.

BEA translates the information in the budget into a NIPA framework for actual receipts and outlays for fiscal year 2008, the projected receipts and outlays for the current fiscal year 2009, and proposed receipts and outlays for the budget year 2010. This article presents NIPA estimates that are more detailed than the comparable estimates in the budget, including quarterly estimates.

The NIPA estimates for 2010 allow for a more detailed analysis of the macroeconomic effects of the budget; forecasters use these data in their models. In addition, the translated estimates for all 3 years are used by BEA to derive quarterly NIPA estimates, including the federal government component of GDP.

The overall translation results are summarized by comparing the budget surplus or deficit to the NIPA measure of net federal government saving (chart 1, table 1). For fiscal year 2010, the NIPA estimate of net federal government saving of  $-\$1,118.8$  billion shows a smaller deficit than the budget estimate of  $-\$1,258.4$  billion. For more information about NIPA adjustments, see the box "NIPA Estimates of the Federal Sector and the Federal Budget Estimates."

This article is divided into four sections. First, budget receipts and outlays are compared with NIPA receipts and expenditures, showing the various

adjustments made to translate the budget estimates into NIPA estimates. Second, the budget estimates are summarized, and the effects of the major legislative proposals and program changes on the budget are reviewed. Third, detailed annual and quarterly NIPA estimates for fiscal years 2009 and 2010 are presented. Fourth, the methodology used to translate the budget

projections into the NIPA framework is explained.

### Comparison of Budget and NIPA Estimates

On a NIPA basis, net federal government saving would decrease \$37.2 billion in fiscal year 2010 after decreasing \$616.1 billion in fiscal year 2009 (table 1 and chart 1). The smaller decrease results from an upturn in federal government current receipts and a deceleration in federal government current expenditures.

NIPA current receipts exceed budget receipts for fiscal years 2008 through 2010. NIPA current expenditures exceed budget outlays for fiscal years 2008 and 2010, while NIPA current expenditures are less than budget outlays for fiscal year 2009. The coverage, netting and grossing, and timing adjustments that BEA makes to budget receipts and outlays are detailed in table 2 (receipts) and table 3 (outlays).<sup>2</sup> The adjustments for national defense spending are shown in table 4.

### Budget Estimates

Federal budget receipts are projected to decrease \$367.7 billion in fiscal year 2009 and to increase \$176.0 billion in fiscal year 2010, according to the budget (table 5). This upturn in receipts can be attributed to the anticipated rebound in economic activity projected in the budget for fiscal year 2010 following the dampen-

2. For more information about differences between the NIPAs and the budget for fiscal years 2009 and 2010, see the box "Treatment of Financial Stabilization Programs" on page 22.

1. Consists largely of contributions for social insurance by residents of U.S. territories and Puerto Rico.

2. These transactions are included in the NIPA personal sector.

3. Consists of estate and gift taxes.

4. Consists largely of Treasury receipts from sales of foreign currencies to Government agencies.

5. Includes proprietary receipts that are netted against outlays in the budget and that are classified as receipts in the NIPAs, and some transactions that are not reflected in the budget but that are added to both receipts and expenditures in the NIPAs.

Sources: *Budget of the United States Government, Fiscal Year 2010* and the Bureau of Economic Analysis, NIPA National income and product account

ing effect of the current recession on payroll taxes and individual and corporate income taxes for fiscal year 2009.

Federal budget outlays are projected to increase \$1,015.0 billion in fiscal year 2009 and to decrease \$406.8 billion in fiscal year 2010 (table 6, page 18), according to the budget. The downturn in outlays can be attributed to a downturn in outlays for "commerce and housing credit," reflecting much lower payments related to financial stabilization in 2010 than in 2009.

Both budget receipts and budget outlays in 2009 and 2010 are affected by the American Recovery and Reinvestment Act of 2009 (ARRA); see the box on page 17 for more details.

### Proposed legislative and program changes

The budget proposes changes to legislation and programs that would increase the federal deficit \$224.5 billion in fiscal year 2009 and decrease the deficit \$12.0

\$41.3 billion in fiscal year 2010, relative to the current-services baseline. Among the legislative proposals, the following have notable effects on receipts:

- A proposal to expand the net operating loss carry-back period for businesses would reduce receipts \$27.8 billion in fiscal year 2009 and \$35.7 billion in fiscal year 2010.
- A proposal to extend several temporary tax provisions through December 31, 2010, would reduce receipts by \$6.3 billion in fiscal year 2010.
- A proposal to permanently extend the existing tax credits for qualified research and experimentation would reduce receipts \$3.1 billion in fiscal year 2010.
- Proposals to reduce U.S. tax evasion by modifying tax rules for multinational corporations would increase receipts by \$2.5 billion in fiscal year 2010.

**American Recovery and Reinvestment Act of 2009**

The American Recovery and Reinvestment Act of 2009 (ARRA) was signed into law on February 17, 2009. The act contains provisions for initiatives such as job preservation and creation, infrastructure investment, energy efficiency and science, assistance to the unemployed, and state and local fiscal stabilization. The ARRA is estimated in the budget to cost \$825.4 billion over the next 10 years. These costs are split between \$600.0 billion in increased outlays and \$225.4 billion in reduced receipts. Although the cost of the ARRA is spread over 10 years, the budget projections show 24 percent of the total cost occurring in fiscal year 2009 and 47 percent of the total cost occurring in fiscal year 2010.

The budget estimates that receipts will be reduced \$77.4 billion in fiscal year 2009 and \$152.3 billion in fiscal year 2010 primarily because of the tax provisions of ARRA. These provisions include the "Making Work Pay" tax credit, which provides a tax credit of up to \$400 for eligible working single taxpayers and \$800 for eligible working married taxpayers; an extension and modification of the first-time homebuyer credit; and various tax

provisions for businesses.

The budget estimates that outlays will be increased about \$120.2 billion for fiscal year 2009 and \$237.8 billion for fiscal year 2010 because of the spending and investment provisions of the ARRA. Some provisions affecting outlays include assistance to state and local governments, one-time payments to retirees, and increases for the Supplemental Nutrition Assistance Program (food stamps) and unemployment compensation.

Because the effects of ARRA will be spread across several sectors (federal government, state and local government, and individual and business taxpayers) and may be intermingled with other spending in the source data, BEA does not expect to be able to separately identify the total quarterly or annual effects of the ARRA on GDP or other NIPA measures. Many ARRA-funded transactions are not directly included in GDP; GDP only includes government spending on goods and services. ARRA-related grants, transfers, and taxes, however, are included in BEA's government sector estimates and in some cases, in statistics on personal income and outlays.

2. Consistent with the budget, the proposed legislation excludes budget reform proposals that are included in the baseline.  
Source: Budget of the United States Government, Fiscal Year 2010.

**Outlays.** The budget would increase total outlays \$196.5 billion in fiscal year 2009 and would reduce outlays \$53.3 billion in 2010, relative to the current-services baseline.

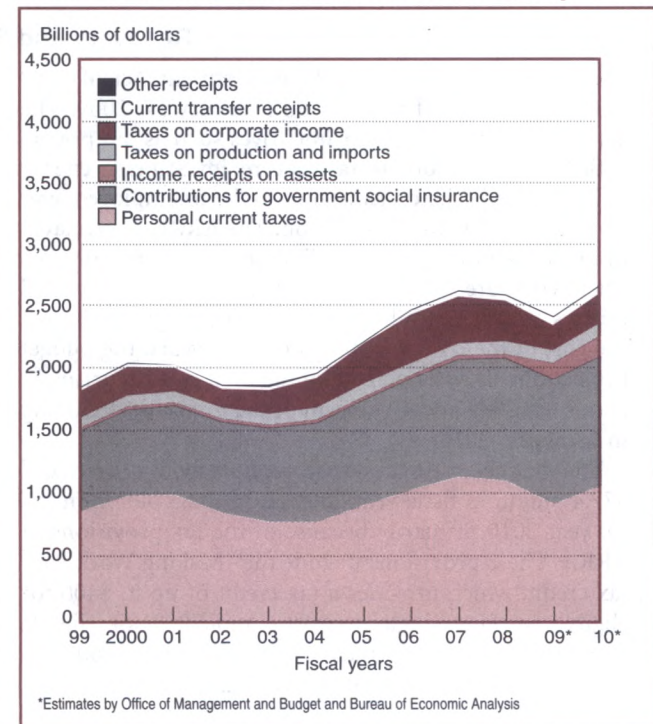

- Outlays for national defense would decrease \$39.9 billion for fiscal year 2009 and \$47.6 billion for fiscal year 2010 as a result of reduced outlays for overseas contingency operations, which include the wars in Iraq and Afghanistan.
- Outlays for net interest would decrease \$24.2 billion for fiscal year 2009 and \$40.1 billion for fiscal year 2010 reflecting increased interest receipts as a result of a proposal to create a financial stabilization reserve.
- Outlays for commerce and housing credit would increase \$257.7 billion in fiscal year 2009 and \$21.3 billion in fiscal year 2010, reflecting financial stabilization efforts such as creating a reserve to cover future financial stabilization costs as well as Federal Deposit Insurance Corporation and National Credit Union Administration premium reprieves.

**NIPA Estimates**

**Fiscal year estimates**

**Receipts.** Total NIPA federal government current receipts would decrease \$177.2 billion in 2009 and would increase \$249.4 billion in 2010 (table 8 and chart 2). The upturn results from increases in the tax base. (The

rent expenditures would increase \$438.9 billion in fiscal year 2009 and \$286.6 billion in fiscal year 2010 (table 9 and chart 3). The deceleration in 2010 reflects decelerations in government social benefits, consumption expenditures, and grants-in-aid to state and local governments. Within social benefits, unemployment benefits would turn down, and social security benefits would decelerate. In contrast, federal interest paid and subsidies would accelerate.

**Quarterly pattern**

BEA prepares seasonally adjusted quarterly NIPA estimates of federal government current receipts and current expenditures that are consistent with the federal budget (table 10).

The quarterly estimates for 2009 and 2010 presented here are extrapolated from the published estimates for the first quarter of 2009, which were released on May 29, 2009. In general, because of the limited information available to estimate quarterly patterns, the estimates should be viewed as approximations that will be superseded by more reliable quarterly estimates that will be published in NIPA table 3.2.<sup>4</sup>

**Receipts.** The NIPA estimates of current receipts reflect the quarterly pattern of estimates that would result from enacted and proposed legislation, based on the administration's projected pattern of wages. The NIPA estimates also reflect BEA's methodology for deriving quarterly estimates of income tax payments and

4. The average of fiscal year quarters may not equal the fiscal year value.

**Chart 3. Federal Government Current Expenditures**

### Treatment of Financial Stabilization Programs

For fiscal years 2009 and 2010, the differences between NIPA (negative) net saving and the budget deficit are unusually high, reflecting the differing treatments of the financial stabilization measures taken by the federal government.

Through the Troubled Asset Relief Program (TARP), the Department of Treasury has injected capital into banks and other financial institutions by purchasing preferred stock and warrants and providing asset guarantees. The TARP has also provided loans and other support to the automotive industry.

TARP loans and equity transactions are recorded in the budget on a credit basis as required by the Federal Credit Reform Act of 1990. Under credit reform, most cash flows for loans and loan guarantee programs are excluded from budget outlays. However, the budget recognizes an outlay calculated as the estimated subsidy value of direct loans, loan guarantees, and TARP equity purchases at the time of the loan or purchase; this outlay is recorded in a budget program account. The budget documents contain a nonbudgetary financing account that records the cash flows of loans and loan guarantees between the federal government and the public in order to show the financing effects of these programs; these transactions do not affect budget outlays. These flows include loans and loan guarantee obligations and offsets, such as principal repayments, subsidy costs, and interest.

In the NIPAs, loan disbursements and repayments and equity purchases and sales are normally excluded because these transactions are considered exchanges of financial assets, which are recorded in the flow of funds accounts.<sup>1</sup> The NIPAs include interest and dividends because they represent the income earned on assets. For loans, the NIPAs do not include the subsidy cost recognized by the budget because the borrower's liability is for the full amount of the loan. For certain transactions related to government capital injections, BEA does record the implied subsidy cost of equity purchases as capital transfers in the NIPAs; capital transfers do not affect GDP or net government saving, but they do reduce net government lending or borrowing.<sup>2</sup>

Coverage differences arise between the NIPAs and the budget because of the differing treatments of these credit programs. To make the necessary NIPA coverage adjustments, BEA's reconciliation tracks the relationship between budgetary program and financing accounts for credit programs. This reconciliation affects several cover-

age adjustments seen in table 3, specifically *financing disbursements from credit programs, capital transfers, loan disbursements less loan repayments and sales, and "other" financial transactions*.

For loans and loan guarantee programs, including those in the TARP, the cash flows shown in the nonbudgetary financing accounts in the budget are recorded in the coverage line *financing disbursements from credit programs*; financing disbursements are net of subsidy costs and interest transactions. Interest transactions included in the nonbudgetary financing accounts do not affect budget outlays, but they are included in NIPA receipts. The amount of financing disbursements plus the subsidy costs and interest adjustments for loans and loan guarantee payments are recorded in the line *loan disbursements less loan repayments and sales*. In this case, the net of *financing disbursements from credit programs and loan disbursements less loan repayments and sales* will leave a coverage adjustment equal to the subsidy costs and interest.<sup>3</sup>

For the TARP equity program, equity purchases classified in the budget as nonbudgetary financing disbursements are recorded in the coverage line *financing disbursements from credit programs*. For TARP equity transactions, the implied subsidy costs, which are shown as outlays in the budget, are included in BEA's *capital transfers*. Therefore, the "other" *financial transactions* coverage adjustment shows the amount of financing disbursements less the subsidy costs and dividends.

The Treasury has also provided support for the housing market by purchasing preferred stock of the government sponsored enterprises Fannie Mae and Freddie Mac. The budget records these transactions as outlays, while BEA records a portion of these outlays as a capital transfer that represents BEA's estimated subsidy cost of the equity purchase.<sup>4</sup>

Other actions in support of financial stabilization cause differences between the NIPAs and the budget. Deposit insurance transactions of the Federal Deposit Insurance Corporation and the National Credit Union Administration are recorded on a cash basis in the budget. Of these transactions, the NIPAs exclude insured deposit payouts less recoveries; this difference with the budget is recorded as *deposit insurance* in table 3. Premiums collected are included in the NIPAs as current transfer receipts from business.

1. For information on the relationship between the NIPAs and the Federal Reserve Board's flow of funds accounts, see Charlotte Anne Bond, Teran Martin, Susan Hume McIntosh, and Charles Ian Mead, "Integrated Macroeconomic Accounts for the United States," *SURVEY OF CURRENT BUSINESS* 87 (February 2007): 14.

2. For more information, see "The 2008 Financial Crisis and the National Accounts," *SURVEY* 89 (February 2009): 7.

3. These interest and dividend transactions are then moved to the receipts side of the NIPAs by a netting and grossing adjustment.

4. In the budget, an equity purchase outside of TARP is recorded in its entirety as an outlay; however the administration plans to review this treatment. See the box "Acquisition of Financial Assets" in *Analytical Perspectives: Budget of the U.S. Government Fiscal Year 2010*, (Washington, DC: U.S. Government Printing Office, 2009): 218.

These data are translated into the following major components of the NIPA federal government current receipts: current tax receipts, contributions for government social insurance, income receipts on assets, current transfer receipts, and current surplus of government enterprises. Quarterly projections are based on the economic assumptions from the federal budget. When monthly and quarterly NIPA estimates are released by BEA, these initial quarterly projections of receipts are reevaluated and revised to incorporate newly available data from the Department of the Treasury including the *Monthly Treasury Statement of Receipts and Outlays of the United States Government*.<sup>7</sup>

### Outlays

Fiscal year budget outlays are organized by appropriation in the federal budget's *Appendix*. These data and supplemental data from the Office of Management and Budget are used to allocate federal budget outlays to the following NIPA categories: current transfer payments, interest payments, subsidies, and consumption expenditures and gross investment.<sup>8</sup> The quarterly projections are mainly derived by interpolation from fiscal year projections.

---

7. Department of the Treasury, Financial Management Service, *Monthly Treasury Statement of Receipts and Outlays of the United States Government* (Washington, DC: U.S. Government Printing Office); [www.fms.treas.gov/mts](http://www.fms.treas.gov/mts).

8. Outlays by program are first adjusted for coverage (for example, for the treatment of federal employer retirement plan transactions) and for netting and grossing (for example, supplemental medical insurance premiums).

When BEA releases its quarterly NIPA estimates, the fiscal year relationships derived from the budget data are used to allocate the spending that is detailed in the *Monthly Treasury Statement of Receipts and Outlays of the United States Government*. Supplemental data are also used. A detailed reconciliation of defense consumption expenditures and gross investment with outlays is prepared, using extensive financial, delivery, and other information from the Department of Defense. In order to prepare seasonally adjusted estimates of non-defense consumption expenditures and gross investment, data from the budget are used to extrapolate portions of nondefense expenditures (for durable goods, "other nondurable goods," services, and equipment) for which there are no quarterly source data. These extrapolated estimates of expenditures incorporate quarterly data for certain expenditures, such as those for construction from the Census Bureau and for compensation from the Office of Personnel Management and the Bureau of Labor Statistics.

### Updated estimates

BEA's initial quarterly projections of federal government receipts and expenditures that are presented in this article will likely differ from later estimates. The initial estimates are prepared from budget data, which are based on various economic assumptions about the budget year. These estimates are then updated during the year as new laws are enacted, as actual spending occurs, as economic conditions change, and as more source data become available.

### NIPA Estimates of the Federal Sector and the Federal Budget Estimates

The Bureau of Economic Analysis (BEA) prepares estimates of the federal sector in the framework of the national income and product accounts (NIPAs). Unlike the federal budget, which is a financial plan of the government, the NIPA federal estimates are designed to facilitate macroeconomic analyses of the effects of federal government activity on economic activity.<sup>1</sup>

The NIPA estimates differ from the budget for three primary reasons:

- **Coverage.** These adjustments are necessary because certain transactions that are included in the budget are excluded from the NIPAs (and vice versa).
- **Netting and grossing.** These adjustments are necessary because certain transactions are recorded as offsets to outlays in the budget but are recorded as receipts in the NIPAs.
- **Timing.** These adjustments are necessary because in the budget, most receipts and outlays are recorded on a cash basis, while in the NIPAs, some transactions are recorded on an accrual basis.

Unlike the federal budget estimates, the NIPAs distinguish current transactions from capital transactions. Current transactions for production, for income, and for consumption are presented in the summary NIPA accounts 1–5, and capital transactions for the acquisition and disposal of nonfinancial assets are presented in summary NIPA accounts 6 and 7.<sup>2</sup> Because of this organization, the following types of transactions are not included in NIPA federal government current receipts and current expenditures but are shown in account 6 and as items in NIPA table 3.2:

- **Government investment in fixed assets.** In the NIPAs, government consumption expenditures exclude investment in fixed assets and include consumption of fixed capital, a depreciation charge on fixed assets that are used in production.
- **Transfers involving the acquisition or disposal of assets.** In the NIPAs, these transactions are classified as capital transfer receipts and payments and are presented in the domestic capital account.<sup>3</sup> Capital transfers include certain investment grants-in-aid to state and local governments, investment subsidies to businesses, lump-sum payments to amortize the unfunded liability of the Department of Defense Medicare-Eligible Retiree Health Care Fund and the Postal Service Retiree Health Benefits Fund, implied subsidy costs of finan-

cial stabilization equity purchases, and estate and gift taxes.

- **Transactions involving nonproduced assets.** In the NIPAs, purchases and sales of nonproduced assets, such as land and the radio spectrum, are reflected in “capital account transactions (net)” in the domestic capital account.

The NIPA estimates also differ from the budget estimates because of the scope and coverage of the federal government sector. Examples include the following:

- **Retirement plans.** Government employee contributions to retirement plans are included in budget receipts, but they are excluded from NIPA current receipts because they are included in personal income as part of the income of employees. Similarly, federal employee retirement benefits are included in budget outlays, but they are excluded from NIPA current expenditures because the benefits are paid from assets that represent equity belonging to the personal sector.
- **Other differences.** The NIPA federal government sector excludes certain transactions with the residents of Puerto Rico and the U.S. Territories and with the Federal Communication Commission Universal Service Fund.<sup>4</sup>

#### Receipts

For most years, the differences between NIPA current receipts and budget receipts primarily reflect capital transfers received, supplementary medical insurance premiums, and personal and business current transfer receipts. (Personal and business current transfer receipts are classified as receipts in the NIPAs, but some are netted against outlays in the budget.)

#### Expenditures

For most years, the differences between the two measures primarily reflect capital transfers paid, federal employee retirement plan transactions, personal and business current transfer receipts, and net investment.

In the NIPAs, budget outlays for national defense and nondefense are reflected in both consumption expenditures and gross investment. For national defense, the budget outlays differ from the NIPA estimates for several reasons:

- The NIPA measure includes general government consumption of fixed capital.
- The NIPAs include cash payments to amortize the unfunded liability for military and civilian retirement benefits as defense consumption expenditures; the budget records these payments as intergovernmental transactions.
- NIPA expenditures are recorded on a delivery (accrual) basis, and budget outlays are recorded on a cash basis; thus, in the NIPAs, all work in progress except ships and structures are included as part of change in private inventories.

1. For a comparison, see tables 4 and 5 and NIPA table 3.18B. See also “National Income and Product Accounts” in *Analytical Perspectives: Budget of the U.S. Government*, 207–212.

2. Current transactions are presented in the “Domestic Income and Product Account,” “Private Enterprise Income Account,” “Personal Income and Outlay Account,” “Government Receipts and Expenditures Account,” and “Foreign Transactions Current Account.” Capital transactions are presented in the “Domestic Capital Account” and the “Foreign Transactions Capital Account.” See “Summary National Income and Product Accounts,” *SURVEY OF CURRENT BUSINESS* 88 (August 2008): 30–31. The federal government components of the domestic capital account are often shown as addenda in tables presenting federal government current receipts and expenditures.

3. The flow of funds accounts of the Federal Reserve Board present detailed information on the acquisition and disposal of financial assets and liabilities by U.S. economic sectors, including the federal government.

4. The NIPA treatment of federal government transactions with the territories will be changing with the release of the 2009 comprehensive NIPA revision in July 2009. See Eugene P. Seskin and Shelly Smith, “Preview of the 2009 Comprehensive Revision of the NIPAs: Changes in Definitions and Presentations,” *SURVEY* 89 (March 2009): 15–16.

# U.S. Travel and Tourism Satellite Accounts for 2005–2008

By Eric S. Griffith and Steven L. Zemanek

THE TRAVEL and tourism industry—as measured by the real output of goods and services sold directly to visitors—shrank in 2008 for the first time in 7 years, according to the most recent statistics from the travel and tourism satellite accounts of the Bureau of Economic Analysis (BEA). Reflecting the broader economic downturn, real direct output decreased 1.8 percent in 2008, compared with increases of 1.1 percent in 2007 and 2.9 percent in 2006.<sup>1</sup> This was the first contraction since 2001. In addition, employment declined for the first time since 2003, decreasing less than 0.1 percent in 2008 after increasing 1.1 percent in 2007 and 1.4 percent in 2006.

Other highlights from the travel and tourism satellite accounts include the following:

- Real output slowed or turned down in 12 of 24 commodities in 2008, including both domestic and international passenger air transportation, gambling, and food and beverage services.
- Inbound tourism grew 14.2 percent in 2008, and outbound tourism grew 7.4 percent. As a result, net exports of travel and tourism increased to a record surplus of \$24.9 billion in 2008 from a \$15.8 billion surplus in 2007.
- Prices for tourism goods and services increased for the sixth consecutive year in 2008, increasing 5.2 percent after increasing 3.5 percent in 2007.

This update of the travel and tourism accounts revises statistics of output and employment for 2005–2008. It incorporates detailed data from the most recent annual input-output (I-O) tables of the U.S. economy, which are available through 2007, and summary statistics from the national income and product accounts (NIPAs) through 2008. The travel and tourism accounts are available on the BEA Web site at [www.bea.gov](http://www.bea.gov); see the box “Data Availability.”

The remainder of this article includes a discussion of trends in travel and tourism output and prices, the composition of tourism demand, and tourism value added and employment, followed by the core travel and tourism account tables.

1. All measures of travel and tourism activity not expressly identified as being in “real” terms are current-dollar estimates.

## Trends in Output and Prices

### Real output

**Contraction.** The 1.8 percent decline in real direct travel and tourism output in 2008 was widespread. The overall downturn reflected faster declines in domestic passenger air transportation (11.8 percent in 2008, compared with 1.8 percent in 2007), gasoline (5.7 percent, compared with 0.1 percent), and gambling (8.8 percent, compared with 0.4 percent) (table A). In addition, international passenger air transportation turned down, falling 0.3 percent in 2008 after rising 7.0 percent in 2007. Food and beverage services also turned down, falling 0.5 percent after rising 0.9 percent. These 2008 declines were offset partially by a sharp acceleration in domestic passenger water transportation (10.3 percent in 2008, compared with 1.0 percent in 2007) and an upturn in automotive repair services (0.4 percent, compared with a decline of 4.3 percent).

**Contributions.** Transportation contributed most to the 1.8 percent decline in real travel and tourism output, accounting for 1.48 percentage points of the over-

all decrease in 2008 (tables B and C). Recreation, entertainment, and shopping accounted for 0.49 percentage point of the decline. While the growth in traveler accommodations decelerated, it was still positive and partially offset the sector's overall decline; it added 0.28 percentage point against the total decrease in 2008 (chart 1).

**Chart 1. Contributions to Annual Growth in Real Tourism Output in 2005–2008**

**Prices**

**Inflation.** The 5.2 percent increase in travel and tourism prices, the sixth consecutive annual increase, reflected an increase in prices for gasoline (16.6 percent in 2008, compared with 8.3 percent in 2007), domestic passenger air transportation services (9.7 percent, compared with 0.9 percent), international passenger air transportation (10.6 percent, compared with 4.5 percent), and automotive rental and leasing (8.1 percent, compared with 1.6 percent). The overall acceleration in price growth for the travel and tourism sector was partly offset by a sharp deceleration in the prices for traveler accommodations (0.2 percent in 2008, compared with 4.8 percent in 2007) and a downturn in the price for travel arrangement and reservation

**Contributions.** Transportation services accounted for 3.45 percentage points of the 5.2 percent growth in travel and tourism prices. Within transportation, growth in domestic air travel services accounted for 0.81 percentage point of the increase. International air travel services accounted for 0.65 percentage point of the overall increase. In addition, gasoline prices

accounted for 1.60 percentage points of the overall travel and tourism increase. Food and beverage services accounted for 0.75 percentage point of total price growth in 2008 (chart 2 and table E). Gasoline prices accounted for 30.7 percent of overall price growth (table F).

PCE Personal consumption expenditures

### Total output

Total tourism-related output increased to \$1.35 trillion in 2008, up 3.6 percent from \$1.31 trillion in 2007. Total output consisted of \$767.0 billion in direct tourism output and \$587.6 billion in indirect tourism output. The 1.77 ratio of total output to direct output in 2008 means that every dollar of direct tourism output required an additional 77 cents of indirect tourism output (chart 3).

**Chart 3. Total Tourism-Related Output in 2005–2008**

Direct tourism output includes goods and services sold directly to visitors, such as passenger air travel. Indirect tourism output includes sales of all goods and services used to produce that direct output, such as jet fuel to fly the plane.

### The Composition of Tourism Demand

The travel and tourism accounts include estimates of the composition of tourism demand by type of visitor. They distinguish expenditures of U.S. residents traveling abroad from those of U.S. residents and nonresidents traveling within the United States for leisure, business, or government purposes. The balance of tourism trade is derived by subtracting expenditures on foreign travel by U.S. residents (an import of goods and services to outbound travelers) from expenditures on U.S. travel by nonresidents (an export of goods and services to inbound travelers).

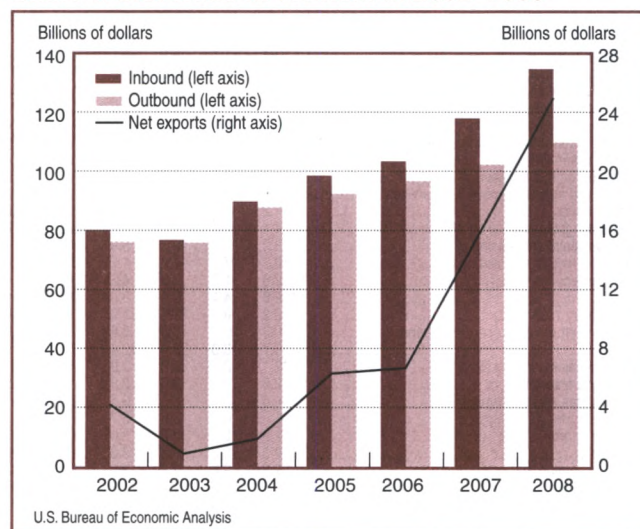

### International travel and tourism

Current-dollar international travel (the sum of inbound and outbound travel) grew 11.0 percent in 2008 after growing 10.0 percent in 2007.

**Inbound travel and tourism.** This consists of travel-related expenditures and international transportation purchases from U.S. providers by nonresidents

traveling in the United States. This activity grew 14.2 percent to \$134.5 billion (chart 4). Inbound activity has been strong in recent years, increasing an average of 12.0 percent every year since 2004. In that same time period, outbound travel increased an average of 7.7 percent.

**Chart 4. U.S. Trade in Tourism in 2002–2008**

Accordingly, net exports grew an average of 110 percent per year from \$1.9 billion in 2004 to \$24.9 billion in 2008. The most recent spike in net exports of travel and tourism stemmed in part from the dollar's depreciation compared to other currencies in the first half of 2008, making travel to the United States by nonresidents less expensive.<sup>2</sup>

**Outbound travel and tourism.** This consists of travel-related expenditures and international transportation purchases from foreign providers by U.S. residents traveling abroad. In 2008, outbound activity grew 7.4 percent to \$109.6 billion. As a result, net exports of travel and tourism increased to \$24.9 billion in 2008 from \$15.8 billion in 2007 (table G).

**Internal travel and tourism.** This consists of travel and tourism within the borders of the United States—the sum of domestic activity and inbound

2. See Douglas B. Weinberg, Erin M. Whitaker, and Gregory A. Tenentes, "U.S. International Transactions," *SURVEY OF CURRENT BUSINESS* 89 Vol. 4 (April 2009): 12–53.

activity.<sup>3</sup> Inbound travel and tourism's share of internal tourism peaked in 2000, accounting for 15.3 percent of the total. After declining to 11.7 percent in 2003, inbound tourism rebounded slightly, accounting for 12.4 percent of internal tourism in 2006 and 13.8 percent in 2007 (table H and chart 5).

**National tourism.** This consists of travel and tourism by U.S. residents, both within the United States and abroad—the sum of domestic tourism and outbound tourism. The calculation of outbound tourism is modified here to include all expenditures on international transportation, whether purchased from foreign or U.S. providers. This is to create consistency between expenditures by U.S. residents traveling within the United States (domestic tourism) and expenditures by U.S. residents traveling abroad (outbound tourism). Outbound tourism's share of national tourism in-

3. As a component of internal tourism, the calculation of inbound tourism is modified to exclude all expenditures on international transportation, whether purchased from foreign or U.S. providers. This makes possible an equally defined comparison between expenditures by U.S. residents traveling within the U.S. (domestic tourism) and expenditures by nonresidents traveling within the U.S. (inbound tourism).

**Table H. Internal Travel and Tourism in the United States by Residents and Nonresidents in 2001–2007**

Year	Millions of dollars			Share	
	Residents	Nonresidents (inbound)	Total	Residents	Nonresidents (inbound)
2001	436,526	70,737	507,263	86.1	13.9
2002	443,862	65,383	509,244	87.2	12.8
2003	478,332	63,245	541,577	88.3	11.7
2004	518,231	73,362	591,593	87.6	12.4
2005	552,335	80,347	632,682	87.3	12.7
2006	593,930	83,988	677,918	87.6	12.4
2007	594,116	94,957	689,073	86.2	13.8

**Chart 5. Inbound Tourism's Share of Internal Travel and Tourism in 2002–2007**

creased to 18.2 percent in 2007, matching the peak in 2000 (table I and chart 6).

**Table I. National Travel and Tourism in the United States and Abroad in 2001–2007**

Year	Millions of dollars			Percent	
	In the United States	Abroad (outbound)	Total	In the United States	Abroad (outbound)
2001	436,526	93,911	530,437	82.3	17.7
2002	443,862	90,224	534,085	83.1	16.9
2003	478,332	91,872	570,204	83.9	16.1
2004	518,231	107,909	626,140	82.8	17.2
2005	552,335	117,073	669,408	82.5	17.5
2006	593,930	125,614	719,544	82.5	17.5
2007	594,116	131,923	726,039	81.8	18.2

**Chart 6. Outbound Tourism's Share of National Travel and Tourism in 2002–2007**

**Domestic travel and tourism**

Domestic tourism includes travel and tourism undertaken by U.S. residents within the borders of the United States. Puerto Rico and the U.S. Virgin Islands are outside of this defined boundary and are classified in "international travel." The travel and tourism accounts break out all expenditures on domestic travel and tourism by type of visitor: resident households, business, and government (table 3). Business's share of domestic travel and tourism increased for the fifth

**Data Availability**

The detailed annual statistics of tourism activity for 2007 are presented in eight tables at the end of this article. The detailed annual statistics for 1998–2007, statistics of output and employment for 2008, and quarterly statistics of output and employment are available on BEA's Web site at [www.bea.gov](http://www.bea.gov) under "Industry" and "Satellite Accounts."

straight year to reach 33.3 percent in 2007, the most recent year for which data are available. Government expenditures made up 5.1 percent of domestic travel and tourism in 2007, holding relatively steady from previous years (table J and chart 7).

**Table J. Domestic Travel and Tourism by Type of Visitor in 2001–2007**

Year	Millions of dollars				Percent		
	Resident households	Business	Government	Total	Resident households	Business	Government
2001 .....	278,072	139,331	24,281	441,683	63.0	31.5	5.5

**Chart 7. Business Travel's Share of Domestic Travel and Tourism in 2002–2007**

### Key Terms

The following key terms are used to describe the travel and tourism satellite accounts.

**Domestic tourism.** Travel-related expenditures by U.S. residents traveling within the United States. It comprises travel by resident households, business travel, and travel by government employees.

**Inbound tourism.** Travel-related expenditures by non-residents traveling within the United States and expenditures by nonresidents on international transportation purchased from U.S. providers. These expenditures exclude expenditures for travel to study in the United States and for medical reasons.<sup>1</sup>

**Internal tourism.** The sum of domestic tourism expenditures and inbound tourism expenditures (net of all international transportation expenditures).

**National tourism.** The sum of domestic tourism demand and outbound tourism demand (including all international transportation expenditures).

**Outbound tourism.** Travel-related expenditures by U.S. residents traveling abroad and expenditures by U.S. residents on international transportation purchased from foreign providers. (See footnote 1.)

**Tourism commodities.** Goods and services that are typically purchased by visitors, such as airline passenger transportation, hotel accommodations, and meals.<sup>2</sup>

**Tourism employment.** Total tourism-related employment consists of direct tourism employment plus indirect tourism employment. Direct tourism employment comprises all jobs where the workers are engaged in the production of direct tourism output (for example, hotel staff and airline pilots), and indirect tourism employment comprises all jobs where the workers are engaged in the production of indirect tourism output (for example, workers producing hotel toiletries and delivering fuel to airlines).

**Tourism output.** Total tourism-related output consists of direct tourism output and indirect tourism output. Direct tourism output comprises all domestically produced goods and services purchased by travelers (for example, traveler accommodations and passenger air transportation), and indirect tourism output comprises all output required to support the production of direct tourism output (for example, toiletries for hotel guests and fuel for airplanes).

**Usual environment.** The area of normal, everyday activities within 50–100 miles of home.<sup>3</sup>

**Visitor.** A person who travels outside of his or her usual environment for less than a year or who stays overnight in a hotel or motel. The visitor may travel for pleasure or business (private sector or government). Visitors exclude travelers who expect to be compensated at the location of their visit (such as migrant workers, persons traveling to new assignments, and diplomatic and military personnel traveling to and from their duty stations and their home countries).

1. In the travel and tourism satellite accounts, inbound and outbound visitors are not differentiated by type of visitor, because the data to prepare these estimates are not available.

2. The classification of tourism commodities in the travel and tourism satellite accounts is based on a list of primary activities of visitors that was developed from recommendations by the World Tourism Organization, by the Organisation for Economic Co-operation and Development, and from various surveys of U.S. visitors.

3. The usual environment depends on the availability of source data.

## Tourism Value Added and Employment

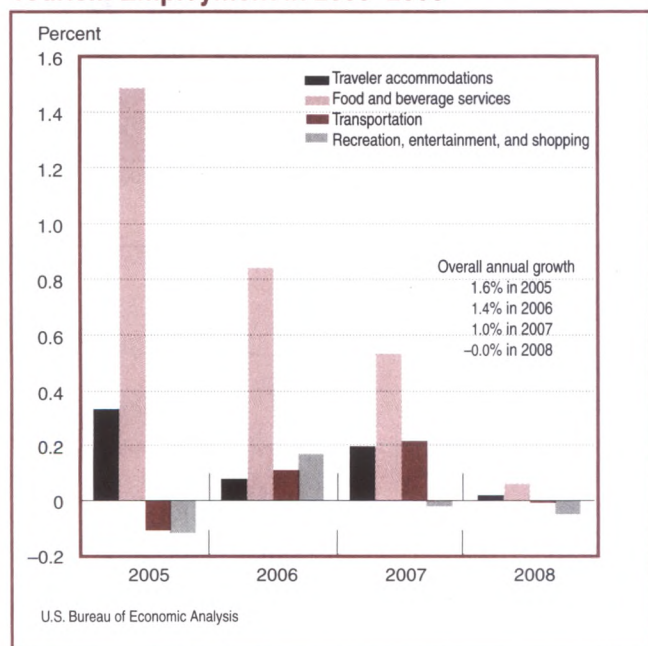

### Value added

A sector's value added measures its contribution to gross domestic product (GDP). In 2007 (the most recent year for which data are available), tourism's share of GDP was 2.7 percent (table K). Travel and tourism's share of GDP continues to account for a larger share of GDP than industries such as utilities, computer and electronic products manufacturing, or broadcasting and telecommunications.

**Table K. Travel and Tourism as a Share of Gross Domestic Product in 2001–2007**

Year	Billions of dollars		Percent
	Gross domestic product (GDP)	Tourism value added	Tourism value added as share of GDP
2001	10,128	283	2.80
2002	10,470	285	2.72
2003	10,961	298	2.72
2004	11,686	317	2.71
2005	12,422	331	2.66
2006	13,178	352	2.67
2007	13,808	370	2.68

**Chart 8. Contributions to Annual Growth in Direct Tourism Employment in 2005–2008**

### Direct employment

Direct tourism employment includes jobs that involve producing goods and services that are directly sold to visitors. Airline pilots, hotel clerks, and travel agents are examples of such employees. Overall, direct employment decreased less than 0.1 percent in 2008. A decline in employment for the shopping industry was the largest contributor to the overall decline in employment growth, contributing 18 percent to the overall decline. Despite the decline in 2008, a few of the industries contributed positively. Food services and drinking places contributed 0.06 percentage point to growth, and traveler accommodations contributed 0.02 percentage point to growth (table L and chart 8). Almost all industries shed employment or cut back on

PCE Personal consumption expenditures

hiring new employees (table M). Previously published estimates for 2005–2007 are shown in table N.

**Total employment**

Total tourism-related employment (the sum of direct and indirect jobs) decreased to 8.6 million jobs in 2008, down from 8.6 million jobs in 2007. The 8.6 mil-

lion jobs consisted of 5.9 million direct tourism jobs and 2.7 million indirect tourism jobs (chart 9). While direct tourism employment includes jobs that produce direct tourism output, such as airline pilots, indirect tourism employment is comprised of jobs that produce indirect tourism output, such as refinery workers producing jet fuel. The most recent data indicate that every direct tourism job generates an additional 46 percent of a job in indirect tourism employment (table 7).

## BEA BRIEFING

# A Primer on BEA's Industry Accounts

By Mary L. Streitwieser

**I**S THE ECONOMY growing? How fast—or slow? While the Bureau of Economic Analysis' (BEA) featured measure of economic output, gross domestic product (GDP), provides an answer, people are often also interested in the industry dynamics playing out within the economy. Which industries are expanding the fastest? Which are contributing the most to economic growth? How much income is generated from production? How much of an industry's growth is due to growth in real output and how much due to price inflation? Which industries are significant exporters?

BEA's industry accounts—which include the annual and benchmark input-output (I-O) accounts, the GDP by industry accounts, the KLEMS statistics, and satellite accounts—provide answers to such questions. Broadly speaking, the accounts facilitate the study of the internal workings of the U.S. economy. They provide a framework to measure and analyze the production of goods and services by industry. They show the flows of goods and services purchased by each industry, the incomes earned in each industry, and the distribution of sales for each commodity to industries and final users. The industry accounts also detail each industry's contribution to GDP and its counterpart gross domestic income (GDI). These accounts thus offer a valuable complementary tool to the national income and product accounts.

The industry accounts are widely used for a variety of purposes, such as estimating the effects of various policies, regulations, and tax proposals. The U.S. International Trade Commission, for example, uses the annual I-O accounts to measure the impact of various trade policies, and the U.S. Patent and Trade Office used the benchmark I-O accounts to measure the size of the domestic copyright-related industries. Macroeconomic and microeconomic forecasting models, private and public, also use information from the industry accounts.

In addition, academics use the data extensively. As just one example, Nobel Laureate Lawrence Klein and Professors Cynthia Saltzman and Vijaya Duggal used annual and benchmark I-O time series data to examine

the strategic importance of intermediate goods and services, particularly the role of information technology on productivity in the financial service industry.<sup>1</sup>

Information from the benchmark I-O accounts is also used by BEA and other statistical agencies in preparing further economic statistics. Within BEA, for example, the benchmark I-O accounts are the building blocks for the national income and product accounts (NIPAs) and the annual I-O accounts.

This article is intended as an introduction to the industry accounts for new users and how they can be used to examine intraindustry and interindustry relationships in the economy. The computer and electronic products industry is used to demonstrate the scope and versatility of the industry accounts.<sup>2</sup>

The first section discusses the annual I-O accounts—the make and use tables and the four main requirements tables. The second section discusses how these accounts might be used for impact analysis. The third section discusses GDP by industry accounts and how they might be used for time series analysis. An appendix looks at the assumptions underlying the accounts. And finally, a list of references is provided for those who want more in-depth information.

### Input-Output Account Basics

A basic understanding of an industry's current economic activity and how it relates to the total U.S. economy can be obtained from the two main tables in the I-O accounts: the standard make and use tables. These two tables provide consistent statistics on an industry's production and its relationship with other industries for a given year. They offer a wealth of information about the size of the U.S. economy, the relative size of specific industries, what and how much is produced by specific industries, the technology used by specific

1. See Lawrence R. Klein, Cynthia Saltzman, and Vijaya G. Duggal, "Information Technology and Productivity: The Case of the Financial Sector," *SURVEY OF CURRENT BUSINESS* 83 (August 2003): 32–37.

2. The industry accounts classify industries according to the North American Industry Classification System (NAICS). This classification facilitates using the BEA industry accounts with industry statistics from other sources such as the Census Bureau and the Bureau of Labor Statistics.

industries, the incomes generated by production, and the size and scope of an industry's market.

Two sets of I-O tables are available. Annual I-O accounts, which are updated once a year, are available for 1997–2007; they include information on 65 industries. Benchmark I-O accounts include more detail, presenting information on more than 425 industries. The benchmark I-O table, for example, disaggregates the computer and electronic products industry into 25 separate industries. The benchmark I-O accounts are prepared less frequently, roughly once every 5 years, and are based on detailed data from the Economic Census conducted by the Census Bureau. The 2002 benchmark was released in October 2007.

### The make table

The standard make table shows the value of each commodity produced by each industry in a given year (table A).<sup>3</sup> Commodities are presented in columns and industries in rows. The entries across a row represent the dollar value of commodities produced by a specific industry. The diagonal cells in the table show the value of production of the commodity for which the industry has been designated the “primary” producer. Entries in the off-diagonal cells in the row show the value of production of “secondary” commodities. For example, a hotel may also provide restaurant services, but these services are not part of the hotel industry's primary product of accommodations. Therefore, the restaurant services are treated as a secondary product of the hotel industry. The sum of all the entries in the row is the total output of that industry.

3. These values are calculated at producers' prices. See the box “The Input-Output Valuation of Transactions.”

The entries in a column represent the value of production by each industry of a specific commodity. The off-diagonal cells in each column represent the production of secondary producers of the commodity. The column total is total commodity output. The row totals of the make table equal the column totals of the use table.

The principal measure of output in the I-O accounts is gross output, which includes the value of intermediate products (which are used by others in their production processes) and final products (which count toward GDP). Because gross output reflects double-counting—both intermediate goods and final goods—it is often referred to as “gross duplicated output.”

A highly aggregated version of the 2007 annual I-O standard make table is shown in Table A. The row for the computer and electronic products industry shows that in 2007 the industry produced not only \$368.6 billion in computers (the industry's primary product in the shaded cell) but also secondary products, including nearly \$10 billion in other manufactured goods (\$378.3 billion – \$368.6 billion) and nearly \$9 billion in services. Total gross output for the industry was \$388.0 billion.

The computer and electronic products column shows that while the computer and electronic products industry produced 98 percent of all computer and electronic products (\$368.6 billion / \$374.9 billion), it was not the only producer of these commodities. Nearly \$6 billion were produced, as secondary products, by other manufacturing industries (\$374.5 billion – \$368.6 billion) and by service industries (\$339 million). Together, all industries produced \$374.9 billion in computer and electronic products commodities.

**Table A. The Make of Commodities by Industries, 2007**

[Millions of dollars]

Industries/commodities	Agriculture, mining, and construction <sup>1</sup>	Manufacturing		Services <sup>2</sup>	Government <sup>3</sup>	Total industry output <sup>4</sup>

<b>Total commodity output.....</b>	<b>2,191,880</b>	<b>5,012,370</b>	<b>374,852</b>	<b>16,287,909</b>	<b>2,362,541</b>	<b>25,808,901</b>

1. Agriculture consists of agriculture, forestry, fishing, and hunting.

2. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food

services; and other services, except government.

3. Consists of federal, state, and local governments.

4. Includes noncomparable imports; inventory valuation adjustment; rest-of-the-world adjustments; and scrap, used and secondhand goods.

### The Input-Output Valuation of Transactions

Transactions in commodities are valued at producers' prices in the industry accounts. Producers' prices exclude wholesale and retail trade margins and transportation costs, but they include excise and sales taxes collected and remitted by producers. Transportation costs and trade margins are shown as separate purchases by the users of the commodities. The sum of the producers' value, transportation costs, and trade margins equals the purchasers' value.

In order to show the relationship between the production of commodities and their purchase by intermediate and final users, commodities are shown as if they move directly to users. The flows of commodities for resale to and from wholesale trade and retail trade are not shown. If trade were shown as buying and reselling commodities, industrial and final users would make most of their purchases from a single source—trade.

Wholesale and retail trade margins on commodities are shown as purchases by users and are included in the trade commodity rows of the use table. Transportation costs are the freight charges paid to move the commodity from the producer to the intermediate user or the final user. All transportation costs are shown as purchases by users and are included in the transportation commodity rows of the use table.

**Wholesale trade.** This sector comprises establishments engaged in wholesaling merchandise, generally without transformation, and rendering services incidental to the sale of merchandise. Wholesalers sell merchandise to other businesses and normally operate from a warehouse or office. Wholesale trade output consists of trade margin output and nonmargin output; both exclude the cost of goods purchased for resale. Both the margin and nonmargin outputs are included in the wholesale trade commodity row of the use table.

The trade margin output occurs when an establishment buys and resells a good. It is included in the purchasers' prices of the goods that are purchased but not in the producers' prices of those goods, and it is measured in two parts. The trade margin is calculated as wholesale sales less the cost of goods sold plus taxes collected by the distributor.

Nonmargin output occurs when a wholesale trade service is purchased separately from the commodity, such as when a wholesaler acts as a broker between buyer and seller. Nonmargin output is assumed to be purchased by the producer of the goods being sold and is thus reflected in the producers' prices of the goods. It is measured as the sum of expenses, excluding the cost of the goods, on goods sold by manufacturers' sales offices, the commissions on goods sold by agents and brokers and by merchant wholesalers acting as commission merchants, the taxes collected, and the customs duties, which are considered as taxes collected by wholesale trade establishments.

**Retail trade.** This sector has one primary product—distributive services for the sale of goods. Its output consists pri-

marily of retail trade margins, which are measured as retail sales less the cost of goods sold plus the taxes collected by retail trade establishments. All retail trade margin and nonmargin output are included in the retail trade commodity row of the use table.

Retail trade margins apply primarily to purchases by persons, but they are also applied to purchases by business and government, such as some purchases of personal computers by business. Retail trade margins are also applied to some intermediate purchases by business, such as office supplies, gasoline, and construction materials.

#### Final use components

**Imports of goods and services.** This component is measured by individual commodity at domestic port values. The domestic port value of an imported commodity, which includes customs duties, is considered equivalent to the producers' price of a domestically produced commodity. The imports of transportation and wholesale trade include adjustments to convert the sum of all commodity imports of goods to foreign port value. Imports of services are valued at producers' prices. No margins or transportation costs are associated with services.

All imports except "noncomparable imports" are assumed either to be consumed within the U.S. boundaries or to have domestic equivalents. Noncomparable imports consist of goods purchased by U.S. residents abroad and of services imports that have no domestic counterparts.<sup>1</sup> These services include travel by U.S. residents abroad—both foreign travel by U.S. residents, which is included in final demand as a part of personal consumption expenditures, and foreign travel by U.S. business people, which is included as intermediate purchases. Noncomparable commodity imports are distributed directly to industries and final users and are shown in a separate row in the use table.

**Exports of goods and services.** This component is measured by commodity at producers' prices—the same as other domestically produced commodities. Transportation costs and trade margins, which are required to move exports from the producer to the port of exit, are included in the transportation and trade commodity rows of the use table.

**Change in private inventories.** This component is measured by commodity at the LIFO-reserve-adjusted book value that is reported by industries in the economic censuses. Inventory values are adjusted to remove the effects of price changes while products are held in inventory. This inventory valuation adjustment is made by holding industry, commodity, and inventory type.

1. Most imported goods now have domestic counterparts. Before the 1992 benchmark I-O accounts, noncomparable imports also included domestically consumed imported goods, such as bananas and coffee, that had no significant domestic counterparts.

## The use table

The standard use table is a matrix that shows the uses of commodities by industries as intermediate inputs and by final users in a given year (table B). In contrast to the make table, the rows in the use table present the value of commodities (in producers' prices), and the columns display the industries and final users that utilize them. The sum of the entries in a row is the gross output of that commodity. The columns show the products consumed by each industry and the three components of "value added," that is, the income generated by production. The components of value added include returns to labor (compensation of employees), capital (gross operating surplus), and government (taxes on production and imports less subsidies). When aggregated across all industries, value added equals GDP for the nation. Value added is defined as the value of the industry's sales to other industries and final users (gross output) less the value of its purchases from other industries (intermediate inputs). The sum of the entries in a column is that industry's total, or gross, output.

Table B shows the aggregate 2007 annual I-O standard use table corresponding to the make table. The row shows the value of computers and electronic products, as a commodity, used by each industry and final use category—that is, the commodity's market. In 2007, total computer and electronic products commodity output was \$374.9 billion, of which nearly 60 percent or \$219.5 billion was used by industries as input to their production and \$155.3 billion was consumed by final users. Personal consumption expenditures accounted for \$74.0 billion in final use; private fixed investment accounted for \$186.3 billion, change in private inventories was \$2.9 billion, net ex-

ports were -\$148.5 billion (the negative value indicates imports exceeded exports), and government expenditures and investment accounted for \$40.6 billion.

The use table is sometimes referred to as a "recipe" matrix because it shows the components that are necessary for producing the output of each industry. The computer industry column of table B shows that the production of the industry's primary and secondary products requires commodity inputs from all areas of the economy, including \$66.9 billion in computer and electronic products, \$38.5 billion in other manufactured goods, \$123.2 billion in services, \$944 million in agriculture, mining, and construction goods, and \$269 million in government goods and services. In total, \$241.7 billion in intermediate inputs were required in 2007.

The computer and electronic products industry generated \$146.3 billion in value added: \$139.1 billion in compensation to labor, \$4.5 billion in taxes on production and imports less subsidies to the government, and nearly \$3 billion in gross operating surplus. Note that for each industry the (shaded) total industry output values in the make table column and use table row are the same. Similarly, for each commodity, the (shaded) total commodity output values reported in the two tables are the same.

In addition, the use table shows that the GDP of \$13,808 billion can be measured in three ways: as the sum of all final uses (the expenditures approach), the sum of all value added across industries (the sum of incomes generated from production), and as total gross output less total intermediate inputs (the production approach). The GDP value reported in the annual industry accounts is consistent with the GDP reported in the NIPA accounts.

1. Agriculture consists of agriculture, forestry, fishing, and hunting.

2. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.

3. Consists of federal, state, and local governments.

4. Includes inventory valuation adjustment.

5. Includes noncomparable imports; inventory valuation adjustment; rest-of-the-world adjustments; and scrap, used and secondhand goods.

## Impact Analysis

While the make and use tables from the I-O accounts provide basic facts about an industry for a given year, researchers often want a more in-depth analysis. The main contribution of the I-O accounts to economic analysis is that they permit users to measure the full, economywide repercussions that changes in final uses (household, business, and governments spending) have on industry and commodity output, employment, and income. A number of industry tables are derived from the standard make and use tables; these tables can be used for additional analysis, such as an “event study” or “impact analysis.”

## Redefinitions

The derivation of tables for this additional analysis starts with the standard make and use tables, in which all products produced by an industry—primary and secondary—are assigned to that industry. For the supplementary make and use tables, however, some secondary products and their associated inputs are redefined; that is, they are reassigned to the industry in which they are the primary products. Redefinitions are made when the input structure of the industry's secondary product differs significantly from the input structure of its primary product. For example, the restaurant services in hotels are redefined from the accommodations industry to the food services industry. These supplementary tables are referred to as “after redefinition.”

Redefinitions affect numerous industries in the I-O accounts, notably wholesale trade, retail trade, construction, publishing industries, and accommodations and food services. As a result of redefinitions, the total value of secondary products is decreased, and the total value of primary products is increased by the same amount.<sup>4</sup> For the 2007 annual I-O accounts the amount of the redefined secondary output was \$702 billion, or 2.7 percent of total output and 40 percent of total secondary output. For most industries, the output shown in the standard make and use tables will differ from that shown in the supplementary make and use tables; however, commodity outputs are not affected.

## Requirements tables

Four requirements tables are derived from the “after redefinitions” make and use table. These tables are the most useful for impact or event analysis, because they

can be used to show the impact of a specified change in final demand throughout the economy.<sup>5</sup> The values in these requirements tables are expressed as portions of industry output rather than in dollars. The coefficients in the requirements tables represent interindustry linkages that, in turn, link output and final demand.

**The commodity-by-industry direct requirements table.** This table is sometimes referred to as “the direct coefficients table” (table C). The direct coefficients calculate only the direct effects, which are the amount of commodity inputs required by an industry to produce a dollar of the industry's output, valued in producers' prices. This table thus ignores the indirect effects, which are the production requirements of all other industries to meet the industry's initial demand for a dollar of its output. For example, consider an increase in the final demand for motor vehicles. The direct requirements table shows the input production requirements—such as paint, steel, and plastic—of the motor vehicles, bodies and trailers, and parts industry to provide additional motor vehicle output. It does not include the “trickle down” effects, that is, the production requirements of all other industries necessary to support the additional demand for intermediate inputs

5. BEA produces three additional supplementary tables that serve as bridges between the I-O statistics and statistics in the NIPAs. The bridge table for personal consumption expenditures (PCE) covers the I-O commodity composition of NIPA PCE. The bridge table for private fixed investment in equipment and software (PES) covers the I-O commodity composition of NIPA PES expenditures. The third bridge table reconciles the I-O statistics of exports and imports with those in the NIPAs. The commodity composition tables are necessary because the I-O accounts value the final use categories in producers' prices while the NIPA final demand categories are expressed in purchasers' prices. In benchmark years, the I-O accounts also include a *Concordance Between Input-Output Commodity Codes and Foreign Trade Harmonized Codes*. This table links Census Bureau merchandise trade data by harmonized foreign trade codes to I-O commodity codes by weight. The weight indicates what portion of the harmonized code value was allocated to the I-O commodity.

**Table C. The Direct Requirements by Industries, 2007**

[Output requirements per dollar of delivery to final demand, at producers' prices]

4. See chapters 4 and 9 in *Concepts and Methods of the U.S. Input-Output Accounts* for details on the redefinition and reclassification process and underlying assumptions ([www.bea.gov/papers/pdf/IOMannual\\_092906.pdf](http://www.bea.gov/papers/pdf/IOMannual_092906.pdf)).

1. Agriculture consists of agriculture, forestry, fishing, and hunting.  
2. Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance; insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.  
3. Consists of federal, state, and local governments.  
4. Includes noncomparable imports; rest-of-the-world adjustments; and scrap, used and secondhand goods.

from the motor vehicles industry, such as the additional requirement for tire cord and synthetic rubber by the plastics and rubber industry to provide the additional tires required by the motor vehicles industry.

The direct requirements table is calculated by dividing each row element (commodity value) of the use table after redefinitions by the column sum for each industry in the table. Table C shows that for the computer and electronic products industry to produce \$1 billion of computer and electronic products output in 2007, it directly required \$634 million of intermediate inputs (\$1 billion  $\times$  0.634). That included \$176 million in computer and electronic products (\$1 billion  $\times$  0.176) and \$102 million in other manufactured goods ( $0.278 - 0.176 = 0.102 \times$  \$1 billion), which included such manufactured goods as \$31 million in fabricated metals, \$20 million in primary metals, and \$12 million in chemical products. The industry also required \$322 million in services inputs, including \$82 million in wholesale trade services, \$61 million in miscellaneous professional, scientific and technical services, and \$7 million in legal services. The industry generated \$366 million in value added for every \$1 billion in industry output, 96 percent of which was for compensation to labor.

In many cases, researchers and policymakers are interested in the total impact—including the direct and indirect effects—of the specified change in final demand.<sup>6</sup> BEA offers three total requirements tables, as shown in the following table.

**Total Requirements Table**

Table	Use
Commodity-by-commodity	Final demand is shown for commodities; the objective is to derive the commodity output that is required.
Industry-by-commodity	Final demand is shown for commodities; the objective is to derive the industry output that is required.
Industry-by-industry	Final demand is shown for industries; the objective is to derive the industry output that is required.

**The commodity-by-commodity total requirements table.** This table shows the production required, both directly and indirectly, of the commodity at the beginning of each row per dollar of delivery to final use

6. The final use requirements coefficients presented in the total requirements tables identify the cumulative effects on total industry and commodity outputs that result from a change in final use. In contrast to conventional macroeconomic multipliers that measure the cumulative impact on final output of a policy change, such as the decline in GDP that results from a reduction in government spending, these final use coefficients measure the impact of a change in final demand (uses) on gross output (final and intermediate output). Indeed, shifts in the composition of final uses can have a "multiple" impact on industry and commodity output but can have no effect on the level of total GDP.

of the commodity at the top of the column.<sup>7</sup> Providing \$1 billion of computer and electronic products to final users required, among other inputs, \$1.2 billion of computer and electronic products, \$61 million in primary metals goods, \$50 million in fabricated meal products, and \$36 million in chemical products.<sup>8</sup> The total commodity requirements coefficient is 2.223, which is the sum of all the entries in the column. This means that the total value of all commodities required for an additional \$1 billion of computer and electronic products delivered to final users is \$2.2 billion.

**The industry-by-commodity total requirements table.** This table shows the production required, both directly and indirectly, from the industry at the beginning of the row per dollar of delivery to final use of the commodity at the top of the column. This table may be the most useful because most information on final uses is in terms of commodities and most other statistical data—for example, employment—is in terms of industries. In order to provide final users with \$1 billion of computer and electronic products goods, the computer and electronic products industry is required to produce \$1.2 billion of industry output.<sup>9</sup> Recall that some of the industry's production will be used by other industries as intermediate inputs; not all reaches final users. Other industries must produce \$975 million of industry output. The total industry output requirement coefficient is 2.174, indicating the additional output of all industries that is required to deliver \$1 billion of computer and electronic products to final users is \$2.2 billion.

**The industry-by-industry total requirements table.** This table shows the production required, both directly and indirectly, from the industry at the beginning of the row per dollar of delivery to final use of the industry at the top of the column. For example, in 2007, providing final users with \$1 billion of computer and electronic products industry output required the computer and electronic products industry to produce \$1.2 billion of output, the primary metals industry to produce \$57 million of output, and the fabricated metal products industry to produce \$50 million of output, and so on.<sup>10</sup> The total industry output requirements coefficient is 2.172, indicating that

7. A coefficient greater than one (on the diagonal) indicates that for a specific commodity, the coefficient includes the increase in demand for that commodity plus other direct and indirect inputs of that commodity required to produce the commodity for final use.

8. Statistics are from the 2007 annual I-O Commodity-by-Commodity Total Requirements Table.

9. Statistics are from the 2007 annual I-O Industry-by-Commodity Total Requirements Table.

10. Statistics are from the 2007 annual I-O Industry-by-Industry Total Requirements Table.

the additional output of all industries to deliver \$1 billion of output to final users from the computer and electronic products industry is \$2.2 billion.

### Other tables

Other tables, such as a domestic output requirements tables and an employment requirements table, can easily be constructed by users.

**Domestic output requirements table.** When using the total requirements tables, it is important to note that the amount of output required to deliver a dollar of commodity to final users includes both imported commodities and domestically produced commodities. However, both the total commodity output requirements coefficient and the total industry output requirements coefficient represent the output required as if all of the commodity were domestically supplied. Therefore, if a portion of the commodity is imported, the impact on domestic output will be lower than that implied by the requirements coefficient.

The coefficients in a domestic output requirements table are used to estimate the domestic output of goods and services required to meet final demand. Users can derive this table by subtracting the import matrix from the use table after redefinitions before calculating a total requirements matrix.<sup>11</sup> So a domestic output industry-by-commodity requirements table for 2007 is generated by subtracting the import matrix from the use table after redefinitions and then calculating the industry-by-commodity total requirements table.<sup>12</sup>

This table shows that in order to provide final users with \$1 billion of computer and electronic products goods, after taking into account imported computer and electronic products, the domestic computer and electronic products industry is required to produce \$1.1 billion of industry output. Other industries contribute \$757 million of industry output. The total industry output requirement coefficient is 1.831, indicating that the total additional output of all domestic industries required to deliver \$1 billion of computer and electronic products to final users is \$1.8 billion. This compares with the total (domestic and foreign output) requirements of 2.174 from the standard industry-by-commodity total requirements table

11. The import matrix is a supplemental table that shows for each commodity, the value of import of that same commodity used by each industry. The import matrix is derived from the use table. The imputed import values are based on the assumption that each industry uses imports of a commodity in the same proportion as imports-to-domestic supply of the same commodity. Therefore, all variability of import usage across industries reflects the assumption and is not based on industry-specific information. BEA prepares two import matrixes, corresponding to the standard use table and the use table after redefinitions.

12. BEA does not prepare domestic output requirements tables as part of the I-O accounts, but it does provide the import matrix so that users can construct domestic output requirements tables.

described previously.

**Employment requirements table.** This table shows the direct and indirect impact of a change in final demand on industry employment. These tables are derived from one of the total requirements tables. The employment requirement coefficient can be calculated from the industry-by-commodity or the industry-by-industry total requirements tables (either the total or domestic requirements tables), depending on the assumptions used for the analysis. From the domestic industry-by-commodity employment requirements table, the direct and indirect impact of a \$1 billion change in final demand for computer and electronic products (commodity) on employment can be calculated.

As one would expect, the greatest impact occurs in the computer and electronics products industry, where in 2007, a \$1 billion dollar increase in final demand required an increase in the industry's employment of nearly 3,500 workers. Higher employment in other industries would also be required: wholesale trade (513 workers), miscellaneous professional, scientific and technical services (419 workers), administrative and support services (350 workers), and management of companies and enterprises (210 workers). Across all industries, roughly 6,785 additional workers would have been required to meet a \$1 billion increase in final demand.

### GDP by Industry Accounts

While the input-output accounts offer a wealth of information in current dollars, the GDP by industry accounts allow for easier time series analysis of industry output in current dollars and in inflation-adjusted dollars.<sup>13</sup> These accounts provide an industry-by-industry breakout of GDP. They are ideally suited for studying industry shares of GDP, the composition of an industry's value added, an industry's returns to labor and capital, and its contribution to U.S. economic growth and inflation.

### Value added

One key feature of the GDP by industry accounts is the value-added estimates for all industries. Value added is a measure of the incomes earned in production in each industry. As such, it is also a measure of an industry's contribution to GDP. The main components of value include the returns to labor (as measured by compensation of employees) and returns to capital (as measured by gross operating surplus) and the returns to

13. The GDP by industry accounts are an extension of the annual I-O accounts and therefore the current dollar value added and its components in the two sets of accounts are consistent.

government (as measured by taxes on productions and imports less subsidies).

Current-dollar value added for the computer and electronic products industry declined at an average annual rate of -0.5 percent in 1998-2007. By contrast, value added for all industries rose at an 5.2 percent rate (table D).

**Returns to capital.** The gross operating surplus includes corporate profits and proprietors' income as well as depreciation, net interest, and business transfer payments. As a share of current-dollar value added, gross operating surplus was consistently lower in the computer and electronic products industry than for the economy as a whole. For the industry, gross operating surplus, as a share of value added, fell from 26.7 percent in 1998 to a trough of -2.5 percent in 2001 before recovering to 1.8 percent in 2007 (table E). The industry was hit hard in the recession of 2001. The ratio across all industries held up much better; the ratio fell from 35.7 percent in 1998 to 34.6 percent in 2001 before rising to 36.4 percent in 2007.

**Returns to labor.** In contrast to the capital share, the compensation of employees share of current-dollar value added in the computer and electronic products industry was 71.7 percent in 1998, while the national level share was just 57.4 percent. However, while the share across all industries declined to 56.6 percent in 2007, the computer and electronic products industry share increased to 95.1 percent.

**Real growth rates.** A look at an industry's "real," or inflation-adjusted, value-added growth rates in comparison to real GDP growth can suggest if the industry is adding to (or reducing) the national economy's growth.

Real GDP increased at an average annual rate of 2.8 percent in 1998-2007 (table D). Real value added also increased for most industries during this period; however, the growth rates varied considerably. The computer and electronic products industry grew at an average annual rate of 21.3 percent over this period,

the highest growth rate of the 65 industries included in the GDP by industry accounts.

**Contributions to economic growth.** Differences in growth rates alone do not indicate the extent to which industries contribute to economic growth. An industry's contribution also depends on the industry's size. For example, real value added for the computer and electronic products industry increased by 45.1 percent in 1998. Even though the computer and electronic products industry is relatively small (1.9 percent of current-dollar GDP in 1998), it contributed a larger share to growth: 0.75 percentage points of the 4.2 percent growth in real GDP. By 2007, the computer and electronic products industry accounted for 1.1 percent of current-dollar GDP; industry real value added increased 19.9 percent during 2007 and contributed 0.20 percentage points to the 2.0 percent growth in real GDP.

### Intermediate inputs

For an industry to produce output, it needs capital and labor, its value-added inputs, and secondary inputs, which are also known as intermediate inputs to production. For example, a baker produces bread by mixing flour, water, eggs, and other material inputs before placing the dough into an oven. In addition to the material inputs, the baker also needs electricity, a kind of energy input, to power the operating equipment. Finally, the baker may have a fleet of vans to transport the bread to the local grocery store, or the baker may contract the delivery (purchased-service input) to a local trucking service.

The KLEMS statistics provide detail on the types of intermediate inputs described above that are consumed by industries to produce goods and services. These statistics break out total intermediate inputs by industry into three cost categories: energy, materials, and purchased services. They also provide information on the contribution of price and quantity changes for the different types of intermediate inputs on the U.S.

NOTE: Industry percentage of real GDP growth is calculated as the ratio of the industry percentage point contribution to all industries percent change in real GDP to percent change in real GDP.

economy; for example, the impact of price changes for energy inputs on overall prices for the nation's output.

A look at the composition of total intermediate inputs for the U.S. economy shows the broad move toward an increasingly services-oriented economy. In each year over 1998–2007, every dollar of gross output represented a progressively higher percentage of purchased services and a lower percentage of materials. In 2007, purchased services accounted for 26.2 percent of the nation's output (table F). That means that every dollar of output in 2007 reflected 26 cents worth of purchased services. Materials accounted for about 18 cents of every dollar of output.

The computer and electronic products industry re-

quires 32 cents worth of materials and 30 cents worth of purchased services to produce a dollar of output. These shares are much more evenly distributed than they were before the economic slowdown in 2001; for example, in 2000, at the height of the information technology (IT) boom, materials accounted for 38 cents and purchased services accounted for 25 cents of every dollar.

The use of materials inputs, adjusted for inflation, for the computer and electronic products industry varied considerably, reflecting the IT boom, the 2001 slowdown, and the subsequent recovery through 2007. In 1999 and 2000, growth in the use of materials neared 20 percent each year (table G), and accounted for 0.81 percentage point, or about 20 percent, of the 4.1 percent growth in the use of materials in 1999 and 0.88 percentage point, or about 38 percent of the 2.3 percent growth in 2000 (table H). This growth was followed by steep declines, 11 percent in 2001 and 21 percent in 2002. The use of materials was relatively flat during the post 2001 recovery.

### Price growth

The price indexes for gross output, value added, and intermediate inputs represent the prices received by an industry for its output and the prices paid for its inputs. Growth rates for these indexes indicate whether prices for these inputs are growing faster or slower than output prices. Price growth for the nation's output averaged 2.3 percent in 1998–2007 and was evenly distributed between value added (2.3 percent) and intermediate inputs (2.4 percent) (table I). Within intermediate inputs, energy prices increased significantly more than prices for materials and purchased services: 6.7 percent, 2.5 percent, and 1.9 percent, respectively. Indeed, energy prices saw double-digit price increases in 2000 and 2003–2005.

The pattern of changes in the price indexes for the computer and electronic products industry was quite different from the national pattern. Most striking is the large and continual decline in prices for gross output

and value added in the industry: averaging -8.1 percent and -18.0 percent, respectively. Over 1998-2007, value-added prices for the computer and electronic products industry subtracted just over 3 tenths of a percentage point from the 2.3 percent average annual growth in the GDP price index (table J). Within intermediate inputs, the growth in prices for material in-

puts was negative 8 of the 10 years. Overall, materials prices paid by the industry declined by 3.8 percent annually, subtracting 0.19 percentage point from the 2.5 percent average annual growth in economywide materials prices. The decline in these price indexes at a time when real output was growing, reflects the significant productivity gains in the industry. The growth in the

energy and purchased services price indexes were dominated by the drop in materials and value added prices.

### Appendix: A Note on Assumptions

When using the industry accounts, the underlying assumptions are worth keeping in mind. The assumptions follow directly from the fundamental economic principles that provide structure to I-O accounts.

First, inspection of the I-O use and the requirements tables shows that each industry is defined so that it has a unique production function, that is, a unique set of inputs.

Second, there are no economies of scale in produc-

tion; the ratio of each input to one unit of output remains constant over a wide range of output levels. This means if the demand for a given product increases 50 percent, all of the inputs required for the product will also increase by 50 percent. This principle is necessary to calculate the effect of a change in final uses on the output of all industries.

Third, the production relationships embodied in the I-O represent aggregate relationships at a given level of production in a given year. Thus, it is important to use the requirements tables to estimate impacts for a year close to the reference year of the accounts. This is particularly important in using the detailed benchmark I-O accounts, which are produced once

#### Data Availability

The industry accounts are available to the public without charge on BEA's Web site at [www.bea.gov](http://www.bea.gov). Users have two options for downloading the industry data: downloading complete tables or creating user specified extracts via an interactive data retrieval tool. Users who want to directly download published I-O data will find all the data files accessible in the Industry Economic Accounts portion of BEA's Web site. Data downloading is recommended for users who want to retrieve the complete tables at the most detailed industry level. All data are in MS Excel format except for the very large detail level benchmark tables, which are in TXT format.

The benchmark I-O tables for 1997 and 2002 are available on a NAICS basis. Tables for 1947, 1958, 1963, 1967, 1972, 1977, 1982, 1987, and 1992 are available on the Standard Industrial Classification (SIC) basis. The import matrix and the concordance between the I-O commodity codes and the foreign trade harmonized codes are available only for 1997 and 2002. The bridge tables are available for 1987 forward.

The benchmark I-O accounts are available at three levels of industry and commodity aggregation:

- The sector level—15 industries, 16 commodities, and 6 final use categories—that corresponds approximately to the two-digit level NAICS
- The summary level—133 industries, 136 commodities, and 13 final use categories—that corresponds approximately to the three- and four-digit level NAICS
- The detailed level—over 425 industries and commodities and 13 final use categories

The NAICS-based annual I-O tables are available for 1997–2007. These tables are consistent with the 2008 annual revision of the integrated annual industry accounts and the 2004 comprehensive revision of the annual industry accounts.<sup>1</sup> The import matrix and the bridge tables are available only for 2002–2007. Historic SIC-based tables are available for 1996–99.

1. The annual I-O accounts consistent with the 2010 comprehensive revision will be available in May 2010.

The annual I-O accounts are available at two levels of industry and commodity aggregation:

- The sector level—15 industries, 16 commodities, and 6 final use categories—that corresponds approximately to the two-digit level NAICS
- The summary level—65 industries, 68 commodities, and 13 final use categories—that corresponds approximately to the three-digit level NAICS

The NAICS-based GDP by industry statistics for gross output, intermediate inputs, and value added and KLEMS statistics are available for 1997–2007. These accounts are integrated with the annual I-O accounts. Historical NAICS-based GDP by industry statistics for value added (1947–97) and for gross output and intermediate inputs (1987–97), and SIC-based GDP by industry statistics for gross output (1977–97) and value-added and its components (1947–97) are also available.

The annual accounts, both annual I-O and GDP by industry, are available approximately 11 months after the end of the reference year. The “advance” GDP by industry statistics are aggregated to 20 broad industry groups and government—roughly corresponding to the two-digit NAICS—rather than to the 65 industries in the revised accounts. The advance statistics are published approximately four months after the end of the reference year.

The core tables for the benchmark I-O accounts for 1997 forward and the annual accounts for 1997 forward also are available on an interactive basis on BEA's Web site. The interactive access area allows users to customize a selection of data from the U.S. I-O account tables. Data can be extracted in Excel or CSV format. In addition, users are able to graph selected information from the GDP by industry accounts and the KLEMS statistics to view trends over time. Select tables allow for four different types of graphs: actual values, normalized values, changes from one period to the next, and percentage changes from one period to the next.

Published articles on the I-O accounts can be found on BEA's Web site. See [www.bea.gov/industry/an2.htm](http://www.bea.gov/industry/an2.htm) for a list of articles.

every 5 years. Interindustry relationships change over time because of changes in market conditions, technology, and productivity. The farther the event year is from the reference year, the less reliable the results.

Fourth, the I-O accounts implicitly assume that all adjustments to a change in final demand are achieved instantly and without price changes. For analyses that require different assumptions, other economic tools may be more appropriate.

Fifth, BEA's industry accounts, following BEA conventions, use Fisher indexes to create price and quan-

tity indexes. For more information, see J. Steven Landefeld, Brent R. Moulton, and Cindy M. Vojtech, "Chained-Dollar Indexes: Issues, Tips on Their Use, and Upcoming Changes," *SURVEY* 83 (November 2003): 8–16.

## References

This article provides a first step in understanding BEA's industry accounts. For readers interested in continuing their education, this section offers references, organized by subject area and industry account.

### Satellite Accounts

Satellite accounts are supplemental accounts that expand the analytical capacity of the BEA's accounts by focusing on a particular aspect of economic activity. BEA currently produces two sets of satellite accounts—the travel and tourism satellite accounts and the research and development satellite account—and is developing satellite accounts for health, innovation, and energy.

**Travel and tourism satellite accounts.** Tourism is not treated as a separate industry in NAICS; rather, data for tourism are scattered among several industries—such as transportation services, accommodations, food and beverage services, and retail trade. As a result, comprehensive data on tourism is not identified specifically in the U.S. national accounts. The U.S. travel and tourism satellite accounts present a rearrangement of information from the NIPAs and the industry I-O accounts, augmented with information from other U.S. government agencies and from a private sector vendor of tourism information. In these accounts, the flows of commodities that are related to travel and tourism activities link tourism expenditures to the industries that produce tourism goods and services in the U.S. The tourism industries in the satellite accounts include industries whose output is purchased directly and indirectly by travelers.

These accounts present statistics on expenditures by tourists, or visitors, for 24 types of goods and services. The accounts also present statistics on the income generated by travel and tourism and statistics on output and employment generated by travel and tourism-related industries. Current-dollar and real dollar tourism output by commodity are reported along with the commodity chain-type price indexes. Both annual and quarterly these satellite accounts are produced.

The travel and tourism satellite accounts can be used by government officials and policymakers and by researchers to determine the size and components of travel and tourism, to assess the contributions of the tourism industry to the U.S. economy, to assess the relationship among the travel and tourism industries, to determine the expenditures of tourists, and to compare travel and tourism industries to other manufacturing and services industries. Because the accounts are a time series, they can be used to analyze how travel and tourism expenditures have change in recent years and examine who is traveling and how

the mix of travelers is changing.

**Research and development satellite account.** The research and development (R&D) satellite account adjusts the accounting conventions of BEA's core accounts to test the impact of treating R&D as a capital investment rather than as a current-period expense. It provides statistics on R&D investment, capital stock, and depreciation in the economy on a funder basis. In addition, it reports R&D-adjusted measures of GDP, gross domestic income, and national savings. Currently, the BEA accounts do not treat R&D and many other intangibles as investment and thus cannot separately identify their contribution to U.S. economic growth. This satellite account is part of a long-term effort to better account for intangible assets. BEA plans to incorporate R&D spending as investment into its core accounts in 2013.

The most recent R&D satellite account, released in September 2008, provides data for 1959–2004 at the national level and R&D statistics for 13 R&D intensive industries. The impact of R&D investment on GDP by state is available for 1998–2002. The R&D satellite account also includes an international component that shows the impact of treating R&D as investment on several dimensions of international transactions, including international transactions balances, the international investment position, and value added for multinational corporations for 1995–2004.

The R&D satellite account is a joint project by BEA and the National Science Foundation that aims to provide detailed statistics to facilitate research into the effects of R&D on the economy. The R&D satellite account can be used to determine the funding distribution of R&D investment and to assess the effects of R&D on the U.S. economy. Many state policymakers view R&D investment as an important part of their state's economic development strategy. For example, enhancing and encouraging R&D and knowledge-based industries within states and developing state-private partnerships with R&D industries are among the highest priorities among state governors.

**Potential future satellite account.** BEA is exploring the feasibility of creating additional satellite accounts—for innovation, including research and development and other intangible investments; health care; and energy.

#### Future Directions for the Industry Accounts

In order to provide more relevant statistics on industry activity, BEA is proposing a number of improvements to the industry accounts. Proposals being considered include preparing quarterly GDP by industry statistics that would be released shortly after the quarterly GDP estimates from the NIPAs; integrating the benchmark I-O accounts with the already integrated annual I-O and annual GDP by industry accounts; preparing an I-O based energy satellite account; and improving the measurement of intangibles and innovation in BEA's core and satellite accounts.

In addition, longer run research on the source data and methodologies used to prepare major portions of the annual I-O accounts and the NIPAs is being considered in order to improve the consistency and quality of both sets of accounts. For more information, see "BEA Briefing: Future Directions for the Industry Accounts" by Brian C. Moyer in the March 2009 *SURVEY OF CURRENT BUSINESS*.

# Foreign Direct Investment in the United States

## New Investment in 2008

By Thomas Anderson

**O**UTLAYS by foreign direct investors to acquire or to establish U.S. businesses rose 3 percent in 2008, to \$260.4 billion, according to statistics from the Bureau of Economic Analysis (table 1 and chart 1). Boosted by several large transactions, the increase occurred despite a falloff of worldwide merger and acquisition activity and amid a slowing U.S. economy.<sup>1</sup> The increase followed a 52 percent rise in 2007. Outlays in 2008 were the third largest on record and the sixth consecutive increase since a falloff in 2001–2002. Almost half of the total was accounted for by outlays of more than \$5 billion, a higher share than in recent years (table 2).

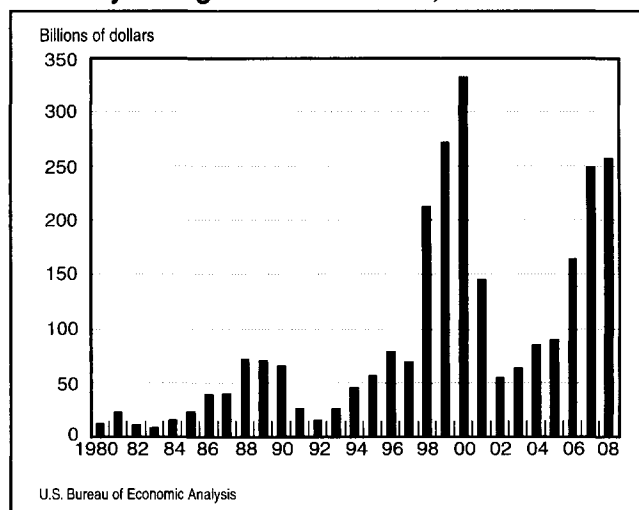

This will be the final article based on the new foreign direct investment survey, which has been discontinued. However, a new survey is being designed that will provide a more expansive look at new foreign direct investment in the United States. See the box “Improved Data on Greenfield Investments” on page 55.

Among major industries, there was a substantial increase in outlays in manufacturing, which accounted for the majority of the spending by investors in 2008. Outlays also rose in information and in finance. Outlays in real estate fell sharply.

1. According to data from Thompson Reuters, the volume of worldwide mergers and acquisitions declined 30 percent in 2008.

Outlays increased from investors in Europe, in the Latin America and Other Western Hemisphere region, and in the Asia and Pacific region. As in previous years, the largest share of outlays was from European investors. Outlays by investors from Canada and the Middle East fell.

## Outlays in 2008

In 2008, as in previous years, outlays to acquire existing U.S. businesses accounted for the majority of spending. These outlays totaled \$242.8 billion in 2008, compared with outlays of \$17.6 billion to establish new U.S. businesses.

Outlays made by, or through, existing U.S. affiliates of foreign companies totaled \$213.3 billion, compared with outlays of \$47.1 billion made directly by foreign direct investors. Of the \$213.3 billion that was spent by U.S. affiliates, \$184.4 billion came from their foreign parent groups. Thus, foreign parent groups, through a combination of direct outlays and funds supplied to existing U.S. businesses, funded a total of \$231.5 billion, representing almost 90 percent of total outlays in 2008. Those foreign parent funds are included in total foreign direct investment in the United States, as recorded in the financial account of the U.S. international transactions accounts.<sup>2</sup>

Outlays in manufacturing rose to \$141.1 billion from \$118.4 billion and accounted for more than half

of total outlays in 2008 (table 3). The increase in outlays was more than accounted for by beverages and tobacco products, where spending in 2008 was boosted by a large transaction. Among other manufacturing industries, spending was also substantial in chemicals, mainly in pharmaceuticals, as foreign drug makers sought to expand their product offerings by acquiring firms in the United States.

Outside manufacturing, outlays continued to be high in finance (except banks) and insurance and in banking. In finance (except banks) and insurance, spending was boosted by acquisitions of securities and commodities brokers and nonlife insurance companies by European and Japanese investors. In banking, European and Canadian banks made several acquisitions.

Outlays rose substantially in information and in professional, scientific, and technical services. In information, most of the outlays were in software publishing and telecommunications. Outlays fell sharply in "other industries" and in real estate and rental and leasing. In "other industries," spending fell in mining and in transportation and warehousing.

Spending by European investors rose to \$157.9 billion and represented 61 percent of total outlays in 2008 (table 4 and chart 2). Much of the increase in European investment was accounted for by countries in "other Europe," especially Belgium and Finland. Outlays by investors from the United Kingdom, which in previous years has often been the largest investing country, fell sharply.

Outlays from investors in the Asia and Pacific region rose to \$44.9 billion, with Japanese investors accounting for more than the total increase and for over

2. Foreign direct investment in the United States as recorded in the international transactions accounts, unlike the data on investment outlays in this article, includes financing of both existing and new U.S. affiliates and reflects sell-offs and other subtractions from investment as well as additions. However, it excludes any domestic-source funds that may be included in the measure of outlays reported in this article. For preliminary estimates of foreign direct investment in 2008, see Douglas B. Weinberg, Erin M. Whitaker, and Gregory A. Tenentes, "U.S. International Transactions: Fourth Quarter and Year 2008," SURVEY OF CURRENT BUSINESS 89 (April 2009): 12–53; revised estimates will be published in the July 2009 SURVEY.

### Improved Data on Greenfield Investments

BEA has eliminated the survey of new foreign direct investment in the United States but is designing a new survey of initial investments by foreign direct investors to better capture greenfield investments. The new survey will collect data on the construction of new plants and other new business facilities in the United States by existing U.S. affiliates of foreign direct investors as well as data on foreign investors' acquisitions of existing U.S. companies and establishment of new U.S. affiliates. The new survey is currently being developed, and comments or suggestions are welcome; send them to [be13@bea.gov](mailto:be13@bea.gov).

As a result of the elimination of the survey of new foreign direct investment in the United States, this report is the last in the series. In addition to the new survey, BEA will continue to collect extensive data on foreign direct investment in the United States through its quarterly and annual surveys.

60 percent of the region's outlays. In 2008, Japanese investors' outlays were boosted by acquisitions of U.S. firms in pharmaceuticals manufacturing, in wholesale trade, and in finance. Spending by investors from Latin America and Other Western Hemisphere also rose in 2008, largely because of several large transactions by Bermudian investors. Outlays by investors from Canada, the Middle East, and the United States<sup>3</sup> fell in 2008.

**Operations of acquired or established U.S. businesses**

In 2008, U.S. businesses that were newly acquired or established by foreign direct investors had 368,500 employees, compared with 496,600 employees in 2007 (table 5). Employment at newly acquired or established firms was largest in manufacturing (146,600),

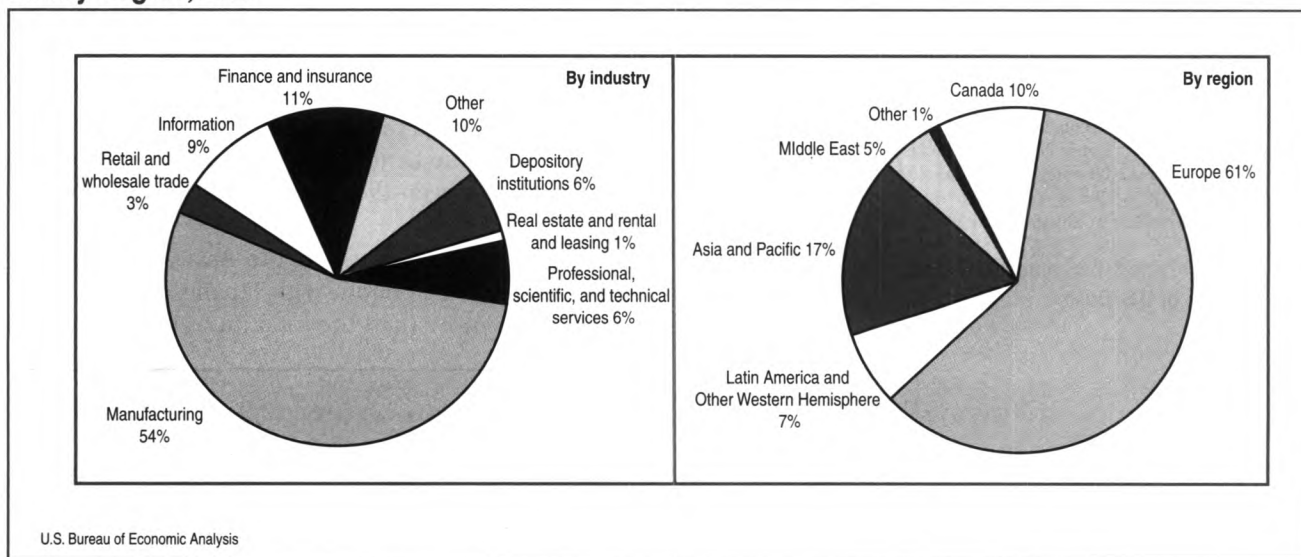

3. The United States is the country of ultimate beneficial owner for businesses newly acquired or established by foreign investors that are ultimately owned by persons located in the United States. See the box "Key Terms."

<sup>r</sup> Revised  
<sup>D</sup> Suppressed to avoid disclosure of data of individual companies.  
 1. One hectare equals 2.471 acres. Thus, for all industries, acres of land owned in 2008 was 200,490.  
 NOTE: For newly acquired businesses, the data cover the most recent financial reporting year preceding acquisition. For newly established businesses, the data are projections for the first full year of operations.

followed by finance (95,700).

In 2008, the total assets of newly acquired or established businesses were \$895.7 billion, up from \$411.8 billion in 2007.<sup>4</sup> In 2008, finance (except banks) and insurance accounted for \$538.1 billion, or 60 percent, of total assets.

Land ownership of newly acquired or established businesses decreased to 81,137 hectares in 2008 from 357,750 hectares in 2007. Net income of newly acquired or established U.S. affiliates was \$7.3 billion in 2008, almost unchanged from 2007. Total sales were \$182.9 billion, up from \$162.7 billion in 2007.

### Revisions

The estimate of total outlays for 2007 has been revised downward 9 percent from the preliminary estimate.<sup>5</sup> In addition, the estimates of operations of U.S. businesses acquired or established by foreign direct investors in 2007 have been revised. The estimate of employment has been revised up 2 percent from the preliminary estimate; the estimate of total assets has been revised down 10 percent; the estimate of sales has been revised down 9 percent; and the estimate of net income has been revised down 5 percent.

4. Because assets can be financed not only by funds from foreign direct investors but also by funds from other owners and lenders, assets of the newly established or acquired U.S. affiliates generally will exceed the related investment outlays.

5. See Y. Louise Ku-Graf, "Foreign Direct Investment in the United States: New Investment in 2007," *SURVEY 88* (June 2008): 33–40.

### Technical Note

The estimates of new foreign direct investment, which cover U.S. business enterprises that were acquired or established by foreign direct investors during the year, are based on data reported in a survey conducted by the Bureau of Economic Analysis (BEA). For the 2008 estimates, BEA augmented the reported data with an estimate for late reports.

For the survey, a U.S. business enterprise was categorized as "established" if the foreign parent or its existing U.S. affiliate created a new legal entity that was organized and operated as a new U.S. business enterprise or that directly purchased U.S. real estate.<sup>6</sup> A U.S. business enterprise was categorized as "acquired" if (1) a foreign parent or its U.S. affiliate obtained a voting interest of 10 percent or more in the equity of an existing U.S. business enterprise and continued to operate the enterprise as a separate legal entity; (2) a foreign parent or its U.S. affiliate purchased a business segment or an operating unit of an existing U.S. business and organized it as a new separate legal entity; or (3) an existing U.S. affiliate purchased a U.S. business, a segment of a U.S. business, or an operating unit of a U.S. business and merged it into its own operations.

6. The number of new U.S. businesses established is not the same as the number of "greenfield" investments, which typically refers to the construction of new plants or other business facilities. First, direct purchases of U.S. real estate—which often involve purchases of existing office buildings, hotels, retail stores, shopping centers, or other property—are included in the "established" measure but are not considered "greenfield" investments. Second, new plants that are built by existing U.S. affiliates are considered "greenfield" investments, but they are included in these data as "established" businesses only if they are set up as separate legal entities.

### Key Terms

**Outlays.** Expenditures by a foreign direct investor to acquire or establish a new U.S. affiliate. The foreign direct investor, its affiliated foreign companies (foreign parent group), and/or its existing U.S. affiliates may supply the funds for the expenditures (outlays).

**Person.** Any individual, corporation, branch, partnership, associated group, association, estate, trust, or other organization, and any government (including any corporation, institution, or other entity or instrumentality of a government).

**Foreign person.** A person that resides outside the 50 States, the District of Columbia, the Commonwealth of Puerto Rico, and all U.S. territories and possessions.

**Foreign direct investment in the United States.** The ownership or control, directly or indirectly, by one foreign person of 10 percent or more of the voting securities of an incorporated U.S. business enterprise or an equivalent interest in an unincorporated U.S. business enterprise.

**U.S. affiliate.** A U.S. business enterprise in which a single foreign investor (a **foreign parent**) owns at least 10 percent of the voting securities, or the equivalent.

**Ultimate beneficial owner (UBO).** For a U.S. affiliate, the person (in the broad legal sense, including a company), proceeding up the affiliate's ownership chain beginning with the foreign parent, that is not owned more than 50 percent by another person. The UBO ultimately owns or controls the affiliate and derives the benefits associated with ownership or control. Unlike the foreign parent, the UBO of a U.S. affiliate may be located in the United States.

**Foreign parent group.** This group consists of (1) the foreign parent, (2) any foreign person, proceeding up the foreign parent's ownership chain, that owns more than 50 percent of the person below it, up to and including the UBO, and (3) any foreign person, proceeding down the ownership chain(s) of each of these members, that is owned more than 50 percent by the person above it.

The estimates of new foreign direct investment do not cover the acquisition of additional equity in an existing U.S. affiliate, the acquisition of an existing U.S. affiliate by one foreign investor from another, or the expansion in the operations of an existing U.S. affiliate when no separate legal entity is created. Sell-offs or other disinvestments were not netted against the new investments. (For more information, see the box “Data on Foreign Direct Investment in the United States.”)

A U.S. business that was acquired or established by a foreign direct investor or by an existing U.S. affiliate of a foreign investor and that had total assets of more than \$3 million or owned 200 acres or more of U.S. land was required to file a full report with BEA. In addition, a U.S. business enterprise that was acquired by an existing U.S. affiliate of a foreign investor and merged into the operations of the affiliate was required to file a full report if the total cost of the acquisition exceeded \$3 million or if the acquired enterprise owned 200 acres or more of U.S. land. To reduce the reporting burden, smaller U.S. businesses that had total assets of \$3 million or less and that owned fewer than 200 acres of U.S. land were permitted to file shorter, partial reports.

BEA prepared estimates to account for data not collected on the partial reports and combined them with the data it collected on the full reports. Because the businesses that filed partial reports were so small, they generally had a negligible impact on the published aggregates. For example, in 2007, the total assets of U.S.

businesses that filed partial reports were \$348 million, less than 0.1 percent of the total assets of all newly acquired or established U.S. affiliates.

Although the values for the partial reports were negligible, the number of partial reports was significant. For example, in 2007, BEA received 1,724 partial reports and 730 full reports. Furthermore, the number of businesses that were subject to partial reporting may have been higher than the actual number of partial reports that BEA received because not all of the smaller U.S. businesses acquired or established by foreigners filed reports. BEA made every effort to contact all U.S. businesses that may have been newly acquired or established by foreigners, but it was necessary to concentrate its resources on ensuring compliance with reporting requirements by larger businesses.

Of the 730 full reports filed for 2007, 544 reported investments to acquire an existing U.S. business, and 186 reported investments to establish a new U.S. business.

#### Availability of New Investment Data

Summary estimates of the outlays by foreign direct investors to acquire or to establish businesses in the United States are presented in this article. More detailed estimates by industry and by country for 1980–2008 are available on BEA’s Web site at [www.bea.gov](http://www.bea.gov).

#### Data on Foreign Direct Investment in the United States

In addition to the data on new foreign direct investment presented in this article, BEA collects and publishes two other broad sets of statistics on foreign direct investment in the United States: financial and operating data of U.S. affiliates and balance-of-payments and direct-investment-position statistics.

Financial and operating data of U.S. affiliates are published at both the enterprise level and the establishment level. Detailed enterprise-level financial and operating data were most recently published in “U.S. Affiliates of Foreign Companies: Operations in 2006” in the August 2008 SURVEY OF CURRENT BUSINESS; the article includes a description of the three types of data.

Summary estimates for 2007 were presented in the April 17, 2009, news release “Summary Estimates for Multinational Companies: Employment, Sales, and Capital Expenditures for 2007,” which is available on BEA’s Web site [www.bea.gov](http://www.bea.gov). Financial and operating data at

the establishment level are available for selected years as a result of a project that links BEA’s enterprise data for U.S. affiliates with the Census Bureau’s establishment data for all U.S. companies. The most recent data are published in *Foreign Direct Investment in the United States: Establishment Data for 2002*, which is available on BEA’s Web site.

The balance-of-payments and direct-investment-position data were published in “The International Investment Position of the United States at Yearend 2007” and “Direct Investment Positions for 2007: Country and Industry Detail” in the July 2008 SURVEY, in “Direct Investment, 2004–2007: Detailed Historical-Cost Positions and Related Capital and Income Flows” in the September 2008 SURVEY, and in “U.S. International Transactions: Fourth Quarter and Year 2008” in the April 2009 SURVEY.

Revised and updated data will be published in the July and September 2009 issues.

The number of full reports by size of outlay is shown in the table below. For 2008, the number of investments in the two largest classes represents the number of reports that were received. The number of investments in the two smallest class sizes includes an estimate of the number of late reports.

	2006	2007 <sup>r</sup>	2008
Total.....	725	730	778
\$5 billion or more.....	3	6	10
\$2 billion–\$4.999 billion.....	16	28	13

### Acknowledgments

The data presented in this article are from BEA's survey of new foreign direct investment in the United States. The survey was conducted under the direction of Lonnie Hunter and Dorrett E. Skipwith, with contributions by Carmene T. Brown, Constance T. Deve, Edward J. Kozierka, and Daniel K. Wakjira. Neeta B. Kapoor programmed the tables.

Tables 6, 7.1, and 7.2 follow.

D Suppressed to avoid disclosure of data of individual companies.

1. The United States is shown as the country of ultimate beneficial owner for businesses newly acquired or established by foreign investors that are, in turn, ultimately owned by persons located in the United States (see the box "Key Terms").

2. The European Union (27) comprises Austria, Belgium, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Poland, Portugal, Slovakia, Slovenia, Spain, Sweden, the United Kingdom and the two countries—Bulgaria and Romania—that joined in 2007.

3. OPEC is the Organization of Petroleum Exporting Countries. In 2007, its members were Angola (which joined at the

beginning of the year), Algeria, Indonesia, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, the United Arab Emirates, and Venezuela. Ecuador rejoined OPEC in November 2007, but is not included as a member in this annual tabulation.

Notes. Data for 2007 are revised. For investments in which more than one investor participated, each investor and each investor's outlays are classified by the country of each individual ultimate beneficial owner. This table presents the major regions, the European Union, OPEC, and the following countries: Australia, Canada, China, France, Germany, Hong Kong, Japan, the Netherlands, Switzerland, the United Kingdom, and the United States. In addition, it presents any country whose total outlays for 2007 were greater than \$500 million.

## Advance Statistics for 2008 and Revised Statistics for 2005–2007

By Caitlin E. Coakley, Daniel A. Reed, Shane T. Taylor

**I**N 2008, inflation-adjusted gross domestic product (GDP) decelerated in 38 states and all 8 BEA regions (chart 1), according to statistics released by the Bureau of Economic Analysis (BEA). The economy was weakest in the Great Lakes region, where real GDP declined 0.4 percent, and strongest in the Rocky Mountain region, where real GDP rose 2.2 percent (chart 2).

Growth in real U.S. GDP by state—a measure of nationwide growth calculated as the sum of GDP of all states deflated by a national price measure—slowed to 0.7 percent in 2008 from 2.0 percent in 2007 (table 1).<sup>1</sup>

Other highlights include the following:

- The decline in the Great Lakes region marked the first decline in a region since the economic slowdown in 2002, when the New England region contracted.
- The slowdown in the Southwest region was the largest of all regions; growth decelerated by 1.9 percentage points to 1.7 percent.
- The decelerations in two regions, the Great Lakes and Far West, resulted from decelerations in every state within those regions.

GDP by state is the most comprehensive measure of overall economic activity in individual states—the state counterpart to GDP in the national income and product accounts (NIPAs). In June, BEA released advance

current-dollar and real (inflation-adjusted) statistics of GDP by state for 2008. The release also provided statistics at a more detailed industry level for 2007 and revised statistics for 2005–2006.<sup>2</sup>

This article first focuses on the industries that contributed the most to the deceleration in GDP growth across regions and states in 2008. Next, it focuses on the industry sectors that contributed to growth in certain states and regions. The article concludes by briefly discussing state contributions to U.S. growth, per capita real GDP by state, and revisions to the GDP-by-state statistics for 2006 and 2007.

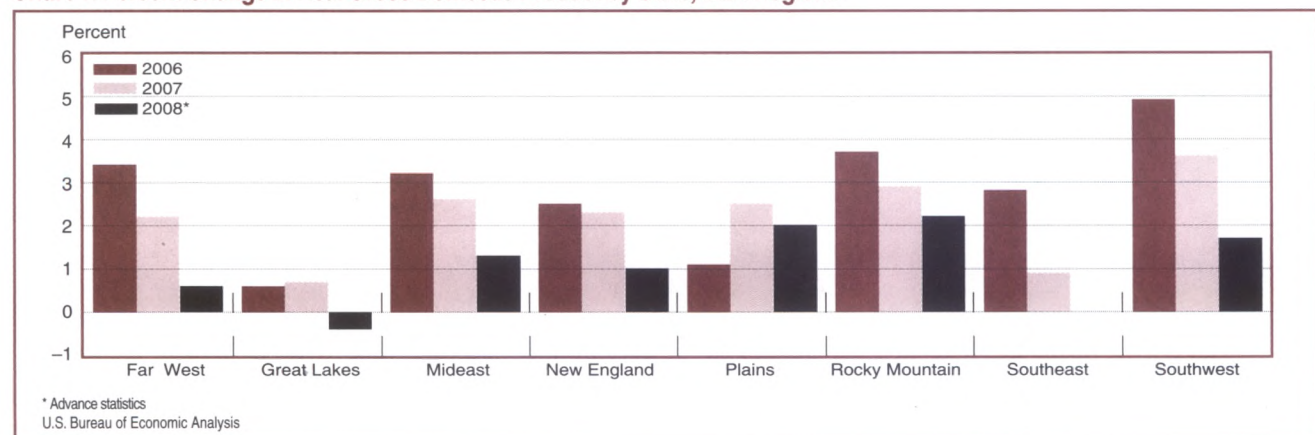

### Industry contributions to regional growth

In 2008, the deceleration in real GDP growth across many regions and their underlying states was primarily the result of declines in particular industry sectors, at least two of which, the construction sector and the finance and insurance sector, were related to the weakened housing market. However, despite the widespread declines in these industries, some regions and states fared well because of growth in (1) certain services sectors, such as the professional and technical services

2. For a description of the abbreviated methodology used to generate the advance statistics, see the box “Advance Statistics of Gross Domestic Product (GDP) by State for 2008.” For a description on the newly available source data, see the section “Revisions.” BEA released advance statistics of 2007 GDP by state based on North American Industry Classification System (NAICS) sectors in June 2008; thus, the 2007 total and sector-level GDP-by-state statistics are revised.

1. This measure differs conceptually from GDP in the national income and product accounts (NIPAs), though the values are similar. For a description of the differences between GDP in the NIPAs and U.S. GDP by state, see the box “Gross Domestic Product (GDP) by State.”

Chart 1. Percent Change in Real Gross Domestic Product by State, BEA Regions

sector and the health care and social assistance sector, and (2) certain goods sectors, such as the agriculture, forestry, fishing, and hunting sector and the mining sector (table 2).

**Industries contributing to the deceleration.** For the United States, private goods-producing industries subtracted 0.60 percentage point from real GDP growth (table 3).<sup>3</sup> The main goods-producing industries that detracted from U.S. growth were construction (0.25 percentage point) and nondurable-goods manufacturing (0.24 percentage point). The finance and insurance sector (0.24 percentage point) was another notable detractor from growth.

Construction contracted in 7 of the 8 BEA regions and in 36 states. In fact, for all states in the New England and Great Lakes regions, construction detracted from growth. This industry sector was also the largest detractor from growth in 16 states and subtracted more than 1 percentage point from growth in Idaho (1.58 percentage

points) and Florida (1.09 percentage points). Although it didn't quite subtract 1 percentage point from Arizona's growth (0.98 percentage point), this sector was still primarily responsible for the state's decline.

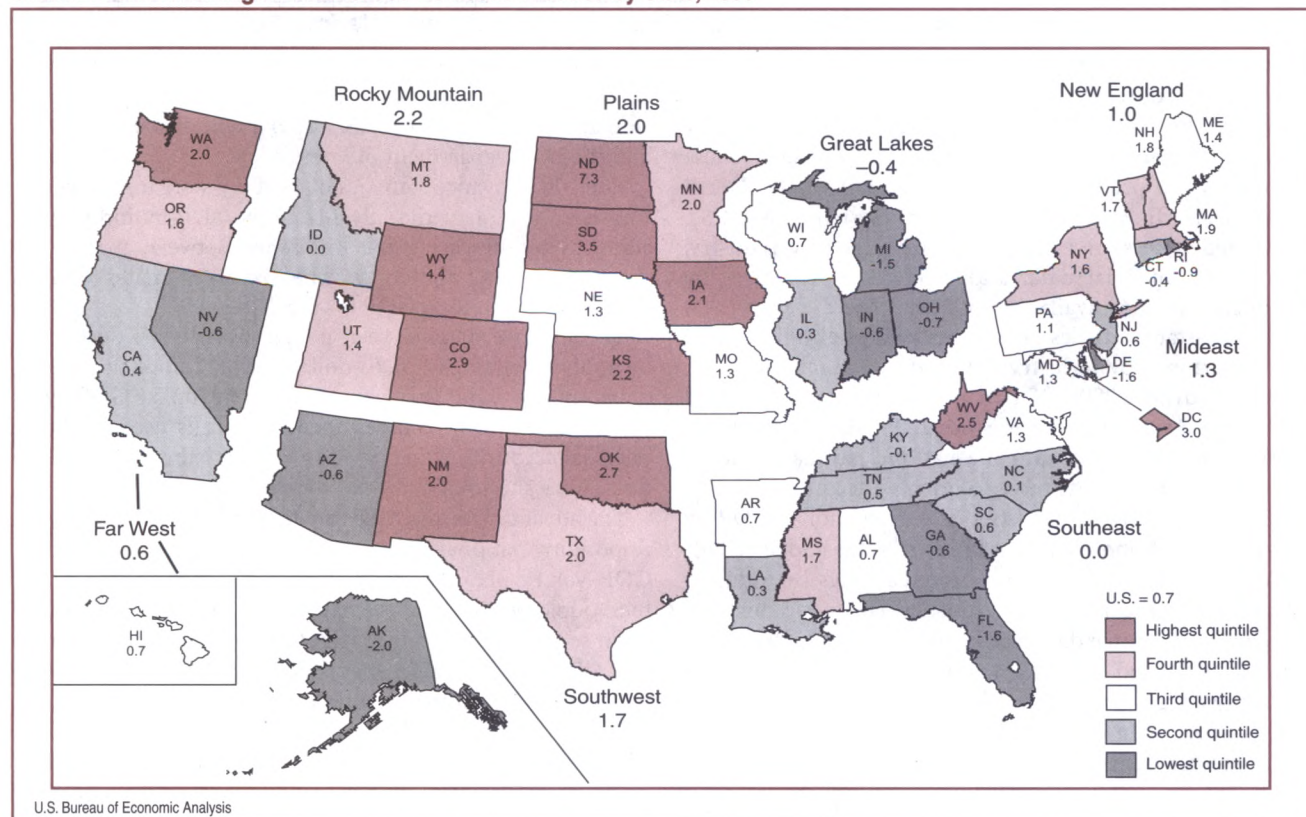

Like construction, nondurable-goods manufacturing contracted in seven of the eight BEA regions. In fact, for all states in the Mideast, Great Lakes, Southeast, Southwest, and Far West regions, nondurable-goods manufacturing detracted from growth. This industry sector contracted in more states, 43 plus the District of Columbia, than did construction. This sector also was the largest detractor from growth in 12 states and subtracted more than 1 percentage point from Louisiana's growth (1.38 percentage points). In Connecticut, the decline in nondurable-goods manufacturing was primarily responsible for the state's overall decline.

Finance and insurance was one of only two industry sectors to detract from growth in all eight BEA regions. (The other industry sector was transportation and warehousing.) Finance and insurance contracted in 38 states and was the largest detractor from growth in 6 states and the District of Columbia. This industry sector subtracted 1.95 percentage points from growth in Delaware, causing the state's overall economy to decline.

**Impact of the housing market.** Several states that benefited from the strong housing market earlier this decade were adversely affected by the recent weakness in

3. Private goods-producing industries consist of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing. Private services-producing industries consist of utilities; wholesale trade; retail trade; transportation and warehousing, excluding Postal Service; information; finance and insurance; real estate, rental and leasing; professional and technical services; management of companies and enterprises; administrative and waste services; educational services; health care and social assistance; arts, entertainment and recreation; accommodation and food services; and other services, except government.

Chart 2. Percent Change in Real Gross Domestic Product by State, 2008

the housing market and in related industries. From 2002 to 2006, average annual growth in Arizona, California, Florida, and Nevada exceeded the national average (table A). However, in 2008, growth in these states fell below the national average; in Arizona, Florida, and Nevada, the economy contracted. California was able to grow slowly because of significant increases in other industries, notably information and professional and technical services. In all four states, declines in construction and in finance and insurance subtracted from growth.

**Industries contributing to growth.** Unlike construction, nondurable-goods manufacturing, and finance and insurance, the professional and technical services sector and the health care and social assistance sector were strong contributors to growth in 2008. For the United States, professional and technical services contributed 0.63 percentage point to growth, and health care and social assistance contributed 0.32 percentage point. In 2008, these were the only two industry sectors to grow in every state. Although the agriculture, forestry, fishing, and hunting sector and the mining sector detracted from growth for the United States and most regions, these two industries were strong contributors to growth in many of the fastest growing states, most of which are located in the central part of the country.

Professional and technical services was the largest contributor to growth in 29 states and the District of

Columbia. This industry contributed more than 1 percentage point to growth in Virginia (1.37 percentage points), the District of Columbia (1.32 percentage points), and Massachusetts (1.24 percentage points). It also contributed nearly 1 percentage point to Maryland's growth (0.96 percentage point).

Health care and social assistance was the largest

### Advance Statistics of Gross Domestic Product (GDP) by State for 2008

The advance statistics of GDP by state are based on limited state source data and an abbreviated estimation methodology that differs from the standard methodology used to prepare the state statistics for 1997–2007. These statistics are prepared at the sector level of the North American Industry Classification System (NAICS). Detailed state source data on value added by industry, company financial data, and state and local taxes by industry are not available for 2008. The advance 2008 GDP-by-state statistics draw heavily on preliminary 2008 state earnings by industry, released on March 24, 2009, and on advance 2008 GDP by industry, released on April 28, 2009. As a result, the advance 2008 GDP-by-state statistics are consistent with the national annual industry accounts and the state personal income accounts.

The 2008 advance statistics of current-dollar GDP by state were extrapolated from industry value added (GDP) for 2007 using the change in state earnings by industry from state personal income statistics. For two industries, preliminary source data was incorporated, which significantly improved the accuracy of the advance estimates. The advance estimates for the agriculture, forestry, fishing, and hunting sector incorporated preliminary data on farm sector cash receipts from the U.S. Department of

Agriculture, and the advance estimates for the mining sector incorporated preliminary data on value of production and prices from the U.S. Department of the Interior and the U.S. Department of Energy.

The 2008 advance statistics of GDP by state for all sectors were scaled to the advance 2008 GDP-by-industry statistics by allocating the difference between the two measures among the states. The sector estimates were then summed to total GDP for the states.

The advance statistics of real GDP by state are derived by applying chained (2000) dollar national implicit price deflators to the industry values of current-dollar GDP by state. The chain-type index formula that is used in the national accounts is then used to calculate the real values for sectors and total real GDP for the states.

The advance U.S. real GDP by state differs from the corresponding national income and product account (NIPA) GDP values because of differences in source data and methodologies used to estimate the related statistics and because of revisions to the NIPA GDP values. In addition, U.S. GDP-by-state values may differ from the corresponding NIPA GDP values because the U.S. GDP-by-state values exclude federal military and civilian activity located overseas, which cannot be attributed to a particular state.

*Clifford H. Woodruff III*

contributor to growth in three states—Arizona (0.54 percentage point), Arkansas (0.29 percentage point), and New Mexico (0.44 percentage point). This industry sector was a strong contributor to growth in South Dakota (0.66 percentage point), Idaho (0.65 percentage point), North Dakota (0.64 percentage point), and Montana (0.53 percentage point).

The agriculture, forestry, fishing, and hunting sector and the mining sector were significant contributors to growth in many states in the highest growth quintile. In North Dakota—the fastest growing state in 2008—agriculture, forestry, fishing, and hunting contributed 1.95 percentage points to the state’s real GDP growth, and mining contributed 0.69 percentage point. In Wyoming—the second fastest growing state in 2008—mining contributed 1.79 percentage points to growth. In Colorado and Oklahoma, mining was one of the largest contributors to growth, accounting for 20 percent and 13 percent of growth, respectively. In West Virginia, mining was the largest contributor to growth, accounting for more than 20 percent. In South Dakota and Iowa, agriculture, forestry, fishing, and hunting accounted for at least 30 percent of GDP growth.

**Regional contributions to U.S. growth**

Contributions to U.S. real GDP growth measure the percentage points that each region or state contributes to real U.S. growth (table 4). The two BEA regions

contributing the most to real U.S. growth were the Mideast (0.23 percentage point) and the Southwest

**Data Availability**

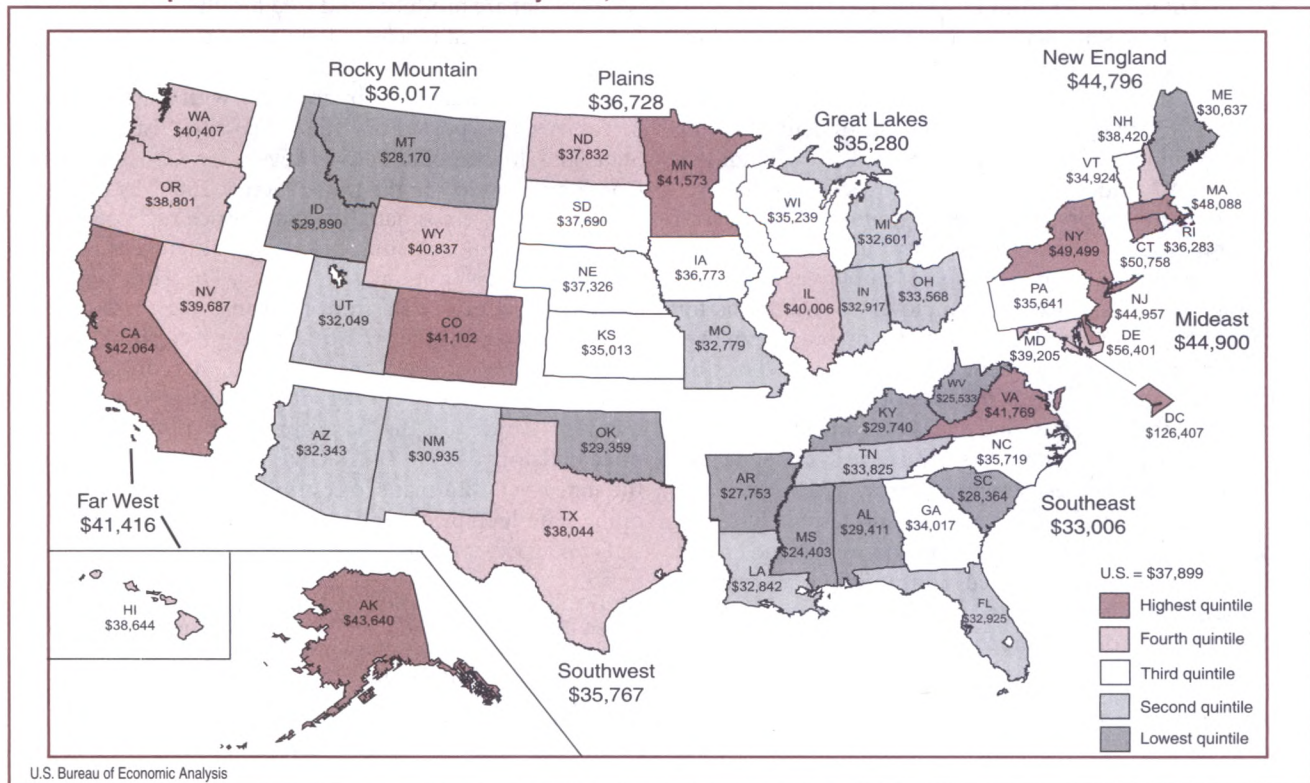

Summary statistics of gross domestic product (GDP) by state in current dollars and in real chained (2000) dollars for 2005–2008 are presented in this article. More detailed GDP-by-state statistics for states, BEA regions, and the United States can be accessed interactively on BEA’s Web site.

The following annual statistics are available at [www.bea.gov/regional/gsp](http://www.bea.gov/regional/gsp):

- Advance statistics of current-dollar GDP by state, real GDP by state in chained (2000) dollars, and quantity indexes for 2008 for 24 NAICS-based sectors.
- GDP by state in current dollars, real GDP by state in chained (2000) dollars, and quantity indexes for 1997–2007 for 81 NAICS-based subsectors.
- Current-dollar statistics of compensation of employees, taxes on production and imports, subsidies, and gross operating surplus for 2001–2007 for 81 NAICS-based subsectors.
- Per capita real GDP by state in chained (2000) dollars for 1997–2008.

The component statistics of GDP by state for 1997–2000 are not available, because NAICS-based GDP for these years is based on unpublished data on wages and salaries from the Bureau of Labor Statistics. For further information, e-mail [gdpbystate@bea.gov](mailto:gdpbystate@bea.gov) or call 202–606–5340.

**Chart 3. Per Capita Real Gross Domestic Product by State, 2008**

### Gross Domestic Product (GDP) by State

Gross domestic product (GDP) by state, is calculated as the sum of incomes earned by labor and capital and the costs incurred in the production of goods and services; it includes the wages and salaries that workers earn, the income earned by sole proprietorships and partnerships and corporations, and business taxes—such as sales, property, and federal excise taxes—that count as a business expense.

In contrast, GDP in the national income and product accounts (NIPAs) is calculated as the sum of spending by consumers, businesses, and government on final goods and services, plus investment and net foreign trade. In theory, income earned should equal spending, but because of different data sources, income earned, usually referred to as “gross domestic income (GDI),” does not always equal what is spent (GDP). The difference is referred to as the “statistical discrepancy.”

Starting with the 2004 comprehensive revision, BEA’s annual industry accounts and its GDP-by-state accounts allocate the statistical discrepancy across all private-sector industries. Therefore, GDP by state is now conceptually more similar to GDP in the national accounts.

U.S. GDP-by-state values differ from the corresponding national income and product account (NIPA) GDP values, and thus the GDP-by-industry values from the annual industry accounts, because the U.S. GDP-by-state values exclude federal military and civilian activity overseas, which cannot be attributed to a particular state. The GDP-by-industry statistics are identical to those from the 2008 annual NIPA revision released in July 2008. However, because of revisions since July 2008, NIPA GDP may differ from U.S. GDP by state.

The GDP-by-state statistics for 1997 forward are prepared for 81 industries defined by the North American Industry Classification System (NAICS), and the estimates for 1963–97 are prepared for 75 industries defined by the Standard Industrial Classification (SIC). For each industry for 1963–97 and 2001–2007, the three components of GDP by state are presented: compensation of employees, taxes on production and imports less subsidies, and gross operating surplus.<sup>1</sup> Compensation of employees is the sum of wage and salary accruals, employer contributions for employee pension and insurance funds, and employer contributions for government social insurance. Taxes on production and imports is the sum of federal excise taxes and customs duties, state and local government sales taxes, property taxes (including residential real estate taxes), motor vehicle licenses, severance taxes, other taxes, and special assessments. Gross operating surplus is the sum of corporate profits, proprietors’ income, rental income of persons, net interest, capital consumption allowances, business transfer payments, nontax payments, and the current surplus of government enterprises.

1. For an explanation of why the components of GDP by state for 1997–2000 are not available, see the box “Data Availability.”

Current-dollar statistics of GDP by state and its components are scaled to equal national totals of current-dollar GDP by industry and its components for all industries except federal military and civilian government. If the national total for an industry differs from the initial sum-of-states for an industry, the difference between the national total and the sum-of-states total is allocated to the states according to the state distribution of the initial estimates.

The statistics of real GDP by state are prepared in chained (2000) dollars. Real GDP by state is an inflation-adjusted measure of each state’s gross domestic product that is based on national prices of the goods and services produced in that state. The statistics of real GDP by state and of quantity indexes with a base year of 2000 were derived by applying national implicit price deflators to the current-dollar GDP-by-state values for the 64 detailed NAICS-based industries for 1997 forward and for the 63 detailed SIC-based industries for 1977–97.

The chain-type index formula that is used in the national accounts is then used to calculate the values of total real GDP by state and of real GDP by state at more aggregated industry levels.<sup>2</sup> Real GDP by state may reflect a substantial volume of output that is sold to other states and countries. To the extent that a state’s output is produced and sold in national markets at relatively uniform prices (or sold locally at national prices), real GDP by state captures the differences across states that reflect the relative differences in the mix of goods and services that the states produce. However, real GDP by state does not capture geographic differences in the prices of goods and services that are produced and sold locally.

BEA is working toward a long-term goal of replacing the national implicit price deflators used to deflate state-level current-dollar GDP by industry with state-specific prices. A paper posted on BEA’s Web site “Estimates of State and Metropolitan Price Levels for Consumption Goods and Services in the United States, 2005” by Bettina H. Aten presents estimates of spatial price deflators that may be used for adjusting price level differences across geographic areas (but not across time). The work is based on microlevel price data from the consumer price index of the Bureau of Labor Statistics and the American Community Survey of the Census Bureau. It represents an important first step in deriving producer-type price indexes—which are the basis for the national implicit price deflators used in BEA’s GDP-by-state accounts—at the state level. BEA plans to continue research into developing state-level prices and to explore estimating GDP by state on an expenditures basis.

2. For additional information, see J. Steven Landefeld and Robert P. Parker, “BEA’s Chain Indexes, Time Series, and Measures of Long-Term Economic Growth,” *SURVEY* 77 (May 1997): 58–68; and Gerard P. Aman, George K. Downey, and Sharon D. Panek, “Comprehensive Revision of Gross State Product: Accelerated Estimates for 2003 and Revised Estimates for 1977–2002,” *SURVEY* 85 (January 2005): 80–106.

*Clifford H. Woodruff III*

(0.20 percentage point). The growth in the Midwest largely reflected the contribution of New York (0.13 percentage point), while growth in the Southwest primarily reflected the contribution of Texas (0.17 percentage point). Growth in both of these states reflected growth in the professional and technical services sector.

Two BEA regions subtracted from national growth—the Great Lakes (0.05 percentage point) and the Southeast (0.01 percentage point). The contraction of the Great Lakes reflected declines in Michigan, Ohio, and Indiana. The contraction of the Southeast reflected declines in Florida and Georgia. The two states subtracting the most from national growth were Florida (0.09 percentage point) and Michigan (0.04 percentage point).

### Per capita real GDP by state

In 2008, per capita real GDP fell in 24 states and in 4 BEA regions. Both slowing or declining state GDP and growing population caused per capita real GDP in these states to fall. Nationwide, per capita real GDP decreased 0.2 percent in 2008.

In 2008, the states in the highest quintile of per capita real GDP did not change significantly from 2007. Delaware continues to have the highest per capita real GDP at \$56,401 (table 5 and chart 3).<sup>4</sup> The lowest quintile is almost identical to 2007 as well. Mississippi again had the lowest per capita real GDP in the nation at \$24,403.

Typically, the year-to-year rankings of state's per capita real GDP do not change much. However, North Dakota has made a sizeable leap since 2006, increasing its ranking by 16 places. In 2008, the state ranked 20th with a per capita real GDP of \$37,832, which is roughly the national average. In comparison, the next closest absolute changes in rank since 2006 were South Dakota, which climbed six places to 21st, and Georgia,

4. Per capita real GDP by state is computed using Census Bureau midyear population estimates.

### Acknowledgements

The statistics of gross domestic product (GDP) by state were prepared by staff in the Regional Product Division under the direction of Charles Ian Mead, Chief, and Clifford H. Woodruff III, Chief of the Regional Product Branch. Joel D. Platt, Associate Director for Regional Economics, provided general guidance. Contributing staff members were Jennifer A. Bennett, Chief of the GDP by State Goods Section; Sharon D. Panek, Chief of the GDP by State Services Section; Frank T. Baumgardner; John E. Broda; Caitlin E. Coakley; Patricia J. Gailey; Natalie M. Hayes; William G. Kendall; Yolanda B. Langford; Christian E. Malagon; Matthew J. McCormick; Daniel A. Reed; Ralph M. Rodriguez; and Shane T. Taylor.

which fell six places to 30th.

### Revisions

The revisions to GDP by state for 2005–2007 primarily reflect the incorporation of new state data from the Census Bureau, specifically the revised Annual Survey of Manufactures (ASM) for 2006, State and Local Government Finances for 2006, and State Government Finances data for 2007. The revised GDP-by-state statistics also incorporated the results of the annual revisions to the annual industry accounts, national income and product accounts, and state personal income statistics.<sup>5</sup>

As expected, revisions to the advance statistics for 2007, which were released in June 2008, were generally larger than the revisions for 2005–2006.

**Current-dollar statistics.** Revisions to the current-dollar statistics, measured as a percentage of the previously published data, were fairly small for most states. For 2007, the revisions ranged from –4.0 percent for Louisiana to 3.8 percent for South Dakota (table 6). For Louisiana, the revision was mainly due to a downward revision to nondurable-goods manufacturing, which resulted from the incorporation of revised 2006 ASM data. For South Dakota, the revision was due to an upward revision in agriculture, forestry, fishing, and hunting, based on revised farm data from the U.S. Department of Agriculture.

**Inflation-adjusted statistics.** The advance GDP growth rates for 2007 correctly identified the direction of change for 45 states and the District of Columbia and also correctly identified whether a state grew at a faster or slower pace than U.S. GDP growth for 39 states.

The revisions to the real growth rates were measured as a percentage point difference from the previously published growth rate. For 2007, only six states had a revision greater than 2 percentage points (in absolute terms); the mean absolute revision was 0.9 percentage point (table 7). The states with the largest absolute revisions were South Dakota (5.8 percentage points), North Dakota (4.1 percentage points), and the District of Columbia (–2.6 percentage points). Revisions to agriculture, forestry, fishing, and hunting led to the upward revisions in North and South Dakota. For the District of Columbia, the revision reflected downward revisions in real estate, rental, and leasing

\* Advance statistics

1. The advance statistics of U.S. real GDP by state differ from the corresponding national income and product account (NIPA) GDP values because of differences in source data and methodologies used to estimate

the related statistics and because of revisions to the NIPA GDP values. In addition, U.S. GDP-by-state values differ from the corresponding NIPA GDP values because the U.S. GDP-by-state values exclude federal military and civilian activity overseas, which cannot be attributed to a particular state.

**Table 2. Contributions to Percent Change in Real**  
[Percentage]

	Percent change in real GDP by state	Agriculture, forestry, fishing, and hunting	Mining	Utilities	Construction	Durable-goods manufacturing	Nondurable-goods manufacturing	Wholesale trade	Retail trade	Transportation and warehousing

\* Advance statistics

1. Private goods-producing industries consist of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.

2. Private services-producing industries consist of utilities; wholesale trade; retail trade; transportation and warehousing, excluding Postal Service; information; finance and insurance; real estate, rental, and leasing; professional and technical services; management of companies and enterprises; administrative and waste services; educational services; health care and social assistance; arts, entertainment, and recreation; accom-

modation and food services; and other services, except government.

3. The advance statistics of U.S. real GDP by state differ from the corresponding national income and product account (NIPA) GDP values because of differences in source data and methodologies used to estimate the related statistics and because of revisions to the NIPA GDP values. In addition, U.S. GDP-by-state values differ from the corresponding NIPA GDP values because the U.S. GDP-by-state values exclude federal military and civilian activity overseas, which cannot be attributed to a particular state.

\* Advance statistics  
1. The advance statistics of U.S. real GDP by state differ from the corresponding national income and product account (NIPA) GDP values because of differences in source data and methodologies used to estimate

the related statistics and because of revisions to the NIPA GDP values. In addition, U.S. GDP-by-state values differ from the corresponding NIPA GDP values because the U.S. GDP-by-state values exclude federal military and civilian activity overseas, which cannot be attributed to a particular state.

1. U.S. GDP-by-state values differ from the corresponding national income and product account (NIPA) GDP values because of revisions to the NIPA GDP values, and because the U.S. GDP-by-state values exclude

federal military and civilian activity located overseas, which cannot be attributed to a particular state.

\* Advance statistics

1. The advance statistics of U.S. real GDP by state differ from the corresponding national income and product account (NIPA) GDP values because of differences in source data and methodologies used to estimate

the related statistics and because of revisions to the NIPA GDP values. In addition, U.S. GDP-by-state values differ from the corresponding NIPA GDP values because the U.S. GDP-by-state values exclude federal military and civilian activity overseas, which cannot be attributed to a particular state.

\* Advance statistics

1. U.S. GDP-by-state values differ from the corresponding national income and product account (NIPA) GDP

values because of revisions to the NIPA GDP values, and because the U.S. GDP-by-state values exclude federal military and civilian activity located overseas, which cannot be attributed to a particular state.

## \* Advance statistics

1. The advance statistics of U.S. real GDP by state differ from the corresponding national income and product account (NIPA) GDP values because of differences in source data and methodologies used to estimate the related

statistics and because of revisions to the NIPA GDP values. In addition, U.S. GDP-by-state values differ from the corresponding NIPA GDP values because the U.S. GDP-by-state values exclude federal military and civilian activity overseas, which cannot be attributed to a particular state.

# Subject Guide

VOLUME 89 JANUARY–JUNE 2009

This guide lists the major items that were published in the SURVEY OF CURRENT BUSINESS in the January–June 2009 issues. It gives the month of the issue and the beginning page number, and it includes selected boxes that are cited by title and page number.

## National

### BEA briefings

- Toward Better Measurement of Innovation and Intangibles {January, 10}
- Measuring Human Capital [box, 12]
- What is Innovation? [box, 14]
- How BEA Accounts for Investment in Private Structures {February, 9}

### Inventories, sales, and inventory-sales ratios for manufacturing and trade

- Third Quarter 2008 {January, 7}
- Fourth Quarter 2008 {April, 9}

### National income and product accounts (NIPAs)

- GDP and the Economy
  - Advance Estimates
    - Fourth Quarter 2008 [February, 1]
    - The 2008 Financial Crisis and the National Accounts [box, 7]
    - The Upcoming 2009 Comprehensive NIPA Revision [box, 8]
    - First Quarter 2009 {May, 1}
  - Preliminary Estimates
    - Fourth Quarter 2008 {March, 1}
    - First Quarter 2009 {June, 1}
  - Final Estimates
    - Third Quarter 2008 {January, 1}
    - Fourth Quarter 2008 {April, 1}
- Government Receipts and Expenditures
  - Fourth Quarter 2008 {April, 6}
  - First Quarter 2009 {June, 11}
- Preview of the 2009 Comprehensive NIPA Revision
  - Changes in Definitions and Presentations {March, 10}
  - Availability of Redesigned Tables [box, 11]
  - Statistical Changes {May, 6}
- Returns for Domestic Nonfinancial Business {May, 17}

### NIPA translation of the federal budget

- For Fiscal Year 2010 {June, 15}
  - American Recovery and Reinvestment Act of 2009 [box, 17]
  - Treatment of Financial Stabilization Programs [box, 22]

### Research spotlight

- A New Approach to Price Measures for Health Care {February, 17}

## Industry

### BEA briefings

- Future Directions for the Industry Accounts {March, 29}
- A Primer on BEA's Industry Accounts {June, 40}

### Industry accounts

- Annual Industry Accounts
  - Advance Statistics on GDP by Industry for 2008 {May, 22}

### Travel and tourism satellite accounts

- For 2005–2008 {June, 25}

## International

### Foreign direct investment in the United States

- New Investment in 2008 {June, 54}

### U.S. international transactions

- An Ownership-Based Framework of the U.S. Current Account for 1998–2007 {January, 62}
- Annual Estimates
  - For 2008 {April, 22}
- Quarterly Estimates
  - Third Quarter 2008 {January, 24}
  - Fourth Quarter 2008 and Year 2008 {April, 12}

## Regional

### Gross domestic product by state

- Advance Statistics for 2008 and Revised Statistics for 2005–2007 {June, 62}

### Local area personal income

- For 2007 {May, 38}

### Regional quarterly reports

- County Compensation by Industry for 2005–2007 {January, 70}
- Regional Multipliers: What Are They and How Do They Look? {April, 59}
- State Personal Income
  - Third Quarter 2008 {January, 65}
    - Economic Stimulus Payments [box, 68]
    - Special Hurricane Ike Adjustments [box, 68]
  - Fourth Quarter 2008 {April, 55}
  - For 2008 {April, 58}

# Finding information on BEA's Web site just got easier...

BEA's Web site now includes a powerful new search engine that can help you locate information quickly and efficiently.

## *Its features include the following:*

### **Clustered Searching**

Search results are automatically grouped into a unique set of meaningful categories that can be further explored.

Clustered Results	
▶ <a href="#">GDP</a> (51)	
▶ <a href="#">Industry</a> (13)	
▶ <a href="#">NIPA, Historical series</a> (8)	
▶ <a href="#">Bureau of Economic Analysis</a> (10)	
▶ <a href="#">Growth</a> (6)	
▶ <a href="#">Revision, National Income and Product Accounts</a> (6)	
▶ <a href="#">Current-Dollar</a> (6)	
▶ <a href="#">FAQ, National Economic Accounts</a> (2)	
▶ <a href="#">Glossary</a> (2)	
▶ <a href="#">Expenditures, Measures</a> (2)	
▶ <a href="#">Other Topics</a> (6)	

### **Search Within a Search**

After an initial search, you can locate specific terms within your search results.

Find in clusters:
<input type="text" value="Enter Keywords"/> <input type="button" value="Go"/>

### **Advanced Search**

This feature allows you to search by keywords or exact phrases, sort the results by relevance or by date, and choose the number of results returned.

Find results with all the words	<input type="text"/>
with the exact phrase	<input type="text"/>
with any of the words	<input type="text"/>
without the words	<input type="text"/>
Language	<input type="text" value="any language"/>
Domains	<input type="checkbox"/> Only return results from the domain
Sort	<input type="text" value="by Relevance"/>
Sources	<input checked="" type="checkbox"/> BEA
Return	<input type="text" value="200 results"/>
Timeout	<input type="text" value="5 seconds"/>

**Visit BEA's Web site at <[www.bea.gov](http://www.bea.gov)>, and find the information you need.**

# BEA Current and Historical Data

A selection of estimates from the national, industry, international, and regional accounts of the Bureau of Economic Analysis (BEA) are presented in this section. BEA's estimates are not copyrighted and may be reprinted without BEA's permission. Citing the SURVEY OF CURRENT BUSINESS and BEA as the source is appreciated.

More detailed estimates from BEA's accounts are available on BEA's Web site at [www.bea.gov](http://www.bea.gov). These estimates are available in a variety of formats. In addition, news releases, articles, and other information, including methodologies and working papers, are available.

The tables present annual [A], quarterly [Q], and monthly [M] data.

## National Data

### A. Selected NIPA tables [A,Q]

1. Domestic product and income .....D-2
2. Personal income and outlays.....D-18
3. Government current receipts and expenditures ...D-21
4. Foreign transactions .....D-33
5. Saving and investment.....D-37
6. Income and employment by industry .....D-42
7. Supplemental tables.....D-43

### B. NIPA-related table

- B.1 Personal income and its disposition [A, M] .....D-46

### C. Historical measures [A, Q]

- C.1 GDP and other major NIPA aggregates .....D-47

### D. Charts

- Selected NIPA series .....D-51

## Industry Data

### E. Industry table

- E.1 Value added by industry [A] .....D-57

## International Data

### F. Transactions tables

- F.1 U.S. international transactions in goods and services [A, M] .....D-58
- F.2 U.S. international transactions [A, Q] .....D-59
- F.3 U.S. international transactions by area [Q] .....D-60
- F.4 Private services transactions [A] .....D-63

## G. Investment tables [A]

- G.1 U.S. international investment position .....D-64
- G.2 USDIA: Selected items.....D-65
- G.3 Selected financial and operating data of foreign affiliates of U.S. companies.....D-66
- G.4 FDIUS: Selected items .....D-67
- G.5 Selected financial and operating data of U.S. affiliates of foreign companies.....D-68

## H. Charts

- The United States in the international economy .....D-69

## Regional Data

### I. State and regional tables

- I.1 Personal income [Q] .....D-70
- I.2 Personal income and per capita personal income [A] .....D-71
- I.3 Disposable personal income and per capita disposable personal income [A] .....D-72
- I.4 Gross domestic product by state [A] .....D-73

### J. Local area tables

- J.1 Personal income and per capita personal income by metropolitan area [A] .....D-74
- J.2 Gross domestic product by metropolitan area for industries [A] .....D-79

## K. Charts

- Selected regional estimates .....D-83

## Appendixes

### A. Additional information about the NIPA estimates

- Statistical conventions .....D-85
- Reconciliation table [A, Q] .....D-86

### B. Suggested reading .....D-87

## National Data

### A. Selected NIPA Tables

The selected set of NIPA tables presents the most recent estimates of gross domestic product (GDP) and its components, which were released on May 29, 2009. These estimates include the "preliminary" estimates for the first quarter of 2009. Also included are revised estimates of wages and salaries and of affected income-side series for the fourth quarter of 2008 and for 2008.

The selected set presents quarterly estimates that are updated monthly. Annual estimates are presented in most of the tables.

The GDP news release is available on BEA's Web site within minutes after the release. To receive an e-mail notification of the release, go to [www.bea.gov](http://www.bea.gov) and subscribe. The "Selected NIPA Tables" are available later that day.

NOTE. Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive.

1. The quantity index for computers can be used to accurately measure the real growth of this component. However, because computers exhibit rapid changes in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series; accurate estimates of these contributions are shown in table 1.5.2 and real growth rates are shown in table 1.5.1.

2. Excludes software "embedded," or bundled, in computers and other equipment.  
NOTE: The residual line is the difference between the first line and the sum of the most detailed lines.

1. Gross domestic income deflated by the implicit price deflator for gross domestic product.

2. Gross national income deflated by the implicit price deflator for gross national product.

3. Net domestic income deflated by the implicit price deflator for net domestic product.

Note: Except as noted in footnotes 1, 2 and 3, chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive.

1. Estimates for financial corporate business and nonfinancial corporate business for 2000 and earlier periods are based on the 1987 Standard Industrial Classification (SIC); later estimates for these industries are based on the North American Industry Classification System (NAICS).  
 2. The current-dollar gross value added is deflated using the gross value added chain-type price index for nonfinancial industries from the GDP-by-industry accounts. For periods when this price index is not available, the chain-type price index for GDP goods and structures is used.  
 3. Chained-dollar consumption of fixed capital of nonfinancial corporate business is calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100.  
 4. Chained-dollar net value added of nonfinancial corporate business is the difference between the gross product and the consumption of fixed capital.

1. Consists of gasoline, fuel oil, and other energy goods and of electricity and gas.

Note. Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

2. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

2. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

Note. Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software in table 3.9.5.

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software in table 3.9.5.

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software in table 3.9.5.

NOTE: Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

1. National defense consumption expenditures are defense services produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software.

5. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

1. National defense consumption expenditures are defense services produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software.

5. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

1. National defense consumption expenditures are defense services produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software.

5. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

Note. Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

1. Exports and imports of certain goods, primarily military equipment purchased and sold by the federal government, are included in services. Beginning with 1986, repairs and alterations of equipment are reclassified from goods to services.

2. Consists of capital transfers and the acquisition and disposal of nonproduced nonfinancial assets.

1. Consists primarily of religious, educational, vocational, lodging, railroads, farm, and amusement and recreational structures, net purchases of used structures, and brokers' commissions on the sale of structures.  
 2. Excludes software "embedded," or bundled, in computers and other equipment.  
 3. Includes communication equipment, nonmedical instruments, medical equipment and instruments, photocopy and related equipment, and office and accounting equipment.  
 4. Consists primarily of furniture and fixtures, agricultural machinery, construction machinery, mining and oilfield machinery, service industry machinery, and electrical equipment not elsewhere classified.  
 5. Consists primarily of manufactured homes, improvements, dormitories, net purchases of used structures, and brokers' commissions on the sale of residential structures.  
 6. Excludes net purchases of used structures and brokers' commissions on the sale of structures.

1. Consists of capital transfers and the acquisition and disposal of nonproduced nonfinancial assets.

Residential structures .....	29	380.7	300.0	320.9	308.4	294.5	276.2	241.0

1. Consists primarily of religious, educational, vocational, lodging, railroads, farm, and amusement and recreational structures, net purchases of used structures, and brokers' commissions on the sale of structures.

2. The quantity index for computers can be used to accurately measure the real growth rate of this component. However, because computers exhibit rapid changes in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series; accurate estimates of these contributions are shown in table 5.3.2 and real growth rates are shown in table 5.3.1.

3. Excludes software "embedded" or bundled, in computers and other equipment.

4. Includes communication equipment, nonmedical instruments, medical equipment and instruments, photocopy and related equipment, and office and accounting equipment.

5. Consists primarily of furniture and fixtures, agricultural machinery, construction machinery, mining and oilfield machinery, service industry machinery, and electrical equipment not elsewhere classified.

6. Consists primarily of manufactured homes, improvements, dormitories, net purchases of used structures, and brokers' commissions on the sale of residential structures.

7. Excludes net purchases of used structures and brokers' commissions on the sale of structures.

NOTE: Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

1. This series is derived from the Census Bureau series "current cost inventories."

2. The inventory valuation adjustment (IVA) shown in this table differs from the IVA that adjusts business incomes. The IVA in this table reflects the mix of methods (such as first-in, first-out and last-in, first-out) underlying inventories derived primarily from Census Bureau statistics (see footnote 1). This mix differs from that underlying business income derived primarily from Internal Revenue Service statistics.

NOTE: Estimates in this table are based on the North American Industry Classification System (NAICS).

NOTE: Estimates in this table are based on the North American Industry Classification System (NAICS).

Chained (2000) dollar series for real change in private inventories are calculated as the period-to-period change in chained-dollar end-of-period inventories. Quarterly changes in end-of-period inventories are stated at annual rates. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

Nonfarm inventories to final sales of goods and structures.....	29	4.11	4.22	4.19	3.99	3.88

1. Inventories are as of the end of the quarter. The quarter-to-quarter change in inventories calculated from current-dollar inventories in this table is not the current-dollar change in private inventories component of GDP. The former is the difference between two inventory stocks, each valued at its respective end-of-quarter prices. The latter is the change in the physical volume of inventories valued at average prices of the quarter. In addition, changes calculated from this table are at quarterly rates, whereas, the change in private inventories is stated at annual rates.

2. Quarterly totals at monthly rates. Final sales of domestic business equals final sales of domestic product less gross output of general government, gross value added of nonprofit institutions, compensation paid to domestic workers, and space rent for owner-occupied housing. It includes a small amount of final sales by farm and by government enterprises.

Note. Estimates in this table are based on the North American Industry Classification System (NAICS).

Nonfarm inventories to final sales of goods and structures.....	30	3.56	3.45	3.48	3.64	3.66

1. Inventories are as of the end of the quarter. The quarter-to-quarter changes calculated from this table are at quarterly rates, whereas the change in private inventories component of GDP is stated at annual rates.

2. Quarterly totals at monthly rates. Final sales of domestic business equals final sales of domestic product less gross output of general government, gross value added of nonprofit institutions, compensation paid to domestic workers, and space rent for owner-occupied housing. It includes a small amount of final sales by farm and by government enterprises.

Note. Estimates in this table are based on the North American Industry Classification System (NAICS).

Chained (2000) dollar inventory series are calculated to ensure that the chained (2000) dollar change in inventories for 2000 equals the current-dollar change in inventories for 2000 and that the average of the 1999 and 2000 end-of-year chain-weighted and fixed-weighted inventories are equal.

1. Consists of used light trucks only.  
 2. Consists of final sales and change in private inventories of new autos assembled in the United States.  
 3. Consists of personal consumption expenditures, private fixed investment, and gross government investment.

1. Consists of used light trucks only.  
 2. Consists of final sales and change in private inventories of new autos assembled in the United States.  
 3. Consists of personal consumption expenditures, private fixed investment, and gross government investment.  
 Note. Chained (2000) dollar series are calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines, excluding the lines in the addenda.

### C. Historical Measures

This table is derived from the "Selected NIPA Tables" that are published in this issue and from the "GDP and Other Major NIPA Series" tables that were published in the August 2008 issue. (The changes in prices are calculated from indexes expressed to three decimal places.)

**Table C.1. GDP and Other Major NIPA Aggregates—Continues**

[Quarterly estimates are seasonally adjusted at annual rates]

Year and quarter	Billions of chained (2000) dollars			Percent change from preceding period		Chain-type price indexes [2000=100]		Implicit price deflators [2000=100]		Percent change from preceding period			
	Gross domestic product	Final sales of domestic product	Gross national product	Gross domestic product	Final sales of domestic product	Gross domestic product	Gross domestic purchases	Gross domestic product	Gross national product	Chain-type price index		Implicit price deflators

p Preliminary

r Revised

1. Reflects adjustments necessary to bring Census Bureau data in line with the concepts and definitions used by BEA

to prepare international and national accounts.

2. Contains goods that cannot be separately identified.

p Preliminary

r Revised

(\*) Transactions are less than \$500,000 (+/-)

1. Details not shown separately; see totals in lines 56 and 63.

2. Details not shown separately are included in line 69.

3. Estimates of financial derivatives for Mexico are included in Latin America and Other Western Hemisphere; and for China and India, in Asia and Pacific. Estimates for the Middle East are combined with estimates for Asia and Pacific.

p Preliminary

r Revised

1. Royalties and license fees and "other private services" by detailed type of service include both affiliated and unaffiliated transactions.

2. Includes royalties, license fees, and other fees associated with intangible assets, including patents, trade secrets, and other proprietary rights, that are used in connection with the production of goods.

3. Includes royalties, license fees, and other fees associated with copyrights, trademarks, franchises, rights to broadcast live events, software licensing fees, and other intellectual property rights.

4. Other services receipts (exports) include mainly film and television tape rentals and expenditures of foreign residents temporarily working in the United States. Payments (imports) include mainly expenditures of U.S. residents temporarily working abroad and film and television tape rentals.

5. These reflect the amount of premiums explicitly charged by, or paid to, insurers and reinsurers.

<sup>p</sup> Preliminary

<sup>r</sup> Revised

\* Less than \$500,000 (+/-)

..... Not applicable

1. Represents gains or losses on foreign-currency-denominated assets and liabilities due to their revaluation at current exchange rates.

2. Includes changes in coverage due to year-to-year changes in the composition of reporting panels, primarily for bank and nonbank estimates, and to the incorporation of survey results. Also includes capital gains and losses of direct investment affiliates and changes in positions that cannot be allocated to financial flows, price changes, or exchange-rate changes.

3. Financial flows and valuation adjustments for financial derivatives are available only on a net basis, which is shown on line 2; they are not separately available for gross positive fair values and gross negative fair values of financial derivatives. Consequently, columns (a) through (d) on lines 4, 5, and 24, 25 are not available.

4. Data are not separately available for the three types of valuation adjustments; therefore, the sum of all three types is shown in column (d). Price changes result from changes in the value of derivatives contracts due to changes in the value

of their underlying assets or reference rates, which may arise from movements in interest rates, stock prices, commodity prices, or other variables. Exchange-rate changes result from the revaluation of foreign-currency-denominated derivatives contracts at current exchange rates. "Other changes" can result when data on investment positions that had accumulated in prior periods are covered by a new or more complete survey.

5. Reflects changes in the value of the official gold stock due to fluctuations in the market price of gold.

6. Reflects changes in gold stock from U.S. Treasury sales of gold medallions and commemorative and bullion coins; also reflects replenishment through open market purchases. These demonetizations/monetizations are not included in international transactions financial flows.

7. Also includes paid-in capital subscriptions to international financial institutions and outstanding amounts of miscellaneous claims that have been settled through international agreements to be payable to the U.S. government over periods in excess of 1 year. Excludes World War I debts that are not being serviced.

8. Includes indebtedness that the borrower may contractually, or at its option, repay with its currency, with a third country's currency, or by delivery of materials or transfer of services.

9. Primarily U.S. government liabilities associated with military sales contracts and other transactions arranged with or through foreign official agencies.

p Preliminary  
r Revised  
1. Per capita personal income was computed using midyear population estimates of the Census Bureau.  
2. Percent change from the preceding period was calculated from unrounded data.

Note: The personal income level shown for the United States is derived as the sum of the state estimates. It differs from the estimate of personal income in the national income and product accounts because of differences in coverage, in the methodologies used to prepare the estimates, and in the timing of the availability of source data.  
Source: Table 2 in the "Regional Quarterly Report" in the April 2009 Survey of Current Business.

Table I.3. Disposable Personal Income and Per Capita Disposable Personal Income by State and Region

p Preliminary

r Revised

1. Per capita disposable personal income was computed using midyear population estimates of the Census Bureau.

2. Percent change from the preceding period was calculated from unrounded data.

Note: The personal income level shown for the United States is derived as the sum of the state estimates. It differs from the estimate of personal income in the national income and product accounts because of differences in coverage, in the methodologies used to prepare the estimates, and in the timing of the availability of source data.

Source: Table 3 in the "Regional Quarterly Report" in the April 2009 Survey of Current Business.

**Table I.4. Gross Domestic Product (GDP) by State for Industries, 2008**

[Millions of dollars]

State and region	Rank of total GDP by state	Total	Natural resources and mining	Construction	Durable-goods manufacturing	Nondurable-goods manufacturing	Trade	Transportation and utilities	Information	Financial activities	Professional and business services	Education and health services	Leisure and hospitality	Other services	Government

NOTE: Totals shown for the United States differ from the national income and product account statistics of gross domestic product (GDP) because GDP by state excludes and national GDP includes the compensation of federal civilian and military personnel stationed abroad and government consumption of fixed capital for military structures located abroad and for military equipment, except office equipment. Also, GDP by state and national GDP have different revision schedules.

Source: This table reflects the GDP-by-state statistics for 2008 that were released on June 2, 2009.

1. Per capita personal income was computed using Census Bureau midyear population estimates.

2. Percent change calculated from unrounded data.

3. The personal income level shown for the United States is derived as the sum of the county estimates. It differs from the estimate of personal income in the national income and product accounts because of differences in coverage, in the methodologies used to prepare the estimates, and in the timing of the availability of source data.

4. The metropolitan area definitions used by BEA for its personal income estimates are the county-based definitions issued by the Office of Management and Budget in June 2003 (with revisions released February 2004, March 2005, December 2005, December 2006, November 2007, and November 2008) for federal statistical purposes.

Source: Table 1 in "Local Area Personal Income for 2007" in the May 2009 SURVEY OF CURRENT BUSINESS.

Table J.2. Gross Domestic Product (GDP) by Metropolitan Area for Industries, 2006—Continues

(Millions of dollars)

Table with 15 columns: Metropolitan area, Rank of total GDP by metropolitan area, Total, Natural resources and mining, Construction, Durable goods manufacturing, Nondurable goods manufacturing, Trade, Transportation and utilities, Information, Financial activities, Professional and business services, Education and health services, Leisure and hospitality, Other services, Government. ### A. Additional Information About the NIPA Estimates

#### Statistical Conventions

Current-dollar GDP is a measure of the market value of goods, services, and structures that are produced in the economy in a particular period. The changes in current-dollar GDP can be decomposed into quantity and price components. Quantities, or “real” measures, and prices are expressed as index numbers with the reference year—at present, the year 2000—equal to 100.<sup>1</sup>

The annual changes in quantities and prices are calculated using a Fisher formula that incorporates weights from 2 adjacent years. For example, the annual percent change in real GDP for 2001–2002 uses prices for 2001 and 2002 as weights, and the 2001–2002 annual percent change in the GDP price index uses quantities for 2001 and 2002 as weights. Because the Fisher formula allows for the effects of changes in relative prices and in the composition of output over time, the resulting quantity or price changes are not affected by the substitution bias that is associated with changes in quantities and prices calculated using a fixed-weighted formula. These annual changes are “chained” (multiplied) together to form time series of quantity and price indexes. The percent changes in the Fisher indexes are not affected by the choice of the reference year.

BEA also publishes implicit price deflators (IPDs), which are calculated as the ratio of the current-dollar value of a component to the chained-dollar value of the component, multiplied by 100. The values of an IPD are very close to the values of the corresponding “chain-type” price index.

The measures of real GDP and its major components are also presented in dollar-denominated form, designated “chained (2000) dollar estimates.” For most series, these estimates are computed by multiplying the current-dollar value in 2000 by a corresponding quantity index number and then dividing by 100. For example, if a current-dollar GDP component equaled \$100 in 2000 and if real output for this component increased by 10 percent in 2001, then the chained (2000) dollar value of this component in 2001 would be \$110 ( $\$100 \times 1.10$ ). The percent changes calculated from the chained (2000) dollar estimates and from the quantity indexes are the same; any differences will be small and due to rounding.

The chained-dollar values for the detailed GDP components will not necessarily sum to the chained-dollar estimate of GDP (or to any intermediate aggregate) in a table, because the relative prices that are used as weights for any period other than the reference year differ from those of the reference year. A measure of the effect of such

differences is provided by a “residual” line—the difference between the chained-dollar value of the main aggregate in the table and the sum of the most detailed components in the table. For periods close to the reference year, when the relative prices that are used as weights have usually not changed much, the residuals tend to be small, and the chained-dollar estimates can be used to approximate the contributions to growth and to aggregate the detailed estimates. For periods further from the reference year, the residuals tend to be larger, and the chained-dollar estimates are less useful for analyses of contributions to growth. In particular, for components for which relative prices are changing rapidly, the calculation of contributions based on chained-dollar estimates may be misleading even just a few years from the reference year. Thus, contributions derived from quantity indexes provide a better measure than contributions derived from chained-dollar estimates; contributions based on quantity indexes are shown in selected NIPA tables 1.1.2, 1.2.2, 1.5.2, 2.3.2, 3.9.2, 4.2.2, and 5.3.2.

For quarters and months, NIPA estimates are presented at annual rates, which show the value that would be registered if the rate of activity that is measured for a quarter or for a month were maintained for a full year. Annual rates are used so that periods of different lengths—for example, quarters and years—may be more easily compared. These annual rates are determined simply by multiplying the estimated rate of activity by 4 (for quarterly data) or by 12 (for monthly data).

For most quarterly NIPA estimates, *percent changes* in the estimates are also expressed at annual rates. Calculating these *changes* requires a variant of the compound interest formula:

$$r = \left[ \left( \frac{x_t}{x_0} \right)^{m/n} - 1 \right] \times 100$$

where  $r$  is the percent change at an annual rate;  $x_t$  is the level of activity in the later period;  $x_0$  is the level of activity in the earlier period;  $m$  is the periodicity of the data (for example, 1 for annual data, 4 for quarterly data, or 12 for monthly data); and  $n$  is the number of periods between the earlier periods and the later periods (that is,  $t - 0$ ).

Quarterly and monthly NIPA estimates are seasonally adjusted if necessary. Seasonal adjustment removes from the time series the average effects of variations that normally occur at about the same time and in about the same magnitude each year—for example, weather, holidays, and tax payment dates. After seasonal adjustment, cyclical and other short-term changes in the economy stand out more clearly.

 ITAs International transactions accounts  
 NIPAs National income and product accounts

## B. Suggested Reading

The Bureau of Economic Analysis (BEA) has published a wealth of information about the methodologies that are used to prepare its national, industry, international, and regional accounts. Most of this information is available on BEA's Web site at [www.bea.gov](http://www.bea.gov).

### National accounts

The national accounts encompass the detailed estimates in the national income and product accounts (including gross domestic product) and the estimates of fixed assets and consumer durable goods.

**National income and product accounts (NIPAs).** This series of papers documents the conceptual framework of the NIPAs and the methodologies that are used to prepare the estimates.

*Concepts and Methods of the U.S. National Income and Product Accounts (Introductory Chapters 1-4)* (2008)

*Corporate Profits: Profits Before Tax, Profits Tax Liability, and Dividends* (2002)

*An Introduction to National Income and Product Accounts* (2007)

*Measuring the Economy: A Primer on GDP and the National Income and Product Accounts* (2007)

The following SURVEY articles describe the upcoming 2009 comprehensive revision of the NIPAs.

"Preview of the Revised NIPA Estimates for 2002: Effects of Incorporating the 2002 Benchmark I-O Accounts and Proposed Definition and Statistical Changes" (March 2008)

Preview of the 2009 Comprehensive NIPA Revision Changes in Definitions and Presentations (March 2009)

New Classifications for Personal Consumption Expenditures (May 2008)

Statistical Changes (May 2009)

The following SURVEY articles describe the 2003 comprehensive NIPA revision.

"Improved Estimates of the National Income and Product Accounts for 1929-2002: Results of the Comprehensive Revision" (February 2004)

"Measuring the Services of Commercial Banks in the NIPAs: Changes in Concepts and Methods" (September 2003)

"Measuring the Services of Property-Casualty Insurance in the NIPAs: Changes in Concepts and Methods" (October 2003)

In addition, see the following articles.

"Annual Revision of the National Income and Prod-

uct Accounts" (August 2008) presents revisions and describes any changes in the data and the methods that are used to prepare the estimates.

"Updated Summary of NIPA Methodologies" (November 2008) describes the source data and the methods that are used to prepare the current-dollar and real estimates of GDP.

"Chained-Dollar Indexes: Issues, Tips on Their Use, and Upcoming Changes" (November 2003) discusses the advantages of using chain-weighted indexes and the challenges of using chained dollars.

"Reliability of the NIPA Estimates of U.S. Economic Activity" (February 2005) evaluates the principal NIPA estimates by examining the record of revisions to them.

"Gross Domestic Product: Revisions and Source Data" (February 2006) describes the categories of data that are used for the advance, preliminary, and final quarterly estimates of GDP.

**Fixed assets and consumer durable goods.** *Fixed Assets and Consumer Durable Goods in the United States, 1925-97* (2003) discusses the concepts and statistical considerations that underlie the estimates and their derivation.

"Fixed Assets and Consumer Durable Goods for 1925-2002" (May 2004) describes the improvements that were incorporated into these estimates as part of the 2003 comprehensive NIPA revision.

"Fixed Assets and Consumer Durable Goods for 1998-2007" (September 2008) provides estimates that reflect the incorporation of the most recent annual NIPA revision.

**Satellite accounts.** These accounts extend the analytical capacity of the NIPAs by focusing on the effects of a particular aspect of economic activity on GDP.

"Research and Development Satellite Account"

For 1959-2002 (December 2006)

For 1959-2004 (October 2007)

### Mission Statement and Strategic Plan

The mission statement of the Bureau of Economic Analysis and its most recently updated strategic plan for improving the accuracy, reliability, and relevance of the national, industry, regional, and international accounts are available on BEA's Web site at [www.bea.gov](http://www.bea.gov) under "About BEA."

## Industry accounts

The industry accounts consist of the annual industry accounts (the input-output accounts and the gross-domestic-product-by-industry accounts), the benchmark input-output accounts, and one satellite account.

**Annual industry accounts.** “Improved Annual Industry Accounts for 1998–2003” (June 2004) describes the comprehensive revision of the annual input-output accounts and the GDP-by-industry accounts that features the integration of the two sets of accounts.

“Annual Industry Accounts” (February 2008) presents the annual revision of these accounts and describes the source data and any changes in the methods that are used to prepare the estimates.

“Preview of the Comprehensive Revision of the Annual Industry Accounts: Integrating the Annual Input-Output Accounts and the Gross-Domestic-Product-by-Industry Accounts” (March 2004) provides the details about the comprehensive revision.

**Benchmark input-output accounts.** “Preview of the Benchmark Input-Output Accounts for 2002” (September 2005) includes the proposed new sectors that are based on the 2002 North American Industry Classification System.

“U.S. Benchmark Input-Output Accounts, 2002” (October 2007)

**Satellite accounts.** These accounts extend the analytical capacity of the input-output accounts by focusing on a particular aspect of economic activity.

“U.S. Travel and Tourism Satellite Accounts”

For 2002–2005 (June 2006)

For 1998–2006 (June 2007)

For 2004–2007 (June 2008)

For 2005–2008 (June 2009)

## International accounts

The international accounts encompass the international transactions accounts, direct investment, and international transactions in services.

**International transactions accounts.** *The Balance of Payments of the United States: Concepts, Data Sources, and Estimating Procedures* (1990) describes the methodologies used to prepare the estimates in the ITAs and the international investment position of the United States. These methodologies are usually updated and improved as part of the annual revisions of the international transactions accounts.

The annual revisions of the international transactions accounts are described in a series of articles, the latest of which was published in the July 2008 SURVEY.

**Direct investment.** *International Direct Investment: Studies by the Bureau of Economic Analysis* (1999) is a collection of previously published articles on U.S. di-

rect investment abroad and foreign direct investment in the United States. It includes “A Guide to BEA Statistics on U.S. Multinational Companies,” which is also available in the March 1995 SURVEY, and “A Guide to BEA Statistics on Foreign Direct Investment in the United States,” which is also available in the February 1990 SURVEY.

In addition, the updated methodologies are available in *U.S. Direct Investment Abroad: Final Results From the 1999 Benchmark Survey* (2004) and in *Foreign Direct Investment in the United States: Final Results From the 2002 Benchmark Survey* (2006).

**International services.** *U.S. International Transactions in Private Services: A Guide to the Surveys Conducted by the Bureau of Economic Analysis* (1998) describes 11 surveys. It includes classifications, definitions, release schedules, the methods used to prepare the estimates, and samples of the survey forms.

“Selected Issues in the Measurement of U.S. International Services” (June 2002) describes key issues in defining and measuring insurance, wholesale and retail trade, finance, construction, and utilities services and explores possible actions to address these issues.

## Regional accounts

The regional accounts include estimates of personal income and gross domestic product. The following methodologies are available on BEA’s Web site at [www.bea.gov/regional/methods.cfm](http://www.bea.gov/regional/methods.cfm).

**Personal income.** Estimates of personal income are prepared for states and for local areas.

*State Personal Income* (2007) describes the improvements in the methodology that are used to prepare the estimates.

*Local Area Personal Income* (2007) describes the detailed methodology that is used to prepare the estimates for counties, metropolitan divisions and areas, micropolitan areas, and BEA economic areas and regions.

**Gross domestic product.** Estimates of gross domestic product (GDP) are prepared for states and metropolitan areas.

*Gross Domestic Product by State* (2006) describes the sources and the methods that are used to prepare the estimates.

“Gross Domestic Product by State” (June 2009) presents the most recent annual revision.

“Introducing New Measures of the Metropolitan Economy: Prototype GDP-by-Metropolitan-Area Estimates for 2001–2005” (November 2007) describes the potential uses of the estimates and the methodology used to prepare them.
