Chronicling 100 Years of the U.S. Economy

For information about Acting Director Mary Bohman and the Bureau, visit the BEA Leadership page.

## Director's Message

In this issue of the Survey of Current Business, we present improved measures of housing services for the U.S. economic accounts. These improvements, which are being implemented as part of the Bureau of Economic Analysis' (BEA's) upcoming annual update of the National Income and Product Accounts (NIPAs) and subsequent revisions to the Regional Economic Accounts, will provide more accurate and reliable estimates for annual current-dollar estimates of personal consumption expenditures of housing services on tenant- and owner-occupied housing for the period $2002-2020$ as well as a more streamlined, integrated approach to estimating housing services across BEA's national and regional programs.

Elsewhere, we discuss new insights into BEA's small business statistics. Using firm-level data categorized by receipts size to estimate wages and gross output by business size, industry, and legal form of organization for 1998-2003, we provide an additional layer of detail to better understand the composition of the nation's small businesses. We are also researching other ways to estimate small business statistics including using different size classes, datasets, and business characteristics. We invite all interested data users to send feedback or suggestions for future research to SmallBusiness@bea.gov.

This month's "GDP and the Economy" article takes a look at the advance estimate of gross domestic product (GDP) for the first quarter of 2021. We also provide a preview of the 2021 annual update of the NIPAs.

Survey centennial content this month includes a 2010 reprint celebrating the 75th anniversary of the national accounts and GDP, a historic milestone highlighting the importance of the work at BEA to continually update and improve our accounts, and a 2019 reprint discussing BEA's first GDP by county statistics, another example of BEA's progress in providing more detail and a more accurate geographic distribution of the U.S. economy. We also present an overview of estimating GDP for the U.S. territories. These annual statistics, first published in 2010, continue to evolve, including the estimation of GDP for Puerto Rico last year. Our influencer profile this month covers John Kendrick, a pioneer in productivity measurement whose work impacted the development and enhancement of BEA statistics.

# Chronicling 100 Years of the 

## GDP and the Economy

## Advance Estimates for the First Quarter of 2021

Real gross domestic product (GDP) increased at an annual rate of 6.4 percent in the first quarter of 2021, according to the "advance" estimates of the National Income and Product Accounts (chart 1 and table 1). ${ }^{1}$ In the fourth quarter, real GDP increased 4.3 percent. The increase in real GDP in the first quarter reflected increases in consumer spending, nonresidential fixed investment, federal government spending, residential fixed investment, and state and local government spending that were partly offset by decreases in private inventory investment and exports. ${ }^{2}$ Imports, which are a subtraction in the calculation of GDP, increased (chart 2).

Chart 1. Real GDP: Percent Change from Preceding Quarter

U.S. Bureau of Economic Analysis

Chart 2. Real GDP: Contributions to the Percent Change in 2021:Q1

[^0]The increase in first-quarter GDP reflected the continued economic recovery, reopening of establishments, and continued government response related to the COVID-19 pandemic. In the first quarter, government assistance payments, such as direct economic impact payments, expanded unemployment benefits, and Paycheck Protection Program loans, were distributed to households and businesses through the Coronavirus Response and Relief Supplemental Appropriations Act and the American Rescue Plan Act. The full economic effects of the COVID-19 pandemic cannot be quantified in the GDP estimates, because the impacts are generally embedded in source data and cannot be separately identified. For more information, see the Technical Note.

## GDP by Expenditure

The acceleration in real GDP growth in the first quarter reflected the continued economic recovery from the COVID-19 pandemic as government assistance payments were distributed to households and businesses. An acceleration in consumer spending and upturns in federal as well as state and local government spending more than accounted for the acceleration in real GDP. These were partly offset by downturns in private inventory investment and exports and by decelerations in residential fixed investment and nonresidential fixed investment. Imports slowed.

- The acceleration in consumer spending reflected an upturn in spending on goods and an acceleration in spending on services.
- Within goods, all components of both durable and nondurable goods contributed to the upturn. The leading contributors were upturns in spending on motor vehicles and parts as well as on food and beverages purchased for off-premises consumption.
- Within services, the leading contributors to the acceleration were upturns in spending on food services and accommodations and on transportation services.
- An upturn in federal government spending was the second largest contributor to the acceleration in real GDP. The upturn primarily reflected an upturn in nondefense spending on intermediate goods and services purchased by government. In the first quarter, the processing and administration of Paycheck Protection Program loan applications by banks on behalf of the federal government added approximately $\$ 13.2$ billion ( $\$ 52.6$ billion at an annual rate) to nondefense services. Federal government purchases of COVID-19 vaccines for distribution to the public contributed to the upturn in nondefense goods.
- The upturn in state and local government spending reflected an upturn in consumption expenditures, led by compensation of employees, that was partly offset by a downturn in gross investment, led by a downturn in structures.
- The downturn in private inventory investment was led by a larger decrease in retail trade and a downturn in manufacturing. Within retail trade, the largest contributor was a larger decrease in inventory investment by motor vehicle dealers. Within manufacturing, there were downturns in both durable and nondurable goods manufacturing inventory investment.
- The downturn in exports reflected downturns in both goods (led by a deceleration in industrial supplies and a downturn in foods, feeds, and beverages) and services (led by a deceleration in transport and a downturn in royalties and license fees).
- Residential fixed investment slowed, largely reflecting a slowdown in new residential structures, notably single-family units, and a downturn in brokers' commissions.
- Nonresidential fixed investment slowed, reflecting a slowdown in investment in equipment that was partly offset by a smaller decrease in investment in structures. Investment in intellectual property products grew at about the same rate as in the fourth quarter.
- The slowdown in equipment investment was more than accounted for by a slowdown in transportation equipment that was partly offset by an acceleration in information processing equipment.
- The smaller decrease in structures was more than accounted for by a smaller decrease in investment in industrial structures.
- Imports slowed. As a subtraction in the calculation of GDP, imports contributed to the acceleration in first-quarter GDP. The main contributor was a downturn in automotive vehicles, engines, and parts.

1. The GDP estimates under the contribution columns are also percent changes.
2. GDI is deflated by the implicit price deflator for GDP.

Note. Percent changes are from National Income and Product Account (NIPA) tables 1.1.1 and 1.2.1, contributions are from NIPA tables 1.1.2 and 1.2.2, and shares are from NIPA table 1.1.10 or are cal culated from NIPA table 1.2.5.

## Prices

Prices for gross domestic purchases-goods and services purchased by U.S. residentsincreased 3.8 percent in the first quarter after increasing 1.7 percent in the fourth quarter (table 2 and chart 3 ). The leading contributors to the acceleration were accelerations in the prices that consumers paid for gasoline and other energy goods and for health care services. A notable offset was in the prices that consumers paid for motor vehicles and parts.

Food prices decreased 0.1 percent in the first quarter; they were unchanged in the fourth quarter. Prices for energy goods and services increased 46.7 percent after increasing 9.1 percent. Gross domestic purchases prices excluding food and energy increased 3.1 percent after increasing 1.6 percent.

Consumer prices excluding food and energy, a measure of the "core" rate of inflation, accelerated, increasing 2.3 percent in the first quarter after increasing 1.3 percent in the fourth quarter.

Table 2. Prices for Gross Domestic Purchases
[Percent change at annual rates; based on seasonally adjusted index numbers (2012=100)]

| Line | Series | Change from preceding period (percent) |  |  |  | Contribution to percent change in gross domestic purchases prices (percentage points) |  |  |  |

| 26 | Gross domestic product | -1.8 | 3.5 | 2.0 | 4.1 | $\ldots$ | $\cdots$ | ...... | ..... |
| 27 | Exports of goods and services | -18.8 | 12.8 | 5.9 | 19.7 | $\cdots$ | ...... | ...... | $\ldots$ |
| 28 | Imports of goods and services | -12.8 | 8.6 | 2.2 | 13.3 | $\ldots$ | ...... | ...... | $\ldots$ |

1. The estimates under the contribution columns are also percent changes.

Note. Most percent changes are from NIPA table 1.6.7; percent changes for personal consumption expenditures (PCE) for food and energy goods and services and for PCE excluding food and energy are from NIPA table 2.3.7. Contributions are from NIPA table 1.6.8. GDP, export, and import prices are from NIPA table 1.1.7.

BEA's gross domestic purchases price index is the most comprehensive index of prices paid by U.S. residents for all goods and services, regardless of whether those goods and services were produced domestically or imported. It is derived from the prices of personal consumption expenditures (PCE), private investment, and government consumption expenditures and gross investment.

The GDP price index measures the prices of goods and services produced in the United States, including the prices of goods and services produced for export. The difference between the gross domestic purchases price index and the GDP price index reflects the differences between imports prices (included in the gross domestic purchases index) and exports prices (included in the GDP price index). For other measures that are affected by import and export prices, see the FAQ "How do the effects of dollar depreciation show up in the GDP accounts?" on BEA's website.

BEA also produces price indexes for all the components of GDP. The PCE price index is a measure of the total cost of consumer goods and services, including durable goods, nondurable goods, and services. PCE prices for food, for energy goods and services, and for all items except food and energy are also estimated and reported.

Because prices for food and for energy can be volatile, the price measure that excludes food and energy is often used as a measure of underlying, or "core," inflation. The core PCE price index includes purchased meals and beverages, such as restaurant meals and pet food. (See "What is the core PCE price index?" on BEA's website.)

BEA also prepares a supplemental PCE price index, the "market-based" PCE price index, that is based on market transactions for which there are corresponding price measures. This index excludes many imputed expenditures, such as financial services furnished without payment, that are included in PCE and in the PCE price index. BEA also prepares a market-based measure that excludes food and energy.

## Personal Income

Measured in current dollars, personal income increased $\$ 2.40$ trillion in the first quarter, in contrast to a decrease of $\$ 351.4$ billion in the fourth quarter (table 3). The increase in personal income primarily reflected increases in personal current transfer receipts (notably, government social benefits) and compensation that were partly offset by decreases in proprietors' income and personal dividend income. The addenda lines in table 3 include detail on the effects of selected federal pandemic response programs on personal income.

- Within government social benefits, "other" social benefits and unemployment insurance increased, primarily reflecting increases in economic impact payments and in pandemic unemployment compensation payments.
- Within compensation, the leading contributor to the increase was private wages and salaries.
- Within proprietors' income, a decrease in farm proprietors' income was partly offset by an increase in nonfarm proprietors' income. For farm proprietors' income, the decrease primarily reflected a decrease in payments related to the Coronavirus Food Assistance Program designed to support farmers and ranchers impacted by COVID-19.
- The decrease in personal dividend income was based primarily on company financial data for the first quarter.

Personal current taxes increased $\$ 36.6$ billion in the first quarter after increasing $\$ 50.7$ billion in the fourth quarter.

Disposable personal income (DPI) increased $\$ 2.36$ trillion in the first quarter after decreasing $\$ 402.1$ billion in the fourth quarter. Personal outlays increased $\$ 492.8$ billion after increasing $\$ 125.3$ billion in the fourth quarter.

The personal saving rate (chart 4)—personal saving as a percentage of DPI—was 21.0 percent in the first quarter, compared with 13.0 percent in the fourth.

Real DPI (chart 5) increased 61.3 percent in the first quarter after decreasing 10.1 percent in the fourth quarter. Current-dollar DPI increased 67.0 percent after decreasing 8.8 percent.

1. Consists of nonmortgage interest paid by households. Note that mortgage interest paid by households is an expense item in the calculation of rental income of persons.
2. The Coronavirus Food Assistance Program, initially established by the Coronavirus Aid, Relief and Economic Security Act (CARES), provides direct support to farmers and ranchers where prices and market supply chains have been impacted by the COVID-19 pandemic.
3. The Paycheck Protection Program, initially established by the CARES Act, provides forgivable loans to help small businesses and nonprofit institutions make payroll and cover other expenses. It also provides funding to reimburse private lending institutions for the costs of administering these loans. For more information, see "How does the Paycheck Protection Program impact the national income and product accounts (NIPAs)?".
4. A two percent reduction in reimbursements paid to Medicare service providers that went into effect in 2013 was initially suspended by the CARES Act. The resulting increased reimbursement rates went into effect beginning on May 1, 2020.
5. Unemployment insurance benefits were expanded through several programs that were initially established through the CARES Act. For more information, see "How will the expansion of unemployment benefits in response to the COVID-19 pandemic be recorded in the NIPAs?".
6. Economic impact payments, initially established by the CARES Act, provide direct payments to individuals. For more information, see "How are the economic impact payments to support individuals during the COVID-19 pandemic recorded in the NIPAs?"
7. The Federal Emergency Mangement Agency (FEMA) was authorized to make payments from the Disaster Relief Fund to supplement wages lost as a result of the COVID-19 pandemic.
8. The Department of Health and Human Services distributes money from the Provider Relief Fund to hospitals and health care providers on the front lines of the coronavirus response. This funding supports heal th care-related expenses or lost revenue attributable to COVID-19 and ensures uninsured Americans can get treatment for COVID19. In the NIPAs, funds provided to nonprofit hospitals are recorded as social benefits.
9. Interest payments due on certain categories of federally-held student loans were initially suspended by the CARES Act. For more information, see "How does the federal response to the COVID-19 affect BEA's estimate of personal interest payments?".

Note. Dollar levels and percent changes are from NIPA tables 2.1 and 2.2B.

## Information on Key Source Data, Assumptions, and Methodologies

A comprehensive table that presents the "Key Source Data and Assumptions" that are used to prepare each vintage of the estimate of GDP for the current quarter is available on BEA's website. For the advance estimates that are released near the end of the month after the close of the quarter, the table shows the months of source data for the quarter that are available; for most components of GDP, 3 months of data are available. For the components for which only 2 months of source data are available, BEA's assumptions for the third month are shown. Second estimates are released near the end of the second month after the close of the quarter, and third estimates are released near the end of the third month after the close of the quarter. With each vintage, the table is updated to add newly available and revised source data that have been incorporated into the estimates.

For additional details about the source data and the methodologies that are used to prepare the estimates, see "Concepts and Methods of the U.S. National Income and Product Accounts" on BEA's website.

The Bureau of Economic Analysis (BEA) plans to release the results of the annual update of the National Economic Accounts (NEAs), which include the National Income and Product Accounts (NIPAs) and the Industry Economic Accounts (IEAs), later this year. Results from the annual update of the NIPAs will be released on July 29, 2021, and results from the annual update of the IEAs will be released on September 30, 2021. As BEA continues to harmonize the methodologies underlying the estimates of the NIPAs, the IEAs, and the Regional Economic Accounts, many of the improvements that will be incorporated during the annual update will impact all three sets of accounts.

The update of the NEAs will cover the first quarter of 1999 through the first quarter of 2021 and will result in revisions to gross domestic product (GDP), GDP by industry, and gross domestic income. The reference year for index numbers and chained-dollar estimates will remain 2012.

Source data updates. The annual update will incorporate source data that are more complete and more detailed than those previously available, including the following:

- Census Bureau data from the 2017 Economic Census as well as from annual surveys of manufacturers, merchant wholesale trade, retail trade, services, and state and local governments
- Federal government budget data
- Internal Revenue Service tabulations of tax returns for corporations, for sole proprietorships, and for partnerships
- Department of Agriculture farm income statistics

Incorporation of International Transactions Accounts. In addition to the source data listed above, the annual update will incorporate results from the 2021 annual update of BEA's International Transactions Accounts (ITAs), scheduled for release on June 23, 2021. The NIPA and IEA update will also extend to 1999 several improvements to ITA measures of income flows and trade in services between the United States and the rest of the world that were previously introduced beginning with 2015. ${ }^{1}$

## Methodology improvements

- Housing services. Estimates of personal consumption expenditures for the services provided by housing to tenants and to owner-occupants in the NIPAs, the IEAs, and the Regional Economic Accounts will be updated beginning with 2002. The improved estimates will use unit-level microdata from the Census Bureau's annual American Community Survey to derive unit-level values of services that will be aggregated to state and national levels. Rental values for tenants will be estimated from actual tenant rents, and imputed rental values for owner-occupants will be estimated using a rental-equivalence method. The use of a single official data source and the rental equivalence methodology will result in more accurate and reliable data across BEA's accounts. For more information, see "Improved Measures of Housing Services for the U.S. Accounts" in this issue of the Survey of Current Business.
- Presentational and classification improvements. A new reconciliation table (NIPA table 4.3C) will reflect the improved alignment of the NIPAs and the ITAs that results from the ITA recognition of exports and imports of financial services provided without payment, which was introduced as part of the 2020 ITA annual update. Additionally, several categories of exports and imports in the NIPAs will be reclassified to further improve alignment of the NIPAs with the ITAs, including exports and imports of these "implicit" services, which will be reclassified to financial services from other services. ${ }^{2}$

[^1]1. "Real" estimates are in chained (2012) dollars, and price indexes are chain-type measures. Each GDP estimate for a quarter (advance, second, and third) incorporates increasingly comprehensive and improved source data; for more information, see "The Revisions to GDP, GDI, and Their Major Components" in the January 2021 Survey of Current Business. Quarterly estimates are expressed at seasonally adjusted annual rates, which reflect a rate of activity for a quarter as if it were maintained for a year.
2. In this article, "consumer spending" refers to "personal consumption expenditures," "inventory investment" refers to "change in private inventories," and "government spending" refers to "government consumption expenditures and gross investment."

## Legend / Footnotes:

Note. Chained (2012) dollar series are calculated as the product of the chain-type quantity index and the 2012 current-dollar value of the corresponding series, divided by
100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive.

The residual line is the difference between the first line and the sum of the most detailed lines.

| 42 | Market-based PCE excluding food and energy ${ }^{4}$ | 1.5 | 1.2 | 1.4 | 1.3 | 1.5 |

## Legend / Footnotes:

1. Final sales to domestic purchasers less government consumption expenditures and gross investment.
2. The arithmetic average of gross domestic product and of gross domestic income, deflated by the implicit price deflator for GDP.
3. Food excludes personal consumption expenditures for purchased meals and beverages, which are classified in food services.
4. Market-based PCE is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most imputed transactions (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.
Note. Percent changes for real estimates are calculated from corresponding quantity indexes presented in NIPA tables 1.1.3, 1.2.3, 1.4.3, and 1.7.3. Percent changes in price estimates are calculated from corresponding price indexes presented in NIPA tables 1.1.4, 1.6.4, and 2.3.4.

## Legend / Footnotes:

1. Prior to 1959, inventories held by construction establishments are included in nondurable goods. Beginning with 1959, these inventories are included in durable goods. Estimates for durable goods and nondurable goods for 1996 and earlier periods are based on the 1987 Standard Industrial Classification (SIC); later estimates for these industries are based on the North American Industry Classification System (NAICS).
2. Includes government consumption expenditures, which are for services (such as education and national defense) produced by government. In current dollars, these services are valued at their cost of production.
3. Some components of final sales of computers include computer parts.

## Legend / Footnotes:

1. Prior to 1959, inventories held by construction establishments are included in nondurable goods. Beginning with 1959, these inventories are included in durable goods. Estimates for durable goods and nondurable goods for 1996 and earlier periods are based on the 1987 Standard Industrial Classification (SIC); later estimates for these industries are based on the North American Industry Classification System (NAICS).
2. Includes government consumption expenditures, which are for services (such as education and national defense) produced by government. In current dollars, these services are valued at their cost of production.
3. Some components of final sales of computers include computer parts.

Note. Chained (2012) dollar series are calculated as the product of the chain-type quantity index and the 2012 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line following change in private inventories is the difference between gross domestic product and the sum of final sales of domestic product and of change in private inventories; the residual line following structures is the difference between gross domestic product and the sum of the detailed lines of goods, of services, and of structures.

| 62 | Gross investment | 2.4 | 3.6 | 12.7 | -2.4 | -4.7 | 7.8 | -6.6 |

## Legend / Footnotes:

1. Net expenses of NPISHs, defined as their gross operating expenses less primary sales to households.
2. Gross output is net of unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; excludes own-account investment (construction and software).
3. Excludes unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; includes membership dues and fees.
4. Excludes software embedded, or bundled, in computers and other equipment.
5. Research and development investment excludes expenditures for software development. Software development expenditures are included in software investment on line 38.

## Legend / Footnotes:

1. Net expenses of NPISHs, defined as their gross operating expenses less primary sales to households.
2. Gross output is net of unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; excludes own-account investment (construction and software).
3. Excludes unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; includes membership dues and fees.
4. Excludes software embedded, or bundled, in computers and other equipment.
5. Research and development investment excludes expenditures for software development. Software development expenditures are included in software investment on line 38.

## Legend / Footnotes:

1. Net expenses of NPISHs, defined as their gross operating expenses less primary sales to households.
2. Gross output is net of unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; excludes own-account investment (construction and software).
3. Excludes unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; includes membership dues and fees.
4. Excludes software embedded, or bundled, in computers and other equipment.
5. Research and development investment excludes expenditures for software development. Software development expenditures are included in software investment on line 38.

Legend / Footnotes:

1. Net expenses of NPISHs, defined as their gross operating expenses less primary sales to households.
2. Gross output is net of unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; excludes own-account investment (construction and software).
3. Excludes unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; includes membership dues and fees.
4. Excludes software embedded, or bundled, in computers and other equipment.
5. Research and development investment excludes expenditures for software development. Software development expenditures are included in software investment on line 38.

Legend / Footnotes:

1. Net expenses of NPISHs, defined as their gross operating expenses less primary sales to households.
2. Gross output is net of unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; excludes own-account investment (construction and software).
3. Excludes unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; includes membership dues and fees.
4. Excludes software embedded, or bundled, in computers and other equipment.
5. Research and development investment excludes expenditures for software development. Software development expenditures are included in software investment on line 38.

## Legend / Footnotes:

1. Net expenses of NPISHs, defined as their gross operating expenses less primary sales to households.
2. Gross output is net of unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; excludes own-account investment (construction and software).
3. Excludes unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; includes membership dues and fees.
4. The quantity index for computers can be used to accurately measure the real growth of this component. However, because computers exhibit rapid changes in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series; accurate estimates of these contributions are shown in table 1.5.2 and real growth rates are shown in table 1.5.1.
5. Excludes software embedded, or bundled, in computers and other equipment.
6. Research and development investment excludes expenditures for software development. Software development expenditures are included in software investment on line 38.
Note. The residual line is the difference between the first line and the sum of the most detailed lines.

Legend / Footnotes:

1. Prior to 1959, current surplus of government enterprises (line 22) is not shown separately; subsidies are included net of the current surplus of government enterprises in line 18.
2. The arithmetic average of gross domestic product and of gross domestic income.
3. Consists of compensation of employees, proprietors' income with inventory valuation adjustment (IVA) and capital consumption adjustment (CCAdj), rental income of persons with CCAdj, corporate profits with IVA and CCAdj, net interest and miscellaneous payments, and consumption of fixed capital.
4. Consists of gross national factor income less consumption of fixed capital.

## Legend / Footnotes:

IVA Inventory valuation adjustment
CCAdj Capital consumption adjustment

1. Includes actual employer contributions and actuarially imputed employer contributions to reflect benefits accrued by defined benefit pension plan participants through service to employers in the current period.
2. Prior to 1959, subsidies (line 20) and the current surplus of government enterprises (line 25) are not shown separately; subsidies are presented net of the current surplus of government enterprises.

## Legend / Footnotes:

1. Estimates for financial corporate business and nonfinancial corporate business for 2000 and earlier periods are based on the 1987 Standard Industrial Classification (SIC); later estimates for these industries are based on the North American Industry Classification System (NAICS).
2. The current-dollar gross value added is deflated using the gross value added chain-type price index for nonfinancial industries from the GDP-by-industry accounts. For periods when this price index is not available, the chain-type price index for GDP goods and structures is used.
3. Chained-dollar consumption of fixed capital of nonfinancial corporate business is calculated as the product of the chain-type quantity index and the 2012 current-dollar value of the corresponding series, divided by 100.
4. Chained-dollar net value added of nonfinancial corporate business is the difference between the gross product and the consumption of fixed capital.

## Legend / Footnotes:

1. The arithmetic average of gross domestic product and of gross domestic income, deflated by the implicit price deflator for GDP.
2. In this table, the net measures are the corresponding gross measures excluding the depreciation of fixed assets as measured by the consumption of fixed capital.
3. Gross domestic purchases excluding change in private inventories.
4. Final sales to domestic purchasers less government consumption expenditures and gross investment.
5. The command-basis estimates (lines 12-15) measure the purchasing power of the income generated by the sale of goods and services produced; they reflect gains or losses in real income resulting from changes in the terms of trade for exports and imports. For more detail on the command-basis measures, see NIPA tables 1.8 .3 and 1.8.6.

## Legend / Footnotes:

1. The arithmetic average of gross domestic product and of gross domestic income.
2. In this table, net measures are the corresponding gross measures excluding the depreciation of fixed assets as measured by the consumption of fixed capital.
3. Equals gross national income less the depreciation of fixed assets as measured by the consumption of fixed capital.
4. Equals gross domestic purchases less change in private inventories.
5. Final sales to domestic purchasers less government consumption expenditures and gross investment.

## Legend / Footnotes:

1. Includes actual employer contributions and actuarially imputed employer contributions to reflect benefits accrued by defined benefit pension plan participants through service to employers in the current period.
2. Social security benefits include old-age, survivors, and disability insurance benefits that are distributed from the federal old-age and survivors insurance trust fund and the disability insurance trust fund.
3. Medicare benefits include hospital and supplementary medical insurance benefits that are distributed from the federal hospital insurance trust fund and the supplementary medical insurance trust fund.
4. Consists of nonmortgage interest paid by households. Note that mortgage interest paid by households is an expense item in the calculation of rental income of persons.
5. The current-dollar measure is deflated by the implicit price deflator for personal consumption expenditures.

## Legend / Footnotes:

1. Net expenses of NPISHs, defined as their gross operating expenses less primary sales to households.
2. Gross output is net of unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; excludes own-account investment
(construction and software).
3. Excludes unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; includes membership dues and fees.
4. Food consists of food and beverages purchased for off-premises consumption; food services, which include purchased meals and beverages, are not classified as food.
5. Consists of gasoline and other energy goods and of electricity and gas services.
6. Market-based PCE is a supplemental measure that is based on household expenditures for which there are observable price measures.It excludes most imputed transactions (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.

## Legend / Footnotes:

1. Net expenses of NPISHs, defined as their gross operating expenses less primary sales to households.
2. Gross output is net of unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; excludes own-account investment
(construction and software).
3. Excludes unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; includes membership dues and fees.
4. Food consists of food and beverages purchased for off-premises consumption; food services, which include purchased meals and beverages, are not classified as food.
5. Consists of gasoline and other energy goods and of electricity and gas services.
6. Market-based PCE is a supplemental measure that is based on household expenditures for which there are observable price measures.It excludes most imputed transactions (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.

5. Consists of gasoline and other energy goods and of electricity and gas services.
6. Market-based PCE is a supplemental measure that is based on household expenditures for which there are observable price measures.It excludes most imputed transactions (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households
Note. Chained (2012) dollar series are calculated as the product of the chain-type quantity index and the 2012 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

## Legend / Footnotes:

1. Consists primarily of contributions by residents of the U.S. territories and the Commonwealths of Puerto Rico and Northern Mariana Islands.
2. Prior to 1960, interest payments to persons (line 28) and interest receipts on line 12 are not shown separately, but are included in interest payments (line 27), which is shown net of interest receipts. Interest payments to persons and business includes interest accrued on the actuarial liabilities of defined benefit pension plans for government employees.
3. Prior to 1999, current transfer payments to the rest of the world (line 26) are displayed net of current transfer receipts from the rest of the world (line 18).
4. Prior to 1959, subsidies (line 30) and the current surplus of government enterprises (line 19) are not shown separately; subsidies are presented net of the current surplus of government enterprises.
5. Prior to 1960, government social benefits to the rest of the world are included in line 26 , 'Other current transfer payments to the rest of the world.'

## Legend / Footnotes:

1. Includes dividends tax for 1933-34 and automobile use tax for 1942-46 as shown in table 3.4.
2. Includes the capital stock tax for 1933-45 as shown in table 3.5.
3. Consists primarily of contributions by residents of the U.S. territories and the Commonwealths of Puerto Rico and Northern Mariana Islands.
4. Prior to 1960, interest payments to persons and business (line 34) and interest receipts (line 14) are not shown separately, but are included in interest payments (line 33), which is shown net of interest receipts. Interest payments to persons and business includes interest accrued on the actuarial liabilities of defined benefit pension plans for federal government employees.
5. Rents and royalties are receipts from the leasing of federally owned lands and mineral deposits. These values do not include bonus payments made to secure such leases.
6. Prior to 1999, current transfer payments to the rest of the world are displayed net of current transfer receipts from the rest of the world.
7. Prior to 1959, subsidies (line 36) and the current surplus of government enterprises (line 23) are not shown separately; subsidies are presented net of the current surplus of government enterprises.
8. Prior to 1960, government social benefits to the rest of the world (line 29) are included in line 32, 'Other current transfer payments to the rest of the world.'

## Legend / Footnotes:

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction, software, and research and development).
2. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

## Legend / Footnotes:

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction, software, and research and development).
2. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

## Legend / Footnotes:

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction, software, and research and development).
2. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.
Note. Chained (2012) dollar series are calculated as the product of the chain-type quantity index and the 2012 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

## Legend / Footnotes:

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction, software, and research and development).
2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.
3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.
4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures, software, and research and development in table 3.9.5.
5. Includes federal purchases of research and development produced by state and local general government.

## Legend / Footnotes:

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction, software, and research and development).
2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.
3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.
4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures, software, and research and development in table 3.9.5.
5. Includes federal purchases of research and development produced by state and local general government.

## Legend / Footnotes:

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction, software, and research and development).
2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.
3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.
4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures, software, and research and development in table 3.9.5.
5. Includes federal purchases of research and development produced by state and local general government.

Legend / Footnotes:

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction, software, and research and development).
2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.
3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.
4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures, software, and research and development in table 3.9.5.
5. Includes federal purchases of research and development produced by state and local general government.

Note. Chained (2012) dollar series are calculated as the product of the chain-type quantity index and the 2012 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

## Legend / Footnotes:

1. National defense consumption expenditures are defense services produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction, software, and research and development).
2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.
3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.
4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures, software, and research and development.
5. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

## Legend / Footnotes:

1. National defense consumption expenditures are defense services produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction, software, and research and development).
2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.
3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.
4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures, software, and research and development.
5. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures, software, and research and development.
5. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.
Note. Chained (2012) dollar series are calculated as the product of the chain-type quantity index and the 2012 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

## Legend / Footnotes:

1. In the NIPAs, pension plans are treated as 'pass-through' institutions that hold financial assets on behalf of households, which are the effective owners. Pension plans are classified as financial corporations that receive contributions and property income on behalf of plan participants but do not have saving or net worth of their own. Table 7.23 shows transactions of the federal government defined-benefit pension subsectors. Contributions for publicly administered insurance funds are transactions with the household sector and include the Medicare-eligible Retiree Health Care Fund.
2. Consists of estate and gift taxes.
3. Beginning with 1996, consists largely of Universal Service Fund receipts; prior to 1996 consisted largely of U.S. Treasury receipts from sales of foreign currencies to government agencies. Includes certain revenues collected from and repaid to U.S. territories and the Commonwealths of Puerto Rico and Northern Mariana Islands.
4. Includes proprietary receipts that are netted against outlays in the budget and that are classified as receipts in the NIPAs. Also includes some transactions that are not reflected in the budget data but that are added to both receipts and expenditures in the NIPAs.
5. Consists of transactions (not included in the budget totals) that record all cash flows arising from post-1991 direct loan obligations and loan guarantee commitments. Many of these flows are for new loans or loan repayments; consequently, related entries are included in 'Loan disbursements less loan repayments and sales.'
6. Consists largely of agencies or accounts such as the Postal Service and the Federal Financing Bank that were not included in the budget in some time periods, and beginning with 1996, the Universal Service Fund. Includes repayments of certain collections from the U.S. territories and the Commonwealths of Puerto Rico and Northern Mariana Islands.
7. Net investment is gross investment less consumption of fixed capital for government enterprises and general government.
8. Includes net expenditures of foreign currencies. Also includes, as subtractions, forgiveness of debts owed by foreign governments to the U.S. government and payments to the Uniformed Services Retiree Health Care Fund and Postal Service Retiree Health Care Fund to amortize unfunded liabilities; these are classified as capital expenditures in the NIPAs and are excluded from both budget outlays and NIPA current expenditures.
9. Primarily includes timing on subsidies and government enterprises.

Note. Through 1976, fiscal year estimates reflect a July 1-June 30 federal fiscal year. Beginning with 1977, fiscal year estimates reflect an October 1-September 30 federal fiscal year. NIPA quarterly and fiscal year estimates in this table are consistent with the not seasonally adjusted estimates in table 3.22.

## Legend / Footnotes:

1. Beginning with 1959, exports and imports of certain goods, primarily military equipment purchased and sold by the federal government, are reclassified from services to goods. Beginning with 1986, repairs and alterations of equipment are reclassified from goods to services.
2. Prior to 1999, current taxes, contributions for government social insurance, and transfer receipts from the rest of the world (line 13) are not separately displayed, and line 29 includes current taxes and transfer payments to the rest of the world net of current taxes, contributions for government social insurance, and transfer receipts from the rest of the world.
3. Consists of capital transfers and the acquisition and disposal of nonproduced nonfinancial assets. Prior to 1982, reflects only capital grants paid to the U.S. territories and the Commonwealths of Puerto Rico and Northern Mariana Islands.

## Legend / Footnotes:

n.e.c. Not elsewhere classified

1. Beginning in 1986, repairs and alterations of equipment are reclassified from goods to services.
2. The quantity index for computers can be used to accurately measure the real growth of this component. However, because computers exhibit rapid changes in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series; accurate estimates of these contributions are shown in table 4.2.2 and real growth rates are shown in table 4.2.1.
3. Includes net exports of goods under merchanting, beginning in 1999, reclassified from services to goods.
4. Includes maintenance and repair services, insurance services, financial services, telecommunication, computer and information services and other other business services.
5. Includes financial services furnished without payment, beginning in 2015.
6. Includes parts of foods, feeds, and beverages, of nondurable industrial supplies and materials, and of nondurable nonautomotive consumer goods.
Note. Chained (2012) dollar series are calculated as the product of the chain-type quantity index and the 2012 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. For exports and for imports, the residual line is the difference between the aggregate line and the sum of the most detailed lines.

## Legend / Footnotes:

1. Includes petroleum and mineral exploration.
2. Consists primarily of religious, educational, vocational, lodging, railroads, farm, and amusement and recreational structures, net purchases of used structures, and brokers' commissions on the sale of structures.
3. Annual chain-type quantity indexes for computers and peripheral equipment: 1959, .0000041; 1960, .000051; 1961, .000093; 1962, .00017; 1963, .00056. Quarterly chain-type quantity indexes for computers and peripheral equipment: 1959:1, .0000006; 1959:2, .0000003; 1959:3, .0000033; 1959:4, .0000123; 1960:1, .000035; $1960: 2, .000040,1960: 3, .000054 ; 1960: 4, .000073 ; 1961: 1, .000073 ; 1961: 2, .000077 ; 1961: 3, .000110 ; 1961: 4, .000111 ; 1962: 1, .00013 ; 1962: 2, .00013 ; 1962: 3$, .00018, 1962:4, .00027; 1963:1, .00040; 1963:2, .00053; 1963:3, .00063; 1963:4, . 00069 .
4. Includes communication equipment, nonmedical instruments, medical equipment and instruments, photocopy and related equipment, and office and accounting equipment.
5. Consists primarily of furniture and fixtures, agricultural machinery, construction machinery, mining and oilfield machinery, service industry machinery, and electrical equipment not elsewhere classified.
6. Excludes software embedded, or bundled, in computers and other equipment.
7. Includes research and development expenditures for software.

## Legend / Footnotes:

1. Includes petroleum and mineral exploration.
2. Consists primarily of religious, educational, vocational, lodging, railroads, farm, and amusement and recreational structures, net purchases of used structures, and brokers' commissions on the sale of structures.
3. The quantity index for computers can be used to accurately measure the real growth rate of this component. However, because computers exhibit rapid changes in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series; accurate estimates of these contributions are shown in table 5.3.2 and real growth rates are shown in table 5.3.1.
4. Includes communication equipment, nonmedical instruments, medical equipment and instruments, photocopy and related equipment, and office and accounting equipment.
5. Consists primarily of furniture and fixtures, agricultural machinery, construction machinery, mining and oilfield machinery, service industry machinery, and electrical equipment not elsewhere classified.
6. Excludes software embedded, or bundled, in computers and other equipment.
7. Includes research and development expenditures for software.
8. Consists primarily of manufactured homes, improvements, dormitories, net purchases of used structures, and brokers' commissions on the sale of residential structures.
9. Excludes net purchases of used structures and brokers' commissions on the sale of structures.
10. Excludes net purchases of used structures and brokers' commissions and other ownership transfer costs.

Note. Chained (2012) dollar series are calculated as the product of the chain-type quantity index and the 2012 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

## Legend / Footnotes:

1. This series is derived from the Census Bureau series 'current cost inventories.
2. The inventory valuation adjustment (IVA) shown in this table differs from the IVA that adjusts business incomes. The IVA in this table reflects the mix of methods (such as first-in, first-out and last-in, first-out) underlying inventories derived primarily from Census Bureau statistics (see footnote 1). This mix differs from that underlying business income derived primarily from Internal Revenue Service statistics.
Note. Estimates in this table are based on the North American Industry Classification System (NAICS).

## Legend / Footnotes:

Note. Estimates in this table are based on the North American Industry Classification System (NAICS).
Chained (2012) dollar series for real change in private inventories are calculated as the period-to-period change in chained-dollar end-of-period inventories. Quarterly changes in end-of-period inventories are stated at annual rates. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

| 29 | Nonfarm inventories to final sales of goods and structures | 3.89 | 4.00 | 3.79 | 3.83 | 3.78 |

## Legend / Footnotes:

1. Inventories are as of the end of the quarter. The quarter-to-quarter change in inventories calculated from current-dollar inventories in this table is not the current-dollar change in private inventories component of GDP. The former is the difference between two inventory stocks, each valued at its respective end-of-quarter prices. The latter is the change in the physical volume of inventories valued at average prices of the quarter. In addition, changes calculated from this table are at quarterly rates, whereas, the change in private inventories is stated at annual rates.
2. Quarterly totals at monthly rates. Final sales of domestic business equals final sales of domestic product less gross output of general government, gross value added of nonprofit institutions, compensation paid to domestic workers, and imputed rental of owner-occupied nonfarm housing. It includes a small amount of final sales by farm and by government enterprises.
Note. Estimates in this table are based on the North American Industry Classification System (NAICS).

| 28 | Private inventories to final sales | 2.51 | 2.74 | 2.52 | 2.51 | 2.43 |
| 29 | Nonfarm inventories to final sales | 2.34 | 2.55 | 2.35 | 2.34 | 2.26 |
| 30 | Nonfarm inventories to final sales of goods and structures | 4.06 | 4.18 | 3.91 | 3.89 | 3.73 |

## Legend / Footnotes:

1. Inventories are as of the end of the quarter. The quarter-to-quarter changes calculated from this table are at quarterly rates, whereas the change in private inventories component of GDP is stated at annual rates.
2. Quarterly totals at monthly rates. Final sales of domestic business equals final sales of domestic product less gross output of general government, gross value added of nonprofit institutions, compensation paid to domestic workers, and imputed rental of owner-occupied nonfarm housing. It includes a small amount of final sales by farm and by government enterprises.
Note. Estimates in this table are based on the North American Industry Classification System (NAICS).
Chained (2012) dollar inventory series are calculated to ensure that the chained (2012) dollar change in inventories for 2012 equals the current-dollar change in inventories for 2012 and that the average of the 2011 and 2012 end-of-year chain-weighted and fixed-weighted inventories are equal.

| 46 | Sales of imported new autos ${ }^{3}$ | 81.1 | 58.5 | 63.1 | 46.8 | 59.8 | 64.4 | 71.3 |

## Legend / Footnotes:

1. Consists of used light trucks only.
2. Consists of final sales and change in private inventories of new autos assembled in the United States.
3. Consists of sales of imported new autos in personal consumption expenditures, in private fixed investment, and in gross government investment.
Note. Chained (2012) dollar series are calculated as the product of the chain-type quantity index and the 2012 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

## Legend / Footnotes:

Note. Chained (2012) dollar series are calculated as the product of the chain-type quantity index and the 2012 current-dollar value of the corresponding series, divided by
100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive.

The residual line is the difference between the first line and the sum of the most detailed lines.

## Legend / Footnotes:

1. Beginning with 1947, includes receipts from the leasing of federally owned lands and mineral deposits. Beginning with 1960, includes interest receipts. Prior to 1960 , interest receipts are included in interest payments (line 20), which are shown net of interest receipts. Interest payments to persons and business includes interest accrued on the actuarial liabilities of defined benefit pension plans for federal government employees.
2. Prior to 1999, current transfer payments to the rest of the world are net of current transfer receipts from the rest of the world.
3. Prior to 1959, subsidies (line 23) and the current surplus of government enterprises (line 10) are not shown separately; subsidies are presented net of the current surplus of government enterprises.
4. Prior to 1960, government social benefits to the rest of the world (line 16) are included in line 19, 'other current transfer payments to the rest of the world.

# Improved Measures of Housing Services for the U.S. Economic Accounts 

By Dylan G. Rassier, Bettina H. Aten, Eric B. Figueroa, Solomon Kublashvili, Brian J. Smith, and Jack York

As part of the upcoming annual update of the National Income and Product Accounts (NIPAs) and subsequent revisions to the industry and regional accounts, the Bureau of Economic Analysis (BEA) is planning to implement improvements in source data and the methodology for annual current-dollar estimates of personal consumption expenditures (PCE) of housing services on tenant- and owner-occupied housing for the period 2002-2020. ${ }^{1}$ Annual PCE housing services in the accounts are currently estimated at the national level using multiple uncoordinated data sources. The national-level estimates are then allocated to states using the best available allocation factors. In addition, the current approach to estimating annual owner-occupied housing serviceswhich account for about 70 percent of total U.S. housing services-relies on a benchmark from 2001 and an extrapolation methodology for subsequent years.

PCE housing services are a large component of gross domestic product (GDP). In 2020, the current-dollar value of PCE housing services was $\$ 2.4$ trillion. That value was just over 25 percent of the PCE services component of GDP and just over 17 percent of total PCE. The value was about 10 percent of GDP. Thus, an accurate and reliable estimate of PCE housing services is important to the overall accuracy and reliability of the accounts.

The new methodology utilizes microdata on housing units from the American Community Survey (ACS), which is an annual survey that replaced the long-form decennial census questions on housing. The ACS data provide a single official statistical source that allows estimates to be made for individual housing units and then aggregated directly to state and national levels for all housing services series without the need for allocations to states. The ACS data also facilitate a more transparent stratified rental equivalence methodology for the owner-occupied series. In addition to improving the accuracy and reliability of BEA housing services measures, the changes provide a more streamlined integrated approach to estimating housing services across BEA's national and regional programs.

In addition to PCE housing services, the new methodology will affect estimates of rental income of persons because those estimates are in part derived from PCE housing services. The new methodology will not affect deflators for PCE housing services. BEA currently uses the Consumer Price Index (CPI) for rent to deflate tenant-occupied housing services and the CPI for owners' equivalent rent to deflate owner-occupied housing services. These CPIs from the Bureau of Labor Statistics (BLS) will also be used to deflate current-dollar values under the new methodology.

## Current Methodology

BEA currently estimates PCE housing services for two main tenure categories: owners and tenants. Each of these categories is further divided into subcategories for permanent site, mobile, farm, and nonfarm.

For benchmark and annual estimates at the national level, the current methodology for each tenure category relies on two main components: number of units and average annual rental value (AARV) per unit. These two components are multiplied to come up with an aggregate currentdollar rental value for tenant-occupied units or an aggregate current-dollar imputed rental value for owner-occupied units. Current-dollar values for tenant-occupied units and owner-occupied units are deflated using the CPI for rent and the CPI for owners' equivalent rent, respectively, from BLS.

To estimate current-dollar, nonfarm tenure categories, BEA data sources include the decennial census, Census Bureau's Housing Vacancy Survey, American Housing Survey and Residential Finance Survey, CPIs for rent and owners' equivalent rent, and BEA real-dollar stocks for owneroccupied structures. Current-dollar farm dwelling estimates generally come from the Economic Research Service (ERS) at the U.S. Department of Agriculture (USDA) using an estimation methodology consistent with BEA's current nonfarm methodology. At the national level, we focus here on the current methodology for nonfarm, permanent-site tenant- and owner-occupied units, which together comprise at least 95 percent of total measured PCE housing services in any given year during the period 2002-2020. We briefly summarize the methodology below; for additional details, see Mayerhauser and McBride (2007) or chapter 5 of the NIPA Handbook. ${ }^{2}$

## National-level tenant-occupied, nonfarm permanent-site housing services

Current-dollar PCE for tenant-occupied, nonfarm permanent-site housing services is currently estimated by BEA extrapolation of actual rents paid. The benchmark AARV for tenant-occupied housing is measured from actual net contract rent plus tenants' nonreimbursed expenditures for replacements, maintenance, and repairs. Net contract rent is calculated by subtracting utility expenses from gross contract rent. Benchmark data on tenant-occupied gross contract rent and number of units are provided by the decennial census. Benchmark data on utilities are estimated by BEA from the American Housing Survey and the Department of Energy's Residential Energy Consumption Survey.

Annual estimates for the AARV and number of units are extrapolated using indicators from the American Housing Survey for years the survey is available. For years the survey is not available, a midpoint indicator is derived, which is informed by the BLS CPI. For years past the most recently available American Housing Survey, CPI growth is used as an extrapolator for the AARV and the Housing Vacancy Survey is used as an extrapolator for the number of units. No quality adjustment is made for the annual extrapolations.

## National-level owner-occupied, nonfarm permanent-site housing services

Current-dollar PCE for owner-occupied, nonfarm permanent-site housing services is the largest component of total PCE housing services-just over 70 percent-and the AARV is currently an extrapolation of a 2001 benchmark value that was estimated with data from the Residential

Finance Survey and the American Housing Survey. The number of units is extrapolated using the Housing Vacancy Survey. The most recent benchmark for the AARV is 2001 because relevant data from the Residential Finance Survey program were discontinued.

To estimate the 2001 benchmark AARV, BEA used a rent-to-value approach, which assumed that owner-occupied units with similar values as tenant-occupied units also had similar rent-to-valueratios. Weighted average rent-to-value ratios by value class for tenant-occupied units from the Residential Finance Survey were applied to the midpoint market value of owner-occupied units within the corresponding value classes reported in the American Housing Survey. The imputed total rental value was then divided by the number of owner-occupied units reported in the American Housing Survey to calculate an AARV. The AARV was then multiplied by the number of owner-occupied, nonfarm permanent-site housing units reported in the decennial census to calculate aggregate current-dollar housing services.

To estimate the annual AARV, the 2001 benchmark AARV has used two extrapolators over time. For 2002-2007, the extrapolator was the percent change in average housing expenditures in the BLS Consumer Expenditure Survey. For 2008 forward, the extrapolator has been the product of the percent change in the BLS CPI for owners' equivalent rent and the percent change in the realdollar stocks of owner-occupied structures, of additions and alterations, and of major replacements using values from BEA's fixed assets accounts divided by the number of owneroccupied units (Mayerhauser and McBride 2007). The latter percent change is a quality adjustment that attempts to account for changes in the real value of housing per unit (Mayerhauser and McBride 2007). Without a quality adjustment in the extrapolation, current-dollar values would be less accurate because the CPI for owners' equivalent rent is a constant-quality (that is, qualityadjusted) price index. With a quality adjustment in the extrapolation, the CPI for owners' equivalent rent is the appropriate deflator for current-dollar values.

The number of units are benchmarked to the decennial census and have been extrapolated using the American Housing Survey for years the survey is available and the Housing Vacancy Survey for other years.

## State-level housing services

BEA currently estimates state-level PCE housing services for three categories of dwellings: tenant occupied, owner occupied, and farm. For each category, an indicator series is developed to allocate the corresponding national control to the state level.

The tenant indicator series uses a weighted sum of contract rent from the ACS Public Use Microdata Sample (PUMS). The rent is adjusted to remove expenditures on utilities. The owner indicator series is developed by applying ratios of owner-to-tenant housing rents to the tenant indicator series. ${ }^{3}$ The farm indicator series uses gross imputed rental values from ERS.

The new methodology for state-level PCE housing services will have impacts on other regional statistics. State-level rental income of persons and state-level GDP (real estate) will be affected by new national-level controls and changes to indicator series used to distribute the controls. Regional price parities (RPPs) will be affected by new expenditure weights as a result of changes to state-level PCE.

## New Methodology

The new methodology utilizes microdata for U.S. housing units from the annual ACS, which replaced the long-form decennial census questions on housing.

The ACS data have four advantages to improve the accuracy and reliability of BEA's housing services estimates. First, ACS is an official statistical source that has been vetted with BEA internal and external stakeholders as a viable alternative to measure housing services. Second, ACS is inclusive of all categories of housing (that is, owner, tenant, permanent site, mobile, farm, and nonfarm), so it provides a single statistical source that allows estimates to be made for individual housing units and then aggregated directly to national and state levels without the need for allocations to states. Third, ACS is a large nationally and regionally representative sample with regional information, so it can facilitate a fully integrated approach to estimating housing services across BEA's national and regional programs. Fourth, ACS supports a stratified rental equivalence methodology for imputed owner-occupied housing services, which is a transparent methodology that is favored by statistical agencies for practical purposes and is used by BLS to construct the CPI for owners' equivalent rent.

For 2005-2019, annual data are available in the ACS for each housing tenure category. Under the new methodology, current-dollar estimates are made at the unit level and then aggregated to national and state levels for 2005-2019. For 2002-2004, the Census Bureau's ACS sample was not fully implemented, so national estimates for those years are wedged between 2001 and 2005 using the Denton method. ${ }^{4}$ There are no revisions to national levels prior to 2002. The state distribution of housing estimates for 2001 is extrapolated backward to 1997 using state population growth rates. Likewise, the ACS PUMS for 2020 will not become available until the fall of 2021, so 2020 is extrapolated using a 3-year average growth rate at the national level with allocations to the subnational level. Quarterly and monthly estimates of housing services will be interpolated using the Denton method. No changes are expected for the NIPA current estimate methodologies.

For 2005-2019, current-dollar rental values for tenant units are sums of actual observations on tenant-occupied units. ${ }^{5}$ For the same period, current-dollar imputed rental values for owner units include two components: rental equivalence and an owner premium.

## Rental equivalence

Rental equivalence is the core of the new methodology for owner imputed rental values and is calculated from stratified averages of reported tenant rental values applied to owner-occupied units following Aten (2017) for each year and Public Use Microdata Area (PUMA). A PUMA is a Census Bureau statistical geographic area defined for the dissemination of PUMS data, including the ACS. PUMAs are built on census tracts and counties, contain at least 100,000 people, cover the entirety of the United States, and do not span more than one state. For each year and PUMA, the stratified rental equivalence for owner units starts by regressing tenant rental values, from which utilities have been excluded, on characteristics of tenant units reported in the ACS. The characteristics include structure type, number of rooms, number of bedrooms, and age of structure. ACS data on the same characteristics of owner units are then applied to the parameter estimates from the tenant regressions to calculate the rental equivalence value. These calculations are done at the unit level.

## Owner premium

An "owner premium" is suggested by economic research to adjust for quality differences between owner units and tenant units. ${ }^{6}$ The owner premium is especially important for high-valued homes that are not well represented in rental markets.

Like the rental equivalence component of the methodology, we calculate the owner premium at the unit level using data from the ACS. The owner premium is calculated for each owner-occupied unit as follows:
$\beta=$ value of the owner-occupied unit $\div$ median value of owner-occupied units in the same
stratum. $^{7}$

A stratum in this case includes the PUMA, structure type, and number of bedrooms. The beta ratio is then multiplied by the rental equivalence value to calculate the imputed rental value for each owner-occupied unit. The betas are constrained to be at least one so that the owner imputed rental values are the maxima of rental equivalence and rental equivalence times beta. ${ }^{8}$ Betas above 10 are considered anomalous and top coded.

At the national level for 2005-2019, the owner premium increases the aggregate imputed rental value of owner-occupied units by 35 to 40 percent of the rental equivalence value in a given year.

## Owner-reported values versus market values for the owner premium

Owner-occupied house values in the ACS are self-reported based on owner understanding of the value rather than a professional assessment or market transaction. ${ }^{9}$ Under the new methodology, the stratified rental equivalence component does not depend on the owner-reported value. However, the owner premium component does depend on the owner-reported value, which may differ from actual market values. ${ }^{10}$ If the owner-reported value for a given housing unit reflects a deviation similar to the stratum to which it belongs, then the ratio of owner-reported value to stratified median owner-reported value should mitigate the effects of the deviation.

To assess the extent to which owner-reported values make a difference in the beta ratio, BEA has matched reported values from Census internal ACS microdata to their corresponding sale prices from market transactions using "big data" from Zillow's Transaction and Assessment Dataset. This research exercise matched individual home values reported by ACS households (2008-2015) to sale prices reported in Zillow transactions for recent (within 2 years) sales on an address level for single-family homes. The linked data allow for a true apples-to-apples comparison by calculating the beta ratio for both owner-reported values and recent market values using the same observational unit in the ACS. These micro-observations were then aggregated to the state level and betas were calculated as a ratio of disclosure-adjusted mean to median for single-family homes with three or more bedrooms, the largest subset of housing unit categories. ${ }^{11}$ The betas were calculated separately according to the Zillow data and the ACS data, respectively, for the same set of homes.

Overall, betas calculated with owner-reported values in the ACS data are generally robust to betas calculated with market values using the corresponding observations in the Zillow data. Chart 1 presents a scatter plot to compare beta ratios calculated from the linked ACS-Zillow data for 24 states from 2008 to 2015 for three or more bedroom single-family homes. ${ }^{12}$ Observations on the 45 -degree line indicate an equality for the summary betas in a given state and year. Despite volatile fluctuations in the housing market during this particular sample period, chart 1 illustrates a high
degree of beta comparability across datasets, suggesting that the owner-reported values used to construct the owner premium produce very similar betas at the state level as the corresponding market transactions would in this sample. ${ }^{13}$

Chart 1. Comparison of Betas from Zillow and ACS for Single-Family Homes with Three or More Bedrooms, 2008-2015

Note. Each observation is a state-year combination. American Community Survey beta is the ratio of disclosure-adjusted mean to median for single family residences with three or more bedrooms. Zillow beta is the ratio of disclosure-adjusted mean to median for single family residences with three or more bedrooms using the same linked observations from the corresponding ACS data.
U.S. Bureau of Economic Analysis

## Mobile units, vacant units, and farm units

In addition to the data and methodology changes for PCE services of tenant- and owner-occupied, nonfarm permanent-site units, the ACS data and new methodology will be used to estimate PCE housing services for mobile units, vacant units, and farm units. These three tenure categories also required additional considerations.

## Mobile units

BEA's estimates of PCE housing services currently include mobile housing units such as manufactured trailer houses and exclude mobile housing units such as houseboats and recreational vehicles (RVs). The System of National Accounts 2008 (SNA 2008) (para. 6.114 (c) and 10.68) recommends that houseboats and RVs used as principal residences be included in the scope of imputed services for dwellings, and the ACS separately identifies the different types of mobile units. Thus, the new methodology expands the scope to include all mobile housing units that are used as principal residences. The category of houseboats and RVs that has been added accounts for about 0.1 percent of all ACS housing units.

## Vacant units

BEA's estimates of PCE housing services currently include some categories of vacant units based on the Housing Vacancy Survey. In the NIPAs, vacant units are classified either as owner occupied at 100 percent of the imputed value of services or as tenant occupied at 50 percent of the imputed
value of services. One category of vacant units for which BEA does not currently estimate housing services is units that are either "for sale" or "for rent" when the survey is administered. The SNA 2008 does not give specific guidance for categories of vacant units, but the European Union regulations for national accounts do specify that service values should be imputed for housing units that are "sold but not occupied" or "rented but not occupied," with no adjustment made for intensity of use. Neither source is clear what time span should apply to vacant units. Vacant units are identifiable in the ACS under some of the same categories as the Housing Vacancy Survey, including "for sale" and "for rent" units.

The new methodology expands the scope of vacant units to include "for sale" and "for rent" units because the ACS data are proposed for annual estimates, which is a lengthy time span. In addition, imputed rental values for vacant units will be included with owner imputed rents since there are no tenants and the imputed rental values are estimated with the rental equivalence methodology. Finally, the owner imputed rents on vacant units will not include the owner premium, because information on housing values that is required for the owner premium is not available for all categories of vacant units.

## Farm units

BEA measures of PCE housing services for farm units are currently estimated by ERS at USDA. For owner-occupied units, ERS multiplies rent-to-value ratios from the 2001 Residential Finance Survey by values reported for individual farm dwellings in the Agricultural Resource Management Survey. These calculations are done at the unit level and then aggregated. There are two dimensions to ERS farm dwellings that are important to understand BEA's current treatment and new treatment under ACS:

1. Identification. ERS generally identifies farms using one of two criteria: 1) agricultural sales greater than $\$ 1,000$ or 2 ) points based on the availability of crops and animals for sale (even if no sale takes place). The latter set is referred to as "point" farms. Farms can be identified in the ACS using the first criterion but not the second criterion.
2. Classification. ERS classifications include tenure (that is, owner and tenant), type of dwelling (that is, operator dwelling and other dwelling), and type of operation (that is, farm operators, landlord operators, and nonoperator landlords). ERS farm operator dwellings are akin to farm owner-occupied dwellings identified in the ACS. No distinction is possible in the ACS for landlord operators and nonoperator landlords. BEA currently publishes rental income estimates with separate line items for farm operators, operator landlords, and nonoperator landlords.

The new methodology limits the scope of farm housing to units identified in the ACS with agricultural sales greater than $\$ 1,000$. Point farms will be left out of farm and included instead in nonfarm. In addition, separate series will be estimated for tenant- and owner-occupied farm units, and the distinction between operator landlords and nonoperator landlords will be eliminated.

## Impacts on BEA's Estimates of Housing Services

The new methodology will impact annual estimates, quarterly estimates, monthly estimates, current-dollar values, and real values for 2002-2020. There will be no impact on prices. In addition, any changes in patterns will not be big enough to generate any changes in the business cycle. Table 1 summarizes the series that will be affected.

Table 1. Summary Impacts in the Accounts

|  | Annual | Quarterly | Monthly | Current-dollar values | Real values |
| :---: | :---: | :---: | :---: | :---: | :---: |
| National Income and Product Accounts |  |  |  |  |  |
| PCE | X | X | X | X | X |
| Rental income of persons | X | X | X | X |  |
| Housing proprietors' income | X | X | X | X |  |
| Housing corporate profits | X | X |  | X |  |
| Operating surplus | X | X |  | X |  |
| GDP | X | X |  | X | X |
| GDI | X | X |  | X |  |
| Personal income | X | X | X | X |  |
| Disposable personal income | X | X | X | X |  |
| Industry Accounts (Real Estate) |  |  |  |  |  |
| Output | X | X |  | X | X |
| Value-added | X | X |  | X | X |
| Operating surplus | X | X |  | X | X |
| Regional Accounts |  |  |  |  |  |
| PCE by state | X |  |  | X |  |
| Rental income of persons by state | X | X |  | X |  |
| GDP by state (real estate) | X | X |  | X | X |
| Regional price parities | X |  |  |  |  |

In the NIPAs, PCE housing services estimates will be directly affected by the new methodology. National rental income of persons will also be affected because rental income of persons is calculated by subtracting consumption of fixed capital and housing expenditures such as mortgage interest and property insurance from PCE housing services. Personal income and disposable personal income will also be affected to the extent of the effect on rental income of persons. Housing proprietors' income and corporate profits in NIPA table 7.4 .5 will both be affected by the new methodology for tenant rents.

In the industry accounts, real estate industry output estimates will be directly affected by the new methodology. Real estate industry value added and operating surplus will also be affected by the new output measure; however, there will be no changes to intermediate consumption, compensation, or taxes less subsidies as a result of the new methodology. Changes to rental income of persons and to proprietors' income and corporate profits from tenant rents will affect real estate industry gross operating surplus.

In the regional accounts, state-level PCE housing services will be directly affected by the new methodology. In addition, state-level rental income of persons and state-level GDP (real estate) will be affected by new national-level controls and changes to indicator series used to distribute the controls. RPPs will be affected by new expenditure weights as a result of changes to state-level PCE.

The panels in chart 2 summarize annual current-dollar national levels of PCE housing services by tenure category for 2001-2019. Currently published estimates are shown in dark blue and estimates under the new methodology are shown as ranges in light blue. Panel A presents series for the total U.S. economy, which shows that current-dollar estimates under the new methodology exceed current-dollar estimates under the current methodology for the period 2007-2014. The two series diverge after 2014. Positive revisions in levels over the period 2001-2019 are as high as almost $\$ 45$ billion—or 2.7 percent of published PCE housing services levels ( 0.3 percent of GDP)— in 2010, and negative revisions in levels over the period are as high as almost $\$ 110$ billion-or 4.6 percent of published PCE housing services levels ( 0.5 percent of GDP) -in 2019. Panels B and C present series for owner-occupied nonfarm units and tenant-occupied nonfarm units, respectively, and demonstrate that the divergence in panel A after 2014 is explained primarily by differences in the tenant-occupied nonfarm series, which accounts for almost 78 percent of the single-year highest revision over the period 2001-2019. Under BEA's current source data and methodology, a 12.3 percent increase in published current-dollar tenant-occupied nonfarm PCE housing services from 2014 to 2015 is explained by increases in both number of units and the AARV, but a similar increase is not supported by the ACS data. ${ }^{14}$ Panel D presents series for farm units, which demonstrate similar patterns over time, but the series under the new methodology is smoother around the housing bubble.

## Chart 2. Annual Current-Dollar National Levels of Personal Consumption Expenditures Housing Services, 2001-2019

[Billions of dollars]

Charts 3 and 4 summarize annual estimates by state for 2019 . Chart 3 presents current-dollar state levels of PCE housing services, which shows the highest levels of PCE housing services in California, Texas, Florida, and New York and the lowest levels in North Dakota, South Dakota, Montana, and Wyoming. Chart 4 presents percent revision to the current-dollar state levels of PCE housing services. The largest upward revisions are in South Carolina, Florida, Maine, and Alabama, and the largest downward revisions are in Connecticut, Maryland, New Jersey, and California.

Chart 3. Current-Dollar State Levels of Personal Consumption Expenditures Housing Services, 2019

Annual estimates by state

U.S. Bureau of Economic Analysis

Chart 4. Percent Revision to State Personal Consumption Expenditures Housing Services, 2019

Annual estimates by state

U.S. Bureau of Economic Analysis

1. In addition to the improvements for 2002-2020, state data will be revised for 1997-2001 to better reflect the new estimates.
2. The NIPA Handbook is available on BEA's website.
3. The ratios are developed to estimate rents expenditure weights for BEA's regional price parities (RPPs), which measure regional price levels. To learn more about the RPPs, see the BEA website.
4. For more information on the development stages of the ACS, see the Census Bureau website.
5. If utilities are included in the contract rent, an estimate of the utility cost for the unit is subtracted.
6. Economic research suggestive of an owner premium is summarized in Aten and Heston (2020). Glaeser and Gyourko (2009) find that in 20 European Union countries and the United States, the average income for owners is at least 30 percent higher than for renters. Glaeser and Gyourko (2018) further cite that costs per square foot of constructing average-quality and luxury-quality housing in the United States are about 25 percent and 90 percent, respectively, higher than constructing economy-quality housing. The owner premium assumes tenants commonly rent in buildings that are of lower quality, in part because of their lower incomes. Heston and Nakamura (2009) provide empirical evidence that contract rents for several locations in the United States understate the flow of imputed rental services, and the idea is further developed in Aten (2018). Katz (2017) provides a discussion of the current homeowner rental imputation of BEA and develops an alternative approach that implies a homeowner premium of over 30 percent. Surveys show that in the United States and elsewhere, the rent-to-value ratio declines with the value of dwellings (Davis and others 2008). In addition, Aten (2017) shows that the rent-to-value ratios for all owneroccupied homes in the United States decline with size. The decline of the rent-to-value ratio is often accepted as a regularity without question as to why it should exist. This collective research suggests that lower rent-to-value ratios for more expensive housing partly reflect omitted variables that are very important in the case of housing, such as the number of bathrooms and size of the lot. In addition to the research summarized here, the System of National Accounts 2008 explains the measure of output of owner-occupied housing services is valued at the estimated rental value that a tenant would pay for the same accommodation, adjusting for factors such as location, neighborhood amenities, size, and quality of the dwelling.
7. Home values are generally skewed, with a few very large values, so the median is generally preferred as a measure of central tendency. The median value is also published by the Census Bureau, so that the values for each PUMA can be checked against publicly available data.
8. Diewert and others (2009) and Diewert(2009) have advocated for an opportunity cost approach, which indirectly avoids imputed values that are lower than rental equivalent values, and our owner premium adjustment is in the same spirit. Under the opportunity cost approach, the measure of owner-occupied imputed housing services is the greater of rents and user costs. In our owner premium approach, the measure of owner-occupied imputed housing services is the greater of rents and rents times the owner premium.
9. The ACS question is as follows: "About how much do you think this house and lot, apartment, or mobile home (and lot, if owned) would sell for if it were for sale?"
10. For research on differences between owner-reported values and actual market values, see Goodman and Ittner (1992), Chan, Dastrup, and Ellen (2016), Kiel and Zabel (1999), Ihlanfeldt and Martinez-Vazquez (1986), van der Cruijsen and others (2014), and Benítez-Silva and others (2016).
11. In order to satisfy Census disclosure criteria, the beta calculated from the linked ACS-Zillow data is interpolated using 11 values. Additionally, the underlying means and medians, as well as betas, have been rounded according to Census disclosure rules. These adjustments have had a minimal effect on the point estimates.
12. The presentation of results is limited due to limitations in the consistent availability of sale prices in the Zillow data for some states (for example, many states do not require public disclosure of sale prices) and restrictions on sample size for disclosure. Analysis was also conducted on other structure types and strata, but linked records for a number of other structure types are either not reliable enough or plentiful enough to pass Census's disclosure review to ensure the integrity of the internal data.
13. Any conclusions expressed herein are those of the authors and do not necessarily represent the views of the U.S. Census Bureau. All results are approved for release by the U.S. Census Bureau, authorization number CBDRB-FY20409. Further, the results and opinions are those of the author(s) and do not reflect the position of Zillow Group.
14. Recall BEA uses the American Housing Survey to extrapolate the annual number of units and the AARV for tenantoccupied nonfarm units. In 2015, changes in sample design and weighting methodology were introduced to the American Housing Survey, which may have made some data incomparable to previous years and, thus, impacted the indicator for extrapolation.

## Acknowledgments

The work summarized in this article was made possible with contributions from a number people in BEA's Regional Economic Accounts directorate, National Economic Accounts directorate, and Office of the Chief Economist. The core implementation team included Bettina Aten, Eric Figueroa, Solomon Kublashvili, Dylan Rassier, Brian Smith, and Jack York.

Prior to implementation, a BEA housing working group gave invaluable input into the research necessary for implementation. The working group included Bettina Aten, Christian Awuku-Budu, Ledia Guci, Sarah Osborne, Dylan Rassier, Casey Ross, Brian Smith, Rebekah Todd, Dirk van Duym, and Scott Wentland.
The following individuals also gave important input into implementation: Melissa Braybrooks, James Choy, Marina Gindelsky, Tom Howells, Arnold Katz, Bob Kornfeld, Jennifer Lee, Carrie Litkowski, Lisa Ninomiya, Mauricio Ortiz, Joel Platt, Erich Strassner, Dave Wasshausen, Cliff Woodruff, Marcelo Yoon, Dan Yorgason, Jeff Young, Steve Zemanek, and members of BEA's National Accounts Methods Board. In addition, Marina Gindelsky and Scott Wentland provided useful analysis using linked data from the ACS and the Zillow Group.

Finally, comments from Katherine Abraham, Joel Prakken, Dan Sichel, and other members of BEA's Advisory Committee and contributions from the following presenters and discussants at two previous BEA Advisory Committee meetings (May 2018 and November 2019) on housing services were essential in laying a foundation for implementation: Bettina Aten, Robert Cage, David Johnson, Dale Jorgenson, André Loranger, Raven Malloy, Dylan Rassier, Marshall Reinsdorf, Erich Strassner, Randal Verbrugge, Susan Wachter, Dave Wasshausen, and Scott Wentland.

Chronicling 100 Years of the U.S: Economy

## Estimating GDP for the U.S. Territories

By Sabrina L. Montes and Aya Hamano

In 2010, the Bureau of Economic Analysis (BEA) published the first of what would become once-a-year articles in the Survey of Current Business describing gross domestic product (GDP) of American Samoa, Guam, the Commonwealth of the Northern Mariana Islands (CNMI), and the U.S. Virgin Islands (USVI). The island area GDP estimates were developed under the Statistical Improvement Program funded by the Office of Insular Affairs (OIA) of the U.S. Department of the Interior. The work continues as a project annually funded by OIA. Note that BEA's GDP statistics for Puerto Rico have been developed separately; this work is described in "BEA's Puerto Rico GDP Estimate Is on a Different Track."

The limited availability of routinely produced economic data for the territories (relative to the United States as a whole and the 50 states) means that the territories data are produced only on an annual frequency and typically lag the current period by about a year. Because of this, BEA is sometimes asked the question: what is the value of these statistics?

GDP is a comprehensive time-series measure of economic activity for a territory, specifically, of the value of the goods and services produced within its borders. It is clear that the lag in the data can make it challenging to use territorial GDP statistics for near-term tactical policy decisions without supplementing them with real-time observations and more frequent and targeted economic indicators, if they are available. Nonetheless, the territorial GDP statistics provide critical data for understanding the structure and performance of a territory's economy over time. In this strategic context, they inform territorial government decisionmakers exploring economic development opportunities, private sector investors, and federal government decisionmakers, such as OIA, the Government Accountability Office, the Federal Emergency Management Agency, and the U.S. Economic Development Administration.

## BEA's Puerto Rico GDP Estimate Is on a Different Track

For over a decade, BEA has provided technical assistance to and worked collaboratively with the Commonwealth of Puerto Rico, the largest of the U.S. territories. Puerto Rico is not within OIA's responsibilities. ${ }^{1}$ Thus, estimating Puerto Rico GDP was not part of the OIA-funded Statistical Improvement Program project to produce island area GDP estimates at BEA.

The 2015 Puerto Rico debt crisis and the September 2017 hurricanes Irma and Maria caused widespread hardship and then physical devastation on the island. These economic catastrophes highlighted the pressing need for more modern Puerto Rico GDP statistics to facilitate recovery efforts. BEA received funding, via a reprogramming, to initiate work on Puerto Rico GDP statistics in late calendar year 2018. Beginning in fiscal year 2020, BEA's appropriations have included funding to estimate Puerto Rico GDP.

BEA published components of Puerto Rico GDP in 2019 and prototype Puerto Rico GDP in 2020. In 2021, BEA plans to finalize methodology and begin publishing Puerto Rico GDP as an annual BEA data product.

1. According to the Congressional Research Service, President Kennedy transferred responsibility for federal relations with Puerto Rico from the U.S. Interior Department's Office of Territorial Affairs (now Insular Affairs) to the Executive Office of the President in July 1961. For more information, see R. Sam Garrett, "Puerto Rico's Political Status and the 2012 Plebiscite: Background and Key Questions," Congressional Research Service, CRS Report R42765, 2013.

Estimating GDP for American Samoa, Guam, the CNMI, and the USVI has unique challenges and opportunities. These are described below. We conclude with a short discussion of next steps for this joint project.

## Unique Challenges and Opportunities of Estimating Territorial GDP

BEA estimates territorial GDP using an expenditure approach, which is the approach that BEA uses for its featured measure of quarterly national GDP. The expenditure approach estimates GDP as the sum of goods and services sold to final users. The methods used for the nation are adapted for each territory based on the availability of source data in that territory.

To estimate territorial GDP, BEA estimates the components of current-dollar GDP: personal consumption expenditures (that is, consumer spending), private fixed investment and change in private inventories (that is, business investment), government spending, and net exports of goods and services (that is, exports less imports). Then, BEA adjusts for inflation to produce estimates of real GDP. While this is the same basic method that BEA uses to estimate national GDP, it is different from the methodology BEA uses to estimate GDP by state. Due to current data limitations, it is not possible at this time to estimate territorial GDP using the GDP by state methods. ${ }^{1}$

It would not be feasible for BEA to produce these estimates without the collaboration of the territorial governments, because the territories are excluded from most federal surveys. Data are typically sourced from the administrative and survey data from each territory. In this context, it is important to keep in mind that these four territories are small. The combined populations of these four territories is less than the population of the least populated U.S. state (Wyoming). Just as any U.S. city or state would only collect the highest priority economic statistics that resources allow, these four U.S. territories typically have limited economic data collection programs. BEA uses the available data from these programs and, more often than not, relies on a variety of administrative data that is available as a by-product of territorial government functions, like
issuing building permits, collecting taxes, or producing routine municipal financial statements. Because of the limited availability of economic data, BEA staff regularly explore alternative data, which sometimes are useful in validating available economic statistics. For example, satellite imagery has been useful in corroborating data on electricity usage and construction activity.

The lack of standardized data sets means it is not possible to use identical methods across all territories. In addition to each territory having a unique economic structure, each territory has different economic and administrative data available. BEA's methodology is therefore specific to that territory.

While each of these territories is unique, there are certain important commonalities across these economies that add to the challenges associated with estimating territorial GDP.

- American Samoa, Guam, the CNMI, and the USVI are all small island economies. Tradeincluding shipments between each territory and the rest of the United States, as well as foreign trade-has a big impact on each island's economy.
- They are nondiversified economies, often reliant on a few industries. - Government has a large share of the economic activity in each of these territories.
- Tourism is a significant economic activity in three out of four of these territories.
- Key industries in these territories are dominated by multinational or stateside enterprises, such as the following:
- Tuna canning in American Samoa
- Garment manufacturing and then casino gambling in the CNMI
- Petroleum refining and storage in the USVI
- Each of the four territories has faced catastrophic damage from natural disasters since BEA began estimating territorial GDP in 2009. Examples include the following:
- Typhoon Mangkhut in 2008 in Guam that led to a federal disaster declaration.
- A tsunami in 2009 in American Samoa that resulted in the deaths of over 30 people.
- Hurricanes Irma and Maria in 2017 in the USVI, which caused widespread devastation.
- Super Typhoon Yutu in 2018 in the CNMI, which was one of the strongest tropical storms ever to strike any part of the United States.
- Federal government funds, such as grants, transfer payments, and loans, are an important factor in the economies of these four territories. These funds include federal aid supporting the territories following a natural disaster. In Guam, the Department of Defense also has a large physical presence.

BEA's territorial GDP estimates, including its by-industry breakdowns of GDP, enable the development of a long-term, strategic understanding of the structure of these four territories' economies. BEA's territorial GDP estimates can be compared with each other and with BEA's national, state, regional, and local-area estimates. BEA's estimates are also internationally comparable, enabling comparisons with island nations in the Caribbean and the Pacific.

## Next Steps: Targeted Efforts at Data Improvement

BEA is contributing insights from over a decade of estimating territorial GDP to OIA's efforts to identify statistical improvement opportunities. Advances that support the development of high quality, more timely economic indicators for territorial decisionmakers will also improve the data used in the GDP estimates.

Pages from the first Survey article on the GDP for the U.S. territories of American Samoa, Guam, the CNMI, and the USVI.

For more on the initial estimates of GDP for the U.S. territories of American Samoa, Guam, the CNMI, and the USVI, see the first Survey article on the topic, which was published in September 2010. The next installment in this series will be published later this year.

1. The methodology used to estimate GDP by state is a two-step process that requires first estimating the income components of GDP (that is, compensation of employees, taxes on production and imports less subsidies, and gross operating surplus) and then scaling these components to national totals that are derived using more comprehensive data for the nation. Because the territories are not included in most of the state- or national-level data sources, the first step is problematic, and the second step is not possible at this time.

# The National Accounts and GDP: Commemorating 75 Years of Continual Innovation 

By Kristina Maze

In 2010, U.S. Department of Commerce leadership joined Bureau of Economic Analysis (BEA) staff in commemorating the $75^{\text {th }}$ anniversary of the National Economic Accounts and gross domestic product (GDP).

The celebration coincided with BEA's annual awards ceremony. Out of the 87 Bureau employees receiving awards in 2010, 25 were recognized with gold, silver, and bronze medals for their work specifically related to GDP and the National Income and Product Accounts (NIPAs). ${ }^{1}$ Among their accomplishments, these BEA staff:

- Developed measures of economic activity for the U.S. territories of American Samoa, the Commonwealth of the Northern Mariana Islands, Guam, and the U.S. Virgin Islands.
- Developed a new, high-performance central processing system and analysis tools for GDP. The technologies improved calculations and the speed at which statistics were delivered.
- Accelerated the release of GDP by metropolitan area economic statistics by a full year.
- Expanded statistics on the use of energy, materials, and purchased services by industry to examine the role of offshore outsourcing, growth, productivity, and its implications for U.S. GDP.
- Reviewed, wrote, and presented GDP briefings and NIPA tables to better inform data users.
- Used newly available NIPA construction types to develop nonresidential structures statistics for 1901-2009.
- Converted pension systems' publicly available data to measures consistent with national income accounting.

Department of Commerce Secretary Gary Locke remarked on the innovations by saying, "The national accounts have been evolving since their inception-from the time of the Great Depression right up to today. Bureau of Economic Analysis employees continue to find ways to meet the changing needs of the businesses and the American people who depend on your work."

Acting Deputy Secretary and the Under Secretary for Economic Affairs Rebecca M. Blank concurred, noting statistical progress made in 2010 was "simply a continuation of the work on the national income and product accounts that began 75 years ago in the Department of Commerce."

Eleven years later, innovations and expansions continue. Comprehensive NIPA revisions were released in 2014 and 2019; quarterly GDP by industry was introduced in 2014; the GDP by county prototype was published in 2019; and in 2020, BEA finalized its methodology to produce GDP data for Puerto Rico.

This 2010 Survey article reprint of the national accounts and GDP milestone anniversary highlights the account's inception, importance during American crises, and global impact. Also included is a $75^{\text {th }}$ anniversary graphic published in the BEA 2010 awards ceremony program: "National Accounts \& Gross Domestic Product: 75 Years of Responding to Policy Needs and Changes in the Economy."

# Innovation Leads to More Granular Gross Domestic Product Data 

By Mariam Tekle-Haimanot | Volume 101, Number 5 | May 20, 2021
In December 2018, in response to demand for more detailed economic data on U.S. counties, the Bureau of Economic Analysis (BEA) released prototype gross domestic product (GDP) by county data. Prior to this release, the only county-level statistics produced by BEA were personal income and its components. Official statistics of GDP by county, covering the nation's 3,113 counties and county equivalents, were released a year later, in December 2019.

As stated in a Survey of Current Business article ${ }^{1}$ on GDP by county:
"Previous substate GDP statistics released by BEA relied solely on county earnings data-the sum of compensation of employees and proprietors' income-from BEA county personal income estimates to geographically distribute state GDP.

Earnings-based GDP estimates capture the labor portion of production well, but their reliability decreases when estimating capital-intensive industries. The GDP by county prototype statistics were the first of their kind to incorporate additional data sources that capture trends in capital, business receipts, and value of production along with BEA county earnings data. Therefore, they provided a more complete image of capital-intensive industries.

Building upon the prototype statistics, the new official GDP by county statistics incorporate new and additional source data and improved methodology. The official statistics also significantly extend the time series and the industry detail."

Cover and images from the March 2019 Survey article, "Research Spotlight: New County-Level Gross Domestic Product."

GDP by county data are used by policymakers, businesses, and researchers who strive to understand fluctuations in their respective local economies, to understand which industries are driving the various counties' economies, and to gauge their counties' economic trends over time. These statistics are released annually by BEA's Regional Directorate.

We hope you enjoy this reprint of the March 2019 article, "Research Spotlight: New County-Level Gross Domestic Product," which thoroughly describes this relatively recent innovation to BEA's economic statistics.

1. See Kirubel D. Aysheshim, Jacob R. Hinson, and Sharon D. Panek, "A Primer on Local Area Gross Domestic Product Methodology: First Official Release of Gross Domestic Product by County, 2001-2018," Survey of Current Business 100 (March 2020).

## Chronicling 100 Years of the

 U.S. Economy
## Top Influencers

The Bureau of Economic Analysis (BEA) and its journal, the Survey of Current Business, are respected sources of data on the health of our national economy due in large part to the individuals who influenced BEA and its predecessor agencies over the past century. From economic theory to the mechanics of producing reliable statistics, their contributions helped make BEA and its accounts the reliable, authoritative sources of economic data they are today. The Survey has chronicled the evolution of BEA's output for almost a century.

As we celebrate the centennial of the Survey, some of these top influencers will be profiled on the centennial website. This month, we present economist John Kendrick.

## John Kendrick <br> Leader in Productivity Measurement and Economic Accounting

By Erin Whitaker

The contributions of John W. Kendrick to economic theory, particularly the study of productivity, provided a framework for understanding the national accounts. His work with the U.S. Office of Business Economics, the predecessor agency to the Bureau of Economic Analysis (BEA), presented (along with George Jaszi) the first estimates of gross national product (GNP) in constant dollars based on price deflation. ${ }^{1}$ His continued work as the Chief Economist for the Department of Commerce and as an academic influenced further development and enhancement of BEA statistics.

Kendrick was born in Brooklyn, NY, and grew up in North Carolina, where his father taught at what is now the University of North Carolina (UNC) at Greensboro. He also pursued advanced research, earning both an undergraduate degree in history and a master's degree in economics from UNC Chapel Hill by 1939. He briefly worked in academia at the University of Georgia ${ }^{2}$ before turning to government and military service, first in Washington on the National Resources Planning Board in 1941 and then with the U.S. Army Air Forces from 1943 to 1945. He then spent a year with the U.S. Bombing Survey in Europe, before returning to Washington in 1946 to join the U.S. Office of Business Economics.

His career in government statistics included the aforementioned estimate of GNP in constant dollars and a paper with Carl Jones that measured "composite productivity" in farming that related the growth of an output to the combination of labor inputs, capital assets, and land. ${ }^{3}$ This paper, one of the first uses of a measure of total factor productivity, ${ }^{4}$ was referenced in the 1953
annual report of the National Bureau of Economic Research (NBER), where Kendrick would serve as a senior researcher until 1977. He would also further develop the concept of total factor productivity as a doctoral candidate at George Washington University, where he received his degree in 1955. Kendrick expanded on this research at NBER and released his first major work, with Maude Peck, Productivity Trends in the United States, in 1961. Then director of research of NBER Simon Fabricant considered this work "the most comprehensive survey of productivity trends in the United States ever made. ${ }^{5}$ He went on to author several additional volumes, most notably The Formation and Stocks of Total Capital in 1976, which expanded the concept of tangible investment as well as intangible investment. This would eventually serve as a guide for the expansion of BEA's Research and Development Satellite Account ${ }^{6}$ as well as household production in the national accounts. ${ }^{7}$ Along with the influence of his research, he again supported BEA and the Commerce Department as a whole, serving as Chief Economist from 1976-1977.

Kendrick's research and academic work would eventually include 12 volumes on economics and productivity, including a popular textbook. He also wrote the Encyclopedia Britannica article on productivity! ${ }^{8}$ He served as a professor of economics at George Washington University from 1955 until his retirement in 1998 and influenced many BEA researchers, particularly former BEA director Carol S. Carson. He supervised her dissertation "The History of the United States Income and Product Accounts: The Development of an Analytical Tool." ${ }^{9}$

Kendrick passed away on November 17, 2009, at the age of 92, after a distinguished career of public service and many contributions to BEA's economic accounts. His publications are often referenced in the Survey of Current Business. For more on John Kendrick, see an "An Appreciation: John W. Kendrick (1917-2009)" in the February 2010 Survey.

# A New Understanding of Small Businesses Wages and Gross Output by Industry and Legal Form of Organization Using Firm Receipts to Classify Business Size, 1998-2003 

## by Tina Highfill, Richard Cao, Annabel Jouard, and Richard Prisinzano (University of Pennsylvania)

There is no universal definition for "small business." While number of employees is a popular metric, many small business statistics also use revenue, income, assets, or a combination of these characteristics to classify businesses by size (U.S. Census Bureau 2020; Organisation for Economic Co-operation and Development (OECD) 2018; Bandhiri and others 2019). In this paper, we use Internal Revenue Service (IRS) data categorized by firm-level receipts to estimate wages and gross output by business size, industry, and legal form of organization for 19982003. These statistics provide an alternative for understanding small business statistics compared to the Bureau of Economic Analysis (BEA) previous estimates of wages and gross output that use enterprise-level employment to classify business sizes ${ }^{1}$ (Highfill and Strassner 2017; Highfill and others 2020). Our break out of estimates by legal form of organization, including corporations, partnerships, and sole proprietors, provides an additional layer of detail to better understand the composition of small businesses.

In this paper, we define small businesses as firms with less than $\$ 10$ million in receipts. We find most gross output and wages for small firms in 2003 were generated by corporations (64 percent of gross output and 71 percent of wages), followed by sole proprietorships ( 23 percent of gross output and 17 percent of wages), then partnerships (13 percent of gross output and 12 percent of wages). Gross output and wages for medium firms (between $\$ 10$ million and $\$ 50$ million in receipts) and large firms ( $\$ 50$ million and greater in receipts) were dominated by corporations and partnerships, with very little representation from sole proprietorships in any industry for 1998-2003. We also find using firm-level receipts to classify business size shows similar overall results to BEA's previous estimates of wages and gross output that used number of employees in an enterprise to classify business size (Highfill and Strassner 2017). Using both a receipts-based and employment-based definition to classify businesses by size, we find small businesses generated around 30 percent of private wages and gross output in 2002, while large businesses generated around 60 percent.

The following section provides a brief overview of the data and methods used in this report. Next, we summarize our estimates of 1998-2003 wages and gross output by business size, industry, and legal form. We then compare these results to BEA's previous estimates of 2002
wages and gross output by industry and business size that used employment-based size classifications. The final section provides additional context to our results and describes possibilities for future research. The full suite of our 1998-2003 estimates by size, industry, and legal form are available on BEA's small business website.

## Methodology

The main data source used in this paper is Statistics of Income (SOI) Integrated Business Data from IRS (IRS 2007). The "Table 2: Selected financial data on businesses" SOI data represent weighted estimates of various U.S. federal tax values aggregated by legal form, industry sector, and size of business receipts for 1998-2003. Data categorized by business size are only publicly available for this 6-year period. (See "Integrated business data, 2003" by Luttrell, Treubert, and Parisi (2006) for a detailed analysis of these data.) We use the variables "total receipts," "costs of goods sold," and "salaries and wages" for our analysis. Although the SOI data are broken into 10 size ranges based on size of business receipts, we collapse the smallest 3 ranges (receipts less than $\$ 25,000, \$ 25,000-\$ 99,999$, and $\$ 100,000-\$ 249,999$ ) into a single category (receipts less than $\$ 250,000$ ) because of the negligible and sometimes negative values that are common in these smallest size classes. The resulting eight size classes are firms with receipts less than $\$ 250,000, \$ 250,000-\$ 499,999, \$ 500,000-\$ 999,999, \$ 1$ million $-\$ 2.49$ million, $\$ 2.5$ million- $\$ 4.9$ million, $\$ 5$ million- $\$ 9.9$ million, $\$ 10$ million- $\$ 49.9$ million, and $\$ 50$ million and greater. Following the U.S. Treasury's Office of Tax Analysis (OTA) paper "Methodology to Identify Small Businesses" (2018) we classify businesses with less than $\$ 10$ million in receipts as "small," and the two remaining categories are classified as medium (between $\$ 10$ million and $\$ 50$ million in receipts) and large (receipts $\$ 50$ million and greater).

BEA (2017) defines wages as money paid in regular intervals to employees by employers and gross output as receipts plus other operating income and inventory change. Therefore, we use the SOI variable "salaries and wages" as a proxy for wages and "total receipts" as a proxy for gross output. To make the SOI-based estimates consistent with BEA's official statistics, we proportionally distribute ("allocate") BEA's private sector wages and gross output totals (BEA 2021a; BEA 2021b) to the SOI distribution of salaries and wages and total receipts disaggregated by industry and size of business receipts. Those results are then disaggregated further for each legal form (corporations, partnerships, and sole proprietorships) based on their relative share of salaries and wages and total receipts. For example, the SOI data show 34 percent of total receipts in the construction industry in 2003 were received by corporations with less than $\$ 10$ million in receipts, so 34 percent of BEA's gross output total for the construction industry for that year is allocated to our "small corporations" category. Formally,

$$
\text { Gross Output }_{y, i, s, 0}=\text { Gross Output }_{y, i} * \frac{R_{y, i, 0}}{R_{y, i}}
$$

where $\mathrm{y}=$ year, $\mathrm{i}=$ industry, $\mathrm{s}=$ business size, $\mathrm{o}=$ legal form of organization, and $\mathrm{R}=$ total receipts. In the rare cases in which SOI receipts were negative, we set those values to zero prior to the second allocation by legal form. For margin industries (retail trade and wholesale trade), we subtract SOI "costs of goods sold" from total receipts to align with BEA's methodology for
those sectors (BEA 2020) prior to the initial allocation of BEA totals. Gross output and wages are presented in nominal terms and are not adjusted for inflation. Finally, nonemployers receive proprietors' income, a category distinct from wages in BEA's national accounting framework and the SOI data. Therefore, while our gross output estimates include businesses with no employees at any point during the year, our wages estimates inherently exclude those nonemployers.

In the next two sections, we describe our results separately for gross output and wages. We initially focus on the estimates by size, industry, and legal form for 2003, the latest year available, before describing the areas that exhibit changes between 1998 and 2003. Within each subsection, we highlight industries in which the distribution of gross output or wages by size and legal form exhibit notable differences from the associated average distribution.

## Gross Output by Business Size, Industry, and Legal Form

## All businesses

Of overall gross output in 2003, corporations produced 80.7 percent, followed by partnerships with 12.8 percent, and sole proprietorships with 6.6 percent. Disaggregating by both legal form and business size, as illustrated in chart 1, we find the principal producer of private gross output was large corporations (firms with $\$ 50$ million and greater in receipts), which generated 54.6 percent of overall gross output in 2003. This was followed by small corporations (firms with less than $\$ 10$ million in receipts) and medium corporations (firms with between $\$ 10$ million and $\$ 50$ million in receipts), which generated 17.9 percent and 8.1 percent of total gross output, respectively. The largest noncorporate group in terms of output was large partnerships, generating 6.9 percent of overall output.

Almost all gross output for sole proprietorships was concentrated in small businesses (97.4 percent), followed distantly by medium businesses ( 1.7 percent) and large businesses ( 0.9 percent). For partnerships, 54.3 percent of gross output was attributable to large businesses,
followed by small businesses with 29.1 percent and medium businesses with 16.6 percent. For corporations, 67.7 percent of gross output was generated by large businesses, followed by small businesses with 22.2 percent and medium businesses with 10.0 percent.

## Small businesses (less than $\$ 10$ million in receipts)

In 2003, small businesses produced 28.1 percent of overall gross output. Chart 2 shows among all small businesses, corporations produced the greatest share of output ( 63.9 percent), followed by sole proprietorships ( 22.8 percent) and partnerships ( 13.2 percent). Small businesses generated over 50 percent of output for six industries: other services ( 80.7 percent); real estate, rental, and leasing ( 59.1 percent); health care and social assistance ( 56.1 percent); agriculture, forestry, fishing, and hunting (excluding farms) ( 55.0 percent); educational services (52.0 percent); and construction ( 50.8 percent). The distribution of gross output by legal form for all industries is illustrated in chart 3 . Highlights include the following:

- Unlike most small businesses, in the mining sector, small partnerships produced a relatively significant share of output. Among small mining businesses, 28.2 percent of output was produced by partnerships (more than twice the share compared to overall small businesses) and 51.5 percent was produced by corporations.
- In the manufacturing sector, small businesses skewed heavily toward corporations. Among small manufacturing businesses, 86.0 percent of output was produced by corporations, 22.1 percentage points higher than small businesses overall.
- The other services sector shows the greatest share of small business activity concentrated in sole proprietorships. In this sector, 34.7 percent of small business output was attributable to sole proprietorships. The sector also had one of the smallest shares of small business output going to partnerships ( 6.4 percent).

Chart 3. 2003 Private Gross Output: Small Businesses

Note. The real estate industry excludes owner-occupied housing; the agriculture, forestry, fishing, and hunting industry excludes farms. Industry shares may not add up to 100 percent due to rounding.
U.S. Bureau of Economic Analysis

## Medium businesses (between $\mathbf{\$ 1 0}$ million and $\$ 50$ million in receipts)

In 2003, medium businesses produced 10.3 percent of overall gross output. Among medium businesses, corporations produced the largest share of output ( 78.4 percent), followed by partnerships ( 20.6 percent) and sole proprietorships (1.1 percent). The four industries with the greatest share of output for medium businesses include construction ( 20.9 percent); agriculture, forestry, fishing, and hunting (excluding farms) (17.3 percent); professional, scientific, and technical services ( 15.9 percent); and real estate, rental, and leasing (15.0 percent). Highlights include the following:

- Among medium businesses in the other services sector, corporations produced 91.7 percent of output. Similarly, among medium businesses in the educational services sector, corporations produced 91.4 percent of output.
- At the other end of the spectrum is the utilities sector, where only 34.6 percent of medium business output was produced by corporations and 65.4 percent by partnerships. Among medium businesses, it was the only sector in which corporations did not lead production.
- In the arts, entertainment, and recreation sector, sole proprietorships generated 7.5 percent of output-almost seven times the share of medium businesses overall.

## Large businesses (\$50 million and greater in receipts)

In 2003, large businesses produced 61.6 percent of overall gross output. Large businesses represented more than 80 percent of output for five industries: utilities ( 97.9 percent), management of companies ( 91.4 percent), manufacturing ( 88.0 percent), information ( 87.4
percent), and finance and insurance (87.2 percent). While corporations dominated production among small and medium businesses, the corporate share of output was greatest among large businesses. Corporations produced 88.6 percent of output, followed by partnerships (11.3 percent) and sole proprietorships ( 0.1 percent). Highlights include the following:

- In the arts, entertainment, and recreation sector, corporations produced 44.7 percent of output among large businesses-almost half the share compared to large businesses overall. Most of the output for this industry was produced by partnerships ( 55.3 percent).
- Corporations produced 68.2 percent of output in the professional, scientific, and technical services sector-20.4 percentage points less than large businesses overall. This sector also had the largest share attributed to sole proprietorships ( 0.5 percent).
- The management of companies sector had the highest concentration of corporate output, where corporations produced 98.3 percent of large business output.

## Changes in gross output activity over time

Across the years 1998-2003, the output distribution remains relatively stable across the three size categories. The greatest shift within size categories is in large businesses, where the share of output increased from 60.2 percent in 1998 to 61.6 percent in 2003 . We also see a reduction in the share of medium business output from 11.1 percent in 1998 to 10.3 percent in 2003, as well as a decline in small business output from 28.7 percent to 28.1 percent. A more significant shift is seen when we analyze legal form of organization. In 1998, corporations produced 84.8 percent of total gross output, dropping to 80.7 percent in 2003 . Meanwhile, we see a rise in the share of partnerships' output over the same period from 8.7 percent in 1998 to 12.8 percent in 2003. The sole proprietorships' share remained stable at 6.5 percent in 1998 and 6.6 percent in 2003. Highlights include the following:

- Utilities. In 1998, large corporations produced 88.6 percent of the utilities sector output. In 2003 , this share dropped over 11 percentage points to 77.4 percent. At the same time, large partnerships' share of utilities sector output almost tripled from 7.2 percent in 1998 to 20.5 percent in 2003.
- Educational services. In 1998, small corporations produced 55.6 percent of educational services output, declining to just 33.0 percent in 2003. At the same time, large corporations' share almost doubled from 17.1 percent in 1998 to 32.6 percent in 2003.
- Arts, entertainment, and recreation. In 1998, small corporations produced 30.7 percent of the output for this sector and small partnerships produced 18.9 percent. By 2003, those shares dropped to 25.2 percent for corporations and 7.4 percent for partnerships. Meanwhile, the share attributed to large partnerships more than tripled from 6.0 percent in 1998 to 21.6 percent in 2003.

## Wages by Business Size, Industry, and Legal Form

## All businesses

Of overall wages in 2003, corporations accounted for 84.1 percent, followed by partnerships with 10.6 percent and sole proprietorships with 5.3 percent. When we look at business size and legal form, we see large corporations produced the greatest share of overall wages at 52.3 percent (chart 4). The next largest share was attributable to small corporations, which produced
22.3 percent of wages, followed by medium corporations, which produced 9.5 percent. The biggest noncorporate category was small proprietorships, which accounted for 5.2 percent of wages in 2003.

For sole proprietorships, most wages were concentrated in small businesses ( 97.3 percent), similar to gross output. This was followed by medium businesses ( 2.1 percent) and large businesses ( 0.6 percent). For partnerships, 45.9 percent of wages were attributable to large businesses, followed by small businesses with 35.8 percent and medium businesses with 18.3 percent. For corporations, 62.2 percent of wages were generated by large businesses, followed by small businesses with 26.5 percent and medium businesses with 11.3 percent.

## Small businesses (less than $\$ 10$ million in receipts)

In 2003, small businesses accounted for 31.3 percent of overall wages. Chart 5 shows among small businesses, 71.2 percent of wages came from corporations, followed by 16.6 percent from sole proprietorships and 12.1 percent from partnerships. Small businesses represented over 50 percent of wages for four industries: other services (77.4 percent); construction (71.4 percent); agriculture, forestry, fishing, and hunting (excluding farms) ( 68.5 percent); and real estate, rental, and leasing ( 56.3 percent). The distribution of wages by legal form for all industries is illustrated in chart 6. Highlights include the following:

- Among small businesses in the construction sector, only 58.7 percent of wages were attributable to corporations-12.5 percentage points less than small businesses overall. Additionally, 36.5 percent of wages went to sole proprietorships, more than double the share of all small businesses.
- While corporations dominated small business wages, in the utilities sector, that dominance was most pronounced. Among small utilities businesses, corporations accounted for 90.1 percent of wages, followed by partnerships ( 9.9 percent) and sole proprietorships (0.0 percent).
- The sector in which we see the highest concentration of wages in partnerships was in the accommodation and food services sector, where 22.1 percent of wages was attributed to partnerships.

Chart 5. 2003 Private Wages Distribution Within Size Category

U.S. Bureau of Economic Analysis

Chart 6. 2003 Private Wages: Small Businesses

Note. The agriculture, forestry, fishing, and hunting industry excludes farms. Industry shares may not add up to 100 percent due to rounding. U.S. Bureau of Economic Analysis

## Medium businesses (between $\$ 10$ million and $\$ 50$ million in receipts)

In 2003, medium businesses accounted for 11.6 percent of overall wages. The four industries with the greatest share of wages attributable to medium businesses include educational services (19.2 percent); professional, scientific, and technical services (17.7 percent); arts, entertainment, and recreation (17.6 percent); and agriculture, forestry, fishing, and hunting (excluding farms)
(16.1 percent). Looking within medium businesses, corporations made up the largest share of wages ( 82.3 percent), followed by partnerships (16.7 percent) and sole proprietorships (1.0 percent). Highlights include the following:

- Among medium utilities businesses, only 35.3 percent of wages was produced by corporations. The legal form with the greatest wage share was partnerships ( 64.7 percent). This was the only industry in which corporations did not account for the majority of wages.
- At the other end of the spectrum is the educational services sector, where wages were mostly concentrated within corporations. In this case, corporations made 93.3 percent of wages, with the remaining 6.7 percent going to partnerships and none to sole proprietorships.
- Sole proprietorships made up a tiny portion of medium businesses' wages and that was also true across all industries. The sector with the highest sole proprietorship share was in agriculture, forestry, fishing, and hunting (excluding farms), where sole proprietorships accounted for 3.6 percent of wages.

## Large businesses (\$50 million and greater in receipts)

In 2003, large businesses made up 57.2 percent of overall wages. Large businesses represented more than 80 percent of wages for four industries: utilities ( 94.7 percent), management of companies ( 91.4 percent), information ( 84.7 percent), and manufacturing ( 82.9 percent). Among large businesses, corporations accounted for 91.4 percent of wages, followed by partnerships ( 8.5 percent) and sole proprietorships ( 0.1 percent). Highlights include the following:

- In the arts, entertainment, and recreation industry, corporations accounted for only 48.6 percent of wages, a drastic difference from large businesses overall, where the share was 91.4 percent. The majority of wages in this sector came from partnerships (51.4 percent).
- Large professional, scientific, and technical services businesses also saw an aboveaverage share of wages attributable to partnerships at 34.9 percent. Additionally, this sector had the largest share of wages attributable to sole proprietorships at 0.5 percent.
- While corporations clearly dominated the large business wage distribution, this disparity was most extreme in the management of companies sector. In this industry, corporations made up 99.2 percent of wages, with the remaining 0.8 percent going to partnerships.

## Changes in wages over time

Across the years 1998-2003, the share of wages across business size remained fairly stable. For small businesses, the share of total wages decreased from 32.5 percent in 1998 to 31.3 percent in 2003. For medium businesses, the share decreased from 11.9 percent in 1998 to 11.6 percent in 2003. Finally, for large businesses, the wage share increased from 55.6 percent in 1998 to 57.2 percent in 2003. A more significant shift can be seen when we analyze legal form of organization. In 1998, corporations produced 86.2 percent of total wages. This share dropped to 84.1 percent in 2003. Meanwhile, we saw a rise in the share of partnerships' wages over the same period (7.8 percent in 1998 to 10.6 percent in 2003). The sole proprietorships' share dropped slightly from 6.0 percent in 1998 to 5.3 percent in 2003. Highlights include the following:

- Arts, entertainment, and recreation. One of the more significant shifts occurs in this sector, where we see a decline in wages for small corporations and partnerships and an increase in wages for large partnerships. In 1998, small corporations and small partnerships had a wage share of 32.0 percent and 25.8 percent, respectively. By 2003, those shares dropped to 24.9 percent and 8.1 percent. Meanwhile, the share for large partnerships grew from 4.0 percent in 1998 to 23.4 percent in 2003.
- Educational services. In this sector, there was a decline in wage shares for small corporations and an increase for large corporations. For small corporations, the wage share dropped from 65.7 percent in 1998 to 35.3 percent in 2003 . At the same time, the wage share grew from 16.6 percent to 37.3 percent for large corporations.
- Construction. In this sector, small sole proprietorships experienced a drop in their wage share from 32.0 percent in 1998 to 26.0 percent in 2003 . At the same time, wage shares for large corporations rose from 11.9 percent in 1998 to 14.8 percent in 2003.

## Comparison to Estimates That Use Employment to Classify Business Size

BEA published estimates of small business gross output and wages by industry in two previous working papers (Highfill and Strassner 2017; Highfill and others 2020). In those papers, enterprise-level employment was used to characterize businesses as "small" instead of firm-level receipts used in this paper. This section describes how those previous estimates compare to our new estimates. Unfortunately, we cannot separate the differences caused by the employmentbased and receipts-based size classifications from the differences caused by the enterprise and firm distinction. However, this distinction may not have a substantial impact on our results, based on research by Bureau of Labor Statistics economists. Sadeghi, Talan, and Clayton (2016) found that while there are large differences in job flow trends between the establishment-level data and firm-level data, this is not the case when comparing firm-level to enterprise-level data. Specifically, "First, gross job flows by size class at the enterprise level are very close to gross job flows at the firm level. Second, the gap between the two series is stable and does not change noticeably over time, making the patterns similar" (Sadeghi, Talan, and Clayton 2016). Additional research is underway at BEA to help determine the extent to which the enterprise versus firm distinction impacts BEA's estimates by business size.

We split the small business category into two groups to better compare to BEA's previous papers, which distinguished between "small" and "very small" businesses (table 1). Very small businesses in a previous analysis (Highfill and Strassner 2017) referred to enterprises with 0-19 employees and small businesses as enterprises with 20-99 employees. For our receipts-based size classes, we use $\$ 2.5$ million as the cutoff to distinguish between very small and small businesses. We chose $\$ 2.5$ million because this value corresponds most closely to the average receipts value for enterprises with 10-19 employees ( $\$ 1.8$ million) in the 2002 Statistics of U.S. Businesses data (table 2).

Table 1. Business Size Classes Using Receipts and Employment Criteria

| Business size class | Firm-level receipts | Enterprise-level employment |
| :--- | :--- | :--- |
| Very small | Less than $\$ 2.5$ million | Less than 20 |
| Small | $\$ 2.5$ million- $\$ 9.9$ million | $20-99$ |
| Medium | $\$ 10$ million $\$ 49.9$ million | $100-499$ |
| Large | $\$ 50$ million or greater | 500 or greater |

Table 2. Receipts for Firms in Census Survey of U.S. Businesses, 2002

| Enterprise size <br> (number of employees) | Number of firms | Receipts <br> (thousands of dollars) | Average firm receipts |
| :--- | ---: | ---: | ---: |
| 0 | 770,041 | $215,139,058$ | $\$ 279,386$ |
| $1-4$ | $2,695,606$ | $937,533,365$ | $\$ 347,801$ |
| $5-9$ | $1,010,804$ | $888,342,543$ | $\$ 878,847$ |
| $10-19$ | 613,880 | $1,085,595,864$ | $\$ 1,768,417$ |
| $20-99$ | 508,249 | $2,884,696,648$ | $\$ 5,675,755$ |
| $100-499$ | 82,334 | $2,547,423,855$ | $\$ 30,940,120$ |
| 500 or greater | 16,845 | $13,503,796,863$ | $\$ 801,650,155$ |

We also exclude the agriculture industry from our analysis to align with our previous estimates. We focus our comparison mainly on the "very small" and "large" categories since these two size classes represent the largest shares of wages and gross output (table 3). Data for the other two class sizes are available on BEA's small business website.

Table 3. Share of Private Gross Output and Wages Using Receipts-Based Business Size Classes and Employment-Based Business Size Classes, 2002

| Business size class | Receipts-Based size class share | Employment-Based size class share | Difference in shares |
| :---: | :---: | :---: | :---: |
| Gross output |  |  |  |
| Very small | 19 | 20 | -1 |
| Small | 9 | 12 | -3 |
| Medium | 11 | 11 | 0 |
| Large | 61 | 58 | 3 |
| Wages |  |  |  |
| Very small | 20 | 16 | 4 |
| Small | 11 | 17 | -6 |
| Medium | 12 | 14 | -2 |
| Large | 56 | 53 | 3 |

[^4]
## Gross output

The distribution of gross output by business size using receipts-based business size classes and employment-based size classes are very close overall (table 3). Receipts-based size classes show very small businesses (firms with less than $\$ 2.5$ million in receipts) represented 19 percent of total gross output in 2002, only 1 percentage point less than the share using employment-based size classes ( 20 percent). For all size classes, shares of gross output by business size are within 3 percentage points using both the receipts-based and employment-based size class definitions.

Comparing receipts-based and employment-based shares of gross output for very small businesses across industries, more than half of sectors have shares within 5 percentage points of each other (table 4). Shares in the professional, scientific, and technical services sector were the same for very small businesses ( 35 percent of gross output) and within 2 percentage points for large businesses using both the receipts- and employment-based size definitions. Other industries with similar gross output shares across all sizes include mining, information, and arts, entertainment, and recreation.

Table 4. Comparing Industry Shares of Private Gross Output by Business Size Using Receipts-Based and Employment-Based Size Classes for "Very Small" and "Large" Businesses, 2002

| Range of differences in shares | NAICS code | Sector | Share using receiptsbased size classes | Share using employment-based size classes | Difference in shares |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Very small businesses |  |  |  |  |  |
| Within 5 percentage points (pp) | 21 | Mining | 9 | 8 | 2 |
|  | 22 | Utilities | 0 | 2 | -2 |
|  | $\begin{aligned} & 31- \\ & 33 \end{aligned}$ | Manufacturing | 3 | 5 | -2 |
|  | $\begin{aligned} & 42- \\ & 45 \end{aligned}$ | Wholesale and retail trade | 16 | 20 | -5 |
|  | 51 | Information | 4 | 6 | -2 |
|  | 52 | Finance and insurance | 4 | 6 | -2 |
|  | 54 | Professional, scientific, and technical services | 35 | 35 | 0 |
|  | 55 | Management of companies | 1 | 3 | -3 |
|  | 71 | Arts, entertainment, and recreation | 36 | 34 | 2 |
| Within 6-10 pp | 23 | Construction | 31 | 40 | -9 |
|  | 56 | Administrative and waste services | 30 | 23 | 7 |
|  | 72 | Accommodation and food services | 33 | 23 | 10 |
| More than 10 pp | $\begin{aligned} & \hline 48- \\ & 49 \end{aligned}$ | Transportation and warehousing | 19 | 33 | -14 |
|  | 53 | Real estate, rental, and leasing* | 43 | 57 | -14 |
|  | 61 | Educational services | 46 | 11 | 35 |
|  | 62 | Health care and social assistance | 40 | 22 | 18 |
|  | 81 | Other services | 70 | 53 | 17 |
| Large businesses |  |  |  |  |  |
| Within 5 pp | 21 | Mining | 74 | 78 | -4 |

| Range of differences in shares | NAICS code | Sector | Share using receiptsbased size classes | Share using employment-based size classes | Difference in shares |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 51 | Information | 86 | 83 | 3 |
|  | 53 | Real estate, rental, and leasing* | 27 | 26 | 1 |
|  | 54 | Professional, scientific, and technical services | 34 | 36 | -2 |
|  | 56 | Administrative and waste services | 46 | 51 | -5 |
|  | 71 | Arts, entertainment, and recreation | 36 | 32 | 4 |
|  | 72 | Accommodation and food services | 43 | 43 | 0 |
|  | 81 | Other services | 10 | 14 | -3 |
| Within 6-10 pp | 23 | Construction | 27 | 19 | 8 |
|  | 42-45 | Wholesale and retail trade | 61 | 53 | 8 |
|  | 48-49 | Transportation and warehousing | 60 | 50 | 9 |
|  | 52 | Finance and insurance | 88 | 81 | 6 |
|  | 55 | Management of companies | 91 | 85 | 6 |
| More than 10 pp | 22 | Utilities | 97 | 85 | 12 |
|  | $\begin{aligned} & 31- \\ & 33 \end{aligned}$ | Manufacturing | 86 | 75 | 12 |
|  | 61 | Educational services | 28 | 57 | -29 |
|  | 62 | Health care and social assistance | 28 | 54 | -26 |

* Excludes owner-occupied housing

Note. See table 1 for size class values.

A few industries show differences in size class shares of more than 10 percentage points. In educational services, very small businesses represented 46 percent of gross output using receipts-based size classes, but only 11 percent of gross output when using employment-based size classes. Likewise, large businesses represented 28 percent of gross output in the educational services sector using receipts-based size classes, compared to 57 percent of gross output using employment-based size classes. The health care and social assistance sector shows a similar pattern. It is unclear if these differences are due to the receipts versus employment size classification, the enterprise versus firm distinction, or a mix of both.

## Wages

The distribution of wages by business size using receipts-based and employment-based classifications is not as close as gross output, though shares across all size classes are within 6 percentage points of each other (table 3). Very small businesses represented 20 percent of wages in 2002 using the receipts-based size class, 4 percentage points higher than the share using employment-based size classes (16 percent). Small businesses show the opposite resultthe share of wages attributable to small businesses using the receipts-based size class was 11 percent, compared to 17 percent using the employment-based size classification. If the very small and small categories are combined, the shares are much closer-31 percent using receipts-based
size classes versus 33 percent using employment-based classes. This may suggest the $\$ 2.5$ million receipts threshold for "very small" businesses may be more applicable when comparing gross output rather than wages.

Similar to gross output shares for very small businesses, more than half of sectors show wage shares are within 5 percentage points of each other (table 5). Across all business sizes, industries with similar wages shares using both receipts- and employment-based definitions include mining; information; real estate, rental, and leasing; and professional, scientific, and technical services. As with gross output, the two industries with the greatest differences in wages shares include educational services and health care and social assistance.

Table 5. Comparing Industry Shares of Private Wages by Business Size Using Receipts-Based and Employment-Based Size Classes for "Very Small" and "Large" Businesses, 2002

| Range of differences in shares | NAICS code | Sector | Share using receiptsbased size classes | Share using employment-based size classes | Difference in shares |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Very small businesses |  |  |  |  |  |
| Within 5 percentage points (pp) | 21 | Mining | 16 | 11 | 5 |
|  | 22 | Utilities | 1 | 2 | -1 |
|  | $\begin{aligned} & 31- \\ & 33 \end{aligned}$ | Manufacturing | 5 | 7 | -2 |
|  | $\begin{aligned} & 48- \\ & 49 \end{aligned}$ | Transportation and warehousing | 13 | 11 | 1 |
|  | 51 | Information | 6 | 6 | -1 |
|  | 52 | Finance and insurance | 7 | 9 | -2 |
|  | 53 | Real estate, rental, and leasing | 36 | 33 | 4 |
|  | 54 | Professional, scientific, and technical services | 26 | 26 | 1 |
|  | 55 | Management of companies | 0 | 1 | 0 |
|  | 71 | Arts, entertainment, and recreation | 27 | 23 | 3 |
| Within 6-10 pp | $\begin{aligned} & 42- \\ & 45 \end{aligned}$ | Wholesale and retail trade | 11 | 19 | -8 |
| More than 10 pp | 23 | Construction | 54 | 32 | 21 |
|  | 56 | Administrative and waste services | 27 | 13 | 14 |
|  | 61 | Educational services | 37 | 7 | 30 |
|  | 62 | Health care and social assistance | 31 | 18 | 12 |
|  | 72 | Accommodation and food services | 31 | 17 | 14 |
|  | 81 | Other services | 64 | 43 | 21 |
| Large businesses |  |  |  |  |  |

## Summary

Compared to BEA's previous estimates of gross output and wages that use number of employees in a business to determine size classes, these new estimates that use receipts to classify size are overall very close. In both cases, our results show that large businesses generated around 60 percent of private gross output and wages in 2002, while small businesses generated around 30 percent of this economic activity. Some industries, such as professional, scientific, and technical services, show that the distribution of wages and gross output by size are essentially the same, using either receipts or number of employees to classify business size. However, the distribution of wages and gross output by size using receipts-based size classes were very different for a few industries, such as educational services and health care and social assistance. It is unclear to what extent these differences are due to using receipts instead of employment to classify business size or due to the unit of analysis in the SOI receipts-based data (firm) versus the employment-based Census data (enterprise).

## Discussion

Defining a small business involves making decisions about a number of factors, including the unit of analysis (for example, establishments, firms, or enterprise), the variable used to classify businesses by size (for example, number of employees in a business or business receipts), and the numerical value delineating small businesses from nonsmall businesses (for example, less than 100 employees or less than $\$ 10$ million in receipts). Data availability can determine which business characteristics are used to identify small businesses. Data from IRS, such as the SOI data used in this paper, typically do not include employment values, so financial variables such as receipts size or asset size are used to categorize businesses by size. The business characteristics used to classify small businesses are sometimes determined by an organization's goal, as is the case with the Small Business Administration (SBA) loan program. The SBA in many cases uses employment to determine if a business is small and therefore eligible for a loan (U.S. Small

Business Administration 2018). However, the SBA also uses revenue to identify small businesses for certain capital-intensive industries that have few employees and high revenue, such as construction (Kobe 2012). This paper shows that using employment or receipts to categorize businesses by size class often results in similar outcomes, though variability is seen across some industries.

These estimates represent BEA's first set of wages and gross output disaggregated by business size and legal form of organization. We find most economic activity for small firms in 2003 was generated by corporations ( 64 percent of gross output and 71 percent of wages), followed by sole proprietorships ( 23 percent of gross output and 17 percent of wages) and partnerships (13 percent of gross output and 12 percent of wages). Gross output and wages for medium and large firms for 1998-2003 were dominated by corporations and partnerships, with trivial representation from sole proprietorships in any industry; over 95 percent of sole proprietors' wages and gross output were generated by small businesses.

While most relationships did not change drastically over the 6-year study period, we see an increase in overall shares of wages and gross output attributable to corporations and partnerships, possibly reflecting changes in the tax code between 1998 and 2003. Tax cuts in 2001 lowered rates for individuals, and therefore for passthrough entities, or businesses where income flows to owners, which includes partnerships (DeBacker and Prisinzano 2015). Since these tax cuts further increased the divide between corporate and noncorporate tax rates during the period, this may explain the overall increase in shares of wages and gross output for partnerships between 1998 and 2003 (from 7.8 percent to 10.6 percent for wages and 8.7 percent to 12.8 percent for gross output) and decreasing shares for corporations (from 86.2 percent to 84.1 percent for wages and 84.8 percent to 80.7 percent for gross output).

Our estimates that use firm-level receipts to classify business size provide a new lens to view small business statistics compared to previous estimates that used employment to categorize business sizes. While these public IRS data are useful to understand certain economic activity across industries and business sizes for 1998-2003, additional and more timely data are needed for a comprehensive understanding of economic activity for small businesses. BEA is currently researching other ways to estimate small business statistics including using different size classes, datasets, and business characteristics. We invite all interested data users to send feedback about these estimates or suggestions for future research to SmallBusiness@bea.gov.
