# Public and Private Debt in the United States, 1929-40 

By Robert B. Bangs

INCREASED private financing due to expansion in demand gencrated by the Defense Program and, to a lesser extent, continued public deficit financing necessitated by the inauguration of that program, combined to raise net public and private debt in the United States by 5.1 billion dollars during 1940. At the end of that year combined public and private net debt reached 167.3 billion dollars; private debt accounted for 69 percent of this total while the remaining 31 percent was represented by public debt.

This comprehensive total of domestic indebtedness in the United States was, on December 31, 1940, 3.2 percent higher than the corresponding figure at the close of 1939 but was still 3.9 percent below the 1930 record high of 173.7 billion dollars, due to the substantial liquidation of debt which occurred during the depression years. In contrast to the figure of $\$ 1,263$ for 1940 , net indebtedness per capita was $\$ 1,406$ and $\$ 1,184$ for 1930 and 1934, respectively, the dates when per capita debt reached high and low points for the 1929-40 period.

During 1940, private debt increased more than public debt, both in dollar amount and in percentage terms. The increase in net private indebtedness of all types amounted to 3.6 billion dollars or 3.2 percent over 1939, while the increase in net public debt was 1.6 billions or 3.1 percent over the 1939 year-end figure.

All the major types of private debt, except farm mortgages, rose during 1940, although the increases, in percentage terms, were very uneven, as may readily be seen from figure 9. The most striking debt increase during the year, as this figure shows, occurred in outstanding consumer credit which advanced by 12.8 percent and added approximately 1 billion dollars to current purchasing power. About one-half of the increase represented heavier automobile financing.

This increase in consumer debt suggests both that the rise in income and employment during 1940 was generally expected to be maintained or even continued during the year ahead, and that the prospect of shortages was accelerating consumer buying. The close association between outstanding consumer debt and national income which characterized not only 1940 but the whole of the past decade (see fig. 10) cannot be expected to continue once the Presidential order authorizing

[^0]control of installment credit is successfully implemented and the supplies of new durable goods available for sale decline because of priority control over raw materials.

The increase of 1.3 billion dollars in corporate shortterm debt during 1940 was concentrated among industrial companies and flowed chiefly from the need of business for additional working capital. Although some
Figure 9.-Percentage Change 1940 from 1939 in Net Public and Private Debt by Classes

Note.-The width of each bar represents the percent that each class is of the totat debt for 1939.

increase in current business indebtedness is characteristic of cconomic expansion, this unusually large rise in corporate short-term debt relative to the rise in national income is evidence of the changes in character of production necessitated by the rearmament program and of the preparation for further business expansion during 1941.

Domestic indebtedness is an important form of investment for individual savings, particularly those savings which are mobilized by banks, insurance companies, and similar financial institutions. Since these institutions invest principally in debt securities, that
part of individual saving placed with financial intermediaries is made available for capital formation chiefly through debt financing by business. During a period such as the present, when important changes are occurring in both the volume and composition of capital formation, the flow of savings into creditor claims constitutes one method of partially meeting the

financial requirements of those business enterprises which are enlarging their plant facilities and which have a larger volume of output in process because of the acceleration in demand for final products.

## Trends in Net Debt, 1929-1940.

Fluctuations in the volume of indebtedness over the 1929-1940 period, shown in figures 11,12, and 13 reveal the varying degrees of sensitivity to economic changes exhibited by different classes of debt but they indicate as well the presence of special factors operating to influence particular debt categories. For example, although the trend of farm and nonfarm mortgage debt was roughly similar during the years $1931-36$, this similarity has been less apparent during recent years.

The trends in public and private debt were opposite during a substantial part of the period since 1929. This is, of course, a result of the fact that the reduction in private debt was a consequence of the same underlying conditions-decreasing business acitivity, employment, and production-- which led to the increase in public debt during the depression period.

Changes in the volume of outstanding private debt generally follow the trend of industrial production and national income although adjustments in the debt structure tend to lag somewhat behind the movements in these two basic series. Furthermore, the duration of the lag varies considerably among the different component parts of net private debt; some outstandings for example, consumer debt, showing very little lag while other series show movements which run considerably behind changes in the level of economic activity.

A number of factors account for the existence of these lags. The rigidity of long-term debt contracts, the prior claims of creditors against the incomes of enterprises, and the slowness of the legal machinery for debt adjustment all contribute to delayed debt reduction during periods of economic contraction and falling prices.

Similarly, during expansion the long-term debt of business enterprises may expand relatively less rapidly than output, both because the capital market is more receptive to equity financing and because the higher volume of new borrowing is more nearly offset by increased capacity to retire old obligations.

One caution should be observed in interpreting the aggregate private debt figures. The trend in both the long- and short-term aggregates is the net result of the changes in the components of these aggregates. Since in certain years these components moved in different directions, the changes in the aggregates tend not to reveal the full dispersion of the changes in particular debt classes.

Short-term debts naturally proved to be more sensitive to economic changes during the period since 1929 than did long-term obligations. This sensitivity found expression not only in the timing of changes, shortterm obligations responding more promptly to business expansion and contraction, but also in the amplitude of changes which, generally speaking, were more pronounced among the classes of short-term debt.

Certain major trends in the debt structure, extending over the whole 12 -year period, are evident. Public debt has risen in each year, although the increase is considerably more moderate than is evident from the gross public debt figures. In each year since 1929,

Figure 11.-Net Public and Private Debt

Source: U. S. Department of Commerce.
an increasing portion of the public debt has either been held as an asset in various government accounts or offset by loans receivable from the public. This latter offset against the public debt is indicative of the increasing importance of government as a financial intermediary, borrowing funds from the public but relending them to farmers, home purchasers, and busi-
ness enterprises in need of additional credits not readily obtained through traditional chamels. Thus, a substantial part of the rise in public debt since 1933 has resulted from a substitution of public for private credit. This substitution, carried out through the lending activities of such Federal agencies as the Reconstruction Finance Corporation or the Home Owners

Figure 12.-Long-Term Private Debt by Major Types

Source: U. S. Department of Commerce.
Loan Corporation, made possible not only the refinancing of certain critical types of debt but also the release of fresh funds required for new investment

In spite of a slight increase since 1938, the general trend of corporate debt, both short and long term, has been downward during the post-1929 period. A major factor which helped to produce this trend was the relatively low level of corporate investment during these years. Funds accumulated incidental to the charging of depreciation and depletion were in many instances employed for debt retirement rather than for reinvestment in plant and equipment.

The sharp downward trend which is evident in the figures on dobt of individuals and unincorporated business contracted for commercial purposes is a result primarily of the great contraction in the volume of brokers' loans since 1929. The volume of these loans has become progressively smaller, thus dominating the trend evident in this class of indebtedness.

Among the major classes of long-term private debt farm mortgages have moved steadily lower in volume since 1929 while urban mortgages, although decreasing through 1937, have since risen to a slightly higher level.

Thus, in summary, all types of private debt were substantially lower in 1940 than in 1929, except for consumer debt which was well above the 1929 level.

## Concepts of Net and Gross Debt.

The estimate of net public and private debt is designed to measure the indebtedness of final borrowers in the United States. To obtain the net debt figures, the total of legal debt obligations outstanding are corrected by eliminating intermediary debt (i. e., debt which is offset by receivables arising from the relending
of borrowed funds) and debt issued by but held within a "unit" having economic coalescence. For purposes of the present cstimates four such "units" are employed:

1. The Federal Government unit, i. e., the United States Government and its corporations and agencies.
2. The local government unit, i. e., the combined State and local governments. ${ }^{1}$
3. The corporate unit, i. e., the individual corporate system under a single management but often consisting of several legally separate corporations.
4. The noncorporate unit; i. e., the separate unincorporated business establishment or the individual person.

This selection of units means that gross debt estimates ${ }^{2}$ are brought to a net basis by the following climinations:
a. Debts issued by government but held by government in trust, investment, or sinking funds.
b. Intercorporate obligations of corporate systems in cases where these "systems" are for all practical purposes a single economic unit coordinated by a common policy.
c. Federal intermediary debt; i. e., that portion of the debt of Federal agencies which is offset by loans receivable from the public. ${ }^{3}$

The elimination of intermediary debt and of debt "internal" to any of the four units employed does not mean that these eliminated obligations are of no importance, nor does it mean that for all purposes these contracts may properly be disregarded. Rather the purpose of the eliminations is to remove from the debt figures those transfers which have less economic

Source: U. S. Department of Commerce.
significance than the transfers from savers and other grantors of credit to ultimate borrowers. By thus removing the effects of changing financial organization, the resultant net debt figures give a clearer and simpler

[^1]picture of the more important major trends in the debt structure.

The details involved in calculating the net public debt are shown in table 2. Both Federal Government and Federal agency obligations held by divisions of the United States Government have been consolidated to
determine the net public debt held outside the Government. Table 3 gives the information relative to both gross and net debt of corporations, adjustments having been made to place corporate obligations on both a consolidated and unconsolidated basis consistently for the entire period.

[^2] connection with filing corporate income tax returns, and also in the case of railroads, from balance sheets filed with the Interstate Commerce Commission.

[^0]:    ${ }^{t}$ The bulk of the material for this report was gathered by J. Wesley Sternberg, formerly economic analyst in the Bureau of Foreign and Donestic Commerce. Mr. Sternberg has prepared a more completo report on Indebtedness in the United Stutes which will be publisted in the near future. This larger report, covering the 12 -year period 1929-40, will give more detailed hreak-downs of the debt estimates and will present a discussion of the sources of information and methods of estimation used.

[^1]:    1 Strictly, the combized State and local governments do not form a significant economic unit, except so far as the whole population is concerned. But the available figures for "internal" debt are such that the exact amount of its own securities held by each local government division is not calculable. However, by consolidating and treating all State and local government divisions as parts of a single debt unit, these estimates are rendered comparable with those for the Federal governnent and the resulting estimate gives a much better picture of the debt of State and local goveruments as ultimate borrowers than the gross debt figures.
    2 The Department of Commerce gross debt estimates do not include the intermediary debt of financial institutions such as deposit liabilities of banks and obligations of life insurance companies to policyholders. These debts are sometimes included in the totals given in other debt studies.
    ${ }^{2}$ This portion of the Federal debt obviously duplicates that portion of private debt arising from these same loans to the public by Federal agencies.

[^2]:    "Adjusted to a gross debt or "unconsolidated" basis and to a net debt of "consolidated" basis from balance-sheet data submitted to the Bureau of Internal Revenue in
