## Preface

This bulletin, Wholesale Prices and Price Indexes, 1962, brings together statistical data on primary market prices published by the Bureau of Labor Statistics for 1962. Indexes for all commodities, major groups, subgroups, product classes, special commodity groupings, and individual items, and prices for selected individual commodities are presented. Also included are an analysis of price movements over the year, brief technical descriptions of the indexes, specifications for the items priced, and a short description of the rebasing of the index that occurred in January 1962, along with the rebasing factors to be used in converting indexes from the 1947-49 base or vice versa.

The bulletin was prepared in the Bureau's Division of Industrial Prices and Price Indexes, under the general direction of Arnold E. Chase, Assistant Commissioner for Prices and Living Conditions, by Edward J. Kazanowski, under the supervision of Lloyd E. Wigren.

## Wholesale Price Trends During 1962

In 1962, wholesale prices continued the overall stability that had prevailed during the previous 4 years. The All Commodities Wholesale Price Index was at the same level in December 1962 as in December 1961, but the annual average for 1962 was 0.3 percent above the average for 1961. Industrial commodities and processed foods averaged somewhat lower over the year while farm products moved higher. Leveling off in economic recovery in the latter part of the year underlay price decreases for a number of industrial commodities, with problems such as excess capacity, oversupply, or import competition again exerting a downward influence. For processed foods, slightly lower prices resulted from failure of demand to absorb increased production and stocks of dairy products and of processed fruits and vegetables. The principal reason for the advance in farm products was generally higher prices for livestock as the overall demand for meats increased more rapidly than output.

### Industrial Commodities

The most noteworthy aspect of primary market price behavior in 1962 was the continued lack of response of prices in the industrial sector to the business recovery which began following the low point of recession early in 1961. Industrial prices on the average declined over the year in 1962 as they had in 1961, and by December 1962, they were 0.5 percent below their level in February 1961, generally considered to be the beginning point of the recovery. This represented the continuation of a dampening tendency noted in previous postwar recovery periods. Prior to 1961, in each succeeding recovery period industrial prices had advanced by a smaller percentage. The 1961-62 period marked the first time in the postwar period that industrial prices actually declined somewhat in an extended period of business expansion.

Stability in prices began after the period of especially intensive capital investment in the years 1955 through 1957. The fact that productive capacity in most industries was more than ample to satisfy immediate market demand continued to underlie the lack of any sharp movement in nonagricultural prices in 1962. Also important was the rapid expansion of output in other industrial countries over the past decade or more, which has been reflected in increasing competition from imported products in domestic markets. Further helping to maintain steady prices has been some slackening in the upward push of costs. While wages continued to rise in 1962, the percentage increase was less than in many previous years. For industry as a whole, increased productivity largely offset higher wages to hold unit labor costs about steady. Costs of many raw materials, as shown by their wholesale price indexes, were well below levels of earlier years. However, State and local taxes continued to rise, and interest rates were slightly higher than in 1961.

While 1962 was a year of generally expanding economic activity, the percentage advances in gross national product and industrial production over the course of the year were not as great as in 1961. There appeared to be a period of hesitation before the year had advanced very far, reflected first in a falling off in new orders. Then later in the year, the rate of expansion in production dropped sharply, and production itself came close to leveling off.

The principal impact of this faltering expansion in 1962 was seen in declining prices of crude materials--which in 1961, had jumped sharply in response to the initial upsurge in business activity--and to a lesser extent in prices of intermediate materials. Prices of crude materials tend to be volatile, responding quickly to changing prospects for future business activity. Price changes for crude materials appear to be closely associated with fluctuations in the volume of new orders for finished goods and shifts in inventory levels (making due allowances for appropriate time leads and lags).

## Durable Goods

By the beginning of 1962, new orders for durable goods had increased about 27 percent from January 1961. But, after remaining at this high level for the first 2 months, ordering of hard goods declined through the summer and early fall of 1962. While increasing somewhat in the last quarter, new orders remained below the level of January 1962. Roughly mirroring the declining support, prices of the principal durable raw or slightly processed goods--the scrap metals--moved lower beginning in February, but leveled off in the later months of the year. A number of intermediate materials for further fabrication also edged down over the year under the same influence.

Metals played a leading role in this pattern of events for durable materials. Shortly before the beginning of the year, industrial consumers of steel began accumulating inventories of steel products beyond their usual needs because of uncertainty concerning a possible strike as well as the possibility of higher prices. Under pressure of this above-normal demand, orders, production, and shipments of steel products were maintained at high levels through March 1962. In late March, a union contract was negotiated without a strike; and in early April, a Government policy favoring price stability was promulgated. As a result, users switched from accumulating inventory to sharply reducing stocks. Beginning in May and lasting through December, users' inventories of steel products were reduced each month with a consequent depressing effect on orders, production, and shipments, although actual consumption remained at fairly high levels.

No effect was registered on prices of steel mill products until July, the time of the usual vacation slowdown, when prices of stainless steel sheets and plates were reduced. August showed increased activity in the steel industry, but prices weakened for steel reinforcing bars as competition among domestic producers was further compounded by competition from imported bars in some areas. Prices of steel mill products averaged unchanged through the remaining months of 1962 (except for a short-lived increase in October), ending the year 0.2 percent below the average of a year earlier, although production gradually increased from August forward.

The largest price impact of these developments was on iron and steel scrap. Ferrous scrap price cuts were the most important single factor in the decline of the metals index over the year. At the end of 1961, and the beginning of 1962, scrap prices had risen with the upsurge in steel production as consumption exceeded immediate supplies. However, the greater steel production itself generated increased supplies as a result of internally produced scrap from steel mill operation, and total supplies began to exceed consumption. Declining export demand for scrap contributed an additional depressing influence. Prices began to drop in February and continued to do so through June. After a slight recovery during the summer, scrap prices reached their lowest point since 1949 by November. Reviving steel production stimulated an increase at the end of the year, but quotations nevertheless averaged more than 20 percent below December 1961. Among other iron and steel items, pig iron prices dropped under pressure of import competition and iron ore prices reflected lower prices for foreign ores. There were increases for gray iron casting and cast iron pipe.

A number of major nonferrous metal prices weakened during the year in a pattern somewhat similar to iron and steel products and were in some cases influenced by the declining markets for iron and steel products. However, price movements in overseas markets also were especially significant. Zinc and tin reflected both these influences. Declining steel production reduced demand for zinc for use in galvanizing while competitively lower prices in European markets also exerted a depressing effect. Primary tin quotations dropped over the year principally because of weakened prices in overseas markets but also reflecting lowered tin mill output and the release of tin from Government stockpiles. Nickel prices were cut to assist stainless steel and other nickel-consuming industries in meeting competition from other metals. Declining consumption and accumulating stocks brought lead prices lower over the year although there was a partial recovery toward the end of the year. A price drop for aluminum ingot near the end of the year was due to intense domestic competition reflecting excess capacity together with rising imports.

Nonferrous scrap and secondary metals dropped substantially under the influence of the depressed primary metal markets. Import competition and excess productive capacity caused price weakness for mill shapes, wire, and cable.

Among other durable materials, continuation of the upsurge in building construction that began in 1961 supported higher prices for lumber and wood products. Douglas fir and other softwood lumber registered the principal gains for lumber, while millwork was significantly higher. As construction leveled off in the second half of the year and production started to outpace shipments, some of the earlier gains for lumber were erased, but prices ended the year well above December 1961 levels. The fact that construction of single-family dwellings, which consume more lumber per unit than other types of residential buildings, did not increase significantly over the year may explain why the price level was lower than in some earlier years when total residential construction was less than in 1962. Southern pine lumber did not share the advance, since a sharp drop in orders near the end of the year brought prices below year-earlier levels. Excess capacity and overproduction depressed plywood prices. The heightened activity in building construction stimulated prices of most nonmetallic mineral building materials. However, a severe cut for one product, asphalt roofing, was sufficient to lower the index slightly for these products over the year. Reductions reflected sharp competition under pressure of more than ample capacity in producing industries.

Although finished durable manufactures declined somewhat on the average over the year, this movement concealed two divergent trends which have been evident among those goods since about 1958. A number of consumer durable goods moved lower in price over the year, continuing the gradual downtrend of the previous 3 years. However, prices of producers' durables moved slightly higher, extending an upward movement that had begun more than a decade before.

Partially responsible for the gradual recession in prices of consumer durables were important increases in productive efficiency in manufacture, changes in product designs making more economical use of materials, and new distribution methods which provided wider markets at retail levels. The more than ample production capacity for many of these products also was a depressing influence. Prices for products such as refrigerators and laundry equipment moved down over the year and were significantly below their levels of the middle and late fifties. The index for the major consumer durable--passenger cars--edged lower over the year, ending the year 3.1 percent under its peak in 1959. Heavy competition from foreign imports was of particular importance for items such as radios, television sets, and other electronic goods for consumers. A major exception to the downtrend among consumer durables was the continued rise in prices of household furniture stemming from higher materials and labor costs.

Generally higher prices for producers' durables--particularly heavy machinery and equipment--also reflected increased costs. Labor and materials together represent a relatively large portion of the total unit cost of many of these products. Furthermore, manufacture of many items of machinery and equipment cannot be carried out with the large-scale automated operations that have resulted in important reductions in costs for some other types of products. Consequently, cost changes tend to be reflected more directly in prices. Also exerting an upward pressure on prices for these producers in 1962 was the higher level of orders for machinery and equipment than in the previous year. New laws providing for tax credits for investments in new equipment and revised regulations for computing depreciation allowances for capital equipment went into effect around the middle of the year. This, no doubt, provided encouragement for some price increases in the latter part of the year--particularly for textile machinery and equipment whose depreciation guidelines were revised earlier than were those for other types of machinery and equipment. The continued trend toward mechanization on farms, together with expanded farm income, lent support to higher prices for agricultural machinery and equipment, while the rise in construction spending helped to boost prices of construction machinery and equipment. A major exception

to the upward trend was the continued price decline for electrical machinery and equipment stemming from excess capacity and severe competition from foreign imports as well as a widespread cost-cutting program.

### Nondurables

After rallying from their 1961 summer lows, at the end of 1961, and remaining at relatively high levels during the first half of 1962, prices of most nondurables (other than foods and feedstuffs) drifted lower in the last 6 months of 1962 as business leveled off. Forces such as overcapacity, competition, or oversupply that had weakened prices a year earlier again exerted a depressing influence. Although manufacturers' sales of nondurables increased over the year, as they have during almost all post-World War II years, the percentage increase was far less than in the corresponding period of 1961 and practically all of the increase was concentrated in the first quarter. Furthermore, for several of the producing industries, particularly of the process type, increases in productive capacity were greater proportionately than the expansion in output and shipments. The resulting easing in operating rates had a depressing effect on prices.

A notable example of this pattern of early price strength and later weakness could be observed among pulp, paper, and paper products. Average prices reached a peak for the year in April, then receded each successive month, ending the year 2.3 percent below their April level and 0.6 percent below the December 1961 figure. Much of the initial strength and subsequent weakness was concentrated in paper other than newsprint and in converted paper and paperboard products such as bags, sacks, boxes, and shipping containers. Woodpulp prices also declined substantially over the year. While output of these products was substantially greater in 1962 than in 1961, capacity utilization in the producing industries actually declined slightly on the average over the year (89 percent vs. 90 percent), and additional downward pressures on prices resulted from accumulating inventories and lower levels of unfilled orders toward the end of the year.

Declines for chemicals represented the continuation of a previous downtrend which had been in evidence since the spring of 1961. Contributing to this downward movement was an expansion in productive capacity which left the industry with a somewhat lower operating rate at the end of 1962 than a year earlier, in spite of substantial increases in output. Additional petrochemical facilities were especially significant. Decreases ranging from 0.8 to 4.9 percent were registered in the indexes for organic industrial chemicals, paint materials, drugs and pharmaceuticals, and mixed fertilizers and fertilizer materials. The sharp 7.1 percent drop for inedible fats and oils reflected the heavier oil supplies generated by increased production of oilseed cake and meal for animal feeding and the declining use of inedible greases for soapmaking.

The decline in the rubber and rubber products index was due largely to competitive price cuts for tires and tubes in the first quarter of the year, only partially restored by the year's end. Although the annual average price of natural rubber was below that of the preceding year, increased buying by foreign users in Far Eastern markets and rising production costs resulted in a higher yearend level in 1962. Synthetic rubber prices, unchanged for more than 5 years, declined in December 1961 and weakened slightly more in 1962 as competition with natural rubber tightened.

Hides and skins prices followed the pattern of most crude and intermediate materials by ending the year substantially lower than the level of December 1961. Heavier cattle slaughter provided an increase in the supply of hides; but because of only a minimal increase in domestic shoe production and a decline in exports, demand for hides did not keep pace with supply. As a result, prices for hides and skins in December 1962 were almost 10 percent below 1961 yearend levels. Sluggish domestic consumption and sharply reduced exports caused a moderate downturn in leather prices. However, other leather products edged up in price largely because of the increases for hides and skins

that had occurred in the latter part of 1961.

Textiles and apparel provided the major exception to the general pattern of weakness for nondurable goods in 1962. Although textile markets were stronger than previously, much of the average price advance for textile products and apparel was explained by the special circumstances of higher costs for raw wool and raw silk. World-wide demand for wool products has been increasing in recent years with rising standards of living. At the same time, domestic flocks of wool-bearing sheep have declined in number and wool production outside the United States has not increased sufficiently to make up the deficit. The higher prices of the raw product were reflected in price advances for woolen fabrics and for a number of apparel items in 1962. The jump in raw silk and silk product prices was more spectacular but appeared to be of a more temporary nature, arising from excessive speculation in certain overseas markets as supplies were limited. Higher prices for burlap also reflected uncertain conditions in overseas supplying areas. Prices of manmade fiber products averaged somewhat higher as demand strengthened for broadwoven fabrics, stimulated by increased apparel production and a shifting of interest away from cotton products because of the legislation then pending that would affect future prices of raw cotton. The latter situation together with import competition largely explained the lower prices for cotton products.

Although the yearend index for fuels and related products and power was slightly higher than December 1961 because of increases for gas fuels and electric power, average prices of refined petroleum products were down somewhat, basically reflecting excess refining capacity. Declines centered in light and middle distillates and residual fuels.

Gasoline prices were 2 percent below 1961 on an annual average basis chiefly because of sharp cuts in prices in the first quarter resulting from the unusually severe winter weather in the Midwest. However, stepped-up nation-wide consumption of gasoline over the course of the year brought prices to the same level as December 1961 by the end of the year. The increased production of gasoline also generated greater supplies of distillates during most of the year, depressing prices of these products.

Higher prices for manufactured animal feeds reflected increased demand as a result of greater numbers of animals on feed and drought conditions early in the year, coupled with a less than proportional increase in production. The over-the-year December to December increase for alcoholic beverages was principally the result of a Government marketing order which limited the volume of grapes available for winemaking and set higher minimum prices for some products.

#### Agriculture-based commodities

As in most post-World War II years, prices of agriculture-based commodities in 1962 moved with little or no reference to developments in the nonagricultural sectors. The principal influences on farm product prices are the various seasonal and cyclical changes in supply, effects of weather, and such long-term developments as the persistent improvement in productive efficiency and gradual shifts in consumption patterns. Processed food prices, also, reflect these factors more than the influence of overall business developments. Since consumer demand for food tends to be relatively inelastic, small or short-term changes in income resulting from business fluctuations normally do not affect demand for food as significantly as they affect the demand for other commodities. An additional influence on processed food prices has been the increasing importance of relatively stable processing and marketing costs. This has tended to dampen short-run fluctuations in prices and has tended to keep them on about the same level in recent years while farm product prices have declined.

In 1962, the dominating influence in the 1.5 percent rise in the farm products index was the sharp boost in livestock and poultry prices. From the beginning of the year a favorable situation existed for the feeding of cattle to obtain higher grades of beef. There was an ample differential between prices of marketed fed cattle and feeder animals, while the cost of feed also was at a favorable level. By spring, shipments of animals to feedlots began to exceed the previous year's level, and this continued throughout the year. In addition, pasture conditions were generally favorable, encouraging farmers to keep range animals off the market. Because of these limitations on supply, total slaughter increased by only about 1.7 percent in numbers of animals, while the lower average weight of animals slaughtered held beef production unchanged. At the same time that supplies were limited, beef consumption continued to increase, bringing stocks below previous year levels. The farmers' withholding program, placing additional pressure on supplies in September 1962, temporarily reduced marketings and pushed livestock prices to their highest levels in more than 3 years. Although prices receded when marketings returned to normal later in the fall, they nevertheless ended the year 4.2 percent above December 1961. Hog prices were an exception to the overall trend, ending the year lower--in spite of the temporary stimulus of the withholding program--as expanded slaughter over the year outpaced consumption. A cutback in production, together with the generally higher meat quotations, pushed up prices of live and processed poultry.

There were several other significant price increases among farm products. The advance for grains was due largely to the reduced crop of winter wheat and strong domestic and export demand for corn and oats. Egg prices rose over the year as consumption expanded faster than supply toward the end of the year. Higher average prices for fresh vegetables resulted from smaller crops for some items, such as lettuce and cabbage.

The most important price decline in 1962 was for fluid milk, as increased production coupled with declining per-capita consumption generated increased supplies. Slightly lower prices for fresh fruits did not reflect the effects of the Florida freeze which came too late to affect prices included in the index for December.

The processed foods index also mirrored developments for livestock, meats and poultry. Higher meat and processed poultry prices kept the index above year-earlier levels during most months of 1962 and were responsible for the higher annual average compared with 1961. However, prices of these products dropped in the last quarter, after the end of the withholding program, and no longer provided an offset to lower prices for some other commodities. As a result, by the end of the year the index dropped (0.1 percent) below its value in December 1961. Heavy carryover stocks and large current packs lowered prices of some canned and frozen fruits and vegetables (prior to the Florida freeze). Heavy supplies of and shifts in consumption patterns away from dairy products depressed these prices. The increased production of vegetable oils as the result of greater output of oilseed animal feeds lowered quotations for edible fats and oils on the average.

## Description of Wholesale Price Index <sup>1/</sup>

### Purpose of Index

The Wholesale Price Index is designed to measure average changes in prices of all commodities sold in primary markets of the United States. It is often used as a general purpose index because of its broad scope, but it is made up of many special groupings or combinations which serve special purposes.

"Wholesale, " as used in the title of the index, refers to sales in quantities, not to prices received by wholesalers, jobbers, or distributors. The index does not measure the price movements of retail transactions, transactions for services (except gas and electricity), construction, real estate, transportation, or securities. The sample of priced items does not include printing and publishing; however, values of physical products of these industries, such as books and magazines, were included in the weight universe for the first time in 1958 and were assigned to the pulp, paper, and allied products major group. The value of separate services performed for others was excluded. Prices of many of the raw and finished materials used in construction or in printing and publishing--lumber, bricks, structural steel, millwork, paper, etc.--are reflected in the index.

### Selection of Sample

The price universe for the index comprises all commodities produced or imported for sale in the United States (including Alaska and Hawaii). A sample of approximately 2,200 priced items is chosen to furnish an adequate measure of average price changes in the primary markets of the United States. Although a smaller sample would serve this purpose for an overall average, a larger sample is chosen to measure price changes for the many subgroupings of the index computed for special purposes.

The monthly Wholesale Price Index is based upon a sample of commodities, a sample of specifications for the commodities, and a sample of reporting sources for the specifications. These samples are selected after consultation with trade associations or with other representatives of industry. The commodities chosen generally include those with the largest shipment values as shown by the industrial censuses. Commodities with smaller shipment values are included if their price movements are sufficiently unlike those of other commodities.

The commodities selected are broadly defined in the Census of Manufactures. For example, "jelly, pure, grape," and "unalloyed copper plate, sheet, and strip," are designations of 7-digit Census product codes. To assure that the measure of price changes reflects only price movement--without reflecting the influence of changes in quantity, quality, terms of delivery, or type of buyer--the items are defined specifically, such as:

"Jelly, pure, grape, 10oz. jar, 2 dozen jars to case, manufacturers' price, in lots of more than 25 cases, f.o.b. distribution point, per case;" and "copper sheet, cold-rolled, 16oz., 24" x 96", in lots of 5,000lbs. and over, f.o.b. mill with freight allowed, per pound."

Thus, a sample of specifications is chosen to represent the commodity. The specification describes the characteristics of the commodity, which define quality and other price-determining factors. The specifications chosen are usually those which describe the largest dollar volume of sales for the commodity.

---

<sup>1/</sup> For a detailed description of the Wholesale Price Index, see Techniques of Preparing Major BLS Statistical Series (BLS Bulletin 1168, 1955), ch. 10.

The reporter sample is selected to give representation by size of company and by geographic distribution of the industry whenever necessary. In all cases, a minimum of three reporters is sought to permit publication of both prices and item indexes. Above this minimum, the number of reporters selected depends on the variability of pricing practices among individual firms, the number of firms producing the item, and the geographic distribution of the industry.

### Prices

The prices used in constructing the index are those which apply as nearly as possible to the first significant commercial transaction in the United States. Later transactions for the same item at other stages in the distribution cycle are not included. However, as raw materials are transformed into semifinished and finished goods, the resulting products are represented according to their importance in primary markets.

Most prices are obtained by mail from the manufacturer or other producer, a few are reported by trade associations, and some are taken from trade publications or from Government agencies which collect price quotations as part of their regular work. Table 4 of this volume shows the number of price series from each type of source as of January 1962.

Prices obtained from manufacturers or other producers are subject to the applicable trade and quantity discounts.<sup>2/</sup> Cash and seasonal discounts are deducted from the price when it is determined that most buyers avail themselves of the reduced prices. Excise taxes are excluded from the price. Closeout sales prices are normally not used. Free deals or allowances are reflected when possible in arriving at the net price to be included in the index calculation. Nominal prices are used when they are indicative of the market situation and no other price is available.

Before 1952, prices were monthly averages of 1-day-a-week prices. Thereafter, prices have been, for the most part, those of the Tuesday of the week which includes the 15th of the month. For some commodities, however, another day may be selected as a more representative trading day, e.g., many farm products are priced as of Monday. Whenever possible, commodities are priced at the production point or at the central marketing point. Prices at delivery point are used only when it is the practice of the industry to quote prices on a delivered basis.

The index is intended to measure price changes between two periods of time, without reflecting the influence of changes in quality, quantity, terms of delivery, level of distribution, unit priced, or source of price. To accomplish this, the index calculations between two periods of time are based on the relative changes in prices of items with identical or nearly identical specifications.

### Substitutions of Items

Adherence to specification is especially difficult in a period when there are many changes in the goods marketed, with new items coming on the market and old items disappearing. Although this is particularly true of manufactured products, such as machinery, household appliances, and furniture, it is also true for nonmanufactured products. Changes may occur in the size of containers used in marketing fruit, for example, or in the market grades of livestock or in the delivery terms for steel scrap.

---

<sup>2/</sup> For a description of the study of discounts used in the Wholesale Price Index, see Supplementary Inquiry on Wholesale Price Reports, in Wholesale Prices and Price Indexes, 1958 (BLS Bulletin 1257, 1959), p. 10.

When new commodities are introduced or when specifications of existing commodities are changed, every effort is made to insure that only price changes influence the index. The method of introducing an altered article or a change in selling terms is called a substitution. A substitution may be made by direct comparison or by linking. Each time a change in specification occurs, the Bureau appraises the significance of the change to ascertain whether an actual price change occurred. If the specification change was minor and did not involve price-making factors, the substitution is effected by direct comparison. This means that any price change between the old and the new item is reflected in the index. When changes in specification are major and no real price change occurred or no information can be obtained relative to an actual price change, the substitution is made by linking and no change is reflected in the level of the index. This means that the difference in price is not permitted to affect the index level.<sup>3/</sup> Prices before and after the link, however, are not comparable and the decimal part of the code number is changed to show noncomparability.<sup>4/</sup> Linking is also used for the addition or deletion of items from the index, the addition or deletion of a company from a composite series, and a change in the source of price.

Some durable goods, such as automobiles, have periodic model changes. Price increases or decreases of these goods, which result from the addition of features which formerly sold at extra cost or from the deletion of equipment which was standard, are not reflected in the index. When the new model is reasonably comparable with the old, a direct comparison of prices is made and the difference is reflected in the index.

In the event production of a specified commodity is discontinued by a reporter, its importance is significantly reduced, or its price becomes unavailable for any other reason, the Bureau collects price data for a similar or a replacement item. This item may or may not vary considerably from the item replaced. Prices are obtained for the new item and for the one to be discontinued for a 1-month overlap period (the last month that the original item was priced). In some cases an item is discontinued before a replacement can be found. When this happens an estimated overlap period price, for the purpose of linking, can be obtained from the movement of related items.

#### Collection of Data

The initial collection of data for each commodity specification from each reporting source is usually made by a personal visit to the reporting company. At that time, detailed information is obtained concerning the pricing structure of the industry and the commodity. This includes information such as:

1. Price-making factors for the commodity.
2. Distribution of sales to the various classes of buyers.
3. The type and amount of discounts or allowances to each class of buyer.

<sup>3/</sup> For example: The September price for a specification for a machinery item used in the calculation of the index was \$2,347.50. In October, a new model of the machine was introduced, priced at \$2,562.60. The new model had a more powerful motor and larger tires valued at \$186.20 more than the value of those used on the former model. For linking, the September price of the new model was estimated at \$2,533.70 (\$2,347.50 September price of former model plus \$186.20 increase in value of motor and tires). The price comparison between September and October was based on the estimated September price of \$2,533.70 and the reported October price of \$2,562.60. Thus a 1.1-percent price increase was reflected in the October index while the price change due to quality improvement (more powerful motor and larger tires) was not reflected.

<sup>4/</sup> Refer to section on Comparability of Prices and Indexes, p. 12

4. The normal size of sale (quantity) to each class of buyer.
5. The terms of delivery to each class of buyer.
6. The usual method of effecting a price change.
7. Applicable excise tax.
8. The market area served for each commodity and for each class of buyer.
9. Type of packaging for each commodity.
10. Means of delivery for each commodity.

After regular reporting has been established, prices are collected by mail, usually on a monthly basis, by means of a shuttle schedule.

Reporting companies are asked to report all changes in list price, excise tax, discounts or allowances, description of the commodity specification, terms of delivery, and class of buyer. This is necessary in order to insure the reflection of all real price changes and to exclude the effect of a change in quality or a change in the selling terms.

#### Weight Universe

The Wholesale Price Index is calculated as a weighted average of price changes. The weights represent the total net selling value of commodities produced and processed in this country, including Alaska and Hawaii, (or imported for consumption), and flowing into primary markets.<sup>5/</sup> The values are f.o.b. production point and are exclusive of excise taxes. The value of interplant transfers, military products, and goods sold at retail directly from producing establishments are also excluded.

The weight universe includes values from industries classified as manufacturing, agriculture, forestry, fishing, mining, quarrying, well operation, and gas and electricity public utilities. It includes values for goods competitive with those produced in the producing sector of the economy, such as waste and scrap materials. All systematic production is included; but individually priced items, such as works of art, are excluded.

Civilian goods normally purchased by the Government are included, but production of military goods is excluded. Sales by the Government are excluded because the Wholesale Price Index refers to the private producing sector of the economy. However, Government sales of electric power are included because they are considered competitive with free market sales.

The import values include imports from foreign countries, Puerto Rico, and the Virgin Islands.

Each commodity price series in the index is representative of a class of prices and is assigned its own weight (the shipment value of the commodity) plus the weights of other commodities not directly priced but whose prices are known or assumed to move similarly.

---

<sup>5/</sup> The revised Wholesale Price Index (1947-49=100) introduced in January 1952, but calculated retroactively to 1947, represented a changed concept in weighting structure. Priced items in the former index (1926=100) were weighted only by their own market value (quantity marketed times price).

The assignment of price movements for priced commodities to those for which quotations are not obtained, based on the assumption that their price movements are similar, is referred to as imputation. For some commodities--such as ships and some kinds of custom-made machinery it is not possible to obtain direct measures of price movement. The weights for such items are added to those for other commodities or groups of commodities for which prices are available, thereby imputing the price movements of the latter to the unpriced commodities. Usually this assignment of weights is made to priced commodities which have a similar manufacturing process. In so doing, it is assumed that the movements of prices for the unpriced commodities are more accurately estimated on the basis of changes in prices of items to which their weights are assigned than they would be from changes in the all-commodities index.

Weights based upon the industrial censuses for 1947 were used in the index from January 1947 through December 1954. Adjustments were made in January 1955 to align the major group weight totals with the 1952-53 average shipment values. Weights introduced in January 1958 were based on the industrial censuses for 1954. These weights were used through 1960. Value data from the 1958 industrial censuses were introduced effective with the January 1961 final index. 6/ These weight revisions do not alter the basic concept of the WPI.

### Index Formula

In concept, the Wholesale Price Index is calculated according to a modified Laspeyres formula:

$$(1) I_i = \left[ \frac{\sum Q_a P_i}{\sum Q_a P_o} \right] \times 100, \text{ where } P_o \text{ is the price of a commodity in the comparison period and } P_i \text{ is its price currently. } Q_a \text{ represents the quantity shipped during the weight-base period.}$$

An alternative formulation more closely approximates the actual computation procedure:

$$(2) I_i = \left[ \frac{\sum (Q_a P_o) (P_i / P_o)}{\sum Q_a P_o} \right] \times 100$$

In this form, the index is a weighted average of price relatives for each item ( $P_i / P_o$ ). The expression ( $Q_a P_o$ ) represents the weights in value form and the "P" and "Q" elements (both of which may originally relate to period "a") are not derived separately. Each value weight includes not only the value of items priced but also the values of all imputed items. When new weights are introduced, the index with new weights is linked to the index constructed with the earlier weights. The weight adjustment itself therefore affects only the later calculations of average price change. When specifications or samples change, the item relatives must be computed by linking (multiplying) the relatives for the separate periods for which the data are precisely comparable.

6/ For a discussion of the effects of the January 1961 weight revision on the WPI, consult Wholesale Prices and Price Indexes, 1961 (BLS Bulletin 1382, 1964), p. 5.

## Publication and Correction Policy

### Publication of Prices and Indexes

The Wholesale Price Index data are published in four forms:

1. Monthly press releases and reports.
2. Annual or other periodic bulletins.
3. Tabulations of historical series.
4. Tables in the Monthly Labor Review

The first publication of wholesale price data in the press releases and reports are considered preliminary and are so identified. This is necessary because individual reports are often not received in time to be included in the first calculation. Preliminary publication is limited to index numbers. Preliminary prices are not published. Final publication of monthly indexes and prices accompanies the publication of preliminary indexes for the succeeding period. Annual average indexes for levels down to and including the product class and for special groupings are published, as final, in a monthly detailed report as soon as practicable after December final figures have become available. Annual average indexes for commodity items are also considered to be final at this time even though they are not published. Complete index and price data are published at a later time in a bulletin covering one or more years.

In January 1963, a new policy was initiated concerning the publication standards set for individual item indexes. When a cell drops to one reporter, that particular index is withheld from publication to avoid possible disclosure of information concerning an individual firm. The cell must be rebuilt to three reporters before index publication is resumed.

Monthly prices published by the Bureau are averages of prices obtained directly from reporting firms or from secondary sources, such as trade or Government publications. Monthly prices are not published: (1) When the average price is based on reports from fewer than three companies; (2) for seasonal commodities for those months in which they are not on the market; and (3) if such publication might disclose the activities of an individual firm.

Annual average prices for other-than-seasonal items are based on 10 or more monthly figures published for the same specification. Annual average indexes for other-than-seasonal items are published when 10 or more monthly indexes have been published. Annual average prices for seasonal items are published when prices have been published for more than three-fourths of the "in season" months. Annual average indexes for seasonal items are published when indexes have been published for more than one-half of the "in season" months.

New indexes for individual commodities or for commodity groupings are introduced only once a year--in the (final) January calculation. Until January 1963, the January of the year of introduction was used as the base period for an index, with the previous December index also shown to provide continuity. Since then, the base has been the preceding December. When prices are available for earlier periods than that in which the item was introduced into the index, item indexes are calculated and are available on request.

### Comparability of Prices and Indexes

Noncomparability in the price series is shown in the code number by addition of digits after a decimal (e.g., 01-31-01.01). Each successive break in the same series is

numbered consecutively (e.g., 01-31-01.02, 01-31-01.03, etc.). Such prices are not comparable with prices quoted for earlier periods because there has been a break in the series resulting from a change in the reporter sample, a modification in the specification, or a change in the unit of quotation or the delivery terms. The price indexes for the individual commodities, however, are adjusted so that they are continuous and comparable, regardless of breaks in the series of prices.

**Specifications.** Specification changes during 1962 are shown for each major group in the appropriate section of this bulletin. The specifications represent the composite of the several reporter series included in the average price. Where a specification lists more than one class of buyer or more than one delivery term, the reporter series are not identical. One company's price may be to the jobber, f.o.b. plant; another company's price may be to the wholesaler, f.o.b. plant with freight allowance. The published specification is made broad enough to cover all of the series included in the average price.

A specification change not accompanied by a code change indicates that the change was of a minor nature and prices are comparable before and after the change. Sometimes the decimal part of a code number may be changed where no change in specification is indicated. In this case, a change has been made in source of the price by adding or dropping a reporter series; or the use of an additional discount, previously in effect but not used, has been initiated in the calculation of the index. Prices before and after the change are not comparable.

#### Correcting Errors in Published Price Indexes and Prices

Sometimes an error in a reported price or in a calculation is found after the prices and indexes have been issued as final. Corrections of previously published prices and indexes are made under the following circumstances:

Corrections in Prices or Item Indexes. A correction of less than 1 percent in a price or in an item index is not published. An error of 1 percent or more in a price or in an item index is corrected, and the corrected figure is published in the next subsequent release which normally carries the series affected. When corrections are made in prices, corresponding corrections are made in the item indexes.

Corrections in summary level indexes. A correction which would cause a change of not more than one-tenth of an index point in the index for any grouping is not published. Adjustment for such an error is made in calculating the current index for the month immediately following its discovery. A correction which would require a larger change in the index for any grouping is made, with appropriate explanation, in the release immediately following the discovery of the error.

An error of no more than one-tenth of an index point in the all-commodities index is not corrected, but adjustment for the error is made in the calculation of the current month's index. An error which affects the published all-commodities index by two-tenths or more of an index point is rare. If such an error does occur, the Bureau usually corrects the published index retroactively to the time when the error occurred but may make the required adjustment in calculating the current index number, depending upon the statistical or economic significance of the correction.

#### Rebasing of the Wholesale Price Index 7/

Beginning with the final data for January 1962, the WPI was converted from a 1947-49 base to 1957-59=100. This was done in accord with a request of the Office of Statistical Standards of the U.S. Bureau of the Budget that all general purpose indexes of the Government be on the new base. A more current reference base will facilitate comparisons of movements for recent periods both within and among index series. Such recent

---

7/ Historical tables, showing the 1957-59=100 indexes for component parts of the WPI from the beginning of each series, are available upon request.

movements are ordinarily of greatest interest and are also the most meaningful comparisons.

The change in only the base of the index does not affect the movements portrayed by the index between any two periods of time. The relative or percent change of an index number, between two periods, will be the same despite the changes in the actual index numbers used.

Many of the component parts of the WPI are still on a base other than 1957-59. This is due to the fact that these indexes were introduced into the index at a period later than January 1957.

### Conversion Procedure

The Wholesale Price Indexes were rebased by obtaining the 36-month total of the indexes for the period January 1957-December 1959, dividing the figure into 3,600 (the desired 3-year total), and multiplying each monthly index by this rebasing factor. Annual averages were recomputed from the rebased monthly data.

For seasonal series where data for each month were not available, the rebasing factor was derived from the sum of the three annual average indexes divided into 300. For these series, annual averages were recalculated and were based on only those months for which actual prices were reported. Before 1953, they had been based on estimates for the out-of-season months as well.

Conversion ratios for each WPI series are published in table 5 of this bulletin. Most series were on a 1947-49 base, but a number of indexes were on other bases where data were not available from January 1947. Indexes on the base 1947-49=100 (or any other particular base period used between January 1947 and January 1957) may be converted to a 1957-59 base by multiplying the previous published index by the appropriate rebasing factor. On the other hand, index users who wish to project the previously published series forward, for contract adjustment or other reasons, need merely divide the appropriate 1957-59 based index by the rebasing factor for the series.

Example 1. The index for machinery and motive products for October 1961 on the 1947-49 base is 152.8. To convert this index to the 1957-59 base, multiply by the factor, 0.6683003 (from Table 5). Thus, 152.8 multiplied by 0.6683003 equals 102.1 (1957-59=100).

Example 2. The index for grains for February 1962 is 96.7 on the new 1957-59 base. To convert this figure to the 1947-49 base divide by 1.2455454 (from table 5). Thus, 96.7 divided by 1.2455454 equals 77.6 (1947-49=100).

### Relative Importance

The rebasing of the indexes does not affect the relative importance of the individual series composing the WPI.

#### Relative Importance of Wholesale Price Index Components

The relative importance of an item represents its basic value weight used in the index multiplied by the relative of price change between the weight date to a later date (December 1962, for example) and the result expressed as a percentage of the total for all commodities or for the major group.

Changes in relative importance of an item result from (1) weight revisions such as those of January 1958 and January 1961; (2) minor weight adjustments to take account of the addition of new items or the deletion of an item; and (3) different rates of price change among the various items. If there were no weight revisions or adjustments, and if the prices of all items changed at the same rate, their relative importance in the index would not change.

The relative importance figure for a commodity represents the value of the commodity itself plus the value of unpriced commodities assumed to have price movements similar to those of the priced item. Table A shows the relative importance of the major groups in December 1960, December 1961, and December 1962, all based on the 1958 weights. Information on the use of relative importance data is contained in Wholesale Prices and Price Indexes, 1954-56 (BLS Bulletin 1214, 1957), pp. 12-14.

Table 2A, (p.32) shows the relative importance of items in the WPI as of December 1960, December 1961, and December 1962, both before and after the changes in sample in January 1963. All of these relative importances are based on 1958 weights.

Description of Special Commodity Grouping Wholesale Price Indexes

Special commodity grouping indexes are designed to meet special needs of index users. All of them are made by regrouping commodities included in the comprehensive Wholesale Price Index; and except for Construction Materials (formerly titled Building Materials) the weights, since the beginning of the indexes in 1947, have been those used in the Wholesale Price Index.

The composition of each index is described below. Code numbers refer to the Wholesale Price Index commodities or groupings of commodities. Detailed specifications for each of the items and their relative importance in the all-commodities index are published in the Wholesale Price Index annual bulletins.

Wholesale Price Indexes by Stage of Processing. This set of indexes, formerly designated as Economic Sector Indexes and described in an earlier publication, 8/ includes all component series of the comprehensive Wholesale Price Index. Index numbers for 1962 appear in the summary section of this bulletin.

Wholesale Price Indexes by Durability of Product. This set of indexes, described in an earlier publication, 9/ includes all component series of the comprehensive Wholesale Price Index. Index numbers for 1962 appear in the summary section of this bulletin.

Construction Materials Index. This index, formerly titled Building Materials, consists of a grouping of selected components of the comprehensive Wholesale Price Index. From 1947 through 1957, it was combined with special weights relating to the use of the included commodities in construction. Beginning in January 1958, the weighting structure was changed to conform to that of the comprehensive Wholesale Price Index. The composition of this index is described in an earlier publication.10/

The special index for all foods has been extended back to 1926 by linking with the former index for foods; and the special index for construction materials has been extended back to 1926 by linking with the former index for building materials. The total steel mill products index has been extended back to 1939 by linking with the combined movement of the steel mill products items in the former index. The "links" were made by means of conversion factors based on the old and the new series as of January 1947. These data are available on request.

The special indexes are calculated by combining the codes listed after each group:

Commodity grouping	Composition of indexes	Bulletin section
All foods -----	Processed foods (code 02) Fresh and dried fruits and vegetables (code 01-1) Eggs (code 01-6)	2
All fish -----	Unprocessed fin fish (code 02-23) Fresh processed fish (code 02-24) Frozen processed fish (code 02-25) Canned fish (code 02-26)	2

### Section 3. Textile Products and Apparel

#### Description of Textile Products and Apparel Group Index

There were no major changes in the group in 1962.

In the underwear and nightwear product class (03-55), one item was discontinued, and another introduced. The item, man's union suit (03-55-02), was deleted due to its declining significance in the total market, and thermal underwear (03-55-04) was added because of the increasing importance of this product.

The changes in relative importance caused by this change in the sample are shown in the following table. (See p. 139 for complete specifications.)

Code number	Commodity	Percent of all items in total index (based on 1958 values)		
		December 1961 revised weight	December 1961 former weight	December 1960 former weight

03-55-22	Shorts, men's, woven -----	.019	.019	.019

Due to its declining importance, the cell for men's rayon jacket (03-52-86), was discontinued in June and its weight transferred to another jacket at the beginning of the following year. Owing to a sharp decline in the value of production of men's suspenders (03-52-76)--from \$12 million to \$4 million--as well as the prevailing small demand for the item, it was discontinued in February of the year and its weight was assigned to the product class (03-52) Men's and boys' apparel.

The number of items by subgroup as of January 1962 was as follows:

Code	Grouping	Number of items
03	Textile products and apparel -----	190
03-1	Cotton products -----	56
03-2	Wool products -----	18
03-3	Man-made fiber textile products -----	30
03-4	Silk products -----	2
03-5	Apparel -----	78
03-6	Miscellaneous textile products -----	6
03-7	Plastic products <sup>1/</sup> -----	0

Section 5. Fuels and Related Products, and Power

Description of Fuels and Related Products and Power Group Index

There were no major changes in the group in 1962.

Grade 26-70 natural gasoline (05-62-01) was deleted from the natural gasoline product class (05-62), despite its somewhat increased importance, because prices were not available.

The changes in relative importance caused by this change in the sample are shown in the following table. (See p. 160 for complete specifications).

Code number	Commodity	Percent of all items in total index (based on 1958 values)		
		December 1961 revised weight	December 1961 former weight	December 1960 former weight
05-6	Crude petroleum and nat. gasoline --	0.783	0.783	0.778
05-61	Crude petroleum -----	.783	.668	.663

Section 6. Chemicals and Allied Products

Description of Chemicals and Allied Products Group Index

There were no major changes in the group in 1962.

In the organic chemicals product class (06-12), quebracho extract (06-12-86) was deleted from the index because of its declining use in tanning.

The changes in relative importance caused by this change in sample, are shown in the following table. (See p.176 for complete specifications.)

Because there is no longer any domestic production of nicotine sulfate (06-12-79), it was discontinued from the index in May 1962. The weight for this item has been assigned to rotenone (06-12-87), which represents domestic natural insecticides. Lithopone (06-22-26) has been dropped from the index--in October--due to its declining importance as a paint pigment. Its weight was distributed among the four other cells for pigment materials: iron oxide (06-22-11), white lead (06-22-16), titanium dioxide (06-22-21), and zinc oxide (06-22-66).

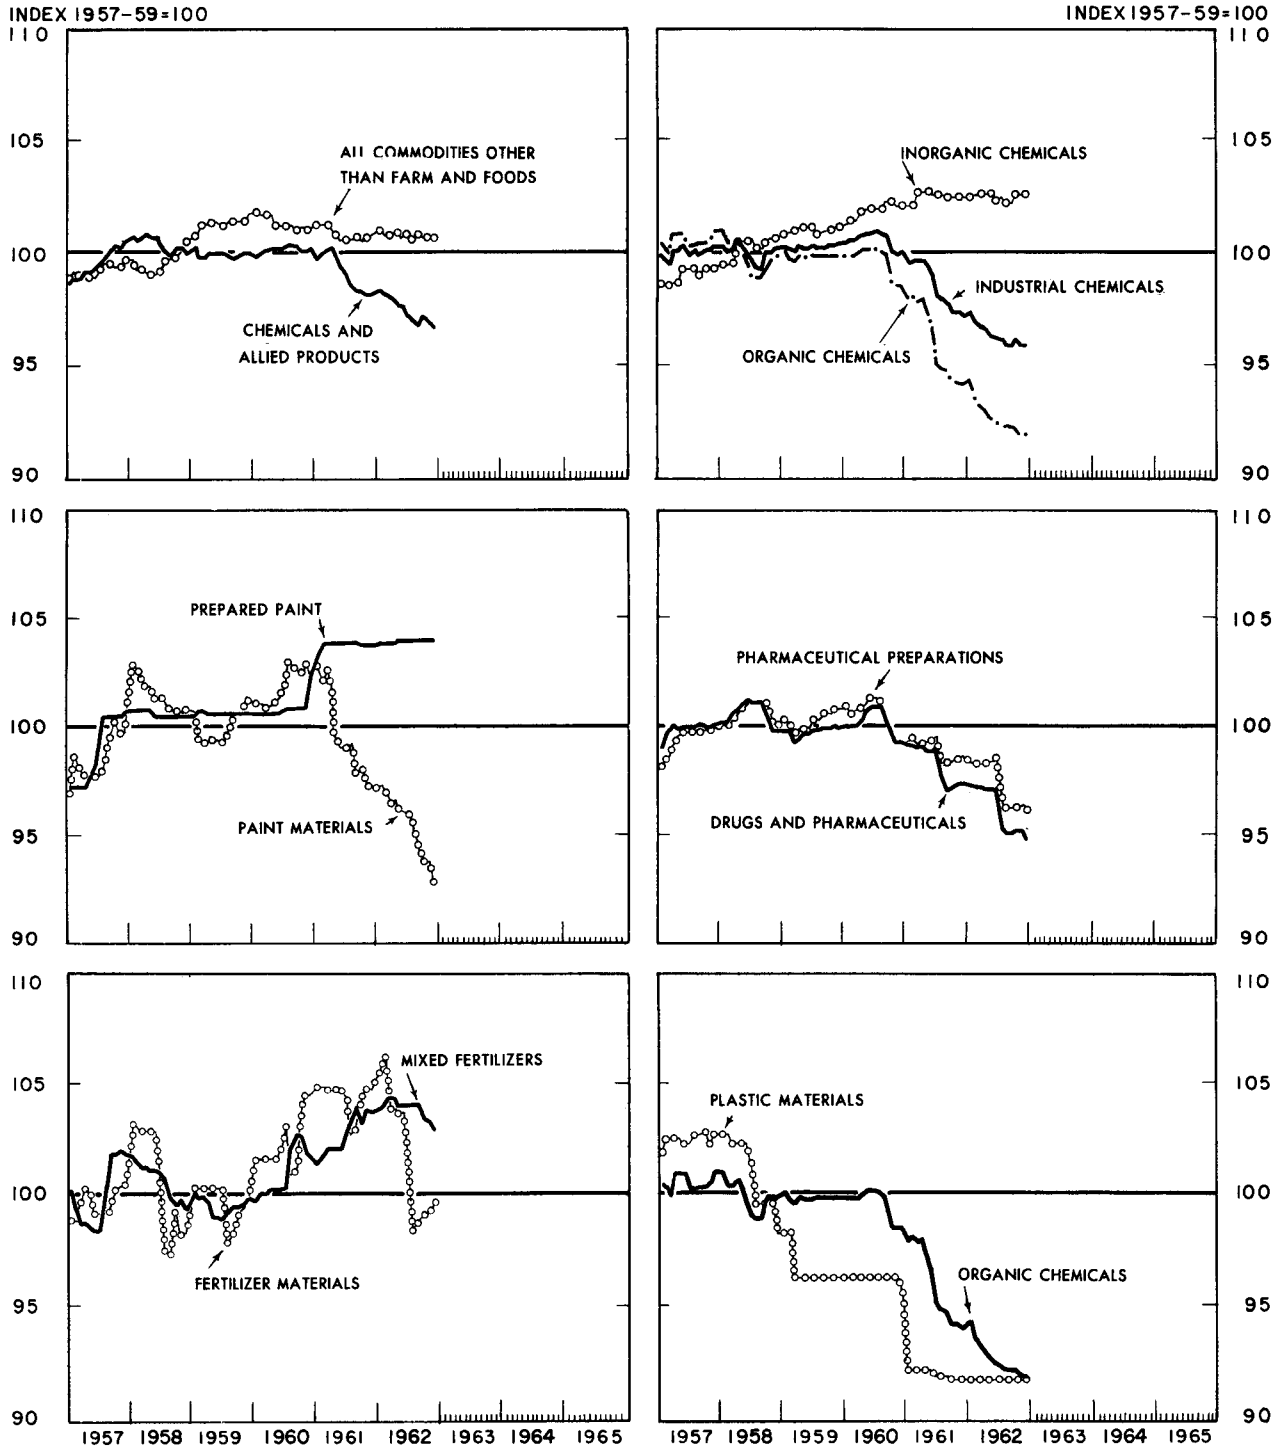

The number of items by subgroup as of January 1962 was as follows:

Code	Grouping	Number of items
06	<b>Chemicals and allied products</b> -----	354
06-1	Industrial chemicals -----	114
06-21	Prepared paint -----	7

Section 7. Rubber and Rubber Products

Description of Rubber and Rubber Products Group Index

There were no major changes in the group in 1962.

Toplift sheet (07-32-01) was deleted since it no longer accounted for a significant part of product class 07-32 (rubber heels and soles). The changes in relative importance caused by this change in the sample are shown in the following table. (See p. 188 for complete specifications.)

Code number	Commodity	Percent of all items in total index (based on 1958 values)		
		December 1961 revised weight	December 1961 former weight	December 1960 former weight
07-32	Rubber heels and soles -----	0.042	0.042	0.042

Section 9. Pulp, Paper, and Allied Products

Description of Pulp, Paper, and Allied Products Group Index

There were no major changes in the group in 1962.

Two additional items were introduced in the woodpulp subgroup (09-1) on the recommendation of a trade association. Chemical sulfate, semibleached woodpulp (09-11-02) and chemical sulphite, unbleached woodpulp (09-11-22) now account for a significant part of total woodpulp produced.

In the wastepaper subgroup (09-2), one item was discontinued, but three new items were introduced. The series (09-21-01), for paper used in books and magazines, was deleted because it no longer adequately represented high-grade wastepaper.

The three items introduced in order to establish a better sample for high-grade wastepaper were: double-lined, kraft corrugated clippings, semi-chemical (09-24-01); double-lined kraft corrugated clippings mixed (09-25-01); and white news blanks (09-26-01). Studies have shown that New York City wastepaper prices do not adequately reflect price movements and trends in the other major market cities or areas, such as Boston, Philadelphia, Chicago, and Los Angeles. For this reason, sample coverage is being broadened for each series to include these major domestic marketing areas.

A new item, acoustical tile (09-61-08), was introduced into the building paper and board subgroup (09-6).

The changes in relative importance caused by these changes in the sample are shown in the following table. (See p.208 for complete specifications.)

Section 10. Metals and Metal Products

Description of the Metals and Metal Products Group Index

There were no major changes in the group in 1962.

Seven new series introduced into the iron and steel scrap product class (10-12) will increase the proportion of scrap items priced directly. The added series steel scrap, No. 1 bundles, in five marketing areas (10-12-6-51, -52, -53, -55, -57); and steel scrap, stainless bundles, in two marketing areas (10-12-7-61, -62) will also reflect the price variations among the scrap items and markets.

Drop forgings of miscellaneous alloy steel (10-15-53) were added to foundry and forge shop products (10-15) to give representation to this increasingly important product.

Special high-grade zinc (10-22-33) was introduced as a nonferrous metals item (10-2) since it appears to have different price movements from related products.

A round, 1-quart oil can (10-31-08) was added to the metal containers subgroup (10-3) because of its rising use in industry.

In order to increase the number of items directly priced in the metal tanks product class (10-72), a 30,000-gallon pressure vessel (10-72-03) was introduced.

The changes in relative importance caused by these changes in the sample are shown in the following table. (See p.229 for complete specifications.)

Section 11 Machinery and Motive Products

Description of Machinery and Motive Products Group Index

There were no major changes in the group in 1962

In the farm and garden tractors product class (11-11), the tricycle, row-crop, under 30-belt horsepower, gasoline-fueled tractor (11-11-01) was deleted because of its declining share of the market.

Two series were added to the agricultural machinery, excluding tractors product class (11-12). A forage harvester, flail-type (11-12-60) and a power unloading wagon box (11-12-92) were introduced to give representation to these important products which appear to have different price movements than other items in the same product class. Seven other items of agricultural machinery were discontinued because of their declining importance. They were 11-12-03, -04, -21, -32, -43, -71, and -73

In the agricultural equipment product class (11-13), one type of milker (pipeline unit, 11-13-21) was discontinued because its price trend was similar to that of the pail-milking machine.

The acetylene generator (11-35-31) was deleted from product class 11-35 (other metalworking machinery) because domestic sales of this product are too small in volume to provide a representative price trend.

The automatic beverage vending machine, bottle type (11-53-24) was added to the office and store machines and equipment product class (11-53) because of its wide-spread use and consistent sales growth

The changes in relative importance caused by these changes in the sample are shown in the following table. (See p.253 for complete specifications.)

The 4-wheel scraper (11-25-01) was discontinued in April due to the decreasing relative importance of small capacity construction equipment. Its weight was transferred to (11-25-02) a larger capacity 4-wheel scraper.

In October, one of the automobile series was discontinued.

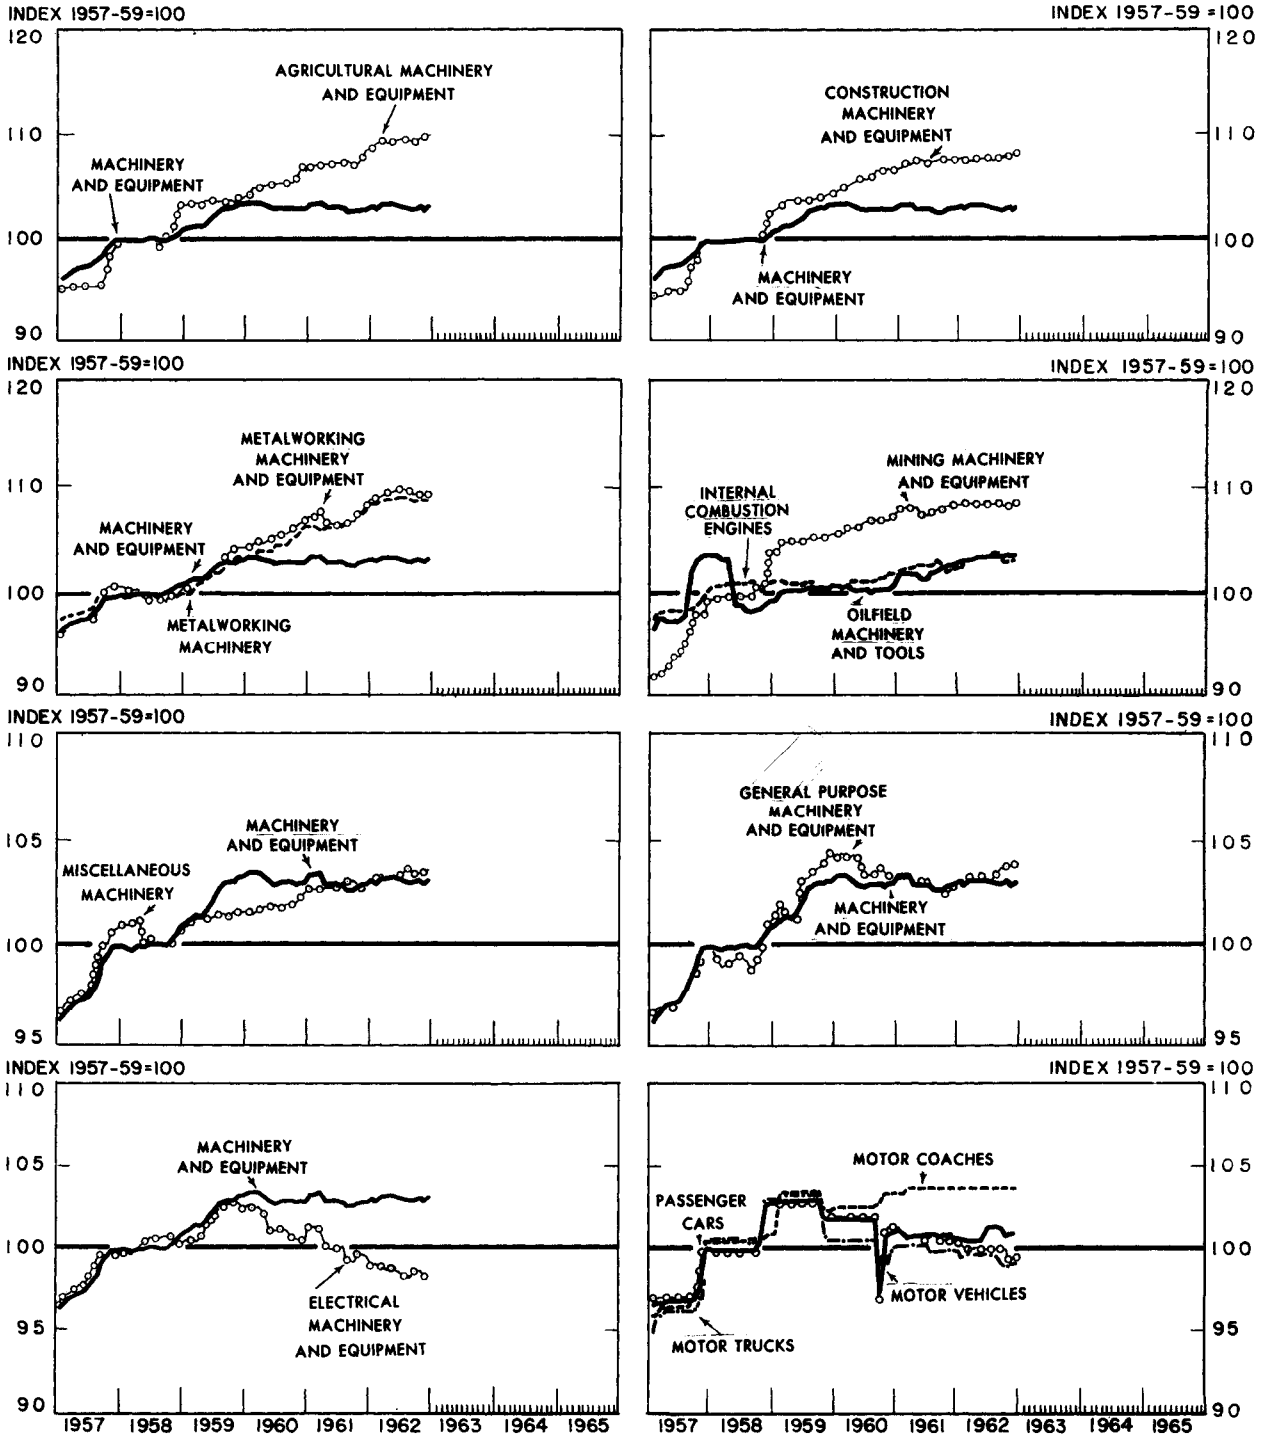

The number of items by subgroup as of January 1962 was as follows:

Code	Grouping	Number of items
11	Machinery and motive products -----	553
11-1	Agricultural machinery and equipment -----	54
11-2	Construction machinery and equipment -----	47
11-3	Metalworking machinery and equipment -----	83

11-61-03.01	Homogenizer, up to 1500 gallons per hour capacity; manufacturer to user, f.o.b. factory.	each		11-62-07	Spinning frame for woolen yarn, 5" or 6 1/2" gauge, 144 or 152 spindles per frame; manufacturer to user, f.o.b. factory.	each	
11-61-03.02	manufacturer to user or jobber		Mar. 1962	11-62-08	Twisting frame, 100 or 212 spindle machine; manufacturer to user, f.o.b. factory.	each	
11-61-04	Ice cream freezer, continuous type, up to 300 gallons mix per hour; manufacturer to user, f.o.b. factory.	each		11-62-09	Cloth winding machine, 60" wide; manufacturer to user, f.o.b. factory.	each	
11-61-05	Soft ice cream freezer, floor type, 3 1/2 or 4 gallons mix storage capacity; manufacturer to dealer or distributor, f.o.b. factory.	each		11-62-10	Cone winding machine, for cotton, woolen, and spun synthetics, 100 spindles; manufacturer to user, f.o.b. factory.	each	
11-61-10	Dough mixer, capacity 1300 or 1600 lbs. of dough; manufacturer to user, f.o.b. factory.	each		11-62-12	Warper, heavy duty, high speed, direct-gear drive, 100-900 yards per minute; manufacturer to user, f.o.b. factory.	each	
11-61-11	Oven, travelling tray, 36 trays-26"x112", direct gas fired; manufacturer to user, f.o.b. factory.	each		11-62-13	Feeder, automatic, for scouring, opening and picking machines, 48" wide; manufacturer to user, f.o.b. factory.	each	
11-61-11.01	26" or 27"x112"		Mar. 1962	11-62-30	Power loom, 46" or 56" between swords; manufacturer to user, f.o.b. factory.	each	
11-61-13	Oven, revolving tray, 6 trays-20"x74" or 22"x80", gas fired; manufacturer to jobber, f.o.b. factory.	each		11-62-31	Knitting machine, for seam-free nylon hosiery, 60 gauge, 80-needle gauge, 474 needles; manufacturer to user, f.o.b. factory.	each	
11-61-14	Bread slicing machine, band type, 3"-7" loaf width, 7"-18" loaf length, 3"-6" loaf height, thickness adjustable from 3/8"-5/8"; manufacturer to user, f.o.b. factory.	each		11-62-32	Knitting machine, for men's and boys' hosiery, 48-needle gauge, 200 needles, 3 1/2" diameter; manufacturer to user, f.o.b. factory.	each	
11-61-15.01	Bread wrapping machine, 32-75 packages per minute, uses all types of wrapping material; manufacturer to user, f.o.b. factory.	each		11-62-33	Knitting machine, for jersey fabric, 20" machine, 24 feeds, 18 cut; manufacturer to user, f.o.b. factory.	each	
11-61-16	Divider, 4 pocket, 8-36 oz. scaling range, 22-66 pieces per minute; manufacturer to user, f.o.b. factory.	each		11-62-34	Knitting machine, for ribbed fabric, 20" to 26" diameter, 20 to 24 feeds, 18 to 24 cut; manufacturer to user, f.o.b. factory.	each	
11-61-16.01	8 to 36 oz. - 8 to 42 oz. scaling range, 22 to 66 - 18 to 70 pieces per minute		Mar. 1962	11-62-34.01	20" to 30" diameter, 20 to 44 feeds, 14 to 16 cut		Apr. 1962

Section 12. Furniture and Other Household Durables

Description of Furniture and Other Household Durables Group Index

There were no major changes in the group in 1962.

In the small electric appliances product class (12-46), the desk-type fan (12-46-01) was deleted because it no longer represented a significant portion of total value. In its place, a new cell for window fans (12-46-02) was introduced.

The self-propelled rotary lawnmower (12-66-22) was introduced into the lawnmowers product class (12-66) because of its increased importance.

The changes in relative importance caused by these changes in the sample are shown in the following table. (See p. 275 for complete specifications.)

Code number	Commodity	Percent of all items in total index (based on 1958 values)		
		December 1961 revised weight	December 1961 former weight	December 1960 former weight
12-46	Small electric appliances -----	0.175	0.175	0.176
12-46-01	Fan, under 12 inches -----	--	.062	.063
12-46-02	Fan, electric, window type -----	.062	--	--
12-46-11	Toaster, automatic -----	.023	.023	.025

Section 15. Miscellaneous Products

Description of Miscellaneous Products Group Index

With the expansion of poultry and livestock production, values of prepared animal feeds have continued to increase. As a result, a new product class, formula feeds (15-24), is being introduced into the index. Within this product class there are five individual cells as follows: poultry feed, broiler (15-24-01); poultry feed, egg laying (15-24-11); dairy feed (15-24-21); beef cattle feed (15-24-31); and hog feed (15-24-41).

The changes in relative importance caused by this change in the sample are shown in the following table. (See p.299 for complete specifications.)
