## BULLETIN OF THE

## U. S. BUREAU OF LABOR STATISTICS

## WAGES AND HOURS OF LABOR IN THE IRON AND STEEL INDUSTRY: 1929

## INTRODUCTION AND SUMMARY

This bulletin presents the results of a study made in $1929^{1}$ of wages and hours of labor of wage earners in 10 departments of the iron and steel industry in the United States. Summary figures for preceding years, taken from previous bulletins of the Bureau of Labor Statistics, are shown for each department. As in other wage studies of the bureau, it was not practicable to make a complete census of all plants in the country. However, these statistics may be taken as representative of the industry, since they are based on a sufficient number of representative plants in each district to show conditions in the various parts of the country.

The data presented in this report for employees in each department are as follows:

Blast furnaces, 1907-1929. ${ }^{2}$
Bessemer converters, 1907-1929. ${ }^{2}$
Open-hearth furnaces, 1910-1929. ${ }^{2}$
Puddling mills, 1914-1929.3
Blooming mills, 1910-1929. ${ }^{2}$
Plate mills, 1910-1929. ${ }^{2}$
Standard rail mills, 1926 and 1929.4
Bar mills, 1907-1929. ${ }^{3}$
Sheet mills, 1910-1929. ${ }^{2}$
Tin-plate mills, 1910-1929. ${ }^{3}$
There are three major steps or processes in the iron and steel industry. The first is the manufacture of pig iron through the reduction of iron ore, the smelting process taking place in the blast furnace. The second step is the conversion of pig iron into steel or wrought iron. The process of changing pig iron into steel takes place in the Bessemer converter or the open-hearth furnace. Wrought iron is made by the puddling process, which may be either hand or mechanical. Only plants doing hand puddling, however, have been

[^0]included in this study. The third step is the process of rolling. Several kinds of rolling mills are included in the data. While all departments of the industry as a whole have not been covered, a sufficient representation of the principal departments has been included to show prevailing conditions.

The greater part of the data was obtained through personal visits of agents of this bureau to the several plants, the remainder being obtained from the plants through correspondence. Whenever possible, the 1929 data were obtained from the same establishments that were covered in 1926, except when it was deemed advisable to include some new plants in a department. This was especially true of bar mills, which now include for the first time employees working in continuous and semicontinuous mills. In a few instances the plants covered in 1926 were not in operation or had ceased to be representative of the industry. In such cases it was necessary to substitute plants which were in regular operation and were representative of conditions in the industry.

The 1929 data were obtained from 208 plants or departments of plants and covered 71,009 employees in all occupations. These wage earners were distributed between the various departments as follows:

| Department | Number of- |  |
| :---: | :---: | :---: |
|  | Plants | Wage earners |
| Blast furnaces.. | 37 | 12, 222 |
| Bessemer converters- | 11 | 2, 251 |
| Open-hearth furnaces.- | 33 | 13, 171 |
| Puddling mills..- | 11 | 1, 800 |
| Blooming mills... | 30 | 6, 266 |
| Plate mards-ail- mills. | 17 | 4,024 2,816 |
| Bar mills -------. | 39 | 7,475 |
| Sheet mills | 15 | 12,598 |
| Tin-plate mills, | 8 | 8,386 |
| Total. | 208 | 71,009 |

According to the Census of Manufactures for 1927, the latest figures available, there was an ayerage of 389,270 wage earners employed in all departments of the iron and steel industry that year. They were divided as follows: 27,958 in blast furnaces and 361,312 in steel works and rolling mills. The 71,009 employees covered by this study constitute a little over 18 per cent of all employees in all departments (including those not canvassed by the bureau). The present study covers 12,222 wage earners in blast furnaces alone, which is practically 44 per cent of the 27,958 wage earners employed in blast furnaces in 1927. Since the census figures do not show the number of wage earners in steel works and rolling mills by separate departments, no data are available to determine the per cent of employees covered by the bureau in these departments. Figures taken from the reports of the Census of Manufactures, showing the importance of the iron and steel industry, are given on page 18.

The figures for 1929 and previous years are based on actual payroll data for one sample pay period, with the exception of companies having weekly pay periods, in which case the actual data for two l-week pay periods have been combined. The data, therefore, do
not show the month to month changes or yearly averages. Data for practically all establishments covered in the 1929 survey are for the first half of March and cover a 15 -day period, while those for 1926 are for a period in January which in most cases was the last half of that month and cover a 16-day period.

A summary of the changes in hours and earnings in the industry as a whole and for each of the 10 departments is shown in Table 1. In addition to the actual averages shown, index numbers based thereon are also given in order that the changes which have taken place over the period 1913 to 1929 may be set forth more clearly.

For all departments, except puddling mills, the year 1913 has been taken as the base, or 100 per cent. The index number for each year is simply the per cent that the average for that year is of the average for 1913. For puddling mills the year 1914 is taken as the base, because data for this department were first obtained for that year.

Table 1.-Average full-time hours per week, earnings per hour, and full-time earnings per week, together with index numbers computed therefrom, for all employees in all occupations in each department separately and all departments combined, 1913 to 1929, by department and year

Table 1.-Average full-time hours per week, earnings per hour, and full-time earnings per week, together with index numbers computed therefrom, for all employees in all occupations in each department separately and all departments combined, 1913 to 1929, by department and year-Continued

When average full-time hours per week for the year 1929 are compared with those for the years prior to 1924, the working time of employees in the industry shows considerable change. In the latter part of 1923 the 8 -hour day was generally adopted in the industry, the effect of this change in customary working time for employees being clearly defined in the 1924 average. In 1913 the average fulltime hours per week for all employees in all occupations in the industry as a whole were 66.1, in 1922 they were 63.2 , which is a decrease of 4 per cent as shown by the index numbers for those years. In 1924 they were 55.2, as compared with 54.6 in 1929. While 1929 shows a slight increase over 1926, the customary working time of employees is 16 per cent less than in 1914.

There was an increase in average earnings per hour from 1914 to 1929, of over 120 per cent, the average for 1914 being 30.1 cents as compared with 67.4 cents for 1929. The high point of earnings was reached in 1920 when the average was 74.5 cents. Reductions in rates paid employees during the period covered in 1922 are reflected in the average of 51.3 cents for that year. However, late in 1922 a general increase was made which approximated 10 per cent, and subsequent changes in rates of pay raised the average to 64.4 cents in 1924. In 1926, the average was 63.7 cents and in 1929, 67.4 cents, an increase of approximately 6 per cent. The 1929 average is higher than that of any other year since 1920, and, as shown by the index numbers, 124 per cent greater than that of 1914.
. Average full-time weekly earnings, like average earnings per hour, reached their peak in 1920 , when they were $\$ 45.65$, or 145 per cent greater than in 1914. In 1924 earnings decreased to $\$ 35.22$, which is 23 per cent less than in 1920, but 89 per cent greater than in 1914. The decrease in earnings was caused in considerable part by the reduction in full-time hours per week as between the two years, 1920 and 1924. Earnings per week were $\$ 36.48$ in 1929, which is an increase of 6 per cent over 1926, and 96 per cent over 1914.

When the 10 departments are considered separately, changes in hours in 1929 as compared with 1914 range from a 3 per cent increase for tin-plate mills to a 23 per cent decrease for open-hearth furnaces. Comparing 1929 with 1926, increases are found in seven departments and decreases in two, while sheet mills show no change. The largest increase is found in the plate-mill department, where full-time hours in 1929 were 58, compared with 55.8 in 1926; there is, however, a 16 per cent decrease m hours compared with 1914. The increased hours were in a large measure due to a regular increased operating time of mills in the eastern part of the country. The largest decrease is found in the puddling-mill department, where full-time hours dropped from 52.1 in 1926 to 50.3 in 1929.

When average earnings per hour for 1929 are considered each of the 10 departments shows increases over 1926, 2 departments-openhearth furnaces and blooming mills-have the highest average hourly earnings of any year shown for these departments. The 1929 average for open-hearth furnaces was 71.4 cents as compared with the previous high rate of 67.1 cents for 1920. The 1929 average for blooming mills was 66.6 cents, which compares with 65.9 cents for 1920 . The greatest increase in earnings per hour between 1926 and 1929 is found in blooming mills and the lowest in Bessemer converters.

The tonnage rates in puddle, sheet, and tin-plate mills are based on the selling price of the product. Thus, it is possible for the rates paid in these departments to fluctuate widely in a two or three year interval, such as occurs between the bureau's studies.

Since changes in full-time hours per week were comparatively small up to 1922, the movement of full-time weekly earnings followed closely the changes in average earnings per hour. In 1924 and 1926 the reduction in customary working time partially offset the increase in a verage earnings per hour, and full-time earnings per week increased less than average hourly earnings in those years.

In 1929 average weekly earnings increased in all 10 departments over similar figures for 1926, ranging from $\$ 32.05$ in blast furnaces to $\$ 41.20$ in open-hearth furnaces. The smallest increase was in puddling mills, where earnings in 1929 were $\$ 34.51$ as compared with
$\$ 34.23$ in 1926, and was due to a reduction in full-time hours per week as average earnings per hour show a material increase. Openhearth furnaces show the greatest increase in full-time weekly earnings over 1914. The index number for 1929 being over two and onefourth times as high as in 1914, while sheet mills show the smallest increase, the index for 1929 being one and one-half times as high as in 1914.

The monthly trend of employment and earnings in the iron and steel industry as published monthly in the Labor Review are repeated in this report on page 19.

## CLASSIFIED FULL-TIME HOURS PER WEEK

In earlier years most of the departments of the iron and steel industry were operated on a 2 -shift basis. During the war period there was some tendency toward the 3 -shift system, but soon thereafter some of the plants returned to the two shifts of 10 and 12 hours. In the later part of 1923 there was a movement started which resulted in many companies adopting the 8 -hour day. In only one department in 1929, that of plate mills, do as many as 50 per cent of the employees have a customary working time of as much as 60 hours per week.

Table 2 contains for 1929 and preceding years a percentage distribution of all employees in all occupations combined, in each department, according to their customary full-time hours per week. The classified hours of this table are "average" hours and as such do not show the long hours of one week that may alternate with shorter hours the next. Thus, employees listed as working 72 hours per week may work 60 hours one week and 84 the next, averaging 72. For a more detailed outline of customary hours from one week to another for each department attention is directed to Table D.

Table 2.-Per cent of employees in all occupations working each specified number of average full-time hours per week, 1914 to 1929, by department and year

Table 2.-Per cent of employees in all occupations working each specified number of average full-time hours per week, 1914 to 1929, by department and year-Contd.

${ }^{1}$ Less than 1 per cent.
The changes that have taken place in the working time of employees in the various departments are clearly reflected in the preceding table. In 1914, 41 per cent of the employees in blast furnaces had an average working week of 84 hours- 12 hours per day, 7 days a week. In 1922, only 17 per cent of the employees worked 84 hours per week, while in 1924, the effect of the 8-hour day is shown in that only 5 per cent had an 84 -hour week. In 1929, however, 73 per cent of the employees had a week of 60 hours or less.

There were no employees in Bessemer converters working so many as 72 hours per week in 1929, as against 65 per cent working a week of 72 hours or over in 1914. In open-hearth furnaces in 1914 only 7 per cent of the employees had a week of less than 60 hours; in 1920 this percentage had increased to 33, and in 1929 to 79.

In 1929 there were 91 per cent of the employees in puddling mills whose full-time hours were less than 60 per week, as compared with 82 per cent in 1914; and in blooming mills the percentage was 77 in 1929 as against 11 in 1914.

As previously stated, customary working time per week for employees in plate mills increased in 1929 as compared with 1926, but when compared with any year prior to 1924 the percentage distribution of employees shows material reductions. In 1914 only 3 per cent of all employees were working less than 60 hours per week, but in 1922 this percentage had increased to 22, and in 1929 to 50.

The working time of employees in sheet and tin-plate mills shows but little change over the period of years 1914 to 1929 . These departments have long been on the 8-hour day except for a small per cent of employees such as laborers and some occupations in the finishing department.

When the 10 departments are combined it is found that in 1929, 14 per cent of all employees had a customary working time of over 60 hours per week as compared with 15 per cent in 1924, and 13 per cent in 1926. In 1929, 22,252 employees, or 31 per cent of the 71,009 employees, had a week of 48 hours or less and only 5 per cent a week of 72 hours or over.

In Table 3 employees in all occupations in each department are classified by percentages, according to their customary number of turns per week. To give a complete picture of the changes, figures for preceding years are presented in addition to those for 1929.

## SEVEN-DAY WEEK

Of the 10 departments included in the study, it is necessary for only one to be in continuous operation; i. e., the blast furnace, which due to the nature of the process, must be operated 7 days per week and 24 hours per day. It might be expected that most of the 7 -day workers would be found in this department. There is, however, another department-the open hearth-which in recent years has been changing from a 6-day to a 7 -day operation, because of an increased demand for steel. This demand, which was especially
strong during 1928, continued into 1929, and has resulted in more open-hearth furnaces normally operating seven days per week in 1929 than during any previous study, as well as in the increase in the number of 7 -day workers from 52 per cent in 1926 to 66 per cent in 1929. In this large increase were included chiefly employees who formerly worked a week of 6 days and those who had a week of 6 days, 7 days, and 7 days in rotation.

In 1929, 54 per cent of all blast-furnace employees covered regularly worked a week of seven days, which percentage is the same as that shown for 1915 and 1920, but is an increase over 1926. The number of employees who regularly worked a week of 6 days, 7 days, and 7 days in rotation decreased from 22 per cent in 1926 to 18 per cent in 1929.

While the Bessemer-converter department is not essentially a 7 -day operation, certain repairs must be made which require a considerable number of employees to be on duty when the converters are not operating. This "fix-up" turn provides most of the 7-day work in this department.

When 1929 is compared with 1926, blooming and rail mills show a decided increase in 7 -day workers. In 1929, 31 per cent of the employees in blooming mills regularly worked a week of seven days, while in 1926 only 20 per cent had a 7 -day week. This change resulted largely from the necessity for extending operations of blooming mills in order to care for the increased output of the open-hearth furnaces. It might also be noted that some new mills were added in 1929, which were regularly operated on a 7 -day week schedule.

In the rail-mill department one large plant had changed from a customary week of 6 days, 7 days, and 7 days in rotation in 1926 to a straight 7-day week in 1929. This change is reflected in the increase in the percentage (20) in 1929, and in the per cent of employees working 6 days, 7 days, and 7 days per week in 1929. There was a decrease of 9 per cent in the number of employees working 6 days per week in 1929 when compared with 1926.

Plate and bar mills show small increases in the per cent of employees who regularly work seven days. Seven-day work in these departments for the most part consists of "light up" and repair turns which take place on Saturday night or Sunday when mills are not on producing time.

## RELIEF SYSTEMS

Many plants have a system of relief whereby an employee in a 7 -day occupation may have one calendar day off once each week, once every two or three weeks, or at some other stated interval, thus making a 6 -day working week each week, or a 6 -day week at each two or three week interval. "Relief" as used in this report is meant a regular turn (calendar day) off during which another man is put in the place of the worker relieved. Rest after a change in turns is not considered relief, when the employee has to work a double turn or extra shift in order to obtain the rest. Employees in plants which simply permit men to take a calendar day off once each week or at some other specified interval, provided they apply for it (but seldom do apply for it), have been considered as 7-day men without relief.

This provision for relief of employees in 7-day occupations started in 1910 and had so far obtained in 1920 that only 54 per cent of all
employees in blast furnaces regularly worked a week of seven days. In 1922 relief systems became more general and only 29 per cent of the employees in blast furnaces and 27 per cent in open hearths regularly worked a week of seven days.

In 1923 when the 8-hour day was generally adopted the tendency was to return to the 7-day working week for employees in 7-day occupations. In some plants this change was made at the request of the wage earners while in others the demand for tonnage was so great that some 6 -day plants were changed to regular 7 -day operation with no relief system having been put into effect.

In order to give some idea of the various methods used to give employees in 7-day occupations relief the following diagrams are presented. The first illustration shows a system used when employees who are relieved one calendar day each week; the second relates to employees who are relieved one calendar day every two weeks; and the third a system used by many plants when employees are relieved 1 calendar day out of each 19.

Mustration No. 1

| Turns per <br> week | Sunday | Mon- <br> day | Tues- <br> day | Wednees <br> day | Thurs- <br> day | Friday | Satur- <br> day |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{6}$ | A | A | A | A | A | A | B |

This is for employees who are relieved one calendar day in seven. The illustration shows that employee A worked only six days out of the possible seven days, a relief employee (B) working the seventh turn. B can relieve six different men one day each week, and thus get a full week's work. In some plants employees are relieved on a certain day each week while in others there is no set day upon which the relief is granted, the only stipulation being that each employee shall be off duty one calendar day out of each week.

Mustration No. 8
[A and $B$ represent the regular workers and $X$ the relief man]

| Turn | Days worked by regulars and those worked by relief man |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1 | 2 | 3 | 4 | 6 | 6 | 7 | 8 | 0 | 10 | 11 | 12 | 13 | 14 |  |  | 6 | 17 | 18 | 19 | 20 | 21 | 22 | 23 | 24 | 25 | 26 | 27 | 28 |
| First.-. | A | A | A | A | A | A | A | A | A | A | A | A | A | B |  |  | B | B | B | B | B | B | B | B | B | B | B | X | $\mathbf{x}$ |
| Second. | B | B | B | B | B | B | B | B | B | B | B | B | X | X |  |  | A | A | A | A | A | A | A | A | A | A | A | A | B |

The relief system as shown by illustration No. 2 is used in some plants where employees are relieved one day in 14 and work 13 days on either the first or second turn before alternating to the opposite turn. The diagram covers a period of 28 days, but it will be observed that the regular employees A and B work only on 26 of these days, while the relief man X works one shift on the 13th, 14th, 27 th, and 28th. Presuming the first turn begins at 12 o'clock midnight and runs to 12 o'clock noon and the second turn begins at 12 o'clock noon and ends at 12 o'clock midnight, regular worker B by having relief on the 13th would be off duty from 12 o'clock midnight of the 12 th until 12 o'clock midnight of the 13th, which is 24 hours. A, by having
relief on the 14th, would be off duty from $12 o^{\prime}$ clock noon on the 13th to 12 o'clock noon on the 15 th, which would be 48 hours. It will be noticed that A was off duty twice as long as B and yet each has only had one relief turn. This is brought about by $B$ alternating to the first turn and A dropping down to the second turn; however, when the shift is again made and $B$ is relieved by $X$ on the 27 th it is $B$ who will be off duty 48 hours and $A$ will be off only 24 .

It might be of interest to see what would happen had no relief man been provided and employees alternated under the same conditions. If this were the case it would be necessary for A to work the full 24 hours on the 13th, while B would be off duty all day; but when the shift in turns would again be made on the 26 th it would be necessary for B to work the full 24 hours on that day, while A would be off duty.

## Mustration No. 3

[ $A, B$, and $C$ represent the regular workers and $X$ the relief man]

The above diagram shows the relief system in use in many plants for employees working in a 7 -day occupation on a 3 -shift basis. This method gives each employee a calendar day off once in 19. It may also be noticed that no employee works more than 6 consecutive turns without having 24 hours of continuous rest. For example, A would go to work at midnight of the first day and work until 8 a. m., B then takes up the work at $8 \mathrm{a} . \mathrm{m}$. and works until 4 p . m., when C takes up the work and continues until midnight, when A comes on duty for his second day. This system would be followed until each employee-A, B, and C-had worked 6 consecutive turns when each would change turns, A dropping from the first to the second, $B$ from the second to the third, and $C$ would move up to the first. This method of rotation would put $A$ on duty again at $8 \mathrm{a} . \mathrm{m}$. on the 7 th , and as he had finished his turn at $8 \mathrm{a} . \mathrm{m}$. on the 6th he would have had 24 hours rest; B, who had finished his turn at $4 \mathrm{p} . \mathrm{m}$. on the 6 th, would again resume work at $4 \mathrm{p} . \mathrm{m}$. on the 7 th, which would have given him 24 hours rest. However, had C started work on the 7th at midnight he would have had no rest as his turn on the 6th had just ended. In order that C may have 24 hours rest, a relief man, $X$, works this turn and $C$ is not obliged to return to work until midnight of the 7th, which gives him 24 hours off duty.

The relief turn for A and B can be analyzed in the same manner as described for C. In this relief system it is possible for 3 men to have 24 hours continuous rest after 6 consecutive turns by giving each man a relief turn off once in 19 days.

In order to give some light on modes of changing shifts in 7-day occupations, working on a 3 -shift basis of 8 hours each, where no relief is given, the following outline is presented. This method of changing shifts is found in many plants and on each change day two workers are off 8 hours each while the third is off 32 hours.

Hustration No. 4
[No relief man]

| Turn | Hours of turn | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| First... | $11 \mathrm{p} . \mathrm{m}$. to $7 \mathrm{~m} . \mathrm{m}$ | C | O | C | A | A | 4 | A | A | A | A | B | B | B | B | B | B | B | C | O | C | C |
| Second. | $7 \mathrm{a} . \mathrm{m}$. to $3 \mathrm{p} . \mathrm{m}$. | A | A | B | B | B | B | B | B | B | C | C | C | C | C | C | C | A | A | A | 4 | A. |
| Third | $3 \mathrm{p} . \mathrm{m}$. to $11 \mathrm{p} . \mathrm{m}$ | B | B | C | C | C | C | 0 | C | C | A | A | A | A | A | A | A | B | B | B | B | B |

As shown by the diagram, A, B, and C work each eight hours on the first and second turns, but when the change-day of the 3 d comes and C drops from the first turn to the third turn it is necessary for him to work the turn $11 \mathrm{p} . \mathrm{m}$. to $7 \mathrm{a} . \mathrm{m}$. and the turn $3 \mathrm{p} . \mathrm{m}$. to 11 p. m. This gives him two 8 -hour shifts out of 24 hours, his rest period coming between the first and third shifts. B works one shift $7 \mathrm{a} . \mathrm{m}$. to $3 \mathrm{p} . \mathrm{m}$. on the 3 d , while A, who went off duty at $3 \mathrm{p} . \mathrm{m}$. on the 2 d , does not return to work until 32 hours later, or at $11 \mathrm{p} . \mathrm{m}$. on the 4th. On the second change-day, which is the 10th, A works 16 hours, C 8 hours, and B is off 32 hours. On the third change-day, which completes the cycle, B works 16 hours, A 8 hours, and C is off 32 hours. Thus, in 3 weeks each employee has been off duty 32 hours in a continuous period, but in order to do this it was necessary to work 16 hours on one day, which would not have been necessary had a relief man been used. It will be noticed that each man worked 21 turns, or 168 hours, which is full time for the period.

## COMMON LABORERS

There are in every department of the iron and steel industry various occupations which require little skill, but for which the basic rate is largely determined by the rate of wages paid common laborers. Thus, the rate paid the latter is of considerable importance not alone to the great number of wage earners receiving it, but for the relation it bears to other occupations.

The rate per hour is practically the same in all departments within the same district, but may vary one district from another. In the 10 departments covered there was a total of 71,009 employees in all occupations, of which 5,205 were common laborers. Of these, 1,548 were in open-hearth furnaces and 1,184 in blast furnaces, or 11.8 per cent of all employees in open-hearth furnaces and practically 10 per cent of all blast-furnace employees.

In this study "common labor" has been confined to the wholly unskilled and more or less floating gang, who worked in aad about the mill proper, but upon whose work the mill was not primarily dependent for operation. While the various methods of classifying common labor used in the several plants have led to difficulties in tabulation, no employee has been placed under that heading who was not paid the common-labor rate in the plant in which he worked.

Average earnings per hour of common laborers in the departments from 1907 to 1929 , are presented in Table 4. Figures for standard rail mills are not shown by districts, but are shown for the years 1924 to 1929 for all districts combined. ${ }^{5}$ The 1926 and 1929 figures
for puddling mills are not identified by districts. In all earlier years figures for tin-plate mills were shown by districts, but in the present study data are shown only for all districts combined. While no data are shown for standard rail mills prior to 1924 the averages for all departments combined contain the averages for that department in many instances, all of which are noted in Table 4.
It will be observed that average hourly earnings of laborers for all departments combined show little change when 1929 is compared with 1926. In the Eastern and Pittsburgh districts there was a slight increase, while in the Great Lakes and Middle West and Southern districts there was a small decline. The average for all districts combined decreased from 41.9 cents in 1926 to 41.4 cents in 1929. However, the average in 1929 was 129 per cent greater than in 1914.

Table 4.-Average earnings per hour of common laborers in specified departments of the iron and steel industry, 1907 to 1929, by district and year

${ }^{1}$ Not reported by districts to avoid identification of any plant.
Average hourly earnings in the 10 departments ranged from 52.8 cents in blast furnaces to 79.3 cents in sheet mills. The great percentage of workers in unskilled or semiskilled positions accounts for the low earnings in blast furnaces. In sheet mills most of the employees work in three shifts at high speed, and as they work on a tonnage basis their earnings are governed by the amount they produce, which condition also prevails in tin-plate mills.

Due to the increased demand for steel, open-hearth furnaces were pushed for large tonnages, which aided employees in this department to earn an average of 71.4 cents per hour. Employees in the Besse-mer-converter department earned an average of 64.3 cents per hour.

Puddling mills averaged 68.6 cents per hour, which is just 2 cents higher than the average for blooming mills. Earnings per hour in plate, standard rail, and bar mills were about the same in each department, ranging from 63.9 cents for plate mills to 62.5 cents for bar mills.

Earnings of employees in the various departments were higher in the Pittsburgh and Great Lakes districts than in the eastern or southern districts. This is due in a large part to the lower rate paid to unskilled and semiskilled workers in the latter districts. It is also not unusual to find plants in these districts carrying a larger percentage of unskilled workers than plants in the Pittsburgh and Great Lakes districts.

## SCOPE OF 1929 DATA

Information as of 1929 was obtained from plants located in 13 States. The plants covered have been grouped into four districts. These districts were established, not strictly on geographical lines, but rather according to similar industrial conditions. The "eastern" district covers the eastern parts of New York, Pennsylvania, and Maryland. The "Pittsburgh" district includes not only the plants in Pittsburgh proper but also others in western Pennsylvania, those along the border line of Ohio from Youngstown south to Bellaire, and those located in the "panhandle" of West Virginia. The "Great

Lakes and Middle West" district includes plants scattered along the Great Lakes and also some in inland territory, including Colorado. Although this last is a very large territory geographically, it is essentially a unit industrially as far as the iron and steel industry is concerned, the wage rates of the entire district being based largely on those paid in the large producing centers, Buffalo and Chicago. The "southern" district includes plants in Virginia, Tennessee, Alabama, Kentucky, and the southern parts of Ohio and Indiana. The southern Ohio and Indiana plants are included in the southern district because the conditions, both as to wages paid and the general class of labor employed, resemble much more closely the conditions of the Alabama and Kentucky plants than they do those of the other plants of Ohio and Indiana.

The actual number of plants and of employees covered in each district in each department in 1929 are shown in Table 6. Each department of an establishment has been counted as a separate plant.
Table 6.-Number of plants and of employees shown on pay rolls, by department and district

1 Details not given by districts to avoid identification of any plant.

## IMPORTANCE OF THE INDUSTRY

The iron and steel industry is one of the largest and most important manufacturing industries in the United States. In 1890, with a population of approximately $63,000,000$ people, the output of pig iron, including ferro-alloys, was $9,202,703$ gross tons, or 327.5 pounds per capita; in 1900, with the population figure at about $76,000,000$, the production was $13,789,242$ gross tons, or around 400 pounds per capita; and in 1920, with a population of nearly $106,000,000$, the production increased to $36,925,987$ gross tons, or approximately 782 pounds per capita. In 1928 the production was $38,155,714$ gross tons, which, with an estimated population of $120,000,000$, equals approximately 712 pounds per capita.

According to the Commerce Yearbook, 1926, the United States in 1913 produced 39.6 per cent of the world's production of pig iron. In 1923 it was 58.8 per cent; in 1924, 46.8 per cent; in 1925, 48.5 per cent; in 1926, 51 per cent. During the same years the per cent of steel ingots and castings produced in the United States in relation to the world's output was $42,58.2,49,51.1$, and 52.2 , respectively.

Table 7, taken from the reports of the Census of Manufactures, gives a good idea of the size and importance of the industry. In 1927 there was an average of 27,958 wage earners employed in blast furnaces and of 361,312 in steel works and rolling mills. The total wages paid these employees during the year was $\$ 44,258,000$ and $\$ 601,-$ 275,000 , respectively. This is an annual wage of $\$ 1,583$ for blast furnace employees and \$1,664 for employees in steel works and rolling mills.

The cost of materials in blast furnaces was $\$ 579,555,000$ and the value of the product was $\$ 708,904,000$. This is $\$ 129,349,000$ more than the cost of materials and represents the value added by manufacture. In the steel works and rolling mills the cost of material was $\$ 1,689,655,000$, the value of the products $\$ 2,779,840,000$, the difference, or $\$ 1,090,185,000$, representing the value added by manufacture.

Wages paid in blast furnaces in 1927 represent 34 per cent of the value added by manufacture, which compares with 31 per cent in 1925 and 43 per cent in 1914. In steel works and rolling mills wages represent 55 per cent of the value added by manufacture in 1927, 54 per cent in 1925, and 57 per cent in 1914.

Table 7.-Number of establishments, wage earners, cost of materials, value of products, and value added by manufacture in the iron and steel industry, 1914 to 1927

## TREND OF EMPLOYMENT

In addition to studies of wages and hours of labor of employees in certain industries in the United States the Bureau of Labor Statistics monthly collects data covering employment and earnings in all of the more important ones. Such figures are published monthly in the Labor Review. Index numbers for employment in iron and steel are repeated in this bulletin for the purpose of throwing additional light on labor conditions in the iron and steel industry but they should not be confused with the index numbers developed by the wage study.

Since the employment figures are based on data collected monthly, it is of course not possible to cover wage conditions in the same detail as in the biennial wage studies. Such figures necessarily indicate the trend of conditions only in a general way and conclusions drawn from them must be considered in that light; for example, the index of employment shows principally the rise and fall of the number of wage earners employed in the industry. This, of course, indicates in a general way the regularity or continuity of employment but does not indicate a change in regular or actual hours or days of labor. The data collected cover only the number of employees appearing on the pay rolls and no reference is made to hours or days of employment. Likewise, the index of pay-roll totals is an index of total earnings during one pay period and does not indicate an increase or decrease in hourly or full-time weekly earnings. From it may be computed the increase or decrease in per capita earnings which might be due to changes in rates of pay, changes in production where employees are paid on tonnage basis, or changes in the amount of time actually put in.

In computing the index numbers for employment and earnings the average for the year 1926 was taken as the base or 100 per cent. The index for each month is simply the per cent that the average for that month is of the average for 1926. These indexes are presented in Table 8 for each month beginning with January, 1923, and ending with December, 1929.

Table 8.-Index numbers of employment and of pay rolls in the iron and st as industry, January, 1923, to December, 1929, by months and years
[Average for 1926=100]

| Month | Index numbers of- |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Employment |  |  |  |  |  |  | Pay rolls |  |  |  |  |  |  |
|  | 1923 | 1824 | 1925 | 1826 | 1927 | 1928 | 1929 | 1923 | 1924 | 1925 | 1926 | 1827 | 1928 | 1980 |
| January | 96.5 | 101.0 | 100.2 | 100.5 | 95.0 | 86.9 | 93.4 | 87.1 | 97.5 | 101. 1 | 99.8 | 92.3 | 83.5 | 95.5 |
| February | 99.3 | 105.8 | 102.0 | 102.0 | 96.4 | 89.8 | 94.0 | 92.1 | 107.8 | 102. 4 | 102.7 | 98.2 | 93.4 | 100.2 |
| March | 101.0 | 108.5 | 102.7 | 101.7 | 97.7 | 91.5 | 95.0 | 94.5 | 110.2 | 102.9 | 104. 4 | 101.2 | 9 Ec 3 | 102.2 |
| April. | 101.3 | 107.8 | 100.4 | 102. 3 | 97.3 | 91.4 | 95.9 | 92.0 | 107.3 | 100.1 | 103.4 | 102.0 | 83.1 | 104.8 |
| May. | 103.3 | 98.3 | 98.2 | 101.0 | 96.4 | 91.2 | 97.1 | 104. 1 | 96.3 | 98.2 | 100.3 | 96. 5 | 98.3 | 105.9 |
| June. | 105.9 | 91.4 | 95.4 | 99.3 | 94.3 | 90.5 | 97.2 | 105.6 | 80.1 | 91.9 | 99.2 | 94.4 | 91.7 | 104.0 |
| July. | 102.8 | 86.1 | 94.0 | 97.8 | 92.3 | 89.6 | 96.6 | 91.1 | 69.7 | 85.8 | 93.3 | 83.9 | 86.5 | 97.6 |
| Angust | 105. 4 | 83.8 | 94.0 | 98.8 | 91.2 | 90.7 | 97.5 | 101.2 | 77.2 | 90.6 | 95.1 | 88.0 | 92.2 | 103.4 |
| September | 104.5 | 86.3 | 94.5 | 100.3 | 90.6 | 91.2 | 96.3 | 98.8 | 79.8 | 89.2 | 99.2 | 85.8 | 91.0 | 101.7 |
| October | 104. 2 | 89.9 | 95.8 | 100.2 | 89.5 | 91.5 | 93.9 | 103.8 | 86.4 | 96.4 | 103.7 | 85.9 | 96.7 | 99.1 |
| November | 102. 2 | 90.3 | 97.2 | 99.1 | 87.8 | 93.1 | 92.3 | 101.0 | 87.3 | 96.0 | 100.2 | 83.8 | 97.6 | 22.3 |
| December. | 98.3 | 05.4 | 100.1 | 96.7 | 86.5 | 92.8 | 87.5 | 96.0 | 96.2 | 102. 2 | 98.5 | 84.5 | 95.8 | 85.2 |
| Year. | 102.1 | 95.4 | 97.9 | 100.0 | 92.9 | 90.9 | 94.7 | 97.3 | 91.3 | 96.4 | 100.0 | 91.4 | 92.7 | 19.3 |

The yearly average index numbers as given in Table 8 show a decrease in employment from 1926 to 1927 and 1928, with an increase between 1928 and 1929. The 1926 wage data collected were mainly as of January, and 1929 data mainly as of March. While the 1926 wage study covered 200 separate establishment departments with 75,109 employees, the 1929 study included 208 such departments with 71,009 employees. Since each separate department of a company is counted separately, there may be two or more departments taken in a single plant. There were 180 departments that were common to both wage studies, which had 69,639 employees in 1926 and 61,892 employees in 1929, a decrease of 11 per cent in the number of employees in these identical departments.

Index numbers of employment in the iron and steel industry as shown in Table 8 were 100.5 in January, 1926, and 95.0 in March, 1929, a decrease of 5.5 per cent. The employment figures are based on about four times as many employees as are the wage studies. The establishments covered in the wage studies, it will be seen, had a reduction in force considerably greater than the industry as a whole shown in the employment index. During 1929 employment held up and increased until late in the year when a considerable decrease occurred. The total wages paid out according to the pay-roll index dropped as between 1926 and 1927, increased slightly in 1928, and rose in 1929 nearly to the level of 1926. But for the drop at the end of 1929 the pay-roll index would have stood higher than in any year given in Table 8. The December, 1929, pay-roll index fell to 85.2 and the employment index to 87.5 . These index numbers reflect the industrial change which occurred late in the year.

## EXPLANATION AND TREATMENT OF THE DATA

In the following pages of this report each of the 10 departments covered in the 1929 study has been treated as a separate industry. The treatment of the data is the same for each department, however, and the same forms of statistical tables have been used in each case. From these tables, of which there are eight, figures have been taken to a large extent for the summary tables already presented. Thus, a general explanation of the methods used in handling the data and the figures shown in the tables will serve as a guide in the study of the figures for each department and the summary of the figures for all departments previously presented.

Adjustment of the data.-As previously stated all data in this report refer to one representative pay period only. Unfortunately for statistical purposes there is no length of pay period universally followed by all companies. While a large majority of the plants in this industry pay their employees on a semimonthly basis, some establishments pay weekly, some biweekly, and at least one establishment pays three times a month. It would have been a prohibitive task to attempt to obtain data from an establishment for any group of days other than a regular pay period.

The period selected for this survey was from March 1 to 15, but that period was not always representative. A few of the establishments covered were closed down almost completely during the first half of March. Thus, while the schedules obtained are in a large measure for the March 1 to 15 period, a few were taken for other
periods. In the case of weekly periods the bureau agents combined the pay rolls for two consecutive weeks, making in effect a two-week pay period.

Therefore before combinations of actual time and actual earnings could be made and averages computed therefrom it was necessary to adjust the figures of a few establishments in order that all schedules would refer to the same or an equivalent length pay period. The adjustments were made for the principal occupations only, since no tables are presented wherein it was necessary to adjust the hours and earnings of the other employees.

In making the adjustment it was first assumed that all employees in an occupation would work the same per cent of full time during any period as they did during the period for which the schedule was taken. The full time of all employees in an occupation was then computed for the new period chosen as the basis for adjustment and the full time for the new period was then multiplied by the per cent of full time which the employees had worked during the period actually covered. That result then became the equivalent actual hours worked in that occupation as used in the preparation of the tables.

The actual earnings of employees were adjusted by multiplying the adjusted hours of employees in an occupation by the average earnings per hour of that occupation. The average earnings per hour were obtained before any adjustments were made and have not been affected by any later computations.

Positions.-The term "positions" or "jobs" as used in this report means the number of places to be filled by employees working the regular full time required to operate a plant under normal working conditions, with provision for two or three shifts or turns per day but with no provision for relief of employees; for example, a blast furnace must have a keeper on duty all of the time. If the furnace employees are on a 12 -hour shift then there are two positions for keeper at the furnace; if on a 3 -shift basis there are three keepers' positions.

Employees.-In each year prior to 1919 the number of positions has been used as the number of employees, but in 1919 and each later year the actual number of individual employees is shown.

In all tables in this report employees appear but once. In cases where they worked at two or more occupations during the period or at more than one set of hours or turns per day or week they have been tabulated under the occupation or number of hours or turns at which they spent the most of their time. This has resulted in disregarding the hours and earnings of some employees in some secondary occupations, but on the whole the figures eliminated were so small as to be of no consequence in determining the averages.

Average earnings per hour.-The earnings per hour shown in the tables include both the earnings of time workers and those of tonnage or piece workers. All earnings per hour are for individuals, no contractors being included. The average was obtained by dividing the total amount earned by the total number of hours actually worked in an occupation before any adjustment was made in the data.

Average full-time hours per week.-The full-time hours of labor as shown in the tables are the customary regular hours of work of individual employees under normal conditions in the establishments. The
working time is the time on duty, including intervals of waiting for work-in other words, the time between the hour of reporting for duty and the hour of going off duty. The working time of individuals is not always the working time of their occupation as a whole. Some plants which operate 7 days per week make provision for laying off each employee 1 day a week. In such a plant the full-time hours per week of an employee working 8 hours per day is 48 hours, and this figure would be used in the compilation of the averages presented in the tables.
In computing the average for all employees in an occupation the individual averages in the various plants were weighted by the number of positions in those plants instead of the number of employees on the pay roll. The number of positions in a plant is practically constant from year to year while considerable variation is shown in the number of employees. Thus the use of the number of employees as a weight would tend to change the average whether any change was actually made in the working time of employees or not.
Average full-time weekly earnings.-Full-time weekly earnings are the earnings per week of employees working their customary full-time or the earnings on broken time reduced to equivalent earnings for a full week. The average has been obtained in each instance by multiplying the average full-time hours per week by the average earnings per hour.

Table A.-Average customary full-time hours per week, average earnings per hour, and average full-time earnings per week, together with the index numbers computed from these averages for the country as a whole, are presented in this table for each of the principal occupations in each department. The table also shows a percentage distribution of employees according to their full-time hours per week. Figures for 1929 were compiled for this report and those for earlier years were taken from previous reports published by this bureau. For the purposes of comparison the class limits used in the distribution of hours of employees were necessarily very wide. A much more comprehensive distribution for employees in several of the occupations in 1929 is contained in Table E. The index numbers have been included as an aid in making a comparison of the actual data over a period of years. The index for each year is the per cent that the average for that year is of the average for 1913.

Table B.-A classification showing numbers and percentages of employees according to the number of turns per week customarily worked is presented in Table B. Figures are shown for employees in all occupations combined for 1929 and preceding years. The plants are grouped according to the four geographical districts used in this survey, and the number and per cent of employees in each district are shown in the table, as well as the total for all districts combined.

Most of the departments of the iron and steel industry are operated day and night. Each day of 24 hours is divided into two or three turns, usually of equal length, and each employee is expected to work but one turn per calendar day, except when changing from one turn to another employees frequently work two consecutive shifts. It is customary for the men in these plants to alternate or rotate from one turn to another at regular intervals, spending equal periods of time on each turn. Thus the term "turns" as used in this table
means a day's work performed on day, night, or intermediate turn and the column headings which include more than one turn indicate a weekly shift from one turn to another. All employees do not change turns each week, however, as it is the practice in many plants for employees to work two weeks on a turn before a change is made. This serves only to increase the time necessary to make a complete rotation of turns. The number of turns worked in the long run is not affected, and in order to combine the data for the various plants all employees have been classified as though turns were all changed weekly.

Various provisions for the relief ${ }^{6}$ of employees are in force in many plants whereby employees are given a day of rest even though the plant, and of course most of the occupations, may normally operate 7 days per week. Some 7 -day plants have regular systems of relief requiring the men to lay off 1 day in 7 , others 1 day in 14, etc. Only definite systems of relief where men are required to take advantage of the day of rest, or at least exercise the privilege reasonably often, have been considered. In the study of this table it must be kept in mind that the turns worked by individuals are shown and not the working turns of the occupations in which they are employed.

All employees in 1929 were classified as nearly as possible by their regular working time. Gas or repair turns have been disregarded when employees customarily worked such turns at less frequent intervals than once every three weeks, and relief systems have also been omitted in a few instances where the periods elapsing between reliefs were longer than that time.

Table C.-This table presents the most important facts for 1929 relative to the customary working time, actual earnings, and actual hours of employees in the principal occupations in each department. The data for each occupation in seven departments are presented by districts and for all districts combined. In the three remaining departments-puddling mills, rail mills, and tin-plate mills-data are presented only for the United States as a whole. In the arrangement of the table the averages are presented in three groups or sections: (1) Averages relating to the customary working time of employees; (2) averages for the hours worked and earnings received by employees while engaged in each specified principal occupation; and (3) averages for the hours and earnings of those same employees while engaged in those and any other occupations within the department at which they may have worked during the pay period.

The first group of averages, including customary turns per week, hours per turn, and hours per week, have been computed for the number of positions necessary to be filled in the different occupations instead of the acutal number of employees hired during the pay period. (For definition of a position see p. 21.) For this reason the number of positions appears in the table in connection with these averages. The number of positions represents the number of men who would be employed at any one time in the occupation. Several men might be necessary to keep a position filled during the pay period, but only one man would be employed at a time. Thus the customary working time of each man employed in a position would be the same while he worked in that occupation, and the aggregate full-time hours or turns in a plant would depend upon the number of available positions
and not upon the number of men employed to fill them during the pay period. However, while the number of positions have been used as a weight for computing the averages, the working time of individual employees is shown in this table and not the hours or turns of the positions; for example, in a blast furnace having 5 stacks in operation 3 turns per day, there would be 15 positions for the occupation of keeper. The plant has a relief system in force whereby each man works but 6 turns each week, although the furnaces, and of course the positions, are necessarily in operation continuously, or 7 turns per week. In the computation of the averages shown in the table the 8 hours per turn, 6 turns, and 48 hours per week customarily worked by the men are used and each multiplied by 15, the number of positions, in order to obtain aggregates for the plant. While the 15. positions would remain constant with 5 stacks in operation, it might be necessary to employ 20 or even more different men during a pay period to keep those positions filled. Were the number of employees used as weights, the hours of labor in the different establishments would not be properly weighted and would depend to a large extent upon unusual plant conditions.

The second group of averages shows the average hours worked and earnings received for the pay period (subject to the adjustment of hours and earnings, as explained on p. 21), average earnings per hour, and average full-time earnings per week of the men who were actually employed during a majority of their time, at least, in the occupation specified. These averages are based on the hours and earnings of each employee in his principal occupation only and do not in any way refer to the number of positions. The actual hours which men have put in and the earnings which they have received are of greater significance than the hours and earnings of an impersonal particular job. (For further definition of employees see p. 21.)

However, while the averages in the second group are based upon employees they do not in any way constitute a measure of employment or unemployment. They refer to the occupation under consideration only, and it must not be assumed that the employees in that occupation had no further opportunity for work. A large percentage of the employees did work at more than one occupation during the period scheduled; hence none of the averages in this group measure the total work or total earnings of the employees.

The average hours worked during the pay period as shown in the table is the result of combining all the hours worked by all employees in that occupation and then dividing by the number of employees. The average earnings per pay period was obtained in the same way. The average earnings per hour and full-time weekly earnings are explained on pages 21 and 22.
The averages in the second group show the work done in a specified occupation only. The averages in the third group show the total work done by the same employees in any and all occupations at which they may have been engaged in the department during the pay-roll period, including the specified occupation. These averages have been deemed necessary, as the averages for the specified occupation alone fail to indicate the entire time and earnings of the individuals under consideration. The averages in the third group apply to an employee within the particular department only. To trace the employee from one department to another was practically impossible.

The averages were obtained by the same methods that were used for the second group of averages.

Table $D$.-The customary turns and hours worked by all employees in the several departments in 1929 are shown in detail in this table. The number of turns per week, hours per turn, hours per week, and average hours per week are presented for three groups of employees: Those who work day turns only, those who work night turns only, and those who alternate or rotate from day to night shift. Data are shown for each district and for all districts combined. Further, like figures are given for one representative key occupation in each department.

The order of arrangement begins with the highest number of average full-time hours per week. As the number of hours worked per day seldom varies during the period Monday to Friday, hours per turn are shown but once under that heading. The hours worked on Saturday and Sunday, however, often differ from the number worked during the first five days of the week, and hours are shown separately for both Saturday and Sunday.

It is the purpose of this table to give a clear picture of the customary working time of all employees in each department in every important detail. At the same time, however, the bureau has endeavored not to allow the numerous small changes, which occur at infrequent intervals of time and affect the hours and turns of employees in only a slight degree, to assume an importance not warranted by conditions. Thus, the regular working time of employees has been considered as nearly as possible, and gas or repair turns have been disregarded when employees customarily work such turns at less frequent intervals than once every three weeks in the case of three-shift workers and once every four weeks for two-shift employees. Relief systems have also been omitted in a few instances where the periods elapsing between reliefs were longer than that time.

The brackets appearing in the table have been used to indicate a working cycle-that is, employees working on shifts which have been bracketed customarily alternate or rotate from one shift to another until they have spent one week on each shift included. The hours and turns of employees who change regularly from one turn to another have been tabulated as though the shift was made weekly in all plants. As explained for Table B, this assumption is not entirely correct, as it is the practice in many plants for employees to work two weeks on a turn before a change is made. This, however, only serves to increase the time necessary to make a complete rotation of turns. The number of turns worked in the long rum is not affected, and in order to combine the data for the various plants all employees have been classified as though turns were all changed weekly. The three 8-hour turns per day are shown as one day turn and two night turns-this for the reason that only one of the three turns is an all-daylight turn, the other two either beginning or ending in the night.

In some instances in the table hours are reported for the seven days of the week, yet the number of days worked are reported as six. This is owing to the fact that the figures are for a seven-day occupation wherein each employee was relieved one day in seven. Either relief was not always on the same day each week or information as to which day was not available; therefore, the hours for all days have been shown and the relief indicated in the full-time hours per week.

The table shows the extent of regular relief systems and their working, but it must not be assumed that there was no chance for rest where such has not been shown. In some plants, while there is no regular system of relief, the employees are not held strictly to the working days of the plant and may often take a day off as they desire it, the plant putting another man in the place of the one absent. As it was impossible to determine when or how often a man might be excused, such plants have been treated in this table as though no relief was granted.

Workmen whose labor is continuous and who are subjected to high temperatures usually have spell hands- that is, three men work on a two-man position or two men work on a one-man position, which arrangement allows each man in rotation intervals for rest. Such intervals of rest are considered as time on duty.

While this table shows the working time of all employees in the department as a whole, no effort has been made to show the hours and turns worked by employees in the different occupations separately. This was too formidable a task to be undertaken. However, in each department one of the principal occupations has been selected and shown as a sample of the hours and turns worked by members of the producing crew. All members of the producing crew do not always work the same hours, but usually there is very little difference, and the occupation shown will give an excellent idea of conditions as regards the productive gang proper. Common labor and certain other unskilled or slightly skilled employees quite often work more hours than the rest of the force.

The remaining four tables-E, F, G, and H-are distribution tables and show the 1929 hours and earnings of employees in considerable detail for a few of the more important principal occupations in each department. It would have been too great a task to attempt to classify all of the principal occupations in the minute detail in which these tables are presented, but the occupations for which data are shown may be accepted as fairly representative of all of the occupations. The occupations tabulated include unskilled, slightly skilled, and skilled employees, and are some of the most important occupations, both numerically and in the process. Common laborers, a very important occupation in this industry, have been included in each department.

In classifying employees in these tables a range of hours or earnings has been used which is sufficiently wide to include all employees for which data are shown, yet the class limits are small enough to show fairly the spread or variation of employees in each occupation. Thus, occupations in a department may be compared with one another or with occupations in other departments. The data are shown for each of the four geographical districts separately as well as for all districts combined.

Table E.-Employees in six of the principal occupations in each department, except standard rail and puddling mills, are classified according to their full-time hours per week. In standard rail and puddling mills employees in only five occupations are shown.

The classification of hours begins with employees who customarily work 40 hours per week and ends with those who work 84 hours per week and over. Employees who regularly work 48 hours, 56 hours, 60 hours, or 72 hours per week have been arranged in separate groups,
and the group of " 84 and over" means 84 hours per week in practically all instances.

The classified hours of the table are average hours for the individual and do not reflect the long hours of one week that may alternate with shorter hours the next. Thus a man who works 72 hours one week and 60 hours the next has an average of 66 hours, which is tabulated in the group " 66 , under 72. ."

Table $F$.--This classification table begins with employees who earned an average of less than 20 cents per hour and ends with those who earned $\$ 3$ or more per hour. Employees are classified by 5 -cent groups from 20 cents to $\$ 1$ per hour and by 10 -cent groups from $\$ 1$ to $\$ 2$ per hour. All who earned $\$ 2$ or more per hour are shown in 25 -cent groups up to $\$ 3$ and then by 50 -cent groups.

Exceptionally high or low earnings per hour in practically all occupations indicate that the employees were working under unusual conditions, such as performing work on Sunday at time and one-half rate, or working on a turn which produced exceedingly high or low tonnage.

Table $G$.-The classification of hours actually worked begins with those who worked less than 32 hours during the pay period and ends with those who worked 192 hours and over.

In preparing this table no adjustment has been made in the data, although, as previously stated, all of the schedules do not cover pay periods of equal length. The hours actually worked by the employees, as taken from the schedules, have been tabulated im all instances. While some few of the schedules were taken for 14 -day and 16-day pay periods the large majority of the schedules cover a 15 -day period. One plant had three pay periods each month and the schedule for it was taken for 20 days. This plant has been omitted from this table. It was found from a thorough examination of the data that employees as a whole worked about the same ratio of full time in one pay-roll period as they did in another. Also, since the pay periods included were so nearly the same in length the actual grouping of the data was approximately the same in each case. Thus, as it was desirable to include all the employees possible in an occupation, all schedules except the one mentioned above have been used.

In classifying the actual hours worked by an employee all of the hours which he worked in any and all occupations in which he may have been engaged during the pay period were included and tabulated under the occupation at which he worked the longest time; for example, if a man worked 40 hours as a larry man in a blast furnace, 35 hours as a keeper, and 20 hours as a keeper's helper he would be classified under the occupation of larry man, but the table would show 95 hours of work.

It must not be assumed that employees worked all the time that there was work for them. Employees may have been ill, on vacation, may have quit, may have been discharged, etc. The data collected by the bureau do not show the availability of employment nor the various reasons for unemployment. The purpose of the table is to show what the employees in this industry are actually doing, but no attempt has been made to interpret the figures.

Table $H$.-In this table employees are classified according to their actual earnings during the pay period for which they were scheduled. The classification begins with those who earned under $\$ 5$ during the
pay period and ends with those who earned $\$ 250$ and over. The classification is by $\$ 5$ groups up to $\$ 100$ and by $\$ 10$ groups from $\$ 100$ to $\$ 160$. Earnings from $\$ 160$ to the end of the table are divided into four groups-two with a spread of $\$ 20$ each, one with a spread of $\$ 50$, and the last group of " $\$ 250$ and over."

The data in this table have been treated in the same way as those in Table G, and the explanation of that table should be read in connection with the explanation of this table.

In classifying the actual earnings received by an employee, all of the earnings shown on the pay roll for him in payment for work in any and all occupations in the department in which he may have been engaged during the pay period were included and tabulated under the occupation at which he worked the longest time; for example, if a man received $\$ 20.80$ as a larry man in a blast furnace, $\$ 18.90$ as a keeper, and $\$ 10$ as a keeper's helper, he would be classified under the occupation of larry men but the table would show earnings of $\$ 49.70$.

While the table shows the total earnings of employees in the various occupations, it must not be assumed that employees have received all the wages that it was possible for them to earn during the pay period, as is indicated in explanation of Table $G$, relating to hours worked.

Index numbers.-The wage studies of this industry prior to 1914 were limited to employees in certain of the principal occupations only. These occupations included actual members of the producing crews almost entirely, laborers being practically the only other occupation covered. No data were collected for employees in the several other less important occupations.

The occupations selected for the studies were assumed as fairly representative of all occupations, and the studies thus limited were accomplished in much less time than would have been required had all occupations been covered.

In the published reports for those earlier years the average full-time hours per week, average earnings per hour, and average full-time weekly earnings, and index numbers computed therefor were shown for each of the principal occupations separately, and the data were further consolidated and expressed in the form of index numbers for each department. In subsequent wage investigations the practice of basing the index numbers for the department upon the principal occupations only was continued, although in the studies of 1914,1915 , 1920, 1922, 1924, 1926, and 1929, all employees in the various plants were covered. This was done so that the data for the later years, though not complete, would be strictly comparable with years prior to 1914.

The method of computing index numbers from specified occupations alone was discontinued in 1926, and except for the connecting link between 1913 and 1914 the index numbers here presented for the departments and for the industry reflect the changes in all occupations as a composite whole.

The year 1913 has been used by the bureau as the base year for the computation of index numbers in its many wage and price studies and for that reason it has been deemed highly desirable to construct the index for this industry upon that base. Unfortunately, as stated, data were not collected for all occupations in 1913. However, there was very little change in wage conditions as between 1913 and 1914 so far as shown by the averages for the principal occupations. Also,
the change in the averages for all occupations between 1914 and 1915 was practically the same as the change in the averages for the principal occupations. Thus, since the change in the principal occupations between 1913 and 1914 was very slight, it has been assumed that the change in all occupations would also be very small and in the same ratio as the change in the principal occupations. The estimated average for 1913 from which the index number was computed was obtained from the proportion, "the average for the principal occupations in 1914 is to the average for all occupations for that year as the average for the principal occupations in 1913 is to x."

While the index numbers for the departments extend back only to 1913, the index numbers for the several occupations in Table A extend back as far as data are available.

The bureau has consolidated the data for the several departments into a general index to represent the iron and steel industry as a whole at least to the extent covered. This general index was constructed ${ }^{7}$ by weighting the data for the various departments by the number of employees covered in each department in 1926. ${ }^{8}$ The most desirable weighting, of course, would have been the total number of wage earners employed in the United States in each separate department. Such figures are not available as there are no authoritative records from which to obtain them. The Census of Manufactures does not show the wage earners in the different departments of steel works and rolling mills separately. However, the bureau in its studies has endeavored to cover a fair representation of wage earners in each department, and it is believed the relative weight given each department by the bureau's figures would not be materially changed by using the number of wage earners in the country generally, if such were available.

[^3]
## BLAST FURNACES

Data for 1929 are for 37 blast-furnace establishments located in 11 States, which during the pay-roll period covered operated 116 stacks and employed 12,222 wage earners in all occupations. Of these, 6,020 are in the 16 principal occupations for which separate averages are given. Comparable data for this department were first obtained in 1907. From 1907 to 1914 employees in only the principal occupations were included, while in 1914 and subsequent years all employees in all occupations were included. ${ }^{1}$

Hours of labor for all employees in blast furnaces decreased 19 per cent between 1914 and 1929. Between 1914, when average hours per week were 74.8, and 1922 there was little change in customary working time; but after the general adoption of the 8 -hour day in 1923, weekly hours of labor declined, the 1924 average being 59.7 as compared with 72.1 in 1920 and 72.3 in 1922. Average hours per week increased slightly in 1926-to 59.8-and increased again to 60.7 in 1929. Table 1, page 3, shows average full-time hours per week, earnings per hour, and full-time weekly earnings for all employees in this department for specified years, 1913 to 1929.

Comparison of 1929 averages in Table A with similar averages for earlier years shows the general downward trend of average fulltime hours per week in the principal occupations. The average hours per week for the principal occupations combined were 60.4 in 1929 as compared with 59.4 in 1926. This is an increase of 1 hour per week, which is almost identical with the change in hours for all employees stated above. Thus it can be seen that the hours per week of the principal occupations represent not alone the changes that have taken place in those occupations but also serve as a general indicator of changes in other occupations for which separate averages are not shown. When the principal occupations are considered separately it will be observed that in all of the 16 occupations save 1 there was an increase in full-time hours per week in 1929 as compared with 1926, but when compared with any year previous to 1924 all occupations save iron handlers and loaders show large decreases. In 1922 all of the principal occupations except 2 had a customary week of more than 70 hours, while $\dot{\mathrm{m}} 1929$ only 1 had a week of more than 70 hours and 11 had a week of less than 60 hours. Average hours per week in 1929 ranged from 73.2 for iron handlers and loaders to 54.3 for bottom fillers. The increase in full-time weekly hours for all the principal occupations combined in 1929 was influenced somewhat by the increase in the percentage of employees working 84 hours per week. These increases are particularly noticeable in stockers, iron handlers and loaders, pig-machine men, cindermen, and laborers. However, it might be well to state that this increase in per cent of employees working 84 hours per week was not brought about by a change in working time of identical plants represented in the 1926 and 1929 studies but rather by the inclusion of some plants which did not report in 1926 and some of the preceding years.

[^4]While the number of hours per day and per week have decreased materially since 1922, the percentage of employees working 7 days per week has increased. In 1922, as shown by Table 2 (p. 6), 69 per cent of all employees in blast furnaces had a week of 72 hours or over, while in 1929 only 11 per cent had a week of this length. Because a blast furnace must be kept in continuous operation it becomes necessary to have a producing crew on duty at all times, therefore the relief provision for employees is reflected in the number working 7 days per week. In 1922, as shown by Table B, the percentage of 7-day workers was at the lowest point, the total for that year being 29 per cent.

When the various districts are considered separately 60 per cent of the employees in the eastern district, 21 in the Pittsburgh district, 25 in the Great Lakes and Middle West district, and 34 per cent in the Southern district regularly worked a week of 7 days.

In 1924 after the adoption of the 8-hour day, relief systems whereby employees were relieved one day in 7 were partially abandoned, and the per cent of 7 -day workers increased to 45 while the per cent of 6 -day workers decreased to 20 . However, the 8 -hour day brought into effect a new working time per week- 6 days, 7 days, and 7 days in rotation. This means that each employee is relieved one day each 3 -week cycle by having another worker take his regular turn on the day he is off duty. In 1924 there were 30 per cent of all employees in blast furnaces working a week of 6 days, 7 days, and 7 days in rotation. In 1926 the per cent of employees working 7 days per week increased to 49 and m 1929 to 54 .

When comparison by district is made for the years 1929 and 1926 the per cent of employees working 7 days per week in the Eastern district shows no change. In the Pittsburgh district there is a decided increase in 7-day workers from 33 per cent in 1926 to 42 per cent in 1929, while the percentage of employees working 6 days, 7 days, and 7 days in rotation was 28 in 1929 as compared with 40 in 1926. In the Great Lakes and Middle West district 65 per cent of all employees worked a week of 7 days as compared with 69 per cent in 1926. The decrease in 7 -day workers was taken up by the increase in per cent of employees working 6 days, 7 days, and 7 days in rotation. There was no change in the per cent of 6 -day workers. The Southern district shows an increase in 7-day workers from 27 per cent in 1926 to 37 per cent in 1929.

There was a decrease in the per cent of employees working 6 days, 7 days, and 7 days in rotation as well as in the per cent of employees working 6 days per week, the former being 26 per cent in 1926 as compared with 18 per cent in 1929.

In order that the prevailing hours per day and per week in this department may be more fully shown Table D is presented, which shows that out of 12,222 employees covered 3,342 worked day turns only, 160 night turns only, and 8,720 alternate or rotate from day to night shift. A total of 1,377 employees regularly worked an average of 12 hours per day, of which 1,011 customarily worked a week of 7 days. A total of 3,132 worked 10 hours each day and 6,711 a day of 8 hours. This table includes data for all employees whether on direct producing crews or not; but in order to give a clearer idea of the actual working time of members of the producing crew, separate figures are given for one key occupation, that of keeper. Of

350 employees who worked as keeper, 29 had a customary working time of 7 days per week, averaging 12 hours per day or 84 hours per week; 11 had a week of 6 days, 12 hours per day or 72 hours per week; 3 worked 8 hours per day, except 2 Saturdays out of 3 when they worked 12 hours, making a weekly average of 56 hours. The remaining 307 had an 8 -hour day or hours that made an average equivalent thereto, of whom 196 customarily worked 7 days each week.

Table $\mathbf{E}$ shows the distribution of employees in six principal occupations according to their average full-time hours per week. There were 3 employees in these occupations whose average full-time hours per week were 48, and 410 whose hours were 84 or over. A total of 2,506 employees out of 4,191 had a week of over 48 and less than 60 hours.

Average hourly earnings in 1929 for employees in the various principal occupations, as shown in Table A, range from 91.8 cents for blowers to 37.3 cents for laborers. For all employees in both skilled and unskilled occupations average earnings per hour were 52.8 cents in 1929 as compared with 51.7 cents in 1926, an increase of approximately 2 per cent, while in principal occupations combined hourly earnings increased from 49.4 cents in 1926 to 50.8 cents in 1929, or about 3 per cent. Hourly earnings were at their peak in 1920, the average for that year being 57.1 cents, or over two and three-fourths times as great as in 1914. While 1922 shows a considerable decrease in earnings when compared with 1920 , they were almost 100 per cent higher than in 1914. In 1924 earnings per hour were 52.0 cents, and the two subsequent studies in 1926 and 1929 show but little variation from that figure, the average for 1929 being 52.8 cents, or two and one-half times as great as in 1914.

The greatest change in hourly earnings in the principal occupations as between 1926 and 1929 will be found in the occupation of bottom fillers, whose earnings were 42.6 cents in 1926 as compared with 62.9 cents in 1929. This radical change was brought about by the exclusion of two southern plants which were not in operation during the period of the 1929 study, and resulted in reducing the number of bottom fillers from 344 to 35 .

The occupation of top fillers also shows a decided change in hourly earnings for the same reason as that given for bottom fillers. It may be stated here that any average might be changed by a shift in the relative number of persons employed at different rates even though no individual had a change in his rate.

An analysis of the changes in average hourly earnings of keepers will tend to show in a general way what has taken place in hourly earnings in the principal occupations over the period 1907 to 1929. In 1907, keepers earned an average of 21.8 cents per hour, this rate remaining about stationary until 1912 when a slight increase is noted, the earnings for that year being 22.3 cents. The years 1913, 1914, and 1915 show practically no change from 1912; however, in 1917 there was a substantial increase and earnings rose to 34.4 cents per hour, which is 46 per cent more than in 1913. Both 1919 and 1920 show increases, the earnings for the latter year being 63.5 cents, the highest of any year for which data are available. In 1922 earnings decreased to 42 cents but in 1924 after the general adoption of the 8-hour day earnings increased to 57.9 cents. The years 1926
and 1929 show practically no change from 1924 as the index number of earrings for all three years was 246.

A distribution of hourly earnings of employees in six of the principal occupations in 1929 is given in Table $F$, which shows in a general way the spread of earnings of employees in other occupations of similar skill for which no distribution tables have been made.

Average full-time earnings per week for all employees were $\$ 15.41$ in 1914 as compared with $\$ 32.05$ in 1929, an increase of more than 100 per cent over 1914, but only of 4 per cent over 1926. In 1920 weekly earnings were $\$ 41.17$, or $\$ 9.12$ more than they were in 1929. Weekly earnings in the various principal occupations show similar or ever greater changes. Again using the occupation of keepers as an example it is found that these employees earned an average of $\$ 19.28$ per week in 1913 as compared with $\$ 33.41$ in 1929, an increase of 73 per cent over 1913, but only a small gain over 1926. In 1920 weekly earnings were $\$ 46.45$, or $\$ 13.04$ more than in 1929.

The 6,020 employees in the principal occupations worked an average of 112.8 hours in a 15 -day pay period for which they received an average of $\$ 57.20$. This compares with 115.4 hours and $\$ 60.96$ for all employees in all occupations. The hours and earnings of employees as given above include all the hours worked and earnings received by employees shown in Table C. Blowing engineers worked the greatest number of hours, 123.6, and laborers the least, 105.1, while the highly skilled occupation of blowers had the highest earnings, $\$ 112.09$, and laborers the lowest, $\$ 39.91$.

A classification of employees in six principal occupations according to hours actually worked in 1929 is made in Table G, which shows that in the occupation of laborers 93 employees out of a total of 1,184 worked less than 32 hours per pay period, while only 3 worked 192 hours or more. The largest number, 186 , is found under the heading "over 120 and under 132."

A like classification of earnings is made in Table H. Due to the variation of hours worked by employees as shown in Table G there is considerable difference in earnings of employees, as 46 laborers earned less than $\$ 5$ for the half-month pay period while 28 earned $\$ 70$ or over. The largest group, 164, earned $\$ 55$ and under $\$ 60$. Blowers show the widest spread in earnings, ranging from under $\$ 10$ to $\$ 200$ and under $\$ 250$, the average for the occupation being $\$ 112.09$.

## BESSEMER CONVERTERS

The 1929 study in this department covers establishments which make steel ingots by the Bessemer process or which only partially reduce it in the converter and finish the product in an open-hearth or electric furnace. The latter is known as the duplex process and the finished product is open-hearth steel. Most establishments do some duplexing in addition to the manufacturing of regular Bessemer steel. It is not uncommon to find establishments duplexing all the product from the Bessemer converters during certain pay-roll periods; therefore, in order to get a period where at least 50 per cent of the time was spent on producing Bessemer ingots it was necessary to secure a 15-day period in February for one establishment and a 15-day period in January for two others.

Data for 1929 were collected from the pay rolls of 11 establishments located in 4 States and cover 2,251 employees in all occupations. Of this total 887 were in the principal occupations for which separate averages are given. In 1907, when data for this department were first secured, there were $11,667,549$ gross tons of Bessemer steel ingots produced, or 117,813 gross tons more than open-hearth steel ingots produced for that year. In 1914 there were only $6,220,846$ gross tons of Bessemer ingots produced as compared with 17,174,684 gross tons of open-hearth steel ingots. Figures for 1928 show $6,620,195$ gross tons of Bessemer as against $44,113,956$ gross tons of open-hearth steel ingots. In 1928 the amount of Bessemer steel ingots produced was only 13.10 per cent of the total production of steel ingots as compared with 14.68 per cent in 1926 and 27 per cent in 1914.

Although 11 Bessemer converter establishments covered in this study are identical with those covered in 1926, the number of employees, 2,251 , in 1929 is approximately 24 per cent less than the number, 2,948, covered in 1926. This reduction in number of employees is mainly due to the fact that in 1926 there were five establishments operating Bessemer cupolas, while in 1929 there were only two. An increasing amount of hot metal is being charged and the effect of this change is clearly seen in the occupation of stockers, where the number of employees decreased from 317 in 1926 to 156 in 1929. Other occupations connected with the cupolas for which separate figures are not presented were similarly affected.

From 1907 to 1914 only employees in the principal occupations were covered, but in 1914 and subsequent years all employees in all occupations were included. ${ }^{1}$ The Bessemer converter establishments covered by this and former studies are located in only two districts, the Pittsburgh and the Great Lakes and Middle West. No data are included from the eastern and southern districts, as the output of these districts is of minor importance. Earnings as a rule in this industry are higher in the Pittsburgh and the Great Lakes and Middle West districts than in the eastern or the southern district. This should be considered when comparing earnings of employees in the Bessemer department with those of other departments where all four districts are included.

[^7]Average hours per week for Bessemer converter employees show an irregular downward trend over the period 1914 to 1929. In 1914 average hours per week for employees in this department were 68.4. No material change from this figure is noted until 1924, when the weekly hours were 52.3 , this reduction having been brought about principally through the general adoption of the 8 -hour day in 1923. Referring to Table 2, page 6, it can be seen that, while in 1922 there were only 17 per cent of all employees who had a week of less than 60 hours, in 1924 there were 78 per cent. Although 53 per cent of the employees in 1922 had a week of 72 hours, less than 1 per cent had a week of 72 hours in 1924. In 1929, 43 per cent of all employees had a week of 48 hours or less and no employees had a week of as many as 72 hours. Employees in 1926 had a customary full-time week of 52.6 hours, which is practically no change from that of 1924, while in 1929 the average was 53.7 hours-an increase of 1.1 hours over 1926, but as shown by the index numbers, 23 per cent less than in 1913. Average full-time hours per week, earnings per hour and full-time earnings per week, 1913 to 1929, for the department as a whole are shown in Table 1, page 3.

Comparisons of full-time hours per week of employees in the various principal occupations, which may be made from Table A, show similar reductions. The average weekly hours for the principal occupations combined were 69.7 in 1907; although 801 laborers, or nearly 50 per cent of the total number of employees in the principal occupations, had a full-time week of 78 hours. In 1929 there was only one occupation in which employees had a week of as many as 59 hours, while four had a week of less than 50 hours, the average for the principal occupations combined being 52.8 hours.

While hours per week have been greatly reduced in this department in recent years the change has not been altogether due to the shorter workday, as there has also been a decrease in the per cent of employees working 7 days per week. Although this department is usually in operation day and night for 6 days per week, a shutdown being made over Sunday for a period of 12 to 36 hours for the necessary repair work on vessels and other equipment when the converters are down. This repair necessarily leads to some 7 -day work for some employees of the producing as well as the mechanical crews. In 1914, 13 per cent of all employees regularly worked a week of 7 days, and in 1920, 26 per cent; but in 1926 the percentage decreased to 12, and in 1929 to only 9. As the number of 7-day workers decreased there was an increase in the number of employees working 6 days, 6 days, and 7 days in rotation, and also in the number working 6 days, 7 days, and 7 days in rotation, the percentages for 1929 being 8 and 10 , respectively, as compared with 7 and 5 in 1926.
In order that prevailing hours per day and per week in Bessemer converters may be more fully shown, Table $D$ is presented. Out of 2,251 employees covered, 358 worked day turns only, 34 night turns only, and 1,859 alternate or rotate from day to night shift. It will be noted that in 1929 only 24 employees had a week of as many as 70 hours and no employee had a day of over 11 hours. There were 631 employees who had a 10 -hour-day, of which 24 worked a week of 7 days, and 1,444 employees who worked the 8 -hour day or its equivalent. Of the latter number 173 worked 7 days a week each week, while others had a 7 -day week once every other week or once in 3 weeks.

Data for all employees, whether on direct producing crews or not, are included in Table D, but in order that a clearer idea of actual working time of members of the producing crews may be given, separate figures are shown for one key occupation-that of vessel men. Of the 28 employees there were 7 who worked 7 days one week, and 6 the next; 3 who worked 6 days per week every third week; 12 who worked 7 days every third week, and 6 who worked 6 days each week. Only 2 worked 10 hours each day, while 3 worked 10 hours each day except every other Saturday, when they worked 8 hours, and 18 worked 8 hours or less each day.

Table E shows the distribution of employees in six principal occupations by average full-time hours per week. According to this table there were 9 employees in these occupations whose average full-time hours were less than 44, and 7 whose hours were over 66 and under 72. Out of 541 employees, 269 had a week of 48 hours.

Average hourly earnings of employees in the various principal occupations range, in 1929, from $\$ 1.301$ for blowers to 45.2 centsfor laborers. For all employees in both skilled and unskilled occupations the average earnings per hour were 64.3 cents in 1929 as compared with 64.1 cents in 1926; and in the principal occupations combined, hourly earnings were 73.0 cents in 1926 and 71.1 cents in 1929 . Thus it can be seen that while earnings for the department as a whole increased, earnings per hour for the principal occupations decreased. This is due to the fact that the principal occupations constituted but 39 per cent of all the employees in the department, and that the remaining 61 per cent as a combined group had an increase in hourly earnings more than sufficient to outweigh the downward trend in the principal occupations. When hourly earnings for all employees in 1929 are compared with 1914 there is an increase of 152 per cent. Earnings per hour were at their peak in 1920, the average for that year being 67.7 cents or over two and one-fourth times as much as they were in 1914. While 1922 shows a considerable decrease when compared with 1920, earnings were 84 per cent higher than in 1914. Earnings per hour were 62.4 cents in 1924 as compared with 64.1 cents in 1926. There was little change in earnings as between 1926 and 1929, the average for 1929 being 64.3 cents. Hourly earnings for employees in the various principal occupations are shown in Table A.

The greatest change in hourly earnings in the principal occupations as between 1926 and 1929 will be found in the occupation of bottom makers, whose earnings were 82.6 cents in 1926 as compared with 71.3 cents in 1929, which decrease was brought about by a change in earnings in 9 out of the 11 establishments reporting. Analysis of the changes in average hourly earnings of vessel men will show in a general way what has taken place in hourly earnings in the principal occupations over the period 1907 to 1929. In 1907 vessel men earned an average of 79.3 cents per hour. In 1908 there was a decided decrease in earnings to $\$ 0.528$ per hour; the next two years, however, show increases and in 1910 earnings were 68.5 cents per hour. They again receded in 1911, but 1913 earnings of $\$ 0.744$ were the highest of any year up to that time except 1907. Earnings for 1919 were $\$ 1.114$, which is a decided increase over either 1915 or 1917; however, it was not until 1920 that earnings reached their highest level- $\$ 1.273$. In 1922 earnings again dropped, being 89.7 cents per hour. In 1924 there was an increase, which was followed by another in 1926, when
earnings were $\$ 1.271$, but decreased to $\$ 1.212$ in 1929 , which, however, is 53 per cent higher than in 1913. A distribution of hourly earnings of employees in six of the principal occupations in 1929 is given in Table F , which shows in a general way the spread of earnings of employees in other occupations of similar skill for which no distribution tables have been made.

Average full-time earnings per week for all employees were $\$ 17.44$ in 1914 , as compared with $\$ 34.53$ in 1929 , an increase of 98 per cent over 1914, but only 2 per cent over 1926. Weekly earnings in the various principal occupations show similar or even greater increases. In the occupation of vessel men, for example, it was found that employees earned an average of $\$ 41.52$ per week in 1913 as compared with $\$ 63.63$ in 1929. This is an increase of 53 per cent over 1913, but is somewhat less than in 1926. In 1920, the peak year, weekly earnings were $\$ 71$, or $\$ 7.37$ more than in 1929 .

The 887 employees in the principal occupations worked an average of 104.4 hours in a 15 -day pay period, for which they received an average of $\$ 72.61$, which compares with 105.6 hours and $\$ 67.94$ for all employees in all occupations. The hours and earnings of employees as given above include all hours worked and earnings received by employees as shown in Table C. Regulators, first, worked the greatest number of hours, 116, and cupola melters the least, 84. Greatest earnings were in the occupation of blowers, $\$ 147.41$; and the least, $\$ 45.99$, in that of laborers.

A classification of employees in six principal occupations, by hours worked, in 1929, is made in Table G. This table shows that laborers had the greatest number of employees working under 32 hours per pay period, 10 out of a total of 196 working these hours, while the occupation of cinder pitmen was the only one that had any employees working over 168 hours. In the highly skilled occupations of blowers and steel pourers no employee worked under 72 hours per pay period and in the occupation of vessel men-also a skilled position-only 1 worked under 72 hours. The occupation of stockers had 19 employees who worked under 72 hours, while that of cinder pitmen had 11 and laborers 35.

A like classification of earnings is made in Table H. Due to the variation of hours worked by employees as shown in Table $G$ for these same occupations there is considerable difference in earnings of employees within the same occupations. Laborers earned from less than $\$ 5$ for the period to between $\$ 75$ and $\$ 80$, while the lowest earnings of any blower were from $\$ 95$ to $\$ 100$ and the highest from $\$ 200$ to $\$ 250$. Only 1 vessel man earned less than $\$ 85$ for the period and 2 earned $\$ 180$ and under $\$ 200$.

Table G.-Average and classified hours actually worked by employees in six specified occupations in pay period covered, 1929, by districtBessemer Converters

Table H.-Average and classified earnings actually received in six specified occupations in pay period covered, 1929, by district-Bessemer Converters

## OPEN-HEARTH FURNACES

Data for this department with few exceptions cover open-hearth furnaces that use the basic process of manufacture. Information for acid furnaces were included in a few instances where establishments operated a furnace or two of this kind in connection with the basic type. "The 1926 and 1929 studies include data for both stationary and "Talbot" furnaces, although 1924 and all studies previous to that time cover only furnaces of the stationary type.
The 1929 study includes pay-roll data from 33 open-hearth furnace establishments located in 9 States and employing 13,171 wage earners in all occupations, 7,452 of these being found in the 15 principal occupations. Pay-roll data for this department were first obtained in 1910, and for that year and all years up to 1914 cover only the principal occupations; but data for all employees in all occupations were included in the figures for 1914 to $1929 .{ }^{1}$ Comparable figures are presented in Table A for employees in the principal occupations from 1910 to 1929.

When full-time hours per week for employees in the department as a whole in 1929 are compared with 1914 there is a decrease of 23 per cent. Average full-time hours per week in 1914 were 74.5, and in 1920, 68.7 , or 8 per cent less than in 1914. In 1922 there was a slight increase, but in 1924 the effect of the 8 -hour day was reflected in a decrease of weekly hours to 58 , or 23 per cent less than in 1914. Since 1924 there has been little change in weekly hours, the averages for 1926 and 1929 being 57.1 and 57.7 , respectively.

Average full-time hours per week for all employees in the principal occupations combined in 1913 were 77, but by 1926 had dropped to 56.1, a reduction of 27 per cent; and in 1929 full-time hours per week had increased to 56.9 , but were 26 per cent less than in 1914. Comparison of full-time hours per week of employees in the 15 principal occupations which may be made from Table A show that in 1929, 14 had an increase in customary working time per week over 1926, and 1 occupation-stock cranemen-had a reduction of 0.5 hour per week. Hours per week ranged from 60.5 for laborers to 54.9 for switchmen. In only one occupation, that of laborers, was there more than 18 per cent of the employees working 60 hours or more per week.

While hours per day and per week were considerably less in 1924, 1926, and 1929 as compared with 1922 and earlier years, the 7 -day week has increased among employees. This is especially true when 1929 is compared with any of the preceding years. The heavy demand for steel during the latter part of 1928 and which continued into 1929 caused some plants to increase the regular operating time of their furnaces from 6 to 7 days per week; no provision, however, for relief of employees had been put into effect at the time of this study. Another factor that helped to increase the percentage of 7 -day workers in 1929 was the collection of data from 2 additional establishments, both of which worked 7 days per week and had no system of relief for employees in the 7-day occupations. Table B shows that 34 per cent of all employees covered in this department in 1914 regularly worked a week of 7 days. There was practically no

[^8]change in this figure until 1922, when 7 -day workers decreased to 27 per cent and 6 -day workers increased to 50 per cent. In 1924, after the 8 -hour day had generally been adopted for the old 12 -hour day, the per cent of employees working 7 days per week increased to 52 , while the per cent of 6 -day workers decreased to 16 . The number of 7 -day workers in 1926 was the same as in 1924, but the 6 -day workers increased to 26 per cent. In 1929 the 6 -day workers decreased to 15 per cent, which is lower than that of any other year shown; and the per cent of employees who regularly work 7 days per week increased to 66 , an increase of almost 27 per cent over 1926.

In order that the prevailing hours per day and per week for employees in open-hearth furnaces may be more fully shown Table D is presented, which shows that out of 13,171 wage earners covered, 1,874 worked day turns only, 85 worked night turns only, and 11,212 alternated or rotated from day to night shift. Of the total employees, 553 had a working-day which averaged 11 hours or over, while 9,039 had a working-day of 8 hours or less. Of the 553 employees, 305 worked a 7 -day week regularly, as did also 7,443 of the 9,039 employees. Data in Table D are for all employees in all occupations, but that there may be a clearer idea of the customary working time of employees on the producing crews, separate figures for one key occu-pation-melters' helpers, first-are given. Of the 980 employees shown in this occupation, 13 worked regularly a day of 12 hours 7 days each week, 10 a day of 12 hours with 1 day off duty in each 4 weeks, and 6 averaged 12 hours a day except every fourth Saturday, when they had a night turn of 8 hours. A day of 8 hours was regularly worked 7 days each week by 738, and 6 days per week by 54 employees.

Table E shows the distribution of employees in six principal occupations by average full-time hours per week. The table shows that out of a total of 4,954 employees, only 1,146 worked over 56 hours per week, and of these only 114 worked 72 hours or more per week.
While the hours of labor for employees in 1929 show large decreases as compared with 1922 and earlier years, earnings show large increases over all years. In 1914 earnings per hour were 23.7 cents, increasing slightly in 1915 to 24.6 cents. In the 5 -year period- 1915 to $1920-$ great changes occurred in the industry and earnings per hour in the latter year were 67.1 cents, an increase of 183 per cent over 1914. Earnings per hour in 1922 were reduced to 48 cents, but after the adoption of the 8 -hour day in 1923 earnings per hour again increased to 63.5 cents in 1924. In 1929 earnings were 71.4 cents which, when compared with 67.7 cents in 1926, is an increase of a little over 5 per cent, but three times what they were in 1914. Hourly earnings of employees in the various principal occupations show the same changes. Using the occupation of melters' helpers, first, as an example, it is seen that earnings were 41.6 cents per hour in 1910 and increased to 44 cents in 1913. Little change occurred until 1917, when earnings had advanced to 58.6 cents, or 33 per cent over 1913. In 1920 earnings per hour were more than a dollar for the first time, averaging $\$ 1.089$. This was the highest point until 1926, when earnings per hour reached $\$ 1.170$. In 1929, earnings of $\$ 1.247$ showed an increase of practically 7 per cent over 1926 and of 183 per cent over 1913. Earnings per hour for the principal occupations combined were 76 cents in 1929 as compared with 72.1 cents in 1926, which is an increase
of 5 per cent, the same as that for all employees in all occupations. A distribution of average hourly earnings of employees in six principal occupations in 1929 is given in Table F.

Average full-time earnings per week were two and one-fourth times as much in 1929 as in 1914 . From 1914, when weekly earnings were $\$ 17.66$, little change is noted until 1920 , when they were $\$ 46.10$, or more than two and one-half times as high as in 1914. Earnings dropped to $\$ 36.83$ in 1924 , but increased to $\$ 38.66$ in 1926 and to $\$ 41.20$ in 1929, an increase of 7 per cent over 1926, but 11 per cent less than in 1920. The decrease in full-time weekly earnings as between 1920 and 1929 was caused by the decrease in weekly hours16 per cent-being greater than the increase in hourly earningsabout 6 per cent.

Weekly earnings for various principal occupations show about the same changes as weekly earnings for the department as a whole. For example, melters' helpers, first, earned an average of $\$ 32.27$ in 1910 , $\$ 33.89$ in 1913 , and $\$ 75.09$ in 1920. The increase in weekly hours partially offset the decrease in hourly earnings in 1922 , the average for that year being $\$ 55.34$. However, in 1924 the increase in hourly earnings more than offiset the decrease in weekly hours and weekly earnings rose to $\$ 59.16$. In 1926 weekly earnings increased to $\$ 64.70$ and in 1929 to $\$ 69.71$, the latter being 7.7 per cent higher than in 1926 but 7.2 per cent less than in 1920.

The 7,452 employees in the 15 principal occupations worked an average of 107.5 hours during the 15 -day pay period covered by this study, for which they received an average of $\$ 81.27$. This includes all the hours worked and earnings received by these employees as shown in Table C. This compares with an average of 110.4 hours worked and $\$ 78.84$ received by all employees in all occupations during the same period. Hours worked ranged from 121.6 for ingot strippers to 97.9 for laborers. Laborers likewise received the lowest earnings, $\$ 43.51$, while melters' helpers, first, received the highest amount, $\$ 137.35$. Charging machine operators received the next largest earnings, $\$ 108.84$, and door operators the next lowest, $\$ 44.12$.

A classification of employees in the six principal occupations by hours actually worked in 1929 is made in Table G. This table shows that of 1,478 laborers, 135 worked less than 32 hours during the pay period, while in the skilled occupation of steel pourers only one worked less than 32 hours. The largest number of laborers is found under the group "over 120, under 132," while in all other occupations the largest number is found under the group of 120 hours. Only one occupation-ladle cranemen-had any employees working as many as 192 hours.

A like classification of earnings is made in Table H. Considerable variation is found in the earnings of employees in the same occupation due to the number of hours worked by employees in these occupations. The earnings received by melters' helpers, first, show the widest spread, one employee having earned $\$ 5$ and under $\$ 10$ and two, $\$ 250$ or more; while laborers show the least spread, 43 employees having had earnings under $\$ 5$, and one earned between $\$ 95$ and $\$ 100$.

## PUDDLING MILLS

Wrought iron, the product of puddling mills, is made from pig iron, often mixed with scrap, by oxidizing and removing most of the silicon, carbon, manganese, and phosphorus content. In the manufacture of wrought iron, hand labor is used to a greater extent than in the production of most forms of tonnage steel. Wrought iron may be produced by two processes, puddling or busheling, both of which are hand-labor operations, one using mostly pig iron and the other practically all scrap. Due to the heavy labor involved and the intense heat to which puddlers are subjected by the hand process, fewer workmen are taking up the puddling trade.

The two greatest items of expense in hand puddling are fuel and labor costs. Usually the old-type hand furnace required a ton of soft coal to produce a like amount of iron. However, this amount may vary somewhat from plant to plant. To offset these items inasmuch as possible and to produce larger tonnages, experiments have been conducted for several years with mechanical puddling devices. The necessary equipment for mechanical puddling is quite expensive and most plants in this department have not shown any great change in working conditions in recent years. However, one large establishment has recently perfected what is said to be a successful method or producing wrought iron by the mechanical process and is now erecting a new plant to carry on production by this process. The present study, however, includes only plants doing hand puddling.

Data were collected from the pay rolls of 11 plants located in 6 States and cover 1,800 employees in all occupations. Of this number 1,467. were in the principal occupations for which separate averages are given. This is practically a complete census of wage earners in puddling mills, as all plants that were operating at the time this study was made were included. A comparison of the total number of plants and employees in 1929 with similar figures for 1914 shows the decline in importance of this department in the industry. Comparable figures for this department were first obtained in 1914 and data here given are for the period 1914 to $1929 .{ }^{1}$ The decline in number of plants reporting after 1924, together with the decrease in number of employees in these plants, made it inadvisable to present data for the years 1926 and 1929 by geographical district, as operations have been curtailed in some parts of the country to such an extent that district comparisons would be misleading. In 1929 no establishments were found to be in operation in the Great Lakes and Middle West district.

The hours of labor for puddling-mill employees as a whole have not fluctuated to the same extent as for employees in some of the other departments. A day's work in the puddling operation usually consists of 5 heats per shift, which requires somewhere between 8 and 10 hours, and since it is still the custom of this department to produce this number of heats, the adoption of the 8-hour day in the industry did not affect employees in this department to any great extent. In 1914 the hours of labor per week were 53.2. Not much change from

[^9]this figure is noted until 1924, when hours increased to 55.7 , or 5 per cent more than in 1914. Hours decreased in 1926 to 52.1 and again in 1929 to 50.3 .

While customary working time for the department as a whole shows little change, comparison of working time of employees in some of the principal occupations shows considerable variation. Stockers, for example, customarily worked 57.6 hours per week in 1914 , which hours gracually increased to 61.3 in 1920 , almost $71 / 2$ hours more than the average for the department as a whole for the same year. In 1922 average hours for stockers were 58.9 and in 1924 decreased further to 57.4, which is practically the 1914 average. In 1926 hours were 51.1, which was also the average for 1929 and only 0.8 hour more than the average for the department as a whole.

Puddling mills during former studies were usually operated 6 days or 6 days and 5 nights per week. Operating conditions, however, had materially changed between 1926 and 1929, so that the customary operating time had reduced the working time of most employees either to 6 days and 5 nights or to 5 days and 5 nights per week. Very few employees are required to work 7 days per week, as most of the repair work is done on Saturday, when the plants are not operating. Table B shows that in 1914 there were 63 per cent of all employees working 6 days one week and 5 the next, with 13 per cent regularly working a 5 -day week. In 1920 less than 1 per cent had a 5 -day week regularly, 26 per cent had a straight 6 -day week, 13 per cent a 6 -day week once in each 3 weeks, and 60 per cent had a 6 -day and a 5 -day week alternately. In 1926 no employee had a 6 -day week once in each 3 weeks, but 67 per cent had alternating weeks of 6 and of 5 days. In 1929 the per cent of employees working 6 days and 5 days per week alternately had been reduced to 39 , and 37 per cent had a regular 5 -day week. In no year did over 2 per cent of all employees work a 7 -day week.
The working time of all employees in 1929 is given in Table D. Of the 1,800 employees in this table, 495 worked days only, 37 nights only, and 1,268 alternated or rotated from day to night work. Thirtyeight employees had a customary working time of 12 hours or its equivalent each day they were on duty, while 1,007 had a day of 9 hours or less. Employees shown in Table D include all wage earners of the department, whether or not directly connected with the furnaces or muck-rolls. To give a better idea of the working time of employees directly connected with the puddling furnaces, the table includes separate figures for puddlers, level-handed. The work of puddlers, level-handed, is the same as that of a puddler and his helper, the only difference being that each of two puddlers, level-handed, operating a furnace assumes an equal amount of responsibility with the earnings divided equally, while a puddler assumes full responsibility, usually paying his helper 30 to 40 per cent of the furnace earnings. Of the 702 employees who worked as puddlers, level-handed, 87 worked days only, while the remainder alternated from day to night duty. Of the total puddlers, level-handed, 406, or approximately 58 per cent, customarily worked 5 days each week. This gives an excellent idea of the operating conditions in this department. Two employees had a customary week of 30 hours, which was due to one plant operating its muck rolls on a 12 -hour shift, but splitting the furnace crews into 2 shifts of 6 hours each in order to provide labor for as many employees as possible. Most of the puddlers in this plant
work with a helper, and are not included in this occupation, but are shown on page 96, in Table D.

Table E shows the distribution of employees in five principal occupations by average full-time hours per week. The table shows that out of a total of 1,160 in the 5 occupations, 397 worked between 40 and 44 hours, 661 between 48 and 56 , while only 23 worked as many as 60 hours per week.

Earnings per hour have more than doubled during the period 1914 to 1929 , having risen from 32.8 cents in 1914 to the high point of 88.5 cents in 1920, or an increase of 170 per cent. In 1922 earnings in this department as in all other departments declined, having dropped to 49.6 cents but in 1924 advanced to 72.1 cents. The year 1926 brought another decline and earnings dropped to 65.7 cents, nearly $41 / 2$ per cent less than the hourly earnings of 68.6 cents for 1929. Tonnage rates paid in most plants in this department are based directly on the selling price of the product; that is, at the close of regular intervals rates are adjusted in accordance with the price of bar iron during that period. Thus, rates paid in this department in most occupations are subject to wide fluctuations in a 2 or 3 year study such as this bureau makes. However, it might be noted that the tonnage rates paid in January, 1926, were practically the same as those paid in March, 1929.

Hourly earnings of employees in the various principal occupations are shown in Table A; for example, puddlers, level-handed, earned an average of 41.6 cents per hour in 1914, which dropped to 39.2 cents in 1915. During the period of the 1919 study earnings were $\$ 1.101$ per hour, or 165 per cent more than in 1914. This was further increased to $\$ 1.227$ in 1920, the peak for earnings of employees in this occupation.

There was a slump in the industry in 1921, the effect of which was still evident in 1922, the average being 62.9 cents for that year. However, by 1924 earnings had regained most of the loss suffered in 1922, and puddlers, level-handed, earned $\$ 1.051$ per hour. Earnings in 1926 dropped to 87.7 cents, which is only slightly less than the average of 88 cents for 1929. A distribution of employees according to average earnings per hour in five principal occupations is shown in Table F.

As average hours per week for the department did not show any decided change over the period 1914 to 1929, average full-time weekly earnings followed very closely the trend of hourly earnings. In 1914 weekly earnings were $\$ 17.45$, which increased until they reached $\$ 47.70$ in 1920, an increase of 173 per cent over 1914. There was a decided reduction in weekly earnings in 1922, to $\$ 25.84$, but an increase to $\$ 40.16$ in 1924 . Earnings were $\$ 34.51$ in 1929 , which is a slight increase over 1926, when the average was $\$ 34.23$. Weekly earnings in the various principal occupations show like changes over the period 1914 to 1929 . Puddlers, level-handed, for example, earned $\$ 20.37$ in 1914 as compared with $\$ 62.25$ in 1920 , and $\$ 29.22$ in 1922, which is 43 per cent above the 1914 average. In 1924 earnings increased to $\$ 48.39$, which was $\$ 5.15$ more than in 1926 . Due to the decrease in full-time weekly hours between 1926 and 1929, weekly earnings decreased to $\$ 40.74$ in the latter year, but were exactly twice as high as in 1914.

The 1,467 employees in the principal occupations worked an average of 83.5 hours during the 15 -day pay period covered by this
study, for which they received an average of $\$ 60.68$, which includes all the hours worked and earnings received by these employees as shown in Table C. This compares with an average of 81.9 hours and $\$ 56.19$ for all employees in all occupations during the same period. Roll engineers worked the most time, 124.8 hours, and heaters' helpers the least, 68.7 hours. Laborers received the least money, $\$ 37.19$, while rollers-a highly skilled occupation-earned the largest amount, $\$ 120.74$. The next largest amount, $\$ 105.80$, was earned by heaters.

A classification of employees in five principal occupations, by hours actually worked in 1929, is made in Table G. This table shows that puddlers, level-handed, had the largest number of employees, 64 , working under 32 hours per pay-roll period while rollers had the least. The occupation of laborers shows the widest variation in hours, 9 having worked under 32 and 1 over 156 and under 168 hours.

A like classification of earnings is made in Table H. Considerable variation is shown in the earnings of employees in the different occupations as well as for employees in the same occupation. Laborers earned from less than $\$ 5$ for the period to $\$ 60$ and under $\$ 65$. Puddlers, level-handed, earned from $\$ 5$ and under $\$ 10$ to $\$ 130$ and under $\$ 140$, while two rollers earned between $\$ 200$ and $\$ 250$.

## BLOOMING MILLS

Data for 1929 were collected from pay rolls of 30 blooming-mill establishments located in 9 States and cover 6,266 employees in all occupations. Of this number, 1,686 were in the principal occupations, for which separate figures are shown. While the 1929 study includes 3 more establishments than were covered in 1926, the total number of employees in all occupations was increased by only 78 and in the principal occupations by only 16. Comparable data for this department were first obtained in 1910, the 1910 to 1914 figures obtained being for principal occupations only, while 1914 and all subsequent years include all employees in all occupations. ${ }^{1}$. Comparable data are presented in Table A for employees in the principal occupations from 1910 to 1929.
While the hours of labor of blooming-mill employees have decreased materially in recent years, there was a slight increase in 1929 over 1926 for the department as a whole. Average hours per week were 54.2 in 1926, the lowest figure shown for any year, as compared with 55 in 1929, which shows a considerable decrease in full-time hours from 70.5 in 1914. Until the summer of 1923 this department, while showing a gradual decrease from earlier years in working time of employees, was still largely on a 12 -hour basis, with some of the employees working 7 days per week. There was a general reduction in the daily hours of labor in the latter part of 1923, a large number of the plants having adopted the 8 -hour day, which brought full-time weekly hours down to 54.6 in 1924. Average full-time hours per week, earnings per hour, and full-time earnings per week for the department as a whole from 1913 to 1929 are shown in Table 1, page 4.

A comparison of full-time hours per week for employees in the various principal occupations may be made from Table A. In 1914 the average full-time hours per week for all employees in the principal occupations combined were 67.9 as compared with 70.5 for all employees in all occupations. In 1929, when the average for all employees in all occupations was 55 hours per week, the average for all employees in the principal occupations combined was 55.2 hours. When attention is turned to the various occupations, it will be observed that 11 out of the 12 principal occupations had an increase in average full-time hours per week in 1929 over similar figures for 1926, these increases ranging from 0.1 hour for bottom makers to 2.7 hours for shearmen's helpers. The occupation of bottom makers' helpers was the only one to show a decrease in average hours per week, the average for 1926 being 54.4 as compared with 53.7 for 1929. The average of 57 hours for laborers was the highest, while that of 53.4 for rollers was the lowest.

While hours per day and per week were less in the years 1924, 1926, and 1929 than in 1922 and earlier years, there has been a tendency toward an increase in 7-day week work. Most plants do not operate on a 7 -day week basis, but "light up" and repair work furnishes a 7-day week for a part of the force. Table B shows that in 1914 there

[^10]were only 11 per cent of all employees working on a 7 -day week basis, while 74 per cent worked 6 days per week regularly and 10 per cent of the employees alternated or rotated from 6 to 7 days per week. These percentages did not change to any great extent until 1920, when 15 per cent of all employees regularly worked a week of 7 days and the number of 6-day workers decreased to 67 per cent. In 1922 there was a further increase in 7 -day workers to 18 per cent and a decrease in 6-day workers to 56 per cent, while 21 per cent alternated or rotated from 6 to 7 days. After the adoption of the 8 -hour day in 1923 weekly turns had increased until 21 per cent in 1924 were working 7 days a week regularly and 35 per cent alternated or rotated from 6 to 7 days, while only 38 per cent worked a 6-day weekregularly. Seven-day work decreased somewhat in 1926. Comparing 1929 with 1926, the per cent of 6-day workers remained the same for both years, 46, while the per cent of 7-day workers increased from 20 in 1926 to 31 in 1929 and the number who alternated or rotated from 6 to 7 days remained unchanged. The increase in per cent of 7 -day workers in 1929 is due in part to changes in working time in some plants covered in both years and to the inclusion in the 1929 survey of plants not covered in earlier years, in which most employees were on a 7-day week basis.

From Table $D$ a good idea of the working time of employees may be obtained. By grouping the employees according to the hours per day, it may be seen that in 1929, of the 6,266 employees covered, 4,399 had working time of 8 hours or less per day, of which 1,887 regularly worked a 6-day week and 1,433 a 7-day week. Only 180 worked as many as 12 hours per day regularly or its equivalentthat is, 11 hours one week and 13 the next-or $10 \frac{1}{2}$ one week and $131 / 2$ the next, ete. The figures presented in Table $D$ cover many miscellaneous employees who are not directly connected with production, and in order to show conditions as they apply to the producing crew separate figures are given for the occupation of rollers. Of the 87 employees who worked as rollers during the pay period, 69 worked 8 hours per day, while only 4 had a day of 12 hours; 33 employees had a working week of less than 50 hours, 40 a week of over 50 and under 60 hours, and the remaining 14 one of 60 hours or over.

Table E shows the distribution of employees in six principal occupations according of their average full-time hours per week. From this table it is seen that 249 of these employees had an average week of 48 hours and 25 an average of 84 and over, while 569 had an average of between 48 and 60 hours. While hours of labor in blooming mills showed little change from 1924 to 1929, the trend in hourly earnings has been decidedly upward. In 1914 the average hourly earnings for all employees was 26.9 cents, which increased to 65.9 cents in 1920 and then dropped to 47.2 cents in 1922, the lowest figure shown by any survey since the war period. Average earnings then steadily increased to 61.3 cents in 1924, to 62.7 cents in 1926, and to 66.6 cents in 1929, which is the highest average shown for any year, being an increase of 148 per cent over 1914, or practically two and one-half times the earnings in 1914. The hourly earnings for the various principal occupations are shown in Table A.

The hourly earnings of rollers may be taken as example of the increases that have taken place since 1910, the first year for which figures were obtained. In 1910 rollers earned an average of 60.5
cents per hour as compared with 70.1 cents in 1913. In 1914 and 1915 hourly earnings decreased slightly, but increased to 91.2 cents in 1917. In 1920, when hourly earnings for the industry as a whole reached their highest point, rollers received an average of $\$ 1.473$ per hour. Earnings fell, however, to $\$ 1.175$ in 1922, but increased again to $\$ 1.400$ in 1924 , to $\$ 1.498$ in 1926 , and to $\$ 1.542$ in 1929 , which is higher than the average for any other year.

A distribution by average hourly earnings of the employees in six of the principal occupations in 1929 is shown in Table F. From this table may be seen the number receiving the various rates per hour. Hourly earnings for the other occupations of similar skill would show the same general spread as the distribution shown for these occupations.

Average full-time weekly earnings in 1929 show a large increase over 1914 and 1915, and were higher than in any previous year, with the exception of 1920, when they reached their highest point. In 1914 the average full-time weekly earnings for all employees were $\$ 18.96$, in 1915 the figure stood at \$19.03, and in 1920 the average had risen to $\$ 44.48$, but in 1922 had decreased to $\$ 32.10$. Between 1922 and 1926 there was an increase from $\$ 32.10$ to $\$ 33.98$ and another increase in 1929 to $\$ 36.63$. Weekly earnings for the various principal occupations show like increases. Again using rollers as an example, it will be seen that they earned $\$ 40$ in $1910, \$ 44.98$ in $1913, \$ 84.73$ in 1920, and $\$ 71.31$ in 1922 . Between 1922 and 1924 there was a material reduction in the full-time hours per week, but the increase in hourly earnings during the same period more than compensated for this decrease in hours and full-time weekly earnings in 1924 were higher than in 1922, being $\$ 72.99$ and $\$ 71.31$, respectively. In 1926 the average was $\$ 77.90$, or $\$ 4.44$ less than the 1929 average of $\$ 82.34$, the highest point since 1920.

The 1,686 employees in the principal occupations worked an average of 106.1 hours during the 15 -day period covered by the 1929 survey and received an average of $\$ 87.92$. During the same period the 6,266 employees in all occupations worked an average of 107.4 hours and earned an average of $\$ 71.54$. The hours and earnings of employees in the principal occupations include all of the hours worked and the earnings received by these employees, as shown in Table C. Roll engineers worked the most time, 114.1 hours, and laborers the least, 96.9 hours. Laborers also earned the least money, $\$ 45.08$, while rollers earned the most, $\$ 169.02$.

A classification of employees in six principal occupations according to hours worked is shown in Table G. This table shows the total time worked by each employee during the pay-roll period scheduled. Rollers worked from 40 and under 48 to 156 hours, while there were 67 laborers who worked less than 32 hours during the pay period and 1 who worked 192 hours and over.

In Table H a classification by earnings is made for the same six occupations. A considerable variation in earnings in the different occupations is shown. There were 40 laborers who earned less than $\$ 5$ and i who earned between $\$ 90$ and $\$ 95$ for the period, while the earnings of rollers ranged from $\$ 70$ and under $\$ 75$ to $\$ 250$ and over, 15 having earned $\$ 200$ and under $\$ 250$.

Table H.-Average and classified earnings actually received by employees in six specified occupations in pay period covered, 1929, by districtBlooming Mills ${ }^{1}$

## PLATE MILLS

Data for this department include both sheared and universal plate mills and cover 20 mills in 17 establishments located in 6 States. Fourteen of these mills, which range in size from 72 to 152 inches, are sheared plate mills, where the edges are not rolled but must be sheared off, while the remaining 6 are universal mills, which range from 48 to 60 inches, where the edges are rolled, and only the ends need be cut. During the pay-roll period covered these establishments employed 4,024 wage earners in all occupations, and 1,487 of these were in the 16 principal occupations, for which separate figures are given. A study of wages and hours of labor for this department was first made in 1910. From 1910 to 1914 employees in the principal occupations only were included, but all employees in all occupations were included in the years 1914 to 1929. ${ }^{1}$ Table A gives comparable figures for employees in the principal occupations from 1910 to 1929.

Hours of labor changed very little in this department over the period 1914 to 1920. In 1914 average full-time hours per week were 69 , as compared with 68.8 in 1920, and in 1922 were 66.2 , or 4 per cent less than in 1914 . Following the adoption of the 8 -hour day in 1923, hours per week had been so far reduced that they were 57.2 in 1924 and by 1926 had fallen to 55.8 , the lowest for any year shown and 19 per cent below the figure for 1914. The demand for plates during the year of 1928, and which continued into 1929, caused many plants in the eastern part of the country to change their regular working time both as to length of day (turn) and number of turns per week. For example, one plant which was working 6 days and 5 nights per week in 1926 had changed over to a regular operation of 6 days and 6 nights per week. Another plant changed from 7 days and 6 nights of 10 hours each to 7 days and 6 nights of 12 hours each, and still another changed its regular working time from 10 hours to 11 hours per day. Small increases in working time also took place in other localities. The effect of these changes is reflected in the full-time hours per week for 1929 which are 58 , or 4 per cent above 1926. Table 1, page 4, shows average full-time hours per week, earnings per hour, and full-time weekly earnings for the department as a whole for the years 1914 to 1929.
Comparison of 1929 averages in the principal occupations with those for earlier years may be made from Table A. In 1910 average hours ranged from 71.6 for charging crane and charging machine operators to 66.8 for laborers. In 1924, after the adoption of the 8 -hour day by many plants, hours had been reduced until the average of 63.3 for roll engineers was the highest and 54.7 for screw men, sheared plate mills, was the lowest. In 1929 screw men, sheared plate mills, whose average was 63 hours, had the longest week and screw men, main rolls, universal mills, had the shortest- 55.4 hours. Laborers had an average week of 59.3 hours in 1929, as compared with 66.8 in 1910.

The increase in average hours per week for most of the occupations is reflected to some extent in the per cent of employees working 6 days per week regularly or alternating or rotating from 6 to 7 days per week. Table B shows that 10 per cent of the workers in 1929 had a

[^11]regular 7 -day week, 8 per cent worked 7 days per week for two weeks and 6 days the third week, 6 per cent worked 7 days every second week, and 7 per cent worked 7 days every third week. A 6 -day week was worked regularly by 51 per cent of all employees in 1929 as compared with 49 per cent in 1926. The eastern district, with 68 per cent, had the greatest number of 6-day workers, followed by the Pittsburgh district with 49 per cent and the Great Lakes and Middle West district with 37 per cent. The eastern district also led in 7-day workers, having 16 per cent as compared to 3 per cent for the Pittsburgh and 11 per cent for the Great Lakes and Middle West districts. The number of 7 -day workers was lowest in 1914, when only 3 per cent worked 7 days per week regularly.

In order that the prevailing hours per day and per week in this department may be more fully shown, Table D is presented. This table shows that out of a total of 4,024 employees covered, 537 worked day turns only, 38 worked night turns only, and 3,449 alternated or rotated from day to night shift; 1,710 worked regularly an average of 8 hours per day, 162 of these working 7 days each week. There were 396 who worked an average of 12 hours per day, 109 of whom worked 7 days regularly; but only 4 employees who worked an average of more than 12 hours per day. This table includes all employees in all occupations, many of whom are not on direct producing crews. That a better idea of working time of members of the producing crews may be given, separate figures are shown for the occupation of screw men, sheared plate mills. Of the 39 employees, 6 worked regularly 8 hours per day and 6 worked 8 hours a day except every third Saturday, when they worked 13 hours. Only 4 employees had a working week of 76 hours or over.

Table E shows the distribution by average full-time hours per week of employees in six principal occupations. Out of the total of 1,093 employees in these 6 occupations, 193 had a week of 48 hours or less, 309 a week of 60 hours, and 35 a week of over 72 and under 84 hours.

Although there was an increase in average hours per week in 1929 over similar figures for 1924 and 1926, the general trend of hours had been downward over the period 1914 to 1929. The general trend of hourly earnings, however, has been upward during this same period. In 1914 average hourly earnings for employees in this department were 25.8 cents and in 1915 increased to 27 cents. Between 1915 and 1920 conditions had so changed that earnings had advanced to 67.1 cents in 1920, which is an increase of 160 per cent over 1914. The effect of the 1921 depression in the industry is reflected in the 1922 average, which dropped to 47.6 cents per hour. After the adoption of the 8 -hour day in 1923 earnings again increased, bringing the average in 1924 to 56.2 cents per hour. Earnings continued to increase, and in 1926 the average hourly rate was 60.6 cents. The increased demand for plates in 1928 and 1929, previously mentioned, coupled with new improvements recently installed by some of the plants covered in the study, led to an average hourly earning of 63.9 cents in 1929, which is slightly over 3 cents more than the average for this department in 1926.

The greatest change in hourly earnings in the principal occupations as between 1926 to 1929 is found in the occupation of rollers, sheared plate mills, whose earnings were $\$ 1.364$ in 1926 as compared with $\$ 1.595$ in 1929, and the smallest change in that for screw men, side rolls, universal mills, whose rate was 70.9 cents in 1926 and 70.4
cents in 1929. The occupation of shearmen may be taken as an example of the changes in hourly earnings of employees in the principal occupations. Their average hourly earnings were 37.8 cents in 1910 and increased to 41.5 cents in 1913. There was a slight decrease in earnings to 40.6 cents per hour in 1914, but in 1915 this loss had more than been made up, earnings having increased to 43.6 cents. The increased demand for plate-mill tonnage between 1915 and 1917 is reflected in the average for the latter year, when earnings were 97.7 cents, or 135 per cent more than in 1913. Earnings increased again in 1920 to $\$ 1.016$, which is the high point of earnings in this occupation as well as for the department as a whole. There was a lessened demand for plates soon after the close of the war, which adversely affected hourly earnings of employees of this department, those of shearmen dropping to 66.6 cents in 1922. However, after the adoption of the 8 -hour day in 1923 there was a partial recovery, and in 1924 earnings increased to 79.3 cents, and each of the subsequent studies shows increased earnings, the average for 1929 of 86.3 cents being 3 per cent more than the 1926 average of 83.6 cents.

A distribution according to hourly earnings for employees in six of the principal occupations is given in Table F. This shows in a general way the spread of employees in other occupations of similar skill for which no distribution tables are given.

Average full-time earnings per week were more than twice as much in 1929 as in 1914, the 1914 average for all employees being $\$ 17.80$ as compared with $\$ 37.06$ in 1929. In 1920 weekly earnings were $\$ 46.16$, the highest figure for any year shown. There was a decided drop in 1922, when the average fell to $\$ 31.51$, but increases are shown for each year since 1922. Changes in earnings for the various occupations are shown in the example of shearmen, who had average earnings of $\$ 50.05$ per full-time week in 1929 as compared with $\$ 25.69$ in 1910. Earnings of $\$ 27.97$ in 1914 increased to $\$ 69.17$ in 1919, and 1920 weekly earnings were $\$ 69.44$, the highest of any year shown and 141 per cent greater than in 1913. There was a decrease in 1922 followed by a slight increase in 1924, when earnings were $\$ 43.15$; slight increases in 1926 and in 1929, earnings for the latter year being 74 per cent greater than in 1913.

The 1,487 employees in the principal occupations worked an average of 109.5 hours in a 15 -day pay period for which they received an average of $\$ 79.81$, as against an average of 107.4 hours and $\$ 68.69$ for all employees in all occupations. The hours and earnings given above include all the hours worked and earnings received by employees shown in Table C. Rollers, sheared plate mills, worked the most hours, 126.9, and had the highest earnings, $\$ 200.29$, while laborers worked the least hours, 85 , and earned the lowest amount, $\$ 35.31$.

A classification of employees in six principal occupations according to hours actually worked is shown in Table G. This table shows that 40 of the 225 laborers worked less than 32 hours per pay period, while only 1 worked as much as 180 hours. In the highly skilled occupation of rollers only 1 employee worked less than 88 hours.

A like classification of earnings is made in Table H. Considerable variation is shown in the earnings of employees in different occupations in this table. Laborers earned from under $\$ 5$ to $\$ 80$ and under $\$ 85$; the largest group, 31 , earned $\$ 40$ and under $\$ 45$. Rollers show only 1 employee earning less than $\$ 100$, while 1 earned $\$ 250$ and over; the largest group, 17 , earned $\$ 200$ and under $\$ 250$.

Table A.-Average customary full-time hours per week, earnings per hour, and full-time earnings per week, and index numbers therefor, 1910 to 1929, by occu-pation-Plate Mills

## STANDARD RAIL MILLS

Data for this department cover seven establishments located in six States. This is practically a complete census of employees and plants engaged in the production of heavy rails. During the payroll period covered by this survey a total of 2,816 wage earners were employed, 1,518 of these being found in the 21 principal occupations for which separate figures are shown. Data for this department were first obtained in 1910, and from 1910 to 1914 figures are for employees in the principal occupations only; figures for all employees in all occupations cover the years 1914 to 1929. ${ }^{1}$
Since the majority of the plants covered in the 1926 and 1929 studies were not included in the surveys previous to 1924, comparable figures for the principal occupations can not be given for all the earlier years, therefore averages for 1926 and 1929 only are presented in Table A. No attempt was made to group the plants by districts in 1926 and 1929, all figures shown for the department being for the country as a whole.

Figures for all employees are comparable from year to year as explained in footnote 4, page 1, and are presented for all years covered, from 1913 to 1929, in Table 1, page 4. Full-time weekly hours of labor of employees in 1929 show a slight increase over 1926. The 1929 average is, however, the lowest shown for any year with the exception of 1926. There was practically no change in hours during the years 1914 and 1915, being 70.1 in 1914 and 70.9 in 1915. Hours decreased to 61.2 in 1920, and were practically the same in 1922, but from 1922 to 1924 again decreased from 61.5 to 57.4. Since 1924 the change in average hours has not been great, dropping to 55.5 in 1926 and rising to 56 in 1929.
Comparison of full-time hours per week of employees in the principal occupations in 1926 and 1929, which may be made from Table A, shows the average for the principal occupations combined to be 55.4 in 1929 as compared to 54.9 in 1926. This is an increase of 0.5 hour, the same as shown for all employees in all occupations combined. Thus it is seen that changes in hours of the principal occupations may be taken as an indicator of changes in other occupations, for which separate data are not shown.

When the principal occupations are considered separately, it is seen that 11 had a decrease, 9 an increase, and 1 no change in fulltime hours in 1929 as compared with 1926. The largest increase was from 56.6 to 59.8 hours for laborers, and the largest decrease from 57.4 to 49.8 hours for roll engineers. Tablemen with an average of 60.1 had the longest hours, while roll engineers with 49.8 had the shortest hours per week in 1929. Table 2, page 7, shows there was little change in the per cent of employees working less than 60 hours per week. In 1929 there were 16 per cent working 60 hours per week as compared with 26 per cent in 1926. However, the per cent who worked over 60 and under 72 had increased from 13 in 1926 to 21 in 1929. Less than 1 per cent worked over 72 and under 84 hours, this being the longest time worked by any employee in 1929.

1 Data were not obtained for the years 1016, 1018, 1921, 1923, 1925, 1927, and 1028.

Table B shows customary turns per week for all employees from 1914 to 1929. In 1914, 88 per cent of the employees regularly worked 6 days per week and 7 per cent worked 5 days one week and 6 the next, while only 4 per cent worked 7 days per week regularly. In 1920 the number working 6 days per week regularly had risen to 92 per cent, while 8 per cent worked 7 days per week either regularly or as often as every 3 weeks. The figures did not vary greatly in 1922, but in 1924, after the adoption of the 8-hour day, the turns per week were increased until only 44 per cent were working 6 days per week regularly and 56 per cent were working 7 days per week either all or part of the time, of which 10 per cent worked 7 days each week, 29 per cent twice in 3 weeks, and 17 per cent once in 2 weeks. In 1926 the per cent of employees working 7 days each week decreased to 6 per cent, while the per cent of employees working 6 days each week increased to 51 per cent. Due to a change in customary working time in 1 large plant from a week of 6 days, 7 days, and 7 days in rotation in 1926 to a straight 7-day week in 1929, the number of 7 -day workers increased from 6 to 20 per cent, and 6-day workers decreased from 51 to 42 per cent.
In order that a clearer idea of the working time of employees in this department may be obtained, Table D is presented. This table shows that out of the 2,816 employees covered in the 1929 study, 416 worked day turns only, 88 worked night turns only, and 2,312 alternated or rotated from day to night turns. A grouping by the number of hours worked per day shows that 1,758 worked regularly a day of 8 hours, of which 406 had a regular 7 -day week and 706 a regular 6 -day week; 1,038 had a 10 -hour day, of which 115 had a regular 7 -day week and 457 a regular 6 -day week. Only 3 employees had a day of more than 10 hours. This table includes those employees engaged in miscellaneous occupations as well as those of producing crews. In order that a better idea may be obtained of working conditions existing in the producing crews, separate figures are given for the occupation of table levermen. Out of the 70 employees reported working as table levermen, 59 had a day of 8 hours and 11 a day of 10 hours; 32 of the 70 employees had a regular 6 -day week and 9 a regular 7 -day week.
Table $\mathbf{E}$ shows the distribution of employees in five principal occupations according to their full-time hours per week. This table shows that 195 employees in these occupations had a customary week of 48 hours, which is the largest number found in any single group. There were 31 laborers who had a week of 66 and under 72 hours, the only occupation in which any employee had a week of as many as 66 hours.

The general trend of earnings has been upward during the period 1914 to 1929. In 1914 average hourly earnings for employees in this department were 25.2 cents, but decreased to 24.6 cents in 1915. In 1920 the average had risen to $2 \frac{1}{2}$ times as much as it was in 1914, or to 63.2 cents-the highest point in earnings of any year shown. The effect of the 1921 depression is reflected in the 1922 average- 47.0 cents. After the 8 -hour day was generally adopted, earnings per hour increased to 57.3 cents in 1924, and in 1926 to 59.5 cents, which is 3 cents an hour less than the 1929 average of 62.8 cents. Average hourly earnings of employees in the various principal occupations are shown in Table A.

Average hourly earnings for employees in the principal occupations combined were 69.8 cents in 1929 as compared with 67.2 cents in 1926, an increase of approximately 4 per cent as compared with about $51 / 2$ per cent for all employees in all occupations during the same period. Earnings per hour for employees in the principal occupations in 1929 range from $\$ 1.676$ for the skilled occupations of rollers to 40 cents for laborers. When the principal occupations are compared separately, 12 occupations show increases and 9 decreases in 1929 as compared with 1926. The greatest change as to increase in hourly earnings is found in the occupation of hotbed men whose earnings were 51.8 cents in 1926 and 57.1 cents in 1929. Rollers show the greatest change as to decrease, their average falling from $\$ 1.888$ in 1926 to $\$ 1.676$ in 1929. A distribution of employees according to average hourly earnings in five principal occupations in 1929 is shown in Table F.

Average full-time weekly earnings for all employees in all occupations as shown by Table 1, page 3, were almost twice as great in 1929 as in 1914. In the latter year the average earnings for all employees were $\$ 17.67$, but in 1915 there was a slight decrease, bringing the average to $\$ 17.44$. In 1920 weekly earnings of $\$ 38.68$ were more than twice the amount shown for any preceding year. Weekly earnings dropped in 1922 to $\$ 28.91$ but advanced to $\$ 33.02$ in 1926.

Due to a small increase in average weekly hours and an increase in average hourly earnings, average full-time weekly earnings in 1929 increased to $\$ 35.17$, which is $\$ 2.15$ more than the 1926 average. Rollers had the highest average weekly earnings of any occupation, $\$ 89.67$. Laborers, with an average full-time earning of $\$ 23.92$ in 1929, had the lowest occupational average.

The 1,518 employees in the principal occupations worked an average of 99.2 hours in a 15 -day pay period, for which they received an average of $\$ 67.94$. This compares with 104.8 hours and $\$ 65.84$ for all employees in all occupations. The hours and earnings shown above include all the hours worked and earnings received by employees as shown in Table C. Tablemen worked the most time, 137.4 hours, and cold-saw helpers the least, 88.4 hours. Laborers earned the least money, $\$ 37.07$, while rollers-a highly skilled occupationearned the most, $\$ 193.81$.

A classification of employees, by hours actually worked in 1929, in five principal occupations is made in Table G. This table shows that the occupation of laborers had 37 employees out of 245 who worked less than 40 hours, but that the largest group, 36, came under the heading "Over 120 and under 132." In the skilled occupation of guide setters no employee worked less than 72 hours.

A like classification of earnings is made in Table H. Considerable variation in earnings is shown in this table, due to the various hours worked by the employees for the same occupations as shown in Table G. Eight laborers earned less than $\$ 5$ and one earned between $\$ 90$ and $\$ 95$. However, 115, or almost half of the laborers, earned less than $\$ 40$ for the 15 -day period.

## BAR MILLS

The 1929 study of this departmentincludes data for continuous, semicontinuous, and hand-operated bar mills, ranging in size from 8 to 18 inches. In all studies prior to 1929 only hand-operated bar mills were included. The continuous and semicontinuous types of bar mills have been gradually increasing in use and are now of sufficient importance to be included in any bar-mill study. A continuous bar mill consists of a number of stands of two high nonreversing rolls set one behind the other, which are driven at progressively increasing speeds. In mills of this type the piece which is being rolled is carried by a mechanical conveyor from one roll stand to another; thus the piece passes in a line through the entire mill without being handled. Hand bar mills consist of a number of stands of rolls set end to end in a straight line. These stands are of either the two or the three high nonreversing type. In the strictly continuous mill, guides are so placed in front of each roll stand, except the first, that the piece being rolled is turned or twisted before it enters each pass. In some so-called continuous mills guides have not been placed in front of the roll stands and it is necessary to have men in front of the stands, who catch the piece with tongs, enter it in the right position, and if necessary hold it to prevent the piece from turning. In a strictly hand-operated mill the piece which is being rolled is passed back and forth through the different stands of rolls until the piece has been reduced in cross section and elongated. The roll train in handoperated bar mills consists of roughing, stranding, and finishing rolls. A semicontinuous mill is one where the roughing and possibly the stranding rolls are set in tandem and operated as a continuous mill, the last or finishing stands being hand operated.

Separate averages are not shown for continuous and semicontinuous mills, as the work of stockers, heaters, heaters' helpers, chargers and helpers, roll engineers, rollers, finishers, hotbed men, shearmen, shearmen's helpers, and laborers is essentially the same as in handoperated mills. The continuous and semicontinuous mills included in this study are located in the Pittsburgh, the Great Lakes and Middle West, and the southern districts of the United States. No continuous or semicontinuous mills are included in the data for the eastern district. The addition of plants operating the continuous type of mill does not influence, except to a slight extent, the figures presented for the country as a whole.

Comparison of hourly earnings in hand-operated mills and in both hand-operated and continuous mills, as given below, shows to what extent the earnings in certain occupations were influenced by the addition of the continuous type of mill. These averages for these occupations are based on the hours and earnings of employees in the three districts specified as having both hand and continuous mills.

| Occupation | Earnings per hour |  |
| :---: | :---: | :---: |
|  | Hand-operated mills only | All mills, both hand and continuous |
| Stockers.-............ | \$0. 524 | \$0. 539 |

| Shearmen's helpers. | . 8389 | . 543 |
| Laborers.. |  | . 403 |

Data for 1929 were obtained from the pay rolls of 39 bar mill establishments located in 11 States, of which 31 were hand-operated mills employing 5,745 employees in all occupations and 8 were continuous and semicontinuous mills having a total of 1,730 employees in all occupations. There were 7,475 employees in all mills, and 4,521 of these were in the principal occupations for which separate figures are given. Comparable data were first obtained for this department in 1907, and from that year until 1914 employees in the principal occupations only were covered, while all employees in all occupations were included in the figures for the period 1914 to $1929 .{ }^{1}$ Comparable figures are presented for all employees in the principal occupations from 1907 to 1929.

Hours of labor in bar mills have decreased 10 per cent over the period 1914 to 1929 . There was practically no change in the average full-time hours per week for all employees in this department of 61.7 in 1914 until 1924, when the average was 55.6 as compared with 61.2 in 1922. This change was brought about by the adoption of the 8 -hour workday in many plants in 1923. In 1926 the average hours for employees had decreased to 54.7 , which is the lowest of any year shown and 0.9 hour less than the 1929 average of 55.6 hours. Average full-time hours per week, earnings per hour, and full-time earnings per week, 1913 to 1929 are shown in Table 1, page 4, for the department as a whole.
Comparisons of the full-time hours per week of employees in the various principal occupations, which may be made from Table A, show similar reductions in customary working time. In 1913 the average full-time hours per week for all employees in the principal occupations combined were 60.9 as compared with 55.1 in 1929a reduction of 10 per cent in working time, which is the same as that for all employees in all occupations during the same period. Considering the principal occupations separately it is found that in 1913 average full-time weekly hours ranged from 69.2 for roll engineers to 58.1 for catchers, while in 1929 average weekly hours ranged from 60.1 for roll engineers to 53.3 for bundlers.

While the increase or decrease in average full-time hours per week of employees in this department from 1914 to 1926 had been caused almost entirely by changes in daily hours of labor, the increase in average full-time hours per week in 1929 over 1926 was caused by

[^12]an increase in both the daily hours of labor and the number of turns per week. Table B shows that in 1914 there were 94 per cent of all employees working from 5 to 6 days per week, in 1920, 89 per cent, while in 1929 this percentage had been reduced to 81. There was little change in the per cent of 7-day workers between 1914 and 1926 but when 1929 is compared with 1926 there was an increase in per cent of 7 -day workers from 2 to 8 . This change for the country as a whole was brought about through the large increase in the number of 7 -day workers in the Pittsburgh district where the percentage of such workers had increased from 1 in 1926 to 16 in 1929.

A good idea of the extent of the spread of hours in this department may be gained from Table D. This table shows that out of a total of 7,475 employees, 2,517 worked days only, 158 nights only, and 4,800 alternated or rotated from day to night turns; and that 560 worked 12 hours or an equivalent thereto each day they were on duty, and 2,589 worked a day which averaged 8 hours or less each day they were on duty. Since Table D covers all employees in all occupations whether employed on producing crews or not, separate figures are presented for one key occupation-roughers-of the producing crews. Of the 195 employees who worked as roughers, only 27 had a customary working week of over 60 hours, while 120 had less than 60 hours per week, and of these there were 35 whose daily hours of labor were regularly 8 hours or less each day they were on duty.

Table E shows a distribution of employees in six principal occupations according to their average full-time hours per week. Of the 1,955 employees in these 6 occupations, 398 worked a customary week of 48 hours or less, while 263 worked over 60 hours. There was only 1 employee in these 6 occupations that had an 84 -hour week.

While average full-time hours per week decreased 10 per cent between 1914 and 1929, average earnings per hour increased 125 per cent. Average earnings per hour for all employees in this department were 27.8 cents in 1914, and there was little change until 1920 , when hourly earnings were 71.3 cents, or more than two and one-half times the average in 1914. Due to the depression in the industry in 1921, earnings dropped to 48.6 cents in 1922 . After the 8 -hour day was generally adopted in 1923, earnings increased and by 1924 had advanced to 58.5 cents per hour, somewhat less than the 1926 average. In 1929 earnings again advanced to 62.5 cents per hour, or an increase of approximately 6 per cent over the 1926 average. Average hourly earnings of employees in the various principal occupations are shown in Table A. For example, roughers earned an average of 43.4 cents in 1907. There was a slight increase to 43.6 cents in 1913, but little change from this time until 1919 when the average was 93.3 cents. This large increase was caused by conditions brought on by the World War. In 1920 earnings per hour again advanced, and were \$1.034, which is the highest average of any year shown. By 1922 hourly earnings had dropped to 70.9 cents but again increased to 81.0 cents in 1924, and to 84.7 cents in 1926. The demand for merchant bars increased in 1928 when, according to the 1928 report of the American Iron and Steel Institute, there was 6,277,835 gross tons produced. This demand continued into 1929, and earnings increased to 88.7 cents per hour, which is 103 per cent above the 1914 average.

A distribution by average hourly earnings of employees in 6 principal occupations in 1929 is given in Table F, which shows that in the unskilled occupation of laborers there were 58 out of a total of 607 who earned less than 25 cents per hour, while in the skilled occupation of rollers no employee earned less than 90 cents per hour.

Average full-time weekly earnings for all employees in this department followed very closely the trend in average hourly earnings during the period 1914 to 1924 . This was due to the very slight change in average weekly hours during that period. In 1914 average weekly earnings were $\$ 17.15$ as compared to $\$ 44.06$ in 1920 , an increase of 157 per cent, which is almost identical with the increase in hourly earnings during the same period. Weekly earnings declined in 1922, but advanced again in 1924 to $\$ 32.53$, which is $\$ 2.22$ less than the 1929 average of $\$ 34.75$. In the various principal occupations weekly earnings show like increases. Roughers, for example, earned $\$ 26.28$ in 1907; weekly earnings decreased somewhat during the years 1908 to 1912 , but in 1913 advanced to $\$ 26$, which was practically the average for 1907. In 1919 average hourly earnings were more than twice those of any year up to this time, and weekly earnings increased to $\$ 56.63$. A further merease in 1920 brought the average to $\$ 59.46$, which is the highest of any year shown. Earnings per week dropped in 1922 to $\$ 40.41$, but in 1924 and each subsequent year increased until weekly earnings stood at $\$ 49.49$ in 1929.

The 4,521 employees in the principal occupations worked an average of 97.9 hours during the 15 -day pay period covered by the 1929 study for which they received $\$ 67.28$. All of the hours worked and earnings received by these employees, as shown in Table C , are included. Roll engineers worked the most time, 112.2 hours, and earned an average of $\$ 62.68$, while shearmen's helpers, who worked the least hours, 87.5, earned \$47.17. Rollers earned the most money during the pay period, $\$ 200.56$, while laborers earned the least, \$37.63.

A classification, by hours actually worked, of employees in six principal occupations is made in Table G. In the unskilled occupatign of laborers it is shown that 81 worked less than 32 hours during the pay-roll period scheduled, while in the skilled occupation of rollers only 2 of the 127 scheduled worked under 32 hours.

A like classification of earnings is made in Table H. Due to the variation of hours worked by employees as shown in Table G, this table shows a wide spread of earnings for employees in the same occupations. For example, 49 laborers out of a total of 607 earned less than $\$ 5$ per pay period, while 1 earned between $\$ 100$ and $\$ 110$; heaters, however, show the widest variation, 1 having earned less than $\$ 5$ and 2 who earned $\$ 250$ and over.

Table A.-Average customary full-time hours per week, earnings per hour, and full-time earnings per week, and index numbers therefor, 1907 to 1929, by occu-pation-Bar Mills

## SHEET MILLS

Data for this department cover 15 sheet-mill establishments located in 6 States, which during the pay-roll period covered employed 12,598 wage earners. Of this total 6,597 were in the 18 principal occupations for which separate figures are shown.

A study of wages and hours of labor for employees in this department was first made in 1910. From 1910 to 1914 data were secured for employees in the principal occupations only, but from 1914 to 1929 employees in all occupations were included. ${ }^{\circ}$ Comparable data for employees in the principal occupations from 1910 to 1929 are given in Table A.
Hours of labor in this department show little change during the years 1914 and 1915, the full-time average hours per week being 52.3 and 52.5 , respectively. In 1920 hours dropped to 50.3 , or 4 per cent less than in 1914. Weekly hours in the years 1922 and 1924 were about the same as in 1920 , but in 1926 hours decreased to 48.9 , this being the 1929 average also, and 7 per cent less than in 1914.

This small decrease in full-time weekly hours in this department was due to the adoption of the 8 -hour day for hot mill crews and certain other occupations long before its general adoption in other departments of the industry. Certain employees, chiefly laborers, have not as yet received the full benefit of the 8 -hour day, as the average hours per day for employees in this occupation are 9.8.

Comparisons of full-time hours per week in the various principal occupations may be made from Table A. The average hours per week of employees in the hot mill occupations which include the heating and rolling crews have not varied much over the period 1910 to 1929. This is also true of the shear crew, but the hours of picklers and laborers show considerable variation. The average hours per week of picklers were 70.8 in 1910 as compared with 68.1 in 1913. There was little change until 1920 when the average was reduced to 51.5, which is 24 per cent below the 1913 figure. In 1922 picklers worked an average of 65.9 hours, but this average dropped to 56.9 in 1926 and to 52 in 1929. The average of 63.1 hours per week for laborers in 1910 did not change to any extent until 1920, when weekly hours were 59.5 . However, in 1922 hours advanced to 65.2 , which is close to the 1919 average of 64.5 . There was a decrease in 1926 in average hours per week to 56.6 , but an increase in 1929 to 60.7, a decrease of only 4 per cent compared with 1910.
The increases or decreases in full-time hours per week of employees have been caused chiefly by changes in daily hours of labor as average turns per week have remained practically the same from year to year. Table B shows that 95 per cent of the employees scheduled in 1914 worked 6 days per week or alternated or rotated regularly from 5 to 6 turns, and in 1929, 94 per cent of the employees worked such turns. While there has been some slight changes in some of the groups during the period 1914 to 1929, the number of turns per week

[^14]changed very little. The per cent of 7-day workers was 4 in 1914, dropped to 3 in 1920, increased to 4 again in 1922, and to 5 in 1926 and 1929.

In order that a clearer idea may be given of the prevailing hours per day and per week, Table D is presented. This table shows that of the 12,598 employees covered 2,211 worked day turns only, 67 worked night turns only, and 10,320 alternated or rotated from day to night turn; 8,889 employees worked a day of 8 hours, 1,884 a day of 10 hours, 350 averaged 12 hours a day, and 4 averaged as many as 13 hours. Figures for all employees, whether on producing crews or engaged at other work, are included in Table D, but in order better to illustrate conditions as they apply to the producing crew, separate figures are given for one key occupation-rollers. While all of the 546 rollers had a day of 8 hours, 407 worked 5 days, 5 days, and 6 days per week in rotation, and 139 worked 5 days, 6 days, and 6 days in rotation. The table also shows the number of turns worked and full-time hours per week for all employees.

Table E shows the distribution of employees in six principal occupations according to their average full-time hours per week. This table shows that 2,018 employees in these occupations had average full-time hours per week of "over 40 and less than 44, " 671 of " 44 and under 48 ," 204 of 60 , and 22 who had a week of 84 hours.
While hours of labor have shown rather small variations from year to year, hourly and weekly earnings have shown great changes. In 1914 the hourly rate for the department was 48.8 cents, which dropped to 45 cents in 1915, but by 1920 earnings reached the high average of $\$ 1.039$. Alternate decreases and increases in hourly earnings followed-to 69.4 cents in 1922, to 80.9 cents in 1924, to 75.9 cents in 1926, and to 79.3 cents in 1929 when the average was 63 per cent higher than in 1914 and 24 per cent lower than in 1920.

The average hourly earnings of employees in the various principal occupations are shown in Table A. Earnings in 1929 ranged from $\$ 1.979$ for rollers to 42.9 cents for laborers. In the principal occupations combined hourly earnings increased from 98.6 cents in 1926 to $\$ 1.008$ in 1929, or an increase of about 2 per cent. Most of the tonnage rates paid in sheet mills are based directly on the selling price of the product, thus the rates in this department in a large number of occupations are subject to wide fluctuations between studies such as made by the bureau. The greatest change in hourly earnings in the principal occupations as between 1926 and 1929 is found in the occupation of rollers, level-handed, whose earnings. were $\$ 1.162$ in 1926 as compared with $\$ 1.381$ in 1929. Shearmen show the least change in hourly earnings, from $\$ 1.222$ in 1926 to $\$ 1.227$ in 1929. A distribution of employees by average hourly earnings for six principal occupations is shown in Table F.

Due to the small change in hours of labor per week full-time weekly earnings for the department have followed closely the changes in hourly earnings. In 1914 the average full-time weekly earnings for all employees was $\$ 25.52$, which dropped to $\$ 23.63$ in 1915 , and then increased to $\$ 52.26$ in 1920, the highest figure for any year. In 1922 the average was $\$ 35.46$, but in 1924 had risen to $\$ 40.61$, and was followed by a decrease in 1926 to $\$ 37.12$. In 1929 the average was $\$ 38.78$, which is 52 per cent greater than in 1914. Weekly earnings of the principal occupations show similar or even greater changes.

Rollers, for example, earned $\$ 63.21$ in 1913 as against $\$ 129.10$ in 1920. In 1922 earnings had decreased to $\$ 82.01$, which was still 30 per cent above the 1913 average. By 1924 part of this loss had been regained, the average for that year being $\$ 93.35$; but earnings dropped again in 1926 to $\$ 84.69$. However, hourly rates increased somewhat in 1929 and full-time weekly earnings rose to $\$ 85.89$, which is 36 per cent above the 1913 figure. Table 1, page 4, shows average full-time hours per week, earnings per hour and full-time weekly earnings for the department as a whole for each year 1913 to 1929 .
The 6,597 employees in the principal occupations worked an average of 80.5 hours in the 15 -day period for which they received an average of $\$ 80.20$. This compares with 91.1 hours and $\$ 72.22$ for all employees in all occupations. The hours and earnings given for the principal occupations above include all hours and earnings received by employees as shown in Table C. Laborers worked the most time- 105.3 hours-and openers, level handed, the least- 71 hours. Rollers-a highly skilled occupation-earned the most money, $\$ 159.33$, and laborers the least, $\$ 45.82$.

A classification of employees in six principal occupations according to hours actually worked is given in Table G. Of a total of 448 laborers this table shows that 34 worked less than 32 hours during the pay period, while only 1 worked 192 hours or more. The two headings under which the largest number of laborers fall are "over 112 and under 120," and "over 120 and under 132," each having 65. Matchers is the only other occupation which had more employees than laborers working under 32 hours.

A like classification of earnings is made in Table H. Due to the variation of hours worked, as shown in Table G, there is considerable difference in earnings of employees in the same occupation. Fourteen laborers earned less than $\$ 5$ during the pay period, while only one earned from $\$ 85$ to $\$ 90$, and the largest number, 92 , earned $\$ 50$ and under $\$ 55$. Rollers earned from $\$ 15$ and under $\$ 20$ up to $\$ 250$ and over, the average for the occupation being $\$ 159.33$.

## TIN-PLATE MILLS

Data for this department were collected from the pay rolls of eight establishments located in four States and cover 8,386 employees in all occupations. Of this number 4,859 were found in the principal occupations for which separate figures are given. Data were first obtained in 1910, and from 1910 to 1914 employees in the principal occupations only were covered, while in 1914 and all subsequent years all employees in all occupations were included. Figures for all employees cover the period 1914 to 1929; ${ }^{1}$ but comparative figures for employees in the principal occupations are given from 1910 to 1929.

In all previous studies averages for this department were shown by geographical district, but in this study averages are given only for the country as a whole and district averages are omitted. In recent years, certain establishments of this department have adopted mechanical equipment to take the place of certain hand work. This has created some new occupations among which are mechanical doublers, single boys, and machine tinners. These changes also affected the duties of certain other occupations such as pair heaters and hand doublers. While all establishments covered have not adopted all of the newer mechanical appliances there are now enough employees in these recently created occupations to warrant adding them to the list of principal occupations and to separate employees in some of the other occupations into two divisions, namely, hand and mechanical. For example, doublers in the studies previous to 1929 had been placed under one classification whether or not they worked as hand or machine operators, but in the 1929 study there are two classificationsdoublers, hand, and doublers, mechanical-and separate averages are given for each.

Another example is that of doublers' helpers which in former years included employees assisting either hand or mechanical doublers as well as pair heaters whose duties, before the adoption of the mechanical doubler, was to assist in the doubling work. Since the mechanical doubler has come into use, duties of pair heaters in some plants have changed to such an extent that they now have full charge of the pair furnace-fire the furnace, clean the grates, charge all pairs into the furnace, and drag all or part of the pairs to the rougher's stand-and in no way do they assist the doubler. This has resulted in the separation of pair heaters from the classification of doublers' helpers and they are now presented as a separate occupation, which separation leaves only employees assisting hand doublers in this classification. Therefore, the averages for 1929 cover doublers' helpers, hand, only. Since all establishments have not yet adopted these newer methods, and in order not to reveal the identity of any plant, all averages are presented for the country as a whole and not by district. This change im no way affects the figures for the United States as a whole as they are comparable from year to year over the period for which they are given. (See Bulletin No. 442 for district figures for earlier years.) However, when comparing the 1929 averages for earnings per hour and per week (with averages for earlier years) those of doublers,
hand; doublers, mechanical; doublers, level-handed, hand; doublers' helpers, hand; are not altogether comparable due to the changes above outlined. In the occupation of tinners, hand, all figures from 1910 to 1929 are for hand tinners, as the employees in the occupation of tinners, machine, were not included in the averages for any year and are first presented as one of the principal occupations in 1929.

The hours of labor of employees in tin-plate mills are subject to only slight variation from year to year. As far back as 1910 , which is the first year for which data for this department were obtained, the 8 -hour day had been found to be desirable for employees working on the hot mills because the shorter workday made possible the speed-ing-up of production. However, there were some employees-such as laborers, branners, and other unskilled and semiskilled general workers-who worked longer hours. The average full-time hours per week for all employees in 1914 were 46 which increased to 50.4 in 1915. Averages for 1920 and 1922 do not show much change, but n 1924 hours dropped to 48.8 . This decrease was continued to 48.1 in 1926 and to 47.4 in 1929. This is the only department where average full-time weekly hours in 1929 are greater than they were in 1914. Average full-time hours per week, earnings per hour and fulltime weekly earnings for the department are shown in Table 1, page 4. Comparisons of full-time hours per week in the various principal occupations may be made from Table A.

While the adoption of the 8 -hour day in 1923 did not affect the daily hours of labor for employees in the hot mill crews it did decrease the hours of employees in certain other occupations such as laborers and branners. In 1910 branners worked an average of 67.8 hours per week, which decreased to 63.7 hours in 1913; and in 1919 a fulltime week of 61.3 hours, which were increased to 65.1 in 1922. However, in 1924, following the general decrease in daily hours in 1923, branners worked a customary week of 52.2 hours, which is 18 per cent below the 1913 average. While the 1926 average is the same as that of 1924 it is 2.6 hours greater than the average of 49.6 in 1929. Laborers had a customary week of 60.6 hours in 1910 which remained at about this figure until 1919 when the average rose to 64.3 hours. In 1924, following the general decrease in hours of labor, laborers had a customary week of 56.9 hours which is only slightly less than the week of 57.1 hours in 1929 .

The decrease in average weekly hours over the period 1914 to 1929 was brought about by a decrease in daily hours rather than by any change in the number of turns (days) worked per week. Table B shows that in 1914, 58 per cent of all employees worked a week of 5 days, 5 days, and 6 days in each 3 -week cycle, and 37 per cent regularly worked a week of 6 days. There was practically no change in these percentages until 1924 when 51 per cent of all employees worked a week of 5 days, 5 days, and 6 days in rotation, and 44 per cent regularly worked a week of 6 days. In 1929 the percentages were 59 and 34, respectively, being practically the same as those for 1914. Sevenday work is of little importance in this department as only 1 per cent worked a week of this length in 1929 as compared with 2 per cent in 1926.

An idea of the prevailing hours per day and per week for employees in this department in 1929 may be gained from Table D. Of the 8,386 employees covered by this table 1,816 worked day turns only,

41 night turns only, and 6,529 alternated or rotated from day to night work. Of the 1,816 employees who worked days only, 1,759 had a customary week of 60 hours or less, while only 2 of the 57 who worked over 60 hours per week had an 84 -hour week. Of the 41 employees who worked night turns only 6 had a customary week of over 60 hours, while 6,429 of the 6,529 who alternated or rotated from day to night turn had a customary week of 60 hours or less. It may also be seen that 5,906 , or 70 per cent of the employees covered in Table D, had a work-day which averaged 8 hours or less each day they were on duty. All employees in all occupations, whether or not connected with producing crews, are included in Table D, but to illustrate conditions as they apply to employees of the producing crews, separate figures are given for one key occupation-roller. All of the 378 employees who worked as roller during the pay period worked 8 hours per day, and $422 / 3$ hours per week.

Table E shows the distribution by average full-time hours per week of employees in six principal occupations. Three of these occupations showed no employees working as many as an average of 44 hours per week. In the occupation of laborers only 6 had a customary week of over 60 hours while 103 had a week of less than 56 hours.

While the trend of hours of labor has been downward in recent years, hourly earnings have advanced greatly. In 1914 the average hourly earnings for all employees were 42.5 cents. By 1920 earnings had advanced to 94.9 cents, the peak of earnings for this department and almost $21 / 4$ times those of 1914 . The depression of 1921 had not been fully overcome in 1922 when the average was 65.0 cents which, however, increased to 79.5 cents in 1924. A decrease in earnings per hour in 1926 to 70.4 cents was followed by an increase in 1929 to 73.2 cents, 72 per cent above the 1914 average. Most of the tonnage rates paid in tin-plate mills are based directly on the selling price of the product; that is, at the close of a certain period tonnage rates are adjusted in accordance with the price of tin-plate sheets during that interval. Thus the rates paid in this department in a large number of occupations are subject to wide fluctuations in a 2 or 3 year study such as the bureau makes.

Comparison of hourly earnings for employees in the principal occupations may be made from Table A. For example, rollers in 1910 earned an average of $\$ 1.025$ per hour which increased to $\$ 1.139$ in 1913, then decreased to $\$ 1.106$ in 1915, but rose to $\$ 2.248$ in 1919. In 1920 the high point of $\$ 2.542$ per hour was recorded, but when the 1922 study was made hourly earnings had decreased to $\$ 1.701$, and in 1924 increased to $\$ 2.099$ but fell again in 1926 to $\$ 1.635$. The heavy production of tin-plate in 1928 continued into 1929 , the effect of which is seen in the 1929 average of $\$ 1.778$ per hour. A distribution by average hourly earnings of employees in six of the principal occupations in 1929 is given in Table F.

In 1914 the average full-time weekly earnings of all employees were $\$ 19.55$ which increased in 1915 to $\$ 21.57$. In 1920 weekly earnings had advanced to $\$ 48.02$ which is the high point and is almost two and a half times the 1914 average. There was a decrease in weekly earnings in 1922 , but an increase to $\$ 38.80$ in 1924 . This average dropped to $\$ 34.70$ in 1929 which is more than one and threefourths times as much as earnings were in 1914. Weekly earnings in
the various principal occupations show similar increases. Rollers, for example, earned an average of $\$ 43.73$ in 1910 which increased to $\$ 47.33$ in 1911. From 1912 to 1915 there was little change in weekly earnings, increasing from $\$ 46.82$ to $\$ 47.17$. An advance in 1919 brought weekly earnings up to $\$ 95.99$, which is $\$ 12.55$ less than the high mark of $\$ 108.54$ for 1920. Due to the 1921 depression in the industry weekly earnings dropped to $\$ 72.56$ in 1922 but by 1924 much of this loss had been regained, weekly earnings having risen to $\$ 89.36$. Earnings again decreased in 1926 to $\$ 69.81$ which is practically 8 per cent less than the 1929 average of $\$ 75.92$.

The 4,859 employees in the principal occupations worked an average of 77 hours during the 15-day period covered by the 1929 study, for which they received $\$ 65.91$. This includes all of the hours worked and earnings received by these employees as shown in Table C. Laborers worked the most time- 103.3 hours-and rollers, level handed, the least- 48.3 hours. Assorters, female, one of the very few female occupations in the industry, earned the least money$\$ 31.33$-and rollers, a very highly skilled occupation, earned the most, $\$ 129.43$. Laborers who worked the most hours of any of the principal occupations received $\$ 43.83$.

A classification of employees in six principal occupations according to hours actually worked in 1929 is made in Table G. The table shows in the occupation of heaters, level handed, that 16 of the 604 employees worked less than 32 hours during the pay period scheduled, while 1 worked over 120 and under 132 hours; however, the largest number-166-is found under the group heading " 80 hours." Laborers show the widest spread; 13 worked under 32 hours and 7 over 144 and under 156 hours.

A like classification of earnings is made in Table H. There is considerable variation in the earnings of employees in the same occupations due to the various hours worked as shown in Table G. Laborers earned from under $\$ 5$ to $\$ 65$ and under $\$ 70$, the largest number having earned $\$ 45$ and under $\$ 50$. Assorters, female, ranged from under $\$ 5$ to $\$ 50$ and under $\$ 55$, the largest number having earnings between $\$ 30$ and $\$ 35$. The occupation of rollers is the only one that had any employees who earned as much as $\$ 200$.

No. 341. Trade agreement in the silk-ribbon industry of New York City. [1923.]
No. 402. Collective bargaining by actors. [1926.]
No. 468. Trade agreements, 1927.
No. 481. Joint industrial control in the book and job printing industry. [1928.]

## Cooperation.

No. 313. Consumers' cooperative societies in the United States in 1920.
No. 314. Cooperative credit societies in America and in foreign countries. [1922.]
No. 437. Cooperative movement in the United States in 1925 (other than agriculture).

## Employment and Unemployment.

*No. 109. Statistics of unemployment and the work of employment offices in the United States. [1918.]
No. 172. Unemployment in New York City, N. Y. [1915.]
*No. 183. Regularity of employment in the women's ready-to-wear garment industries. [1915.]
*No. 195. Unemployment in the United States. [1916]
No. 196. Proceedings of the Employment Managers' Conference held at Minneapolis, Minn., January 19 and $20,1916$.
*No. 202. Proceedings of the conference of Employment Managers' Association of Boston, Mass, held May 10, 1916.
No. 206. The British system of labor exchanges. [1918.]
No. 227. Proceedings of the Employment Managers' Conference, Philadelphia, Pa., April 2 and 8, 1917.

No. 235. Employment system of the Lake Carriers' Association. [1918.]
*No. 241. Public employment offices in the United States. [1918.]
No. 247. Proceedings of Employment Managers' Conterence, Rochester, N. Y., May 9-11, 1918.
No. 310. Industrial unemployment: A statistical study of its extent and causes. [1922.]
No. 409. Unemployment in Columbus, Ohio, 1921 to 1925.

## Foreign Labor Laws.

${ }^{*}$ No. 142. Administration of labor laws and factory inspection in certain European countries. [1914. $\boldsymbol{\eta}$
No. 494. Labor legislation of Uruguay. [1929.]
No. 510. Labor legislation of Argentina. (In press.)

## Housing.

*No. 158. Government aid to home owning and housing of working people in foreign countries. [1914.]
No. 263. Housing by employers in the United States. [1820.]
No. 205. Building operations in representative cities in 1920.
No. 500. Building permits in the principal cities of the United States in [1021 to] 192s.

## Industrial Accidents and Hygiene.

*No. 104. Lead poisoning in potteries, tile works, and porcelain enameled sanitary ware factories. [1912.]
No. 120. Hygiene of the painters' trade. [1913.]
*No. 127. Dangers to workers from dusts and fumes, and methods of protection. [1913.]
*No. 141. Lead poisoning in the smelting and refining of lead. [1914.]
*No. 165. Lead poisoning in the manufacture of storage batteries. [1914.]
*No. 179. Industrial poisons used in the rubber industry. [1915.]
No. 188. Report of British departmental committee on the danger in the use of lead in the painting of buildings. [1916.]
*No. 201. Report of committee on statistics and compensation insurance cost of the International Association of Industrial Accident Boards and Commissions. [1916.]
*No. 207. Causes of death, by occupation. [1917.]
*No. 219. Industrial poisons used or produced in the manufacture of explosives. [1917.]
No. 221. Hours, fatigue, and health in British munition factories. [1917.]
No. 230. Industrial efficiency and fatigue in British munition factories. [1917.]
*No. 231. Mortality from respiratory diseases in dusty trades (inorganic dusts). [1918.]
*No. 234. Safety movement in the iron and steel industry, 1907 to 1917.
No. 236. Effects of the air hammer on the hands of stonecutters. [1918.]
No. 249. Industrial health and efficiency. Final report of British Health of Munition Workers' Committee. [1919.]
*No. 251. Preventable death in the cotton-manufacturing industry. [1919.]
No. 256. Accidents and accident prevention in machine building. [1919.]
No. 267. Anthrax as an occupational disease. [1920.]
No. 276. Standardization of industrial accident statistics. [1920.]
No. 280. Industrial poisoning in making coal-tar dyes and dye intermediates. [1921.]
No. 291. Carbon-monoxide poisoning. [1921.]
No. 293. The problem of dust phthisis in the granite-stone industry. [1922.]
No. 298. Causes and prevention of accidents in the iron and steel industry, 1910-1919.
No. 306. Occupation hazards and diagnostic signs; A guide to impairments to be looked for in bas. ardous occupations. [1922.]
No. 392. Survey of hygienic conditions in the printing trades. [1925.]
No. 405. Phosphorus necrosis in the manufacture of freworks and in the preparation of phosphorus. [1926.]
No. 425. Record of industrial accidents in the United States to 1925.
No. 427. Health survey of the printing trades. 1922 to 1925.
No. 428. Proceedings of the Industrial Accident Prevention Conference, held at Washington, D. C., July 14-16, 1926.
No. 460. A new test for industrial lead poisoning. [1928.]
No. 466. Settlement for accidents to American seamen. [1928.]
No. 488. Death from lead poisoning, 1925-1927.
No. 490. Statistics of industrial accidents in the United States to the end of 1927.
No. 507. Causes of death, by occupation.
Industrial Relations and Labor Conditions.
No. 237. Industrial unrest in Great Britain. [1917.]
No. 340. Chinese migrations, with special reference to labor conditions. [1923.]
No. 349. Industrial relations in the West Coast lumber industry. [1923.]
No. 361. Labor relations in the Fairmont (W. Va.) bituminous-coal field. [1924.]
No. 380. Postwar labor conditions in Germany. [1925.]
No. 383. Works councll movement in Germany. [1925.]
No. 384. Labor conditions in the shoe industry in Massachusetts, 1820-1924.
No. 399. Labor relations in the lace and lace-curtain industries in the United States. [192and
No. 483. Conditions in the shoe industry in Haverhill, Mass., 1928.
Labor Laws of the United States (including decisions of courts relating to labor).
No. 211. Labor laws and their administration in the Pacific States. [1917.]
No. 229. Wage-payment legislation in the United States. [1917.]
No. 285. Minimum-wage laws of the United States: Construction and operation. [1921.]
No. 321. Labor laws that have been declared unconstitutional. [1922.]
No. 322. Kansas Court of Industrial Relations. [1923.]
No. 343. Laws providing for bureaus of labor statistics, etc. [1923.]
No. 370. Labor laws of the United States, with decisions of courts relating thereto. [1925.]
No. 408. Laws relating to payment of wages. [1926.]
No. 444. Decisions of courts and opinions affecting labor, 1926.
No. 467. Minimum wage legislation in various countries. [1928.]
No. 486. Labor legislation of 1928.

Proceedings of Annual Conventions of the Association of Government Labor Officials of the United States and Canada. Name changed in 1928 to Association of Governmental Oficials in Industry of the United States and Canada.
*No. 266. Seventh, Seattle, Wash., July 12-15, 1920.
No. 307. Eighth, New Orleans, La., May 2-6, 1921.
No. 323. Ninth, Harrisburg, Pa., May 22-26, 1922.
No. 352. Tenth, Richmond, Va., May 1-4, 1923.
*No. 389. Eleventh, Chicago, Ill., May 19-23, 1924.
*No. 411. Twelfth, Salt Lake City, Utah, August 13-15, 1925.
No. 429. Thirteenth, Columbus, Ohio, June 7-10, 1926.
No. 455. Fourteenth, Paterson, N. J., May 31 to June 3, 1927.
No. 480. Fifteenth, New Orleans, La., May 15-24, 1828.
No. 508. Sixteenth, Toronto, Canada, June 4-7, 1929.
Proceedings of Annual Meetings of the International Association of Industrial Aecident Boards and Commissions.

No. 210. Third, Columbus, Ohio, April 25-28, 1916.
No. 248. Fourth, Boston, Mass., August 21-25, 1917.
No. 264. Fifth, Madison, Wis., September 24-27, 1918.
${ }^{*}$ No. 273. Sixth, Toronto, Canada, September 23-26, 1919.
No. 281. Seventh, San Francisco, Calif., September 20-24, 1920.

[^0]:    ${ }^{1}$ Summary figures for 1929 appeared in the Labor Review for September, October, and November, 1929. For data for years up to 1915, see Bulletin No. 218; for 1917, the March, 1918, Labor Review; for 1919, Bulletin No. 265; for 1920, Bulletin No. 305; for 1922, Bulletin No. 353; for 1924, Bulletin No. 381; and for 1926, Bulletin No. 442.
    ${ }^{2}$ No data available for 1916, 1918, 1921, 1923, 1925, 1927, or 1928.

    * No data available for 1916, 1917, 1918, 1921, 1923, 1925, 1927 , or 1928.

    4 The plants covered in the 1924, 1926, and 1929 studies were in many cases different from those covered in previous surveys and no comparison is made for the principal occupations between the 1929 figures and those for the years prior to 1926. However, the averages for all employees in the country as a whole were not affected by the change of plants to the extent that were the averages for employees in the specified occupations only, and in all comparative tables covering all employees data have been included for all years available. No data available for 1916, 1917, 1918, 1921, 1923, 1925, 1927, or 1928.

[^1]:    I Including earnings of common laborers in rail mills although average earnings for that department are not shown separately.

[^2]:    ${ }^{1}$ Including earnings of common laborers in rail mills although average earnings for that department are not shown separately.

[^3]:    ${ }^{7}$ For 1926 and eariler years.

    - The weighting for 1929 was the number of employees covered in the year.
    $97114^{\circ}-30-3$

[^4]:    1 Data were not obtained for the Jears 1916, 1918, 1921, 1923, 1928, 1927, and 1098

[^5]:    ${ }^{2}$ Including less than 1 per cent whose full-time hours were 91.

[^6]:    ${ }^{1}$ Including 1 per cent whose full-time hours per week were 91.

[^7]:    ${ }^{1}$ Data were not obtained for the years 1916, 1918, 1921, 1923, 1925, 1927, and 1928.

[^8]:    1 No data were obtained for the years 1916, 1918, 1921, 1923, 1925, 1027, and 1928.

[^9]:    1 Data were obtained for the years 1916, 1918, 1921, 1923, 1925, 1927, and 1928.

[^10]:    Data were not obtained in 1916, 1918, 1921, 1923; 1925; 1927, and 1928.

[^11]:    ${ }^{1}$ Data were not obtained for the years 1916, 1918, 1921, 1923, 1925, 1927, and 1928.

[^12]:    ${ }^{1}$ Data were not obtained for the years 1916, 1918, 1921, 1923, 1925, 1927, and 1928.

[^13]:    ${ }^{1}$ Less than 1 per cent.
    ${ }^{2} 1$ per cent whose full-time hours per week were 843/2 and less than 1 per cent whose full-time hours per week were 91.

[^14]:    ${ }^{1}$ Data were not obtained for the years 1916, 1918, 1921, 1923, 1925, 1927, and 1923.
