PREFACE

Food constitutes one-third or more of the total annual expenditures of wage earners. Changes in the cost of all foods or in the cost of a single group of related foods such as cereals, meats, or dairy products, are of prime importance not only to customers but also to Federal or private agencies responsible for policy determination. They are also of significance to industrialists and labor organizations interested in maintaining adequate wage levels, and to many other groups studying a wide range of problems dealing with food costs. The Bureau of Labor Statistics has collected retail prices of food in large cities for use in the computation of a food-cost index since 1903. This index has constituted one of the groups in the indexes of changes in the cost of living of wage earners and lower-salaried workers.

From time to time, the food-cost data have been assembled and published in bulletin form. The last bulletin, No. 495, was published in 1929. It contained detailed statistics for the years from 1913 to 1928, inclusive.

Many changes have taken place during the intervening years. Merchandising practices have been modified; consumer interest has increased; and statistical methods have been more highly developed. As a result of these changes, the Bureau has revised both the content and methodology of its indexes of the retail cost of food. Insofar as possible, these revisions have been carried back through the year 1923. This bulletin contains indexes and average prices for the years from 1923 to 1936, inclusive.

It was prepared in the Retail Price Division, under the direction of Stella Stewart, Chief of the Division, with the assistance of Ethel D. Hoover. The consumption weights and the population weights used in the computation of the indexes were computed in the Cost of Living Division under the direction of Faith M. Williams.

ISADOR LUBIN,
Commissioner of Labor Statistics.

OCTOBER 1937.

Bulletin No. 635 of the
United States Bureau of Labor Statistics

Retail Prices of Food, 1923-36

Introduction

The last comprehensive report of the Bureau of Labor Statistics on retail prices and costs of food was published in 1928, as Bulletin No. 495. In 1935, major changes were made in this phase of the statistical work of the Bureau. These changes involved the modification of the food consumption weights, a different method of computing indexes for cities combined, the shift of the base from the average for 1913 as 100 to the 3-year average 1923-25, and an increase in the number of foods included in the indexes. This bulletin contains a detailed statement of these changes, together with average prices and indexes for the years from 1923 to 1936, inclusive.

Changes in Food Costs, 1923-36

A study of food costs during the years from 1923 to 1936 reveals four major movements. There was a gradual rise from 1923 which reached its peak in November 1925. This was followed by a period of comparative stability which extended until the break in November 1929. This break was the beginning of a long movement downward. The lowest level was reached in the first quarter of 1933. The reversal of this trend in April 1933 was the beginning of an advance in food costs which continued until September 1936. Compared with the 3-year average 1923-25 as 100, the indexes for all foods ranged from 112.6 in November 1925 to 59.8 in March 1933. In September 1936, the index was 84.3.

Changes in the combined indexes, as just cited, are greatly influenced by changes in the four most important commodity groups—the "Meats" group which ranks first in importance and accounts for about one-fourth of the total food cost; and "Cereals and bakery products," "Dairy products," and "Fruits and vegetables," each of which constitutes approximately one-fifth of the total food cost. These four groups combined make up about 85 percent of the total food-cost aggregate.

Prices of cereals, meats, and fruits and vegetables rose from 1923 through 1926. From 1926 to 1929, meats continued to advance while the cost for other groups declined or showed little change. Fruits and vegetables declined the most. All groups contributed to the general

movement downward from 1930 to 1933 and all joined in the advance which was shown in 1934. During 1935 the advance continued for cereals, meats, and dairy products, but lower costs were shown for fruits and vegetables. The continued advance in the combined index in 1936 was altogether due to higher costs for dairy products and a price upturn for fruits and vegetables. Indexes for all other groups averaged lower in 1936 than in 1935.

The average annual indexes of retail food costs in 51 cities combined for all foods and for each of the eight food groups, from 1923 to 1936, are presented in table 1. The trend during these years is shown by the charts on page 3.

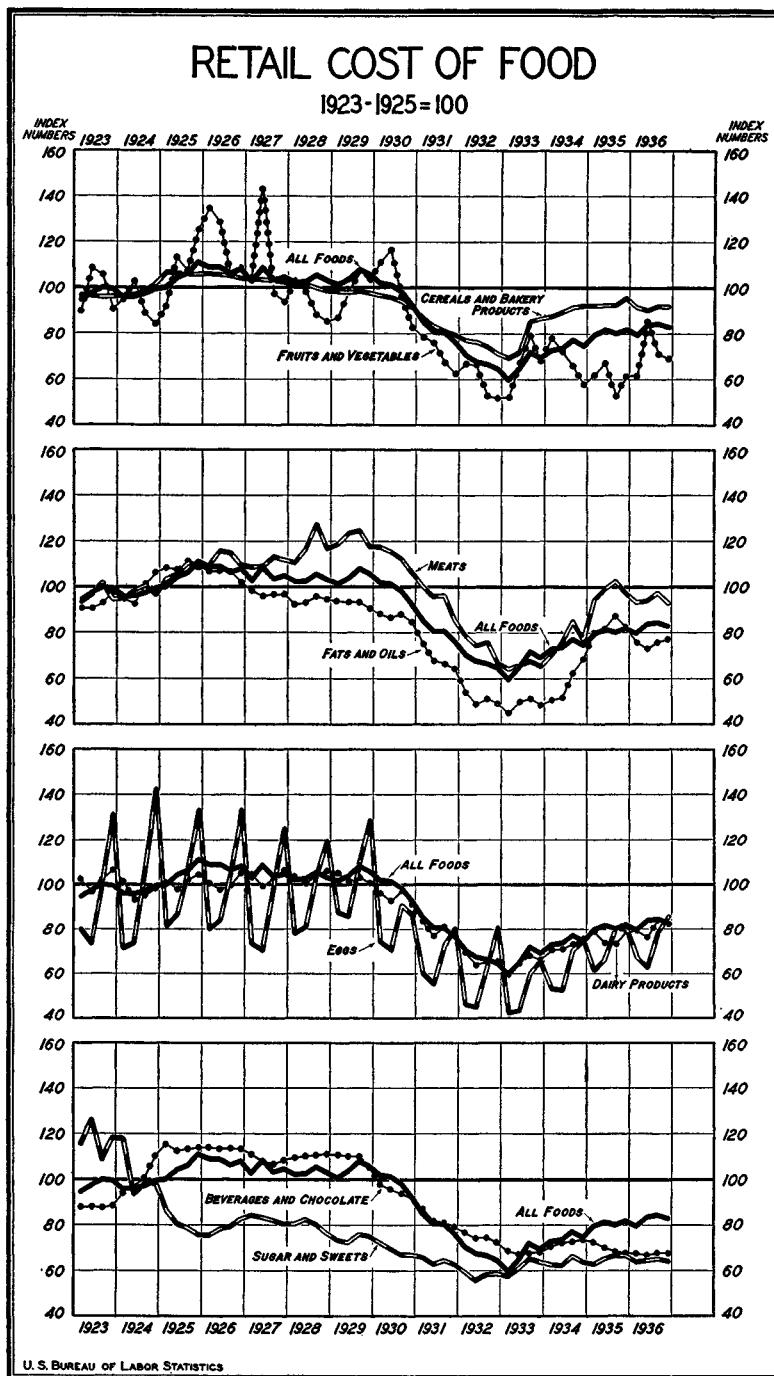

TABLE 1.—*Indexes of retail food costs in 51 cities combined by commodity groups—annual averages, 1923-36*

[1923-25=100]

Year	All foods	Cereals and bakery products	Meats	Dairy products	Eggs	Fruits and vegetables	Beverages and chocolate	Fats and oils	Sugar and sweets
1923	97.9	96.2	96.3	101.7	95.7	98.8	87.8	92.5	114.4
1924	97.0	97.9	97.5	96.9	97.9	93.0	98.5	98.2	103.9
1925	105.0	105.9	106.1	100.7	106.4	108.1	113.7	109.2	81.4
1926	108.5	105.5	112.2	100.1	99.7	122.9	113.8	106.2	78.3
1927	104.5	103.5	110.6	102.7	93.5	107.1	109.0	97.3	83.0
1928	103.3	100.4	117.4	103.3	96.6	93.9	110.3	94.0	80.2
1929	104.7	98.1	121.1	102.9	101.2	98.4	110.0	93.1	74.6
1930	99.6	95.1	113.6	95.1	85.4	103.4	95.7	86.7	70.1
1931	82.0	83.5	96.4	80.8	67.2	73.3	83.2	70.4	64.7
1932	68.3	75.5	75.5	66.7	57.9	60.4	75.1	52.0	58.4
1933	66.4	77.4	65.7	65.2	55.3	65.8	68.4	48.6	61.5
1934	74.1	91.2	75.1	71.3	62.5	69.9	71.8	55.8	63.9
1935	80.5	98.0	96.2	76.8	73.6	60.6	70.3	81.6	65.1
1936	82.1	91.7	94.7	80.2	72.7	69.7	67.5	75.6	64.4

A discussion of the movement of costs for each of the commodity groups follows:

Cereals and bakery products.—From 1923 to 1936, the cost of cereals and bakery products was relatively more stable than were costs for other commodity groups. The index reached its upper limits in 1925 and 1926, averaging slightly more than 105.0, and prices of seven of the eight items included in the index reached their highest levels. The index for flour went to 123.1; corn meal reached 115.7; and bread, 103.7. From 1927 through 1932, there was a gradual decline to the low of 69 and a fraction during the first 4 months of 1933. The index for flour declined to 55.0 and rice fell to 54.5. Other items declined less. There was a reversal of the downward trend in May 1933 and the year ended with the index for cereals and bakery products at 86.4. The upward movement continued through 1934 and 1935 to the level of 95.6 in December 1935. In 1935 the index for flour went to 102.8, for bread to 95.9, for corn meal to 109.7, and for rice to 84.4. Costs were somewhat lower in 1936 due chiefly to a decline in the prices of flour and bread.

Meats.—The cost of meats moved upward from about 94.0 percent of the 1923-25 average in the first quarter of 1923 to 115.6 in June 1926. During this period, beef prices increased slowly and steadily. The advance for pork was more rapid, with the peak in the summer of 1926. There was a sharp break in pork prices in the fall of 1926 which continued throughout 1927 and the early part of 1928. They recovered somewhat in the summer of 1928. During 1927 and 1928, prices of beef, lamb, and hens continued their advance, and the group index reached its highest point, 127.4, in September 1928. During the first 8 months of 1929, meat costs were consistently higher than for the corresponding months of 1928. The index stood at 125.9 for both July and August of 1929. But there was a change in direction in September, and with minor exceptions the index for each succeeding month reflected rapidly descending prices. Pork prices reached their low early in 1933, but beef was lowest in the early months of 1934. The lowest point reached for the group as a whole was 63.4 reported for April 1933. May 1933 was the turning point and the trend was then continuously upward to 102.6 in September 1935. Prices of both beef and pork then began to decline, these decreases offsetting advances for lamb and hens. The highest point reached for the group in 1936 was the seasonal peak of 97.4 in September. From this point there was a decline to 93.0 in December due in large part to a decrease in prices of pork and lamb.

Dairy products.—Price changes for major commodities in the dairy products group are seasonal in character. These prices are lowest in the midsummer months and highest in the late fall and early winter. These seasonal movements must be recognized in any discussion of year to year changes in the cost for this group.

In 1923 the index for dairy products stood at 101.7 percent of the 1923-25 average. It dropped to 96.9 in 1924 due to declines in the prices of milk, butter, and cheese. Base levels were regained in 1925 and 1926 with the index around 100.0 in each year. In 1927, costs advanced and each monthly index was higher than for the corresponding month of the preceding year. The increase continued through 1928, when the index reached 103.3, the highest average for the years from 1923 through 1936. Dairy costs held up during the first three-quarters of 1929, but by the fall of that year, there was a definite change downward. The index for 1930 averaged 95.1 and costs declined through successive years to the low of 65.2 for 1933. During the latter half of 1933, costs showed a more seasonal advance. The upward trend was gradual and continuous during subsequent years and the index for 1936 rose to 80.2.

Milk prices reached their peak in 1929, when the index went to 104.2. Butter and cheese were highest in 1928. The index for butter rose to 104.7. The price of cheese advanced more than prices of

either milk or butter, the index reaching an average of 110.2 in 1928. All three of these commodities contributed to the general decline and were at their lowest level in 1933, when the index for butter was 51.1. The decrease for milk and cheese was somewhat less. During the period of recovery, the price of milk rose faster and went higher than prices of either butter or cheese. In December 1936, the price indexes for these foods were: Milk, 90.2; butter, 73.6; and cheese, 79.2.

Eggs.—Prices of eggs, like dairy products, are highly seasonal and usually reach their peak in the late fall or early winter of each year.

The annual average price indexes for eggs increased from 95.7 in 1923 and 97.9 in 1924 to 106.4 in 1925, the highest average for the years from 1923 through 1936. In subsequent years, there was a gradual decline to an average of 85.4 in 1930. Thereafter prices fell rapidly and in 1933 the index averaged 55.3 for the year. Early in 1934, there was evidence of a more than seasonal increase, and prices moved upward steadily but very slowly. The index averaged 72.7 in 1936.

Fruits and vegetables.—Changes in the cost of the fruit and vegetable group are due chiefly to price fluctuations in the fresh items, which constitute more than four-fifths of the group aggregate. Since prices of these fresh items are subject to wide seasonal variations, it has been deemed wise to use annual averages as a basis for long time comparisons.

In the long interval from 1923 through 1936, the composite index for the group reached its highest point in 1926, when it averaged 122.9. The index for the fresh items was 128.0 for 1926. The 1926 index for potato prices, which is a potent factor in the cost level for this group, was 158.2 and reached 216.5 in April of that year. Onion prices were highest in 1925, cabbage in 1930, and oranges in 1928. All fresh items maintained a high level well into 1930 and then followed the general price trend downward, reaching the low of 59.9 in 1932, when the index for potatoes was 54.3. Costs moved slowly upward in 1933 and 1934. In January 1935 the number of items included in the index was greatly increased, and the decline in the index to 58.7 for 1935 reflected lower prices not only for potatoes but for many of these additional items, notably apples. During 1936 these prices advanced and the subgroup index rose to 69.1.

The canned and dried fruits and vegetables each account for somewhat less than 10 percent of the group total. The index for the canned foods held up to 90 or above well into 1930 and did not fall as low as either the fresh or dried products. It averaged 68.5 in 1933 and advanced to 79.8 in 1936. The index for the dried items was highest in 1923 when prices of prunes, raisins, and navy beans were all well above the 3-year average for 1923-25. The index for navy beans rose sharply in 1928 and moved up to 135.3 for 1929. Prices of these dried items

broke in 1930 and the indexes dropped below 60 in 1933. They increased only slightly during subsequent years, until in August 1936, when the price of navy beans turned sharply upward and increased steadily throughout the remainder of the year.

Beverages and chocolate.—The index for beverages and chocolate follows the trend of the price of coffee, the dominant item in the group. Price changes for tea, cocoa, and chocolate have little effect on the general trend for the group. The index rose to its highest point during 1925 and 1926 when it averaged slightly more than 113. During those years the price index for coffee was about 116. The indexes for both coffee and tea remained well over 100 into 1929. Then coffee prices declined while the index for tea averaged over 100 throughout 1930 and 1931. By 1933, the group index had declined to 68.4 with the level for coffee still lower. In 1934 the price of tea began an increase which continued until, in December 1936, the tea index stood at 106.4. But coffee prices did not recover and the index for December 1936 was 56.6. Cocoa and chocolate were added to the index in January 1935. Prices of both decreased month by month during 1935 and 1936.

Fats and oils.—The cost of fats and oils was highest during 1925. The index stood at 112.3 in October of that year. The price index for lard, the most important item in the group, was 121.2 that October. Although the prices of vegetable shortening and oleomargarine did not go so high, prices of all three of these fats remained well above the 1923-25 average throughout 1926. They receded in 1927, but the decline for vegetable shortening was checked, and that item was at its highest price level in 1928. When the general price decline occurred, the indexes for lard and oleomargarine fell below 50 in 1933, but that for vegetable shortening never went below 70. Prices of lard and vegetable shortening gained in the summer of 1934 and continued upward through 1935. Vegetable shortening held its gain through 1936, with an average index of 90.1 for that year. The index for lard reached an average of 98.5 in 1935 and declined to 82.8 in 1936. Oleomargarine prices recovered very slowly. The index rose from 45.0 in 1933 to 63.9 in 1935 and receded slightly in 1936. Although the upward movement of the composite index after 1923 followed the fluctuations in the price of lard, its level was lowered by the slow recovery of oleomargarine prices. It rose from 48.6 in 1933 to 81.6 in 1935 and fell back to 75.6 in 1936.

Sugar and sweets.—The cost index for sugar and sweets is really a price index for sugar. Other items added to the group in January 1935 were relatively unimportant. The price of sugar was higher in 1923 than at any time since the post-war peak of 1920. The 1923 index averaged 114.4 (1923-25=100). The price broke in the summer of 1924 and the decline continued until October 1926, when the index

was 80.8. It was slightly higher in 1927, but in the autumn of 1928, the long downward movement began which reached its lowest point in June 1932, when the index was 55.7. By June 1933 it had climbed back up to 61.0. It averaged 63.9 in 1934, went to 65.1 in 1935, and was slightly lower in 1936.

Price Collection

Foods Priced

The number of foods included in the Bureau's retail price collection service has varied from time to time. From January 1921 until August 1933 it included the following 42 representative foods:

Cereals (8 items).—Corn flakes, corn meal, wheat flour, macaroni, rice, rolled oats, wheat cereal, and white bread.

Meats (11 items).—Sirloin steak, round steak, rib roast, chuck roast, plate beef, pork chops, sliced bacon, sliced ham, leg of lamb, roasting chickens, and canned red salmon.

Dairy products and eggs (5 items).—Butter, cheese, fresh milk, evaporated milk, and eggs.

Fruits and vegetables (12 items).—Bananas, oranges, cabbage, onions, potatoes, canned beans with pork, canned corn, canned peas, canned tomatoes, prunes, raisins, and navy beans.

Beverages (2 items).—Coffee and tea.

Fats (3 items).—Lard, vegetable shortening, and oleomargarine.

Sugar (1 item).

This list was gradually extended between August 15, 1933, and January 15, 1935, to include 45 additional foods. The additional items made the full list more representative of current consumer habits, with particular reference to meats and to the increased use of fruits and vegetables. In selecting these items, the Bureau had the advice of experts in other Federal agencies.

The additional 45 foods, with the dates when they were made a part of the price reporting service, were:

August 29, 1933—3 items

Rye bread, canned peaches, and canned pears.

January 30, 1934—31 items

Cereals.—Whole wheat bread.

Meats.—Veal cutlets, pork loin roast, whole ham, whole picnics, salt pork, breast of lamb, lamb chuck, lamb rib chops, and canned pink salmon.

Fruits and vegetables.—Apples, lemons, green beans, carrots, celery, lettuce, spinach, sweetpotatoes, canned pineapple, canned asparagus,

canned green beans, tomato soup, tomato juice, dried peaches, black-eyed peas, and lima beans.

Fats.—Lard compound and peanut butter.

Sweets.—Corn sirup and molasses.

Salt.

March 13, 1934—2 items

Cake and cream.

January 2, 1935—9 items

Hominy grits and soda crackers; beef liver and strip bacon; cocoa and chocolate; salad oil and mayonnaise, and strawberry preserves.

A description of each of the foods priced is presented in the appendix, part III. The differences in descriptions from city to city are due to the policy of collecting food prices on the "volume seller" of each item in the individual stores.

Foods Included in the Revised Indexes

From January 1923 to December 1934, inclusive, the prices of the 42 foods used in the earlier series were used in the computation of the revised indexes.

As of January 2, 1935, the prices of 84 foods were used, adding to the original list 42 of the items priced subsequent to August 1933. Three of the priced foods—whole picnics, tomato juice, and salt—were not included in the index because of inadequate quantity weights.

In the following list the 84 foods included in the index since 1935 are arranged as they are used in the computation of the commodity group indexes. The 42 foods which were included prior to 1935 are indicated with an asterisk.

Cereals and bakery products:	Meats:	Meats—Continued.
Cereals:	Beef:	Lamb:
*Corn flakes	*Sirloin steak	Breast
*Corn meal	*Round steak	Chuck
*Flour, wheat	*Rib roast	*Leg
Hominy grits	*Chuck roast	Rib chops
*Macaroni	*Plate	Poultry:
*Rice	Liver	*Roasting chickens
*Rolled oats	Veal:	Fish, canned:
*Wheat cereal	Cutlets	Salmon, pink
Bakery products:	Pork:	*Salmon, red
*Bread, white	*Chops	Dairy products:
Bread, whole wheat	Loin roast	*Butter
Bread, rye	*Bacon, sliced	*Cheese
Cake	Bacon, strip	Cream
Soda crackers	*Ham, sliced	*Milk, fresh
	Ham, whole	*Milk, evaporated
	Salt pork	*Eggs

Fruits and vegetables:	Fruits and vegetables—	Beverages and chocolate:
Fresh:	Continued.	*Coffee
Apples	Canned—Contd.	*Tea
*Bananas	Pineapple	Cocoa
Lemons	Asparagus	Chocolate
*Oranges	Beans, green	Fats and oils:
Beans, green	*Beans with pork	*Lard, pure
*Cabbage	*Corn	Lard compound
Carrots	*Peas	*Vegetable shortening
Celery	*Tomatoes	Salad oil
Lettuce	Tomato soup	Mayonnaise
*Onions	Dried:	*Oleomargarine
*Potatoes	Peaches	Peanut butter
Spinach	*Prunes	Sugar and sweets:
Sweetpotatoes	*Raisins	*Sugar
Canned:	Black-eyed peas	Corn syrup
Peaches	Lima beans	Molasses
Pears	*Navy beans	Strawberry preserves

Cities Included in the Indexes

Retail prices of food have been collected from 51 large cities in the United States during the entire period covered by this bulletin.¹ The cities have been grouped into the nine geographical regions used by the Bureau of the Census.

The regional areas and the cities included in each are:

New England:	East North Central—	South Atlantic—Contd.
Boston	Continued.	Savannah
Bridgeport	Columbus	Washington, D. C.
Fall River	Detroit	East South Central:
Manchester	Indianapolis	Birmingham
New Haven	Milwaukee	Louisville
Portland, Maine	Peoria	Memphis
Providence	Springfield, Ill.	Mobile
Middle Atlantic:	West North Central:	West South Central:
Buffalo	Kansas City	Dallas
Newark	Minneapolis	Houston
New York	Omaha	Little Rock
Philadelphia	St. Louis	New Orleans
Pittsburgh	St. Paul	Mountain:
Rochester	South Atlantic:	Butte
Scranton	Atlanta	Denver
East North Central:	Baltimore	Salt Lake City
Chicago	Charleston, S. C.	Pacific:
Cincinnati	Jacksonville	Los Angeles
Cleveland	Norfolk	Portland, Oreg.
	Richmond	San Francisco
		Seattle

¹ During the summer of 1935, the following 13 cities were added to the list: Albuquerque, N. Mex.; Binghamton, N. Y.; Cedar Rapids, Iowa; Columbia, S. C.; El Paso, Tex.; Jackson, Miss.; Knoxville, Tenn.; Oklahoma City, Okla.; Sioux Falls, S. Dak.; Spokane, Wash.; Tucson, Ariz.; Wichita, Kans.; Winston-Salem, N. C. Average prices for these additional cities have been released in mimeographed form and are available upon request. They are not included in the present series of index numbers.

Frequency of Price Collection

For many years, the Bureau collected retail food prices on the 15th of each month. In August 1933 this procedure was changed and food prices were collected every other Tuesday. This plan was followed through June 30, 1936, and on July 14, 1936, the Bureau returned to a monthly collection. Since that date prices have been collected on the Tuesday nearest the fifteenth of each month.

With minor exceptions, prices are collected for the same foods on the same date in each city.

Method of Food-Price Collection

Blank food-price schedules are sent by mail to agents of the Bureau or to representatives of other Federal bureaus in each of the cities in which food prices are collected. These agencies distribute the schedules to approximately 2,000 food dealers on the date set for price collection. The dealers include both chain and independent grocers, bakers, and dairymen. They are selected by representatives of the Bureau of Labor Statistics from those patronized largely by wage earners. For some chains, prices are secured from individual stores and for others from the chain headquarters.

The number of reporting firms is roughly proportional to the population of the cities in which the prices are collected and varies from 10 stores in the smallest city to 50 in the largest. When one dealer can no longer continue his service, another in the same neighborhood and with similar trade practices is substituted. As the wage earning population of a city shifts, stores are selected in new localities to insure the representative character of the prices.

Each collection agent and each food dealer is provided with sets of "master" schedules to assist in maintaining comparability in the prices. Simple specifications are also provided to guide the dealers in quoting on the quality of food indicated on the schedule. Changes from time to time in brand or size of package and any seeming inconsistency in reported prices are noted in the Washington office and checked with the dealers by means of memoranda sent out with the schedules at each price reporting period.

Explanation of Detailed Tables

The explanations given below are for the detailed tables which follow. The index numbers and average prices presented in these tables are shown for each price-reporting period from January 1923 to December 1936, inclusive. Annual averages are also presented in each table.

Table 2.—Indexes of retail food costs in 51 cities combined, by commodity groups, 1923 to 1936, inclusive. The methods employed in the computation of these indexes are stated on page 163 of this bulletin.

Table 3.—Indexes of the average retail costs of all foods, by regions, 1923 to 1936, inclusive. These indexes were constructed by the same method used in the computation of the other composite indexes.

Table 4.—Indexes of retail food costs for each region, by commodity groups, 1923 to 1936, inclusive. These index numbers allow for a review of regional differences in the movement of the costs of related foods.

Table 5.—Indexes of the average retail costs of all foods, by cities, 1923 to 1936, inclusive. In these indexes, food prices for each city have been combined by the use of consumption weights representative of the annual quantity of family purchases of all foods in that city.

Table 6.—Relative retail prices of 42 foods in 51 cities combined, 1923 to 1936, inclusive. The 42 foods included in this table are those for which prices are available throughout the entire period covered in this bulletin and were used exclusively in the computation of the indexes from 1923 to 1934, inclusive.

Table 7.—Average retail prices of 42 foods in 51 cities combined, 1923 to 1936, inclusive. In this table are shown the average prices of the foods used in the computation of the index numbers presented in table 6.

Table 8.—Average retail prices of 42 additional foods in 51 cities combined, 1935 and 1936. The foods included in this table are those which were incorporated into the indexes on January 2, 1935.

Table 9.—Annual average retail prices of 42 foods in each of 51 cities, 1928 to 1936, inclusive. Since the revision in methods of computing index numbers and average prices in 51 cities combined did not affect the computation of average prices by cities, data are presented in this table for only those years since the latest available bulletin. The foods shown are those which were included in the index numbers prior to January 2, 1935.

Table 10.—Annual average retail prices of 42 additional foods in each of 51 cities, 1934 to 1936, inclusive. The foods included in this table are those which were incorporated into the indexes on January 2, 1935.

TABLE 2.—Indexes of retail food costs in 51 cities combined, by commodity groups, 1923-36, inclusive

[1923-25=100]

¹ These foods were not included in the food cost indexes prior to 1935.¹³ Prices include a 2½-percent sales tax from July 31, 1933, to July 1, 1935, when food prices were exempted.¹⁴ Prices include a 2-percent sales tax effective May 1, 1935. Prices of the following foods were exempted: Milk, butter, cheese, eggs, bread, canned milk, and raw fruits and vegetables.

Appendix

Part I.—Computation of the Revised Series of Food-Cost Index Numbers

The revision of the series of food-cost index numbers presented in this report involved important changes in methodology and an increase in the number of foods included in the indexes after 1934. A complete recomputation of the indexes for earlier periods has been made on the basis of the new procedure.

A. Changes in Methodology

Three major factors were involved in this revision: (a) Modified consumption weights; (b) the introduction of population weights for combining the cost of food in the 51 cities into a composite index; (c) shift of the base period to the 3-year average 1923–25. The revision was made upon the recommendation of an advisory committee appointed at the request of the Secretary of Labor in April 1933.

Consumption weights.—The basic data used for the computation of the consumption weights for both the earlier series and the revised series of food-cost indexes were derived from the results of the 1917–19 investigation of the family expenditures of wage earners and lower-salaried workers.

For the earlier series five sets of regional weights had been computed from the average annual food purchases in the cities reporting food prices to the Bureau. Identical weights had been used for all cities in the same area. For the composite index, there had been a separate set of weights representative of average food purchases in all of the cities.

When the 1917–19 data were reviewed they were found in general to be adequate for the computation of consumption weights on a city basis. For cities where the available data were not fully adequate, data for other cities with similar food habits were used. These revised weights permit the computation of city indexes that are more representative of the considerable differences in consumer food habits which obtain in the widely scattered cities where food prices are collected. The cities which provided the quantity data used in the computation of these weights together with the number of families from which the data were obtained are shown in Appendix, part I, section C, table D.

In the earlier series each of the 42 priced foods had been weighted by the quantity purchased of that food only. The result was an "all foods" index which placed undue emphasis on price changes for some foods, such as dairy products, and did not provide sufficient representation for groups of foods which were represented in the index by a very limited number of price series, notably fruits and vegetables.

A second modification of the consumption weights was therefore introduced and combined weights were computed for groups of foods which are related in kind and seemed to follow the same price trend (see Appendix, part I, section C, table E). In the computation of these weights, data collected by the Bureau of Home Economics of the United States Department of Agriculture were used to supplement the data available in the Bureau of Labor Statistics. This change in method made it possible to so weight the price of a single food as to give better representation to food groups for which it was impossible to carry a complete price series. These modified consumption weights were computed both for the 42 foods included in the revised indexes prior to January 1935 and for the 84 foods included since that date. The result is an index which maintains a better balance among the commodity groups than the index weighted by the purchases of the specific foods priced. The effect of this change in the method of weighting is shown in table A.

TABLE A.—*Distribution of food costs on the basis of 42 foods with individual weights and on the basis of 84 foods with representative weights—prices as of September 24, 1935*

Item	Distribution based on prices of 42 foods each weighted by the quantity purchased of that particular food		Distribution based on prices of 84 foods each weighted by the quantity purchased of all similar foods	
	Number of items	Percentage distribution	Number of items	Percentage distribution
All foods.....	42	100.00	84	100.00
Cereal and bakery products.....	8	21.92	13	19.57
Meats.....	11	27.33	21	30.20
Dairy products.....	4	21.27	5	17.71
Eggs.....	1	7.46	1	6.37
Fruits and vegetables.....	12	8.71	29	14.83
Beverages and chocolate.....	2	5.17	4	4.03
Fats and oils.....	3	4.74	7	3.85
Sugar and sweets.....	1	3.40	4	3.44

The revised quantity weights are shown in Appendix, part I, section D, table F, for the 42 foods included in the indexes prior to 1935 and in table G for the 84 foods included since January 1935. A detailed discussion of the revision of the weights was published in the Monthly Labor Review for September 1935.

From time to time the relative importance of the eight major commodity groups included in the index changes with differences in the rate

of price change of the foods included in each group. The distribution of the aggregate food costs on a percentage basis is shown in table B for specified periods. Since these aggregate costs are for identical quantities of food at each period, variations in the costs from time to time are due to price changes only. The dates selected for this comparison are representative of high and low food prices in different years and at different seasons. Regardless of varying rates of price change for related foods or of differences in price movements of unrelated foods, meats always rank first. Cereals and bakery products, dairy products, and fruits and vegetables rank next and are almost equally important. Each one of these groups is more significant in the total cost of the market basket than are the four remaining groups combined.

TABLE B.—*Retail food costs—relative importance of commodity groups in food-cost aggregates on specified dates*

Commodity group	Nov. 15, 1925	July 15, 1929	Mar. 15, 1933	Sept. 15, 1936
	Percent 100.0	Percent 100.0	Percent 100.0	Percent 100.0
All foods.....				
Cereals and bakery products.....	16.5	16.2	20.5	18.5

Fats and oils.....	3.5	3.1	2.6	3.1
Sugar and sweets.....	2.2	2.3	3.2	3.2

Introduction of population weights for combining city costs.—Prior to the revision the composite indexes for the 51 cities combined were computed in the following manner. The average price of each food for all cities combined was the simple arithmetic average of all price quotations obtained for that food. To secure the indexes for the eight commodity groups and for all foods, these average prices were weighted by the average quantities purchased of each food in all of the cities.

In the revised series, the food-cost indexes for the 51 cities combined were computed from the food costs for the several cities, weighted according to population. These population weights, which are shown in Appendix, part I, section D, table H, represent the average population in 1920 and 1930, including the population not only of the cities where retail prices are obtained, but of adjacent metropolitan areas and cities of over 50,000 in the same region apportioned by similarity of price movement.

Change in base period.—The change in the base period from 1913 to 1923–25 as 100 made the indexes of retail food costs comparable with the indexes of factory pay rolls, published by the Bureau of Labor Statistics, the indexes of industrial production published by the Federal Reserve Board, and monthly business indexes published

by the Bureau of Foreign and Domestic Commerce, all of which are computed on a 1923-25 base. The indexes of changes in the cost of food comprise one of the commodity groups in the cost-of-living indexes which have likewise been shifted to a 1923-25 base.

Revised indexes on 1913 base.—In the process of the revision it was found that prices of 42 foods were available back to March 1919. It was, therefore, decided that in addition to computing revised food-cost indexes for each reporting period from January 1923 on, revised indexes would also be computed as of the dates at which cost-of-living indexes were calculated for the years 1919 through 1922. For the use of persons wishing to compare the new series for all cities with the indexes from 1913 through 1918, and with those for earlier dates, the new series was linked with the one previously computed as of March 1919. A continuous series of food-cost indexes for 51 cities combined, from 1913 through 1936, is given below:

TABLE C.—*Revised indexes of retail costs of food, 1913-36, inclusive*¹

[1913=100]

Year	Index	Year	Index	Year	Index
1913.....	100.0	1921.....	161.0	1929.....	165.9
1914.....	102.4	1922.....	150.6	1930.....	157.9
1915.....	101.3	1923.....	155.2	1931.....	130.0
1916.....	113.7	1924.....	153.5	1932.....	108.2

1918.....	168.3	1926.....	172.0	1934.....	117.5
1919.....	190.4	1927.....	165.6	1935.....	127.6
1920.....	211.0	1928.....	163.7	1936.....	130.3

¹ Indexes from 1913 through 1918 are based on prices of 22 foods and weighted by average quantities of food purchased in 1901-2. Indexes from 1919 through 1934 are based on prices of 42 foods and weighted by imputed (representative) weights representing average food expenditures in 1918-19. Annual averages have been computed from the revised indexes for the years from 1919 through 1922 by interpolating between given dates on the assumption of a straight line change between those dates. Indexes were computed monthly from 1923 to August 1933, biweekly from September 1933 to July 1936, and monthly thereafter. Indexes for 1934 through 1936 are based on prices of 84 foods and weighted by imputed weights representing average food expenditures in 1918-19. At the beginning of the year 1913, retail food prices were being collected in 39 cities. Between 1913 and 1920, 12 cities were added. Since then, prices have been collected and indexes prepared for 51 cities.

B. Technical Procedure

Computation of average prices for each city.—Prior to 1931, the average price for each commodity in a city had been obtained by making a simple arithmetic average of all quotations received from dealers in the city. The growth of the chain grocery system and its influence on food prices necessitated the use of some method by which chain store prices would receive their appropriate weight in the average for the city. The results of the 1930 Census of Retail Distribution provided a measure of the relative importance of sales of chain and independent groceries.

In setting up the weighting factors for combining the independent and chain store quotations, it was deemed sufficiently accurate to assign a weight of 1 to each independent store quotation. Accordingly,

the combined weight for the independent store quotations for a given commodity in a city was equal to the number of schedules received from independent stores. To secure a corresponding combined weight for the chain stores, the independent store combined weight was multiplied by the ratio of sales of chain stores to sales of independent stores, as shown by census figures. The combined chain store weight was then distributed among the several chain systems in the city in direct proportion to the number of stores operated in that city by each chain system. The prices for each food received at each pricing period from the independent and chain stores are multiplied by the appropriate weights, the products summed and divided by the sum of the weights to secure an average price as nearly representative as possible of stores of all types. This method has been employed by the Bureau in computing average prices of each food in each city for 1931 and subsequent years.

Every effort is made to collect prices of the same quality for each food throughout the 51 cities. Grades and qualities to be priced are always specified, but there is considerable variation in the brands and package sizes of any one food for which prices are quoted. This is partially due to the policy of requesting each dealer to quote prices on the goods which he sells in greatest volume. The extensive number of price quotations used in each average results, however, in a representative price for all cities combined and for given cities in terms of time comparisons. In making price comparisons from city to city, the policy of allowing each dealer to quote on his "volume seller" and the differences in food habits should be borne in mind.

Computation of city index numbers.—For each city, the base aggregate was computed by multiplying the annual average price of each food in 1923–25 by the consumption weight for that food. These products were then added and the result was the cost of a year's supply of food at 1923–25 prices. Similar costs were computed for each pricing period from January 1923 to December 1934, inclusive. The index numbers for each city were then obtained by dividing the aggregate food costs for each period by the comparable aggregate for 1923–25 and multiplying the result by 100. From 1923 to 1934 the indexes were computed from the prices of 42 foods.

The number of foods included in the indexes was increased to 84 as of January 2, 1935 (see Appendix, part III, for description of foods included). Since there were no prices for the additional 42 foods available before that date, it was necessary to link the new series to the one previously computed.

All subsequent index numbers have been computed by the link-relative method. This method was adopted as best suited for the Bureau's purposes and allows for comparability between any two

consecutive periods. The computation of the index number for any specified period by this method involved the following procedure:¹

1. Compute for the preceding period an aggregate which is comparable with the aggregate for the specified period.
2. From these two comparable aggregates, compute an index for the specified period using the preceding period as a base.
3. Multiply the index for the preceding period on the 1923-25 base by the index as indicated under 2. The result is the index for the specified period on the 1923-25 base.

Adjustments in the cost aggregates from one period to another are made to maintain comparability from period to period insofar as is possible. Some of the factors which make such adjustments necessary are:

1. From time to time dealers change the brands of the canned and packaged foods for which they report prices to the Bureau.
2. Seasonal foods are not carried throughout the year by some reporting dealers.
3. Changes are made from time to time in the list of dealers from whom reports are received.

In other words, at each pricing period there are always a certain number of changes in brands of foods for which prices are reported. When such substitutions occur, the price of the substituted brand is always secured for the previous period as well as the current period. In addition, whenever stores from which prices are secured fail to report, the link-relative method makes possible the computation of the percentage change in food costs from one pricing period to another on the basis of prices of foods which were as nearly as possible identical in the two periods, and from an identical list of stores.

These indexes show changes in the cost of food over a period of time in each of the 51 cities. The differences in the indexes for these cities at any one period are due to varying rates of change in the food prices, and comparisons of the rates of change in food costs between cities are valid.

The estimated food costs from which the indexes are computed represent, however, a somewhat different level of living in the various cities. The consumption weights for each city reflect these differences in that they are based on local food-purchasing habits. Therefore, the dollar costs at the base period vary from city to city and make

¹ The procedure can be explained in symbolical fashion by the following formula:

$$I_c = I_{c-1} \times \frac{\sum p_c q_b}{\sum p_{c-1} q_b}$$

where

I_c =index for current period

I_{c-1} =index for preceding period on the 1923-25 base

p_c =price in current period

p_{c-1} =price in preceding period

q_b =quantity consumption weights based on food purchases during a given period

invalid the use of these indexes for measuring differences in the level of food costs among the 51 cities.

Between two periods, food costs may have moved upward 1.7 percent in one city and 3.0 percent in another city; in the third city, they may have decreased 1.0 percent. This does not necessarily mean, however, that the cost of food is higher in one city than in the other.

Computation of the composite indexes.—The indexes for the United States, that is, for the 51 cities combined, are computed from the sum of the food costs for the individual cities after they are weighted for population. These indexes, too, are computed by the link-relative method.

Computation of average prices for 51 cities combined.—The method of computing the composite indexes provided data from which an average price for the United States was computed for each food, weighted both by purchases in the cities represented and by the population affected. This method superseded the simple arithmetic average used in the old series. Approximately 100,000 price quotations are represented in these averages for each reporting period.

C. Data Used for Computing Weights for Revised Index Numbers of Food Costs

¹ In each case the city first enumerated is that in which prices are obtained.

² Not classified as a metropolitan district by the census.

³ For the purpose of computing the composite food-cost index, the Providence weight is computed on the basis of two-thirds of the combined population of the Providence metropolitan district as given by the census; Fall River weight on the basis of one-third of that population.

⁴ For the purpose of computing the composite food-cost index, the Peoria weight includes one-third of the combined population of the Davenport-Moline-Rock Island metropolitan district; the Springfield, Ill., weight, two-thirds of that population.

⁵ Not classified as a metropolitan district by the census. For the purpose of computing the composite food-cost index, the Peoria weight includes one-third of the combined population of the Davenport-Moline-Rock Island metropolitan district; the Springfield, Ill. weight, two-thirds of that population.

⁶ Population of Duluth prorated over Minneapolis and St. Paul.

Part II.—Revised Indexes of Food Costs, by Cities, 1919 to 1922, Inclusive

Revised food-cost indexes were computed for specified periods for the years from 1919 to 1922, inclusive, to enable the inclusion of food-cost indexes in the "All items" indexes of the cost of goods purchased by wage earners and lower-salaried workers. In the following table, food-cost indexes for the 51 cities are shown quarterly for the years 1919 to 1922, inclusive.

TABLE I.—*Revised indexes of retail costs of food in each of 51 cities, for quarterly periods, 1919–22, inclusive*

Part III.—Description of Food Articles**CEREALS**

Flour, wheat.—In most cities flour prices are quoted on the 12- or 24-pound bag. In Salt Lake City the 48-pound bag is predominant, while in certain southern cities—Jacksonville, Memphis, and New Orleans—the majority of the sales are for quantities less than 12 pounds. All quoted prices are reduced to a pound basis for comparison.

Macaroni.—The bulk of the quotations for macaroni are for the standard brands in various size packages—the 7-, 8-, and 9-ounce sizes predominating. Prices for the various sizes are converted to the pound basis by using the net weight of the package as reported by dealers.

Wheat cereal.—Prices are published for a 28-ounce package, the size most frequently reported by dealers. The quotations are for uncooked wheat cereals, such as Cream of Wheat, Wheatena, Farina, etc.

Corn flakes.—Corn flakes are quoted almost exclusively for standard brands in the 8-ounce package, which is the basis of the published prices.

Corn meal.—Dealers report corn-meal prices for the quantities most in demand among their customers. The units of sale, which vary greatly (from 1 to 24 pounds—86 percent of the quotations are for 5 pounds or less), are reduced to a 1-pound basis for publication. In the northeastern cities, corn meal is usually sold in 16- or 24-ounce bags, but in the South larger units of sale predominate.

Hominy grits.—Prices are published for the 24-ounce package, the size for which the greater number of quotations are received. As in the case of corn meal, however, larger units of sale are usual in the South.

Rice.—Practically all quotations are for domestic rice. Prices are for whole grain only in bulk or in packages where packaged rice constitutes the bulk of the sales. The majority of quotations are for 16 ounces and are published for this quantity.

Rolled oats.—Prices are quoted for standard brands both in bulk and in packages. Although the most frequent size reported is 20-ounce, a substantial number of the total sales are for the 3-pound package. All prices have been reduced to a pound basis for publication.

BAKERY PRODUCTS

Bread.—Prices are given for three kinds of bread—white, whole wheat, and rye. They are based on 18 ounces of dough, which is the average scaling weight of a baked loaf weighing 1 pound. Representative bakeries in each city quote on those brands having the

largest sale to family trade. Since the loaves in a given city often vary considerably in size, a pound price for each loaf has been computed and the average for the city determined therefrom.

Pound cake.—Prices are quoted on pound cake made according to a standard formula for those brands having the largest sale to family trade.

Soda crackers.—The predominant size package for soda cracker quotations is 1 pound. Other sizes, including the popular 3½-ounce package, are converted to a pound basis for published prices.

MEATS

Beef

In this bulletin prices are given for five cuts of beef—sirloin steak, round steak, rib roast, chuck roast, and plate beef—and for beef liver.

The specifications which serve as a guide for quotations on the various cuts of beef state that "prices are desired on the best cut of the best grade of beef handled." Intercity comparisons of these prices however, are subject to a number of very definite limitations. The method of cutting beef varies so greatly that the same name is often applied in different cities to entirely different cuts. Furthermore, prices are affected by differences in the grade or quality of the meats and by the custom of trimming bone and fats from the cuts before weighing. This custom varies from trimming off almost all bone and fat in some cities to little or none in others. These factors, which cannot readily be measured often account for a considerable portion of the price difference between cities. Rib roast, chuck roast, and plate beef are priced with the bone in. Prices of plate beef include corned plate in several of the New England cities where this product is in demand. There is usually no additional charge for corning. The prices for beef liver are for good grade of fresh beef liver.

Veal

Veal cutlets.—Prices are quoted on cutlets taken from the first two-thirds of the round of the best grade of milk-fed veal.

Pork

Pork chops.—Prices are for loin chops, but not for rib chops or chops from the thick end of the "loin of pork."

Pork loin roast.—Quotations are for the best cut of pork loin roast (with "bone in") which the dealer handles, and are usually based upon the sale of a whole or half loin weighing from 8 to 10 pounds.

Sliced bacon.—Quotations are limited to dry sugar-cured bacon of the best grade sold in considerable quantity to wage earners. This excludes both the fancy grades and ready-sliced bacon packed in glass jars.

Strip bacon.—Prices are quoted on No. 1 grade, dry, sugar-cured bacon, sold in strips without slicing.

Ham, smoked, sliced.—Quotations are for center cuts from the best grade of smoked ham sold.

Ham, smoked, whole.—The price reported by each dealer is for whole smoked ham weighing from 10 to 14 pounds, of the best grade sold.

Picnic, whole.—Prices are for the best grade of whole smoked picnics (shoulders) sold by the dealer. The sizes on which quotations are given range from 4 to 8 pounds.

Salt pork.—Prices of salt pork are for bellies of No. 1 grade. In the section of the United States from Chicago and Milwaukee east through Philadelphia and the New England States, most of the quotations are for pickled pork. In Southern cities dry salt pork is used almost exclusively, and dealers quote prices on this product. There is a price differential between the dry salt and the pickled pork which must be remembered in comparing prices from city to city.

Lamb

Lamb breast.—Prices are reported for lamb breast, or stew with shank, of good grade, from the lower third of the forequarter.

Square chuck.—Prices of square chuck or shoulder of lamb are for good grade forequarter without the breast, shank, and rack.

Leg of lamb.—Prices relate to the section of the hind leg of a lamb which extends to the hip bone, but does not include the whole quarter. The Bureau classifies sheep from 9 to 19 months old as "yearlings," or lambs.

Rib chops.—Prices are quoted on lamb rib chops of good grade.

Poultry

Roasting chickens.—Quotations are for chickens at least a year old, such as are usually sold for roasting or baking. Dealers report prices for chickens, "dressed" but not drawn.

Fish, Canned

Salmon.—Dealers report prices of both red and pink salmon to the Bureau. All quotations are for the 1-pound tall cans. Prices of steak salmon are excluded.

DAIRY PRODUCTS

Butter.—Quotations are for butter of 92 score or better, which is known to the market as "creamery extra." Creamery extra is sold either in bulk, otherwise known as "tub" butter, or in bricks, termed "print" butter. Ordinarily, print butter commands a slightly higher price than tub, but in some cities the price is the same for both.

Cheese.—Prices are for mild cheese of the type known as "whole milk." Although some of the prices are for local cheese, the New York or the Wisconsin product is usually the basis for quotations.

Cream.—All quotations are for the $\frac{1}{2}$ -pint bottle and are for regular or table cream with a butterfat content ranging from 18 to 25 percent. Prices reported by both dairies and groceries are included in the average. No allowance is made for a deposit on the bottle.

Milk, fresh.—All quotations are by the quart and are for milk delivered regularly to customers. The average price published includes only prices reported by dairies, either the original producer or the dealer. No quotations from grocers are included in this bulletin.

In each city, the grade quoted is that which forms the dominant part of the milk supply. With each quotation is a statement indicating whether "raw" or "pasteurized," whether or not sold bottled, and, since 1934, the butterfat content.

Milk, evaporated.—The price of evaporated milk is for unsweetened, in the 14 $\frac{1}{2}$ -ounce can. In Bulletin No. 495 of the Bureau of Labor Statistics, the published price of evaporated milk was based upon a 16-ounce can. In order that comparison may be made with prices of subsequent dates, all prices from 1923 to 1928 have been converted to a 14 $\frac{1}{2}$ -ounce basis.

EGGS

Eggs, fresh.—Egg quotations are for a strictly fresh "breakfast egg" of the highest grade handled by the dealer, excluding fancy eggs or eggs selected for size and color. The trade terms used to describe eggs of this grade and quality vary somewhat in the different localities. The reporting dealers are chiefly grocery stores.

FRUITS AND VEGETABLES

Fresh Fruits

Apples.—Quotations are obtained from dealers on general-purpose apples which meet the requirement for a United States No. 1 grade. Prices are very largely for standard varieties, such as Jonathan, Winesap, etc., and are published for the pound.

Bananas.—Quotations are for the best bananas in the bunch, excluding all small or overripe fruit.

Bananas are sold by the pound in about two-thirds of the reporting cities, and by the dozen in the remainder. Average prices are published for each city on the basis of the prevailing method of sale. All prices are converted to a pound basis, however, for computing the average for all cities combined.

Lemons.—Lemon prices are quoted by the dozen for the sizes which constitute the bulk of the dealer sales. The sizes range chiefly from 380 to 460 lemons to the standard box.

Oranges.—Quotations are given for the size which constitutes the bulk of the dealers' sales. With the exception of Pacific coast cities, only the sizes which fall within the 176–220 range are used for computing average prices. Both Florida and California oranges are included. Prices are quoted by the dozen.

Fresh Vegetables

Green beans.—Quotations are for green beans meeting the requirements of a United States No. 1 grade.

Cabbage.—Cabbage is sold very largely by the pound and this basis is used for the publication of prices. The United States No. 1, or equal grade, is specified in order to eliminate, so far as possible, the price differences which arise from variations in quality. New cabbage is quoted when it becomes a sizeable factor in the dealers' sales.

Carrots.—Prices are for carrots which conform with the United States No. 1 specifications. Sizes within the range of 60 to 72 bunches to the crate are quoted. Prices are published for the bunch.

Celery.—Prices are for the stalk and are given for bleached celery of United States No. 1 or equal grade.

Lettuce.—Dealers are requested to report on head lettuce which meets the standards of the United States No. 1 grade. The usual size range is from 4 to 5 dozen heads to the crate. The Iceberg and New York varieties predominate, although local varieties are often quoted.

Onions.—Onion prices are reported on the pound basis for the variety in common use. In most localities this is a yellow onion. Quotations for the United States No. 1 grade, or its equivalent, are requested from dealers.

Potatoes.—Quotations are for the "Irish" or "white" potato of United States No. 1 grade. New potatoes are reported by the dealer only when they form the bulk of his sales. The unit of sale for these quotations varies, but all prices have been reduced to the pound basis for publication.

Spinach.—Prices are quoted by the pound for the United States No. 1 or equal grade.

Sweetpotatoes.—Prices are published for the pound for United States No. 1 grade.

Canned Fruit

Peaches.—Prices are for standard grade peaches of recognized brand in No. 2½ size cans (1 pound 13 ounces). Quotations are given on halves packed in sirup.

Pears.—Prices of canned pears are for a No. 2½ can (1 pound 13 ounces) of a standard grade and recognized brand.

Pineapple.—All quotations are for standard grade of sliced Hawaiian pineapple, packed in No. 2½ can (1 pound 14 ounces).

Canned Vegetables

Asparagus.—Quotations on canned asparagus are for fancy grade. All prices are converted to No. 2 can equivalent (1 pound 3 ounces), for publication.

Green beans.—Prices are for green beans in a No. 2 size can (1 pound 3 ounces).

Beans with pork.—Quotations are for standard brands for the No. 1 can (16 ounces).

Corn.—Quotations are for whole grain corn of standard grade, packed in a No. 2 can (1 pound 4 ounces). Prices for fancy or sub-standard grades are excluded.

Peas.—Peas of standard grade and recognized brand are quoted. Extra fancy or very low grades are excluded. Prices are published for the No. 2 can (1 pound 4 ounces).

Tomatoes.—Prices are for the standard grade packed under recognized brands. The No. 2½ can (1 pound 12 ounces) is sold almost exclusively in the far western cities due to the popularity of this size for canning fruit. In other cities the No. 2 size (1 pound 3 ounces) predominates. For the purpose of computing the average price for all cities combined, all quotations are converted to their equivalent for the No. 2 can.

Tomato soup.—Quotations are for the brands and sizes sold in largest quantities for household consumption. Prices are published on the basis of the 10½-ounce can.

Tomato juice.—Each dealer reports the brands and sizes of tomato juice sold in largest volume in his store. All quotations are converted to the 13½-ounce can.

Dried Fruits

Peaches.—Prices are for the grade designated as "extra choice."

Prunes.—The prunes for which prices are given are mostly California prunes, although in the western cities quotations are also given on Oregon or Italian prunes. The majority of quotations are on the loose prunes, for sizes ranging from 30 to 60 to the pound. Dealers quote prices on the size having the greatest sales in their stores.

Raisins.—Raisin prices are published for the 15-ounce package, which is the predominant size for quotations. The greater number of quotations are on "seeded" raisins, although prices for "seedless" are given in some cases.

Dried Vegetables

Black-eyed peas.—Prices are quoted on clean, well-screened dried black-eyed peas having a good natural color.

Lima beans.—Quotations are for No. 1 grade dried lima beans.

Navy beans.—Prices are for navy or "pea" beans, United States No. 1 grade.

BEVERAGES AND CHOCOLATE

Coffee.—The coffee for which prices are quoted, is pure roasted coffee of the grade and brand sold in largest quantities in the various stores. Some coffee in bulk is quoted but most of the reports are for coffee in 1-pound packages.

Tea.—Prices of tea are quoted on both black and green for a large number of brands and for various size packages. However, quotations for black tea in the 4-, 8-, and 16-ounce packages predominate. Each dealer quotes the brand and size most in demand in his store.

All reported prices are converted to the pound for publication.

Cocoa.—The 8-ounce can is the most popular unit of sale and has been used as a basis for the published price. Quotations are for breakfast cocoa.

Chocolate.—Prices are for the best quality of unsweetened cooking chocolate. The 8-ounce package is the size most frequently quoted and average prices are published for this quantity.

FATS AND OILS

Lard.—All quotations are for “pure” lard with the exception of a few for “pure leaf.” The majority of quotations are for lard sold in bulk (“tub” lard). A substantial number of dealers, however, report prices on lard packed in 1-pound cartons.

Lard compound.—Prices are quoted on lard compound of good quality. The majority of the quotations are for the packaged article.

Vegetable shortening.—Prices for vegetable shortening are for such products as Crisco, Snowdrift, Spry, etc.

Salad oil.—Dealers report prices for salad oil made from vegetable products for table use and for cooking. The pint container is the most popular size and is used as the basis for published prices.

Mayonnaise.—Prices are for mayonnaise and do not include quotations on salad dressing. The half-pint jar, which is the size most frequently quoted, is used for published prices.

Oleomargarine.—In many cities (particularly in the north-central areas) there is as much oleomargarine used as butter, while in cities in the mountain area, scarcely any butter substitutes are sold.

In this bulletin, the term “oleomargarine” includes all butter substitutes whether made from animal fat or vegetable oils.

Prices are quoted for the best grade sold by the reporting dealer.

Peanut butter.—Prices are quoted on peanut butter of good quality, prepared from sound nuts which have been carefully washed, cleaned, and ground.

SUGAR AND SWEETS

Sugar.—Prices are for granulated sugar. Quotations are chiefly on the 10-pound basis, but the pound is the unit for published prices.

Corn sirup.—Dealers quote prices of corn sirup on a good standard grade and on the size container most generally sold to family trade. The 24-ounce can is the size sold in largest volume and prices are published for this quantity.

Molasses.—Quotations are for molasses of good standard grade. Since the predominant size is the 18-ounce can, this size has been used as a basis for published prices.

Strawberry preserves.—Prices are for preserves of good quality. All reported prices have been converted to the pound.

Salt, table.—Quotations are for brands of salt most commonly sold for family trade. All prices are converted to the pound basis.

Part IV.—History of Earlier Series

Retail prices of food have been collected by the Bureau since 1903. In that year, Bureau agents collected retail prices of food for the years from 1890 to 1903. Thirty staple articles of food were priced and prices were collected in representative cities in 33 States. The Eighteenth Annual Report of the Commissioner of Labor, published in 1903, included the first of a series of food prices and of indexes. These indexes were computed with the 10-year average 1890-99 as a base, and annual average prices and indexes were published for the years from 1890 to 1903 inclusive. There were minor changes in content and methodology from time to time, during the years from 1904 to 1913. From 1907 to 1913 prices of 15 foods were used in the indexes. For this entire period, from 1890 to 1913, two series of indexes were computed from price relatives:¹ One series was a simple arithmetic average of the price relatives and the other series was a weighted average of the relatives. The weighting factors used in the computation of this second series were obtained from the results of an extensive investigation made by the Bureau of the expenditures of workingmen's families in 1901-2. Six sets of weights were used, five for the main geographic divisions and one for the United States. In all cases the weights represented average expenditures by urban wage earners' families for the specific foods priced in the north Atlantic, south Atlantic, north central, south central, and western divisions and for the United States. The second index, therefore, represented changes in food costs as they affected the wage-earner group.

In 1914 there was a complete revision of the method used in computing the indexes and the base was shifted to 1913, the latest year

¹ The price relatives were the ratios of the prices in each period to the corresponding price in the base period times 100, thus expressing the relationship in percentage terms.

for which price data were available. At that time the Bureau introduced the use of the aggregative¹ method in the computation of the food-cost indexes, and recomputed the indexes back through 1907. Five sets of quantity weights were used, representing the average annual consumption of foods in the cities reporting food prices to the Bureau in each of five geographical areas. There was an additional set of weights for the composite index which was representative of the average annual consumption of foods in all of the cities. These weights were again obtained from the family expenditure study of 1901–2. With these weights, aggregative cost figures for the base year were computed for each food, using the average unit price of that food in 1913. These individual food costs were summed for each area and for the United States. For each subsequent period similar costs were computed by multiplying the base cost for each food by the relative price of that food. The sum of these costs was then compared with the sum of the costs in the base year, 1913. A detailed explanation of this revision, together with a complete statement of the methods used prior to 1914, was included in Bulletin 156, published in 1914.

The revisions which were made in the period 1914 to 1920 were systematized into a single comparable series of index numbers showing changes in the cost of 22 foods from 1913 to 1920. During this period of revision actual average prices were computed for each food for each city. Aggregates for each food were computed by weighting the prices for each city with regional consumption weights, using identical weights for all cities located in the same region. City indexes then replaced the regional indexes and were computed for the years from 1913 to 1920 inclusive by using the method shown above. For the composite index covering all reporting cities, the arithmetic average of all price quotations was found. The average prices and indexes discussed in this paragraph and the methods of computation were published in Bulletins 270 and 300.

In 1921 a revision was effected by changing the weighting factors and increasing the number of foods. Quantity weights, obtained from the family expenditure survey made in 1918–19, replaced those used for earlier years. Prices of 42 foods were used, an increase from the 22 foods upon which the index was based from 1913 to 1920, inclusive. A description of the method used in this revision of the index was contained in the Monthly Labor Review for March 1921 and in Bulletin No. 315 published in 1923. Bulletin No. 396, published in 1925, contained complete details of content and methodology as well as historical references. Thus, by 1928, when the last general bulletin, No. 495, was published, the number of priced foods

¹ The contrast between the use of weighted "relatives" for computing an index and the "aggregative" method is that the first is an average of ratios whereas the second is a ratio of totals.

had increased from the original 30 to 42, and food dealers in 51 widely scattered cities were regularly reporting to the Bureau.¹

Since 1928, the Monthly Labor Review has been the Bureau's vehicle for presenting statistics of retail food prices and costs, and reprints of this material have been published monthly in pamphlet form. Annual average indexes of retail costs of food in cities combined from 1890 to 1934, as discussed in the preceding paragraphs, are shown in table J.

No major changes were made between 1928 and 1935, the year in which the revision presented in this bulletin, took place. Although the number of priced foods was gradually increased from 42 to 87 after August 1933, no additional items were included in the unrevised indexes because of the lack of price data for the base period and the link-relative method was not in use at that time. Early in 1935 price data were obtained for the base period for six items—cocoa, lard compound, salad oil, corn sirup, molasses, and strawberry preserves, and these foods were included in the indexes in May 1935.

For many years indexes were computed for only three commodity groups—cereals, meats, and dairy products. The index for the 20 foods not included in these three groups was classified as "Other foods." In November 1934 a separate index was computed for fruits and vegetables, using prices of 12 of the 20 foods, and an index was also computed for eggs. In May 1935 three additional commodity groups were introduced—fats and oils, beverages, and sugar and sweets. The index for "Other foods" was thus discontinued. No further change was made in the index until the full revision of the indexes in 1935.

TABLE J.—*Unrevised indexes of the average retail cost of all food, 1890 to 1934¹*

[1913=100]
