## PREFACE

---

The Study of Consumer Purchases was directed toward two related objectives. The first was to ascertain the distribution of families according to income, occupation, and family composition. The second was to learn how families of different incomes, occupations, and family types apportion their expenditures among specific goods and services, in different parts of the country.

The material presented in the present volume was secured from a survey conducted in 1936 by the United States Bureau of Labor Statistics in cities varying in size and representing different parts of the country. This survey was paralleled by a study of small city, village, and farm families conducted by the Bureau of Home Economics of the United States Department of Agriculture. Both surveys which together constitute the Study of Consumer Purchases were administered under a grant of funds from the Works Progress Administration. The National Resources Committee and the Central Statistical Board both cooperated in the Nation-wide survey. Technical plans for the Study were developed and the administration of the survey was coordinated by a technical committee which consisted of Hildegard Kneeland, National Resources Committee, chairman; Faith Williams, Bureau of Labor Statistics; Day Monroe, Bureau of Home Economics; Milton Forster, Works Progress Administration; and Samuel J. Dennis, Central Statistical Board.

In selecting the data to be secured and the analyses to be made, consideration was given to the different interests which may be served by a study of consumer purchases. Scientific groups as well as legislative bodies and administrative agencies of the Government regularly need analyses of family incomes and expenditures to aid them in the study of such social and economic problems as taxation, social security, consumer protection, and wage adjustments. The analyses of general interest have been presented in a series of volumes on income and expenditures in various regions.

The present volume gives in detail family expenditures for food for the use of those people who are concerned with the original work materials. It is one of a series of eight which will present the data secured in regard to the expenditures of 26,241 families in the cities covered by the Bureau of Labor Statistics in the analyses of the data from the Consumer Purchases Study.

Simultaneous studies of rural and urban family incomes, and the manner of their disbursement, can shed light on the relative abilities of farm and city to absorb each other's products, and on the manner in which that capacity changes as rural and urban incomes change.<sup>1</sup>

Welfare agencies are concerned with data bearing on the budgetary requirements of families in the maintenance of minimum standards of subsistence. Successful budgeting presupposes some consideration of the balance habitually maintained by families as between various types of expenditure. This concern runs not only in terms of gross expenditures which have already been shown, but also in terms of such refined detail as is here presented.

Manufacturers and distributors will utilize the information on income distribution and consumer preferences in the planning of their production and sales programs. Their interests are better served by a knowledge of expenditures for specific commodities than for broad classes of consumption which have more general interests.

Obviously, any economic program must have, as one fundamental prerequisite, a definite knowledge of the distribution of families by incomes and of the choices made by families in the disbursement of their incomes. The publication of the details of family expenditures at different income levels and in different parts of the country provides concrete information as to the point at which families enter the market for specific types of goods and makes it possible to relate the probable demand for given commodities and services to changes in income structure.

In view of the fact that a number of persons outside the Bureau's regular staff took part in the investigation, the Bureau of Labor Statistics wishes to acknowledge the services of the following persons who served as regional or metropolitan directors of field work: Ruth Ayres, LeRoy Clements, Rachael S. Gallagher, Forest R. Hall, Sybil Loughhead, Glenn W. Sutton, Margaret D. Thompson, Georges M. Weber, and Erika Hartmann Wulff.

Acknowledgment is also made to Frances W. Valentine, Jesse R. Wood, Jr., and William Loudon who were in charge of computation and tables; Joseph A. Smith, in charge of machine tabulation; Dorothy McCamman who served as chief check editor; Frank Strohkarck, Marie Bloch, Ethel Cauman, Verna Mae Feuerhelm, Lenore A. Epstein, Trusten P. Lee, Mary Wyatt Chace, and Allan W. Winsor, who were in charge of editing and reviewing.

ISADOR LUBIN,

*Commissioner of Labor Statistics.*

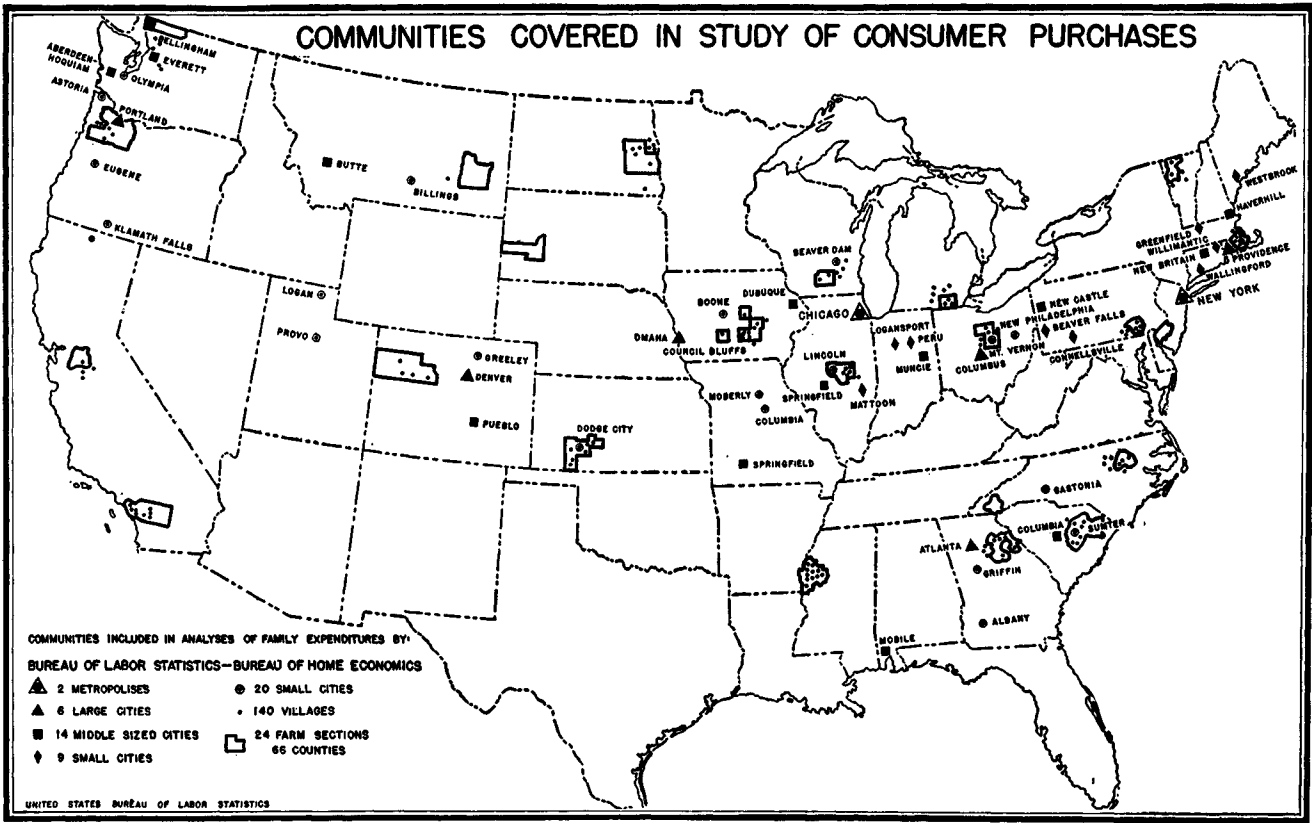

MAY 1939.

---

<sup>1</sup> While the present investigation obtained data on the expenditure patterns of families at different income levels, it provides inferential evidence on the alterations which would occur in family spending if income were raised or lowered.

# COMMUNITIES COVERED IN STUDY OF CONSUMER PURCHASES

**Family Expenditures in Selected Cities  
1935-36**

**FOOD**

**Scope and Method of the Study**

The data collected in the Urban Series of the Study of Consumer Purchases are presented in three sets of publications. The first two, which have been published in a series of two-volume bulletins, pertain to the distribution of families according to nativity, income, occupational group, family composition, and home tenure; and to the expenditure of current income for the major categories of consumption.<sup>1</sup>

The third set of publications covers the details of expenditures; for example, the report on food presents not only total expenditures for food but also the details on expenditure for meals away from home, and for specific food items, such as white flour and lamb chops. These details are presented in a series of volumes,<sup>2</sup> each one containing

---

<sup>1</sup> See the following bulletins:

- Bull. No. 642. Family Income and Expenditure in Chicago, 1935-36.
- Bull. No. 643. Family Income and Expenditure in New York City, 1935-36.
- Bull. No. 644. Family Income and Expenditure in Nine Cities of the East Central Region, 1935-36.
- Bull. No. 645. Family Income and Expenditure in Selected New England Cities, 1935-36.
- Bull. No. 646. Family Income and Expenditure in Selected Urban Communities in the West Central-Rocky Mountain Region, 1935-36.
- Bull. No. 647. Family Income and Expenditure in Selected Southeastern Cities, 1935-36.
- Bull. No. 649. Family Income and Expenditure in Four Urban Communities in the Pacific Northwest region, 1935-36.

Each bulletin is published in two volumes. Volume I presents the income data and volume II the summary of expenditures.

<sup>2</sup> The volumes which together make up Bull. No. 648, Family Expenditures in Selected Cities, are as follows:

- Volume
- I. Housing.
- II. Food.
- III. Clothing and Personal Care.
- IV. Furnishings and Equipment.
- V. Medical Care.
- VI. Travel and Transportation.
- VII. Recreation, Education, and Contributions and Personal Taxes.
- VIII. Changes in Assets and Liabilities.

the data in tabular form for a certain group of expenditures, such as those for food or for housing, for all the communities covered by the Urban Series of the Study of Consumer Purchases.<sup>3</sup>

### The Population Covered

*Cities studied.*—The cities included in the Consumer Purchases Study were chosen to represent the metropolis, the large city with a population from 250,000 to 300,000, the middle-sized city with a population from 30,000 to 75,000 and the small city with a population of from 8,000 to 20,000, in 6 different regions of the country. In the field work the Bureau of Labor Statistics covered all the cities included in the first 3 groups, and 10 of the small cities. In the analysis of the results, this Bureau has been responsible for the data from the cities shown in the following table.<sup>4</sup>

*Cities included by Bureau of Labor Statistics in the analyses of family expenditures*

Region	Metropolitan and large cities	Middle-sized cities	Small cities
Northeast.....	New York, N. Y. Providence, R. I.	Haverhill, Mass. New Britain, Conn.	Wallingford, Conn. Willimantic, Conn. Westbrook, Maine. Greenfield, Mass.
Southeast.....	Atlanta, Ga.....	Columbia, S. C. Mobile, Ala.	
East Central.....	Chicago, Ill. Columbus, Ohio.	Muncie, Ind. New Castle, Pa. Springfield, Ill.	Beaver Falls, Pa. Connellsville, Pa. Logansport, Ind. Mattoon, Ill. Peru, Ind.
West Central Rocky-Mountain.	Omaha, Nebr.—Council Bluffs, Iowa. Denver, Colo.....	Dubuque, Iowa. Springfield, Mo. Butte, Mont. Pueblo, Colo.	
Pacific Northwest.....	Portland, Oreg.....	Aberdeen - Hoquiam, Wash. Bellingham, Wash. Everett, Wash.	

Since the purpose of the expenditure survey was to determine, insofar as it is possible to do so, the influence of income, family type, and occupation upon family spending, it seemed wise not to try to cover, with the restricted funds available for the investigation, the total population of each community studied. Instead, certain qualifications were set up, for the purpose of eliminating so far as possible the effect of alien customs, economic stress, and broken family ties which might tend to obscure the factors in family spending which it was desired to measure.

<sup>3</sup> Families providing income and expenditure data selected the report year that they preferred, either the calendar year 1935 or a 12-month period ending in 1936. All data represent family expenditure for a period of 12 months during 1935-36, except the material pertaining to the details of expenditure for food. This is based on 1 week's consumption.

<sup>4</sup> See p. 404 for the cities covered by the Bureau of Home Economics.

*Nativity groups.*—The survey was limited to families in which the husband and wife were both native born. In New York, Columbus, and the Southeast, data were obtained not only from white families but also from Negro families; in the other cities the investigation was confined to white families.

*Income and occupational groups.*—In all cities families having received relief at some time during the year were excluded from the expenditure survey. The population covered was further restricted by the omission of nonrelief families with incomes below the levels which define the customary spending of nonrelief groups. Families with incomes below \$500 in the metropolises, white families with incomes below \$500 in the large cities, and white families with incomes below \$250 in the other cities were omitted. Among Negro families in Columbus, those with incomes below \$250 were likewise excluded.

In most of the cities studied, families in the wage-earner and clerical groups only were included in the sample at the lowest income levels, and only families in the business and professional groups, at the upper levels, since the families in these groups were considered most representative of the extremes of the income scale.

For purposes of this study, families were classified into six major occupational groups: Wage earner, clerical, independent business, independent professional, salaried business, and salaried professional. The occupational classification of a family was determined by the major source of earnings, whether contributed by one or more members.

*Range of family income included in expenditure study, by occupational groups and tabulation unit*

Tabulation unit	Occupational groups <sup>1</sup>			
	Wage earner	Clerical	Independent business professional <sup>2</sup>	Salaried business and professional
<i>White families</i>				
Metropolises:				
New York.....	\$500 to \$3,999...	\$750 to \$3,999...	\$1,250 to \$10,000 and over..	\$1,250 to \$10,000 and over.
Chicago.....	\$500 to \$4,999...	\$750 to \$4,999...	\$1,250 to \$10,000 and over..	\$1,250 to \$10,000 and over.
Large cities:				
Columbus.....	\$500 to \$3,999...	\$750 to \$4,999...	\$1,250 to \$7,500 and over...	\$1,250 to \$7,500 and over.
Other.....	\$500 to \$2,999...	\$750 to \$2,999...	\$1,250 to \$7,500 and over...	\$1,250 to \$7,500 and over.

Columbus.....	\$250 to \$1,749...	\$750 to \$2,999...	\$250 to \$2,999.....	\$500 to \$2,999.
Atlanta.....	Under \$250 to \$1,499.	\$250 to \$2,250 and over.	\$250 to \$2,250 and over....	\$250 to \$2,250 and over.
Middle-sized cities unit.	Under \$250 to \$1,499.	Under \$250 to \$2,500 and over.	Under \$250 to \$2,500 and over.	Under \$250 to \$2,500 and over.

<sup>1</sup> The occupational group in which a family was classified was determined by the source from which a major portion of its earnings were derived.

<sup>2</sup> Families in which the major portions of earnings were derived from work in which the earner was self-employed.

Data secured from families with no gainfully employed members, which formed a very small proportion of all families in the selected random sample, were not included in the summary of the details of expenditures. A special study of the expenditures of families with no gainfully employed members was made for Chicago, for Columbus white families, and for families in the East Central middle-sized cities. For this material, see volume II of Bulletins Nos. 642 and 644.

The lower and upper limits of the income range at which families in different occupational groups were studied is shown in the table on table 3.

*Family type groups.*—Only families of the relatively more frequent types were included in the sample eligible for the expenditure schedule. For the purpose of distinguishing the expenditure patterns of the predominant family-composition groups, the following types were defined (see fig. 1):

<i>Family type</i>	<i>Composition</i>
I	Husband and wife (families of 2 persons).
II	Husband and wife, and one child under 16 years (families of 3 persons).
III	Husband and wife, and 2 children under 16 years (families of 4 persons).
IV	Husband, wife, one person 16 years or over, and one or no other person, regardless of age (families of 3 or 4 persons).
V	Husband, wife, and one child under 16 years, one person 16 years or over, and 1 or 2 other persons, regardless of age (families of 5 or 6 persons).
VI	Husband, wife, and 3 or 4 children under 16 years (families of 5 or 6 persons).
VII	Husband, wife, one child under 16 years and 4 or 5 other persons, regardless of age (families of 7 or 8 persons).

These seven family types were studied in Chicago, in the white sample in the three East Central city units, and in the Atlanta Negro sample. Elsewhere, the funds available for the expenditure survey made it necessary to restrict the coverage to families of the first five types only.

*Other eligibility requirements.*—The expenditure survey was further restricted by excluding a few families for the following reasons:

1. The family did not occupy a home in the community for at least 9 months of the schedule year.
2. The family moved from one dwelling unit to another between the end of the schedule year and the date of the interview.
3. The family did not have access to housekeeping facilities for at least 9 months of the schedule year.
4. The family had more than the equivalent of one roomer and/or boarder in the household for 52 weeks of the report year.
5. The family had more than the equivalent of one guest for 26 weeks.

### Sampling Procedures

*Expenditure schedule.*—The collection of data on family expenditures and family living requires more than ordinary skill and is a time-consuming process. In the interests of economy it was necessary to develop special procedures in order that the families covered might constitute a representative sample of the population included.

Income is the most important single factor influencing expenditure. Since there are no directories of families by income, it was necessary in the first place to secure a random cross section, by income, of the families that might be included in the expenditure survey in each community.

The percentage coverage of households for the random sample was determined in large part by the size of the community. The random sample for New York was equivalent to 4 percent of all families; for Chicago, to 10 percent. For the six large cities, this sample represented a 20 to 50 percent coverage; and in the middle-sized and small cities, 50 to 100 percent of the families were interviewed to obtain a minimum of information necessary to identify and classify the family. This random sample (the record-card sample) in which data were obtained from about 625,000 families, made it possible to ascertain the distribution of the families in the whole community by nativity, color, and family type composition. From those families which met specified requirements as regards these three items, additional information was secured relating to income, occupation, family composition, and home tenure.

From this random sample, there was determined the number of families eligible for the expenditure schedule on the basis of the eligibility requirements described above (see pp. 3 and 4 for the color groups, occupation, income groups, and family types covered in each area). In order to hold the number of expenditure schedules to a minimum and at the same time to secure adequate information for types of family that are found infrequently in the community, it was decided to secure detailed expenditure data from an approximately equal number of families in the eligible group, for each family type group within each occupational class at each income interval. Families which were similar in respect to these three controls were taken to represent an expenditure pattern unit, or "cell." So far as practicable, the goal in Chicago, the East Central cities (white sample), and Atlanta (Negro sample) was to schedule 10 families to represent each cell in each tabulation unit. In the case of the other city units the goal was to schedule 6 families for every cell. In each case the families scheduled as regards expenditures were drawn as a random sample of the families listed as eligible for scheduling in a given "cell."

It can be seen from table 1 that the number of families from which data were secured was much larger in some cases than in others; that it was much larger, for instance, at the middle income levels than

at either the top or the bottom of the income scale. It will be seen, too, that despite the special efforts made in the sampling process, some occupational groups and family types are much better represented than others.

The discrepancies between the number of schedules secured and the general goal may be attributed to several factors,<sup>5</sup> the most important

<sup>5</sup> Another obstacle to an exact control of the number of expenditure schedules in each cell resulted from shifts in the cell classification of families after the detailed interview on expenditure data. The income class in which the family was classified on the basis of the relatively short family schedule interview did not always correspond with the income class in which the family fell on the basis of the interview for expenditures. The shifts arose partly from the fact that the methods of computing income differed slightly for the two schedules, and partly from the fact that sources of income which the family had forgotten to mention to the agent obtaining the family schedule data occasionally came to light in the course of the long interview in connection with the discussion of expenditures.

Because of the extensive coverage of the family income survey, it was necessary to keep the time of the family schedule interview as short as possible. On that account information on the expenses of an owned home other than interest payments was not obtained from the families covered in the large random sample. Therefore, in estimating nonmoney income from home ownership for the income report, it was necessary to resort to a table of estimated average expenses at given rental values. During the expenditure interview, however, figures were obtained on expenses such as taxes, repairs, special assessments, and insurance and thus a revised figure on the nonmoney income from owned home was computed by subtracting the *actual* rather than the *estimated* expenses.

Similarly, for families having boarders the income figure on the family schedule included the *estimated* net income from boarders after deductions had been made for the cost of food; these deductions varied with the amount of the payment for board and were estimated on the basis of data secured in the Bureau of Labor Statistics study of the money disbursements of wage earners and clerical workers. At the time of the expenditure schedule interview, detailed information was obtained on the food expenditures of the family, from which it was possible to compute more accurately the money expense for boarders' food, and thus to gauge more correctly the net income from boarders.

No attempt was made at the time of the family schedule interview to determine nonmoney income from an owned vacation home. This figure was obtained, however, from information secured during the expenditure interview, and is included in the income figure by which families in the controlled sample were classified.

Furthermore, rent received as a gift is not included in the income figure of the family schedule but it was taken into account in deriving the income code of families giving expenditure data.

Changes in the family type of classification also resulted from the longer interview—chiefly because of differences in the definition of the economic family. Whereas all related persons living under the same roof, or eating at least two meals daily with the family whose *income* could be ascertained were included in coding the family type for purposes of the family schedule tabulation, only persons dependent on a common family fund whose *expenditures* could also be ascertained were regarded as members of the economic family in the controlled sample. The discrepancies in the codes resulting from these differences, however, were negligible; For example, less than 1 percent of all Chicago families from which expenditure data were secured were classified in a different family type by the two procedures.

The shifts in occupational code resulting from the longer interview also were relatively infrequent.

Aside from the effect of discrepancies arising from different definitions of the economic family, the longer interview brought to light additional facts concerning the net earnings of various family members. Detailed information on automobile expenditure, for example, occasionally revealed a different, and more accurate, figure for occupational expenses than that which had been deducted when reporting the net earnings of family members in the family schedule interview.

In the process of obtaining the last schedule needed to complete a cell according to the basic plan, it sometimes happened that two or more field agents secured complete schedules where only one had been required. Since these schedules added to the reliability of the averages for the given cells, it was decided to make use of all the completed schedules which fell within the income, occupation, and family type limits set for the investigation.

The shifts in cells had another effect which, though not numerically very important, made some difficulty in preparing the basic tabulations; namely, expenditure schedules appeared in cells for which no weights were available since no eligible cases had been classified in these cells in the tabulation of the random sample. It was decided to give cells in which no random sample schedules were secured but in which expenditure schedules appeared a weight equivalent to the number of expenditure schedules appearing in the tabulations.

These arbitrary weights would tend to make the number of families in the city appear greater than was actually found but counterbalancing these added weights was the fact that a number of cells which contained eligible cases in the random sample had no expenditure schedules, and thus were not utilized.

The above discussion of changes in cell code has been presented primarily to give the reader some insight into the type of problems involved in obtaining equal numbers of cases in each cell in the controlled sample. Since the final code for the family type, income, and occupational group was prepared during the final office edit of an expenditure schedule, it was inevitable that changes would tend to increase the number of schedules in some cells and decrease others.

of which was the fact that families of specified types at certain income levels were not sufficiently numerous to yield the desired number of schedules. Furthermore, not all families from which expenditure data were desired contributed the information. Some had moved out of the city, others could not be found at home, while still others were unable or unwilling to give the detailed information requested. Of the schedules which were secured, a number had to be discarded because of inconsistency, incompleteness, or unreliability of data shown.

For some of the cells the random sample did not furnish a sufficient number of cases to permit computation of reliable averages for the expenditure patterns of the families. For example, in a 10-percent sample of Chicago families there were only four salaried professional families with incomes of \$1,750 to \$2,000 and with three or four children under 16. In this case and others like it an effort was made to locate more families of the type required in the cell by a process of stratified sampling, as for example by canvassing lists of doctors, lawyers, and similar professional people. Even with the use of the stratified sample, however, some of the cells did not have the desired minimum of families, and therefore had to be combined with contiguous cells to give a somewhat broader classification for analysis than had originally been contemplated.

The total number of expenditure schedules used in the tabulation for each of the urban units analyzed by the Bureau of Labor Statistics was as follows:

*Number of expenditure schedules completed, by geographic area*

Geographic area and color	Number of schedules	Geographic area and color	Number of schedules
<i>Metropolitan centers</i>		<i>Middle-sized city units</i>	
New York:		New England.....	854
White families.....	1, 703	East Central.....	1, 173
Negro families.....	294	Southeast:	
Chicago.....	1, 2, 635	White families.....	1, 407
		Negro families.....	620
<i>Large cities</i>		Rocky Mountain.....	1, 244
Providence.....	1, 217	West Central.....	1, 187
Columbus:		Pacific Northwest.....	957
White families.....	1, 2, 260	<i>Small-city units</i>	
Negro families.....	248	New England.....	1, 034
Atlanta:		East Central.....	1, 570
White families.....	1, 588		
Negro families.....	869		
Omaha-Council Bluffs.....	1, 073		
Denver.....	1, 346		
Portland.....	1, 738		

<sup>1</sup> Excludes 76 families with no gainfully employed members in Chicago, 70 in the Columbus white sample, and 78 in the sample for the East Central middle-sized cities.

The number of families of the types, incomes, and occupational groups covered by the investigation are given in table 1.<sup>6</sup>

<sup>6</sup> In order to make possible comparisons between city and regional groups, the figures on the number of eligible families presented in table 1 are given in terms of the total number of eligible families in each city or regional group; that is, in terms of 100-percent coverage even for the cities where the sample was less than 100 percent.

*Supplementary schedules (check lists for food, clothing, and furnishings and equipment).*—All the families which furnished expenditure schedules were also asked to give detailed data concerning weekly consumption of food at home, expenditures for specific items of clothing for the different members of the family, and expenditures for specific items of furnishings and equipment. The population represented in the controlled sample was thus the same for the check lists as for the expenditure schedule; and these supplementary schedules were classified in the same income-family-type-occupation groups as the corresponding expenditure schedules.

The number of check lists per cell was smaller in some cases than the number of expenditure schedules. Some families were unable to supply the necessary information (quantity, price, and value or expenditure) for the specified items; and others were unable to spend the time needed to complete the check lists. Because of an insufficient number of check lists, no tabulations on individual items of food consumed were prepared for the Negro families in the New York City-Columbus unit. Further, in the case of clothing check lists for individual members of the family, data were obtained in many instances for some members of the family but not for all. For example, clothing expenditure by items might be reported by the wife for herself and for children under 16 years of age in the family, but for her husband in some cases she gave only his total clothing expenditure. The following table shows the number of supplementary schedules used in the tabulation.

*Number of check lists tabulated by geographic area*

Geographic area and color	Check list		
	Food (families)	Clothing (individuals) <sup>1</sup>	Furnishings and equipment (families)
<i>White families</i>

<sup>1</sup> Clothing check lists pertained to family members, rather than to the family as a unit.

<sup>2</sup> Excluded from tabulations because of insufficient number of cases.

The proportion of families in the controlled sample which supplied check lists varied considerably among the units. The number of

families covered in the analyses of the food check lists is shown for the different geographic areas, with an occupational and family type classification within each income level, in table 1-A of volume II (Bull. No. 648); the number of persons for whom clothing expenditures were reported is given in tables 1-B and 1-C of volume III; and the number of families represented in the tabulations of the furnishings and equipment check lists appears in table 1-A of volume IV.

### Method of Securing Averages

*Combinations of cities.*—As noted above, the cities included in this study were selected to represent the various geographic sections, and size of city groups in the country. Data are presented for the two metropolitan and six large cities separately. The two or three middle-sized cities in each geographic area<sup>7</sup> were combined as a unit, when analyzing the data from the expenditure schedule.

There were two main reasons for combining the data for the middle-sized cities, and for the small cities, in each region. In the first place, the number of schedules secured in each of these communities was necessarily smaller than in the case of the metropolitan centers and the large cities. These small numbers made some combinations necessary in order to secure reliable averages, particularly since it was desired to analyze part of the data by occupational group or by family type as well as by income level. In the second place, the middle-sized cities and the small cities were selected as representative of the different community types predominating in the regions in which they were located. Significant figures on expenditures by families of given income, family type, and occupation could best be secured for communities with population under 70,000 persons by combining into one set of figures the data secured for all cities of a given size in each area.

With the tabulation of the data as outlined above, it is possible to make analysis of regional differences in the data secured, as well as of differences growing out of varying degrees of urbanization.

Due to the smaller number of families supplying data on the details of food, clothing, and furnishings and equipment purchases, and to the variety of items covered, further combinations were made when analyzing the supplementary schedules, as follows:

#### *White families*

New York City and Chicago.

New England and East Central, 2 large and 5 middle-sized cities.

New England and East Central, 9 small cities.

Southeast, 1 large and 2 middle-sized cities.

West Central and Rocky Mountain, 2 large and 4 middle-sized cities.

Pacific Northwest, 1 large and 3 middle-sized cities.

<sup>7</sup> The geographic sections used are Northeast (i. e., New England and New York City). East Central, Southeast, West Central, Rocky Mountain, and Pacific Northwest.

*Negro families*

Southeast, 1 large and 2 middle-sized cities.  
New York City and Columbus, Ohio (except for food).

*Combinations of occupations and family types.*—The number of occupational groups differentiated in the tabulation of the data from the expenditure schedules varied with the number of families in the given groups. Data for the six major occupational groups (wage-earner, clerical, independent business, independent professional, salaried business, and salaried professional) were tabulated separately for the white sample in the metropolitan centers. Five occupational groups were differentiated among white families for the large cities, with families in the two self-employed groups pooled; four groups were tabulated for white families in the middle-sized cities by further pooling the two salaried groups; only three groups were differentiated for the small cities, with all business and professional families considered as a unit. In the case of Negro families, the two independent groups and the two salaried groups, respectively, were pooled for Atlanta; families in the four business and professional groups were pooled for New York and Columbus; and only two groups, wage-earner and all other, were differentiated for the Southeastern middle-sized cities.

As noted above, expenditure schedules were obtained from families of seven types in Chicago, the East Central city units (white sample), and Negro families in Atlanta. For these units the sample was selected to be large enough to present data for seven family types separately. In other regions where only five family types were covered and the sample was smaller, averages are presented for only three type groups: type I, types II and III combined, and types IV and V combined.

Three occupational groups were distinguished for the tabulation of the check lists for the white families in the metropolitan, large, and middle-sized cities—namely, wage-earner, clerical, and business and professional. In the small cities only two occupational groups were used—wage-earner and all others.

Expenditures for items of food, clothing, and furnishings and equipment vary so greatly from family to family that it is necessary to use a larger number of cases in obtaining averages for these items than is required when securing averages for family expenditures for broader categories. On account of this the income classes were combined into \$500 and \$1,000 groups in presenting the check-list data.

In order to secure occupational homogeneity within these broader income classes, the income ranges covered in the check-list data are somewhat different from those covered in the data from the main expenditure schedule. (See table on p. 3.) In the tables giving the details on expenditures of white families for food, clothing, and

furnishings and equipment in New York City, Chicago, and the large cities, the clerical group is first represented in the income class, \$1,000-\$1,499; and the business and professional group in the class, \$1,500-\$1,999. No data are presented for white families with incomes less than \$500. In the Negro sample in Atlanta, clerical, business and professional families are first represented in the income class, \$500-\$999.

Family type groups were pooled for all white families as follows: Type I, types II and III, types IV and V, and types VI and VII in those areas where such were eligible.<sup>8</sup>

In the analyses of the data from the clothing check lists for persons other than husbands and wives in each sex-age group, all occupational and family type groups were pooled within each income class in all tabulation units (for both white and Negro families).

Because of the relatively small number of check lists secured from Negro families, all occupational and family type groups were pooled within each income class in the tabulations of the three check lists.

*The weighting process.*—Since the design of the Study called for an equal number of cases in each income-family-type-occupation group, it was necessary to weight the data for each "cell" by its frequency in the total population represented by the survey. That is, in order to secure averages which adequately represent the whole group of families at a given income level, the simple averages for families of a given type within each occupational group were multiplied by the number of eligible families in the given cell. The sum of these products at any income level was then divided by the total number of eligible families at that level to secure the desired averages.

The figures showing percentages of families at successive income levels reporting expenditures for the various items were derived from the simple percentages in each cell. These were then multiplied by the number of eligible families in the given cell; and the resulting products after being totaled for each income class, were divided by the total number of eligible families at the given level. Similar procedures were followed when computing percentages and average expenditures for specified family type groups at each income level. That is, the products described above for each cell were totaled by family type-income groups; and were then divided by the corresponding total number of eligible families.

Two exceptions to the weighting process just described have already been noted in connection with tabulations based on the check lists.<sup>9</sup> The data shown for all Negro families in such tables represent un-

<sup>8</sup> See p. 4 for family types covered in the different cities.

<sup>9</sup> The tables involved are as follows: Tables 4 and 5, vol. II (Bull. No. 648); tables 4, 5, 6, vol. III; and tables 5 and 6, vol. IV.

weighted percentages and averages, that is, since all occupational and family type groups were pooled within an income class (because of the relatively small number of check lists), data for all Negro families are simple percentages and averages at each income level. No weights to give effect to the relative proportions of the family type and occupational groups were applied to the figures. Further, all data pertaining to the details of clothing expenditure for persons other than husbands and wives are unweighted, and are presented as simple percentages or averages. As before, it was necessary to combine all occupational and family type groups because of the relatively small sample.

Except where specifically stated to the contrary, the averages are based on all families in any given group without regard to the proportion reporting expenditures on the specific item concerned. Average expenditures at a given income level for those families which reported an expenditure may be computed by dividing the averages based on all families by the corresponding percentage of families reporting an expenditure for the given item.

Averages are presented whenever three or more families furnished an expenditure schedule, although perhaps only one or two families reported an expenditure for the specific item shown. If, for instance, only two families were covered in a given family type-income group in some city or group of cities for which averages are shown, no average is shown for that family type-income group. (The figures for such families are included in any over-all averages.) If, however, five families were scheduled, but only two of them reported expenditure for meals at school, for example, during the schedule year, data are shown for the average expenditure for meals at school.

To secure an estimate of the expenditure among the eligible families in any tabulation unit for any specified item of expenditure over a wider income range than that presented in these tables, the average amounts, based on all families scheduled at each income level, may be multiplied by the number of eligible families shown at the corresponding income level (table 1). The sum of these products will furnish an estimate of aggregate amounts; and division of this aggregate by the total number of eligible families in the income classes combined will give an estimate of the average amount per family over the new range.

It must be emphasized, however, that these data refer only to the eligible families, that is, the native white or Negro nonrelief families containing both husband and wife, and meeting the other eligibility requirements outlined in the sampling section above and within the income ranges shown on page 3. No data were secured concerning the disbursements of families other than those which met the eligibility requirements set up for the investigation.

## Explanation of Tables in Tabular Summary

Table 1. Number of Families

Table 1 presents the number of families eligible for the expenditure study and the number reporting on expenditures. The data are shown by income class, by family type and income class, and by occupation and income class in the cities covered, as grouped for analysis of the data from the expenditure schedule—16 city groups for white families, and 4 for Negro families.

The “Number of eligible families” as shown in section A was used as the weights when combining the data for the various family types and occupational groups within each income class.<sup>1</sup> Although the size of sample varied in the different communities, the figures in section A are stated in terms of a 100-percent coverage.<sup>2</sup> It is necessary to express the weights on a comparable basis so that combinations of the data may be made by geographic areas or by income groups, if desired.

Section B indicates the number of families reporting on expenditures. As stated in the Introduction those families having no gainfully employed members have not been included in the figures in this section nor in the remainder of the tables in the volume.

Table 1-A. Number of Families

Table 1-A shows for the city groups studied in the tabulation of the check lists the number of families eligible for the expenditure study and the number reporting the details of food consumption at home. In order to show seasonal differences and to clarify inter-regional comparisons the families completing check lists were divided into two groups—those which reported food consumption for one week during the period of May through August, and those which reported during the period September through November. No supplementary schedules were obtained for other seasons. The week covered by the food check list was that immediately preceding the field agent's interview with the homemaker, and since the field collection work of the expenditure survey did not extend over the other months of the year, no data were secured for the period December through April.

<sup>1</sup> See the discussion on sampling in the Introduction, p. 6.

<sup>2</sup> The data for New York City are stated in terms of a 100-percent coverage of families in census tracts in which more than one-third of all the families were native born; these tracts include approximately 82 percent of native families in the city.

The occupational and family type distributions of families completing food check lists are presented in this table.

The numbers of eligible families as shown in the left-hand section of the table were used as the weights when combining the data for the various family type and occupational groups within each income class for the white sample.<sup>3</sup> Although the size of the sample varied in the different communities, the figures in this section are stated in terms of the total number of eligible families in each geographic area, that is, in terms of a 100-percent coverage.<sup>4</sup> It is necessary to express the weights on a comparable basis so that additional combinations of the data may be made by income groups, if desired.

The right-hand section of the table indicates the number of families reporting the details of consumption of food at home for one week.

### Table 2. Adjusted Income and Expenditure

*Adjusted income and expenditure* are shown in table 2 in the same detail as the data on number of families in table 1. Adjusted income, section A, represents money income, nonmoney income from housing, plus the value of food and fuel received without money expenditure.<sup>5</sup> The expenditure figures in section B represent money expenditure plus the value of housing, food, and fuel received without money expenditure; that is, these three items have been considered as part of the value of current family living, the total current expenditure of the family for the year. Data on the value of the clothing, and other items, received without direct money expenditure were not obtained from all families and hence it was impossible to include them in either the income or expenditure figures.

### Table 3. Food

The average value of all family food, average expenditure for food purchased for consumption at home and away from home, and the average value of food received without money expenditure are presented in table 3. In addition, the average expenditure per meal per food expenditure unit is shown. Expenditures for such items as ice cream, candy, soft drinks, beer, and alcoholic beverages are included here. Cod-liver and haliver oils were also considered as food; however, certain nonfood articles which are frequently purchased in grocery stores, such as cleaning supplies, matches, soap, tobacco, and food for pets were excluded from this category. All data in table 3 came from the expenditure schedule.

<sup>3</sup> As mentioned in the Introduction, the data for the Negro families were not weighted.

<sup>4</sup> See footnote 2, p. 14.

<sup>5</sup> Families were classified into income groups according to the amount of their money income plus non-money income from housing. The amount of income received by most city families in terms of food and fuel is very small, and no information on income of this type was secured on the income (family) schedule used with the large random sample.

Expenditures for all food purchased from family funds were recorded whether served to family members, guests, servants, or boarders. However, the amount spent for food served to boarders (derived through the use of the average expense per meal per equivalent adult) was deducted from total expenditure for food at home, so that the figures shown represent net family expense.

A distinction was made between food purchased to be prepared at home, and food purchased and eaten away from home. (See discussion below.)

The data in this table are presented for families of all the types and occupational groups covered, combined at successive income levels, and also for each family type group by income.<sup>6</sup> Averages computed for each income class, and for each family type group within each income class, are based on the total number of families scheduled in that group without regard to the proportion of families reporting an expenditure for a particular item.

*Average value of all family food.*—The value of all family food includes expenditure for all food purchased and value of food received without money expenditure.

*Food at home.*—Food at home included food purchased to be prepared at home, whether eaten at home or away from home. In the latter group were home-prepared lunches for work, school, or picnics. Expenditures for coffee, milk, or other food bought at work or school to supplement the home-prepared lunches were classified with expenditure for food away from home.

Food purchased to be prepared in a vacation home occupied by the family was considered as expense for food at home.

As mentioned above, the figures shown here represent net family expense for food at home as the amounts spent for food served to boarders was deducted from total expenses for food.

*Food away from home.*—Expenditures for food away from home represent amounts spent for the following items: Meals at work and at school (except food carried from home), including board at school; meals while traveling or on vacation (except food prepared in a vacation home), and meals purchased on a business trip for which there was no reimbursement by an employer; other meals eaten out; and ice cream, candy, soft drinks, and alcoholic beverages consumed away from home.

Expense for food away from home necessarily included in many cases expense for service and entertainment as well as food costs proper.

*Average value of food home-produced or received without money expense.*—A value was placed on food which was raised for family consumption or given to the family as a gift or in lieu of cash pay-

<sup>6</sup> See p. 3 for statement of family types covered for each tabulation unit.

ment for services. All such food was evaluated at the retail price prevailing in the community. No deductions from the evaluation of home-produced food were made for the cost of seeds and implements or for the value or cost of labor. If members of the family received a substantial number of free meals as guests in excess of the number of meals furnished to guests (not counting house guests, since they were treated as members of the household though not of the economic family, for the period of their stay), the value of meals so received in excess of those furnished was tabulated.

An evaluation was made of meals which were furnished to members of the family without charge by the employer or paid for from expense accounts. Persons obtaining such food include salesmen reimbursed for meals taken while traveling, students working for their board at school, and restaurant and hotel workers who received meals as part of their pay.

Likewise, if the owner of a store or an employee brought home food, which he received at his place of business without money payment, such food was evaluated at local retail prices and included in the total value of food received without direct money expense. However, if the store proprietor charged himself for food which he brought home regularly for family consumption, the retail value of such food was added to his money earnings and the goods were entered as purchases in the subsection for food at home.

*Average money expenditure per meal per food expenditure unit.*—In recognition of the variations in quantity, and thus in expense, of food consumption among persons of different ages, the following scale of relative requirements for various persons served from the family food supply was adopted:<sup>7</sup>

<i>Age of person</i>	<i>Relative food expense</i>
20 years of age and over.....	1. 0
13 to 19 years.....	1. 1
6 to 12 years.....	. 9
Under 6 years.....	. 6

These relatives were applied whether the person was a member of the economic family or a boarder, guest, or domestic servant. The relative factor applied to nurses for the sick was 0.9. The term "equivalent adult" is used as representing one food expenditure unit.

It was assumed that 21 meals per week were eaten by each member of the economic family during that portion of the report year spent at home. For other members of the household (boarders, house guests, household help, and nurses) the actual number of meals eaten was ascertained. The average expenditure per meal per equivalent

<sup>7</sup> This scale of food relatives was developed from data secured from the Bureau of Home Economics of the Department of Agriculture, which furnished information on standard food allowances, based on actual food expense records, differentiated by age, sex, and activity.

person was derived by dividing the total family food expense (after subtraction of expense for food eaten while traveling or on vacation) by the total number of equivalent person meals.

In order to determine the expense for meals served to boarders, the average expenditure per meal per food expenditure unit was multiplied by the total number of meals served to boarders; the resulting sum was deducted from the total family expense for food at home.

#### Tables 4 and 5. Weekly Consumption of Food at Home

Tables 4 and 5 present data from the food check lists. The food check list afforded a means of determining and recording the quantity and money value of foods used during the 7 days preceding the day on which the check list was filled in. Total consumption of food prepared at home (whether purchased, home-produced, or received as gift or pay; and whether eaten at home or away from home) was included; that is, food served guests, boarders, and household help, as well as that eaten by members of the economic family. The number of families supplying food check lists is shown in table 1-A.

Depending on the date of interview, the check lists were divided into two groups—those covering 1 week during the period May through August and those prepared during September, October, and November. It would have been desirable to have obtained food check lists for other months, but the field collection work of these schedules did not extend over the other months.

*Money value.*—The expense for, or money value of, food consumed during the week covered by the check list was calculated for each family from the quantity used and the unit price or value.<sup>8</sup> If more than one purchase of a particular item was made at different prices, each price was reported.

The price for each item of food consumed was entered in terms of the unit in which the food was ordinarily purchased. In the case of a special group price, the entry was as follows:

Item	Quantity used last 7 days	Price or value per unit	Money value or expense
Evaporated milk.....	5 14½-oz. cans.....	3 cans for \$0.17.....	\$0.28

The price of home-canned food which was eaten during the week was estimated in the editing process, on the basis of ingredients used. The money value of food home-produced or received as gift or pay was determined by the editors by reference to local retail prices.

<sup>8</sup> See Introduction for discussion of weighting process.

No tabulations have been made showing distribution of foods consumed by unit prices paid. The average money value per unit of quantity can be computed for items in which "Average quantity consumed" is shown in table 5. The average money value of food consumed during the week as entered in section B should be divided by the "Average quantity consumed."

*Quantity consumed.*—The amount of each item of food used by the family during the seven days covered by the check list was recorded. "Used" was interpreted to mean eaten or thrown away as waste or spoiled food. Food prepared but not eaten during the period covered was not included. For example, the ingredients of a cake baked the last day of the period and not eaten were not reported as consumed. If, however, half of the cake was eaten during the period, half of the ingredients were reported as consumed. Food canned at home was not considered as used until it was eaten.

Neither food prepared to give away, as for church suppers, nor food purchased especially for pets, was included as part of the food consumption of the family. The first was recorded under contributions to religious organizations and the second under "Pets" in the recreation section. If, on the other hand, pets were fed left-overs from the table, this food was necessarily included.

The quantity of each item of food used was entered on the schedule in terms of the unit in which the food was ordinarily purchased—pound, can, or dozen. The consumption of certain types of food, however, as sugar, flour, and cereals, could be more easily estimated in terms of some other unit of measure than the one in which the food was purchased. In such cases, consumption was reported in terms of standard measuring cups, and the price or value was reported in terms of the unit in which purchase was made. The money value of consumption was then calculated as part of the editing process.

Some articles, such as salt and spices, were used in such small quantities that it was not practical to report quantities.

Whenever it was known, the weight of the unit of customary purchase was recorded. This applied to such units as loaves of bread and cans of peaches. Home-canned food was entered under canned food when used, and the quantity was estimated in pints or quarts.

In order to tabulate the data in terms of quantity consumed, a unit of measure was adopted for each item. This unit was the one most frequently reported in each case. When a family had reported consumption in other units, conversion was made into the standard unit by means of a conversion table. Quantities of tea consumed, for instance, were tabulated in terms of an 8-ounce package. If the family reported purchase in terms of a pound package, the quantity consumed was converted, in the editing process, to fractions of an 8-ounce package.

Although a check list was not accepted for tabulation unless the family reported the total expense or value, during the week covered, for each item, it was accepted if quantity consumed was not reported. Figures in table 5 on average quantities consumed are therefore based on the assumption that the quantity consumed by the families which reported value but not quantity was the same as the average quantity consumed by the families in the same cell which did report quantity.

**Table 4. Summary of Weekly Consumption of Food at Home**

Table 4 constitutes a summary of the material in the food check lists for the two seasons showing for 29 types of food in 6 major groups the percentage of families reporting consumption and the average money value of food consumed. Data are presented for all families at successive income levels with family type and occupational groups combined. Averages are based on all families in the income class completing food check lists, without regard to the proportion reporting consumption of a particular food. The average value of the food consumed during a week by families reporting consumption may be computed by dividing the average presented in the table for all families by the corresponding percentage of families reporting consumption.

It should be pointed out that the percentages shown in the "Total" columns do not represent an arithmetic sum of the percentages of the subgroups, but rather the percentage of families reporting consumption during 1 week of one or more of the items in the group.

The food items included under each group shown in this summary are presented in table 5, and so it is unnecessary to make detailed explanations of such items here.

**Table 5. Weekly Consumption of Food at Home**

Information secured from the food check lists on the consumption of 167 food items is presented in table 5. The percentage of families reporting consumption, the average money value of food consumed, and, for many items, the average quantity consumed during 1 week are shown for families at successive income levels with family type and occupational groups combined.<sup>9</sup>

Averages have been computed at each income level for all families furnishing food check lists whether or not all families reported consumption of a given item. Average money value of food consumed and the average quantity consumed may be determined for those families which reported consumption by dividing the average figures shown in sections B and C for all families by the corresponding percentages in section A.

<sup>9</sup> Family type and occupational groups were pooled in each income class when preparing the tables for Negro families in the Southeast region.

As stated in the general discussion of the food check list, the average money value per unit of quantity of food consumed can be computed by dividing the figures in section B, "Average money value of food consumed," by the corresponding data in section C, "Average quantity consumed." (Average quantities consumed have not been computed for those items in which it was impossible to express the unit in terms of a common factor.)

As in table 4 the percentages shown in the "Total" columns of section A are not arithmetic sums of the percentages for the specific items, but rather represent the proportion of families reporting consumption of any one or more of the items in the section.

The following items in this table need further explanation:

*Beef, other.*—Other beef included such beef parts as hearts, kidneys, tongues, and tripe.

*Veal, other.*—Other veal included such veal parts as sweetbreads, hearts, kidneys, calves' liver, and tongues.

*Mutton and lamb, other.*—Other mutton and lamb included such parts as kidneys, liver, and loin.

*Fresh pork, other.*—Other fresh pork included fresh hams, shoulder, fresh pigs' feet, spareribs, and pigs' liver.

*Smoked or cured pork, other.*—Other smoked or cured pork included spiced pork and such parts as "Canadian bacon," smoked butts, pickled hearts, and pickled feet.

*Other meats, other.*—Game was included here; also parts such as tongue and sweetbreads when it was not known whether they were beef, veal, lamb, or pork.

*Sea food.*—Frozen fish and eel were entered as fresh fish. Cured fish included smoked herring and salmon, finnan haddie, snails, turtles, etc. Other sea food included oysters, clams, shrimp, etc., and was classified as to fresh or frozen, and canned.

*Fresh vegetables, other.*—Fresh vegetables as brussels sprouts, cauliflower, broccoli, corn, cucumbers, eggplants, endive, lima beans, parsnips, peppers, radishes, and squash were included here.

*Canned vegetables, other.*—Canned beets, hominy, pumpkin, sauerkraut, lima beans, spinach, succotash, etc., were included here.

*Dried vegetables, other.*—Dried corn and beans (not navy or lima) were included in this item.

*Fresh fruit, other.*—Other fresh fruit included pineapples, apricots, cherries, grapes, plums, avocados, rhubarb, etc.

*Canned fruit, other.*—Such canned fruits as grapefruit, cherries, plums, fruit salad, etc., were considered under this item.

*Dried fruits, other.*—Dates, figs, shredded cocoanut, and citron, were classified here.

*Baked goods.*—Home-made bread and cakes were accounted for under the various ingredients, flour, milk, etc. White bread included

cracked wheat and any bread containing less than 50 percent whole wheat flour. Such items as rolls, cookies, pastry, and doughnuts, which were purchased were considered as other baked goods.

*Flour, cereals, and other grain products, other.*—Such grain products as popcorn, and prepared cake, biscuit, and pancake flour were included here.

*Miscellaneous foods.*—The money value of baking powder, soda, yeast, salt, vinegar, spices, and extracts for which no break-down was recorded has been included in the average money value shown for "Total miscellaneous foods." Miscellaneous canned foods included such items as mince meat, chicken and noodles, and canned corned beef hash. Other miscellaneous foods included proprietary foods and cooked foods not elsewhere specified, such as baked beans in bulk, and salads.

## Appendix A

### Classifications and Definitions of Terms—Glossary

The following glossary of terms is limited to those classifications and definitions needing general explanation for the tabular material on the detail of expenditures. Specific notes pertaining to individual items appear in the section of this volume "Explanation of Tables." Items appearing on the expenditure schedule which are not discussed in the present volume are omitted from the glossary.

Any system of classifying goods and services necessarily has certain limitations and may not meet the needs of all groups or agencies which utilize the data. The classification adopted for the Study of Consumer Purchases is in substance one that has been found useful in other studies and which thus has the advantage of yielding comparable data. Since the uses to which specific goods may be put by consumers vary considerably from family to family and even within the family circle, depending upon a multiplicity of factors, the decisions to classify commodities in one category rather than another were necessarily arbitrary. The classifications determined upon have, however, been applied consistently throughout the tabulations.

Specific definitions of terms should be prefaced by the explanation that, whenever a sales tax was enforced in a particular community during the period covered by the Study, the estimated total amount of sales tax paid for each taxable item appearing on the schedule was added to the total expense for the item.

*Family.*—For purposes of the Study of Consumer Purchases, an economic family was defined as a group of persons belonging to the same household and dependent upon a common income.<sup>1</sup> Expenditure data were secured only from families including both a husband and a wife.

*Family type.*—Families were classified, according to the number and age of members, in one of seven types, as follows: <sup>2</sup>

---

<sup>1</sup> For more detailed definition, see vol. I, glossary, Bull. Nos. 642 to 647 and 649.

<sup>2</sup> See pictogram of family types, p. 5.

<i>Family type</i>	<i>Composition</i>
I	Husband and wife (families of 2 persons).
II	Husband and wife, and one child under 16 years (families of 3 persons).
III	Husband and wife, and 2 children under 16 years (families of 4 persons).
IV	Husband, wife, and person 16 years or over, and one or no other person, regardless of age (families of 3 or 4 persons).
V	Husband, wife, one child under 16 years, one person 16 years or over, and one or 2 other persons, regardless of age (families of 5 or 6 persons).
VI	Husband, wife, and 3 or 4 children under 16 years (families of 5 or 6 persons).
VII	Husband, wife, one child under 16 years, and 4 or 5 other persons, regardless of age (families of 7 or 8 persons).

The above family types are based upon the equivalent number of persons under 16 years of age and the equivalent number 16 years or over in the economic family during the year. By the use of a conversion table the number of weeks of membership of persons in the economic family for only a portion of the schedule year is expressed in terms of equivalent members. If the economic family contained in addition to the married couple, only one person who was a member for 26 weeks or less, he was not regarded as an equivalent member; had he been in the family for 27 weeks he would have been classified as one equivalent member. If two persons, both of whom were under 16 years, were members of the economic family for a total of from 27 weeks through 78 weeks, together they counted as one equivalent member; had there been members for a total of from 79 through 130 weeks, they would have been counted as two equivalent members. The same method of computation applied to persons 16 and over. If, however, the family contained one person 16 years of age or over and one child under 16 years, each for less than 27 weeks, neither would be counted as a member of the economic family, although the period of membership for the two together equalled more than 26 weeks.

*Occupational group.*—Families were also classified in one of seven occupational groups: wage earner, clerical, independent business, independent professional, salaried business, salaried professional, and families with no gainfully employed members.<sup>3</sup> In general, the wage earner classification included all types of skilled, semiskilled, and unskilled manual jobs which are usually paid by the hour, day, or week, rather than on monthly or annual salary basis. In the clerical classification were grouped store clerks and salesmen working for others, as well as office workers. Professional, semiprofessional, and

<sup>3</sup> The occupational categories are based upon the Works Progress Administration's Manual of Work Division Procedure, sec. 2, Occupational Classification (June 1935); and Index of Occupations, Circ. No. 2A (September 1935).

technical workers were included in the independent professional group when employed on their own account, and in the salaried professional group when they were employed by others on a salary basis. Persons classified in the independent business group were entrepreneurs owning and operating businesses of any type. Also classified in the independent business category were families which derived the major portion of their earned income from roomers and boarders. The salaried business category consisted mainly of salaried managers and officials; chief officers of corporations who drew salaries, as well as minor executives, were thus classified in the salaried business groups, even though some owned controlling interest in the business. The seventh category consisted of families that had no earnings from an occupation.<sup>4</sup>

The occupational classification of a family was determined by the occupational group from which it derived the major portion of its earnings during the report year, whether that portion was contributed by one or more family members.<sup>5</sup>

*Income.*—The total income by which the family was classified included money income (derived from earnings and other sources such as interest, dividends, pensions, etc.), and in addition, non-money income from housing (for owners, the difference between rental value of the home and current expense for interest, repairs, taxes, and the like; for renters, the value of rent received as gift of pay).

To arrive at the figure for earnings from gainful occupations of family members (wages, salaries, profits, and other withdrawals from business for family use, tips, commissions, and bonuses), occupational expenses were deducted. Similarly, the figures for earned income not attributable to individual members (i. e., income and family enterprises such as the keeping of roomers and boarders, or casual work in the home) represented net rather than gross income from such sources. Items classified as nonearned money income were: Interest and dividends; net rents from property; pensions, annuities and benefits; gifts in cash, etc.<sup>6</sup>

Adjusted family income, presented in table 2 of the Tabular Summary, consists of total income plus the value of food and fuel obtained without money expense.

*Expenditures.*—Money expenditures include all money expenses incurred during the report year for current family living, whether or

---

<sup>4</sup> The expenditures of families with no gainfully employed members were excluded from the tabulations shown in this volume. A special study of the expenditure of these families was made for Chicago, for Columbus white families, and for families in the East Central middle-sized cities. For this material, see vol. II of Bull. Nos. 642 and 644.

<sup>5</sup> For more detailed statement, see vol. I, glossary, Bull. Nos. 642, to 647 and 649.

<sup>6</sup> For more detailed statement of the components of income as used in the Study, see vol. I, glossary, Bull. Nos. 642 to 647 and 649.

not the full amount was paid during the year.<sup>7</sup> Balances remaining unpaid at the end of the year were considered as increases in liabilities. Total expenditures include money expenditures and the value of housing, food, and fuel obtained without money expense. All categories except housing, food, and fuel are therefore represented only by money expenditures. Total expenditures are thus synonymous with "Money value of current family living", defined below.

*Value of family living.*—The money value of current family living consisted of money expenditures for current living, and the value of housing, food, and fuel obtained without money expense. The value of housing included the imputed net income from owned family and vacation homes and the rental value of housing received as gift or pay.

*Nonmoney income from housing.*—An attempt was made to evaluate all housing received without money expense, whether in the form of rent as pay or gift, or of imputed income from an owned home.

If a family received any rent as part of wages or salary, as in the case of a minister, a resident manager, or a janitor, the estimated monthly rental value was multiplied by the number of months such premises were occupied, and the resulting amount was included as a part of the family's income. If a family occupied rent free during any part of the schedule year, a home that was owned by a relative or friend, the rental value was estimated for the period, and from it was subtracted any housing expenses incurred by the family in connection with such occupancy. The net figure was then added to the family's income. Housing furnished to individual family members while away from home, whether as gift or in return for services, was not included in nonmoney income from housing, which relates solely to housing that served the entire family.

Much more important, on the average, than rent as pay or gift, was imputed income from owned home. If a family during any part of the schedule year occupied a home owned by a member of the family the rental value of this home was estimated (on the basis of rental rates on equivalent quarters) for the period of occupancy. From this sum were deducted all expenses incurred for the home, for interest on a mortgage, repairs, taxes, special assessments, and premiums for insurance, during the period of occupancy. The remaining amount was considered as imputed income from housing, and included as a nonmoney part of the family's total income. If the expenses were greater than the estimated rental value, the family was considered to have had a negative income from housing.

This procedure applied to either a family home or an owned vacation home. The net effect was to place many home owners in a higher

---

<sup>7</sup> This was not true in the case of a few items such as fire-insurance premiums on owned homes and contributions to the Community Chest. For these items only the amounts paid during the year were classed as expenditures.

income class (\$250 intervals) than they would have been classified on the basis of money incomes alone.

*Surplus or deficit.*—The difference between the family's total money income for the year and its total money expenditure was, if a positive sum, a surplus, or, if a negative sum, a deficit. This surplus or deficit was accounted for by one or more of a series of changes in assets and liabilities, described below.

*Receipts.*—The term "receipts" has been used to designate current money income plus funds made available through liquidation of assets or through credit.

*Disbursements.*—The term "disbursements" has been used to designate money expenditures for current family living plus money used to decrease debts incurred before the beginning of the report year or to increase assets.

*Balancing difference.*—Due to the difficulty experienced by families, few of which kept detailed records, in accounting in toto for receipts and disbursements, a margin of tolerance was set up for discrepancies between the two. If the difference amounted to less than 5.5 percent of receipts or disbursements, whichever was larger, the schedule was tabulated, this amount being carried as a balancing difference. If the discrepancy was 5.5 percent or larger, the schedule was discarded. In cases where disbursements exceeded receipts, as accounted for by the family, the balancing difference was negative; if receipts exceeded disbursements, the difference was positive.

### Communities Included by the Bureau of Home Economics in the Study of Consumer Purchases

A parallel study was conducted by the Bureau of Home Economics of the United States Department of Agriculture which, together with the study made by the Bureau of Labor Statistics, constitutes the Study of Consumer Purchases. The communities in which the families were visited by the agents of the Bureau of Home Economics and the Bureau of Labor Statistics respectively are listed in Bulletin 649, volume I, page 297. For consistency in analysis of expenditure data, schedules for all small cities in a given region were analyzed by one or the other Bureau, irrespective of which Bureau had gathered the data. Thus the Bureau of Home Economics analyzed all expenditure data for small cities in the Southeast and the West Central-Rocky Mountain Region. The Bureau of Labor Statistics analyzed all data for small cities in New England.

*Communities included by Bureau of Home Economics in the analyses of family expenditures*

Region	Small cities	Villages	Farm counties
New England.....		6 in Vermont.....	2 in Vermont. .
Central.....	Mount Vernon, Ohio.....	8 in Massachusetts.	2 in New Jersey.
	New Philadelphia, Ohio.....	7 in Pennsylvania.....	1 in Pennsylvania.
	Beaver Dam, Wis.	6 in Ohio.	3 in Ohio.
	Lincoln, Ill.	8 in Michigan.	1 in Michigan.
	Boone, Iowa.	6 in Wisconsin.	1 in Wisconsin.
	Moberly, Mo.	8 in Illinois.	4 in Illinois.
	Columbia, Mo.	11 in Iowa.	5 in Iowa.
Mountain and Plains.....	Dodge City, Kans.....	6 in Kansas.	4 in Kansas.
	Greeley, Colo.	9 in North Dakota.	4 in North Dakota.
	Logan, Utah.	4 in Colorado.	3 in Colorado.
	Provo, Utah.	1 in Montana.	1 in Montana.
	Billings, Mont.	2 in South Dakota.	1 in South Dakota.
Pacific.....	Astoria, Oreg.....	12 in California.	1 in central California.
	Eugene, Oreg.	5 in Oregon.	2 in southern California.
	Klamath Falls, Oreg.	7 in Washington.	5 in Oregon.
	Olympia, Wash.		1 in Washington.
Southeast:			
White and Negro families.	Albany, Ga.....	8 in Georgia.....	2 in North Carolina.
	Gastonia, N. C.	7 in South Carolina.	2 in Mississippi.
	Griffin, Ga.	8 in North Carolina.	2 in South Carolina.
	Sumter, S. C.	10 in Mississippi.	7 in Georgia.
White families.....			2 in North Carolina.
			4 in South Carolina.
			1 in Georgia.
			2 in Mississippi.
Negro families only.....		1 in Mississippi.	

## Appendix C

### Cities included by Bureau of Labor statistics in the study of money disbursements of wage earners and clerical workers

An investigation of the income and money disbursements of families of wage earners and clerical workers was undertaken by the Bureau of Labor Statistics in the fall of 1934 for the purpose of revising the cost-of-living index published currently by the Bureau. The data from that investigation cover 1 year within the period 1934-36 and include details on income, family composition, expenditures for principal categories, and for detailed items of consumption for a total sample of 14,668 families of employed wage earners and lower-salaried clerical workers in 42 cities, all with population over 50,000. Data on quantities of food, clothing, and furnishings and equipment purchased; on types of medical care received; and on changes in assets and liabilities are also included. A summary of these findings is presented in United States Bureau of Labor Statistics Bulletin No. 638.

The individual cities for which data are available and the bulletins in which the detailed data appear are as follows:

*North Atlantic Region, New York City* (B. L. S. Bull. 637, vol. 1): White and Negro families.

*North Atlantic Region, Eleven Cities* (B. L. S. Bull. 637, Vol. II):

Boston, Mass.	Pittsburgh, Pa. (white and Negro families).
Buffalo, N. Y.	Portland, Maine.
Johnstown, Pa.	Rochester, N. Y.
Lancaster, Pa.	Scranton, Pa.
Manchester, N. H.	Springfield, Mass.
Philadelphia, Pa. (white and Negro families).	

*East North Central Region*, (B. L. S. Bull. 636):

Cincinnati, Ohio (white and Negro families).	Grand Rapids, Mich.
Cleveland, Ohio	Indianapolis, Ind. (white and Negro families).
Columbus, Ohio	Lansing, Mich.
Detroit, Mich.	Milwaukee, Wis.

*West North Central and Mountain Region* (B. L. S. Bull. 641):

Denver, Colo.	Minneapolis and St. Paul, Minn.
Kansas City, Mo. and Kansas City, Kans. (white and Negro families).	St. Louis, Mo. (white and Negro families).
	Salt Lake City, Utah.

*Southern Region* (B. L. S. Bull. 640):

Baltimore, Md. (white and Negro families).  
 Birmingham, Ala. (white and Negro families).  
 Dallas, Tex.  
 Houston, Tex. (white other than Mexican and Mexican families).  
 Jackson, Miss. (white and Negro families).  
 Jacksonville, Fla.  
 Louisville, Ky. (white and Negro families).

Memphis, Tenn. (white and Negro families).  
 Mobile, Ala. (white and Negro families).  
 New Orleans, La. (white and Negro families.)  
 Norfolk and Portsmouth, Va. (white and Negro families).  
 Richmond, Va. (white and Negro families).

*Pacific Region* (B. L. S. Bull. 639):

Los Angeles, Calif. (white other than Mexican and Mexican families).  
 Sacramento, Calif.

San Diego, Calif.  
 San Francisco, Calif.  
 Seattle, Wash.
