PREFACE

The present report on expenditures for clothing and personal care embodies the findings relating to these categories of expenditure that were obtained by the United States Bureau of Labor Statistics in the Study of Consumer Purchases. This study was conducted in 1936 by the Bureau of Labor Statistics in cities in selected size ranges located in different geographic regions of the country. It was paralleled by a study of small-city, village, and farm families conducted by the Bureau of Home Economics of the United States Department of Agriculture. Both surveys, which together form the Study of Consumer Purchases, were administered under a grant of funds from the Works Progress Administration. Cooperating in the planning and technical direction of this Nation-wide study were the National Resources Committee and the Central Statistical Board. The plans for the project were developed and its administration coordinated by a technical committee composed of representatives of the following agencies: National Resources Committee, Hildegarde Kneeland, chairman; Bureau of Labor Statistics, Faith M. Williams; Bureau of Home Economics, Day Monroe; Works Progress Administration, Milton Forster; and Central Statistical Board, Samuel J. Dennis.

The volume on expenditures for clothing and personal care is one of a number of special commodity and service bulletins prepared by the Bureau of Labor Statistics from data obtained in that investigation. The results of this study are presented in three series of reports, of which the present constitutes a part of the third. The first series was concerned with an analysis of the distribution by income class, occupation, family type, nativity, and home tenure, of families studied in selected communities in different parts of the country. Each volume in that series pertained to a specific geographic region. The second series comprised reports for the same regions on the size and relative importance of expenditures for the main categories of family living, with only incidental reference to the constituent items in those categories. The third series presents the detailed data collected in all regions covered by the Study for each of the more important of these categories. The volumes of the third series contain detailed tabular material for each category or group of categories, together with a description and analysis of the findings on clothing and personal care (vol. III).

The analysis of expenditures for clothing and personal care presented in this report, therefore, is based on reports from all communities for

Federal Reserve Bank of St. Louis

which the Bureau of Labor Statistics published expenditure summary data in its series of regional reports, embodied in volumes II of Bulletins No. 642–647 and 649. Accordingly, it undertakes to generalize the detailed information on expenditures for these consumption categories, insofar as uniformities appear in the data for different communities, and to point out differences whenever such differences appear to be present.

Attention is directed to the fact, explained more fully in part II, pp. 538–541, that expenditure data from the Study of Consumer Purchases do not represent all families in the communities studied, but only those meeting certain qualifications. The most important of these requirements limited the expenditure study to families that included a husband and wife, both native white (except in selected cities where Negro families also were studied), and that had received no relief during the year. These qualifications were imposed in order to eliminate as far as possible factors of economic stress, broken family ties, and alien customs, which might tend to obscure the analysis of family consumption in terms of the basic controls established for the Study. Other requirements were concerned with family composition, occupational status, length of residence in the community, and several other minor circumstances.

In considering the material presented in the following report, therefore, it should be borne in mind that the data do not represent the groups in these communities that, on the whole, occupied the least favorable economic positions. The fact that families receiving relief, those in which husband or wife, or both, were foreign born, and the broken families (those that did not include both husband and wife) generally had smaller incomes, was shown in the first series of reports from this study, which dealt with family income.

In view of the fact that a number of persons outside the Bureau's regular staff took part in the investigation, the Bureau of Labor Statistics wishes to acknowledge the services of the following persons who served as regional or metropolitan directors of field work: Ruth Ayres, LeRoy E. Clements, Rachel S. Gallagher, Forest R. Hall, Sybil Loughead, Glenn W. Sutton, Margaret D. Thompson, Georges M. Weber, and Erika Hartmann Wulff.

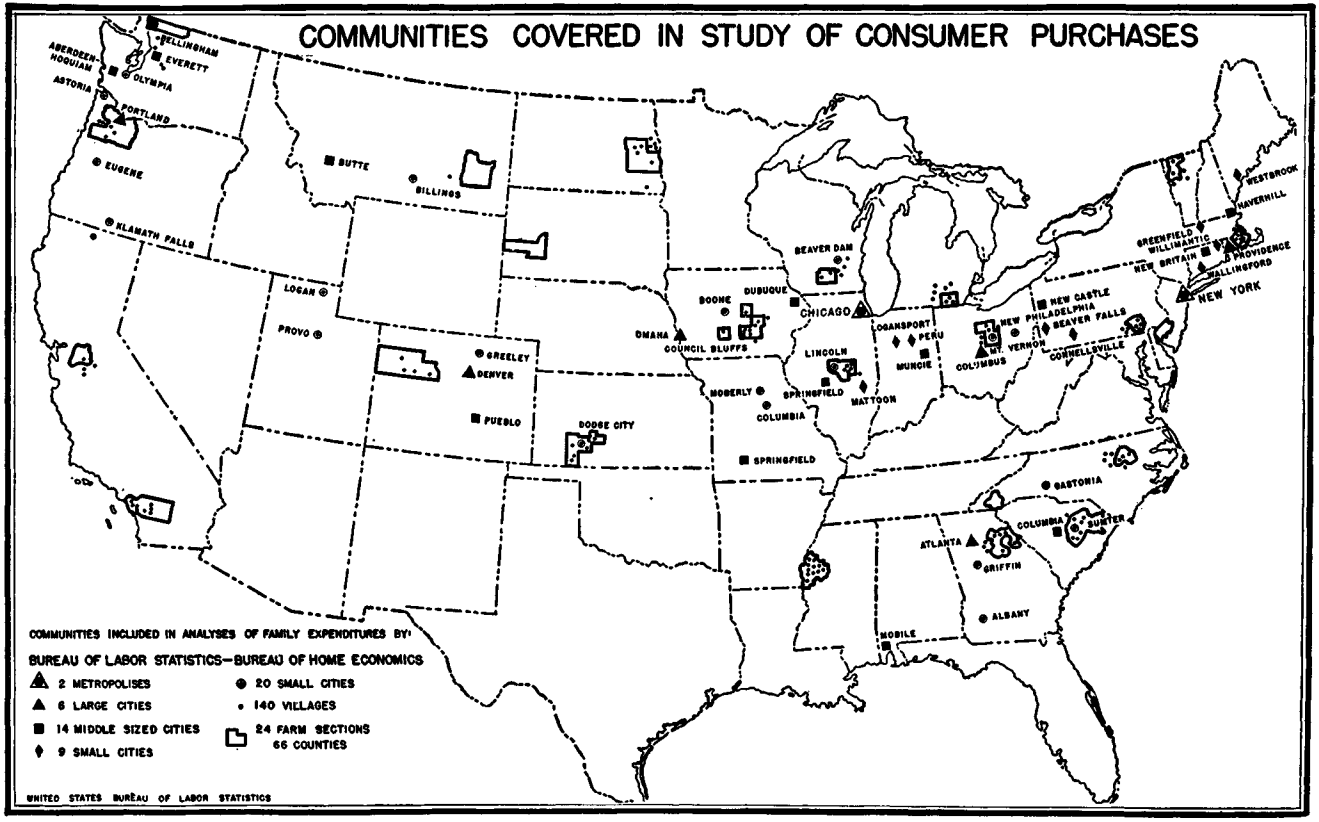

Acknowledgment is also made to Frances W. Valentine, Jesse R. Wood, Jr., and William Loudon, who were in charge of computation and tables; Joseph A. Smith, in charge of machine tabulation; Dorothy McCamman, who served as chief check editor; Frank Strohkarck, Marie Bloch, Ethel Cauman, Verna Mae Feuerhelm, Lenore A. Epstein, Trusten P. Lee, Mary Wiatt Chace, and Allan M. Winsor, who were in charge of editing and reviewing.

ISADOR LUBIN,
Commissioner of Labor Statistics.

Family Expenditure In Selected Cities, 1935-36

CLOTHING AND PERSONAL CARE

Chapter I

Family Expenditures for Clothing

While clothing constitutes one of the basic essentials in family living, the provision of adequate clothing for the population does not represent the same kind of urgency as the provision of food and shelter. Nevertheless, current conventions, as well as the more fundamental requirements for protection against cold and other adverse weather conditions, impose minima for persons who undertake to live normally with respect to present-day patterns of community living in the groups in which they find themselves. Such minima are, of course, not standardized for the population as a whole. They vary with community, with climate, and with socio-economic status. To some extent, likewise, even subjective differences involve variations in these minimum requirements.

Clothing represents a category of consumption for which expenditures may be more sharply contracted or expanded in any given year to meet particular circumstances than can expenditures for almost any other essential. A considerable part of this flexibility clearly arises from the fact that most articles of clothing are fairly durable, and that families are equipped with smaller or larger stocks of clothing that may be made to suffice for most needs if other demands on spendable funds are sufficiently pressing. Much more than in the case of food, or even housing, therefore, the level of expenditures for clothing accommodates itself to the current family situation with respect both to income and to requirements other than clothing, including such as those arising out of serious illness or other events involving unavoidable expenditures above the usual level.

Apart from these factors introducing variation in clothing expenditures there is also the element of tastes and habits which are reflected in wide differences among families [1] of the same composition at the

[1] In classifying families according to income in the Study of Consumer Purchases a definition of income was adopted that included not only net money income received during the year, but also the net money value of the occupancy of owned homes and the money value of rent received as a gift or as part of pay. (See pt. II, glossary.)

http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

same income level in the amount spent for clothing. Perhaps in no other main category of consumption is there wider latitude for choice both in the number and kind of articles to be bought, and in their unit price. Individual standards of style and appearance vary widely, notwithstanding the leveling influence of advertising and the pressure to conform that is particularly evident in urban communities.

In spite of these factors, and others, that introduce wide variations in the level of spending for clothing among families that are at the same income level and similar in a number of other respects, the data collected in the Study of Consumer Purchases indicate rather clear tendencies toward expenditure patterns of surprising uniformity in widely separated communities. It is with these patterns, based on averages for groups that are homogeneous in certain important respects, that the present report will be chiefly concerned. Nevertheless, it is desirable before proceeding to a discussion of these averages to give some consideration to the extent of the variations in expenditures for clothing which are concealed in these averages.

Variations in Clothing Expenditures

As a basis for a consideration of the variations in clothing expenditures, families in a few selected communities were classified by the amount spent for clothing during the year. The data for Chicago, Atlanta, and the Pacific Northwest middle-sized cities are presented in table 1.[2]

The present study indicates that variation in expenditures for clothing among families at the same income level appears all along the income range, but is relatively somewhat greater in the lower and intermediate income classes than at the top of the income scale. In Chicago, for example, one-sixth of the families with incomes of $500 to $1,000 spent less than $25 for the clothing of the entire family during the year, while more than 1 in 20 spent in excess of $150. Among those with incomes of $4,000 or over, none spent less than $100, and fewer than 20 percent reported clothing expenditures under $250. In the highest income class studied in Chicago ($7,500 and over), where average income was approximately $12,000, nearly 96 percent of the families devoted $500 or more to clothing, and none used less than $300 in this way. (See table 1.)[3]

[2] See footnote to table 1 for definitions of the several types of families used as a basis for classification of families in the Study of Consumer Purchases. See also Appendix A, on Scope and Method of this study.

[3] In considering the variation in clothing expenditures along the income range it is important to keep in mind the proportion of families represented by any given income class. For this reason there are presented in appendix A figures showing the median income and the percentage distribution by income of families that were eligible for the expenditure schedule in each city and group of cities for which expenditure schedule data are presented. Considering all families in these communities, however, the median income falls much lower in each city than does the median for eligible families. (See vol. I of Bulletins Nos. 642–647 and 649 for income material in the communities included in the Urban Series of the Consumer Purchases Study.)

[1] The 7 family types are distinguished on the basis of the number and age of members other than husband and wife, as follows:

I No other persons (families of 2 persons).
II 1 child under 16 (families of 3 persons).
III 2 children under 16 (families of 4 persons).
IV 1 person 16 or over and 1 or no other person, regardless of age (families of 3 or 4 persons).
V 1 child under 16, 1 person 16 or more, and 1 or 2 others, regardless of age (families of 5 or 6 persons).
VI 3 or 4 children under 16 (families of 5 or 6 persons).
VII 1 child under 16, and 4 or 5 others, regardless of age (families of 7 or 8 persons).

A comparison of the data for Chicago with those for Atlanta white families and those for families in the Pacific Northwest middle-sized cities reveals a fairly close similarity among these communities in the distribution of families by amounts spent for clothing at any given income level. There was some tendency in the lower part of the income scale for a greater proportion of Chicago families to report expenditures under $75 than was the case in the other communities. This difference is reflected in somewhat larger average expenditures for clothing by families at those income levels in Atlanta and the Pacific Northwest cities. In the highest income classes, on the other hand, there was greater concentration of Chicago families in the groups spending above $500 for clothing than there was in the less highly urbanized communities. This suggests a tendency, in line with common observation, for greater extremes in the level of spending for clothes in metropolitan centers, where relatively high food and housing costs restrict the clothing allowances of the lower income groups, while at the upper income levels there is likely to be more occasion for luxury expenditures in clothing than in cities of moderate size.

Variations in expenditures for clothing differ among families of different composition, because of the varying incidence of family needs. The manner in which this occurs may be illustrated from among Chicago families with incomes of $4,000 to $4,999. Families consisting of husband and wife (type I) [4] at this income level are relatively well off. More than one-quarter of them spent over $500 for clothing, while some few spent less than $150. Families with 3 or 4 children under 16 (type VI) could not afford such a range. They were too well off to try to dress in any year for as little as $150; as a matter of fact, none of the families surveyed spent less than $250. On the other hand, competing demands for food and other needs would presumably prevent such families from attempts to appear better than "well dressed." Fewer than one-tenth spent as much as $500, while three-quarters spent $300 to $500. In other words, especially in income ranges which allow families to meet basic needs but require strict economy in the apportionment of funds for higher standards, the patterning of clothing expenditures is quite pronounced.

In spite of the wide range in expenditures for clothing at the different income levels, there was also considerable concentration of families within a small part of the range for each income class. Half of the white families with incomes of $500 to $1,000 in Chicago, Atlanta, and the Pacific Northwest middle-sized cities spent between $25 and $75 for the year's clothing. At the $4,000 to $5,000 income level almost half of those in Chicago and Atlanta, and one-third of those in the smaller cities, spent between $300 and $500. Among the

[4] See fig. 1, which shows pictorially the basis on which families included in the Study of Consumer Purchases were classified by type.

Negroes there was a similar concentration of families with expenditures between $25 and $75 at the $500 to $1,000 income level, while among those with incomes of $3,000 to $4,000 nearly one-third spent between $300 and $400.

When the distribution of families by amounts spent for clothing are compared for Atlanta white and Negro families some rather interesting racial contrasts appear. For example, in the income classes between $1,000 and $2,000 a considerably larger proportion of Negro families had clothing expenditures of more than $200 than did white families at that level. This was true not only of all families considered together, but also of husband and wife families in the two racial groups.[5] The data suggest also that in the higher comparable income levels a greater proportion of the Negro families than white spent in excess of $300 for clothing during the year. In general, for families of all types considered together, there was a greater range between lowest and highest expenditures for clothing at a given income for white families than for Negroes.

Average Family Expenditures for Clothing

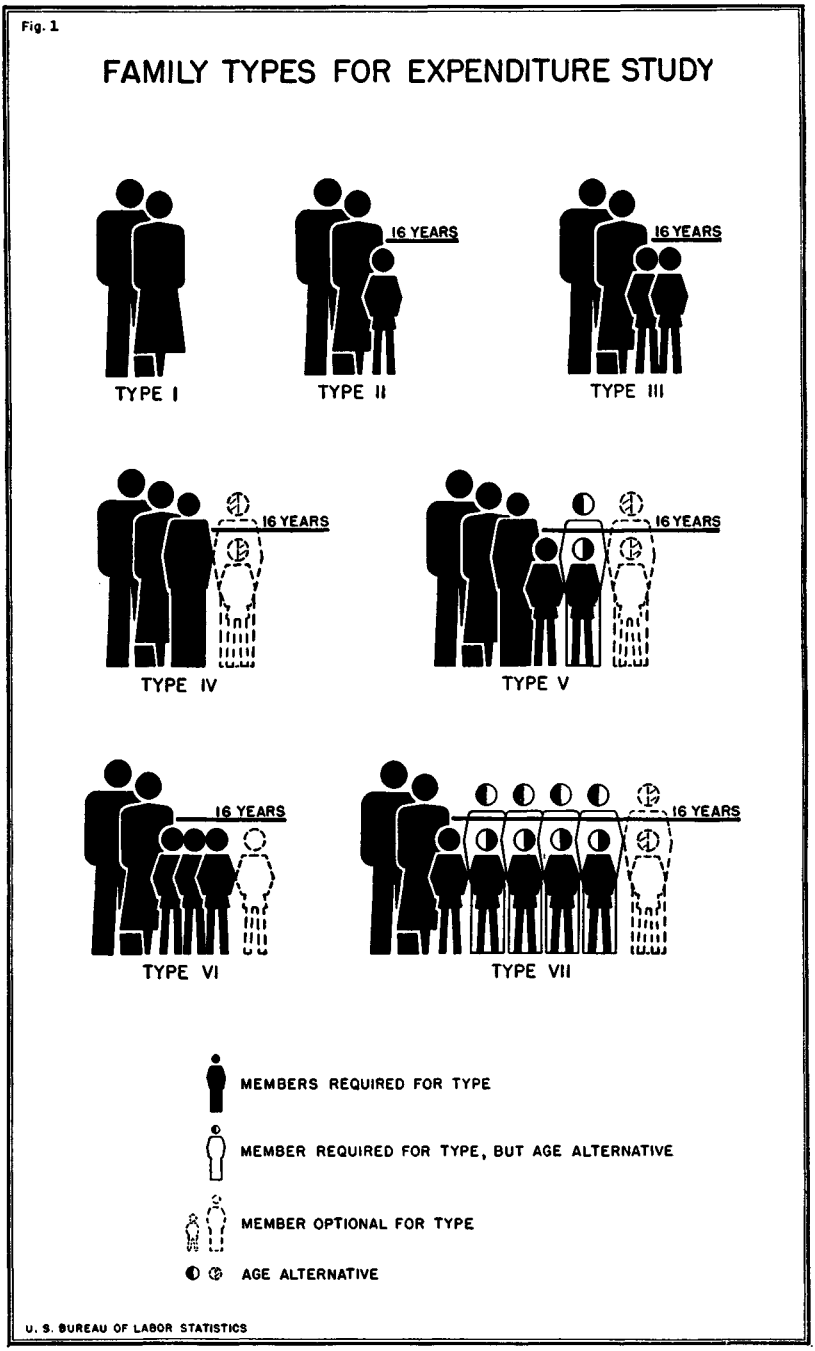

Although the cities included in the Study of Consumer Purchases present sharp climatic differences, such as those between New England and the southeastern States of Georgia and Alabama, or the mild coastal strip of the Pacific Northwest and the midcontinent States of Colorado and Nebraska, these differences are not reflected in the level of average family expenditures for clothing. Nor are differences associated with different degrees of urbanization well marked when comparisons are made of families at the same income level. On the whole, in terms of average total clothing expenditures at least, the data collected by this study are more striking for the similarities they present than for the differences, when families of a given income level are compared.

Among both white and Negro families in all communities studied, expenditures for clothing were relatively elastic up to income levels well above the median in the community. Families with incomes between $500 and $1,000 in most areas spent for clothing an average of from 6 to 9 percent of their total outlay for current living, while

[5] In Atlanta seven types were included in the expenditure analysis of Negro families but only five types were studied for white families. Strictly speaking, therefore, the data for the two samples are not entirely comparable except for two-person families, since figures for each of the seven types were tabulated separately for the Negroes, while those for white families represent combinations of types II and III, and of types IV and V. Nevertheless, such data as are available indicate that the relatively small number of the largest families (types VI and VII) had little effect on the data for clothing expenditures when families of all types are combined, in spite of the fact that there is a tendency for clothing expenditures to vary directly with family size. For example, averages for Chicago families based on five family types varied at most income levels by only one or two dollars from the averages for all seven types, and these differences were sometimes positive and sometimes negative, thus indicating that no consistent bias was introduced throughout the greater part of the income range by including or excluding the families of types VI and VII.

those receiving $3,000 and over generally spent between 10 and 13 percent for family apparel. (See table 2.)

Average family expenditures for clothing were closely similar in New York and Chicago. Up to the $3,000 level the averages for the two cities were generally within $10 or $15 of each other, with Chicago tending to be a little higher than New York. Above $3,000 the differences were generally larger, but at those levels New York families generally reported higher expenditures than did those in Chicago. For the income range as a whole, however, the level of spending was sufficiently alike in these two cities to warrant generalization regarding metropolitan communities in the matter of clothing expenditures by the kinds of families represented in the Consumer Purchases Study.[6] (See fig. 2.)

[6] Although families of seven or eight members (types VI and VII) were included in the Study in Chicago and excluded in New York, a comparison of averages for Chicago based on data for families of the first five types only with those for seven family types indicates very little difference between the two sets of averages. (See part II, pp. 551–552 for a statement of the limitations imposed on the generalization of these data for all families.)

Intercity Differences in Clothing Expenditures

A comparison of clothing expenditures by families in the six large cities included in the Study of Consumer Purchases indicates that while there was usually a fairly substantial difference in average outlay between the city ranking highest and lowest at any given income level, the increase over the income range was very similar in all communities, and the averages for the cities occupying an intermediate position were close to those for New York and Chicago. The similarity of the average amounts spent in these six cities by families with incomes of $2,000 to $5,000 is especially striking. Since the income range covered in the large cities was not so great as that for New York and Chicago, however, average family expenditures at the top of the income scale ($7,500 and over) were below $1,000, but were about the same as those for New York and Chicago families with incomes between $7,500 and $10,000. (See fig. 2.)

Families in the six middle-sized city units also followed a pattern of expenditures for clothing that did not differ materially among the several groups of cities, nor was it unlike that indicated by the data for the larger communities. While there was somewhat greater divergence in the level of spending for clothing among families in these groups of cities than among those in the larger cities, particularly at income levels below $4,000, the averages for the cities in an intermediate position in the two groups of communities were remarkably close to each other at most income levels. (See fig. 2.)

Although expenditure data were compiled by the Bureau of Labor Statistics for small-city families in only two regions, the New England and the East Central,[7] these data indicate that for comparable income groups small-city families maintain a level of clothing expenditure fully as high as that in New York and Chicago, and generally as high as those reported in the majority of large and middle-sized cities.

When the data for the large and middle-sized cities are considered jointly there is some indication that families west of the Mississippi spend rather more for clothing than do comparable income groups east of that line. At income levels below $3,000 families in Portland, Oreg., generally ranked high in average expenditures for clothing, while those in Columbus and Providence tended to be relatively low. At these income levels, Denver families reported expenditures fairly close to those for families in Portland, while above $4,000 average outlay for clothing was higher in Denver than in Portland. At the top of the income scale Omaha families outranked those in both Denver and Portland.

[7] The communities covered in the reports of the Bureau of Home Economics include small cities in all regions except the New England, in which small-city data collected by that Bureau have been combined with those collected by the Bureau of Labor Statistics.

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

Among the middle-sized cities, likewise, those of the Pacific Northwest were rather consistently high throughout the income range, while Butte-Pueblo families also ranked relatively high, even exceeding those for the Northwest cities at scattered income levels.

It is quite possible that these differences, which were usually not very large, arose more from differences in prices paid than from differences in standards of dress, since the cities in which clothing expenditures tended to be fairly high were those farthest from the principal centers of clothing manufacture. This interpretation is supported by the data on expenditures for specified articles of clothing purchased by husbands and wives.[8]

Racial Differences in Clothing Expenditures

Average expenditures for clothing by Negro families in the four communities for which such data are available show a more irregular change with income than do those for white families, and a somewhat less consistent relationship among the different units. On the whole, however, Negro families in New York and Columbus tended to report smaller expenditures than did those in the cities of the Southeast.

As a rule Negro families devoted a greater proportion of their total expenditures to clothing than did white families in the same city and at the same income level. The difference was greater in the Southeast, where the level of expenditures by Negro families for clothing was relatively high, than in New York and Columbus.

Family Type Differences in Clothing Expenditures

As might be expected there was a tendency in all communities for family clothing expenditures to vary with family composition, increasing both with size of family and with increases in the proportion of members 16 years of age and over. Such increases were not in direct proportion to the number of persons to be clothed, both because requirements vary with the age and occupational status of family members, and because other demands on income make it necessary for the larger families to restrict purchases of wearing apparel for individual members.[9] (See fig. 1.)

[8] See tables 8 and 12, and pt. II, table 5.

[9] See pt. II, table 3, for detailed data on clothing expenditures for families of each of the types distinguished in the communities included in the Urban Series of the Consumer Purchases Study.

[1] The 7 family types are distinguished on the basis of the number and age of members other than husband and wife, as follows:

I No other persons (families of 2 persons).
II 1 child under 16 (families of 3 persons).
III 2 children under 16 (families of 4 persons).
IV 1 person 16 or over and 1 or no other person, regardless of age (families of 3 or 4 persons).
V 1 child under 16, 1 person 16 or over, and 1 or 2 others, regardless of age (families of 5 or 6 persons).
VI 3 or 4 children under 16 (families of 5 or 6 persons).
VII 1 child under 16, and 4 or 5 others, regardless of age (families of 7 or 8 persons).

[2] Includes families with incomes of $3,000 and over.

†Fewer than 3 cases.

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

The smaller number of cases on which the averages for families of the several types are based resulted in averages that showed a considerably less regular variation with income than did average expenditures for families of all types considered together. For this reason a comparison at given income levels of clothing expenditures among the different family type groups indicates that while the level of such expenditures was quite generally lower for two-person families than for any of the other family type groups, the percentage differences among the several groups were very far from uniform either from one income class to another within the same city or for the same income class in the different communities. Such differences were often as low as 5 percent and as high as 30 or 40 percent. (See table 3.) In Chicago, at all but two income levels, the largest families, containing seven or eight members (types VI and VII), spent more for clothing than did families of any other type, whereas in Columbus, where white families of seven types were studied also, families with five or six members, at least one under 16 and at least three 16 or over (type V) were as likely to spend more than the seven- or eight-person families as they were to spend less. In the communities where families were classified into only three groups on the basis of number and age composition of members, those with from three to six members, at least three of them 16 or over (types IV and V) generally reported the highest average clothing expenditures. In none of the cities studied in the Urban Series was there any consistent tendency for the percentage differences among the family type groups to be greater at one end of the income scale than at another.

Chapter II

Clothing Expenditures for Family Members

Data on the allocation of the family's clothing allowance among husband, wife, and all other family members combined are available for Chicago, New York, and each of the large cities separately, as well as for the middle-sized city and small-city groups in each of the regions in which the Study was conducted.[1] Data on clothing expenditures for individual family members, husbands, wives, and other members classified by age and sex, are available only for six groups of cities, since data on the details of clothing expenditures were not tabulated in as great geographic detail as were figures on expenditures for items which are less variable from family to family.[2]

Expenditures of Husbands and Wives

Expenditures for clothing for husbands and wives together generally averaged between 60 and 75 percent the total family clothing bill among families of the types studied in this investigation. As a rule, the proportion of total clothing expenditures accounted for by amounts spent for husbands and wives was greater in the lower part of the income scale than at the upper part. This difference probably results chiefly from the fact that the average number of persons in nonrelief families tends to increase with income in virtually all communities, from about three members, or fewer, at the lower levels, to 3.5 members or more in the higher income groups.[3] Thus, in the allocation of the family clothing budget among its members, husbands and wives do not appear to have shared disproportionately in the total when families of all types are considered together.[4]

---

[1] See pt. II, table 3. Such data are obtained from the expenditure schedule and hence are tabulated on the same geographic basis as are those presented in vol. II of each of the regional reports on the Study of Consumer Purchases. See U. S. Bureau of Labor Statistics Bulletins Nos. 642–647, and 649.

[2] As adjuncts to the expenditure schedule, but not as indispensable parts thereof, families giving expenditure schedule data were asked to supply the information called for on detailed check lists of individual items of clothing expense for each family member. Since some families were unable or unwilling to supply such detail, and since some supplied it for certain family members but not for others, the check-list data are tabulated not by family, but by individual members classified for members other than husband and wife into five age groups for each sex, and infants under 2 years of age. Since the number of members in any specific sex-age group was usually not large for individual cities, and, since clothing expenditures are highly variable, combinations of cities were made in order to increase the number of cases on which the averages were based.

[3] See pt. II, table 1–A.

[4] Tables presenting average expenditures for clothing by husbands and wives represent averages that were weighted by the number of families eligible for the expenditure schedule. Average expenditures by other family members classified by sex and age represent averages based on the actual number of clothing check lists obtained for family members of that sex and age group, since no data were compiled as to the distribution by age and sex of the family members other than husband and wife in the eligible sample.

At all income levels except the lowest, wives spent somewhat more than husbands for clothing. These differences were usually comparatively small except in the income classes above $3,000. Even at the highest income levels in New York–Chicago, for example, average expenditures for clothing by wives were only about one-third higher than those for husbands. (See table 4.)

[1] The 7 family types are distinguished on the basis of the number and age of members other than husband and wife, as follows:

I No other persons (families of 2 persons).
II 1 child under 16 (families of 3 persons).
III 2 children under 16 (families of 4 persons).
IV 1 person 16 or over and 1 or no other person, regardless of age (families of 3 or 4) persons.
V 1 child under 16, 1 person 16 or more, and 1 or 2 others, regardless of age (families of 5 or 6 persons).
VI 3 or 4 children under 16 (families of 5 or 6 persons).
VIII 1 child under 16, and 4 or 5 others, regardless of age (families of 7 or 8 persons).

[2] Includes families with incomes of $5,000 and over.

[3] Families of types VI and VII were studied in Chicago and the East Central cities only.

It is noteworthy that while the share of the total clothing expense allocated to husbands and wives varied inversely with size of family, as would be expected, expenditures by husbands showed much less relative curtailment in the larger families than did those of wives, particularly at income levels below $3,000. Since comparatively few wives were employed outside the home in most communities studied,[5] their clothing allowances could more readily be reduced to effect necessary economies than could those of husbands, the great bulk of whom were the principal family breadwinners.

Among white families that included only husband and wife yearly clothing expenditures for husbands and wives averaged between $20 and $30 each in most communities in the income groups under $1,000. At the top of the income scale covered in the large and middle-sized cities ($5,000 and over), expenditures by husbands averaged between $200 and $300, while those of wives were above $350 in two of the four groups of communities of that size range, and were below $300 only in the New England and East Central cities. In New York and Chicago, among families with incomes of $7,500 and over, husbands in these two-person families spent nearly $400 during the year, and wives spent over $600.

Among Negro families of the same composition in the Southeastern cities studied, expenditures for clothing by husbands and wives at the income level under $500 averaged below $12 apiece for the entire year. Among those few families receiving $3,000 and over, husbands spent more than $200 and wives more than $400.[6] At all lower income levels there was comparatively little difference in the average amount spent by husbands and wives.

In both racial groups, husbands and wives in families with one or two children under 16 tended to spend less for clothing than did those at comparable income levels in two-person families, but the differences were relatively irregular from one income class to another and from one group of communities to another. Similarly, husbands and wives in families with three to six members, at least three of them 16 or over (types IV and V), generally spent less for clothing than did those in either of the other two groups of families. On the whole, therefore, there was at most income levels a rather decided difference in the level of expenditures for clothing for husbands and wives between the smallest families and those with three to six members. In the communities in which seven- or eight-person families

[5] See vol. I of U. S. Bureau of Labor Statistics Bulletins, Nos. 642-47, and 649, for data on the gainful employment of wives in communities covered by the present study. In general, fewer than 10 percent of the wives in families of the types covered by the expenditure survey were earners in the cities covered by the Urban Series of the Study of Consumer Purchases.

[6] For New York and Columbus Negroes, data on clothing expenditures by husbands and wives were not tabulated for the several family type groups separately, since the number of families giving check-list data was insufficient to warrant this detail.

(types VI and VII) were also included in the consumption analysis expenditures of husbands and wives, particularly of husbands, were likely to average about as much as they did in the families with three to six members.

Expenditures by Members Other Than Husbands and Wives

The data on average clothing expenditures by income for members of the different sex-age groups are somewhat irregular in the several communities, owing partly to rather wide differences in the number of persons in a specific group represented by the averages. Nevertheless, for the most part, the communities do not appear to differ significantly from each other in the general level of clothing expenditures for family members of the sex and age groups designated, nor in the relationship among them in average outlay for apparel. Ignoring random irregularities, there was a rather persistent pattern of spending evident in all groups of cities covered by the Urban Series of the Study of Consumer Purchases, insofar as the level of clothing expenditures for the several age groups and for the two sexes is concerned.

Racial differences in clothing expenditures for members of families in comparable income classes were likewise negligible, but there was some indication of a tendency for sex differences in the average outlay for clothing to be less consistent among the Negroes than among the whites.

Clothing expenditures for family members other than husbands and wives varied directly with the age of members, except in the case of the group 30 years of age and over. Since this latter group included a considerable proportion of elderly persons it is not surprising that average amounts spent by such persons at virtually all income levels were considerably below the level of spending by family members of the same sex in the age group 16 to 29.

At all ages there was some tendency for average clothing expenditures of females to exceed those of males in families at corresponding income levels, but such differences were not well marked among the children under 12 years of age, nor at the lower end of the income scale for any age group. With comparatively few exceptions, however, among families above the $1,000 income level, females had average expenditures for clothing substantially above those of males in the same age group.[7] In the upper part of the income range average expenditures for females of this age group were often as much as 50 percent above those for males (See table 5 and fig. 3.)

[7] Among New York and Columbus Negro families the data indicate a tendency for male members, aged 16 to 29, to spend more than females, although the size of the sample was not large enough to yield conclusive evidence on this point.

*Fewer than 3 cases.

Members 30 years of age and over, other than husband and wife.—As indicated above, this group obtained a considerably smaller proportion of the family clothing budget than did husbands and wives, or members aged 16 to 29. In fact, average expenditures were frequently less than those for children in the 6 to 11 group, and usually below those for family members between 12 and 29 years of age. This was true of both males and females in this age group.

While expenditures for clothing for members 30 years of age and over rose with income, this increase tended to be less regular than in the case of most other age groups. Below the $2,000 income level,

average clothing expenditures for that group were generally below $30 for females as well as for males. In families with incomes above $4,000 in the communities where data for such families are presented, clothing expenditures for members 30 and over usually averaged above $100. At most of the income levels in the various communities females over 30 had somewhat larger expenditures than did males.

Members 16 to 29 years of age, other than husband and wife.—This group ranked higher in average clothing expenditures than did any other except husbands and wives. In some communities there was a tendency for the wives to spend a little less for their clothing than the other females in the family who were in this age group. Most of the "other" females in this age classification were grown daughters, some of whom were undoubtedly employed outside the home. Quite apart from this factor as affecting requirements for clothing, however, persons of both sexes in the 16 to 29 age group tend to place more emphasis on personal appearance than they do at any other period in their lives. It is common observation that grown daughters are likely to spend more for clothing than do their mothers, particularly if they are in school or if they have gainful employment.

Average expenditures for clothing by females aged 16 to 29 were generally in the neighborhood of $30 among families with incomes between $500 and $1,000, and were between $80 and $100 in families at the $2,000 to $3,000 level. In the communities where the data from all families receiving more than $5,000 are combined, females in this age and income group spent $194 or more during the year. In the Pacific Northwest, where as previously indicated, total family clothing expenditures tended to be relatively high in comparison with those in other parts of the country, the average outlay for clothing by females at that income level between 16 and 29 years of age was $240. In these communities, however, the average expenditures of females aged 16 to 29 was somewhat less than that of wives in families at income levels above $2,000.

At the lower end of the income scale ($500 to $1,000) grown sons and other male members in the age group 16 to 29 years spent between $10 and $40 during the year for clothing, while in families above the $5,000 level this group averaged between $125 and $150. Thus, the level of outlay among the low income groups was quite similar for males and females for this age classification, but higher incomes, particularly above the $3,000 level, resulted in a considerably greater increase in the amount spent for girls and young women than for male family members of the same age. This fact no doubt reflects the much greater variety in kinds of apparel that conventions accept as desirable for women, in comparison with those worn by men.

Members 12 to 15 years of age.—Since this group is one representing family members in a transitional period between childhood and

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

adolescence, it is in accord with expectations to find that average expenditures for clothing were not widely different for boys and girls when comparison is made for the same income groups. As in the case of the older members, however, the differential was usually greater, both relatively and absolutely, in the upper part of the income scale than in the lower.

Average clothing expenditures were, almost without exception, substantially smaller for this age group than those for members of the same sex in the age group 16 to 29 years; at the upper income levels average outlay for the younger group was often only about half that for the older. The families at the lower end of the range (with incomes of $500 to $1,000) reported expenditures for children 12 to 15 that averaged between $15 and $25 in most groups of communities studied. These averages increased with considerable regularity with income, amounting to between $50 and $60 for boys, and between $65 and $85 for girls in families with incomes from $3,000 to $4,000. At the $5,000 and over income level for white families in the large and middle-sized cities, clothing outlay for boys in this age group averaged between $70 and $100, and that for girls considerably over $100 in each of the four groups of communities. In New York and Chicago, among families receiving $5,000 to $7,500, clothing expenditures for boys average $94, and for girls $128.

Members 6 to 11 years of age.—Among children of this age group the level of expenditures for clothing differed very little between boys and girls. In most communities such differences as were maintained were small, even in the upper part of the income scale, but were in the same direction as those for older family members, with expenses for girls tending to be slightly above those for boys. Below the $2,000 level, expenditures for children of each sex generally averaged less than $30, and were about $15 for those in families with incomes between $500 and $1,000. In the communities where data for families with incomes of $5,000 and over were tabulated together, the average outlay for children of this age group was between $60 and $70 for boys, and between $60 and $80 for girls.

Throughout the income range the usual difference based on age was apparent in the level of expenditures for children aged 6 to 11, in comparison with those for children in the next higher age group. At the upper end of the income scale the differences were quite substantial, with expenditures for the younger children often averaging not more than two-thirds as much as those for members aged 12 to 15.

Members 2 to 5 years of age.—In most communities average expenditures for clothing for children aged 2 to 5 did not reach $50 at any income level below $5,000, and only for girls among New York and Chicago families with incomes of $7,500 and over was the average as much as $100. The amount spent for clothing for these children in

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

families below the $1,000 income level generally averaged $10 or less for both sex groups.

At this age level, expenditures for girls were not consistently above those for boys except in the upper part of the income scale. In all communities and for all income groups the average amount spent for children aged 2 to 5 was less than that for family members of the same sex in the next higher age classification.[8]

Members under 2 years of age.—Since clothing for children under 2 does not differ greatly with the sex of the child, data on clothing expenditures for all children of this age group have been tabulated together. The amounts spent were comparatively small throughout the income range, rarely averaging as much as $35, even among families in the highest income classes studied. In most communities the increase with income was more irregular than in the case of the other age groups. This irregularity may have rested in part in the comparatively small numbers represented by the averages at some income levels, but it also suggests that such expenditures were not very sensitive to income changes, particularly above the $2,000 level.

Gifts of Clothing

The widespread custom of making gifts of clothing to infants is reflected in the data on the money value of gifts of clothing received during the year from persons outside the economic family.[9] For husbands, wives, and other family members above the age of 2 years, the average value per person of such gifts was less than $10 for the great majority of groups studied. For infants under 2, on the other hand, this value was more often above $10 than it was below that figure, and in several communities it exceeded $20 among families at the highest income level studied. (See table 6.) In consideration of the relatively small money outlay for clothing for infants under 2 years of age it is clear that gifts of clothing made very substantial contributions to the wardrobes of such members.

While there is considerable irregularity in the data the value of gifts of clothing to infants tended to increase with family income in most communities. This increase undoubtedly reflects the fact that social convention calls for gifts to new-born children, and the ability to observe this convention naturally increases as income rises.

[8] Except among New York and Columbus Negro families, for which averages tended to be somewhat erratic because of the relatively small numbers of cases on which the averages were based.

[9] Gifts of clothing from one family member to another were entered as expenditures, since they represented the use of family funds.

Gifts to family members other than infants under 2 showed no consistent relation to family income status. They were as likely to be high in the lower part of the income range as in the upper. For this reason gifts of clothing were far more important in their effect on the level of living of families in the low income groups than they were in the upper part of the income range.

The same sex differences as were found in the level of expenditures for clothing appear also in the value of gifts. Wives rather consistently

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

received clothing of greater value than that received by husbands, while other women and girls of the several age groups generally received more than did the corresponding groups of men and boys.

At virtually all comparable income levels, gifts of clothing to Negro families were of smaller average value than were those received by white families. In approximately half of the income classes in the two groups of communities where Negro families were studied no gifts of clothing were reported.[10]

[10] Those readers interested in the effect of individual occupation on clothing expenditure are referred to ch. VIII of bull. 638, where the effect of this factor is considered. The analysis provides figures on the average clothing expenditures of wage earners and clerical workers with the effect of income and family size eliminated.

Chapter III

Types of Clothing Purchased for Family Members

The present-day wardrobe for persons in moderate circumstances as well as for those with ample means includes a great variety of articles, particularly for women. How much greater this variety is than it was several decades ago, however, cannot be readily determined. In certain directions there has undoubtedly been a development toward simplification in women's attire, but in others there has been a trend toward greater diversity to meet the need arising from the larger number of activities in which women now engage, as compared with 40 or 50 years ago. It seems probable, also, that cheap mass production of garments of all types, in imitation of the more expensive and diversified apparel designed for the higher income groups, has made possible a variety of spending for clothing that was not attempted before factory-made clothes were so widely available and comparatively so inexpensive.

An attempt to itemize with reasonable completeness for members of either sex the articles of apparel now in current use results in rather extended lists, particularly if garments are classified by material, such as into cotton, wool, or silk.[1] Certainly the list used in the present study indicates a wardrobe much more extensive than that shown in the Sixth Annual Report of the Massachusetts Bureau of Labor Statistics for the year 1875. In that report are presented the requirements of an American working woman (income status not indicated) with those of a Swiss woman of the same class. The list for the American working woman is as follows:

American working woman

1 shawl, to last 3 years.
5 dresses, to last 2 years.
12 yards of print for aprons.
2 hats to last 2 years.
1 pair gloves.
2 pair shoes.
5 petticoats to last 2 or 3 years.
20 yards cotton cloth and trimming for chemises.
2 corsets.
2 sets of underwear.
5 pairs of hose.[2]
4 handkerchiefs, to last 1 year.
Collars, cuffs, scarves, ribbons, etc.

[1] See pt. II, p. 571, for copy of the clothing lists used in collecting clothing expenditure data for males and females in the present study.

[2] Presumably cotton or wool.

Digitized for FRASER

Federal Reserve Bank of St. Louis

While this list indicates clearly the changes regarding type of attire worn that have occurred in the last half century, it also shows very plainly that, for women at least, the stock of wearing apparel considered customary has increased greatly during this period, particularly as regards outer garments and wraps. Although the Study of Consumer Purchases obtained no data on stocks of wearing apparel owned, but only on expenditures for the various clothing items made during the report year, the indicated life of the stocks specified on the 1875 list suggests the average level of purchase, quantitatively considered, in any one year for working women of that period. There can be little argument that the 1875 list, after translation to its present-day equivalent, would fall far short of meeting current standards of dress for employed women, even those in wage-earner occupations in the lower part of the income scale.

In order to summarize the numerous items purchased for the several family members as recorded on the clothing check lists used in the present study, these items have been classified into a few broad groups which represent the principal types of clothing requirements for the two sexes. For males these groups include headwear; coats and other wraps; suits, trousers, and overalls; shirts; special sportswear; underwear, nightwear, and hose; footwear; and accessories. For females the list is the same except that a group comprising suits, dresses, blouses, and skirts are substituted for the two groups for suits and trousers, and shirts.[3]

Clothing Purchased by Wives

At almost all income levels wives spent more for dresses, suits, blouses, and skirts than for any other group of garments distinguished in the present study. Among families with incomes of $1,500 or over at least 90 percent of the wives reported expenditures for such apparel, and even at the lowest income levels studied well over half of the wives purchased something during the year in this category. (See part II, table 4.)

Average expenditures for dresses, suits, etc., increased very rapidly with income, reflecting the purchase of more expensive garments as well as the purchase of a greater number of such articles. Among white families with incomes between $500 and $1,000 a yearly average of only $5 or $6 was reported for such apparel, while wives in families above the $5,000 level averaged between $65 and $85. For comparable income levels the average expenditures of Negro wives were similar to those for whites.

[3] The discussion which follows is based in large part on tabular material presented in pt. II. Since such material is very extensive no attempt has been made to analyze all detail there presented. Instead, the summary findings from those data are presented, accompanied usually by tables for selected communities only and for selected income groups.

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

Among the articles of apparel included in this group those most frequently purchased by wives in most communities studied were cotton house dresses, at the lowest income level represented, and silk and rayon dresses, at succeeding levels.[4] Among families with incomes of $500 to $1,000 between 40 and 50 percent of the wives bought cotton house dresses during the year, while between 25 and 40 percent bought silk or rayon dresses. At the higher economic levels well over half of the wives reported the purchase of silk or rayon dresses, and among those in families with incomes of $5,000 or over from 80 to 90 percent bought such garments during the report year. Cotton street dresses were also purchased by from one-third to one-half of the wives in families above the $1,500 income level in most communities. Comparatively few, except in families with incomes of $3,000 or over, bought wool dresses.

Since silk garments have been included with rayon in the present analysis it is not possible to present the average price for garments of the two fabrics separately. For silk and rayon dresses together, however, the average expenditure per garment by the wives that purchased them did not exceed $26 at any income level in any community and was generally under $15. Wives in families at the $500 to $1,000 level paid an average of from $4 to $5 per dress. In general, the average outlay per garment suggests that the great majority of wives purchased dresses made, not of pure dye silk, but of rayon, of rayon and silk mixed, or of heavily weighted silk. Even those in New York and Chicago, in families with incomes between $5,000 and $7,500, paid an average of slightly under $13 for silk and rayon dresses. (See table 8.)

The comparative infrequency of purchase of wool dresses may be explained in part by the fact that dresses of wool were generally more expensive than those of rayon and silk. With a few exceptions, the average expenditure per wool dress was greater at each income level than were those for dresses of other materials. In addition to the price factor, it is probable that the prevalence in urban communities of dwellings well heated in winter has reduced the demand for all but the thin, sheer woolens that are likely to be too expensive for clothing budgets that must be closely limited.

Average expenditures per dress for cotton house dresses did not amount to as much as $2.25, even in the upper part of the income range, and were around $1 or less at most income levels. Cotton street dresses naturally averaged a little higher, but expenditures for these garments were under $7 per garment, even at the highest income levels.

[1] See explanation of tables, p. 563.

*Average amounts of less than $0.005 are not shown.

Expenditures for silk and rayon dresses accounted for more than 10 percent of the clothing expenditures of wives in New York and Chicago families with incomes above $1,000. Similar proportions of the totals were accounted for in this way in most other groups of communities studied. Cotton street dresses, on the other hand, absorbed only 2 or 3 percent of the total clothing outlay by wives at most income levels, except among Negroes in the Southeast cities, where from 3 to 5 percent of the total was so used.

Wool suits without fur were purchased by a larger proportion of wives than were either wool suits with fur or silk and rayon suits, but at no income level in any community studied did as many as two-fifths of the wives buy a wool suit without fur during the report year. Below the $3,000 income level fewer than one in five bought such suits,[5] and only in the West Central-Rocky Mountain and Pacific Northwest cities did as many as one-third report their purchase. Such garments, however, involved considerably greater expenditure per article, on the average, than did any type of dress, particularly among wives in the intermediate and higher income groups. In most communities, the average amount paid per suit by wives was not far from $10 even in families with incomes of $500 to $1,000; among these in the $5,000 and over groups it was between $20 and $30. Wives in Pacific Northwest cities at this level paid an average of nearly $32 per wool suit without fur.

In most groups of families fewer than 10 percent of the wives purchased silk and rayon suits. Such suits were considerably less expensive than the wool suits, with prices generally ranging a little higher than those for silk and rayon dresses for corresponding income groups.

While the proportion of wives purchasing skirts and blouses was comparatively small throughout the income range, this proportion did increase fairly consistently in successive income classes, particularly in the case of silk and rayon blouses. At the highest income levels studied in the several groups of communities, between one-fifth and one-fourth of the wives reported expenditures for silk or rayon blouses, as compared with only about one in 15 or 16 at the lower end of the income range. The proportion buying cotton blouses showed much less relationship to income, and tended to be considerably smaller at all income levels than the proportion buying silk and rayon blouses.

Average expenditures per garment for blouses purchased by wives varied rather irregularly among the several communities. Prices of silk and rayon blouses were generally around $2 or less in the lower and intermediate income classes, and under $4 at the upper levels. For cotton blouses wives reported prices of $1 or less below the $1,000 income level, and between $1.50 and $2.50 above the $3,000 level.

It will be recalled from the list of garments for an American working woman of 1875, shown above, that this list included no type of outer wrap except one shawl, estimated to last 3 years. Even a very modest wardrobe of today for an employed woman might be expected to include one heavy coat and one light coat, with the possibility of a suit coat or a jacket, and probably a sweater, in addition. Thus,

[5] Except among Southeast Negroes.

http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

in the field of outer wraps, at least, the trend since the last quarter of the 19th century has clearly been toward greater diversity in women's apparel.

In the higher income classes, coats and other wraps ranked next to dresses and suits in the proportion of wives' clothing expenditures which they absorbed. In most communities, however, fewer than half of the wives in income classes below $2,000, incurred expenses for coats or other wraps during the report year, and among the families receiving $500 to $1,000, only one-third to one-fourth of the wives purchased such apparel. At the top of the income scale in New York and Chicago more than three-fourths of the wives bought some type of coat or wrap during the year.

Average expenditures by wives for coats and other wraps, like those for dresses and suits, increased markedly over the income range, from under $5 in the lowest income classes studied to more than five times that amount among families above the $3,000 level in most communities. While this increase reflected the growing proportion of families that purchased such garments, it represented also the larger average purchase price paid and, to some extent, the growing number of wives that bought more than one coat during the year. Thus, among the wives that reported expenditures for coats and other wraps, average expenditures at the $500 to $1,000 income level generally varied between $10 and $20, while above the $3,000 level these averages were above $40 in most groups of communities and for both racial groups.[6] In New York and Chicago, wives at the top of the income scale covered in the survey, who reported outlay for coats and wraps, spent an average of $180 for such apparel.

In all groups of communities except the Southeast, wives reported the purchase of light wool coats more frequently than either heavy coats with fur or heavy coats without fur. Since, however, the amount paid for heavy coats was much greater than that for light coats the former constituted a more important part of the clothing budget than the latter.

Among wives in families with incomes between $500 and $1,000 scarcely 1 in 20 reported the purchase of a heavy coat with fur, and not many more bought heavy coats without fur. Thus, if it is assumed that none at this economic level purchased two heavy coats in the same year, it appears that only about 1 wife in 8 in such families bought a heavy coat. This cannot be taken to mean necessarily that replacement occurred on an average of only once in 8 years among wives in families below the $1,000 income level, since it is

[6] Here and subsequently in the report, when average expenditures for specific items or groups of items are presented for family members that incurred such expense, the averages were computed by dividing the averages based on all members of the group by the corresponding percentages of the members of that group that reported expense for the item in question.

Federal Reserve Bank of St. Louis

probable that some of the wives in these income groups got along without heavy coats or obtained used coats as gifts. Among the wives buying coats, therefore, the frequency of purchase was probably somewhat greater than one every 8 years.[7]

Data on expenditure per article for the several types of wraps purchased by wives reporting details of clothing expenditures indicates that there was a tendency, particularly at the higher income levels, for wives to spend as much or more for heavy coats with fur as for heavy coats without fur and for light wool coats, combined. In the New England and East Central large and middle-sized cities, for example, average expenditures per coat for heavy coats with fur rose from about $27 at the $500 to $1,000 level to $84 among wives in families receiving $5,000 and over. Over the same income range average prices paid for heavy coats without fur varied from $12 to $40, and light wool coats from $11 to $25.

Among families with incomes of $3,000 and over, approximately 20 percent of the wives purchased heavy coats with fur. The proportion in these same income groups buying heavy coats without fur varied much more widely in the several groups of communities, ranging from 8 percent among white families in New York and Chicago to 22 percent for Negroes in New York and Columbus. Although some wives at the higher income levels doubtless bought both types of heavy coat in the same year, it is probable that the number was not large enough to introduce a serious error if the two percentages are combined to obtain an indication of the approximate frequency of purchase of heavy coats by wives in families above the $3,000 level. Thus, on the average, one-third or more of the wives at this economic level bought heavy coats during the year, suggesting replacement approximately every third year.

Since women's heavy coats are likely to be the most expensive individual garment in the wardrobe, it is interesting to note the proportion of their total clothing expenditures allocated by wives to such apparel. Because of the irregularity of purchase, there is also wide variation in the percentage of total clothing expenditures by wives shown as going to heavy coats. In New York and Chicago, wives spent from 5 to 11 percent of their total clothing outlay for heavy coats with fur. In the other communities such garments tended to take rather smaller proportions of the total. In the cities studied there appeared to be no relationship, either direct or inverse, between family income and the proportion of total clothing expenditures of wives that was allocated to heavy coats with fur.

[7] It is probable, also, that the nonrelief income groups below $1,000 include a number of families that do not remain at that level for any considerable number of years consecutively, so that the rate of replacement of garments cannot be approximately ascertained for families at that level.

Underwear, nightwear, and hose together comprised a very important element in the clothing expenditures of wives, particularly in the lower part of the income scale. In the lowest income classes studied in most groups of communities, average expenditures for such garments exceeded those for dresses, suits, and blouses, and they generally exceeded those for coats and other wraps among families receiving incomes of less than $3,000. Among white families in almost all communities more than 95 percent of the wives at every income level reported expenditures for articles in this category, and above the $2,000 level more than 98 percent had such expenditures. Among Negroes, fewer than 90 percent of the wives in families below the $500 income levels reported the purchase of any underwear, nightwear, or hose during the year, but all wives in families with incomes of $2,000 and over made expenditures in this category.

The average outlay for these items of apparel was generally between $5 and $6 among families with incomes of $500 to $1,000, amounts very similar to those spent for dresses and suits by the same economic group. Above that level average outlay increased quite regularly, but only moderately with income, and the level of spending for underwear and hose was usually around $40 for the year by wives in families with incomes of $5,000 and over in the large and middle-sized cities. For corresponding income groups, average amounts spent for these articles was very similar for white and Negro families.

One of the striking differences between a present-day list of women's garments and the list for an American working woman of 1875 lies in the relative importance of hose in the wardrobe at the two periods. The 1875 list called for 5 pairs of hose, presumably heavy cotton or wool hose, designed, it may be assumed, to last 1 year. Current American standards of appearance, even among comparatively low income groups, call for silk hose, and the ephemeral life of such hose means that many women buy a dozen and a half or two dozen pairs of hose during 1 year.[8] While the present study does not provide for the separate analysis of clothing expenditures by wives with gainful employment, it is well known that those working outside their homes commonly have considerably higher average expenditures for clothing, particularly for hose, than do those employed only as housewives.

In this connection it is of interest to examine data on purchases of hose by wives and other females in the age group 16 to 29 years. (See tables 9 and 10.) Among wives in both white and Negro families the purchase of silk hose[9] was reported by well over 80 percent of the

[8] A not inconsiderable number of employed wives and other females reported the purchase of a pair of hose every week.

[9] In the present study expenditures for silk and rayon hose were not reported separately, but the comparatively small production of rayon hose in the United States suggests that most of even the inexpensive hose, other than cotton, were probably made of silk.

wives even in families with incomes between $500 and $1,000.[10] This percentage rose with income, so that all but a very small percentage in families above the $3,000 level had such expenditures. Purchases of cotton hose, on the other hand, were generally inversely related to income. Between 10 and 20 percent of the wives at the low income levels bought cotton hose during the year, while an average of scarcely 5 percent made such purchases in the income groups above $2,000.

*$3,000 and over.

Average expenditures for silk hose by wives buying such hose was generally under $5 at the $500 to $1,000 income level, but averaged above $15 at the upper end of the income scale. The relative importance of hose in women's clothing budgets today is attested by the fact that average expenditures by hose for all wives and for all females aged 16 to 29 years accounted for at least 10 percent of their respective total clothing outlays throughout the greater part of the income range covered in the several groups of communities.

Among women in New York and Chicago silk hose absorbed an average of close to one-sixth of all clothing expenditures for these members in the income groups under $2,000. Above the $4,000 level such hose generally took less than one-tenth of the total. On the whole, silk hose occupied a somewhat more important position in the clothing expenditures of New York and Chicago women than of those in the smaller communities. Between white and Negro families in the Southeast, there was no consistent difference in the proportion of total clothing outlay allocated to such hose.

Although silk hose thus took substantial portions of the amounts spent for clothing by wives and other young adult females in the

[10] Except in white families in the Southeast large and middle-sized cities, where only 68 percent of the wives at that income level purchased silk hose during the year.

families studied, the unit price paid per pair by wives were relatively low at all income levels. In most communities even the top income group paid only about $1 per pair, while the average for those below the $2,000 income level was usually under 75 cents. (See part II, table 5.)

* $3,000 and over.

Footwear, like underwear, nightwear, and hose, was a relatively inelastic category of clothing expenditure among the wives studied. Except among Negro families at the bottom of the income scale at least nine wives out of ten reported expenditures for footwear during the year. Average expenditures, therefore, were not materially different whether based on all wives or only on the wives that purchased footwear. Among families with incomes between $500 and $1,000 the amounts reported averaged about $5, while at the $5,000 and over level in the large and middle-sized cities they were about $25.

The increase with income in expenditures for footwear, which was quite regular in the several groups of communities, resulted both from the fact that wives at the higher economic levels bought more shoes and from the somewhat higher average prices paid per pair. Both street shoes and dress shoes purchased by wives in families below the

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

$2,000 income level averaged between $3 and $4. At the top of the income scale, wives paid an average of about $6 or $7 for street and dress shoes. It is clear that the increased number of pairs purchased in a year was more responsible for the larger outlays for footwear in successive income classes than was the higher price paid per pair.

Although hats have generally been considered a very important part of women's wardrobes, at the present time this importance does not come primarily from the amounts spent for such apparel. While well over half of the wives at all income levels purchased one or more hats during the year, expenditures for headwear occupied a relatively small place in their total clothing outlays. Average expenditures for headwear by wives was less than $10 for the year in all income groups below $4,000, and did not reach $20 in any income group except the $7,500 and over group in New York and Chicago.

The data on average quantities purchased for hats of felt, straw, and fabric, indicate that most wives above the lowest income levels studied purchased more than one hat during the year. For example, in New York and Chicago, average expenditures for headwear by wives in families with incomes of $1,500 to $2,000 were about $4. At this level, however, the average price paid for hats either of felt, straw, or fabric was only slightly above $2. Since only 87 percent of the wives at that income level in these metropolitan centers reported any expenditure for headwear during the year of the Study, the average number of hats for the wives that made such purchases was a little more than two. At the highest income levels studied in these cities, where average expenditures per hat were between $4 and $5, an average of approximately five hats were purchased during the year.

The types of wearing apparel so far discussed accounted for all but relatively small proportions of the clothing outlay of wives in the cities studied. The remaining groups of items include special sportswear such as bathing suits or ski costumes, jewelry and accessories, materials and paid help for making garments, and expenditures for cleaning, pressing, and repairing garments. All of these items together amounted to less than $6 for the year among families below the $1,500 level in all cities except the Pacific Northwest. There was, however, a fairly rapid rise with income in the amounts spent for the miscellaneous articles and services, particularly for accessories, such as purses, gloves, handkerchiefs, umbrellas, and jewelry. Accordingly, average expenditures for accessories at the upper end of the income scale were generally as high as, or higher than, outlay for headwear. For special sportswear, accessories, and miscellaneous clothing expenditures together, wives in the income groups above $5,000 in the large and middle-sized cities spent from about $30 to $40, or not far from the same average amount reported for underwear, nightwear, and hose.

Federal Reserve Bank of St. Louis

Most wives in the communities studied spent relatively little for cleaning and pressing services during the year. At the $500 to $1,000 income level fewer than one-third reported such expenditures, and the average outlay for those reporting them was under $2, in every group of cities except the Pacific Northwest, and among New York and Columbus Negroes. The proportion of wives utilizing such services increased rapidly with income, exceeding 50 percent above the $1,500 level, and amounting to 90 percent or more among families with incomes of $5,000 or over in the large and middle-sized cities. At this latter level the wives who reported outlay for cleaning and pressing spent an average of close to $1 monthly.[11]

The data on expenditures by wives per article for selected articles of apparel indicate that for most of the items listed in table 8, wives in the Pacific Northwest cities paid rather more than did those at comparable income levels in other groups of communities. The chief exception to this appeared in the case of heavy coats, both with and without fur, for which wives in these Pacific Northwest cities generally spent less than did wives elsewhere. A partial explanation for relatively low prices paid for coats in those cities may lie in the fact that the comparatively mild winters on the coastal strip make it unnecessary to buy as heavy coats as those worn in areas with more severe winters. Coats not interlined are likely to be somewhat less expensive than those that have interlinings.[12] As regards prices paid for other garments, it is not possible to state whether wives in the Pacific Northwest cities tended to purchase articles of a somewhat more expensive type, or whether the difference was due to retail price differences between that region and others studied. It seems probable, however, that the latter factor was of more influence than the former, since the Pacific Northwest cities are farther from centers of clothing and textile manufacture than are others included in the investigation.[13]

Clothing Purchased by Husbands

On the whole, the data showing husbands' clothing expenditures classified into the main items and groups of items reveal considerable uniformity among the various communities not only in the apportionment of clothing expenditures of husbands among the various types of wearing apparel, and in the relative frequency of purchase of the different garments, but also in the relationship between income and the pattern of clothing expenditures. Disregarding occasional irregularities, there is comparatively little in these data to indicate clear differences among communities in different parts of the country, among cities of different size, nor, for comparable income groups, between whites and Negroes.

Among husbands, the group of clothing items representing suits and trousers ranked first in average amount spent at each income level in every community studied. Except among Negro families in New York and Columbus, more than half of the husbands at each income level studied reported expenditures for such apparel. In most cities at least 9 out of 10 of the husbands in families with incomes of $3,000 and over had expenditures for these garments, but at no

[12] Climatic differences, however, do not explain the fact that among Southeast white families the prices paid by wives for heavy coats averaged fully as high as did those in the New England and East Central, or West Central and Rocky Mountain cities.

[13] According to the report of the Works Progress Administration on Intercity Differences in Costs of Living in 59 Cities, March 1935, the cost of clothing in Portland, Oreg., was higher than in all but a few of the 59 cities included in that investigation.

Federal Reserve Bank of St. Louis

income level in any group of communities did every husband report outlay for such items. (See part II, table 4.)

At most economic levels suits and trousers (including overalls) accounted for about one-third of the average clothing expenditures of husbands. There was a tendency for this group of garments to absorb a larger proportion of the total at the upper end of the income scale than at the lower. Thus, among families at the $500 to $1,000 level, average expenditures by husbands for suits, trousers, and overalls were between $5 and $10, while among those in the group receiving $5,000 and over in the communities where families above the $5,000 level were grouped together, average expenditures were around $70. New York and Chicago husbands in families with incomes of $7,500 and over spent over $130 during the year for these garments. Since so high a proportion of husbands had expenditures for suits or trousers, the average outlay by those reporting such expenditures was not generally materially higher than the average for all husbands in the group.

Although well over half of the husbands reported expenditures during the year for some article in the group comprising suits, trousers, and overalls, the proportion that bought heavy wool suits was very much smaller than this at all income levels. In general, fewer than 10 percent of the husbands in families with incomes below $1,000 bought heavy wool suits, and the proportion buying light wool suits was little greater. Among families above the $5,000 level, on the other hand, more than half purchased heavy wool suits, and more than half, light wool suits. While no data are available as to the number buying both types of suit during the year it is evident that a fair proportion at these upper income levels did incur expense for both heavy and light wool suits.

Average prices paid for heavy wool suits by husbands purchasing such garments were between $18 and $25 among families with incomes of $500 to $1,000. Average prices rose consistently with income in each group of communities, and amounted to between $40 and $50 at the income level of $5,000 and over in the large and middle-sized cities. Average expenditures per suit for light wool suits were generally somewhat less than those for heavy wool suits, increasing over the same income range from between $16 and $20 to from $30 to $35 in most communities. (See table 12.)

Men's heavy and light wool suits together accounted for 20 percent or more of total clothing expenditures of husbands at virtually all income levels except the lowest in the various groups of communities included in the investigation. In the upper part of the income range not far from 30 percent of the total was accounted for by these garments. Husbands in Negro families in the Southeast cities devoted about the same proportion of their total clothing outlay to these items as did those in white families at comparable income levels

Except in the upper part of the income range, shoes and other footwear were next in importance to suits and trousers in husbands' clothing expenditures. Because of the limited durability of shoes, and because they can less easily be exchanged among family members than many other articles of apparel it is not surprising that a relatively high proportion of husbands reported expenditures for footwear at all income levels.

Among husbands in families with incomes of $500 to $1,000, the average yearly expenditure for footwear was between $4 and $6. At the $5,000 and over level approximately four times this amount was spent. These data indicate that footwear is a considerably less elastic item in the clothing budget than are suits and trousers. A part of this relative inelasticity is accounted for by the fact noted above, that the percentage buying shoes during the year increased very little with income, so that increases in average outlay came only from the greater number of pairs purchased per person and the higher average price.

Husbands in families with incomes of $500 to $1,000 spent between $3 and $4 per pair for street shoes. The average price per pair purchased by husbands rose quite consistently in successive income classes, approximately doubling between the lowest and highest income class studied in the several groups of communities. There were no well-marked differences among the several communities in the average price paid by husbands at any given income level, except in the Pacific Northwest communities, where the prices averaged considerably higher than in the New England and East Central small cities. The comparative nearness of these latter communities to the shoe-manufacturing centers may help to account for the relatively low prices paid by husbands for street shoes in that group of cities.

The data on average quantities purchased for street shoes indicate that, above the lowest income group studied, husbands averaged not far from two pairs per year at the intermediate income levels, and between two and three pairs above that level.

Expenditures for overcoats and other wraps were very small among husbands in families at the lower end of the income scale, but they rose fairly rapidly with income to rank generally above expenditures for footwear among those at the highest economic levels studied. One reason for the relatively rapid increase in average expenditures is the fact that the proportion incurring expense for such garments also rose sharply in successive income classes. Below the $1,000 income level between one-fifth and one-third of the husbands bought overcoats, jackets or sweaters, while more than half purchased such garments, beginning as low as the $1,500 level in some groups of cities, and as high as the $3,000 level in others.[14]

[14] In the Southeastern cities, fewer than half of the husbands reported expenditures for coats and other wraps at every level below $5,000. This difference may be related to the comparative mildness of the climate in that region.

Federal Reserve Bank of St. Louis

The expenditures for overcoats and other outer wraps at the low income levels chiefly represented the less expensive garments such as jackets and sweaters, since even for the husbands that reported outlay for articles in this category the average amount spent was generally less than $10 at income levels under $1,500. In families below the $2,000 level fewer than one husband in six purchased an overcoat during the year.[15] The proportion purchasing overcoats varied rather widely among husbands at the higher economic levels; more than two-fifths of those in the Pacific Northwest cities in families above the $5,000 level bought such apparel, as compared with fewer than one in four in the Southeast. The proportion in the other groups of communities was about one-third at this income level. Largely because of the relatively small percentage of husbands at a given income level in the Southeast that bought coats, average expenditures for this group of garments were generally lower there than in the other communities. Only above the $5,000 level, did their average expenditures for coats and other wraps amount to as much as $10.

Among the husbands who bought overcoats during the report year average expenditures per garment rose in successive income classes from between $15 and $25 at the $500 to $1,000 income level to $40 or more among families with incomes of $5,000 and over. Husbands in Negro families spent about the same amount per overcoat as did those in white families at comparable income levels (see table 12).

There was little uniformity among the groups of cities in the proportion of husbands purchasing topcoats. In all communities, however, the proportion was small at the low and intermediate income levels, and increased in successive income classes. Only one or two percent of the husbands at the $500 to $1,000 income level had such expenditures, but at the upper end of the income scale among families receiving $5,000 and over, the proportion varied from 8 percent in the Pacific Northwest cities to nearly 30 percent in the New England and East Central cities. As a rule average expenditures per coat for these lighter garments were considerably less than those for overcoats purchased by husbands at the same income level, the difference often amounting to as much as 50 percent.

In the lower part of the income range, wool sweaters were purchased by a substantially greater proportion of the husbands than were either overcoats or topcoats. In most communities, the proportion reporting such expenditures was somewhat higher at the top of the income scale than at the bottom, but because of the fairly small expense involved in the purchase of sweaters, income had much less effect on frequency of purchase than in the case of the more expensive garments. In most communities the proportion of husbands buying

[15] Except among New York and Columbus Negro families at the $1,500 to $2,000 level, where more than one-fifth of the husbands purchased overcoats in the year covered by the Study.

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

wool sweaters varied between 10 and 20 percent along the income range.

The average prices paid by husbands for sweaters, like those for other garments, rose in successive income classes from between $2 and $3 among families with incomes of $500 to $1,000 to between $4 and $5 in the highest income groups studied.

The group of articles included in underwear, nightwear, and hose generally absorbed almost as large as a share of husbands' total clothing expenditures as did footwear, and more than coats and other wraps in the lower and intermediate parts of the income range. These articles, like those for footwear, were a relatively inelastic element in husbands' clothing budgets, the increase in average expenditures in most communities being only about fourfold between the two extremes of the income scale.

With a few scattered exceptions, 95 percent or more of the husbands in white families reported expenditures for one or more of the items included in this group. Among the Negroes the proportion varied rather irregularly between 70 and 98, without any very close relation to income. In both racial groups the proportion was high enough so that average expenditures by husbands spending for this category generally differed little from the averages based on all husbands. On the latter basis, the amounts spent by husbands averaged a little below $4 among families with incomes of $500 to $1,000 and between $15 and $18 at the $5,000 and over level in the large and middle-sized cities. Husbands in New York and Chicago families with incomes of $7,500 and over reported an average outlay for the year for underwear and hose of $30.

As in the case of wives, the most frequently purchased articles in this group were hose. Husbands appeared to get along with less frequent purchases of hose than did wives, however, since fewer than two-thirds bought either cotton dress hose or rayon and silk hose. The proportion of husbands buying cotton dress hose was much greater than the proportion of wives buying them, and in most communities, except at the upper end of the income scale, cotton hose were purchased by a greater percentage of husbands than were those of silk and rayon. Only above the $5,000 income level did the proportion buying silk and rayon hose equal or exceed 50 percent in all communities surveyed.

Average prices paid by husbands for hose were comparatively small, even for those of silk and rayon. Below the $2,000 income level the average price paid for cotton hose was under 25 cents, and for silk and rayon hose 35 cents or less. Even among families at the highest income level studied in the several groups of communities the average price for cotton hose was generally under 50 cents, and for silk and rayon, under 60 cents.

Federal Reserve Bank of St. Louis

Among white families in all groups of communities studied except New York and Chicago at least three-fourths of the husbands reported expenditures for shirts during the year of the Study, even at the lower end of the income scale. In general, between 8 and 9 husbands in 10 had such expenditures, with the proportion somewhat higher at the upper economic levels than at the lower. Average expenditures rose from under $3 for the year to about $15 among husbands in families above the $5,000 level in the large and middle-sized cities. In New York and Chicago, husbands above the $7,500 income level spent an average of $23 for shirts.

The data on expenditures per article for cotton shirts purchased by husbands indicate that relatively inexpensive shirts were purchased by the great bulk of the husbands, even at the upper end of the income scale. With few exceptions neither cotton work shirts nor other cotton shirts averaged above $2 in price, in any part of the income range. The most characteristic price for work shirts was around $1.

Except in the Pacific Northwest cities more than half of the husbands in white families bought some form of headwear during the year. The proportion reporting purchase rose fairly consistently with income, increasing in most groups of communities from between 53 and 65 percent to 90 percent or over between the two ends of the income scale. Average outlay for hats and caps was not large, however, and did not amount to more than $10 for the year among any group of husbands except those in New York and Chicago at income levels above $7,500. While the proportion of Negro husbands buying headwear varied rather irregular from one income class to the next, average outlay for comparable income groups was similar to that for whites.

Husbands purchasing felt hats paid prices averaging between $2 and $3 in families at the $500 to $1,000 level, and between $4.50 and $5.50 among those receiving $5,000 and over in the large and middle-sized cities. Straw hats varied in average prices from about $1 to $3.50 or $4 over the same income range.

The articles of apparel not included in the groups discussed above were not very important in husbands' clothing budgets at most income levels. These articles include special sportswear, such as bathing suits, accessories such as ties, belts, suspenders, jewelry, and handkerchiefs, and miscellaneous items, including expense for cleaning, pressing, and repair. Comparatively few husbands purchased special sportswear, and the average outlay was extremely small. While expenditures for accessories were reported by from 60 to 90 percent of the husbands included in the Study, the average amounts spent were below $10 at income levels under $4,000, except in New York and Chicago. In the group receiving $7,500 in those two cities husbands spent an average of $22 for accessories.

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

Miscellaneous clothing expenses were also unimportant in the lower and intermediate income groups, but exceeded accessories in average amount in the upper portion of the income range. At the levels above $3,000, cleaning and pressing was the major item accounting for the rise.

As might be anticipated, cleaning and pressing was a more important element in the clothing expenditures of husbands than of wives. This difference probably reflects both the fact that most husbands and comparatively few wives have gainful employment outside the home, and that men's garments are much less easily cleaned and pressed at home than are women's. At the $500 to $1,000 income level from 30 to 50 percent of the husbands reported some outlay for

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

these services, although the average amount spent per husband reporting such outlay at this level was comparatively small—between $2 and $4 for the entire year. (See table 13.) The percentage utilizing cleaning and pressing services increased rapidly with income, as did the average outlay by those reporting such expense. Among husbands in families above the $5,000 level in the large and middle-sized cities 95 percent or more had expenditures for cleaning, the amounts so spent averaging (for husbands having cleaning expense) between $16 and $20. For comparable income groups the proportion of husbands utilizing cleaning and pressing services and the average outlay was similar for whites and Negroes.

Clothing Purchased by Females Other Than Wives [16]

It will be recalled that clothing expenditures of wives in all age groups averaged considerably more than those of other women 30 years of age and over in families at the same income level, but about the same as, or in some cases less than, the outlay reported by girls and other women 16 to 29 years of age. These facts find reflection in the proportion of these girls and other women that had expenditures for the different groups of garments distinguished in the present analysis. Although the proportion of "other" females aged 30 and over who reported expenditures of the several types of apparel varied somewhat irregularly from one income class to another [17] the data as a whole indicate very clearly that the variety in type of clothing expenditures was substantially less for this age group than it was for wives. Among girls and other women 16 to 29 years of age, on the other hand, the proportion having expenditures for the several types of garments tended to be a little greater than it was for wives in the same income group. In the case of special sportswear, representing garments for active participation in sports, the difference, as might be expected, was quite marked. Only in the case of underwear did wives report expenditures with as great relative frequency as did females 16 to 29 years of age.[18]

Although average expenditures for each group of articles were substantially larger for wives than for other females over 30 in the same communities at all comparable income levels, this difference

[16] The following discussion of expenditures of family members other than husbands and wives for the various types of garments has been based on the data for white families. Similar information regarding Negroes in the two groups of communities for which data on expenditures by Negro families are available is based on so small a number of persons in many of the sex-age groups classified by family income that comparison with data from white families has limited validity. So far as the available figures are indicative of consumption patterns in clothing expenditures, however, they suggest that the general relationships observed in the case of the white families were present among the Negroes also. (See pt. II, tables 4 and 6, for details of clothing expenditures of family members other than husbands and wives.)

[17] This irregularity probably arose chiefly from the fact that the number of members in this category was considerably smaller than the number of wives, or the number of other females 16 to 29 years of age.

[18] See pt. II, table 4.

was in considerable part the result of the differences in the proportion purchasing. When average expenditures for wives and other females over 30 are computed for those that incurred expense for the various types of garments the differences are considerably smaller, although in most cases they are consistent enough to indicate that the garments bought were either fewer in number per person or were less expensive per article.[19]

Insofar as comparison is possible between wives and other females aged 16 to 29, it appears that the pattern of spending for clothing is fairly similar for these two groups of family members, not only in the total amount spent, but in the relative importance of the constituent items.

The most important difference appeared at the upper end of the income range where average total clothing expenditures and expenditures for such groups of articles as headwear, coats, dresses, and suits were, in general, appreciably larger for wives than for females aged 16 to 29. Throughout the income range, wives generally spent appreciably more for both heavy and light wool coats than did these other members. Average expenditures for silk hose by females aged 16 to 29 were very similar to those reported by wives in the same cities and at comparable income levels. (See table 10.) For the underwear category as a whole, likewise, the level of spending by girls and other women 16 to 29 years of age was not consistently higher or lower than that of wives, except at the upper income levels, where there was some tendency for wives to spend more than the others. As indicated earlier, special sportswear was more important in the spending of the girls and women in the age group 16 to 29 than among wives, but since average expenditures for such items were very small for both groups, this difference was relatively unimportant even at the higher economic levels.

Among the children in the age groups from 2 through 15, the relative importance of the various groups of apparel items was naturally somewhat different from that of the older family members. In the lower and intermediate income groups, at least, the proportion for whom headwear was purchased during the year tended to vary inversely with age, and for each of these groups to be smaller than for the adults.

Partly because of these differences in the proportions having expenditures, but probably also because of differences in expenditures per hat, the average outlay for headwear, even for the group aged 12 to 15, was at many income levels in the various communities less than half that for the group in the 16 to 29 age group. As might be anticipated, these expenditures, like the proportion reporting them, varied inversely with

[19] Data on the quantity of the different articles of clothing purchased, and on average expenditures per article are available for husbands and wives only.

Federal Reserve Bank of St. Louis

the age of the children. Even at the highest income level studied in New York and Chicago ($7,500 and over) average outlay for headwear for children aged 2 to 5 was under $4; and that for the 6 to 11 group was less than $5.

Although the proportion of children in the age groups under 16 for whom dresses, suits, skirts, and blouses were purchased was as high as it was in the case of wives and other females in the 16 to 29 age group, average amounts spent were much smaller in every comparable income group in all communities included in the Urban Series of the Consumer Purchases Study. At most income levels the average amount spent by girls in the 12 to 15 age group was only one-half or two-thirds as large as that reported for wives, and in a number of cases only about one-third as much was spent for these children. For the lower age groups the average expenditures for such garments were correspondingly smaller.

The propensity children have for going through their shoes quickly is evidenced by the fact that in the lower part of the income range in virtually all groups of cities shoes were purchased for a greater proportion of children aged 6 to 15 than for wives or other adult females in corresponding groups of families. Higher in the income scale, however, this difference was not clearly apparent, since at those levels all but a very small percentage of family members of all age groups bought shoes during the year. In fact, average outlay for shoes for girls 12 to 15 did not differ significantly from that for wives when corresponding income groups are compared in the same communities. Expenditures for shoes for girls aged 6 to 11 averaged somewhat lower, probably because shoes for the younger children can usually be purchased somewhat more cheaply than for older persons. There was a similar differential between average expenditures for footwear for children in the 6 to 11 age group and those for children aged 2 to 5. In all communities, expenditures for shoes absorbed a much larger proportion of the total outlay for children's clothing than they did of the expenditures of their parents.

On the whole, a greater percentage of the children of the several age groups under 15 acquired coats and other wraps than did wives in comparable groups of families. Average expenditures for such garments, however, were considerably smaller, even when such averages are based on all families in the respective groups. In such apparel, as in the case of most other groups of items, there was a tendency for each younger age group to have smaller average expenditures.

In outlay for accessories the young family members naturally ranked relatively low in comparison with the adult members. For those under 12 years of age the average amount spent was below $4, even at the highest levels studied in the several groups of communi-

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

ties, although above the $1,000 level in most communities well over half had expenditures for such items.

Clothing Purchased by Males Other Than Husbands

In some ways the relationships observed in the case of clothing expenditures for wives and other female members of the family were paralleled by those obtaining among male family members. As indicated earlier, husbands spent more than any other male group; other men 30 years of age and over in these family groups spent less than boys and men aged 16 to 29, and the level of clothing outlay for the groups under 16 varied directly with age. As in the case of female members, the low average outlay for clothing by males over 30 in comparison with other adult members of that sex was related both to the smaller proportion buying the several types of garments and also to the fact that, among those who bought, average expenditures for the larger groups such as coats, suits, underwear, and footwear, were less than they were for husbands and young men aged 16 to 29. In general, however, there was closer similarity in the pattern of clothing expenditures for other men 30 years of age and over and those of husbands and young men aged 16 to 29 than there was between that of females over 30 and those of wives and young women in the 16 to 29 age group. An explanation for this difference may lie in the probability that the men over 30 were more likely than the women in that age group to have employment away from home. If so, their clothing requirements would be relatively greater.

The higher level of spending for clothing by husbands as compared with the other adult males was maintained fairly consistently in most of the individual groups of garments distinguished in the present analysis. They ranked high in both the proportion reporting and in average outlay for headwear, but in most other categories of apparel they were higher than members aged 16 to 29 in the average amount spent, but not in the proportion spending. This indicates a tendency for the articles of clothing purchased by husbands to be somewhat more expensive than those bought by young men in the 16 to 29 age group. This inference is supported by the data on average outlay by the several groups of members based on the number that had expenditures for the specified garments.[20] For example, in New York and Chicago, husbands at the $1,500 to $2,000 income level who bought heavy wool suits spent an average of $28 during the year, while boys and other men aged 16 to 29 spent $25 for such

[20] Since data on expenditures per article or on quantities purchased are available only for husbands and wives, no absolute comparison can be made on prices paid by the various members. In the case of garments such as overcoats or heavy wool suits, however, of which only one would generally be purchased during the year by a member of a family at the lower and intermediate income levels, the data on average expenditures for the several groups indicates fairly well the average prices paid.

Digitized for FRASER

Federal Reserve Bank of St. Louis

garments. For overcoats, husbands at the same economic level spent $26, and the other men and boys, $17.

It is interesting that in footwear the 16 to 29 age group, on the whole, reported expenditures somewhat more frequently than did husbands, although in average amounts spent the latter group still ranked a little ahead of the former.

Among the boys under 12 years of age there were comparatively few consistent differences in the proportion spending for the several groups of items except in case of shirts, which were purchased for relatively few boys under 6 years of age, even in the upper part of the income range. In the case of accessories, likewise, such as ties, belts, and jewelry, the proportion for whom expenditures were made was lowest for the youngest boys, but was fairly similar for the next two age groups. Footwear was purchased for at least 95 percent of the boys in each age group at the majority of income classes, even at the lower economic levels.

There was no indication either in the proportion obtaining shoes or in average outlay for footwear that boys are harder on shoes than girls of the same age. In fact, expenditures for footwear for girls in the 12 to 15 age group averaged consistently higher than for boys of the same age. Between boys and girls in the other two age groups there was very little difference, but average outlay was fully as high for the girls as for the boys.

Although shoes were purchased during the year for approximately the same percentage of boys of each age group, average expenditures for the smallest boys were quite consistently less than those in the other age groups under 16. This fact is probably accounted for largely by lower unit prices per pair for shoes for small children, and to some extent, perhaps, by the fact that the boys under 6 are less likely to play strenuously out of doors and on pavements than are those between 6 and 16.

There was less difference than might be anticipated in average outlay for suits and trousers for boys in these three age groups. Such differences are generally clearer, however, at the higher income levels than at the lower. In accordance with expectations, the older boys generally spent more than the younger.

The greater variety and, in general, the greater cost of feminine underwear as compared with that for boys and men appears even in the average outlay for children under 12. Expenditures for underwear, nightwear, and hose for girls aged 12 to 15 averaged close to twice those for boys of the same age in the same group of communities. Even among children in the next lower age interval (6 to 11), expenditures for the girls were definitely above those for the boys, and among the smallest children classified by sex there was a tendency in most communities in the same direction.

Expenditures for Sewing

The data on types of clothing expenditures obtained in the Urban Series of the Consumer Purchases Study indicate strikingly the extent to which the purchase of factory-made apparel has supplanted the earlier practice of making garments at home and employing dressmakers to do part or all of the family sewing. In spite of the fact that, over the income range covered, from 50 to 90 percent of the families studied in the various cities reported ownership of sewing machines,[21] comparatively little was spent at any income level for materials and paid help for sewing for any family member. Evidently, a considerable proportion of these machines were purchased at a time when the practice of making garments at home was more widespread than it appears to be today.

On the whole, expenditures for materials and paid help in sewing were reported somewhat more frequently for girls in the age groups under 16 than for wives, but in most income classes in the several communities such expenditures were reported for fewer than half of the girls in any age group. There was comparatively little consistent relation, either direct or inverse, between income and the proportion reporting expenditures for such purposes.

With few exceptions average expenditures by wives were substantially larger than those for girls in families at corresponding income levels. While there was considerable irregularity in the data there was a fairly clear tendency for such averages to increase with income. In only a few cases, however, did the amount reported average as much as $5, even among wives in families above the $5,000 level. Among girls under 16, the amounts reported varied independently of income in most communities, and were generally least for the youngest girls, in the age group 2 to 5, for whom the average outlay was usually under $1.50 for the entire year. Even the averages based on those for whom such expense was reported were so small as to indicate that very little apparel was acquired that was not ready-made. (See table 14.)

For boys expenditures for materials and paid help for sewing were both infrequent and very small. At most income levels in the various communities such expense was incurred for fewer than one-fifth of the boys between 2 and 12 years of age. Average outlay were generally under 50 cents, and for a considerable proportion of the groups, were even below 25 cents.

Chapter IV

Expenditures for Personal Care

Expenditures for personal care, unlike those for clothing, constitute a small but relatively fixed proportion of the family budget. At virtually all income levels, and in all communities studied, the goods and services included in this category accounted for close to 2 percent of total money expenditures for current living among white families, and between 2 and 3 percent among Negroes. Even more than in the case of clothing therefore, the data for personal care expenditures exhibit a marked similarity in relative importance in the communities differing widely in size and in geographic location that were included in the Urban Series of the Consumer Purchases Study.[1]

In the large cities, expenditures for personal care were between $16 and $20 per family at the lower end of the income scale, and were five or six times as large at the upper end. In general, a rate of spending as high as $1 weekly for all items included in personal care was maintained only above the $3,000 income level, while in most cities less than $2 weekly was spent even by families in the $7,500 to $10,000 level. In the middle-sized and small cities average expenditures were quite similar to those in the larger cities for corresponding income groups.[2] At income levels below which half the families that were studied live [3] expenditures for personal care for the entire family averaged 75 cents or less per week. This level of spending clearly indicates that for such groups, at least, the outlay for personal care included very little besides haircuts, toilet soap, dentifrices, and tooth brushes.

While the differences were comparatively small, Negro families tended to spend more for personal care than did white families at the same income level. Thus, in the two categories most closely associated with personal appearance, Negro families outranked whites in their level of spending.

---

[1] Detailed data on personal care expenditures were obtained from the expenditure schedules, and were therefore tabulated on the same geographic basis as were total family expenditures for clothing, presented in ch. I.

[2] See pt. II, table 3, for detailed data on expenditures for personal care for all families and for families of the several types distinguished in this study.

[3] Median incomes for the families eligible for the expenditure schedule ranged from $1,400 to $1,900 among white families in the cities other than New York, and between $575 and $1,325 for the Negroes. See table 1, appendix A for the median incomes of eligible families in each of the cities and groups of cities for which expenditure schedule data are presented.

Personal Services

At most income levels, personal services to family members, including haircuts, shampoos, manicures, and all other barber shop and beauty parlor services, accounted for slightly over half the total amounts spent for personal care. The remainder comprised toilet soap and dentifrices, all cosmetics, and toilet articles such as brushes, combs, manicure equipment, and other articles used in personal grooming. There was a general tendency in most communities for average expenditures for services to increase more rapidly with increases in income than those for toilet articles and preparations.

Expenditures for personal services have been tabulated for husbands, wives, children under 16, and other family members. Throughout the income range, in the majority of cities studied, services for husbands and wives together accounted for approximately three-fourths of the total when families of all types are considered together. Other family members over 16 generally absorbed over half of the remainder, in income classes above $2,000, and less than half below that level. (See table 15.)

In the lower income groups expenditures by husbands for personal services were larger than those by wives, but above the $2,000 level or thereabouts in most communities wives spent more than husbands. In Chicago, for example, in families with incomes of $2,000 to $2,250, husbands spent an average of $9 per year for personal services, or at the rate of 75 cents per month. This level of spending clearly included very little besides the periodic haircuts. In the same income group wives had an average outlay of only $8.10 for the year. Between this economic level and the highest studied in Chicago ($10,000 and over) expenditures for personal services by husbands increased less than threefold while average outlay by wives increased twice as rapidly, or approximately sixfold. In income classes under $1,250 in this metropolitan center expenditures of husbands for personal services were twice those of wives, while above the $7,500 level those of wives were virtually twice as great as the amount spent by husbands.

This shift in relative size of expenditures for personal services by husbands and wives was somewhat more pronounced in Chicago than in many of the other cities included in the Urban Series of the Study of Consumer Purchases, particularly the less highly urbanized communities, but among the white families at least, the data show that the same general pattern of spending was followed. It is interesting that among Negro families in the Southeast cities, husbands spent more for personal services than did wives throughout the income range. Among Columbus Negroes, likewise, husbands spent more than wives at all but two income levels. In New York, however, expenditures for personal services were consistently larger for wives than for husbands in the upper part of the income scale.

The distribution of expenditures for personal services naturally varied considerably among families of different composition, the share going to husbands and wives decreasing in families of successively larger membership. Among those with three to six members, at least three of them 16 and over (types IV and V), in the communities where families of those types were analyzed together, expenditures for members over 16 were usually greater than those for wives in the lower part of the income range, and often greater than those of husbands at the upper income levels. The relatively large average amounts spent by such members often reflects the presence in the family of two or more members in that age group.

Toilet Articles and Preparations

Since toilet articles and preparations include such standard items in the family budget as toilet soap, dentifrices, tooth brushes, hair brushes, and combs, it is not surprising that virtually every family throughout the income range in all communities studied reported expenditures for one or more of these items.

Average expenditures increased fairly consistently over the income range in all communities studied, rising from between $10 and $15 per family at income levels of $750 to $1,000 in most urban groups to be-

Federal Reserve Bank of St. Louis

tween $40 and $50 among families with incomes above $7,500 in the two metropolitan centers and in the large cities. Families in the highest income groups ($5,000 and over) studied in the middle-sized cities generally averaged between $30 and $40 during the year for toilet articles and preparations (see table 16). For comparable income groups there was relatively little difference among the communities in average outlay for these items, even when those differing in degree of urbanization as greatly as do Chicago and the New England small cities are compared. So far as the items making up the miscellany of toilet articles and preparations are concerned, therefore, the data indicate a rather widely uniform pattern of spending among American families belonging to the groups from which those included in the expenditure analysis were selected.

In the lower part of the income range, toilet soap naturally ranked first among the items included, both in the proportion of families having expenditures and in the average amount spent. (See table 16.) Only at scattered income levels were a few families found that incurred no expense during the year for toilet soap. Among families with incomes of $750 to $1,000 average expenditures for the year ranged between $3 and $4 in most cities, or between 6 and 8 cents per week. Such outlay accounted for from 30 to 40 percent of expenditures for all toilet articles and preparations.

While toilet soap is one of the relatively inelastic categories of expenditure, average amounts spent increased fairly regularly with income, but much more slowly than did most of the other groups of items included in toilet articles and preparations. Accordingly, outlay for toilet soap declined almost one-half as a proportion of this total between the $500 and $1,000 income level and that of $5,000 and over.

In the case of most commodities included in family living, increasing expenditures at successive income levels represented not only increasing quantities purchased but also higher prices paid per unit. In the case of toilet soap, average outlay per cake increased very little with income. In the lower part of the income range families in most cities studied reported yearly purchases of between 60 and 80 cakes. At the highest income levels the amount purchased was close to twice as great, while average expenditures were usually between two and three times the amount reported by low income families. For example, families at the $750 to $1,000 income level in Chicago purchased approximately 70 cakes of toilet soap per family during the year for which they paid an average of about $4, or not quite 6 cents per cake. Among families receiving $5,000 to $7,500 an average of 116 cakes of soap were purchased, costing $7.60, or about 6.5 cents per cake. Even the group receiving $10,000 and over spent slightly less than 8 cents per cake.

Expenditures for dentifrices, including tooth paste, tooth powder, mouth washes, and dental floss were considerably smaller than those for toilet soap in the lower and intermediate income groups, but generally exceeded soap at the higher economic levels. This shift in rank reflected the more rapid rise with income in expenditure for dentifrices as compared with toilet soap, although the former did not increase rapidly enough, on the whole, to account for an increasing proportion of total outlay for toilet articles and preparations.

Expenditures for shaving soaps and shaving cream were quite small at all income levels, and rarely accounted for as much as 10 percent of total outlay for toilet articles and preparations. Among Negro families less than 5 percent of the total was so used at most levels. While the amounts spent rose with income, they were generally below $3, even in the upper part of the income range.

The most elastic group of items represented in toilet articles and preparations was that comprising perfumes, cold cream, powder, and other cosmetics. Since expenditures for the items included in this group may be greatly reduced, if other needs are very pressing, it is not surprising that the low income families generally spent comparatively little in this way. Average expenditures were generally under $4 in income groups below $1,500, and were $2 or less at the lowest levels studied. Among families receiving $7, 500 and over in the large cities expenditures for these items were usually between $15 and $20. New York families above the $10,000 level spent an average of $27, but the same group in Chicago reported outlays averaging about the same as those for the $7,500 and over group in the large cities. Thus, expenditures for these items rose with income rapidly enough to account for increasing proportions of the total amount spent for toilet articles and preparations, the relative increase approximately balancing the relative decline in amounts spent for soap.

Appendix A

Scope and Method of the Study of Consumer Purchases: Urban Series

The data collected in the Urban Series of the Study of Consumer Purchases are presented in three sets of publications. The first two, which have been published in a series of two-volume bulletins, pertain to the distribution of families according to nativity, income, occupational group, family composition, and home tenure; and to the expenditure of current income for the major categories of consumption.[1]

The third set of publications covers the details of expenditures; for example, the report on food presents not only total expenditures for food but also the details on expenditure for meals away from home, and for specific food items, such as white flour and lamb chops. These details are presented in a series of volumes,[2] each containing data for a certain group of expenditures, such as those for food or for housing, for all the communities covered by the Urban Series of the Study of Consumer Purchases.[3]

---

[1] See the following bulletins:

Bull. No. 642.—Family Income and Expenditure in Chicago, 1935-36.
Bull. No. 643.—Family Income and Expenditure in New York City, 1935-36.
Bull. No. 644.—Family Income and Expenditure in Nine Cities of the East Central Region. 1935-36.
Bull. No. 645.—Family Income and Expenditure in Selected New England Cities, 1935-36.
Bull. No. 646.—Family Income and Expenditure in Selected Urban Communities in the West Central-Rocky Mountain Region, 1935-36.
Bull. No. 647.—Family Income and Expenditure in Selected Southeastern Cities, 1935-36.
Bull. No. 649.—Family Income and Expenditure in Four Urban Communities in the Pacific Northwest Region, 1935-36.

Each bulletin is published in two volumes. Volume I, Family Income, pertains primarily to the income data but also includes information on family composition and rents paid.

Volume II, Family Expenditures, contains the summary of expenditures for each of the major categories of consumption, such as housing, food, clothing, personal care, etc. Thus in these volumes, total expenditures for clothing and personal care are compared with expenditures for these other groups of items of consumption.

[2] The volumes which together make up Bull. No. 648, Family Expenditures in Selected Cities, are as follows:

Volume	
I	Housing.
II	Food.
III	Clothing and Personal Care.
IV	Furnishings and Equipment.
V	Medical Care.
VI	Travel and Transportation.
VII	Recreation, Education, and Contributions and Personal Taxes.
VIII	Changes in Assets and Liabilities.

[3] Families providing income and expenditure data selected the report year that they preferred, either the calendar year 1935 or a 12-month period ending in 1936. All data represent family expenditure for a period of 12 months during 1935-36, except the material pertaining to the details of expenditure for food. This is based on 1 week's consumption.

The Population Covered

Cities studied.—The cities included in the Consumer Purchases Study were chosen to represent the metropolis, the large city with a population from 250,000 to 300,000, the middle-sized city with a population from 30,000 to 75,000, and the small city with a population of from 8,000 to 20,000, in 6 different regions of the country. In the field work the Bureau of Labor Statistics covered all the cities studied in the first 3 groups, and 10 of the small cities. In the analysis of the results, this Bureau has been responsible for the data from the cities shown in the following table.[4]

Cities included by Bureau of Labor Statistics in the analyses of family expenditures

Region	Metropolitan and large cities	Middle-sized cities	Small cities
Northeast	New York, N. Y. Providence, R. I.	Haverhill, Mass. New Britain, Conn.	Wallingford, Conn. Willimantic, Conn. Westbrook, Maine. Greenfield, Mass.
Southeast	Atlanta, Ga.	Columbia, S. C. Mobile, Ala.	
East Central	Chicago, Ill. Columbus, Ohio.	Muncie, Ind. New Castle, Pa. Springfield, Ill.	Beaver Falls, Pa. Connellsville, Pa. Logansport, Ind. Mattoon, Ill. Peru, Ind.
West Central–Rocky Mountain.	Omaha, Nebr. - Council Bluffs, Iowa. Denver, Colo.	Dubuque, Iowa. Springfield, Mo. Butte, Mont. Pueblo, Colo.	
Pacific Northwest	Portland, Oreg.	Aberdeen-Hoquiam, Wash. Bellingham, Wash. Everett, Wash.	

Since the purpose of the expenditure survey was to determine, insofar as it is possible to do so, the influence of income, family type, and occupation upon family spending, it seemed wise not to try to cover, with the restricted funds available for the investigation, the total population of each community studied. Instead, certain qualifications were set up for the purpose of eliminating as far as possible the effect of alien customs, economic stress, and broken family ties, which might tend to obscure the factors in family spending which it was desired to measure.

Nativity groups.—The expenditure survey was limited to families in which the husband and wife were both native born. In New York, Columbus, and the Southeast, data were obtained not only from white families but also from Negro families; in the other cities the investigation of expenditures was confined to white families.

[4] See p. 575 for the cities covered by the Bureau of Home Economics.

http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

Income and occupational groups.—In all cities families having received relief at some time during the year were excluded from the expenditure survey. The population covered was further restricted by the omission of nonrelief families with incomes below the levels which define the customary spending of nonrelief groups. Families with incomes below $500 in the metropolises, white families with incomes below $500 in the large cities, and white families with incomes below $250 in the other cities were omitted. Among Negro families in Columbus, those with incomes below $250 were likewise excluded.

TABLE A.—*Median incomes and percentage distribution by income of families represented by the expenditure data*

City and color	Median income	Percentage of families represented by the expenditure data								
		All families	Under $1,000	$1,000–$1,499	$1,500–$1,999	$2,000–$2,499	$2,500–$2,999	$3,000–$3,999	$4,000–$4,999	$5,000 and over

[1] Families with incomes below $500 were excluded from the expenditure schedule sample.
[2] Families with incomes below $250 were excluded from the expenditure schedule sample.
[3] Includes all families with incomes of $3,000 and over.
[4] Families with incomes above $3,000 were excluded from the expenditure schedule sample.
[5] Includes all families with incomes of $4,000 and over.
[6] Includes all families with incomes of $2,500 and over.

In most of the cities covered in the expenditure study, families in the wage-earner and clerical groups only were included in the sample at the lowest income levels, and only families in the business and professional groups, at the upper levels, since the families in these groups were considered most representative of the extremes of the income scale.

For purposes of this study, families were classified into six major occupational groups: wage-earner, clerical, independent business, independent professional, salaried business, and salaried professional.

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

The occupational classification of a family was determined by the major source of earnings, whether contributed by one or more members.

Data secured from families with no gainfully employed members, which formed a very small proportion of all families in the selected random sample, were not included in the summary of the details of expenditures. A special study of the expenditures of white families with no gainfully employed members was made for Chicago, Columbus, and the East Central middle-sized cities. For this material see volume II of Bulletins Nos. 642 and 644.

The lower and upper limits of the income range at which families in different occupational groups were studied is shown in the accompanying table:

Range of family income included in expenditure study, by occupational groups and tabulation unit

Tabulation unit	Occupational groups [1]			
	Wage-earner	Clerical	Independent business and professional [2]	Salaried business and professional
White families				
Metropolises:				
New York	$500 to $3,999	$750 to $3,999	$1,250 to $10,000 and over	$1,250 to $10,000 and over.
Chicago	$500 to $4,999	$750 to $4,999	$1,250 to $10,000 and over	$1,250 to $10,000 and over.
Large cities:				
Columbus	$500 to $3,999	$750 to $4,999	$1,250 to $7,500 and over	$1,250 to $7,500 and over.
Other	$500 to $2,999	$750 to $2,999	$1,250 to $7,500 and over	$1,250 to $7,500 and over.
Middle-sized cities	$250 to $2,499	$500 to $2,499	$1,000 to $5,000 and over	$1,000 to $5,000 and over.
Small cities:				
New England	$250 to $2,499	$500 to $2,499	$1,000 to $3,000 and over	$1,000 to $3,000 and over.
East Central	$250 to $4,999	$500 to $3,999	$1,000 to $3,000 and over	$1,000 to $3,000 and over.
Negro families				
New York	$500 to $2,999	$750 to $2,999	$750 to $2,999	$750 to $3,000 and over.
Columbus	$250 to $1,749	$750 to $2,999	$250 to $2,999	$500 to $2,999.
Atlanta	Under $250 to $1,499.	$250 to $2,250 and over.	$250 to $2,250 and over	$250 to $2,250 and over.
Middle-sized cities unit.	Under $250 to $1,499.	Under $250 to $2,500 and over.	Under $250 to $2,500 and over.	Under $250 to $2,500 and over.

[1] The occupational group in which a family was classified was determined by the source from which a major portion of its earnings was derived.
[2] Families in which the major portions of earnings were derived from work in which the earner was self-employed.

Family type groups.—Only families of the relatively more frequent types were included in the sample eligible for the expenditure schedule. For the purpose of distinguishing the expenditure patterns of the predominant family-composition groups, the following types were defined (see fig. 2):

Family type	*Composition*
I	Husband and wife (families of two persons).
II	Husband and wife, and one child under 16 years (families of three persons).
III	Husband and wife, and two children under 16 years (families of four persons).

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

Family type	*Composition*
IV	Husband, wife, one person 16 years or over, and one or no other person regardless of age (families of three or four persons).
V	Husband, wife, and one child under 16 years, one person 16 years or over, and one or two other persons regardless of age (families of five or six persons).
VI	Husband, wife, and three or four children under 16 years (families of five or six persons).
VII	Husband, wife, one child under 16 years, and four or five other persons regardless of age (families of seven or eight persons).

These seven family types were studied in Chicago, in the white sample in the three East Central city units, and in the Atlanta Negro sample. Elsewhere, the funds available for the expenditure survey made it necessary to restrict the coverage to families of the first five types only.

Other eligibility requirements.—The expenditure survey was further restricted by excluding a few families for the following reasons:

1. The family did not occupy a home in the community for at least 9 months of the schedule year.
2. The family moved from one dwelling unit to another between the end of the schedule year and the date of the interview.
3. The family did not have access to housekeeping facilities for at least 9 months of the schedule year.
4. The family had more than the equivalent of one roomer and/or boarder in the household for 52 weeks of the report year.
5. The family had more than the equivalent of one guest for 26 weeks.

Sampling Procedures

Expenditure schedule.—The collection of data on family expenditures and family living requires more than ordinary skill and is very time-consuming. In the interests of economy it was necessary to develop special procedures in order that the families covered might constitute a representative sample of the population included.

Income is the most important single factor influencing expenditure. Since there are no directories of families by income, it was necessary in the first place to secure a random cross section by income of the families that might be included in the expenditure survey in each community.

The percentage coverage of households for the random sample was determined in large part by the size of the community. The random sample for New York was equivalent to 4 percent of all families; for Chicago, to 10 percent. For the six large cities, this sample represented a 20 to 50 percent coverage; and in the middle-sized and small cities, 50 to 100 percent of the families were interviewed to obtain a minimum of information necessary to identify and classify the family. This random sample (the record card sample) in which data

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

were obtained from about 625,000 families, made it possible to ascertain the distribution of the families in the whole community by nativity, color, and family type composition. From those families which met specified requirements as regards these three items, additional information was secured relating to income, occupation, family composition, and home tenure.

From this random sample, there was determined the number of families eligible for the expenditure schedule on the basis of the eligibility requirements described above. (See p. 66 for the color groups, occupation, income groups, and family types covered in each area.) In order to hold the number of expenditure schedules to a minimum and at the same time to secure adequate information for types of families that are found infrequently in the community, it was decided to secure detailed expenditure data from an approximately equal number of families in the eligible group, for each family type group within each occupational class at each income interval. Families which were similar in respect to these three controls were taken to represent an expenditure pattern unit, or "cell." So far as practicable, the goal in Chicago, the East Central cities (white sample), and Atlanta (Negro sample) was to schedule 10 families to represent each cell in each tabulation unit. In the case of the other city units the goal was to schedule 6 families for every cell. In each case the families scheduled as regards expenditures were drawn as a random sample of the families listed as eligible for scheduling in a given "cell."

It can be seen from table 1 of the Tabular Summary that the number of families from which data were secured was much larger in some cases than in others; that it was much larger, for instance, at the middle income levels than at either the top or the bottom of the income scale. It will be seen, too, that despite the special efforts made in the sampling process, some occupational groups and family types are much better represented than others.

The discrepancies between the number of schedules secured and the general goal may be attributed to several factors,[5] the most im-

[5] Another obstacle to an exact control of the number of expenditure schedules in each cell resulted from shifts in the cell classification of families after the detailed interview on expenditure data. The income class in which the family was classified on the basis of the relatively short family schedule interview did not always correspond with the income class in which the family fell on the basis of the interview for expenditures. The shifts arose partly from the fact that the methods of computing income differed slightly for the two schedules, and partly from the fact that sources of income which the family had forgotten to mention to the agent obtaining the family schedule data occasionally came to light in the course of the long interview in connection with the discussion of expenditures.

Because of the extensive coverage of the family income survey, it was necessary to keep the time of the family schedule interview as short as possible. On that account information on the expenses of an owned home other than interest payments was not obtained from the families covered in the large random sample. Therefore, in estimating nonmoney income from home ownership for the income report, it was necessary to resort to a table of estimated average expenses at given rental values. During the expenditure interview, however, figures were obtained on expenses such as taxes, repairs, special assessments, and insurance and thus a revised figure on the nonmoney income from owned home was computed by subtracting the actual rather than the estimated expenses. (Footnote continued on p. 543.)

portant of which was the fact that families of specified types at certain income levels were not sufficiently numerous to yield the desired number of schedules. Furthermore, not all families from which expenditure data were desired contributed the information. Some had moved out of the city, others could not be found at home, while still others were unable or unwilling to give the detailed information requested. Of the schedules which were secured, a number had to be discarded because of inconsistency, incompleteness, or unreliability of data shown.

For some of the cells the random sample did not furnish a sufficient number of cases to permit computation of reliable averages for the expenditure patterns of the families. For example, in a 10-percent sample of Chicago families there were only four salaried professional families with incomes of $1,750 to $2,000 and with three or four

Similarly, for families having boarders the income figure on the family schedule included the estimated net income from boarders after deductions had been made for the cost of food; these deductions varied with the amount of the payment for board and were estimated on the basis of data secured in the Bureau of Labor Statistics Study of the Money Disbursements of Wage Earners and Clerical Workers. At the time of the expenditure schedule interview, detailed information was obtained on the food expenditures of the family from which it was possible to compute more accurately the money expense for boarders' food, and thus to gage more correctly the net income from boarders.

No attempt was made at the time of the family schedule interview to determine nonmoney income from an owned vacation home. This figure was obtained, however, from information secured during the expenditure interview, and is included in the income figure by which families in the controlled sample were classified.

Furthermore, rent received as a gift is not included in the income figure of the family schedule, but it was taken into account in deriving the income code of families giving expenditure data.

Changes in the family type classification also resulted from the longer interview—chiefly because of differences in the definition of the economic family. Whereas all related persons living under the same roof, or eating at least two meals daily with the family, whose income could be ascertained were included in coding the family type for purposes of the family schedule tabulation, only persons dependent on a common family fund whose expenditures could also be ascertained were regarded as members of the economic family in the controlled sample. The discrepancies in the codes resulting from these differences, however, were negligible; for example, less than 1 percent of all Chicago families from which expenditure data were secured were classified in a different family type by the two procedures.

The shifts in occupational code resulting from the longer interview also were relatively infrequent.

Aside from the effect of discrepancies arising from different definitions of the economic family, the longer interview brought to light additional facts concerning the net earnings of various family members. Detailed information on automobile expenditure, for example, occasionally revealed a different, and more accurate, figure for occupational expenses than that which had been deducted when reporting the net earnings of family members in the family schedule interview.

In the process of obtaining the last schedule needed to complete a cell according to the basic plan, it sometimes happened that two or more field agents secured complete schedules where only one had been required. Since these schedules added to the reliability of the averages for the given cells, it was decided to make use of all the completed schedules which fell within the income, occupation, and family type limits set for the investigation.

The shifts in cells had another effect which, though not numerically very important, made some difficulty in preparing the basic tabulations; namely, expenditure schedules appeared in cells for which no weights were available since no eligible cases had been classified in these cells in the tabulation of the random sample. It was decided to give cells in which no random sample schedules were secured but in which expenditure schedules appeared a weight equivalent to the number of expenditure schedules appearing in the tabulations.

These arbitrary weights would tend to make the number of families in the city appear greater than was actually found, but counterbalancing these added weights was the fact that a number of cells which contained eligible cases in the random sample had no expenditure schedules, and thus were not utilized.

The above discussion of changes in cell code has been presented primarily to give the reader some insight into the type of problems involved in obtaining equal numbers of cases in each cell in the controlled sample. Since the final code for the family type, income, and occupational group was prepared during the final office edit of an expenditure schedule, it was inevitable that changes would tend to increase the number of schedules in some cells and decrease others.

Digitized for FRASER

Federal Reserve Bank of St. Louis

children under 16. In this case and others like it an effort was made to locate more families of the type required in the cell by a process of stratified sampling, as for example by canvassing lists of doctors, lawyers, and the like professional people. Even with the use of the stratified sample, however, some of the cells did not have the desired minimum of families, and therefore had to be combined with contiguous cells to give a somewhat broader classification for analysis than had originally been contemplated.

Number of families from which expenditure data were secured.

The total number of expenditure schedules used in the tabulation for each of the urban units analyzed by the Bureau of Labor Statistics was as follows:

Number of expenditure schedules completed, by geographic area

Geographic area and color	Number of schedules	Geographic area and color	Number of schedules
Metropolitan center		*Middle-sized city units*	
New York:		New England	854
White families	1,703	East Central	[1] 2,173
Negro families	294	Southeast:	
Chicago	2,635	White families	1,407
Large cities		Negro families	620
Providence	1,217	Rocky Mountain	1,244
Columbus:		West Central	1,187
White families	2,259	Pacific Northwest	957
Negro families	248	*Small-city units*	
Atlanta:		New England	1,034
White families	1,588	East Central	1,570
Negro families	869		
Omaha-Council Bluffs	1,073		
Denver	1,346		
Portland	1,738		

[1] Excludes 76 families with no gainfully employed members in Chicago, 70 in the Columbus white sample, and 78 in the sample for the East Central middle-sized cities.

The number of families of the types, income, and occupational groups covered by the investigation are given in table 1 of the Tabular Summary.[6]

Supplementary schedules (check lists for food, clothing, and furnishings and equipment).—All the families which furnished expenditure schedules were also asked to give detailed data concerning weekly consumption of food at home, expenditures for specific items of clothing for the different members of the family, and expenditures for specific items of furnishings and equipment. The population represented in the controlled sample was thus the same for the check lists as for the expenditure schedule; and these supplementary schedules were classified in the same income–family-type–occupation groups as the corresponding expenditure schedules.

[6] In order to make possible comparisons between city and regional groups, the figures on the number of eligible families presented in table 1 are given in terms of the total number of eligible families in each city or regional group; that is, in terms of 100-percent coverage even for the cities where the sample was less than 100 percent.

The number of check lists per cell was smaller in some cases than the number of expenditure schedules. Some families were unable to supply the necessary information (quantity, price, and value or expenditure) for the specified items; and others were unable to spend the time needed to complete the check lists. Because of an insufficient number of check lists, no tabulations on individual items of food consumed were prepared for the Negro families in the New York City-Columbus unit. Further, in the case of clothing check lists for individual members of the family, data were obtained in many instances for some members of the family but not for all. For example, clothing expenditure by items might be reported by the wife for herself and for children under 16 years of age in the family, but for her husband in some cases she gave only his total clothing expenditure. The following table shows the number of supplementary schedules used in the tabulations:

Number of check lists tabulated by geographic area

Geographic area and color	Check list		
	Food (families)	Clothing (individuals)[1]	Furnishings and equipment (families)
White families			
New York City and Chicago	1,723	7,509	1,962
New England and East Central, 2 large and 5 middle-sized cities	3,675	14,078	3,796
New England and East Central, 9 small cities	1,606	6,968	1,958
Southeast, 1 large and 2 middle-sized cities	2,343	7,295	2,476
West Central and Rocky Mountain, 2 large and 4 middle-sized cities	3,664	13,380	3,937
Pacific Northwest, 1 large and 3 middle-sized cities	1,912	7,509	2,165
Negro families			
Southeast, 1 large and 2 middle-sized cities	1,335	2,920	1,278
New York City and Columbus, Ohio	(2)	993	269

[1] Clothing check lists pertained to family members, rather than to the family as a unit.
[2] Excluded from tabulations because of insufficient number of cases.

The proportion of families in the controlled sample which supplied check lists varied considerably among the units. The number of families covered in the analyses of the food check lists is shown for the different geographic areas, with an occupational and family type classification within each income level, in table 1–A of volume II (Bull. No. 648); the number of persons for whom clothing expenditures were reported is given in Tabular Summary tables 1–B and 1–C of this volume; and the number of families represented in the tabulations of the furnishings and equipment check lists appears in table 1–A of volume IV.

Method of Securing Averages

Combinations of cities.—As noted above, the cities included in this study were selected to represent the various geographic sections and city-size groups in the country. Data are presented for the two metropolitan and six large cities separately. The two or three middle-sized cities in each geographic area [7] were combined as a unit, when analyzing the data from the expenditure schedule.

There were two main reasons for combining the data for the middle-sized cities and for the small cities in each region. In the first place, the number of schedules secured in each of these communities was necessarily smaller than in the case of the metropolitan centers and the large cities. These small numbers made some combinations necessary in order to secure reliable averages, particularly since it was desired to analyze part of the data by occupational group or by family type, as well as by income level. In the second place, the middle-sized cities and the small cities were selected as representative of the different community types predominating in the regions in which they were located. Significant figures on expenditures by families of given income, family type, and occupation could best be secured for communities with population under 70,000 persons by combining into one set of figures the data secured for all cities of a given size in each area.

With the tabulation of the data as outlined above, it is possible to make analysis of regional differences in the data secured, as well as of differences growing out of varying degrees of urbanization.

Due to the smaller number of families supplying data on the details of food, clothing, and furnishings and equipment purchases, and to the variety of items covered, further combinations were made when analyzing the supplementary schedules, as follows:

White families

New York City and Chicago.
New England and East Central, two large and five middle-sized cities.
New England and East Central, nine small cities.
Southeast, one large and two middle-sized cities.
West Central and Rocky Mountain, two large and four middle-sized cities.
Pacific Northwest, one large and three middle-sized cities.

Negro families

Southeast, one large and two middle-sized cities.
New York City and Columbus, Ohio.

[7] The geographic sections used are Northeast (i. e. New England and New York City), East Central, Southeast, West Central and Rocky Mountain, and Pacific Northwest.

Combinations of occupations and family types.—The number of occupational groups differentiated in the tabulation of the data from the expenditure schedules varied with the number of families in the given groups. Data for the six major occupational groups (wage-earner, clerical, independent business, independent professional, salaried business, and salaried professional) were tabulated separately for the white sample in the metropolitan centers. Five occupational groups were differentiated among white families for the large cities, with families in the two self-employed groups pooled; four groups were tabulated for white families in the middle-sized cities by further pooling the two salaried groups; only three groups were differentiated for the small cities, with all business and professional families considered as a unit. In the case of Negro families, families in the two independent groups and in the two salaried groups, respectively, were pooled for Atlanta; families in the four business and professional groups were pooled for New York and Columbus; and only two groups, wage-earner and all others, were differentiated for the Southeastern middle-sized cities.

As noted above, expenditure schedules were obtained from families of seven types in Chicago, the East Central city units (white sample), and Negro families in Atlanta. For these units the sample was selected to be large enough to present data for 7 family types separately. In other regions where only 5 family types were covered and the sample was smaller, averages were presented for only three type groups: type I, types II and III combined, and types IV and V combined.

Three occupational groups were distinguished for the tabulation of the check lists for the white families in the metropolitan, large, and middle-sized cities—namely, wage-earner, clerical, and business and professional. In the small cities only two occupational groups were used—wage-earner and all others.

Expenditures for items of food, clothing, and furnishings and equipment vary so greatly from family to family that it is necessary to use a larger number of cases in obtaining averages for these items than is required when securing averages for family expenditures for broader categories. On account of this the income classes were combined into $500 and $1,000 groups in presenting the check-list data.

In order to secure occupational homogeneity within these broader income classes, the income ranges covered in the check-list data are somewhat different from those covered in the data from the main expenditure schedule. (See table on p. 540.) In the tables giving the details on expenditures of white families for food, clothing, and furnishings and equipment in New York City, Chicago, and the large cities, the clerical group is first represented in the income class $1,000–$1,499; and the business and professional group in the class

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

$1,500–$1,999. No data are presented for white families, or for Negro families in New York City and Columbus, with incomes less than $500. In the Negro samples in Atlanta, clerical, business and professional families are first represented in the income class $500–$999.

Family type groups were pooled for all white families as follows: Type I, types II and III, types IV and V, and types VI and VII in those areas where such were eligible.[8]

In the analyses of the data from the clothing check lists for persons other than husbands and wives in each sex-age group, all occupational and family type groups were pooled within each income class in all tabulation units (for both white and Negro families).

Because of the relatively small number of check lists secured from Negro families, all occupational and family type groups were pooled within each income class in the tabulations of the three check lists.

The weighting process.—Since the design of the Study called for an equal number of cases in each income–family-type–occupation group, it was necessary to weight the data for each "cell" by its frequency in the total population represented by the survey. That is, in order to secure averages which adequately represent the whole group of families at a given income level, the simple averages for families of a given type within each occupational group were multiplied by the number of eligible families in the given cell. The sum of these products at any income level was then divided by the total number of eligible families at that level, to secure the desired averages.

The figures showing percentages of families at successive income levels reporting expenditures for the various items were derived from the simple percentages in each cell. These were then multiplied by the number of eligible families in the given cell, and the resulting products after being totaled for each income class were divided by the total number of eligible families at the given level. Similar procedures were followed when computing percentages and average expenditures for specified family type groups at each income level. That is, the products described above for each cell were totaled by family type-income groups, and were then divided by the corresponding total number of eligible families.

Two exceptions to the weighting process just described have already been noted in connection with tabulations based on the check lists.[9] The data shown for all Negro families in such tables represent unweighted percentages and averages, that is, since all occupational and family type groups were pooled within an income class (because of the relatively small number of check lists) data for all Negro families are simple percentages and averages at each income level. No

[8] See pp. 540–541 for family types covered in the different cities.

[9] The tables involved are as follows: Tables 4 and 5, vol. II (Bull. No. 648); tables 4, 5, and 6, vol. III; andtables 5 and 6, vol. IV.

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

weights to give effect to the relative proportions of the family type and occupational groups were applied to the figures. Further, all data pertaining to the details of clothing expenditures for persons other than husbands and wives are unweighted, and are presented as simple percentages or averages. As before, it was necessary to combine all occupational and family type groups because of the relatively small sample.

Except where specifically stated to the contrary, the averages are based on all families in any given group without regard to the proportion reporting expenditures for the specific item concerned. Average expenditures at a given income level for those families which reported an expenditure may be computed by dividing the averages based on all families by the corresponding percentage of families reporting an expenditure for the given item.

Averages are presented whenever three or more families furnished an expenditure schedule, although perhaps only one or two families reported an expenditure for the specific item shown. If, for instance, only two families were covered in a given family type-income group in some city or group of cities for which averages are shown, no average is shown for that family type-income group. (The figures for such families are included in any over-all averages.) If, however, five families were scheduled, but only two of them reported expenditure for topcoats, for example, during the schedule year, data are shown for the average expenditure for topcoats.

To secure an estimate of the expenditure among the eligible families in any tabulation unit for any specified item of expenditure over a wider income range than that presented in these tables, the average amounts, based on all families scheduled at each income level, may be multiplied by the number of eligible families shown at the corresponding income level (table 1 of the Tabular Summary). The sum of these products will furnish an estimate of aggregate amounts; and division of this aggregate by the total number of eligible families in the income classes combined will give an estimate of the average amount per family over the new range.

The discussions given above for averages pertaining to family expenditures also apply to averages presented for individual members of the family when studying the details of clothing expenditures.

It must be emphasized, however, that these data refer only to the eligible families, that is, the native white or Negro nonrelief families containing both husband and wife, and meeting the other eligibility requirements outlined in the sampling section and within the income ranges shown on page 540. No data were secured concerning the disbursements of families other than those which met the eligibility requirements set up for the investigation.

Appendix B

Classifications and Definitions of Terms—Glossary

The following glossary of terms is limited to those classifications and definitions needing general explanation for the tabular material on the detail of expenditures. Specific notes pertaining to individual items appear in appendix C of this volume, "Explanation of tables." Items appearing on the expenditure schedule which are not discussed in the present volume are omitted from the glossary.

Any system of classifying goods and services necessarily has certain limitations and may not meet the needs of all groups or agencies which utilize the data. The classification adopted for the Study of Consumer Purchases is in substance one that has been found useful in other studies and which thus has the advantage of yielding comparable data. Since the uses to which specific goods may be put by consumers vary considerably from family to family and even within the family circle, depending upon the multiplicity of factors, the decisions to classify commodities in one category rather than another were necessarily arbitrary. The classifications determined upon have, however, been applied consistently throughout the tabulations.

Specific definitions of terms should be prefaced by the explanation that, whenever a sales tax was enforced in a particular community during the period covered by the study, the estimated total amount of sales tax paid for each taxable item appearing on the schedule was added to the total expense for the item.

Family.—For purposes of the Study of Consumer Purchases, an economic family was defined as a group of persons belonging to the same household and dependent upon a common income.[1] Expenditure data were secured only from families including both a husband and a wife.

Family type.—Families were classified, according to the number and age of members, in one of seven types, as follows:[2]

[1] For more detailed definition, see vol. I, glossary, Bulletins Nos. 642 to 647 and 649.

[2] See pictogram of family types, p. 10.

152917°—41——36

Digitized for FRASER

Federal Reserve Bank of St. Louis

Family type	*Composition*
I	Husband and wife (families of 2 persons).
II	Husband and wife, and one child under 16 years (families of three persons).
III	Husband and wife, and two children under 16 years (families of four persons).
IV	Husband, wife, one person 16 years or over, and one or no other person regardless of age (families of three or four persons).
V	Husband, wife, one child under 16 years, one person 16 years or over, and one or two other persons regardless of age (families of five or six persons).
VI	Husband, wife, and three or four children under 16 years (families of five or six persons).
VII	Husband, wife, one child under 16 years, and four or five other persons regardless of age (families of seven or eight persons).

The above family types are based upon the equivalent number of persons under 16 years of age and the equivalent number 16 years or over in the economic family during the year. By the use of a conversion table the number of weeks of membership of persons in the economic family for only a portion of the schedule year is expressed in terms of equivalent members. If the economic family contained in addition to the married couple, only one person who was a member for 26 weeks or less, he was not regarded as an equivalent member; had he been in the family for 27 weeks he would have been classified as one equivalent member. If two persons, both of whom were under 16 years, were members of the economic family for a total of from 27 weeks through 78 weeks, together they counted as one equivalent member; had there been members for a total of from 79 through 130 weeks, they would have been counted as two equivalent members. The same method of computation applied to persons 16 and over. If, however, the family contained one person 16 years of age or over and one child under 16 years, each for less than 27 weeks, neither would be counted as a member of the economic family, although the period of membership for the two together equalled more than 26 weeks.

Occupational group.—Families were also classified in one of seven occupational groups: wage-earner, clerical, independent business, independent professional, salaried business, salaried professional, and families with no gainfully employed members.[3] In general, the wage earner classification included all types of skilled, semiskilled, and unskilled manual jobs which are usually paid by the hour, day, or week, rather than on monthly or annual salary basis. In the clerical classification were grouped store clerks and salesmen working for

[3] The occupational categories are based upon the Works Progress Administration's Manual of Work Division Procedure, sec. 2, Occupational Classification (June 1935); and Index of Occupations, Circ. No. 2A (September 1935).

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

others, as well as office workers. Professional, semiprofessional, and technical workers were included in the independent professional group when employed on their own account, and in the salaried professional group when they were employed by others on a salary basis. Persons classified in the independent business group were entrepreneurs owning and operating businesses of any type. Also classified in the independent business category were families which derived the major portion of their earned income from roomers and boarders. The salaried business category consisted mainly of salaried managers and officials; chief officers of corporations who drew salaries, as well as minor executives, were thus classified in the salaried business groups, even though some owned controlling interest in the business. The seventh category consisted of families that had no earnings from an occupation.[4]

The occupational classification of a family was determined by the occupational group from which it derived the major portion of its earnings during the report year, whether that portion was contributed by one or more family members.[5]

Income.—The total income by which the family was classified included money income (derived from earnings and other sources such as interest, dividends, pensions, etc.) and, in addition, nonmoney income from housing (for owners, the difference between rental value of the home and current expense for interest, repairs, taxes, and the like; for renters, the value of rent received as gift or pay).

To arrive at the figure for earnings from gainful occupations of family members (wages, salaries, profits and other withdrawals from business for family use, tips, commissions and bonuses), occupational expenses were deducted. Similarly, the figures for earned income not attributable to individual members (i. e., income and family enterprises such as the keeping of roomers and boarders, or casual work in the home) represented net rather than gross income from such sources. Items classified as nonearned money income were: Interest and dividends; net rents from property; pensions, annuities and benefits; gifts in cash, etc.[6]

Adjusted family income, presented in table 2 of the Tabular Summary, consists of total income plus the value of food and fuel obtained without money expense.

Expenditures.—Money expenditures include all money expenses incurred during the report year for current family living, whether or

[4] The expenditures of families with no gainfully employed members were excluded from the tabulations shown in this volume. A special study of the expenditure of these families was made for Chicago, for Columbus white families, and for families in the East Central middle-sized cities. For this material, see vol. II of Bulletins Nos. 642 and 644.

[5] For more detailed statement, see vol. I, glossary, Bulletins Nos. 642 to 647 and 649.

[6] For more detailed statement of the components of income as used in the Study, see vol. I, glossary, Bulletins Nos. 642 to 647 and 649.

Digitized for FRASER

Federal Reserve Bank of St. Louis

not the full amount was paid during the year.[7] Balances remaining unpaid at the end of the year were considered as increases in liabilities. Total expenditures include money expenditures and the value of housing, food, and fuel obtained without money expense. All categories except food, housing, and fuel are therefore represented only by money expenditures. Total expenditures are thus synonymous with "Money value of current family living," defined below.

Value of family living.—The money value of current family living consisted of money expenditures for current living, and the value of food, housing, and fuel obtained without money expense. The value of housing included the imputed net income from owned family and vacation homes and the rental value of housing received as gift or pay.

Nonmoney income from housing.—An attempt was made to evaluate all housing received without money expense, whether in the form of rent as pay or gift, or of imputed income from an owned home.

If a family received any rent as part of wages or salary, as in the case of a minister, a resident manager, or a janitor, the estimated monthly rental value was multiplied by the number of months such premises were occupied, and the resulting amount was included as a part of the family's income. If a family occupied rent free during any part of the schedule year, a home that was owned by a relative or friend, the rental value was estimated for the period, and from it was subtracted any housing expenses incurred by the family in connection with such occupancy. The net figure was then added to the family's income. Housing furnished to individual family members while away from home, whether as gift or in return for services, was not included in nonmoney income from housing, which relates solely to housing that served the entire family.

Much more important, on the average, than rent as pay or gift, was imputed income from owned home. If a family during any part of the schedule year occupied a home owned by a member of the family the rental value of this home was estimated (on the basis of rental rates on equivalent quarters) for the period of occupancy. From this sum were deducted all expenses incurred for the home, for interest on a mortgage, repairs, taxes, special assessments, and premiums for insurance, during the period of occupancy. The remaining amount was considered as imputed income from housing and included as a nonmoney part of the family's total income. If the expenses were greater than the estimated rental value, the family was considered to have had a negative income from housing.

This procedure applied to either a family home or an owned vacation home. The net effect was to place many home owners in a higher

[7] This was not true in the case of a few items such as fire insurance premiums on owned homes and contributions to the Community Chest. For these items only the amounts paid during the year were classed as expenditures.

Federal Reserve Bank of St. Louis

income class ($250 intervals) than they would have been classified on the basis of money incomes alone.

Surplus or deficit.—The difference between the family's total money income for the year and its total money expenditure was, if a positive sum, a surplus, or, if a negative sum, a deficit. This surplus or deficit was accounted for by one or more of a series of changes in assets and liabilities, described below.

Receipts.—The term receipts has been used to designate current money income plus funds made available through liquidation of assets or through credit.

Disbursements.—The term disbursements has been used to designate money expenditures for current family living plus money used to decrease debts incurred before the beginning of the report year or to increase assets.

Balancing difference.—Due to the difficulty experienced by families, few of which kept detailed records, in accounting in toto for receipts and disbursements, a margin of tolerance was set up for discrepancies between the two. If the difference amounted to less than 5.5 percent of receipts or disbursements, whichever was larger, the schedule was tabulated, this amount being carried as a balancing difference. If the discrepancy was 5.5 or larger, the schedule was discarded. In cases where disbursements exceeded receipts, as accounted for by the family, the balancing difference was negative; if receipts exceeded disbursements, the difference was positive.

Appendix C

Explanation of Tables in Tabular Summary

Table 1. Number of Families

Table 1 presents the number of families eligible for the expenditure study and the number reporting on expenditures. The data are shown by income groups, by family type and income groups, and by occupational and income groups for each of the tabulation units (16 for white families and 4 for Negro families) into which the cities were combined, for purposes of analysis of data from expenditure schedules.

The "Number of eligible families" as shown in section A was used as the weights when combining the data from the expenditure schedules for the various family types and occupational groups within each income class.[1] Although the size of sample varied in the different communities, the figures in section A are stated in terms of a 100-percent coverage.[2] It is necessary to express the weights on a comparable basis so that combinations of the data may be made by geographic areas or by income groups, if desired.

Section B indicates the number of families reporting on expenditures. As stated in appendix A, those families having no gainfully employed members have not been included in the figures in this section nor in the remainder of the tables in the volume.

Table 1–A. Average Number of Persons per Family

The average number of persons in the economic family, the average number under 16 years of age, and the average number 16 years and over in addition to husband and wife are presented in table 1–A. The figures are shown for all families, for family type groups, and for occupational groups at successive income levels; and are based on the number of year-equivalent persons in the families that completed expenditure schedules. The number of year-equivalent persons was computed for each family by obtaining the total number of member-weeks for persons under 16 years of age, and for persons 16 years and over. The following table was then used in calculating the number of equivalent persons in each age group:

[1] See the discussion on sampling and on weighting in appendix A.

[2] The data for New York City are stated in terms of a 100-percent coverage of families in census tracts in which more than one-third of all the families were native born; these tracts include approximately 82 percent of native families in the city.

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

Number of member-weeks	*Equivalent persons*
0–26	0
27–78	1
79–130	2
131–182	3
183–234	4

If, for example, a family consisted, in addition to husband and wife, of one person under 16 years of age who belonged to the family for 26 weeks, and two others 16 years or over whose membership in the family totaled 70 weeks, the family was classed as having no equivalent person under 16 years and one equivalent person in the older age group. (Such a family was classified as type IV.)

The average number of equivalent persons per family in each of the age groups was then computed for each cell; cell averages were combined in accordance with the weighting procedures outlined above, in order to derive the data given in sections B and C of the table. Since each family contained a husband and wife, both of whom were members for at least 27 weeks, the average number of persons per family (sec. A) was derived by adding 2.0 to the sum of the average number of persons under 16 years (sec. B) and the average number 16 years and over (sec. C). It should be borne in mind that the number of equivalent persons 16 years of age and over per family as shown in section C of table 1–A are in addition to husband and wife.

Table 1–B. Number of Families as Grouped for Analysis of Data From Check Lists

Table 1–B shows the number of families eligible for the expenditure study, in the cities covered as grouped for analysis of data from the check lists—six groups for white families, and two for Negro families. The table also shows the number of husbands and wives for whom clothing check lists were completed. Clothing check lists were prepared for the individual members of the family rather than for the family as a unit. Distributions by family type and occupational groups are given in each case.

The numbers of eligible families (sec. A) were used as weights when combining the data pertaining to husbands and wives in white families for the various family type and occupational groups within each income class. Since, by definition, each family which furnished an expenditure schedule contained both a husband and wife, the number of eligible families for the expenditure study also represents the number of husbands and the number of wives who were eligible for the expenditure study. As stated earlier, the data based on clothing check lists furnished by husbands and wives in Negro families were not weighted because of the relatively small number of check lists

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

completed. These data were presented as simple averages within each income class.

Although the proportion of families included in the random sample varied in the different communities, the figures in section A of this table are stated in terms of the total number of eligible families in each group of cities, that is, in terms of a 100-percent coverage.[3] It is necessary to express the weights on a comparable basis so that additional combinations of the data may be made, if desired.

Table 1–C. Number of Persons, Other Than Husbands and Wives, for Whom Clothing Expenditures Were Reported

Table 1–C shows the number of persons other than husbands and wives for whom detailed clothing expenditures were reported in each of the geographic areas included in the tabulations of the check lists. These persons were grouped according to five age groups for each sex, with an additional group consisting of children under 2 years of age.[4]

Distributions of the members for whom check lists were accepted for tabulation are shown according to family type and occupational group in each case. These distributions should not be interpreted as the distributions of all persons other than husbands and wives in the families which completed expenditure schedules, since data were obtained in many instances for some members of the family but not for all. Clothing check lists were tabulated only for persons who were members of the economic family for the entire year. Family type I has not been listed in this table among the family types since no family could be classified in type I if there were persons other than the husband and wife for more than 26 weeks of the year; similarly, it will be noticed that there could be no clothing check lists for persons 16 years of age and over in types II and III.

Because of the scattered distributions of these check lists by family types and occupational groups, the data based on clothing check lists for persons other than husbands and wives have been presented as unweighted figures in each of the sex and age groups for both white and Negro families. For this reason no weights, as represented by the number of persons in families eligible for the expenditure schedules, are shown in these tables for the different sex and age groups.

Table 2. Adjusted Income and Expenditure

Adjusted income and expenditure are shown in table 2 in the same detail as the data on number of families in table 1. Adjusted income, section A, represents money income, nonmoney income from housing,

[3] See footnote 2, p. 557.

[4] See discussion of clothing check lists on pp. 561–562.

Federal Reserve Bank of St. Louis

and the value of food and fuel received without money expenditure.[5] The expenditure figures in section B represent money expenditure plus the value of housing, food, and fuel received without money expenditure; that is, these three items have been considered as part of the value of current family living, the total current expenditure of the family for the year. Data on the value of clothing, and other items, received without direct money expenditure were not obtained from all families and hence it was impossible to include them in either the income or expenditure figures.

Table 3. Clothing and Personal Care

Average expenditures for clothing and for personal care as reported on the expenditure schedules are presented in table 3. Expenditures for personal care were subdivided into two groups—those for personal services for the family members, and those for toilet articles and preparations for the family as a group. The averages are shown for families at successive income levels (family type and occupational groups combined) and for family type groups at successive income levels (occupational groups combined). These averages are based on all families scheduled in each group whether or not expenditures were reported by all families for a given item.

Clothing.—Expenditures for clothing are shown in this table for husbands and wives, and all other members of the economic family, as reported on the expenditure schedule. Details of the purchases made were not entered in the expenditure schedule, but were recorded in the clothing check lists for such members for whom the necessary information was supplied. (See tables 4, 5, and 6 in this volume for such data.)

Personal service.—Expenditures for personal services were recorded and tabulated separately for husbands, wives, children under 16 years of age, and all others. The following items were among the most important classified as services: Haircuts, shampoos, shaves, all types of waves, manicures, facials, dyeing and dressing of hair, and Turkish baths. Tips to barbers and beauty-shop operators were added to the charge for the service.

Toilet articles and preparations.—Expenditures for toilet articles were recorded under six headings, as shown in columns 13 through 18. Expenditures for dental floss and other dentifrices were included with those for toothpaste and powder, and mouthwash. After-shaving lotions were included with shaving soap and cream. Expenditures recorded under cold cream, powder, rouge, perfume, and nail polish

[5] Families were classified into income groups according to the amount of their money income plus non-money income from housing. The amount of income received by most city families in terms of food and fuel is very small, and no information on income of this type was secured on the income (family) schedule used with the large random sample.

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

included those for lotions, toilet water, liquid soaps, lipstick, eyebrow pencils, and hair dyes and liquids, as well as the articles named in the heading. Purchases of all brushes used for personal care, razors and razor blades, and manicuring instruments were classified together. Expenditures recorded as other toilet articles and preparations included purchases for such articles as facial tissues, powder puffs, compacts, curling irons, hair dryers, and pocket mirrors.

Clothing Check Lists

Tables 4, 5, and 6 present data from the clothing check lists. A separate check list was prepared for each member of the economic family for whom the person interviewed was willing and able to spend the time and to furnish the information. As previously stated, these check lists were completed, in many cases, for some members of the family but not for all. The number of clothing check lists used in the tabulations is shown in tables 1–B and 1–C by family members.

The check lists called for information on the number of articles of each kind purchased, the prices paid, total expenditures for the year, and the season or seasons in which the purchases were made. The total expenditure, including any sales tax, was recorded for each item. When goods were purchased from a mail-order house, the amount of the postage or shipping charges was included as part of the expenditure. Any unpaid balance at the end of the year for clothing purchased during the year was recorded as an increase in liabilities.

Expense for clothing given by one member of the economic family to another was entered, as any other purchase, in the appropriate item, since the expense was met out of family funds. The value of all clothing received as gift or pay from persons not members of the economic family was estimated in terms of local retail prices, and entered as a separate item at the end of the check list.

Separate tabulations were made of the data reported for husbands, for wives, and for other family members classified by sex and age. The age intervals used in each sex group were 30 years and over, 16 through 29, 12 through 15, 6 through 11, and 2 through 5. Check lists for all children under 2 years of age were tabulated together. In each of the 13 family member groups, the percentage of persons for whom expenditures were reported and the average amount spent was tabulated by items (tables 5 and 6). In addition, for husbands and wives only, the average quantity purchased and the average expenditure per article have been presented in table 5. No tabulations have been prepared from the data recorded for price, or for purchases by seasons.

Although a check list was not accepted for tabulation unless the total expense was reported for each item for which a purchase was

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

made, it was accepted if the number of articles purchased was not reported. In computing the average number of articles purchased for husbands and for wives, it was assumed that the quantity purchased when quantity was not reported was the same as the average quantity purchased for those in the same cell for whom quantity was reported. The resulting figures on average quantities are shown in table 5 and were used in deriving the average expenditure per article.

In tables 4, 5, and 6 data are presented for successive family income levels. Family type and occupational combinations of the data for husbands and wives in white families were made within income classes by weighting; but for husbands and wives in Negro families and for all members other than husbands and wives in both racial groups the combinations of family types and occupational groups were made by pooling the data within each income class.[6] Average expenditure for a given item or group of items,[7] and, in the case of husbands and wives, average quantities purchased, are based on the total number of clothing check lists accepted for each family member group, without regard to the percentage of persons for whom expenditures for such items were reported. The average expenditure for those for whom expenditures were reported for a particular item or group of items may be derived by dividing the average presented in the table by the corresponding percentages shown. In a similar manner the average quantity purchased for husbands and for wives having such purchases may be computed from data in table 5.

Average expenditure per article was determined by dividing the expenditure per person by the number of articles purchased. The divisions were made from the weighted aggregates, rather than from the rounded averages shown in table 5.

Table 4. Summary of Expenditures for Specified Types of Clothing

The material in the clothing check lists is summarized in table 4, showing for husbands, wives, and other members in each sex and age group, the percentage for whom expenditures of specified types of clothing were reported; and the average expenditure in each case. The types of clothing are: Headwear; coats and other wraps; suits, trousers, and overalls for males; shirts for males; suits, dresses, and other outer clothing for females; special sportswear; underwear, nightwear, and hose; footwear; and clothing accessories. Also total expenditures for clothing are presented for each group of members.

[6] See pp. 548–549 for discussion of weighting procedures.

[7] Groups of items are referred to as types of clothing in table 4.

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

Table 5. Expenditure for Specified Items of Clothing for Husbands and Wives

The information obtained from the clothing check lists on the specific items for husbands and wives is presented in table 5. The percentage of husbands and of wives for whom expenditure was reported, the average expenditure, the average quantity purchased, and the average expenditure per article are shown at successive income levels for each item.

Percentages shown in the "Total" columns are not sums of the percentages for the specific items, but represent the proportion of persons for whom expenditures were reported for any one or more of the items in the section. (See discussion under "Clothing check lists" for the method of deriving averages.)

The following explanations of specific items in the check lists cover only those that are not self-explanatory. When an article contained a mixture of materials such as wool and cotton, the expenditure was entered according to the predominating material.

Husbands

Suits.—This item included uniforms (such as chauffeurs' or policemen's) which were purchased for work unless paid for by the employer.

Shirts, cotton work, and other cotton.—Office workers' cotton shirts were considered as other cotton shirts and were distinguished from shirts generally called work shirts, which are worn for manual labor.

Special sportswear, other.—Expenditure for all types of clothing purchased and used for participation in sports, such as baseball and football uniforms, ski suits, and riding habits was entered in this item.

Shoes, work and street.—Shoes worn at work by office and store workers were classified as street shoes and were distinguished from those worn by laborers. Sport shoes included tennis and golf shoes and the like but not sport shoes for street wear. Other shoes included dancing shoes and bedroom and house slippers.

Jewelry.—Expenditure for such items as cuff links, collar buttons, belt buckles, tie pins, and the purchase and repair of watches, was included with expenditure for other jewelry.

Clothing received without money expenditure.—The value of uniforms furnished by employers and of clothing received as gift or pay from persons not members of the economic family was entered in this item.

Wives

Dresses, cotton house; aprons and smocks.—Uniforms for wives employed as maids, nurses, or waitresses were included in one of these two items, unless paid for by employer.

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

Special sportswear, other.—Purchases for all types of clothing for use in participating sports, such as ski suits, tennis dresses, and riding habits, were recorded in this item.

Shoes.—Street shoes included those for street and house wear. Sport shoes included tennis shoes, bathing shoes, and the like, but not sport shoes for street wear. Other shoes included dancing and ballet shoes.

Jewelry.—This item included expense for costume jewelry and for the purchase and repair of watches, as well as for necklaces, bracelets, and all other jewelry.

Clothing received without money expenditure.—The value of uniforms furnished by employers and of clothing received as gift or pay from persons not members of the economic family was entered in this item.

Table 6. Expenditure for Specified Items of Clothing for Persons Other Than Husbands and Wives

Table 6 shows, by sex and age groups for members of the economic family, other than husbands and wives, the percentage of persons for whom clothing expenditures were reported and the average amount of such expenditure for the specific items. As previously stated, average expenditures for each item in this table were based on the number of check lists accepted for members of that sex-age group within each income class whether or not expenditures were reported for all persons; and were not weighted. (See discussion under "Clothing check lists" for further explanation.)

Explanations given for certain items in table 5 generally apply in table 6. However, because of differences in clothing purchased for persons in the different age groups in each sex, some grouping of the items was necessary. This was especially true for boys and girls 2 through 5 years of age. For example, in the case of shoes no distinction was made as to the use of the shoes; expenses for furs were combined with those for clothing accessories; gloves and mittens were combined into one item; etc. Further, for boys under 16 years of age, shirts were classified as play or school rather than as work or street.

For children under 2 years of age, layette included clothing items purchased as a unit, when the expense could not be distributed among the individual items. "Other clothing" included mittens, leggings, jewelry, sweaters, cleaning for coats, etc.

Appendix E

Communities Included by the Bureau of Home Economics in the Study of Consumer Purchases

A parallel study was conducted by the Bureau of Home Economics of the United States Department of Agriculture, which, together with the study made by the Bureau of Labor Statistics, constitutes the Study of Consumer Purchases. The communities in which the families were visited by the agents of the Bureau of Home Economics and the Bureau of Labor Statistics, respectively, are listed in Bull. 649, Vol. I, page 297. For consistency in the analysis of the expenditure data, schedules for all small cities in the regions mentioned hereafter were analyzed by one Bureau or the other, irrespective of which Bureau had gathered the data in the original field survey. The Bureau of Home Economics analyzed all expenditure data for small cities in the Southeast, and in the West Central–Rocky Mountain region. Likewise, the Bureau of Labor Statistics analyzed all expenditure data for small cities in New England.

Communities Included by Bureau of Home Economics in the Analyses of Family Expenditures

Region	Small cities	Villages	Farm counties
New England		6 in Vermont. 8 in Massachusetts.	2 in Vermont.
Central	Mount Vernon, Ohio. New Philadelphia, Ohio. Beaver Dam, Wis. Lincoln, Ill. Boone, Iowa. Moberly, Mo. Columbia, Mo.	7 in Pennsylvania. 6 in Ohio. 8 in Michigan. 6 in Wisconsin. 8 in Illinois. 11 in Iowa.	2 in New Jersey. 1 in Pennsylvania. 3 in Ohio. 1 in Michigan. 1 in Wisconsin. 4 in Illinois. 5 in Iowa.
Mountain and Plains	Dodge City, Kans. Greeley, Colo. Logan, Utah. Provo, Utah. Billings, Mont.	6 in Kansas. 9 in North Dakota. 4 in Colorado. 1 in Montana. 2 in South Dakota.	4 in Kansas. 4 in North Dakota. 3 in Colorado. 1 in Montana. 1 in South Dakota.
Pacific	Astoria, Oreg. Eugene, Oreg. Klamath Falls, Oreg. Olympia, Wash.	12 in California. 5 in Oregon. 7 in Washington.	1 in central California. 2 in southern California. 5 in Oregon. 1 in Washington.
Southeast:			
White and Negro families.	Albany, Ga. Gastonia, N. C. Griffin, Ga. Sumter, S. C.	8 in Georgia. 7 in South Carolina. 8 in North Carolina. 10 in Mississippi.	2 in North Carolina. 2 in Mississippi. 2 in South Carolina. 7 in Georgia.
White families			2 in North Carolina. 4 in South Carolina. 1 in Georgia. 2 in Mississippi.
Negro families only		1 in Mississippi.

Appendix F

Cities Included by Bureau of Labor Statistics in the Study of Money Disbursements of Wage Earners and Clerical Workers

An investigation of the income and money disbursements of families of wage earners and clerical workers was undertaken by the Bureau of Labor Statistics in the fall of 1934 for the purpose of revising the cost of living index published currently by the Bureau. The data from that investigation cover 1 year within the period 1934–36 and include details on income, family composition, expenditures for principal categories and for detailed items of consumption for a total sample of 14,669 families of employed wage earners and lower salaried clerical workers in 42 cities, all with population over 50,000. Data on quantities of food, clothing, and furnishings and equipment purchased; on types of medical care received; and on changes in assets and liabilities are also included. A summary of these findings is presented in United States Bureau of Labor Statistics Bulletin No. 638.

The individual cities for which data are available and the bulletins in which the detailed data appear are as follows:

North Atlantic Region, New York City (B. L. S. Bull. 637, Vol. 1): White and Negro families.

North Atlantic Region, Eleven Cities (B. L. S. Bull. 637, Vol. II):

- Boston, Mass.
- Buffalo, N. Y.
- Johnstown, Pa.
- Lancaster, Pa.
- Manchester, N. H.
- Philadelphia, Pa. (white and Negro families).
- Pittsburgh, Pa. (white and Negro families).
- Portland, Maine.
- Rochester, N. Y.
- Scranton, Pa.
- Springfield, Mass.

East North Central Region, (B. L. S. Bull. 636):

- Cincinnati, Ohio (white and Negro families).
- Cleveland, Ohio.
- Columbus, Ohio.
- Detroit, Mich.
- Grand Rapids, Mich.
- Indianapolis, Ind. (white and Negro families).
- Lansing, Mich.
- Milwaukee, Wis.

West North Central and Mountain Region (B. L. S. Bull. 641):

- Denver, Colo.
- Kansas City, Mo. and Kansas City, Kans. (white and Negro families).
- Minneapolis and St. Paul, Minn.
- St. Louis, Mo. (white and Negro families).
- Salt Lake City, Utah.
