PREFACE

The Bureau of Labor Statistics wishes to acknowledge with gratitude the cooperation of thousands of business organizations and Federal, State, and local government agencies whose officials have given freely the statistics and other information needed for this volume. The figures shown provide a unique opportunity to reveal not only the vast panorama of our industrial economy, created by the people of the United States through their imagination, enterprise, and labor, but also the varied detail of which it is made. In this book we show, among other facts, in what industries people have jobs, how many hours they work each week, and how much they earn by the hour and by the week. Studying the past helps us to understand the present and assess the future; this book, through the data shown, traces the growth and transformation of the Nation's industrial economy and the distribution of its manpower through the most recent 5 decades of this century.

Payroll employment statistics, which provide detailed industry information for the Nation on the employment, hours of work, and earnings of nonfarm wage and salary workers, are based on information supplied by employers. Each month, a sample of industrial, commercial, and government establishments, employing collectively about 25 million workers, send data drawn from their payrolls to State agencies cooperating with the Bureau of Labor Statistics. In these agencies, data are extracted for preparation of figures on State and area employment, hours, and earnings. Then the reports are sent to the BLS to be used in the preparation of national figures. The costs of this Federal-State program are shared in 44 States with the U.S. Department of Labor's Bureau of Employment Security; the costs in the remaining States are shared by the State departments of labor with the BLS. Employers' contribution reports under the unemployment insurance system are the major source of benchmarks on which most industry employment estimates are based. These reports are collected and tabulated by State employment security agencies under Bureau of Employment Security direction. Benchmark data for the remaining portions are obtained with the help of records from the Bureau of Old-Age and Survivors Insurance, the Civil Service Commission, several other Government agencies, and private organizations including the American Hospital Association, National Catholic Welfare Conference, and the National Council of Churches.

Labor turnover statistics showing the rate of accessions and separations, by industry, for the Nation and for selected States and areas, are also based on data supplied by employers. The 42 State agencies currently in the cooperative program on these turnover statistics have the same responsibilities as in the employment statistics program. This program is jointly financed by the Bureau of Labor Statistics and the Bureau of Employment Security.

A separate section presenting some of the broader categories of labor force statistics is also embodied in this volume, in order to provide a rounded picture of historical employment trends. The labor force statistics are compiled through household interviews, and provide estimates covering the entire labor force, including unemployed and agricultural workers.

This volume of historical statistics represents a significant technical achievement by the Division of Manpower and Employment Statistics. The following units and individuals made important contributions to the final result.

The volume was prepared under the general direction of Harold Goldstein, Chief, and of Dudley E. Young, Assistant Chief for Industry Employment Statistics, and under the direct supervision of Rudolph C. Mendelsohn, Chief of the Branch of Employment Operations, and Robert O. Dorman, Chief of the Branch of Program Planning and Techniques.

The estimating techniques underlying the statistics were the responsibility of John P. Wymer, who was assisted by Dorothy M. Hinton, Samuel Schechter, Joaquin A. Pavia, Nathan Buchalter, Margaret W. Testerman, and Carol M. Utter. Emeline French and Maurice M. Levin provided technical assistance in the adaptation of the series to the new industrial classification system. David M. Fishbein was responsible for the organization of the volume, under the supervision of Robert M. Shaw. Edward B. Morris designed the electronic computer programs generating data for 1959 and 1960. Programs for earlier years, and for direct printing of the statistical pages by the computer were designed under the guidance of Frederick W. Suffa, by Walter Stuart, aided by Carol G. King, Pauline T. Padgett, and Brendan J. Powers. Vincent W. Casey and Alene B. Chase supervised the technical staff review of the statistics.

INTRODUCTION

This volume presents historical data based on the 1957 Standard Industrial Classification system for nonagricultural industries in the economy. Statistics included are monthly and annual data on the following: Employment, production workers, weekly earnings, weekly hours, hourly earnings, overtime hours, employment of women, and labor turnover rates. In addition, there are seasonally adjusted data for some of these series, as well as indexes of aggregate weekly hours and weekly payroll. Tables on spendable weekly earnings and hourly earnings, excluding overtime, are also included.

In a separate section on labor force statistics, historical tables of employment and unemployment data by broad demographic characteristics are presented. These statistics have been included to complete this history of labor market developments, as the labor force survey covers certain groups not reached by establishment payroll statistics, e.g., the unemployed, the self-employed, unpaid family workers, and agricultural employment.

The trends reflected in these particular statistics may be useful economic indicators. The average weekly hours series and layoff and accession rates in manufacturing may provide lead indicators of swings in the business cycle. Labor economists and other social scientists should find in these series an important indication of the health of the Nation's economy as well as a measure of the well-being of the millions of Americans who depend on salaries and wages. Industrial growth and progress may be assessed by using the employment and hours series in conjunction with other economic data to obtain measures of productivity. The data on U.S. employment, hours, and earnings may offer insight into the problems of foreign economies.

In the field of business, the labor turnover series can be used in measuring the effectiveness of management and personnel policies. An establishment's labor turnover rate found to be higher than the average for similar firms may alert management to serious personnel problems.

The earnings and hours data afford guidance in plant location, sales, and purchases. Also, in the negotiation of long-term supply or construction contracts, the series on average hourly earnings is an aid in arriving at an equitable agreement; "escalation clauses" included in the contracts permit an increase or a lowering of the settlement price, depending on the movement of average hourly earnings in a selected industry, generally the industry in which the supplying firm is classified. Wide need has been demonstrated by both labor and business for industry series on hourly earnings and weekly hours to provide a basis for labor-management negotiations. They not only furnish essential information, both past and present, on a given industry, but provide corresponding data on related industries for comparison.

The industry statistics in this volume are based on the 1957 Standard Industrial Classification (SIC) Manual published by the Office of Statistical Standards of the Bureau of the Budget. Previously, the series for the United States conformed to the 1945 Standard Industrial Classification Manual for manufacturing industries, to the 1949 Standard

Industrial Classification Manual for government, and to the 1942 Social Security Board (SSB) Industrial Classification Code for other nonmanufacturing industries. Conversion to the new classification system has resulted in significant shifts of activities from one industry to another, among groups within an industry division, and also between divisions. At the industry division level, for example, milk pasteurization plants and ready-mixed concrete establishments were transferred from trade to manufacturing; and radio and television were transferred from the service division to the transportation and public utilities division. Shifts among groups within division were numerous; in manufacturing, for example, fats and oils were transferred from chemicals to foods, and plastics from miscellaneous manufacturing to rubber. Although many classification changes were made, some industries have identical definitions under the old and new classification systems.

Beginning with data for January 1958, the BLS retabulated each one of the 120,000 monthly reports, on which the series in this volume are based, after recoding the reports to conform to the 1957 SIC. For the period prior to January 1958, the series of statistics based on the prior classification system were used to construct data conforming to the new classification system. This was more feasible when there was no conceptual difference for a series between the new classification system and the old, or where the conceptual differences in definition were of a minor nature. Special attention was focused on series for industry divisions, subdivisions, and major groups in manufacturing because of the wide interest in these data. Series on the new basis to replace those on the old were reconstituted as far back as technically feasible, even though conceptual differences may have been significant. For many series, however, this was not possible and for these series data do not exist for periods prior to 1958.

The national industry statistics at all levels include Alaska and Hawaii beginning with 1959. Definitions of the industries in this volume are available in the Guide to Employment Statistics of BLS, 1961, which describes the industries and identifies the component industries when the definitions combine two or more industries of the 1957 Standard Industrial Classification.

The occasion for the revision to the new 1957 SIC structure was an opportune time to introduce improvements, some of them of considerable significance. These included adjustment to March 1959 benchmark levels—previous estimates had been projected from first quarter 1957 benchmarks. This was also the first time that benchmark levels and employment samples stratified in many cases, by size, or region, or both were used; it was found, after intensive analysis of the sample reports, that significant improvements could be made for many earnings and hours series by the introduction of stratification. Additional technical improvements have resulted from the development of new and improved sources of benchmark data for employment to supplement data available from social insurance records, particularly for the service division. Further progress occurred also, because of the use of improved automatic electronic data-processing equipment as a means of providing more analyses and controlling and maintaining quality. A detailed discussion of

concepts and methodology is contained in the Explanatory Notes at the back of this volume.

Future issues of this publication are planned on an annual basis, to keep the information up to date. Users requiring current statistics, however, will find all of these published in *Employment and Earnings*, and some of the key figures in the *Monthly Labor Review* and the U.S. Department of Labor press releases on employment, labor turnover, and spendable earnings. *Employment and Earnings* and the *Monthly Labor Review* are available for reference in many public and university libraries, or by subscription from the Superintendent of Documents, U.S. Government Printing Office. Names will be added to the mailing lists for the releases, upon request to the BLS.

This volume contains only national data; State and metropolitan area data may best be obtained from the cooperating State agencies. Addresses of these offices are listed on the inside back cover. Users interested in the identity of series available for States can obtain the *Guide to State Employment Statistics, 1960*, which is an index to the industries for which statewide employment, hours, and earnings series are currently published by State agencies cooperating in the employment statistics program of the Bureau of Labor Statistics. The *Guide to Area Employment Statistics* lists

similar information for each metropolitan area along with the metropolitan area definitions. These guides may be obtained free as long as the supply lasts by writing to the U.S. Department of Labor, Bureau of Labor Statistics, Division of Manpower and Employment Statistics, Washington 25, D. C.

The main content of this volume is composed of the historical series of data that have been developed from the Bureau's establishment sample of payroll data. In addition, for the convenience of the users, some summary historical data on total employment (including wage and salary workers, the self-employed, and unpaid family workers in agriculture as well as nonagricultural industries), unemployment, and the labor force are presented in Section II. These labor force statistics are based on a monthly household survey conducted by the Bureau of the Census for the Bureau of Labor Statistics. In that survey, interviews are carried out with a national sample of 35,000 households located in 333 areas throughout the country, and information is obtained for the calendar week ending nearest the 15th of the month. The results are analyzed and published, together with the payroll data, in the Bureau of Labor Statistics reports, *The Monthly Report on the Labor Force*, and *Employment and Earnings*. More detailed analyses are prepared in the form of articles in the *Monthly Labor Review* and reprinted with additional statistics in a series of *Special Labor Force Reports*.

SECTION I.

ESTABLISHMENT DATA

PART A.

PAYROLL EMPLOYMENT HOURS AND EARNINGS LABOR TURNOVER BY INDUSTRY

ESTABLISHMENT
DATA

NOTE: All data in Section I include Alaska and Hawaii beginning 1959.

For labor turnover rates, beginning with January 1959, transfers between establishments of the same firm are included in total accessions and total separations, therefore rates for these items are not strictly comparable with prior data. Transfers comprise part of other accessions and other separations, the rates for which are not shown separately.

^{1/} DATA ARE BASED UPON REPORTS SUMMARIZED IN THE M-300 REPORT BY THE INTERSTATE COMMERCE COMMISSION AND RELATE TO EMPLOYMENT AT THE MIDDLE OF THE MONTH; AVERAGES ARE BASED UPON MONTHLY DATA (EXCLUSIVE OF SWITCHING AND TERMINAL COMPANIES) AND RELATE TO ALL EMPLOYEES WHO RECEIVED PAY DURING THE MONTH, EXCEPT EXECUTIVES, OFFICIALS, AND STAFF ASSISTANTS (ICC GROUP I). BEGINNING JANUARY 1956, DATA INCLUDE ONLY RAILROADS HAVING ANNUAL OPERATING REVENUES OF \$3,000,000 OR MORE. THIS CLASS FORMERLY INCLUDED ALL RAILROADS HAVING ANNUAL OPERATING REVENUES OF \$1,000,000 OR MORE.

^{1/} BEGINNING JANUARY 1943 LABOR TURNOVER RATES REFER TO ALL EMPLOYEES; PREVIOUSLY, TO PRODUCTION WORKERS ONLY.

^{2/} BEGINNING JANUARY 1959, TRANSFERS BETWEEN ESTABLISHMENTS OF THE SAME FIRM ARE INCLUDED IN TOTAL ACCESSIONS AND TOTAL SEPARATIONS, THEREFORE RATES FOR THESE ITEMS ARE NOT STRICTLY COMPARABLE WITH PRIOR DATA. TRANSFERS COMPRISE PART OF OTHER ACCESSIONS AND OTHER SEPARATIONS, THE RATES FOR WHICH ARE NOT SHOWN SEPARATELY.

^{1/} PRIOR TO JANUARY 1956, DATA WERE BASED ON THE APPLICATION OF ADJUSTMENT FACTORS TO GROSS AVERAGE HOURLY EARNINGS (AS DESCRIBED IN THE MONTHLY LABOR REVIEW, MAY 1950, PP. 537-540; REPRINT AVAILABLE, SERIAL NO. R 2020).

DATA ARE NOT AVAILABLE FOR THE PRINTING, PUBLISHING, AND ALLIED INDUSTRIES GROUP, AS AVERAGE OVERTIME RATES ARE SIGNIFICANTLY ABOVE TIME AND ONE-HALF. INCLUSION OF DATA FOR THE GROUP IN THE NONDURABLE GOODS TOTAL HAS LITTLE EFFECT.

^{2/} 11-MONTH AVERAGE.

^{3/} AUGUST 1945 EXCLUDED BECAUSE OF VJ-DAY HOLIDAY PERIOD.

^{1/} FIGURES IN THESE TABLES HAVE BEEN ADJUSTED FOR COMPARABILITY WITH DEFINITIONS OF EMPLOYMENT AND UNEMPLOYMENT ADOPTED IN 1957. BEGINNING WITH 1960, ALASKA AND HAWAII ARE INCLUDED IN THESE FIGURES, RESULTING IN AN INCREASE OF APPROXIMATELY 300,000 IN THE LABOR FORCE, MOSTLY IN NONAGRICULTURAL EMPLOYMENT; THE OTHER CATEGORIES WERE NOT SIGNIFICANTLY CHANGED.

^{2/} UNEMPLOYMENT EXAGGERATED BY MISCLASSIFICATION OF SOME WORKERS.

Explanatory Notes

Additional information concerning the preparation of the labor force, employment, hours and earnings, and labor turnover series--concepts and scope, survey methods, and limitations--is contained in technical notes for each of these series, available from the Bureau of Labor Statistics free of charge.

INTRODUCTION

The statistics in this publication are compiled from two major sources: (1) household interviews and (2) payroll reports from employers.

Data based on household interviews are obtained from a sample survey of the population. The survey is conducted each month by the Bureau of the Census for the Bureau of Labor Statistics and provides a comprehensive measure of the labor force, i.e., the total number of persons 14 years of age and over who are employed or unemployed. It also provides data on their personal and economic characteristics such as age, sex, color, marital status, occupations, hours of work, and duration of unemployment. The information is collected by trained interviewers from a sample of about 35,000 households in 333 areas throughout the country and is based on the activity or status reported for the calendar week ending nearest the 15th of the month.

Data based on establishment payroll records are compiled each month from mail questionnaires by the Bureau of Labor Statistics, in cooperation with State agencies. The payroll survey provides detailed industry information on nonagricultural wage and salary employment, average weekly hours, average hourly and weekly earnings, and labor turnover for the Nation, States, and metropolitan areas.

The figures are based on payroll reports from a sample of establishments employing about 25 million nonfarm wage and salary workers. The data relate to all workers, full- or part-time, who received pay during the payroll period ending nearest the 15th of the month.

Relation between the household and payroll series

The household and payroll data supplement one another, each providing significant types of information that the other cannot suitably supply. Population characteristics, for example, are readily obtained only from the household survey whereas detailed industrial classifications can be reliably derived only from establishment reports.

Data from these two sources differ from each other because of differences in definition and coverage, sources of information, methods of collection, and estimating procedures. Sampling variability and response errors are additional reasons for discrepancies. The factors which have a differential effect on levels and trends of the two series are described below:

Employment

Coverage. The household survey definition of employment comprises wage and salary workers (including domestics and other private household workers), self-employed persons, and unpaid workers who worked 15 hours or more during the survey week in family-operated enterprises. Employment in both farm and nonfarm industries is included. The payroll survey covers only wage and salary employees on the payrolls of nonfarm establishments.

Multiple jobholding. The household approach provides information on the work status of the population without duplication since each person is classified as employed, unemployed, or not in the labor force. Employed persons holding more than one job are counted only once, and are classified according to the job at which they worked the greatest number of

hours during the survey week. In the figures based on establishment records, persons who worked in more than one establishment during the reporting period are counted each time their names appear on payrolls.

Unpaid absences from jobs. The household survey includes among the employed all persons who had jobs but were not at work during the survey week--that is, were not working or looking for work but had jobs from which they were temporarily absent because of illness, bad weather, vacation, labor-management dispute, or because they were taking time off for various other reasons, whether or not they were paid by their employers for the time off. In the figures based on payroll reports, persons on paid sick leave, paid vacation, or paid holiday are included, but not those on leave without pay for the entire payroll period.

Hours of Work

The household survey measures hours actually worked whereas the payroll survey measures hours paid for by employers. In the household survey data, all persons with a job but not at work are excluded from the hours distributions and the computations of average hours. In the payroll survey, employees on paid vacation, paid holiday, or paid sick leave are included and assigned the number of hours for which they were paid during the reporting period.

Comparability of the household interview data with other series

Unemployment insurance data. The unemployed total from the household survey includes all persons who did not work at all during the survey week and were looking for work or were waiting to be called back to a job from which they had been laid off, regardless of whether or not they were eligible for unemployment insurance. Figures on unemployment insurance claims, prepared by the Bureau of Employment Security of the Department of Labor, exclude persons who have exhausted their benefit rights, new workers who have not earned rights to unemployment insurance, and persons losing jobs not covered by unemployment insurance systems (agriculture, State and local government, domestic service, self-employed, unpaid family work, nonprofit organizations, and firms below a minimum size).

In addition, the qualifications for drawing unemployment compensation differ from the definition of unemployment used in the household survey. For example, persons with a job but not at work and persons working only a few hours during the week are sometimes eligible for unemployment compensation, but are classified as employed rather than unemployed in the household survey.

Agricultural employment estimates of the Department of Agriculture. The principal differences in coverage are the inclusion of persons under 14 in the Agricultural Marketing Service (AMS) series and the treatment of dual jobholders who are counted more than once if they worked on more than one farm during the reporting period. There are also wide differences in sampling techniques and collecting and estimating methods, which cannot be readily measured in terms of impact on differences in level and trend of the two series.

Comparability of the payroll employment data with other series

Statistics on manufactures and business, Bureau of the Census. BLS establishment statistics on employment differ from employment counts derived by the Bureau of the Census from

its censuses or annual sample surveys of manufacturing establishments and the censuses of business establishments. The major reason for lack of comparability is different treatment of business units considered parts of an establishment, such as central administrative offices and auxiliary units, and in the industrial classification of establishments due to different reporting patterns by multi-unit companies. There are also differences in the scope of the industries covered, e.g., the Census of Business excludes professional services, transportation companies, and financial establishments, while these are included in BLS statistics.

County Business Patterns. Data in County Business Patterns, published jointly by the U.S. Departments of Commerce and Health, Education, and Welfare, differ from BLS establishment statistics in the units considered integral parts of an establishment and in industrial classification. In addition, CBP data exclude employment in nonprofit institutions, interstate railroads, and government.

Employment covered by Unemployment Insurance programs. Not all nonfarm wage and salary workers are covered by the Unemployment Insurance programs. All workers in certain activities, such as nonprofit organizations and interstate railroads, are excluded. In addition, small firms in covered industries are also excluded in 32 States. In general, these are establishments with less than four employees.

ESTABLISHMENT DATA

COLLECTION

Payroll reports provide current information on wage and salary employment, hours, earnings, and labor turnover in nonfarm establishments, by industry and geographic location.

Federal-State Cooperation

Under cooperative arrangements with State agencies, the respondent fills out only one employment or labor turnover schedule, which is then used for national, State, and area estimates. This eliminates duplicate reporting on the part of respondents and, together with the use of identical techniques at the national and State levels, ensures maximum geographic comparability of estimates.

State agencies mail the forms to the establishments and examine the returns for consistency, accuracy, and completeness. The States use the information to prepare State and area series and then send the data to the BLS for use in preparing the national series. The BLS and the Bureau of Employment Security jointly finance the current employment statistics program in 44 States, the turnover program in 42 States.

Shuttle Schedules

The Form BLS 790 is used to collect employment, payroll, and man-hours data, and Form DL 1219 or BLS 1219 for labor turnover data. These schedules are of the "shuttle" type, with space for each month of the calendar year. The schedule is returned to the respondent each month by the collecting agency so that the next month's data can be entered. This procedure assures maximum comparability and accuracy of reporting, since the respondent can see the figures he has reported for previous months.

The BLS 790 provides for entry of data on the number of full- and part-time workers on the payrolls of nonagricultural establishments and, for most industries, payroll and man-hours of production and related workers or nonsupervisory workers for the pay period ending nearest the 15th of each month. The labor turnover schedule provides for the collection of information on the total number of accessions and separations, by type, during the calendar month.

INDUSTRIAL CLASSIFICATION

Establishments are classified into industries on the basis of their principal product or activity determined from information on annual sales volume. This information is collected each year on an industry class supplement to the monthly 790 or 1219 report. In the case of an establishment making more than one product or engaging in more than one activity, the entire

employment of the establishment is included under the industry indicated by the most important product or activity.

All national, State, and area employment, hours, earnings, and labor turnover series are classified in accordance with the Standard Industrial Classification Manual, Bureau of the Budget, 1957. Since many of the published industry series represent combinations of SIC industries, the BLS has prepared a Guide to Employment Statistics of BLS, 1961 which specifies the SIC code or codes covered by each industry title used in BLS publications. In addition, the Guide provides industry definitions and lists the beginning date of each series. The Guide is available free upon request.

Prior to January 1959, all national, State, and area series were classified in accordance with the following documents: (1) For manufacturing, Standard Industrial Classification Manual, Volume I, Bureau of the Budget, 1945, and (2) for non-manufacturing, Industrial Classification Code, Social Security Board, 1942. State and area series were converted to the 1957 SIC beginning in January 1959 (with an overlap for 1958) and national industry statistics were converted in the latter part of 1961 (with an overlap from 1958 to the month of conversion). Consequently, back issues of Employment and Earnings, the Bureau's monthly periodical showing current data, will not provide earlier data on a comparable basis. However, for many industries, both BLS and the cooperating State agencies have constructed series for years prior to 1958 which are comparable with data starting with 1958 and based on the 1957 SIC. National data for earlier periods comparable with those currently published are shown in Employment and Earnings for the United States, 1909-60. State and area data are available from the cooperating State agencies listed on the back cover.

COVERAGE

Employment, Hours, and Earnings

Reports on employment and, for most industries, payroll and man-hours are collected monthly from sample establishments in nonagricultural industries. The table below shows the approximate proportion of total employment in each industry division covered by the group of establishments furnishing monthly employment data. The coverage for individual industries within the division may vary from the proportions shown.

Approximate size and coverage of BLS employment and payrolls sample ^{1/}

Industry division	Employees	
	Number reported by sample	Percent of total
Mining.....	336,000	46
Contract construction.....	538,000	21
Manufacturing.....	10,851,000	66
Transportation and public utilities:		
Railroad transportation (ICC).....	904,000	97
Other transportation and public utilities.....	1,996,000	66
Wholesale and retail trade.....	2,046,000	19
Finance, insurance, and real estate...	790,000	31
Service and miscellaneous.....	1,108,000	16
Government:		
Federal (Civil Service Commission) ^{2/}	2,192,000	100
State and local.....	2,863,000	48

^{1/} Since a few establishments do not report payroll and man-hour information, hours and earnings estimates may be based on a slightly smaller sample than employment estimates.

^{2/} State and area estimates of Federal employment are based on reports from a sample of Federal establishments, collected through the BLS-State cooperative program.

Labor Turnover

Labor turnover reports are collected monthly from establishments in the manufacturing, mining, and communication industries. The following table shows the approximate coverage, in terms of employment, of the labor turnover sample.

Approximate size and coverage of
BLS labor turnover sample

Industry	Employees	
	Number reported by sample	Percent of total
Manufacturing.....	8,995,000	55
Metal mining.....	65,000	59
Coal mining.....	75,000	37
Communication:		
Telephone.....	600,000	84
Telegraph.....	28,000	72

CONCEPTS

Industry Employment

Employment data for all except the Federal Government refer to persons on establishment payrolls who received pay for any part of the pay period ending nearest the 15th of the month. For Federal Government establishments, current data generally refer to persons who received pay for the last day of the month.

The data exclude proprietors, the self-employed, unpaid family workers, farm workers, and domestic workers in households. Salaried officers of corporations are included. Government employment covers only civilian employees; Federal military personnel are excluded from total nonagricultural employment.

Persons on an establishment payroll who are on paid sick leave (when pay is received directly from the firm), on paid holiday or paid vacation, or who work during a part of the pay period and are unemployed or on strike during the rest of the period, are counted as employed. Not counted as employed are persons who are laid off, on leave without pay, or on strike for the entire period, or who are hired but do not report to work during the period.

Benchmark Adjustments

Employment estimates are periodically compared with complete counts of employment in the various industries defined as nonagricultural, and appropriate adjustments made as indicated by the total counts or "benchmarks." The industry employment estimates are currently projected from March 1959 benchmarks. After allowing for the effect of shifts in products or activities resulting from conversion to the 1957 Standard Industrial Classification, and the changes in level resulting from improved benchmark sources for employment not covered by the social insurance systems, meaningful quantitative comparisons can be made between estimates for March 1959 projected from the last previous benchmarks (1957) and the actual March 1959 benchmark levels. This comparison reveals a difference of 0.6 percent for total nonagricultural employment, practically identical with the extent of the adjustment in March 1957, the last benchmark adjustment prior to the shift in classification systems. The differences were less than 1.0 percent for four of the eight major industry divisions; under 2 percent for two other divisions; and 3.8 and 4.9 percent for the remaining two divisions.

One significant cause of differences between benchmark and estimate is the change in industrial classification of individual establishments, which is usually not reflected in BLS estimates until the data are adjusted to new benchmarks. Other causes are sampling and response errors.

The basic sources of benchmark information are the quarterly tabulations of employment data, by industry, compiled by State agencies from reports of establishments covered under State unemployment insurance laws. These tabulations are prepared under Bureau of Employment Security direction. Supplementary tabulations prepared by the Bureau of Old-Age and Survivors Insurance are used for the group of establishments exempt from State unemployment insurance laws because of their small size. Benchmarks for industries wholly or partly excluded from the unemployment insurance laws are derived from a variety of other sources. Among improvements introduced in 1961, when the industry statistics were converted to the 1957 Standard Industrial Classification Manual, was the development of new and better sources of benchmark data for employment either outside the social insurance system or covered by it only on a voluntary basis.

The BLS estimates relating to the benchmark month are compared with the new benchmark levels, industry by industry. Where revisions are necessary, the monthly series of estimates are adjusted between the new benchmark and the preceding one. The new benchmark for each industry is then carried forward progressively to the current month by use of the sample trends. Thus, under this procedure, the benchmark is used to establish the level of employment while the sample is used to measure the month-to-month changes in the level.

Industry Hours and Earnings

Hours and earnings data are derived from reports of payrolls and man-hours for production and related workers or nonsupervisory employees. These terms are defined below. When the pay period reported is longer than 1 week, the figures are reduced to a weekly basis.

Production and Related Workers include working foremen and all nonsupervisory workers (including leadmen and trainees) engaged in fabricating, processing, assembling, inspection, receiving, storage, handling, packing, warehousing, shipping, maintenance, repair, janitorial and watchman services, product development, auxiliary production for plant's own use (e.g., power plant), and recordkeeping and other services closely associated with the above production operations.

Nonsupervisory Employees include employees (not above the working supervisory level) such as office and clerical workers, repairmen, salespersons, operators, drivers, attendants, service employees, linemen, laborers, janitors, watchmen, and similar occupational levels, and other employees whose services are closely associated with those of the employees listed.

Payroll covers the payroll for full- and part-time production, construction, or nonsupervisory workers who received pay for any part of the pay period ending nearest the 15th of the month. The payroll is reported before deductions of any kind, e.g., for old-age and unemployment insurance, group insurance, withholding tax, bonds, or union dues; also included is pay for overtime, holidays, vacations, and sick leave paid directly by the firm. Bonuses (unless earned and paid regularly each pay period), other pay not earned in pay period reported (e.g., retroactive pay), and the value of free rent, fuel, meals, or other payment in kind are excluded.

Man-Hours cover man-hours worked or paid for, during the pay period ending nearest the 15th of the month, for production, construction, and nonsupervisory workers. The man-hours include hours paid for holidays and vacations, and for sick leave when pay is received directly from the firm.

Overtime Hours cover premium overtime hours of production and related workers during the pay period ending nearest the 15th of the month. Overtime hours are those for which premiums were paid because the hours were in excess of the number of hours of either the straight-time workday or workweek. Weekend and holiday hours are included only if premium wage rates were paid. Hours for which only shift differential, hazard, incentive, or other similar types of premiums were paid are excluded.

Gross Average Hourly and Weekly Earnings

Average hourly earnings for manufacturing and nonmanufacturing industries are on a "gross" basis, reflecting not only changes in basic hourly and incentive wage rates, but also such variable factors as premium pay for overtime and late-shift work, and changes in output of workers paid on an incentive plan. Employment shifts between relatively high-paid and low-paid work and changes in workers' earnings in individual establishments also affect the general earnings averages. Averages for groups and divisions further reflect changes in average hourly earnings for individual industries.

Averages of hourly earnings differ from wage rates. Earnings are the actual return to the worker for a stated period of time, while rates are the amounts stipulated for a given unit of work or time. The earnings series, however, does not measure the level of total labor costs on the part of the employer since the following are excluded: Irregular bonuses, retroactive items, payments of various welfare benefits, payroll taxes paid by employers, and earnings for those employees not covered under the production-worker or nonsupervisory-employee definitions.

Gross average weekly earnings are derived by multiplying average weekly hours by average hourly earnings. Therefore, weekly earnings are affected not only by changes in gross average

hourly earnings, but also by changes in the length of the work-week, part-time work, stoppages for varying causes, labor turnover, and absenteeism.

Average Weekly Hours

The workweek information relates to the average hours for which pay was received, and is different from standard or scheduled hours. Such factors as absenteeism, labor turnover, part-time work, and stoppages cause average weekly hours to be lower than scheduled hours of work for an establishment. Group averages further reflect changes in the workweek of component industries.

Average Overtime Hours

The overtime hours represent that portion of the gross average weekly hours which were in excess of regular hours and for which premium payments were made. If an employee worked on a paid holiday at regular rates, receiving as total compensation his holiday pay plus straight-time pay for hours worked that day, no overtime hours would be reported.

Since overtime hours are premium hours by definition, gross weekly hours and overtime hours do not necessarily move in the same direction, from month-to-month; for example, premiums may be paid for hours in excess of the straight-time workday although less than a full week is worked. Diverse trends at the industry-group level may also be caused by a marked change in gross hours for a component industry where little or no overtime was worked in both the previous and current months. In addition, such factors as stoppages, absenteeism, and labor turnover may not have the same influence on overtime hours as on gross hours.

Railroad Hours and Earnings

The figures for class I railroads (excluding switching and terminal companies) are based on monthly data summarized in the M-300 report of the Interstate Commerce Commission and relate to all employees who received pay during the month, except executives, officials, and staff assistants (IOC group I). Gross average hourly earnings are computed by dividing total compensation by total hours paid for. Average weekly hours are obtained by dividing the total number of hours paid for, reduced to a weekly basis, by the number of employees, as defined above. Gross average weekly earnings are derived by multiplying average weekly hours by average hourly earnings.

Spendable Average Weekly Earnings

Spendable average weekly earnings in current dollars are obtained by deducting estimated Federal social security and income taxes from gross weekly earnings. The amount of income tax liability depends on the number of dependents supported by the worker, as well as on the level of his gross income. To reflect these variables, spendable earnings are computed for a worker with no dependents, and a worker with three dependents. The computations are based on the gross average weekly earnings for all production or nonsupervisory workers in the industry division without regard to marital status, family composition, or total family income.

"Real" earnings are computed by dividing the current Consumer Price Index into the earnings averages for the current month. The resulting level of earnings expressed in 1957-59 dollars is thus adjusted for changes in purchasing power since the base period.

Average Hourly Earnings Excluding Overtime

Average hourly earnings excluding premium overtime pay are computed by dividing the total production-worker payroll for the industry group by the sum of total production-worker man-hours and one-half of total overtime man-hours. Prior to January 1956, these data were based on the application of adjustment factors to gross average hourly earnings (as described in the *Monthly Labor Review*, May 1950, pp. 537-540). Both methods eliminate only the earnings due to overtime paid for at one and one-half times the straight-time rates. No adjustment is made for other premium payment provisions, such as holiday work, late-shift work, and overtime rates other than time and one-half.

Indexes of Aggregate Weekly Payrolls and Man-Hours

The indexes of aggregate weekly payrolls and man-hours are prepared by dividing the current month's aggregate by the monthly average for the 1957-59 period. The man-hour aggregates are the product of average weekly hours and production-worker

employment, and the payroll aggregates are the product of gross average weekly earnings and production-worker employment.

Labor Turnover

Labor turnover is the gross movement of wage and salary workers into and out of employment status with respect to individual establishments. This movement, which relates to a calendar month, is divided into two broad types: *Accessions* (new hires and rehires) and *separations* (terminations of employment initiated by either employer or employee). Each type of action is cumulated for a calendar month and expressed as a rate per 100 employees. The data relate to all employees, whether full- or part-time, permanent or temporary, including executive, office, sales, other salaried personnel, and production workers. Transfers to another establishment of the company are included, beginning with January 1959.

Accessions are the total number of permanent and temporary additions to the employment roll, including both new and rehired employees.

New hires are temporary or permanent additions to the employment roll of persons who have never before been employed in the establishment (except employees transferring from another establishment of the same company) or of former employees not recalled by the employer.

Other accessions, which are not published separately but are included in total accessions, are all additions to the employment roll which are not classified as new hires including transfers from another establishment of the company.

Separations are terminations of employment during the calendar month and are classified according to cause: *Quits*, *layoffs*, and other separations, as defined below.

Quits are terminations of employment initiated by employees, failure to report after being hired, and unauthorized absences, if on the last day of the month the person has been absent more than 7 consecutive calendar days.

Layoffs are suspensions without pay lasting or expected to last more than 7 consecutive calendar days, initiated by the employer without prejudice to the worker.

Other separations, which are not published separately but are included in total separations, are terminations of employment because of discharge, permanent disability, death, retirement, transfers to another establishment of the company, and entrance into the Armed Forces expected to last more than 30 consecutive calendar days.

Comparability With Employment Series

Month-to-month changes in total employment in manufacturing industries reflected by labor turnover rates are not comparable with the changes shown in the Bureau's employment series for the following reasons: (1) Accessions and separations are computed for the entire calendar month; the employment reports refer to the pay period ending nearest the 15th of the month; and (2) employees on strike are not counted as turnover actions although such employees are excluded from the employment estimates if the work stoppage extends through the report period.

ESTIMATING METHODS

Several major technical improvements were achieved in 1961, when the industry statistics were converted to the 1957 *Standard Industrial Classification Manual*. The benchmark tabulations obtained from State unemployment insurance agencies (see section on benchmark adjustments), which formerly gave employment totals by industry, were tabulated to give separate totals by size of establishment within industries for the first quarter of each year beginning with 1959. Intensive analysis revealed that significant improvements could be made for many of the hours and earnings series if the employment estimates for certain industries were stratified by size of establishment and/or by region, and the stratified production- or nonsupervisory-worker data were used in weighting the hours and earnings into broader industry groupings. Accordingly, the basic estimating cell for an employment, hours, or earnings series, as the term is used in the summary of computational methods on page 5-E may be an industry size and/or regional stratum or it may be an entire industry or combination of industries. Further analysis will be made, as resources permit, to determine whether stratification will improve the estimates of labor turnover rates.

Summary of Methods for Computing Industry Statistics on Employment, Hours, Earnings, and Labor Turnover

Item	Basic estimating cells (industry or region, and size cells)	Aggregate industry levels (divisions, groups and, where stratified, individual industries)
Monthly Data		
All employees	All-employee estimate for previous month multiplied by ratio of all employees in current month to all employees in previous month, for sample establishments which reported for both months.	Sum of all-employee estimates for component industries.
Production or nonsupervisory workers; women employees	All-employee estimate for current month multiplied by (1) ratio of production or nonsupervisory workers to all employees in sample establishments for current month, (2) ratio of women to all employees.	Sum of production- or nonsupervisory-worker estimates, or women estimates, for component industries.
Gross average weekly hours	Production- or nonsupervisory-worker man-hours divided by number of production or nonsupervisory workers.	Average, weighted by production- or nonsupervisory-worker employment, of the average weekly hours for component industries.
Average weekly overtime hours	Production-worker overtime man-hours divided by number of production workers.	Average, weighted by production-worker employment, of the average weekly overtime hours for component industries.
Gross average hourly earnings	Total production- or nonsupervisory-worker payroll divided by total production- or nonsupervisory-worker man-hours.	Average, weighted by aggregate man-hours, of the average hourly earnings for component industries.
Gross average weekly earnings	Product of gross average weekly hours and average hourly earnings.	Product of gross average weekly hours and average hourly earnings.
Labor turnover rates (total, men, and women)	The number of particular actions (e.g., quits) in reporting firms divided by total employment in those firms. The result is multiplied by 100. For men (or women), the number of men (women) who quit is divided by the total number of men (women) employed.	Average, weighted by employment, of the rates for component industries.
Annual Average Data		
All employees and production or nonsupervisory workers	Sum of monthly estimates divided by 12.	Sum of monthly estimates divided by 12.
Gross average weekly hours	Annual total of aggregate man-hours (production- or nonsupervisory-worker employment multiplied by average weekly hours) divided by annual sum of employment.	Annual total of aggregate man-hours for production or nonsupervisory workers divided by annual sum of employment for these workers.
Average weekly overtime hours	Annual total of aggregate overtime man-hours (production-worker employment multiplied by average weekly overtime hours) divided by annual sum of employment.	Annual total of aggregate overtime man-hours for production workers divided by annual sum of employment for these workers.
Gross average hourly earnings	Annual total of aggregate payrolls (production- or nonsupervisory-worker employment multiplied by weekly earnings) divided by annual aggregate man-hours.	Annual total of aggregate payrolls divided by annual aggregate man-hours.
Gross average weekly earnings	Product of gross average weekly hours and average hourly earnings.	Product of gross average weekly hours and average hourly earnings.
Labor turnover rates	Sum of monthly rates divided by 12.	Sum of monthly rates divided by 12.

More advanced automatic electronic data-processing equipment has also contributed to improving the program. The advanced equipment, with its greater capacity, has made feasible the increased number of computations required by the introduction of size cells, and facilitates closer quality control of data input and output.

The general procedures used for estimating industry employment, hours, earnings, and labor turnover statistics are described in the table on page 5-E. Details are given in the technical notes on Measurement of Employment, Hours, and Earnings in Nonagricultural Industries and Measurement of Labor Turnover, which are available upon request.

LABOR FORCE DATA

COLLECTION AND COVERAGE

Statistics on the employment status of the population, the personal, occupational, and other economic characteristics of employed and unemployed persons, and related labor force data are compiled for the BLS by the Bureau of the Census in its Current Population Survey. (A detailed description of this survey appears in Concepts and Methods Used in the Current Employment and Unemployment Statistics Prepared by the Bureau of the Census, U. S. Bureau of the Census, Current Population Reports, Series P-23, No. 5. This report is available from BLS on request.)

These monthly surveys of the population are conducted with a scientifically selected sample designed to represent the civilian noninstitutional population 14 years and over. Respondents are interviewed to obtain information about the employment status of each member of the household 14 years of age and over. The inquiry relates to activity or status during the calendar week, Sunday through Saturday, ending nearest the 15th of the month. This is known as the survey week. Actual field interviewing is conducted in the following week.

Inmates of institutions and persons under 14 years of age are not covered in the regular monthly enumerations and are excluded from the population and labor force statistics shown in this report. Data on members of the Armed Forces, who are included as part of the categories "total noninstitutional population" and "total labor force," are obtained from the Department of Defense.

The sample is spread over 333 areas comprising 641 counties and independent cities, with coverage in 50 States and the District of Columbia. At present, completed interviews are obtained each month from about 35,000 households. There are about 1,500 additional sample households from which information should be collected but is not because the occupants are not found at home after repeated calls, are temporarily absent, or are unavailable for other reasons. This represents a non-interview rate for the survey of about 4 percent. Part of the sample is changed each month. The rotation plan provides for approximately three-fourths of the sample to be common from one month to the next, and one-half to be common with the same month a year ago.

CONCEPTS

Employed Persons comprise (a) all those who during the survey week did any work at all either as paid employees, or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (b) all those who were not working or looking for work but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for various other reasons, whether or not they were paid by their employers for the time off.

Each employed person is counted only once. Those who held more than one job are counted in the job at which they worked the greatest number of hours during the survey week.

Included in the total are employed citizens of foreign countries, temporarily in the United States, who are not living on the premises of an embassy (e.g., Mexican migrant farm workers).

Excluded are persons whose only activity consisted of work around the house (such as own home housework, and painting or repairing own home) or volunteer work for religious, charitable, and similar organizations.

Unemployed Persons comprise all persons who did not work at all during the survey week and were looking for work, regardless of whether or not they were eligible for unemployment insurance. Also included as unemployed are those who did not work at all and (a) were waiting to be called back to a job from which they had been laid off; or (b) were waiting to report to a new wage or salary job within 30 days (and were not in school during the survey week); or (c) would have been looking for work except that they were temporarily ill or believed no work was available in their line of work or in the community. Persons in this latter category will usually be residents of a community in which there are only a few dominant industries which were shut down during the survey week. Not included in this category are persons who say they were not looking for work because they were too old, too young, or handicapped in any way.

The Unemployment Rate represents the number unemployed as a percent of the civilian labor force, i.e., the sum of the employed and unemployed. This measure can also be computed for groups within the labor force classified by sex, age, marital status, color, etc. When applied to industry and occupation groups, the labor-force base for the unemployment rate also represents the sum of the employed and the unemployed, the latter classified according to industry and occupation of their latest full-time civilian job.

Duration of Unemployment represents the length of time (through the current survey week) during which persons classified as unemployed had been continuously looking for work or would have been looking for work except for temporary illness, or belief that no work was available in their line of work or in the community. For persons on layoff, duration of unemployment represents the number of full weeks since the termination of their most recent employment.

The Civilian Labor Force comprises the total of all civilians classified as employed or unemployed in accordance with the criteria described above. The "total labor force" also includes members of the Armed Forces stationed either in the United States or abroad.

Not in Labor Force includes all civilians 14 years and over who are not classified as employed or unemployed. These persons are further classified as "engaged in own home housework," "in school," "unable to work" because of long-term physical or mental illness, and "other." The "other" group includes for the most part retired persons, those reported as too old to work, the voluntarily idle, and seasonal workers for whom the survey week fell in an "off" season and who were not reported as unemployed. Persons doing only incidental unpaid family work (less than 15 hours) are also classified as not in the labor force.

Occupation, Industry, and Class of Worker apply to the job held in the survey week. Persons with two or more jobs are classified in the job at which they worked the greatest number of hours during the survey week. The occupation and industry group used in data derived from the household interviews are defined as in the 1950 Census of Population. Information on the detailed categories included in these groups is available upon request.

The industrial classification system used in the Census of Population and the Current Population Survey differs somewhat from that used by the BLS in its reports on employment, by industry. Employment levels by industry from the household survey, although useful for many analytical purposes, are not published in order to avoid public misunderstanding since they differ from the payroll series because of differences in classification, sampling variability, and other reasons. The industry figures from the household survey are used as a base for published distributions on hours of work, unemployment rates, and other characteristics of industry groups such as age, sex, and occupation.

ESTIMATING METHODS

The estimating procedure is essentially one of using sample results to obtain percentages of the population in a given category. The published estimates are then obtained by multiplying these percentage distributions by independent estimates of the population. A description of the principal steps involved follows. Under the estimation methods used, all of the results for a given month become available simultaneously and are based on returns from the entire panel of respondents. There are no subsequent adjustments to independent benchmark data on labor force, employment, or unemployment. Therefore, revisions of the historical data are not an inherent feature of this statistical program.

1. **Noninterview adjustment.** The weights for all interviewed households are adjusted to the extent needed to account for occupied sample households for which no information was obtained because of absence, impassable roads, refusals, or unavailability for other reasons. This adjustment is made separately by groups of sample areas and, within these, for six groups--color (white and nonwhite) within the three residence categories (urban, rural nonfarm, and rural farm). The proportion of sample households not interviewed varies from 3 to 5 percent depending on weather, vacations, etc.

2. **Ratio estimates.** The distribution of the population selected for the sample may differ somewhat, by chance, from that of the Nation as a whole, in such characteristics as age, color, sex, and residence. Since these population characteristics are closely correlated with labor force participation and other principal measurements made from the sample, the latter estimates can be substantially improved when weighted appropriately by the known distribution of these population characteristics. This is accomplished through two stages of ratio estimates as follows:

a. **First-stage ratio estimate.** This is the procedure in which the sample proportions are weighted by the known census data on the color-residence distribution of the population. This step takes into account the differences existing at the time of the latest decennial census between the color-residence distribution for the Nation and for the sample areas.

b. **Second-stage ratio estimate.** In this step, the sample proportions are weighted by independent current estimates of the population by age, sex, and color. These estimates are prepared by carrying forward the most recent census data to take account of subsequent aging of the population, mortality, and migration between the United States and other countries.

3. **Composite estimate procedure.** In deriving statistics for a given month, a composite estimating procedure is used which takes account of net changes from the previous month for continuing parts of the sample (75 percent) as well as the sample results for the current month. This procedure reduces the sampling variability especially of month-to-month changes but also of the levels for most items.

Reliability of the Estimates

Since the estimates are based on a sample, they may differ from the figures that would have been obtained if it were possible to take a complete census using the same schedules and procedures. Estimates of sampling variability have been computed for all the major statistics and are published in *Employment and Earnings*.

SEASONAL ADJUSTMENT

Many economic statistics reflect a regularly recurring seasonal movement which can be measured on the basis of past experience. By eliminating that part of the change which can be ascribed to usual seasonal variation, it is possible to observe

the cyclical and other nonseasonal movements in the series. Current seasonally adjusted data for selected labor force and establishment series are published regularly.

The seasonal adjustment method used for these series is a new adaptation of the standard ratio-to-moving average method, with a provision for "moving" adjustment factors to take account of changing seasonal patterns. A detailed description and illustration of the basic method was published in the August 1960 *Monthly Labor Review*.

The seasonally adjusted series on weekly hours and labor turnover rates for industry groupings are computed by applying factors directly to the corresponding unadjusted series, but seasonally adjusted employment totals for all employees and production workers by industry divisions are obtained by summing the seasonally adjusted data which are published for component industries. The factors currently in use are available upon request.

In the case of unemployment, data for four age-sex groups (male and female unemployed workers under age 20, and aged 20 and over) are separately adjusted for seasonal variation and are then added to give a seasonally adjusted total unemployment figure. The seasonally adjusted rate of unemployment is derived by dividing the seasonally adjusted figure for total unemployment (the sum of the four seasonally adjusted age-sex components) by the figure for the seasonally adjusted civilian labor force. Seasonal adjustment factors for major components of the labor force to be applied to data for 1959 and later are provided in the table below, since seasonally adjusted labor force series, except for the unemployment rates, are not published regularly.

The seasonal adjustment factors applying to current data are based on a pattern shown by past experience. These factors are revised in the light of the pattern revealed by subsequent data. Data through June 1960 were used in deriving the current factors applicable to 1959-61. Revisions will be made annually as each additional year's data (from June 1960) become available.

Seasonal adjustment factors for the labor force and major components, to be used for the period 1959-61

Month	Civilian labor force	Employment			Unemployment			
		Total	Agriculture	Nonagricultural industries	Males		Females	
					Aged 14 to 19	Aged 20 and over	Aged 14 to 19	Aged 20 and over
