BULLETIN NO. 1556

FOR SALE BY THE SUPERINTENDENT OF DOCUMENTS, U.S.

GOVERNMENT PRINTING OFFICE WASHINGTON, D.C., 20402

PRICE 75 CENTS

Preface

This bulletin on clothing expenditures by urban families is an addition to the series of statistical reports presenting the results of the Bureau's Survey of Consumer Expenditures, 1960-61, and identified as BLS Reports 237-1 through 93. The design of the accompanying tabulations is unique in this series: Average expenditures are for individual family members, classified by sex and age. In all other reports, the averages are for the entire family as an earning and spending unit.

The tabulations of clothing purchased for men and women and for boys and girls of different ages were designed for use in general economic analyses of markets for apparel, textiles, footwear, and related items. The details for boys and girls under 18 years of age will help fill a gap in official information on the costs of rearing a child. Per-person expenditures and quantities purchased by families in different income classes provide home economists, and public and private welfare agencies with a variety of spending patterns to guide families in developing their clothing budgets. Broadly speaking, this report can be considered a basic reference in the Nation's expanding program of consumer education.

This bulletin was prepared in the Office of Prices and Living Conditions by staff members of the Division of Living Conditions Studies in collaboration with systems analysts in the Section of Electronic Data Programing.

CLOTHING FOR URBAN FAMILIES

Expenditures per Member by Sex and Age, 1960-61

Clothing ranks fourth in the average urban family's spending for day-to-day living expenses. Only food, shelter, and automobile expenses take larger fractions of the urban consumer's dollar. Urban families reported, in the 1960-61 BLS Survey of Consumer Expenditures (CES), that purchase and upkeep of clothing accounted for about 10 cents of every dollar spent for current living expenses.

In earlier reports presenting information from the 1960-61 survey, expenditures for clothing--in common with all other items--were expressed in terms of averages per family. There was no reasonable or logical alternative for most items, since, by CES definition, a family of more than one person referred to a group of people living together who pooled their income and drew from a common fund for their major expenses. Most items of apparel, however, are purchased for a particular family member (although they may go through a "hand-me-down" cycle), and generally families can report clothing purchases for individual members. Primarily to provide detail needed for revising the Consumer Price Index and deriving quantities for the Standard Budgets, the Bureau in its 1960-61 survey continued to record clothing purchases for each family member. BLS experience in 1950 and in some earlier expenditure surveys also had demonstrated that associating clothing purchases with the wearer aided recall and added to the completeness of the family's account of its expenditures.

What kind and how many items of clothing a person purchases are influenced by many considerations. The accompanying tabulations have been designed to classify individuals by some of the principal causes of variation in clothing purchases: Sex, age, family income, and family type. Tables 3 through 34 show average expenditures, quantities purchased, and prices paid for clothing by persons living in all urban areas combined, but classified by family income after taxes. Table 1 shows only expenditures

per person for all income classes combined, but indicates regional variation in clothing purchases by classifying family members according to the geographic region in which they live.

Data Sources and Definitions

Information in this report was collected by the Bureau of Labor Statistics (BLS) as part of its nationwide Survey of Consumer Expenditures in urban places. The Survey was conducted in 2 years--in 1961, covering family expenditures and income in the calendar year 1960, and in 1962, providing data for 1961.

A three-stage sample design was used to select a sample representing all families in the urban population of the United States. The sampling procedures yielded a sample of approximately 12,000 living quarter addresses in 66 urban places

All data were collected by personal interviews and with the voluntary cooperation of families included in the samples. A total of 9,476 families in urban places¹ furnished usable schedules on which the tables in this bulletin are based.

A fuller explanation of survey methodology and a list of areas in the sample are contained in chapter 8² of the Handbook of Methods for Surveys and Studies (BLS Bulletin 1458).

¹This includes 134 schedules covering 1959 expenditures of families in Anchorage, Alaska. Anchorage was 1 of 3 cities surveyed in 1960 prior to mounting the nationwide CES, and schedules from Anchorage were combined with those from other urban places in the 1960-61 regional and U.S. tabulations.

²Reprints of this chapter, entitled "Consumer Expenditures and Income" are available upon request.

In this survey, the family, or consumer unit, referred (1) to a group of people usually living together who pooled their income and drew from a common fund for their major items of expense, or (2) to a person living alone or in a household with others but who was financially independent, i.e., his income and expenditures were not pooled. Never-married children living with their parents were always considered as members of the consumer unit. Information was recorded for the family unit as it existed in the survey year.

All members of consumer units residing at a sample address were eligible for inclusion in the survey, except for the periods in the year during which they were living in military camps, posts, or reservations

personal taxes (Federal, State, and local income taxes, poll taxes, and personal property taxes). It represents the total money income during the survey year of all family members from all sources, plus the value of two nonmoney items--food and housing received as pay.

The family type classification is based on the relationship of family members and the age of the children (including adopted and stepchildren) of the family head. The family types selected as classifying variables in the accompanying tabulations are shown and defined in table 2.

The geographic classification is by four broad regions, defined by the U.S. Bureau of the Census as follows:

South

Alabama
Arkansas
Delaware
District of Columbia
Florida
Georgia

(other than periods of 45 days or less in a reserve or National Guard unit); in institutions; abroad (except on vacation, etc.); or were members of another consumer unit.

Expenditures represent the cost (including alterations, credits, charges, and sales and excise taxes) of all clothing bought during the survey year, whether or not payments were completed during the year. Prices were reported as the price actually paid for new or used items--whether at regular prices, "on sale," or at a discount.

The income classification is based on the family's money income after deduction for

Tabulation Methods

Tabulations of annual clothing expenditures per person in this bulletin were obtained in conjunction with automatic data processing programs written to provide data for deriving clothing quantities for the Standard Budgets. The tables in this report show annual expenditures and quantities purchased for persons who were in the family the full survey year (52 weeks). An exception was made for boys and girls under 2 years of age, all of whom were included, since in most instances, part-year membership for these children would be limited to babies born during the survey year.

The averages and percentages in the accompanying tables are based on all persons included in each class, whether or not they reported expenditures for a particular item. Averages were calculated by dividing the aggregate amount of expenditures by the total number of persons in the class.³ Since all averages for a class are based on a common divisor, they are additive.⁴

All data obtained for urban areas in the 1960-61 CES sample were combined at regional and U.S. levels using a system of weights based on the 1960 Census of Population. A description of the derivation of the weights for each of the 67 urban strata (66 sample areas and Anchorage, Alaska, which was surveyed for 1959) is available upon request. Briefly, the effective weights ("blow-up" or "expansion factors") were the estimated number of consumer units (CU's) in the universe represented by each complete and usable schedule in a sampling stratum. They were obtained by dividing the estimated number of CU's in the universe for each sampling stratum by the number of CU's in the stratum for which there were usable schedules.

Stratum expansion factors were applied to the individual family member clothing records. Regional and U.S. averages were obtained by dividing the sum of the stratum aggregates by the number of persons in the universe for the class.

Guides to Interpreting Statistics

It should be noted that in the survey, clothing expenditures refer only to purchases made by the family. They included gifts of

clothing exchanged within the consumer unit or family, as defined previously, but do not include gifts received from relatives outside the consumer unit, from friends, and from public or private welfare agencies. Each family was asked to estimate the value of all items received without expense. In some instances, the values were nominal because the family had little or no knowledge of the value of goods and services received. Clothing was the largest single category of gifts reported by urban families. Gifts of clothing averaged \$52.76 per urban family, or more than a quarter of the estimated value of all goods and services received without expense.⁵

Some types of clothing are more favored as gift items than others. Also, it is more customary to give major items of clothing to some age groups than to others. For children under 2 years of age, particularly, the family's expenditures shown in the accompanying tables may understate actual clothing requirements, since the practice of giving all types of clothing to babies and small children is widespread. According to the Wall Street Journal, the clothing trade refers to some expensive fashions for little girls as "grandmother clothes" because indulgent grandmothers very often are the purchasers.⁶ Frequently, clothing is given to elderly people who have lost interest in shopping or find it too tiring.

Expenditures and quantities of individual clothing items may be somewhat understated because some families reported total clothing expenditures, but were unwilling or unable to give the item detail for each family member. The average amount of such expenditures is shown as "Expenditures not allocated" at the end of each expenditure table. The averages of unallocated expenditures ranged from \$2.40 per child under 2 years to \$20.20 per girl 16 or 17 years old. Girls at this age frequently have clothing

³Blanks or 00's in columns of data indicate either that no amounts were reported or that reported amounts averaged less than \$0.01.

⁴The totals for some subgroups may exceed the sum of the items by more than is attributable to rounding. This occurs when the subgroup total includes combined expenditures which could not be allocated among the items listed. See also footnotes at end of table 34.

⁵Survey of Consumer Expenditures, 1960-61: Consumer Expenditures and Income, Urban United States, 1960-61 (Supplement 3-Part A to BLS Report 237-38, 1964), p. 14.

⁶Wall Street Journal, March 23, 1967.

allowances or use their own money from babysitting, etc., to buy clothes. The interviewer may experience greater difficulty in obtaining details for such purchases than for items bought directly by parents who may be able only to approximate their teen-age child's total clothing expenses.

Data obtained from a sample survey as complex as the Survey of Consumer Expenditures are subject to many types of errors. These include sampling, recording, and processing errors, and errors due to the refusal or inability of some families to give the information requested. The reliability of the information from this survey is discussed in a forthcoming report on the 1960-61 survey methodology. That report includes computations of sampling error in the average expenditures per family for selected

items of clothing, but no sampling errors have been computed for the average expenditures per person.

Particular care is required in using averages for persons in families at the extremes of the income scale. These averages are based on small numbers of persons who may differ sharply in their spending patterns. For example, the lower income classes include disproportionate numbers of elderly persons, but they may include an occasional student or persons in families which reported losses from a business or from rental property. Table 2 shows the number of persons in the sample in each class on which the weighted averages in tables 3-34 are based. It is assumed that the analyst will recognize the limitations of the averages computed for small numbers of persons.

PERCENT REPORTING	7		5	7	6	5	7	8	11	11	19

1) BASED ON DATA FOR PERSONS WHO WERE IN THE FAMILY THE FULL YEAR (52 WEEKS), EXCEPT FOR BOYS AND GIRLS UNDER 2 YEARS OF AGE, ALL OF WHOM WERE INCLUDED, SINCE IN MOST INSTANCES PART-YEAR MEMBERSHIP FOR THIS AGE GROUP WOULD BE LIMITED TO INFANTS BORN DURING THE SURVEY YEAR.

2) COMPUTATION OF AVERAGES--

AVERAGE EXPENDITURE. THE AGGREGATE EXPENDITURE OF PERSONS IN EACH CLASS, DIVIDED BY THE AGGREGATE NUMBER OF PERSONS IN THE RESPECTIVE CLASS, WHETHER OR NOT THEY REPORTED THE PURCHASE OF THE PARTICULAR ITEM. EXPENDITURES FOR ITEMS PURCHASED SECONDHAND, AT WHOLESALE OR DISCOUNT PRICES, OR ON SALE WERE INCLUDED IN THE COMPUTATION. SINCE ALL EXPENDITURE AVERAGES FOR A PARTICULAR CLASS ARE BASED ON A COMMON DIVISOR, THEY ARE ADDITIVE. BECAUSE OF ROUNDING, SUMS OF INDIVIDUAL ITEMS MAY NOT EQUAL TOTALS.

AVERAGE PRICE. SOME REPORTS DID NOT INCLUDE THE QUANTITIES AND/OR PRICES PAID FOR ITEMS OF CLOTHING PURCHASED. THEREFORE, AVERAGE PRICES WERE CALCULATED BY DIVIDING THE AGGREGATE EXPENDITURE OF PERSONS IN EACH CLASS WHO REPORTED THE QUANTITY PURCHASED BY THE AGGREGATE QUANTITY REPORTED IN THE RESPECTIVE CLASS.

AVERAGE QUANTITY. THE AVERAGE EXPENDITURE FOR ALL PERSONS IN EACH CLASS DIVIDED BY THE AVERAGE PRICE IN THE RESPECTIVE CLASS.

3) THE PERCENT REPORTING WAS OBTAINED BY DIVIDING THE NUMBER OF PERSONS REPORTING EXPENDITURES FOR A SPECIFIED ITEM BY THE TOTAL NUMBER OF PERSONS IN THE APPLICABLE CLASS.
