PREFACE

The Capital Flow Matrix, 1958, is a product of the research carried out by the Interagency Growth Project. The work on capital flows was done in the Bureau of Labor Statistics, Division of Economic Growth, by Jack Alterman and Ronald E. Kutscher, assisted by Robert L. Ball and Arlene K. Shapiro.

The Office of Business Economics, U.S. Department of Commerce, made significant contributions to this work, not only in making basic data available, but also through helpful comments and suggestions.

CAPITAL FLOW MATRIX, 1958

The purpose of this capital flow matrix is to carry the interindustry flows of the 1958 input-output table by the Office of Business Economics 1/ one step further by showing the transactions of capital goods among producing and using industries. In a conventional input-output table the output of each industry is distributed to each of the intermediate industries of the economy as well as to final demand, e.g., consumer expenditures. The output of capital goods industries destined for domestic business capital investment, however, is not distributed to the industries actually purchasing the capital goods but to a single final demand category covering "gross private domestic fixed capital formation." The capital flow matrix is therefore a logical extension which traces the transaction between capital producing and capital consuming industries.

Concepts and Definitions

The capital purchases covered in the capital flow matrix are conceptually consistent with the definition of capital expenditures used in the national income and product accounts as well as that used for the interindustry transactions table for 1958 prepared by the Office of Business Economics. This definition includes net plant 2/ and equipment 3/ purchases by the private sector of the economy for the year 1958, regardless of whether the capital goods

were produced domestically or manufactured abroad. 4/ It includes the trade and transportation cost of delivery to the purchaser and

pipelines, and communication lines. Residential construction as well as commission on all real estate transactions was not distributed to purchasing industries in the capital flow matrix, although in concept they are included.

3/ Equipment included in the capital flow matrix covers large machinery items usually associated with business investment such as construction machinery; metalworking machines; special industry machines such as textile industries or printing trade machines; computers and other business machines including typewriters and adding machines; large material handling equipment such as hoists; electric generating equipment; airplanes; trucks; and railroad equipment. Other items included in the capital flow matrix, but which usually may not be associated with business investment are carpets, desks, chairs, filing cabinets, and other office furniture; stoves, refrigerators, and food preparation equipment used by restaurants; business use of automobiles including fleet operations and automobile expenditures by doctors, lawyers, and other self-employed individuals; and many smaller implements, tools, and instruments used by the private sector. A fuller description of all items included can be found in the appendix.

4/ The capital flow table contains a row called imports among the capital producing sectors. In the treatment of imports within the 1958 input-output study, this import row would include only imported capital goods allocated directly to gross private capital formation. However, it does not cover all of the imported capital goods, since most are transferred to the comparable domestic intermediate industry. The allocation from this industry is made to final demand without designating the proportion that comes from imports and the proportion that comes from domestic production.

1/ Morris R. Goldman, Martin L. Marimont, and Beatrice N. Vaccara, "Interindustry Structure of the United States for 1958," Survey of Current Business, November 1964; also Survey of Current Business, August and September 1965.

2/ The plant included in the capital flow matrix is all new construction as well as major alterations and additions by the private sector. This includes residential construction, nonresidential buildings such as offices, industrial buildings, stores, churches, private schools, and private hospitals, and other nonbuilding construction such as private electric power, gas

installation cost wherever applicable. In addition, the definition includes the transportation and trade cost for transaction on used capital goods as well as real estate commissions on the sale of plant. ^{5/} It excludes, on the other hand, purchases by domestic corporations for use in overseas subsidiaries, any equipment purchased by the Federal Government or by State and local governments, and exports of capital goods. It does not cover the value of land in any transactions, liquid assets of any form, ^{6/} and inventory accumulation. However, it does cover all capital purchases by the private sectors of the economy including non-profit institutions, private universities, and hospitals.

The industry definitions used in the capital flow matrix are identical to the 1958 interindustry sales and purchases industry categories. In the Office of Business Economics input-output study, there are 82 producing and 82 consuming industries. In the capital flow matrix, there are 36 producing industries (inasmuch as all industries do not produce capital) and 77 purchasing industries. ^{7/} To be consistent with the treatment of industries within the Office of Business Economics study, the capital purchases represent purchases by establishments rather than companies classi-

^{5/} There are several items which conceptually are part of gross private domestic investment and which are shown in the totals columns as well as in the 1958 Office of Business Economics input-output matrix but are not distributed to a consuming industry in the capital flow table. These include commission on real estate transactions, transactions in buildings between final users, and changes in net stocks of used goods.

^{6/} Excluded also is capital consumed on current account which is no longer considered capital in the national accounts.

^{7/} The Office of Business Economics input-output study has 87 industries of which 82 are

fied within these sectors. In industries or lines of capital where extensive leasing is prevalent, this capital is shown in the capital flow matrix in the using rather than owning industries, particularly in relation to computers, construction equipment, and railroad cars.

Relationship to National Accounts

The capital flow matrix can be viewed as an addition or extension of two existing sets of national accounts. These are the income and product accounts and the input-output system of flows of goods and services. Perhaps the extension can be viewed in this simple form which assumes gross private capital is the only measure of final demand. See opposite page.

Input-Output Tables. The first section of the preceding chart illustrates an interindustry transactions table with four producing and four consuming industries. By reading across the rows of the input-output table for any industry, the sales of its output to each industry, including itself, can be seen. In addition, the chart shows the sales from this industry to final demand. (Shown here as gross private capital formation, excluding any purchases by the other final purchasers—consumers, government or foreign.) For instance, it can be seen, by reading across the row, that industry 1 sells

intermediate industries. Only the intermediate industries are considered in the capital flow matrix. The 5 intermediate sectors which do not consume capital are interindustry sales and purchases (ISP) 80, imports; ISP 81 and 82 which are dummy sectors; and ISP 78 and 79, Federal and State and local enterprises, the capital purchases of which, in the national income accounts, are treated as general government purchases and are shown as final demand purchases.

two units of its output of 11 to itself, it sells one unit to industry 2, no units to industry 3, and four units to industry 4. Its sales to final demand (or gross private capital formation) are four units completing its 11 units of output.

The input-output flow table also can be read down the columns. The columns show purchases by an industry from each industry, including itself. Again, for illustration, by examining column 1, the inputs (or costs) to industry 1 can be determined. For industry 1 to produce its output, requires inputs of two units from itself, two units from industry 2, three units from industry 3, and two units from industry 4. Its costs include purchases from value added (two units); this represents industry 1's expenditures for employee compensation, depreciation, proprietors' income, indirect business taxes, and profits. The 11 units of inputs for industry 1 equal the 11 units of output as do the output and input for each of the other industries. The final entry at the bottom of each column and at the end of each row is the total output or input for that industry. 8/

8/ The input-output illustration above of input-output transactions table shows actual transactions between purchasing and producing industries. Input-output data, however, usually are presented in three separate tables. In addition to the transactions table which is usually table 1, the second table presents direct requirements per dollar of output for each industry. These relationships which are called input-output coefficients or technical coefficients are determined by dividing the dollar value of each industry's input by the dollar value of its output. The third table in the usual presentation of input-output data is the total requirements table.

The total requirements table, or inverse matrix, is the algebraic solution of the direct requirements or technical coefficients. The inverse matrix allows one to calculate the total (direct and indirect) impact of a change in demand for one industry's product on all industries in the economy.

In the input-output table capital investment purchases are shown only as purchases by gross private capital formation from the capital producing sectors. Any sales by the capital producing industries to other industries represent only repair parts. Therefore, the marketing pattern among the various industries purchasing capital goods are not available. These marketing patterns do become apparent in a capital flow matrix.

Capital Flow Tables. The final portion of the chart shows the relationship between the capital flow table and an input-output table where capital allocated from an industry to gross private capital formation becomes the control total for capital produced by this industry in a capital flow matrix. By reading across the rows of the capital flow matrix, just as in a conventional input-output matrix, the sales of capital producing industries to each of the capital purchasing industries can be determined. To continue the example for industry 1 described in the section on input-output, the four units of industry 1 output allocated to gross private capital formation represents the capital production control total for industry 1's in the capital flow matrix. The distribution of these four units of capital production can be seen from row 1 of the capital matrix as follows: one unit to itself, no units to industry 2, two units to industry 3, and one unit to industry 4.

In a similar fashion, the column in the capital flow matrix shows purchases of each of the capital consuming industries from the capital producing industries. For industry 1, the column shows the distribution of its capital purchases among the capital producing industries. Thus, for industry 1 of the two units of capital that it purchases, one unit comes from itself and one unit from industry 4. It can be seen from this example, that there are several obvious differences between a capital flow matrix and an input-output table. First, the sum of the rows in a capital matrix for an industry does not necessarily equal the sum of the column as was the case in an input-output table.

Second, not all industries in a capital flow matrix are producers of capital; in the input-output matrix all industries are producers. ^{9/} Finally, a capital flow table does not have an allocation to final demand or value added as do industries in the input-output system. However, just as in an input-output table, the rows of the capital flow matrix can be thought of as the marketing patterns of each type of capital produced. Similarly, the columns of the capital flow matrix show the distribution of that industry's capital purchases among the capital producing industries.

Uses

The development of the capital flow matrix for 1958 was primarily for use in the Inter-agency Growth Project. ^{10/} In this project it was used to determine a distribution of capital by producing industry consistent with the relative industry growth rates. In this procedure, the major changes in capital input patterns such as increased use of computers and instruments were projected to 1970. To yield an estimated capital distribution by producing industry, derived estimates of capital by consuming industry were applied to the projected 1970 capital coefficients, thus deriving a level of capital production for each capital producing industry. This derived estimate of capital by producing industry was used as a means of modifying the initial estimates of capital by producing industry in the 1970 final demand bills of goods.

Another possible use of the capital flow matrix is to analyze the varying marketing patterns of capital goods industries. This is difficult with the conventional input-output tables since, in these tables, capital goods industries intermediate sales are only repair parts and the capital items are shown as purchases from the final demand sectors. With the capital flow matrix, however, a marketing pattern for capital producing industries can be

^{9/} There are exceptions to this in most input-output tables where certain special purpose industries such as dummy industries may

found similar to the one for noncapital producing industries found in the conventional input-output tables.

Labor Requirements

Table 4 illustrates an additional use of the capital flow tables. This table shows the direct and indirect employment impact of one billion dollars of capital investment in seven selected industries. These estimates are derived by using the capital input pattern for these industries in the 1958 capital flow matrix and applying each in turn to an interindustry employment table. ^{11/} In this way, not only are the direct employment requirements estimated but also the indirect employment. Direct employment would be the employment required to fabricate a capital good, such as a metalworking machine, in its final stage of manufacture. All of this employment, therefore, would be in the metalworking machine manufacturing industry. Indirect labor, on the other hand, would include all other employment required to produce a given capital good. For a capital good such as a metalworking machine, indirect labor would include that employed by the suppliers of raw materials such as steel, iron ore, nonferrous metals, as well as the employment required in the utilities, advertising, and other service industries which contribute indirectly to the production of a metalworking machine.

The industries covered by table 4 were selected so that a wide variety of capital consumption patterns would be included. It can be seen however, that the total labor impact of a billion dollars of capital expenditures in each of these industries is in a relatively narrow range of jobs (98-111,000). However, the range of the impact on individual industries can be quite

not, in fact, have output in the more conventional use of the term.

^{10/} See BLS Bulletin 1536, Projections 1970: Interindustry Relationships, Potential Demand, Employment.

^{11/} Jack Alterman, "Interindustry Employment Requirements," Monthly Labor Review, July 1965, pp. 841-850.

pronounced. This range is revealed by an examination of the various industries listed in table 4. For example, in the new construction industry, between 1,792 and 31,172 jobs are required for one billion dollars of investment in these selected industries. A good reason for this range can be found from the capital flow table A-1. It can be seen that investment in the new construction industries is largely for equipment; thus it would follow that a small proportion of its employment impact would be in the construction industry. On the other hand, a high proportion of the investment by the medical, educational and nonprofit sector is for new construction, explaining its high employment requirements from the new construction industry.

Several other industries can be highlighted for the different impact that the various investment patterns have. Investment by the farm sector has a large impact on the farm machinery industry and a very small one on all others. The construction machinery industry is affected greatly by investment in the construction industry, but only moderately by the other selected industries' investment. Investment by the iron and steel manufacturing industry on the metalworking machinery has a sizable effect on the metalworking machinery industry, but much smaller impact is felt from the other selected industries. The employment impact of investment by the food and kindred products industries and the medical, educational and nonprofit sector is more widely distributed among a large number of industries.

This example of the employment impact of investment illustrates another use of the capital flow tables. It is planned that at some future date the 1963 capital patterns for all of the industries will be translated into the employment requirements.

Techniques and Methods

The basic source of the capital production data by industry is the Census of Manufactures; additional estimates are by the Office of Business Economics. These data included not only

the level of capital production by industry but sufficient supplementary detail, in many cases, to work with product detail rather than sector aggregates. The procedure followed in allocating capital production to the consuming industries was varied. The detailed estimates of products within each capital producing sector were allocated separately where such detail existed, and a method could be found to allocate separately each product. For example, in farm machinery (ISP 44), not much is gained by allocating separately most of the farm machinery, such as discs or harrows, since a large portion of all types of farm equipment goes directly to the farm sector. On the other hand, the product detail available in the special machinery category (ISP 48) was particularly relevant, since it separated this sector's allocation to investment into such items as textile industry machines, food products industry machinery, and chemical industry machinery.

Thus, the method of allocation of capital to consuming sectors and the detail in which it was allocated varied, depending on the type of equipment to be distributed and information available to make this preliminary distribution. For some types of equipment, such as computers and metalworking machinery, data existed on the industrial distributions of existing stock of this type of equipment which was used for the initial distributions. For other types of equipment, such as typewriters, office machines, and certain types of scientific and professional equipment, the preliminary distribution was made using an industrial distribution of the occupations or professions closely associated with this equipment. In many cases the type of machine determined the initial allocation; for instance, textile industry machines were distributed to the textile industry (largely ISP 16), cigarette and cigar-making machines to the tobacco manufacturing industry (ISP 15). For a few types of capital equipment, a distribution was made based on the distribution of an industry's output. The distribution of electrical generating equipment followed such an approach where an industrial distribution of electricity generated was used. An industrial distribution of nonproduction work-

ers was used to distribute purchases of office furniture and carpets and rugs, since these are the employees most likely to be using this equipment. In many cases, of course, the initial distribution of equipment to consuming industry was based on judgment. (See appendix for a fuller description of methods.)

The distribution of new construction or plant could be made in many instances based on end use of construction, i.e., hospital going to the medical sector (77), utility construction to electric, water, gas and sanitary services (68), and social and recreational construction to the amusements sector (76). Industrial construction was distributed among the manufacturing sectors by using a distribution of plant expenditures by industry obtained from the Census of Manufactures.

After all equipment and plant had been distributed to a consuming sector by the best method which could be found, totals were derived for each consuming sector. These totals of capital investment by consuming industry were compared with other sources of information on investment by industry, such as Census of

Manufactures; Census of Mineral Industries; and the Survey of Capital Expenditures, prepared by the Office of Business Economics and the Security and Exchange Commission. An investigation of large disparities between these sources and the initial estimates from the capital flow matrix was made and, wherever possible, the differences were reconciled. Because of conceptual and coverage differences, it was not possible in every case to make complete reconciliations. In sectors where two independent estimates of capital investment existed, the one which conceptually was closer to the definition of that industry in the capital flow matrix generally was accepted. Where no estimate existed, an independent estimate was made. After a control total of capital expenditures by consuming industry was decided upon and a method arrived at for distributing each type of capital equipment produced, the capital flow table was then brought into final balance.

Capital Flows, 1958

Capital purchases by major sector are shown in the following tabulation:

Capital expenditures by purchasing sector, 1958

Sector	Total	Equipment	Plant
Total.	42,192	25,047	17,145
Agriculture, forestry, and fishery.	4,544	3,156	1,388
Mining	3,326	1,251	2,075
Construction	963	933	30
Manufacturing.	9,686	6,475	3,211
Transportation, communi- cations and public utilities	10,969	5,754	5,215
Trade	4,696	3,263	1,433
All other.	8,008	4,215	3,793

This tabulation shows the amount of capital purchases by each of the seven major sectors distributed between expenditures for plant and for equipment. This information is a summary of the data in the capital flow matrix, table 1 and table A-1.

The detailed 1958 capital flow tables are presented in two sets of three tables each. The first set of tables (1, 2, and 3) shows the capital flow data for major industry groups. Table 1 of this set has the dollar value of capital production and consumption by industry. Table 2, in this set, presents capital coefficients by consuming industry for each of the major sectors. This table illustrates the capital input patterns for each of the major sectors of the economy and is calculated by taking a percent distribution of the columns in table 1. Table 3, capital distribution by producing industry, for each of the major sectors, shows the same data as table 1, but as a percent distribution of each row. This presentation provides information on the marketing pattern between the capital producing industries and their major purchasing sectors.

Appendix tables 1, 2, and 3 show the same information as in the text tables but in the full industry detail, i.e., 77 consuming industries rather than 29 major sectors shown in text tables 1, 2, and 3.

An analysis of the major sector tables will highlight the data presented in the 1958 capital flow matrix. A few observations from the more detailed tables also will be made.

As seen in table 1, the manufacturing sector purchased the largest amount of capital of any major sector in 1958. The \$9.7 billion of capital equipment purchased by the manufacturing sector exceeded by over \$1 billion the communication and public utilities sectors' purchase of \$8.4 billion of capital. The service sector (business services, personal services, amusement, auto repair, and medical, educational and nonprofit groups) and agriculture and trade, are large purchasers of capital. A separate examination of expenditures on plant

and expenditures on equipment shows the same sectors predominating; however, communication and public utilities are the largest purchasers of plant.

In examining the distribution of capital inputs by major sectors (table 2), similar patterns of the proportion of capital investment going to plant and the proportion going to equipment are found in agriculture, most manufacturing sectors, and trade. This pattern shows that roughly two-thirds of the expenditures by these sectors were for equipment and the other one-third for plant. In construction, a radically different picture emerges; nearly all of the expenditures are for equipment. In only a relatively few sectors is the reverse found, namely, plant representing a larger proportion of expenditures than equipment. Mining is one such sector. The explanation for the large expenditure for plant in mining can be found in one of the mining subsectors, crude petroleum and natural gas drilling where exploration and drilling costs are counted as plant expenditures. In communication and public utilities, plant represents a larger portion of capital expenditures than equipment, because plant covers outside lines built by utilities and communication firms. Within manufacturing there is remarkably small variation in the plant-equipment distribution for the major sectors except for the petroleum refining group. However, an examination of table A-2 shows that at the more detailed industry level much greater variation in the plant-equipment allocation is found.

An examination of the distribution of equipment expenditures among the various types for each of the major consuming sectors reveals a greater degree of variation in the sector's purchasing patterns (table 2) than was found generally in their plant and equipment mix. The prevalent pattern is for each sector to have one large item which accounts for from 20 to 40 percent of its total capital expenditures. This capital item is usually of a very specialized type which is made often specifically for use by the particular industry and often is not used widely, if at all, by other sectors. In agriculture, for example, this purchase is farm mach-

inery. In most metal manufacturing industries, it is some type of metalworking machine. In nondurable manufacturing sectors the specialized capital item is special industry machinery. The exception is the chemicals sector, where general industrial machinery is more important. In most of the nongoods producing sectors (transportation, trade, and service) some form of transportation equipment usually is the most important single purchase. In public utilities and communication, however, the largest single purchase is electrical equipment. Again, less conformity to this pattern is noted in the more detailed industry consumption pattern (table A-2).

An examination of table 3 allows one to analyze the marketing pattern for each of various types of capital equipment, as well as for total plant and equipment expenditures. For instance, this table shows that over one-fifth of all capital expenditures in 1958 were for plant and equipment purchases by the manufacturing sector. Also about one-fifth of capital purchases were made by the communication and public utilities group. Communication and public utilities purchase more than one-quarter of total plant.

For individual capital producing industries, marketing patterns of at least two types seem to emerge. First, are those industries which sell about two-thirds of their output to one sector. This pattern is exemplified by farm machinery, metalworking machinery, special industry machinery, general industrial machinery, as well as aircraft, other transportation equipment, and electrical machinery among the larger capital producing sectors. The other pattern is a wide distribution of the items among all purchasing sectors, such as found in motor vehicles, furniture and office and computing machinery. The margin industries, transportation and trade, (ISP 65 and ISP 69) also show this pattern, as would be expected, since the margin on various types of capital equipment does not vary widely enough to concentrate margins in any sector. ^{12/} Again, many of the patterns observed at the major sector detail do not hold true at the detailed industry

level (table A-3). For instance, in the more detailed capital flow table, the marketing pattern of a larger number of capital producing industries is spread widely among purchasing sectors. Still, farm machinery, aircraft, other transportation equipment (which includes both railroad equipment and ships and boats), service industry machinery, electrical transmission and distribution equipment, radio, TV and communication equipment, and professional and scientific equipment, among the major capital producing sectors sell more than 50 percent of their output to one sector.

Limitations

This effort to construct a capital flow matrix was undertaken as part of the Economic Growth Project and it was possible to give only limited resources to this work. It represents one of the first efforts at constructing, for the U.S. economy, a comprehensive table showing all flows of capital for a single year. Because it is a first effort and because of the scarcity of the type of data necessary for this purpose, its limitations should be emphasized. For each of the industries outside the manufacturing sector at the detail we are working, control totals of capital purchases by consuming industry were not always available and such gaps had to be filled by crude estimates. Also, where more than one estimate for a sector was available, a selection had to be made as to the one which seemed most consistent with the capital flow work. Information on distribution of sales of capital equipment also is extremely limited. Therefore, it was necessary to find other data

^{12/} The valuation of each capital item in the capital flow matrix is the value at the site of production. However, the total value of capital investment for each industry is at purchaser value or cost to the investor. The difference between value of capital investment at purchaser prices and at producer prices is trade and transportation margin. The margin for transportation represents freight costs for delivery of the capital goods; trade margin is the return to the wholesaler or retailer for handling capital goods.

which could be used as a guide to distribution of a given type of capital among consuming industries.

Since this capital flow matrix represents only one year and a recession year at that, it is not possible at this point to know how atypical 1958 may be and to what extent capital input patterns have any stability, particularly since many types of capital, both equipment

and plant, require more than one year for installation. The Bureau of Labor Statistics currently is pursuing some of these questions. A limited amount of investigation has been undertaken on the stability of an industry's capital inputs by type. Also, a major research effort is underway currently to estimate a capital flow table for 1963 which will complement the work at the Office of Business Economics on a 1963 input-output table.

Appendix

DETAILED DESCRIPTION OF METHODS FOR THE CAPITAL FLOW MATRIX, 1958

The following section presents a description of the procedures used in the initial distribution of capital equipment in the Capital Flow Matrix, 1958.

After this initial distribution, capital expenditures were derived for each consuming sector in the capital flow matrix. The comparison of these totals with independent control totals necessitated changing the initial distribution of capital purchases in many cases.

The allocation of capital was made from the producing sector, i.e., the marketing pattern of capital produced was estimated. The estimates of the amount of capital produced by each sector were obtained from the Office of Business Economics (OBE). The matrix reflects use of capital rather than ownership by the respective interindustry sales and purchases (ISP) sectors.

For each category of producer durable equipment:

1. The new ISP number is given followed by the sector title.
2. The producers' value and trade and transportation margins are given. All figures are in thousands of dollars.
3. For each producer durable category the specific producer durable equipment items in the sector are given. Each of these is followed by its SIC number. This information is based upon data supplied by the Office of Business Economics.
4. There is a description of the method of distribution used. In many cases the description is based on a judgment. When some other system was employed, the source used is noted. The main consuming sectors also are listed, and in some instances their relative magnitude of consumption is pointed out.

Interindustry Sales and Purchases Category (ISP)

ISP 17 Miscellaneous Textile Products:

<u>Value:</u>	Producers' value	44,645
	Transportation margin	1,311
	Trade margin	7,511

Producer Durable Equipment (PDE) consists of: carpets and rugs, Standard Industrial Classification Number (SIC) (2271,2,9; 2291051).

Method of Distribution. Percent breakdown of nonproduction workers for 1958 by ISP sector excluding farm. Source: Employment and Earnings and Survey of Current Business.

ISP 20 Lumber and Wood Products:

<u>Value:</u>	Producers' value	5,920
	Transportation margin	605
	Trade margin	963

PDE consists of: wooden vats and tanks, noncoopered (SIC 2499566).

Method of Distribution. Judgment: it was decided that these noncoopered wooden vats and tanks were used mainly for storage of bulk items. They were distributed to farm, food processing, and transportation sectors.

ISP 22 Household Furniture:

<u>Value:</u>	Producers' value	126,206
	Transportation margin	4,306
	Trade margin	8,653

PDE consists of: household type furniture purchased for business use (SIC 251).

Method of Distribution. Percent distribution of nonproduction workers for 1958 by ISP sector except farm. Source: Employment and Earnings and Survey of Current Business.

ISP 23 Other Furniture and Fixtures:

<u>Value:</u>	Producers' value	798,350
	Transportation margin	21,116
	Trade margin	347,136

PDE consists of: wood office furniture (SIC 2521), metal office furniture (SIC 2522), public building and related furniture (SIC 2531), partitions and shelving (SIC 254), venetian blinds and shades (SIC 2591), and furniture and fixtures, not elsewhere classified (n.e.c.) (SIC 2599).

Method of Distribution. The method of distributing other furniture and fixtures was the same as that used for carpets and rugs and for household furniture because the same type of employee would be using office furniture. Since partitions and shelving was such a large part of this category, more emphasis was placed on the trade sector. Other exceptions to the general method: wood office furniture went primarily to trade, finance and insurance; business services; and medical, educational, nonprofit organizations and related services (sector 77). Public building furniture all went to medical, educational, nonprofit organizations and related services. Hospitals beds were allocated to sector 77. Restaurant furniture all went to trade.

ISP 32 Rubber and Miscellaneous Plastics Products:

<u>Value:</u>	Producers' value	52,318
	Transportation margin	1,566
	Trade margin	6,162

PDE consists of: flat transmission belts (SIC 3069113) and plastic dinnerware and plastic and rubber gas/water hose (SIC 3069, 79).

Method of Distribution. Flat transmission belts went to all sectors which use belt driven machines, conveyors, and equipment utilizing this type of belt drive. Plastic dinnerware went exclusively to trade.

ISP 34 Other Leather Products:

<u>Value:</u>	Producers' value	4,705
---------------	------------------	-------

Transportation margin	116
Trade margin	3,487

PDE consists of: saddles, whips and harnesses (SIC 31990).

Method of Distribution. A portion was given to amusements, some to livestock, and the remainder to other farms.

ISP 39 Metal Cans, Shipping Barrels, Drums, Kegs and Pails:

<u>Value:</u>	Producers' value	10,202
	Transportation margin	388
	Trade margin	158

PDE consists of: beer barrels (SIC 3491312)

Method of Distribution. The largest portion was given to beverage industry (14); the rest went to liquor wholesalers and retailers (trade).

ISP 40 Heating, Plumbing, and Fabricated Structural Metal Products:

<u>Value:</u>	Producers' value	707,859
	Transportation margin	16,831
	Trade margin	33,724

PDE consists of: heat transfer equipment and steam condensers (SIC 34431), water tube and fire tube steel power boilers (SIC 34433), metal pressure tanks and boiler shop equipment (SIC 34435).

Method of Distribution. Some items were allocated directly using detailed breakdown such as oil field tanks, farm storage tanks and liquid gas tanks. Metal pressure tanks and vessels were distributed by judgment basis to sectors utilizing them. Water tube and fire tube steel power boilers and heat transfer and steam condensers were distributed by a percent breakdown of electrical energy purchased, generated and sold by ISP. Source: 1963 Census of Manufactures, subject report on "Fuels and Electric Energy," (Series MC63(P)-2, January 8, 1964).

ISP 42 Other Fabricated Metal Products:

<u>Value:</u>	Producers' value	166,145
	Transportation margin	4,650
	Trade margin	94,213

PDE consists of: safes and vaults (SIC 3492) and valves and fittings (SIC 3494).

Method of Distribution. Valves and fittings were distributed to those industries and sectors which flow liquids or gas. The 1958 Census of Manufactures was used to get a breakdown of safes and vaults, most of which were bank safes and vaults and safe deposit boxes which were given to the finance and insurance sector.

ISP 43 Engines and Turbines:

<u>Value:</u>	Producers' value	576,461
	Transportation margin	9,357
	Trade margin	71,640

PDE consists of: steam engines and turbines (SIC 3511) and internal combustion engines, not elsewhere classified (n.e.c.) (SIC 3519). The "other" category is distributed among the following: gasoline, diesel, nonautomotive, gas and outboard.

Method of Distribution. The 1963 Statistical Abstract was used to determine that, in 1962, the electrical output of the country was divided as follows: 86 percent from the public utilities sector and 14 percent from all other sources. Steam engines and turbines were split in the same ratio. The 14 percent that went to all other sectors was distributed by using a percent breakdown of electricity purchased, generated, and sold by ISP from a subject report on "Fuels and Electric Energy," 1963 Census of Manufactures (Series MC63(P)-2, January 8, 1964).

Gasoline and diesel engines were distributed by using a percent breakdown of the "Horsepower of Power Equipment Available in Manufacturing, December 31, 1962," a subject report, 1963 Census of Manufactures (Series MC63(P)-1, November 21, 1963).

Outboard motors were given mainly to amusements; the remainder were distributed widely by judgment to many sectors.

ISP 44 Farm Machinery and Equipment:

<u>Value:</u>	Producers' value	1,669,612
	Transportation margin	53,151
	Trade margin	405,379

PDE consists of: wheel tractors (SIC 35222), planting and seeding machinery (SIC 35223), plows and harrows (SIC 35224), harvesting machinery (SIC 35225), haying machinery (SIC 35226), farm dairy machinery (SIC 3522810), cultivating and weeding machinery (SIC 3522815), crop preparing machinery (SIC 3522821), poultry equipment (SIC 3522831), barn and barnyard equipment (SIC 3522841), farm elevators (SIC 3522871), garden tractors (SIC 35228815), spraying and dusting machinery (SIC 3522891), lawnmowers (SIC 35227), and other farm machinery (SIC 35228).

Method of Distribution. All of this category was given to farm with three exceptions: some garden tractors, half of the lawnmowers and some of the "other" category were given to many sectors. These items were distributed using a percent breakdown of gardeners and groundskeepers (except farm) by industry. Source: Census of Population, 1960, "Occupation by Industry." Also, in the "other" category, half the farm blowers were given to transportation due to this sector's huge grain storage facilities.

ISP 45 Construction and Mining Machinery:

<u>Value:</u>	Producers' value	1,319,091
	Transportation margin	38,681
	Trade margin	147,354

PDE consists of: off-highway wheel tractors (SIC 35311,3), tracklaying tractors (SIC 35312,3), construction machinery and equipment (n.e.c.) (SIC 35314,9), mining machinery and equipment (SIC 3533).

Method of Distribution. After a more detailed study of the types and relative values obtained from the 1958 Census of Manufactures, most of the construction machinery was given to the construction sector. Some tractors went to farm and logging, some concrete equipment to stone and clay manufacturing, some washers and grinders and large shovels to all mining sectors.

All mining machinery was apportioned to the mining sectors and oil field machinery to petroleum mining.

Leasing seems to be a major problem in the allocation of construction machinery.

ISP 46 Materials Handling Equipment:

<u>Value:</u>	Producers' value	351,833
	Transportation margin	8,126
	Trade margin	27,330

PDE consists of: conveyors (SIC 35351), hoists (SIC 35361), industrial trucks and tractors (SIC 3537).

Method of Distribution. Judgment: emphasis was on sectors with heavy equipment, those which move large bulk items, and mining.

ISP 47 Metalworking Machinery:

<u>Value:</u>	Producers' value	1,153,203
	Transportation margin	25,162
	Trade margin	123,176

PDE consists of: metal cutting-type machine tools (SIC 3541), metalworking machines, except machine tools (SIC 3542), metal molds (SIC 3544213), forging dies and die-cast sets (SIC 3544131-51), power driven handtools (SIC 3548211-26), metalworking machinery, (n.e.c.) (SIC 3548).

Method of Distribution. Distributed by a percent breakdown of metalworking machinery from a McGraw-Hill survey in the American Machinist, June 1963.

ISP 48 Special Industry Machinery

<u>Value:</u>	Producers' value	1,468,374
	Transportation margin	24,555
	Trade margin	127,655

PDE consists of: food products machinery (SIC 3551), textile machinery (SIC 3552), woodworking machinery (SIC 3553), woodworking machinery for home workshops (SIC 35532), pulp and paper industry machinery (SIC 3554), printing trades machinery (SIC 3555), special industry machinery, (n.e.c.) (SIC 3559). The last category was further broken up using the 1958 Census of Manufactures. Ratios obtained from the value of shipments, table 6A, were applied to the value of the n.e.c.

category. It was broken down into the following categories: chemical industry machinery, foundry machinery, plastic-working machinery, rubber-working machinery, petroleum refining machinery, tobacco manufacturing machinery, clay-working machinery, cement and concrete machinery, shoe-making and repairs machinery, cotton-ginning machines, metal cleaning, degreasing, finishing, drying machines, electronic-tube-making machines, electronic nonmetallic processing ovens, kilns, and lehrs, fuel-fired kilns (cement, wood and chemical processing, other nonmetallic processing ovens and furnaces, and other special industry machines).

Method of Distribution. It is reasonably well established that the industry utilizing this type of equipment was fairly well isolated by its descriptive Census title. Therefore, the distribution was made generally on this basis.

ISP 49 General Industry Machinery:

<u>Value:</u>	Producers' value	1,050,818
	Transportation margin	21,174
	Trade margin	171,819

PDE consists of: pumps and compressors (SIC 3561), blowers and fans (SIC 3564), industrial patterns (SIC 3565), industrial furnaces and ovens, electrical (SIC 35671), fuel-fired (SIC 35672), and general industrial machinery, n.e.c. (SIC 3569).

Method of Distribution. Pumps and compressors went to all sectors, especially to those which flow liquids and gas or petroleum, and to trade, transportation, and public utilities. Blowers and fans, dust collection and air purification equipment went to all industries but especially to coal mining, metal mining, manufacturing, trade, and medical, educational, and related services. Industrial patterns were apportioned to the major machinery makers, rubber and plastics, and to miscellaneous manufacturing. Industrial furnaces and ovens went primarily to metal manufacturing. For distribution of general industrial machinery, n.e.c., a greater detail was obtained from the 1958 Census of Manufactures.

ISP 51 Office, Computing, and Accounting Machinery:

<u>Value:</u>	Producers' value	1,015,811
	Transportation margin	23,188
	Trade margin	273,006

PDE consists of: computing and related equipment (SIC 3573,74), typewriters (SIC 3572), scales and balances (SIC 3576) including railroad and motor truck scales, industrial scales, retail and commercial scales and miscellaneous scales, office and store machinery, n.e.c. (SIC 3579).

Method of Distribution. A percent distribution of computers by industry was obtained from a study by Diebold Group, Inc., Use of Electronic Computers, unpublished (1962). This was used to apportion electronic computing and processing equipment. To distribute related equipment which includes punched card systems, accounting and bookkeeping, adding and calculating machines, a percent distribution of office machine operators was obtained from the Census of Population, 1960, "Occupation by Industry." The same source was used to obtain a percent distribution of office machine operators, secretaries, and stenographers to apportion typewriters and other

office and store machines. This category includes duplicating, dictating, check handling, time recording, autograph and other machines. Scales and balances were distributed as follows: railroad and truck scales to transportation, retail and commercial scales to trade and industrial scales to all industries by judgment. Cash registers went to the trade sector.

ISP 52 Service Industry Machinery:

<u>Value:</u>	Producers' value	955,253
	Transportation margin	39,786
	Trade margin	301,646

PDE consists of: automatic vending machines (SIC 3581), laundry and drycleaning equipment (SIC 3582), industrial vacuum cleaners (SIC 35893), air conditioning and refrigeration machinery (SIC 3585), measuring and dispensing equipment (SIC 3586), and service industry machines, n.e.c. (SIC 3589).

Method of Distribution. Automatic vending machines went to trade; commercial laundry and dry-cleaning equipment to the personal services sector; industrial vacuum cleaners went primarily to trade but also to personal and repair services, real estate, and medical, educational services, and nonprofit organizations. Some parts of the refrigeration machines category were apportioned directly to trade and warehousing (transportation) and all the rest was distributed by a percent breakdown of air conditioning and refrigerator repairmen by industry from the special occupational publication, cited previously, of the Bureau of Census, 1960. Measuring and dispensing equipment went primarily to trade and secondarily to transportation. The smaller items in the not elsewhere classified category included floor sanding, carpet-sweeping equipment and household and farm water softeners. These were distributed to all sectors. The larger items in the not elsewhere classified category were distributed as follows: commercial cooking, industrial water softeners and dish-washing machinery to trade, personal and repair services, and medical, educational services, and nonprofit organizations; floor waxing and polishing machinery to construction sectors.

ISP 53 Electrical Transmission and Distribution Equipment:

<u>Value:</u>	Producers' value	1,616,843
	Transportation margin	46,365
	Trade margin	154,680

PDE consists of: electrical measuring instruments (SIC 3611), power distribution and specialty transformers (SIC 3612), switchgear and switchboard apparatus (SIC 3613), motors and generators (SIC 3621), industrial controls (SIC 3622), welding apparatus (SIC 3623), and electrical industrial apparatus, n.e.c. (SIC 3629) which consists mainly of capacitors (SIC 36291).

Method of Distribution. This category was distributed mainly on a judgment basis. Electrical measuring instruments went chiefly to communications, radio and TV, and personal and repair services. Power distribution and specialty transformers all were given to the utilities sector. Switchgear and switchboard apparatus went mainly to utilities; some went to transportation and some to communications. Motors and generators went primarily to utilities and to others producing their own electricity. Industrial controls, welding apparatus and apparatus, n.e.c., were distributed to all manufacturing using a percent breakdown of sector output.

ISP 54 Household Appliances:

<u>Value:</u>	Producers' value	92,776
	Transportation margin	2,824
	Trade margin	19,226

PDE consists of: household cooking equipment (SIC 3631), household refrigerators (SIC 36321), household laundry equipment (SIC 3633), electric houseware and fans (SIC 3634), household water heaters (SIC 36391), sewing machines (SIC 3636), household vacuum cleaners (SIC 3635).

Method of Distribution. Cooking equipment went primarily to trade, household refrigerators to trade, household laundry equipment to personal services and trade, electrical houseware and fans to trade, household water heaters primarily to trade, industrial sewing machines to apparel, and household vacuum cleaners to personal services.

ISP 55 Electrical Wiring and Lighting Equipment:

<u>Value:</u>	Producers' value	25,466
	Transportation margin	685
	Trade margin	3,297

PDE consists of: lighting fixtures (SIC 3642) and lightning arrestors (SIC 3643).

Method of Distribution. Some portable residential type fixtures, other fluorescent fixtures, and special commercial and institutional fixtures and lamps were distributed to all sectors based on output. Most of the equipment involved here was assumed to be purchased by trade, personal and repair services, and medical, educational services, and nonprofit organizations.

ISP 56 Communications Equipment:

<u>Value:</u>	Producers' value	1,008,776
	Transportation margin	21,062
	Trade margin	62,215

PDE consists of: radio and television receiving sets, except communication type (SIC 3651), telephone and telegraph apparatus (SIC 3661), radio and television transmitting, signaling, and detection equipment (SIC 3662).

Method of Distribution. All of telephone and telegraph equipment went to communications, except teletype, a portion of which went to printing and publishing (newspapers) and to finance and insurance (stockbrokers). Most radio and TV communications equipment went to radio and TV broadcasting. Two items were distributed widely: intercom equipment and electrical alarms.

ISP 57 Electrical Components and Accessories:

<u>Value:</u>	Producers' value	26,650
	Transportation margin	644
	Trade margin	1,432

PDE consists of: magnetic recording tape (SIC 36795).

Method of Distribution. Fifty-five percent to all sectors utilizing computers by a percent breakdown of computers owned and leased (source: Diebold study, 1962); 28 percent to the communications equipment sector (manufacturers of phonograph records); 12 percent to radio and TV broadcasting; and 5 percent to the communications sector.

ISP 58 Miscellaneous Electrical Machinery and Equipment:

<u>Value:</u>	Producers' value	83,419
	Transportation margin	1,780
	Trade margin	14,633

PDE consists of: storage batteries (SIC 3691), wet-cell primary batteries (SIC 3692), X-ray and therapeutic apparatus (SIC 3693).

Method of Distribution. Industrial truck storage batteries were distributed the same as industrial trucks (see ISP 46); communications type batteries went to communications; railroad air-conditioning and lighting batteries went to transportation. All X-ray and therapeutic apparatus went to medical and educational services, except industrial X-ray equipment which was distributed to a wide range of industry.

ISP 59 Motor Vehicle and Equipment:

<u>Value:</u>	Producers' value	3,575,464
	Transportation margin	88,477
	Trade margin	689,601

PDE consists of: truck and bus bodies not sold to manufacturing (SIC 3713), ambulance and hearses (SIC 371307-5), truck trailers (SIC 3715), truck tractors and chassis (SIC 37172), motor buses (SIC 3717311), passenger cars (SIC 3717).

Method of Distribution. The truck and bus bodies category was distributed as follows: vans to trade, transportation, and personal and repair services; panel, delivery and pick-up trucks to trade and personal and repair services; dump to mining and construction; stake and platform to farm and food processing; others to scattered sectors. Ambulances went to medical services and hearses to the personal services sector (mortuaries). Motor buses went almost exclusively to transportation, a small amount going to educational and nonprofit organizations. Passenger cars, truck trailers, trucks, tractors, and chassis were distributed by trying first a percent breakdown of intermediate purchases of repair services by ISP from the input-output tables, and second, by using the distribution of gasoline purchases from the input-output chart. Neither of these gave a reasonable distribution of passenger car and truck purchases, so significant changes from the initial distributions were made, based largely on judgment.

ISP 60 Aircraft and Parts:

<u>Value:</u>	Producers' value	357,810
	Transportation margin	4,818
	Trade margin	44,154

PDE consists of: aircraft (and accessories) (SIC 3721).

Method of Distribution. Major portion of airplanes went to transportation sector. These were the large commercial planes. Smaller business aircraft were distributed to all sectors. Dollar

amounts were arrived at by judgment. A percent breakdown of airplane pilots and navigators by industry from the 1960 Census of Population was tried for the distribution of the business aircraft. It was found unsatisfactory because of several irregularities in the distribution.

ISP 61 Other Transportation Equipment:

<u>Value:</u>	Producers' value	1,178,300
	Transportation margin	8,848
	Trade margin	36,934

PDE consists of: railroad service type locomotives (SIC 37411), other industrial locomotives (SIC 37412), rebuilt locomotives (SIC 37414), freight train cars (SIC 37422), streetcars (SIC 37423), other auto trailers (SIC 37991), farm wagons (SIC 3799211-221), boat trailers (SIC 3799291), other transportation equipment, n.e.c. (SIC 37992), ships, new construction (SIC 37313), ships conversion and repair (SIC 37316), new boats (SIC 3732), and boat repair (SIC 37324).

Method of Distribution. Locomotives were given almost entirely to transportation; a few went to mining. Trailers and coaches were allocated to trade and transportation, farm wagons to the farm sectors. Ships and boats went mainly to transportation, a small amount to the amusement sector. Freight and passenger cars were distributed largely to transportation; however, some were apportioned to the mining and manufacturing sectors. The n.e.c. category and smaller items were distributed primarily to trade, transportation, construction, and amusements.

ISP 62 Professional, Scientific, and Controlling Instruments:

<u>Value:</u>	Producers' value	531,543
	Transportation margin	17,031
	Trade margin	76,309

PDE consists of: laboratory balances (SIC 3811271,61), laboratory furniture (SIC 3811281-9), other scientific instruments (SIC 381211,41), gas, water and other liquid meters (SIC 3821), other mechanical and measuring instruments (SIC 3821), surgical and medical instruments (SIC 3841), orthopedic, prosthetic instruments, and surgical supplies (SIC 3842), and dental equipment (SIC 3843).

Method of Distribution. A percent distribution of dentists, physicians, surgeons, and natural scientists from the 1960 Census of Population, "Occupation by Industry" was used.

After further comparisons, it appears as though, under the method of apportionment used, food processing got an excess of the value, and utilities and iron and steel, too little.

ISP 63 Optical and Photographic Equipment:

<u>Value:</u>	Producers' value	162,809
	Transportation margin	5,589
	Trade margin	17,077

PDE consists of: field glasses and telescopes (SIC 3831031), microprojectors (SIC 3831051), microscopes (SIC 3831053), optical measuring instruments (SIC 3831071), other optical instru-

ments and lenses (SIC 3831098), ophthalmic goods (SIC 3851), still picture equipment (SIC 38611), photocopy and microfilm equipment (SIC 38612), motion picture equipment (SIC 38613).

Method of Distribution. This category was distributed on a judgment basis. Field glasses and telescopes went to agriculture and forestry services, mining, transportation (mainly airport facilities and pilots), amusements, construction, and educational and nonprofit organizations. Microprojectors went to medical and educational services, microscopes to chemicals, drugs, research, and mainly to the medical and educational services sector. Optical measuring instruments were apportioned to a wide range of sectors but primarily to aircraft and motor vehicles, research and development, and medical and educational services. Ophthalmic goods, which is entirely composed of industrial goggles and protectors, went to all manufacturing industries but mainly to metal manufacturing. Still picture equipment went almost exclusively to printing and publishing and personal and repair services (where photo labs and portrait studios are located); some went to educational services, and some to business services. Photocopy equipment was given to printing and publishing, and microfilm equipment to business services, educational and nonprofit organizations (libraries). All 35 MM movie equipment went to amusements as did most of the 16 MM equipment. Some 16 MM equipment went to personal and repair services, some to business services, and some to educational services.

ISP 64 Miscellaneous Manufacturing:

<u>Value:</u>	Producers' value	278,695
	Transportation margin	8,804
	Trade margin	31,426

PDE consists of: musical instruments (SIC 3931), sporting and athletic goods (SIC 3949), luminous tube and bulb signs (SIC 3993111), signs, n.e.c. (SIC 3993000), chemical fire extinguishing equipment (SIC 39991), coin operated amusement machines (SIC 39992), and beauty and barbershop furniture (SIC 3999311).

Method of Distribution. Musical instruments and sporting and athletic equipment went to amusements and to educational and nonprofit institutions. Most of the luminous tube and bulb signs and the fire extinguishing equipment went to trade. The remaining portion of these latter two items in addition to other signs was distributed to all industries. Coin operated amusement machines went largely to the amusement sector; what remained was given to trade. Beauty and barbershop furniture all went to personal and repair services.

ISP 65 and 69 Transportation and Trade:

<u>Value:</u>	Transportation margin	507,242
	Trade margin	3,747,475

Method of Distribution. Transportation and trade were distributed within producing industries by the margin ratios of that producer durables category. These ratios were obtained from the input-output tables of OBE. The individual transportation and trade values then were summed by consuming industry.

ISP 66 Communications (except radio and TV broadcasting):

<u>Value:</u>	Producers' value	361,814
---------------	------------------	---------

PDE consists of: see comments.

Method of Distribution. See comments.

Comments. This item is the capitalized payrolls for installation of transformers, switchboards and other communications equipment. These payrolls are capitalized and depreciated like capital equipment but are not included with equipment costs. Method of distribution was to take a percent breakdown of communications equipment (ISP 56) and to apply this to the total value of this category, thus apportioning it in the same manner as the equipment which was installed.

ISP 71 Real Estate and Rental:

<u>Value:</u>	Producers' value	1,209,000
---------------	------------------	-----------

PDE consists of: margin on residential and nonresidential construction.

Method of Distribution. This item was not distributed separately.

ISP 80 Gross Imports of Goods and Services:

<u>Value:</u>	Producers' value	15,500
---------------	------------------	--------

PDE consists of: special and general industrial machinery.

Method of Distribution. The above was placed in ISP 80. It was apportioned as follows:

ISP 48 Special Industry Machinery:

Producers' value	15,068
Transportation margin	912
Trade margin	2,042

ISP 49 General Industrial Machinery:

Producers' value	432
Transportation margin	26
Trade margin	58

Table A-1. Capital Flows, 1958
Producers' Values
(Millions of dollars)

Consuming industries Producing industries	Livestock and livestock products	Other agricul- tural products	Forestry and fishery products	Agricul- tural, forestry, and fishery services	Iron and ferro- alloy ores mining	Nonfer- rous metal ores mining	Coal mining	Crude petro- leum and natural gas
