Preface

Results of a 1969 Survey of Scientific and Technical Personnel in Industry conducted by the Bureau of Labor Statistics are shown in the following manuscript. Included are a brief summary of findings; survey methods; the questionnaire, reporting instructions, and definitions used to collect data; and tables. The reference date of the survey is January 1969. For some series data are shown also for January 1968.

The Bureau wishes to express its appreciation to the many organizations and individuals whose cooperation made this survey possible.

19. Employment of scientists in Federal Government work, total, and in reseach and development by agency and industry, 1969	32
11. Employment of scientists and engineers in Federal Government work, total, and in research and development, all agencies by industry, 1968	33
12. Employment of scientists and engineers in industry, and in research and development work within industry, distributed by State, 1969	34
13. Employment of scientists and engineers, and technicians, and percent receiving in-house training in science and technology by industry, 1969	35

Highlights

An estimated 1,062,000 scientists and engineers were employed in private industry in 1969, up to 3.9 percent from the 1,022,000 employed in 1968, according to a Bureau of Labor Statistics survey. These workers represented 3.0 percent of total private employment in 1969, the same percent as in most years since 1963.

Between 1968 and 1969, employment of scientists increased faster than the employment of engineers—4.6 percent compared with 3.8 percent. Among the scientific occupations, the greatest increase in employment was shown by mathematicians, up 6.8 percent. Technicians jobs rose by only 2.5 percent over the year. The growth in specific technician occupations, however, was uneven. Employment of surveyors, for example, increased by over 9 percent; draftsmen showed an increase of 1.2 percent. The increased employment of surveyors reflects primarily a strong upturn in the contract construction industry.

Approximately 7 out of 10 scientists and engineers in private industry were in manufacturing. Engineers outnumbered scientists by about 4 to 1. Over half of all scientists and engineers in private industry were employed in only six manufacturing industries—electrical equipment, chemicals, aircraft and parts, machinery, ordnance, and instruments.

Employment of scientists and engineers in nonmanufacturing industries increased by over 8 percent between 1968 and 1969. The number of scientists and engineers in contract construction increased by more than 10 percent, and employment in industries closely related to construction also showed strong increases in scientific and technical employment. In engineering and architectural services, for example, employment of scientists and engineers increased by nearly 7 percent.

The number of scientists and engineers in manufacturing industries increased slowly, only about 2 per-

cent, because of slowdowns in defense-related employment. For example, scientific and engineering personnel in the ordnance industry grew by less than 1 percent; in aircraft and parts and communications equipment, employment of scientists and engineers declined 1.8 and 3.0 percent, respectively. This decline was in contrast to earlier years. For example, employment of scientists and engineers in aircraft and parts increased by 12 percent between 1966 and 1967 and by about 7 percent between 1967 and 1968. Technician employment also declined in defense-related industries in 1969. Employment of these workers was down 4.7 percent in ordnance, almost 2 percent in communications equipment, and 5 percent in aircraft and parts.

The number of scientists and engineers in research and development (R&D) increased by about 1 percent between 1968 and 1969. As a part of total scientists and engineer employment, however, R&D scientists and engineers dropped by about 1 percent—from 37.7 in 1968 to 36.7 in 1969, in part as a result of reduced government expenditures for research and development.

Approximately 280,000 scientists and engineers in private industry, or over 26 percent, were employed on Federal Government work in 1969, about 3 percent more than the estimated 273,000 employed in 1968. About 55 percent of those employed on Federal Government work were in R&D. Almost 200,000 were engaged in work for the Department of Defense and another 40,000 for the National Aeronautics and Space Administration.

Although scientists and engineers were employed in every State in 1969, more than 3 out of 10 were in California, New York, and Ohio. The largest number of engineers were employed in California, and the largest number of scientists were in New York.

Survey Methods

This appendix contains a brief discussion of coverage and conduct of the survey, nature of the estimates, problems of definition and classification of data, and comparability of the 1969 survey with earlier surveys.

Scope of the survey

The basic sample in the survey was drawn from establishments reporting to State employment security agencies for unemployment compensation (first quarter of 1964 and 1965). This list was supplemented by a list of railroads and related companies. (Except in Hawaii and Alaska, most railroads are interstate and are not included in the State UI statistics.) These combined lists included approximately 2,300,000 organizations with around 45 million employees and comprise the most comprehensive and readily accessible roster of establishments available in the United States. The sample was further supplemented by a list of establishments which had reported an exceptionally high proportion of scientists and engineers in the 1966, 1965, and 1964 surveys. This group of reporting units included a large number of establishments selected in earlier samples as supplemental members.¹ Most of these establishments were independent research and development laboratories which work under contract. The ratio of scientists and engineers to total employment in these units was, on the average, 50 percent higher than the overall average for industry. Although no special recognition was made for technicians in the supplemental listing, they were considered in the general design of the sample. For example, medical and dental laboratories which have a high representation of technicians were covered extensively in the survey—all size groups were represented and there was no cutoff.

Certain categories of establishments were eliminated from the master list before the sample was selected, either because a separate survey of the given category was being sponsored by the National Science Foundation or because the number of scientific and technical personnel employed was believed to be negligible. The categories or organizations omitted were those classified according to the standard industrial classification system² in the following major industry groups: 01 and 02—farms; 071—agricultural services, except animal husbandry and horticultural services; 55—automotive deal-

ers and gasoline service stations; 56—apparel and accessory stores; 57—furniture and home equipment; 80—medical and other health services (except 807, medical and dental laboratories, which was included); 82—educational services; 84—museums, art galleries, and botanical and zoological gardens; 86—nonprofit membership organizations; 88—private households; 89—miscellaneous services (except 891, engineering and architectural services, which was included); 91 through 94—government; and 99—nonclassifiable establishments.

Establishments below a specified minimum size, determined separately for each major industry group, also were excluded from the sample, because it was found that very few scientists, engineers, or technicians are employed in most small sized establishments. These minimum-size cutoffs were essential to the efficiency of the survey. Altogether, 1.8 million establishments employing nearly 11 million workers were excluded from the original lists of establishments. Since the unemployment insurance (UI) listing of establishments from which the sample was drawn was compiled as of March 1964 and 1965, the survey also did not reach establishments created after those dates. However, this exclusion does not necessarily mean an understatement, since current employment figures are used as the basis of the estimate to which are applied the proportionate ratios of scientists and engineers.

As a result of the exclusions described above, a sampling universe of about 530,000 establishments employing around 33 million workers remained. Before the sample was drawn, the universe listing was stratified by State, region, industry, and size of establishment.

Sample design

The survey sample consists of three major segments: The probability segment, supplementals, and multiestablishment reporters. The probability segment comprised

¹ The 1961-64 sample contained a supplemental group of about 800 research and development laboratories drawn originally from the 11th edition of *Industrial Research Laboratories of the United States, 1960* No. 844 (National Research Council), and *A List of Small Business Concerns Interested in Performing Research and Development, June 1960* (U.S. Department of Commerce, Small Business Administration).

² All industrial classification for this survey was in terms of the 1957 Standard Industrial Classification Manual. See *Standard Industrial Classification Manual, 1957* and the *1963 Supplement*. Executive Office of the President, Office of Management and Budget.

nearly 25,000 establishments in the 1969 survey, selected at random from the March 1964 and 1965 State UI lists. Supplementals, including railroads and selected establishments known to employ large numbers of scientists and engineers, raised this total to slightly over 27,000 establishments. About 1,200 of these establishments were known to be incorporated into about 300 companies that report on a multiestablishment basis, either company- or industrywide or on a divisional or regional basis. In addition to the 1,200 establishments drawn in the probability sample, the reports from these 300 companies covered about 10,000 units not in the sample.

The sampling ratio in the probability segment was varied in relation to size of establishment and other factors to obtain maximum reliability with resources available. In every covered industry, all establishments having 1,000 employees or more were included in the sample. In other industry-size cells, the sampling ratios ranged from 1 in 1 to 1 in 100. In general, the larger the establishment and the greater the number of technical personnel used by the industry, the higher was the sampling ratio. This procedure varied for the supplementals. Although the railroads were reported on a company rather than establishment basis, they were handled the same as the probability segment with certainty cases of 1,000 or more and a cutoff (50) for the smaller size groups. In contrast, all establishments on the supplemental list of high scientist- and engineer-users were included with a weight of unity and added to their appropriate industry-size class, regardless of the sampling ratio used in the UI sample for that particular industry-size class; and if the supplemental establishment duplicated a UI sample unit, it was treated as a supplemental unit with a weight of unity. The sample was designed to obtain satisfactory estimates of total scientists and engineers and of technicians in as much industry detail as possible from a sample of this size and, in addition, to obtain State estimates for as many States as practical. This necessitated different sampling ratios in the same industry-size group for different States.

Definitions used

The definitions used in the 1969 survey were the same as those used in previous surveys. These definitions were developed originally in consultation with industry representatives and others having knowledge of the field. The objective was to describe clearly the desired information and also to conform, insofar as possible, to customary personnel accounting practices. It was recognized that wide differences in organization and personnel records among industries, as well as among establishments in the same industry, would make inevitable

some variation interpretation and application of the definitions.

The definition of the term "technician" was especially subject to variations in interpretation. There is, as yet, no general agreement as to the meaning of this term, which covers positions with a variety of job titles that differ among establishments. Consequently, the categories of personnel included in the figures reported for this item probably contain a higher order of response variation than do any of the other occupational categories contained in this bulletin.

A definition of the desired reporting unit also was provided. This definition was based, by necessity, on that used by the UI agencies in the listing of establishments from which the sample was drawn.³ Separate information was requested for each establishment. Since it was known that some multiestablishment companies might find it difficult to supply the requested information for each separate establishment, it was stated on the questionnaire that if necessary, data might be submitted on a multiestablishment basis. In 1969, this alternative procedure was followed by about 300 companies with over 10,000 establishments. It also was noted on the questionnaire that multi-industry companies might submit separate reports among corporate industrial division lines or on another comparable basis, since this method, from an industry survey viewpoint, is generally preferable to a single multiestablishment company report. About half of the multiestablishment reporters chose to report according to this option.

Conduct of the survey

The questionnaire for the 1969 survey, reproduced in appendix III was substantially the same as that used in previous surveys.

The questionnaires were mailed in May 1969, in most instances directly to the establishments. There were two full scale mail followups; the first was a simple reminder letter to the entire mailing list, and the second was a complete followup of all outstanding respondents. A third followup by mail, telephone, or field visit was made of selected critical nonrespondents that were essential to obtain meaningful data on a State level.

Each questionnaire was screened before it was accepted. Screening was designed to insure that each report was arithmetically consistent with the various items, subtotals, and totals reported; that it was properly classified by industry and size class; and that it represented the specific establishment drawn for the sample

³ UI reporting procedures permit establishments reports for units that may be statewide or countrywide in scope or less than plantwide (e.g., all of a corporation's insurance agents in a given State cited as a separate establishment).

rather than multiestablishment report of either a single or multi-industry type. Each questionable item was researched to the fullest extent possible, including contact with the respondent, to determine what sort of correction to the originally submitted data was needed. Approximately 25 percent of all questionnaires required some form of correction adjustment.

The industrial classifications of the establishment in the survey were, in general, those assigned by the State employment security agencies, which developed the lists from which the sample was drawn. The industry classification for each establishment in the probability segment of the sample was determined by each State agency on the basis of the establishment's principal product. The industry code originally assigned to an establishment was changed in relatively few cases. When a multiestablishment return was received, the employment data for the return were distributed by occupation, industry, and size according to product or service information furnished by each respondent.

Comparability with previous surveys

The 1969 survey is basically comparable to other STP surveys. The same sample of establishments, identical questionnaires, and definitions were used. However, certain factors can affect comparability to some degree. Even though response rates may be similar, for example, the data received from the same establishment responding in two different years may indicate a difference in the interpretation of the definitions. Despite these variations, the total effect on year-to-year comparability is small, except for items where very small numbers were involved.

The estimating and processing procedures between 1969 and earlier surveys were unchanged.

Estimating methods

Estimating procedures used in this survey apply individually to each of the covered occupations. The group totals, such as life scientists, physical scientists, and total scientists and engineers, are summed from the estimates of the individual occupations comprising them. Estimates are obtained for each industry-size cell as a result of applying, to the total employment of the corresponding universe cell, the ratio of the sum of weighted employment in each occupation to the sum of weighted total employment derived from sample respondents.

The procedures used for the probability cells and the supplemental cells are necessarily treated in some what different ways. The methods are described below. The symbols used in the estimating equations were as follows:

M = total universe employment (derived from BLS employment estimates and a special tabulation of employment reported in the UI program), as of January of each related year.

e_{1i} = total employment reported by the i -th establishment in the probability sample.

e_{2i} = total employment reported by the i -th establishment in the supplemental sample.

e_{3i} = total employment distributed by estimating cell, as reported by the i -th consolidated reporter (both multi- and single-industry types).

B_0 = total employment of the supplemental units at the time the selection was made (January 1963).

B_1 = corresponding total employment of all responding supplement units (January 1963).

w_i = the sampling ratio reciprocal of units selected in the probability sample.

P_{1i} = item of estimate reported by the i -th establishment of the probability sample.

P_{2i} = item of estimate reported by the i -th establishment in the supplemental sample.

P_{3i} = distributed item of estimate imputed from the i -th unit of a consolidated reported (both multi- and single-industry types).

Since all estimates are calculated separately for each stratum, no notation representing industry or size is used.

The estimate (P'_1), such as the number of engineers performing research and development, was calculated for establishments tabulated in the probability sample as:

$$P'_1 = M' \left(\frac{\sum p_i w_i}{\sum e_{1i} w_i} \right), \text{ where}$$

$$M' = M - (E'_2 + \sum e_{3i}) \text{ and}$$

$$E'_2 = \sum e_{2i} \left(\frac{B_0}{B_1} \right)$$

Estimates of all functions in each occupation were obtained by summation. The estimate for establishments drawn in the supplemental sample was calculated as:

$$P'_2 = \sum P_{2i} \left(\frac{B_o}{B_1} \right)$$

The estimate for each industry-size stratum was calculated as:

$$P' = P'_1 + P'_2 + \sum P_{3i}$$

Returns from multiestablishment reporters are only for the units covered and are not used as a basis for estimating total of other units, such as nonrespondents. Thus, the total from these multiestablishment reports

are not subject to sampling errors as such. However, since reports of this type frequently cover units in two industries or more, it is necessary to distribute occupational employment among these industries. The method of distribution is the same for each occupation and can be illustrated by the following example:

Company X reports a total of 1,500 employees, 1,000 in cell Pa and 500 in cell Pb. In addition it reports a total of T engineers but does not indicate how many are in each of the two cells. In brief, the procedure used to estimate the distribution by cell was: A preliminary estimate was first made for each cell by applying the cell ratio of engineers to total employment (in the probability segment of the cell) to the reported employment by Company X in that cell. These preliminary estimates were proportionately adjusted to the reported total number of engineers for the company. This is expressed in symbolic terms as follows:

	<u>Cell P_a</u>	<u>Cell P_b</u>
Given		
Engineers in probability segment	$\Sigma(P_{ai} w_{ai})$	$\Sigma(P_{bi} w_{bi})$
Reported employment in probability segment	$\Sigma(e_{ai} w_{ai})$	$\Sigma(e_{bi} w_{bi})$
Reported company X employment	1000	500
Then	$P'_a = \frac{1000 \Sigma(P_{ai} w_{ai})}{\Sigma(e_{ai} w_{ai})}$	$P'_b = \frac{500 \Sigma(P_{bi} w_{bi})}{\Sigma(e_{bi} w_{bi})}$
	$P_{3a} = \frac{P'_a}{P'_a + P'_b} \cdot T$	$P_{3b} = \frac{P'_b}{P'_a + P'_b} \cdot T$

where P_{3a} = estimated engineers for company X in cell P_a and P_{3b} = estimated engineers for company X in cell P_b.

II. Questionnaire, reporting instructions and definitions

BLS 2716A

U.S. DEPARTMENT OF LABOR
BUREAU OF LABOR STATISTICS
WASHINGTON, D.C. 20212

Budget Bureau No. 44-R1157
Approval expires March 1970

Information supplied on this form will be seen only by sworn employees of the Bureau of Labor Statistics. Only statistical summaries that preserve the confidentiality of the data supplied will be released.

Information reported should cover all establishments in the location designated to the left.

(Change if incorrect, include ZIP code.)

Survey of Scientific and Technical Personnel in Industry, 1969

Gentlemen:

The Bureau of Labor Statistics is again conducting its annual Survey of Scientific and Technical Personnel in Industry. The results, which provide current nationwide information on scientific and technical manpower resources, serve as a guide in developing programs to strengthen the country's scientific potential.

To minimize costs, establishments are selected on a sample basis to represent small and large establishments in all types of industries, regardless of whether scientific and technical personnel are employed. Consequently, it is important to complete the report only for the unit(s) identified on the address label, even if scientific and technical personnel are not employed at that location. Reporting instructions and occupational definitions are provided in the enclosed booklet.

If you have any problems in reporting data for the establishment(s) specified, or questions concerning unit identification, or on any other aspect of the survey, please use the Letter Saver on the back page of the questionnaire. If you prefer to talk directly with a member of our staff, telephone collect: Area code 202-961-2477.

Please complete the questionnaire and return it to us within 3 weeks in the enclosed addressed envelope which requires no postage. Your cooperation in making this survey a success will be genuinely appreciated.

Sincerely yours,

Jeffrey S. Moore
Commissioner

Person to be contacted if questions arise concerning this report:

Name and title (please print or type)

Area code, phone no.

Street, city, State, and ZIP code

(Please complete items 1.10 and 1.20 even if you do not employ scientific or technical personnel.)

1.10 Employment

How many employees were on the payroll in the establishment(s) identified above for the period which included January 12, 1969, and 1968, respectively?

Total employed in January of—

1969 1968

Report all employees in addition to those in the occupations covered by the survey (e.g., all full- or part-time—salaried, or hourly paid employees in production, maintenance, office, administrative, sales, and managerial jobs).

--	--

1.20 Nature of Business

1. Enter the principal type of activity of this establishment (e.g., manufacturing, wholesale trade, retail trade, construction, public utility, research laboratory, etc.).

2. Enter in order of importance the principal products manufactured, lines of trade, specific services, or other activities (e.g., electric fuses, gas meters, engineering services, etc.).

Percent of total annual sales value or receipts, 1968

a. _____	_____
b. _____	_____
c. _____	_____
d. _____	_____

3. If manufacturing, please indicate:

a. Principal materials used (e.g., aluminum castings, machined parts, assembled parts; rayon staple, wool yarn, cotton fabrics, etc.—in the form brought into plant; do not list materials produced in this plant.).

b. What are the general types of operations performed (e.g., foundry, machine shop, assembly; spinning, weaving, sewing, etc.).

Please complete items 2-A, B, C; 3; and 4 on pages 2 and 3. If, however, none of your employees are in the occupations listed, check the blocks provided at the beginning of each of these items and return the form.

For BLS Use Only

Batch no.	
-----------	--

GENERAL INSTRUCTIONS

Employment data in the establishment(s) identified on the address label should relate to the pay periods which include January 12, 1969, and 1968, respectively. Include employees who are on paid vacations or sick leave during these periods. This survey covers both full- and part-time employees. Exclude consultants paid by another company, as well as pensioners, and members of the Armed Forces carried on the rolls, but not working during the period covered.

The number of employees should be reported for each occupation covered by the survey. Classify each employee in the occupational category in which he spends most of his time in accordance with the definitions found in section 2 of the Detailed Reporting Instructions. For example, an Organic Chemist in charge of a particular phase of production, and who works primarily as a Chemist, should be reported as a Chemist in item 2.31.

Personnel reported for occupations in items 2.00 through 2.49 and 4.00 under column (a), who in January 1969 were primarily engaged in research and development activities, should also be reported separately in column (b).

Detailed reporting instructions on methods of reporting, occupational descriptions, and definitions of terms are provided in the enclosed booklet. Please read the "Detailed Reporting Instructions" carefully before completing the questionnaire.

2A. Engineers, Mathematicians, and Natural Scientists (If none are employed check here.) 1969 1968

Item and occupation	Total employed in January 1969		Total employed in January 1968 (c)
	All employees	Number performing or managing research and development activities	
	(a)	(b)	
2.00 Total Engineers, Mathematicians, Physical Scientists, and Life Scientists			
2.10 Total Engineers			
2.20 Total Mathematicians			
2.30 Total Physical Scientists			
2.31 Chemists			
2.32 Physicists			
2.33 Metallurgists			
2.34 Geologists and Geophysicists			
2.39 Other Physical Scientists			
2.40 Total Life Scientists			
2.41 Medical Scientists (exclude practitioners)			
2.42 Agricultural Scientists			
2.43 Biological Scientists			
2.49 Other Life Scientists			

Summation instructions: Item 2.00 = the sum of 2.10 + 2.20 + 2.30 + 2.40;
 item 2.30 = the sum of 2.31 through 2.39;
 item 2.40 = the sum to 2.41 through 2.49.
 Column (b) cannot exceed column (a).

2B. In-House Training in Science and Technology

(See section 5 of the Detailed Reporting Instructions for further explanation.)

Please check (✓) whether the establishment covered by this report currently conducts or engages in any formal in-house training programs in the form of: instruction, courses, seminars, lectures, etc., covering science and technology subject matter for:

- 2.51 Engineers and natural scientists listed in item 2A, column (a) ----- Yes No
- 2.52 Nonprofessional technical personnel listed in item 4, column (a) ----- Yes No

2C. Engineers, Mathematicians, and Natural Scientists Engaged in Federal Government Work

Please check (✓) whether any of the Engineers, Mathematicians, or Scientists reported in item 2A, columns (a) and (c), were employed on Federal Government work in January 1969 or January 1968? If answer is "Yes" please complete items 2.70 through 2.91.

2.61 As of January 1969 Yes No

2.62 As of January 1968 Yes No

NOTE: For this survey the production of standard items (e.g., shelf or vendor items) for the Federal Government is not considered work performed for the Federal Government. See section 3 of the Detailed Reporting Instructions for further explanation.

Item and occupation	Total employed in January 1969				Total employed in January 1968, all Federal agencies (e)
	All Federal agencies (a)	Department of Defense (b)	National Aeronautics and Space Administration (c)	Other Federal agencies (d)	
2.70 Total Engineers, Mathematicians, Physical Scientists and Life Scientists					
2.80 Total Engineers					
2.81 Engineers primarily engaged in performing or managing research-development					
2.90 Total Mathematicians, Physical or Life Scientists					
2.91 Mathematicians, Physical or Life Scientists primarily engaged in performing or managing research-development					

Summation instructions: Item 2.81 cannot exceed 2.80 and item 2.91 cannot exceed 2.90.
Vertically, item 2.70 = the sum of 2.80 + 2.90.
Column (a) = the sum of columns (b) + (c) + (d).
Number of employees reported in the occupations listed in item 2C. cannot exceed those in item 2A.

3. Economists, Statisticians, and Psychologists (If none are employed, check here.) 1969 1968

Item and occupation	Total employed in January	
	1969 (a)	1968 (b)
3.00 Total Economists, Statisticians, and Psychologists		
3.10 Economists		
3.20 Statisticians		
3.30 Psychologists		

Summation instructions: Vertically, item 3.00 = the sum of items 3.10 through 3.30.

4. Draftsmen, Surveyors, and Technicians (If none are employed, check here.) 1969 1968

Item and occupation	Total employed in January 1969		Total employed in January 1968 (c)
	All employees (a)	Number performing or managing research and development activities (b)	
4.00 Total, all occupations listed below			
4.10 Draftsmen			
4.20 Surveyors			
4.30 Electrical and Electronic Technicians			
4.40 Other Engineering and Physical Science Technicians			
4.50 Biological and Agricultural Technicians			
4.60 Medical and Dental Technicians			
4.90 Other Technicians			

Summation instructions: Vertically, item 4.00 = the sum of items 4.10 through 4.90.
Column (b) cannot exceed column (a).

LETTER SAVER

Gentlemen:

I cannot complete the questionnaire in accordance with your instructions for the following reason(s). (Check appropriate block(s) and identify person to be contacted on page 1 of the questionnaire.)

- 1. Employment data for scientific and technical personnel are not available separately for the establishment(s) identified on the address label but can be reported together with other establishments of our company.
- 2. Please return this questionnaire and send us _____ additional copies of BLS Form 2716A.
- 3. We cannot file a report for the establishment(s) identified on the address label for the following reason:
 - a. The unit identified on the address label has been combined with the following subdivision of our company:

 and no longer exists as a separate organizational entity.
 - b. The unit identified on the address label was temporarily inactive and had no employment as of January 12,
 1969 1968
 - c. The unit identified on the address label was not in business on January 12,
 1969 1968
 - d. The unit identified on the address label has been sold or is no longer part of our company. The new owner is:

 (name)

 (address)
 - e. Other (specify) _____

- 4. I will need assistance to complete your survey questionnaire.

REMARKS

- 5. Check if you desire a copy of our report, Scientific and Technical Personnel in Industry, 1961-66.

Detailed Reporting Instructions

1. REPORTING UNIT

The establishment location for which data are requested is shown on the bottom line of the address label. County and State designation is generally used unless more specific detail is available. For purposes of this survey, an establishment is generally a single physical location, engaged in one predominant activity.

Because the establishments in this survey are selected on a sample basis to represent all sizes of establishments in all manufacturing and nonmanufacturing industries, multiunit companies may receive more than one questionnaire. It is important that you complete the questionnaire only for the establishments designated.

Total employment (item 1.10) and business activity (item 1.20) should be completed even if you do not employ engineers, scientists, or technicians. These items are essential to our estimating procedures. Providing us with this information will avoid unnecessary correspondence.

The letter saver on the back page of the questionnaire should be used if you are unable to report for the establishment designated or have trouble reporting the occupational data requested. For example, you may not have data available on an individual establishment basis, or you cannot determine which establishment should be included in your report because two or more are located in the designated area, or you have no establishment in the designated area. Please indicate in the space allocated on the front page of the questionnaire who we should contact to resolve any reporting problems.

2. DEFINITION OF TERMS

A. General

Employees in the specialized occupations covered by this survey should be counted on a "Working As" basis, as of the date of the report (mid-January 1969 or 1968) regardless of their field of degree or whether they hold a college degree. For example, an employee trained as an engineer but working as a mathematician as of the date of the report should be reported as a mathematician. Similarly, an employee trained as a biological technician but working as a medical technician as of the date of the report should be reported as a medical technician. If actual data are not available, estimates are acceptable. When data are not available and reasonable estimates are deemed to be impossible, please write "not available" in the appropriate items of the questionnaire.

B. Occupations

ENGINEERS (item 2.10)

Count as engineers all persons actually engaged in chemical, civil, electrical, mechanical, metallurgical, or any other type of engineering work at a level which requires knowledge of engineering equivalent at least to that acquired through completion of a 4-year college course with a major in one of these fields, regardless of whether they hold a college degree. Include all en-

engineers in research and development, production, management, technical service, sales, and other positions which require them to use the indicated level of knowledge in their work. Exclude persons trained in engineering, but currently employed in positions not requiring the use of such training. Include architectural engineers; exclude architects.

MATHEMATICIANS (item 2. 20)

Count as mathematicians only those persons whose positions require a knowledge of mathematics equivalent at least to that acquired through a 4-year college course with a major in mathematics and who spend the greatest proportion of their time in development or application of mathematical techniques, regardless of whether they hold a college degree. Include all mathematicians in research and development, production, management, technical service, sales, and other positions which require them to use the indicated level of knowledge in their work. Include actuaries, statisticians, and computer programmers only if they specialize in mathematical techniques. Exclude accountants.

PHYSICAL SCIENTISTS (item 2. 30)

Count as physical scientists all chemists, physicists, metallurgists, geologists, geophysicists, and other physical and earth scientists who are actually engaged in scientific work at a level which requires a knowledge of the physical sciences equivalent to that acquired through completion of a 4-year college course with a major in one of the physical science fields, regardless of whether they hold a college degree. Include all physical scientists engaged in research and development, production, management, technical service, sales, and other positions which require them to use the indicated level of knowledge in their work. Exclude persons trained in the physical sciences but currently employed in positions not requiring the use of such training.

LIFE SCIENTISTS (item 2. 40)

Count as life scientists all medical scientists, agricultural scientists, biological scientists, and other life scientists who are actually engaged in scientific work at a level which requires a knowledge of the life sciences equivalent to that acquired through completion of a 4-year college course with a major in one of the life science fields, regardless of whether they hold a college degree. Include all life scientists engaged in research and development, production, management, technical service, sales, and other positions which require them to use the indicated level of knowledge in their work. Exclude persons trained in the life sciences but currently employed in positions not requiring the use of such training. Exclude psychologists from this category, and report them in item 3. 30. Definitions for medical, agricultural, and biological scientists follow.

Medical Scientists. Count as medical scientists only those physicians, dentists, public health specialists, pharmacists, and members of other scientific professions who meet the general requirements for "Life Scientists" and who are concerned with the understanding of human diseases and improvement of human health, and spend the greatest proportion of their time in clinical investigation or other research, production, technical writing, and related activities. Exclude from this category all practitioners—that is, those medical scientists who spend the greatest proportion of their time providing care to patients, dispensing drugs or services, or in diagnosis, etc. Persons working as pathologists, microbiologists, pharmacologists, etc., should be excluded from the figures for medical scientists and included in the figures for biological scientists.

Agricultural Scientists. Count as agricultural scientists all persons who meet the general requirements for "Life Scientists" and who are primarily concerned with the understanding and improvement of agricultural productivity, such as those working in agronomy, animal husbandry, forestry, horticulture, range management, soil culture, and veterinary science. Exclude veterinarians who spend the greatest proportion of their time providing care to animals, since they are primarily practitioners and are not within the scope of this survey.

Biological Scientists. Count as biological scientists all persons who meet the general requirements for "Life Scientists" and who spend the greatest proportion of their time in scientific work dealing with life processes other than those classified in the agricultural and medical sciences. Include pathologists, microbiologists, pharmacologists, bacteriologists, taxicologists, botanists, zoologists, etc.

ECONOMISTS, STATISTICIANS, AND PSYCHOLOGISTS (item 3).

Include all employees who are actually working as economists, statisticians, or psychologists, at a level which requires knowledge of these subjects equivalent at least to that acquired through completion of a 4-year college course with a major in one of these fields, regardless of whether they hold a college degree. Exclude persons trained in one of these fields who are currently employed in positions which do not specifically require the use of such training. Definitions for the individual occupations follow.

Economists. Count as economists those persons who meet the general requirements for this item and who perform studies, or are engaged in research, of a fundamentally economic nature, e. g., the analysis, interpretation, or forecasting of economic trends and conditions; the study of relationships within the economy—either of wide scope or in specialized areas such as finance, price movements, manpower, international trade, or domestic market conditions. Include market research analysts who are trained in economics and who utilize this knowledge in the performance of their duties. Also include persons whose primary function is to consult with or advise management on economic conditions and trends in the formulation of company plans or policy. Exclude accountants or fiscal analysts whose primary duties are to evaluate company costs or prepare corporate ratios.

Statisticians. Count as statisticians all persons, other than those reported as mathematicians, who meet the general requirements for this item and who are primarily engaged in the recurrent application of statistical techniques which involve the use of mathematical-statistical theory equivalent to that taught at the college level, regardless of college degrees held. For purposes of this survey, statistical techniques shall include the design of surveys or experiments as well as the collection, organization, interpretation, or analysis of numerical data. Such data may represent either complete enumeration or statistical samples. Persons counted within the framework of this definition may be employed in business fields such as finance, marketing, management analysis, or advertising; in social science fields such as economics, political science, demography, or psychology; in engineering fields; or in physical or life science fields such as biology, agriculture, pharmacology, or medicine. Exclude statisticians who are engaged solely in the development of mathematical theory associated with the general application of statistical techniques—these persons should be reported as mathematicians. Also, exclude persons engaged in quality control, time or motion study applications, inventory control, computer programming, testing, etc., who utilize statistical techniques merely as an occasional tool in connection with the performance of other primary duties; these persons should be reported as engineers, economists, psychologists, technicians, or excluded entirely from the specialized personnel included in this survey—whichever is most appropriate.

Psychologists. Count as psychologists all persons who meet the general requirements for this item and who are concerned with the application or establishment of principles related to human behavior. Psychologists frequently will be engaged in specialized fields such as industrial, experimental, consumer, consulting, clinical, social, educational, or engineering psychology. Examples of psychologists range of job duties might include such provinces as: Consultation with management to furnish expert professional advice, opinion, assistance, or knowledge in the application and use of psychological methods, theories, and techniques; behavior modification through personal counseling, interviewing, management development, and industrial, communication programs; training and education for employees and managers; or measurement and evaluation of individual and group behavior through the application, development, administration, validation, and interpretation of psychological tests. Other job duties might be related to techniques of product design and development, including the application of knowledge derived from studies of consumer behavior and of human characteristics; research on personnel policies and practices; employee attitudes and motivation; job and organizational effectiveness; marketing and advertising, and the design, development, and operation of complex systems with regard to the human factors involved.

DRAFTSMEN, SURVEYORS, AND TECHNICIANS (item 4)

Count in this occupational grouping all persons actually engaged in technical work at a level which requires knowledge of engineering, mathematical, and physical or life sciences, comparable to that acquired either through study at technical institutes, junior colleges, or other formal post-high school training less extensive than a 4-year college course, or through equivalent on-the-job training or experience. Some typical job titles are draftsman, surveyor, laboratory assistant, physical science aid, and electronic technician. All persons in positions which require the indicated level of knowledge should be counted, regardless of job title or department in which employed. Computer programmers who meet the above definition of technicians should be reported on line 4.90 of the questionnaire, "Other technicians." Exclude those persons whose positions require knowledge or training consistent with the foregoing definitions of engineers, mathematicians, or scientists, and report them in the appropriate occupational category on the questionnaire. Also, exclude all craftsmen such as machinists and electricians, and specialized personnel such as airline pilots, navigators, flight engineers, and ships' officers. Separate definitions of electrical and electronic technicians; other engineering and physical science technicians; biological and agricultural technicians; and medical and dental technicians follow.

Electrical and Electronic Technicians. Count in this group technicians with a background in electrical or electronic theory, physical science, and mathematics which enables them to perform jobs above the routine operating or maintenance levels. Normally, such employees are engaged in constructing, repairing, testing, installing, modifying, operating, or even designing a variety of production or experimental types of complex electrical or electronic equipment.

Other Engineering and Physical Science Technicians. Count in this group technicians who assist engineers and physical scientists in both laboratory and production types of activities. Normally, these technicians work under the direct supervision of an engineer or scientist and assist him in those functions usually described as routine at the professional level.

Biological and Agricultural Technicians. Count in this group all life science technicians except medical and dental technicians, defined as follows.

Medical and Dental Technicians. Count in this group employees working as laboratory assistants whose duties include such operations as making laboratory tests; taking or developing X-ray pictures; constructing metal clamps, inlays, and bridge work according to specifications; and who in other ways assist in medical or dental research or laboratory operations. Exclude technicians whose primary function is care or treatment of patients, such as nurses.

C. Research and Development Functions

Include in this function those engineers; mathematicians; physical and life scientists; and draftsmen, surveyors, and technicians who spend the greatest proportion of their time performing, managing, or administering basic and applied research in engineering, mathematics, and physical and life sciences (including medicine) and in the design and development of prototypes and processes. If the primary objective of an activity is to make further improvements on the products or processes, then the work is research-development. If, on the other hand, the product or process is substantially operational and the primary objective is to develop markets, do preproduction planning, or get the production process going smoothly, then the work is no longer research-development. For purposes of this survey, research and development includes the activities described below whether assigned to separate research and development organizational units of the establishment, or carried on by laboratories and technical groups not part of a separate research and development unit per se.

- (a) Pursuit of planned research for new knowledge, whether or not the search has reference to a specific application.
- (b) Application of existing knowledge to problems involved in the creation of a new product or process, including work required to evaluate possible uses.
- (c) Application of existing knowledge to problems involved in the improvement of a present product or process.

Research and development excludes the following functions: Market research (including statistical surveys of product acceptance, estimates of market size, and studies of channels of distribution); market development (including the sale of either old or new products to obtain acceptance of them in new outlets); quality and quantity control tests and analyses; trouble-shooting in connection with breakdowns in full scale production, including related analytical work; technical plant sanitation control; work required for minor adaptations of a specific product to meet the requirements of a specific customer, including installation and servicing in a customer's plant; engineering and other technical service furnished in accordance with agreements to licensees outside the company; aid furnished by the research and development organization to manufacturing divisions to enable them to operate in accordance with previously determined formulas, standard practice instructions, or finished product specifications; aid furnished to develop advertising programs to promote or demonstrate new products or processes, including the development of material furnished for trial or demonstration; assistance in preparation of speeches and publications for persons not engaged in research and development; experimental work performed at the request of the patent division to provide information needed during the prosecution of a patent litigation, and technical writing.

3. FEDERAL GOVERNMENT WORK

Item 2C on the questionnaire is needed to obtain estimates of the total number of engineers, mathematicians, and scientists employed by industry whose work is involved directly with national defense, space, and other programs of the Federal Government. Work performed for the Federal Government includes production, research, development, testing, evaluation, or other activities under prime contracts with the Department of Defense, including the Army, Navy, Air Force, Marine Corps, Defense Atomic Support Agency, and all other Department of Defense organizations; the National Aeronautics and Space Administration; or other agencies of the Federal Government. Also, include work performed under subcontracts with prime contractors or other subcontractors. The production of standard items for sale (e.g., shelf or vendor items) to the Federal Government is not considered work performed for the Federal Government for purposes of this survey.

4. NATURE OF BUSINESS (item 1.20)

Occupational employment data obtained in this survey are published for 89 different industry groups. Therefore, please provide sufficient information on the business activity of each establishment included in the survey so that we can accurately classify it by industry. If your report covers only the central office, warehouse, or research laboratory of your company, please designate in section 1 of item 1.20 and omit other sections of this item. If your report covers two or more establishments which have unlike business activities, please note under "Remarks" on back page of questionnaire and omit response to item 1.20.

5. IN-HOUSE TRAINING IN SCIENCE AND TECHNOLOGY (item 2B)

The National Science Foundation and other Government agencies have responsibilities and support programs related to the education and training of scientific and technical personnel. Also they are aware that private industry makes significant contributions in this area for its own employees. Since the extent of industry's participation is unknown, response to this question should provide some general measures of the prevalence of in-house training.

A. Formal in-house training programs, for purposes of this survey, are defined as instruction, courses, lectures, seminars, etc., specifically related to science and technology. Include subjects, for example, on (1) new knowledge in scientific research or technical developments; (2) technical information required for performing current or new assignments; and (3) scientific or technical knowledge required for upgrading an employee's job. Exclude programs concerned with (1) general orientation on company policies and programs; (2) general management development; (3) supervision; and (4) other nontechnical subjects dealing with cost, finance, sales, communications, etc. Also exclude on-the-job training given at employee's work site.

B. The conduct of such programs is limited to training given at any of three types of locations: (1) The establishment(s) covered by this report; (2) another establishment, school, or training center owned or operated by the same company; or (3) an establishment, school, or training center owned or operated by another company where training is provided under a cooperative arrangement with the reporting establishment or its parent company. Specifically excluded are all types of training given by colleges, universities, or schools even though the reporting establishment, or its parent company, pay all or part of the costs associated with such training.

C. In-house training applies only to scientists and engineers (item 2.51) and technicians (item 2.52) in the establishment(s) covered by this report regardless of whether such training is available in other establishments of your company not covered by the survey.

BLS 2716B

Industry Definitions and Group Codes

(To be used in completing BLS Form 2716B when reporting data on a combined establishment basis)

A SURVEY OF SCIENTIFIC AND TECHNICAL PERSONNEL IN INDUSTRY

For purposes of this survey, American industry has been classified into 89 separate categories. Each category, or industry grouping, represents a single Standard Industrial Classification (SIC) code (see manual published by the Bureau of the Budget, 1967), or a grouping of these codes. The subdivisions used for this survey are identified in three ways: (1) An industry group code, (2) a descriptive name of the industries or types of business activity included in the group code, and (3) the related SIC code or codes. These three identifying elements are specified in the list of industry classifications which follows.

Industry group code	Principal product or service	Related SIC codes
01	Ammunition, sighting and fire control equipment (Excludes small arms ammunition.)	192 & 194
02	All other ordnance and accessories (Excludes group code 01.)	191, 193 & 195-9
03	Grain mill products and sugar (Includes prepared feeds for animals and fowls.)	204 & 206
04	All other food and kindred products (Includes related items such as ice, chewing gum, fats and oils.)	201-3, 205, & 207-9
05	Tobacco manufactures (Excludes the manufacture of insecticides made from tobacco byproducts.)	21
06	Textile mill products	22
07	Apparel and other textile products	23
08	Lumber and wood products	24
09	Furniture and fixtures (made from wood, metal, or other products.)	25
10	Paper and allied products (Includes the manufacturing of pulps from wood or other cellulose products.)	26

U. S. DEPARTMENT OF LABOR
Bureau of Labor Statistics

2

Industry group code	Principal product or service	Related SIC codes
11	Printing and publishing (Excludes news syndicates and textile product printing or finishing.)	27
CHEMICALS AND ALLIED PRODUCTS		
12	Industrial chemicals (Excludes products made from these chemicals.)	281
13	Plastics materials and synthetics (Excludes the manufacture of finished products made from these materials and glass or glass products.)	282
14	Drugs	283
15	Soaps, cleaners, toilet goods, paints, gum and wood chemicals, and Miscellaneous chemicals products	284-6 & 289
16	Agricultural chemicals (fertilizers, pesticides, etc.)	287

PETROLEUM REFINING AND RELATED INDUSTRIES

17	Petroleum refining (Excludes the production of natural gas and the manufacture of lubricants by blending and compounding purchased materials.)	291
18	Paving and roofing materials, and miscellaneous petroleum and coal products	295 & 299

RUBBER, PLASTICS AND LEATHER PRODUCTS

(Excludes manufacture of rubberized clothing; fabrics, webbing, and the production of basic plastics materials.)		
19	Rubber, footwear, and reclaimed rubber	302-303
20	All other rubber and plastics products (Excludes group code 19.)	301 & 306-7
21	Leather and leather products (Includes artificial leather products.)	31

STONE, CLAY, AND GLASS PRODUCTS

22	Hydraulic cement; concrete, gypsum, and plaster products; and miscellaneous non-metallic mineral products	324, 327 & 329
23	All other stone, clay, and glass products (Excludes group code 22 and the manufacture of ophthalmic lenses.)	321-3, 325-6, & 328

Industry group code	Principal product or service	Related SIC codes	Industry group code	Principal product or service	Related SIC codes
PRIMARY METAL INDUSTRIES			tools (except power driven), and electrical household appliances. Machines powered by "built in," or detachable motors ordinarily are included in this group.) 353-6 & 358		
24	Blast furnace and basic steel products (Excludes foundries, as well as primary and secondary smelting and refining of nonferrous metals.)	331	33	Office and computing machines (Includes scales and balances, except laboratory. Classify photo-copy equipment in industry group code 47.)	357
25	Iron and steel foundries and forgings (Do not use this code unless it is the principal activity of the reporting unit.)	332 & 3391	34	Miscellaneous machinery, except electrical (Includes machine shops engaged in jobbing, repair, or manufacturing of special machinery or parts—not elsewhere classified.)	359
26	Smelting, refining, and finishing of nonferrous metals (Do not use this code unless it is the principal activity of the reporting unit.)	333-6 & 3392 & 3399	ELECTRICAL MACHINERY, EQUIPMENT, AND SUPPLIES		
FABRICATED METAL PRODUCTS			35	Electric test and distributing equipment, and industrial apparatus (Excludes manufacturing of frequency transformers, current-carrying devices, turbo generators, and automatic temperature controls.)	361-2
27	Metal cans; cutlery, hand tools, and hardware; heating apparatus (except electrical) and plumbing fixtures; screw machine products and fasteners; metal stampings; coating and allied services; and miscellaneous fabricated wire products	341-3 & 345-8	36	Household appliances (Excludes commercial cooking equipment, industrial refrigeration, commercial laundry equipment, and industrial vacuum cleaners.)	363
28	Fabricated structural metal products	344	37	Electric lighting and wiring equipment (Excludes glass blanks for bulbs, lamp components such as filaments, etc.; production of glass ware for lighting fixtures; porcelain and glass insulators.)	364
29	Miscellaneous fabricated metal products (Excludes plumbers brass goods.)	349	38	Radio and television receiving equipment (except communication types) and phonograph records	365
MACHINERY (EXCEPT ELECTRICAL)			39	Communications equipment (Excludes manufacturing of transmitting tubes.)	366
30	Engines and turbines (Excludes aircraft and rocket engines; automotive engine, except diesel; engine generator sets; and locomotives.)	351	40	Electronic components and accessories (Includes the manufacturing of electron tubes, except X-ray tubes.)	367
31	Farm machinery and equipment (Excludes machinery and equipment used primarily for construction purposes.)	352	41	Miscellaneous electrical machinery, equipment, and supplies (Includes the manufacturing of storage and primary batteries; X-ray tubes; electrical equipment for internal combustion engines, and electrical items, not classified elsewhere.)	369
32	Construction, mining, materials handling machinery and equipment; metalworking machinery and equipment; special and general industrial machinery and equipment, except electrical; and service industry machinery (Includes elevators and moving stairways; conveying equipment; hoists; exhaust and ventilating fans; refrigeration machinery (except household) and complete air conditioning units; and measuring and dispensing pumps. Excludes transportation equipment, hand				

Industry group code	Principal product or service	Related SIC codes	Industry group code	Principal product or service	Related SIC codes
TRANSPORTATION EQUIPMENT			MISCELLANEOUS MANUFACTURING INDUSTRIES		
42	Motor vehicles and equipment (Excludes the manufacturing of motorcycles, track laying tractors, combat tanks, tires and tubes, automobile glass, vehicular lighting equipment, ignition systems, and storage batteries.)	371	49	Jewelry, silverware, and plated ware; musical instruments and parts; toys, and sporting goods; pens, pencils, and artists supplies; costume jewelry and notions (Excludes athletic apparel; small arms ammunition and firearms; drafting instruments; and children's bicycles.)	391, 393-396
43	Aircraft and parts (Excludes the manufacturing of aeronautical instruments and electrical equipment.)	372	50	Miscellaneous manufacturing industries, not elsewhere classified	399
44	Ship and boats building and repairing; railroad equipment; motorcycles, bicycles, and parts; and miscellaneous transportation equipment (Excludes the fabricating of structural assemblies or components for ships; and shops owned or operated by railroads or transit companies, which build or repair cars for their own use.)	373-5 & 379	AGRICULTURAL SERVICES, FORESTRY, AND FISHERIES		
INSTRUMENTS AND RELATED PRODUCTS			51	Animal husbandry services (Excludes establishments engaged in poultry raising; and commercial kennels primarily engaged in raising dogs.)	072
	(Excludes manufacturing of sighting and fire control instruments; molded glass blanks; unsensitized paper stock, mounts, easels, and folders for photographic use; photographic chemicals; flash, flood, and projection lamps; glass and unbreakable crystals.)		52	Horticultural services, hunting and trapping, game propagation, forestry, and fisheries (Excludes logging camps and logging contractors.)	073-4, 08 & 09
45	Engineering and scientific instruments (Excludes optical, surgical, dental, and mechanical measuring instruments and tools; and electrical measuring and recording instruments.)	381	MINING (SOLIDS, AND LIQUIDS)		
46	Mechanical measuring and control devices (Excludes the manufacturing of industrial electric controls.)	382	53	Metal mining	10
47	Optical instruments and lenses and photographic equipment and supplies	383 & 386	54	Anthracite and bituminous coal, and lignite mining	11 & 12
48	Medical instruments and supplies, ophthalmic goods, watches, clocks and watchcases	384-5 & 387	55	Crude petroleum and natural gas (Excludes field services for operators on a contract or fee basis.)	131
			56	Natural gas liquids, and oil and gas field services (Includes field services for operators on a contract or fee basis.)	132 & 138
			57	Quarrying and extracting stone, sand and gravel, and clay ceramic and refractory minerals	141-5
			58	Mining, or otherwise preparing, other non-metallic minerals, except fuels	147-9
			CONTRACT CONSTRUCTION		
			59	Central building contractors	15
			60	Highway and street construction	161
			61	Heavy construction, except highway and street	162
			62	Plumbing, heating, air conditioning, and electrical contractors	171 & 173
			63	All other special trade contractors (Excludes group code 62.)	172 & 174-9

Industry group code	Principal product or service	Related SIC codes	Industry group code	Principal product or service	Related SIC codes
TRANSPORTATION AND RELATED SERVICES			82	Wholesale trade—machinery, equipment, and supplies	508
64	Railroads, sleeping and dining car service, and railway express service (Includes repair shops.)	4011, 402 & 404 (except 4013)	83	Retail trade—building materials, and farm equipment, general merchandise; food; eating and drinking places; and other miscellaneous retail stores (Note: Excludes automotive dealers, gasoline service stations, and the retail sale of apparel, accessories, home furnishings and equipment. These types of retail stores are not within the scope of this survey. Retail department stores, however, which sell a wide variety of products are classified within SIC 53 and, therefore, are covered by this survey.)	52-54 & 58-59
65	Switching and terminal companies (Excludes such activities when operated by railroad companies.)	4013			
66	Local and suburban transportation	411			
67	Trucking, local and long distance	421			
68	Water transportation	44			
69	Transportation by air (Includes terminal services.)	45			
70	Pipe line transportation (pipe line transportation of natural gas is classified in industry group code 76.)	46			
71	Transportation services	47			
COMMUNICATION AND RELATED SERVICES			FINANCE, INSURANCE, AND REAL ESTATE		
72	Telephone communication (wire or radio)	481	84	Finance and real estate	60-62 & 64-67
73	Telegraph communication (wire and radio)	482	85	Insurance carriers	63
74	Radio and television broadcasting	483	SERVICES		
75	Other communication services	489	86	Hotels and lodging places; personal services; automobile and miscellaneous repair; amusement and recreation; advertising; and legal services (Excludes commercial laboratories, and miscellaneous business and consulting services.)	70, 72; 731-6 & 75, 76, 78, 79 & 81
ELECTRIC, GAS, AND SANITARY SERVICES			87	Commercial research, development, and testing laboratories; business and management consulting services; and other miscellaneous business services (Laboratories operated primarily to service their company's own manufacturing activities should be assigned the industry group code of these activities.)	739
76	Electric and gas companies and systems	491 & 492	88	Medical and dental laboratories	807
78	Combination companies and systems (Includes companies that provide gas or electric services, in combination with other utility services.)	493	89	Engineering and architectural services	891
79	Water supply, sanitary services, steam supply and irrigation systems	494-7			
WHOLESALE AND RETAIL TRADE					
80	Wholesale trade—dry goods and apparel, groceries, and farm products—raw material	503-5			
81	Wholesale trade—motor vehicles and automotive equipment; drugs and chemicals; electrical goods; hardware, plumbing, and heating equipment and other miscellaneous wholesalers (except machinery, equipment, and supplies.)	501-2, 506-7 & 509			

III. Statistical tables

Table 1. Employment of scientists, engineers, and technicians by industry, 1969

Industry	Scientists and engineers	Engineers	Scientists	Technicians
Total, all industries	1,062,500	849,000	213,500	772,500
Manufacturing	735,700	586,500	149,200	421,900
Durable goods manufacturing, total	567,400	501,300	66,100	346,100
Ordnance and accessories	63,000	54,200	8,800	20,100
Stone, clay, and glass products	12,100	9,700	2,400	7,000
Primary metal industries	32,100	21,600	10,500	19,700
Fabricated metal products	31,200	28,700	2,500	25,400
Machinery, except electrical	89,800	81,100	8,700	76,300
Specialized machinery and equipment	50,100	47,800	2,300	41,300
Office and computing machines	26,300	20,800	5,500	24,800
Electrical machinery	160,600	146,700	13,900	106,400
Electrical distribution equipment	32,600	30,700	1,900	23,100
Communications equipment	78,600	71,300	7,300	45,200
Electronic components and accessories	28,200	24,800	3,400	23,400
Transportation equipment	135,900	123,700	12,200	61,800
Motor vehicles	32,400	29,100	3,300	16,600
Aircraft and parts	98,100	89,300	8,800	37,600
Instruments and related products	35,800	30,000	5,800	23,300
Other durable goods manufacturing ¹	6,900	5,600	1,300	6,100
Nondurable goods manufacturing, total	168,300	85,200	83,100	75,800
Food and kindred products	14,700	7,400	7,300	5,900
Textiles and apparel products	5,800	3,700	2,100	2,900
Paper and allied products	14,700	9,200	5,500	6,800
Chemicals and allied products	103,500	4,200	59,300	45,400
