Annual Earnings and Employment Patterns of Private Nonagricultural Employees, 1966-67

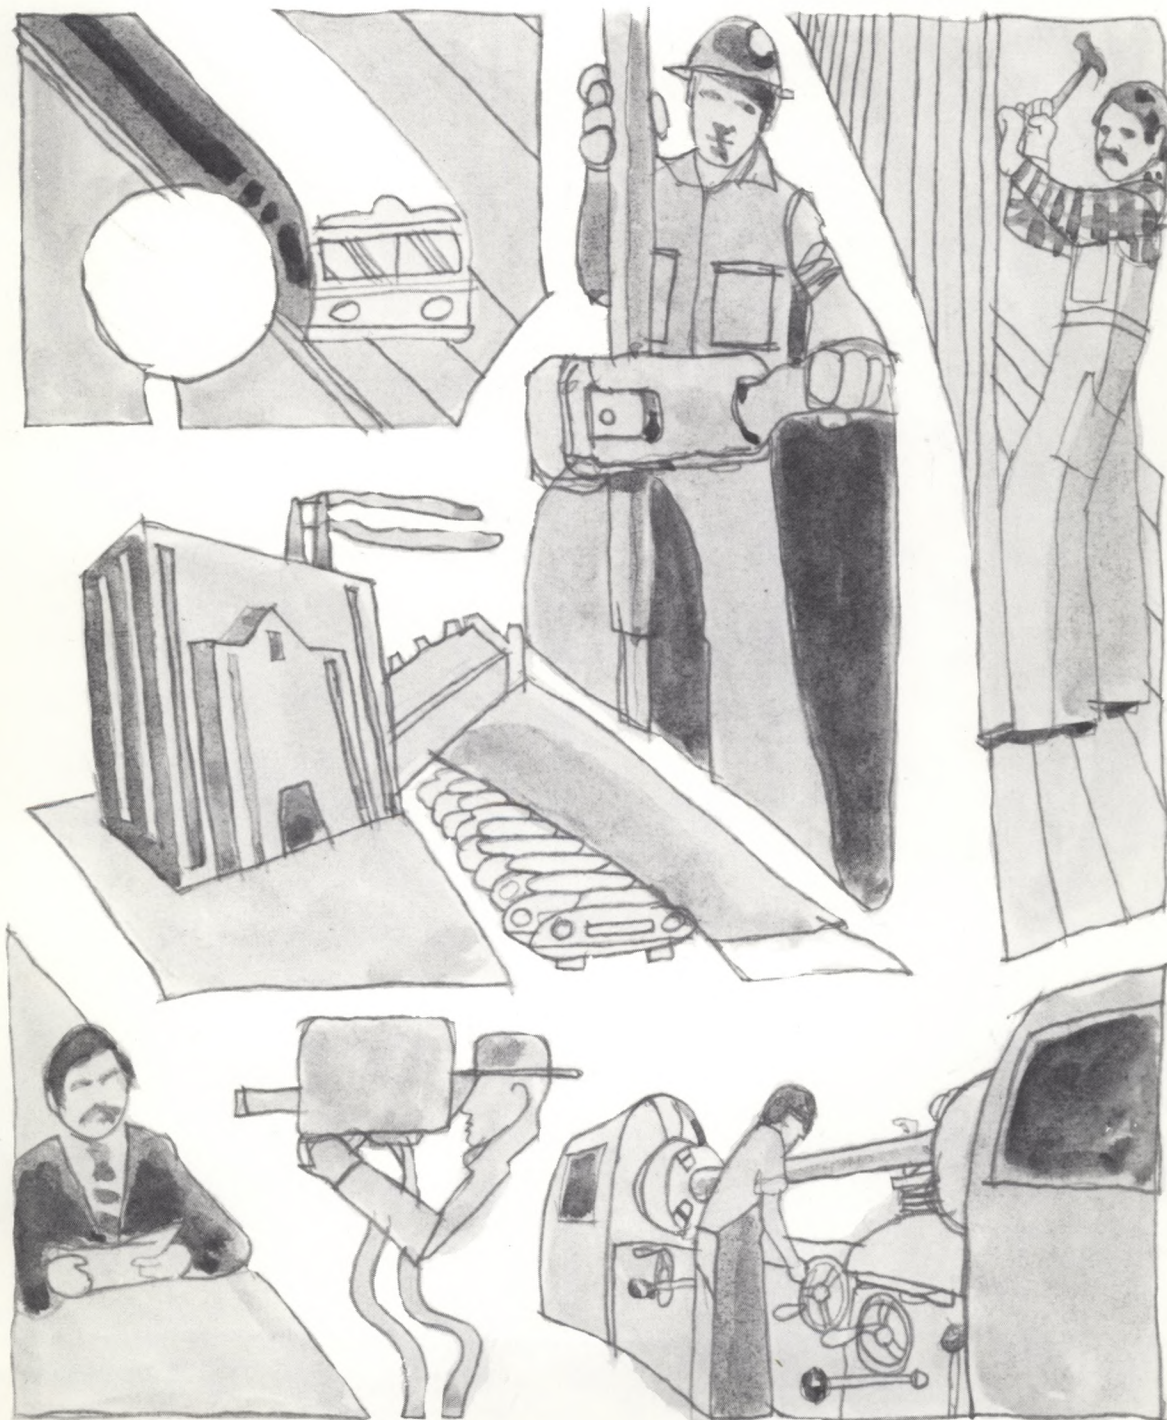

Bulletin 1765

U.S. DEPARTMENT OF LABOR

Peter J. Brennan, Secretary

BUREAU OF LABOR STATISTICS

Ben Burdetsky, Deputy Commissioner

1973

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, GPO Bookstores, or
BLS Regional Offices listed on inside back cover. Price \$2.60 domestic postpaid or \$2.25 over-the-counter.

Make checks payable to Superintendent of Documents.

Microfiche edition available from National Technical Information Service, Springfield, Va. 22151, at 95 cents a set.

Make checks for microfiche payable to NTIS.

Preface

The statistics presented in this bulletin were developed by the Bureau of Labor Statistics from the records of the Social Security Administration and the Railroad Retirement Board and relate to 1966 and 1967. The data provide a more comprehensive and accurate picture of the earnings-employment pattern than is available from any other source.

The Bureau planned originally to publish annual earnings and employment data as they become available from the Social Security Administration each year. Under a speeded-up delivery system, data for 1968 and 1969 have already been received by the Bureau and data for 1970 are expected in mid-1973.

To take advantage of the speeded-up delivery, the Bureau will forego processing and publication of the 1968-69 data, and will accelerate production of the 1970 data. The Bureau is planning release of a summary of the highlights of the 1970 data in late 1973, and a complete bulletin will follow in a few months. These steps should result in a considerable shortening of the time lag between the reference year and date of publication. The 1968-69 data will be stored on tapes, and will be available in the future for processing and time series analysis.

This bulletin was prepared in the Bureau's Division of General Compensation Structures by Franz A. Groemping, under the general direction of Alvin Bauman.

Introduction

The Bureau's program of studies of annual earnings and employment patterns was initiated in the 1960's to fill the gap in knowledge of annual wage and salary earnings from private nonagricultural employment. Coverage of hourly and weekly earnings data reported in other studies¹ cannot be converted to annual earnings estimates with any degree of precision because annual earnings are determined by the interaction of variables, such as straight-time rates of pay, number of hours worked, and hours worked at premium rates. These, in turn, depend on other variables such as occupation, union status, industry, and area. Moreover, some workers move into and out of the labor force during the year. In addition, a substantial portion works for more than one employer in the same industry and for one or more employers in different industries.

The first study in this series for 1964,² was limited to wage and salary earnings covered by social security. The second,³ for 1965, included data on wage and salary earnings covered under either the Social Security Act or the Railroad Retirement Act. This study, for 1966 and 1967, has the same scope as the 1965 study and contains the most recent available data.

The major statistical data in this bulletin have been divided into two sections. Tables A-1 to A-28 provide information for all private nonagricultural industries and each major (two digit) industry group. Instead of being treated in their usual combined form, transportation, communication, and public utilities are handled as separate divisions, as are wholesale and retail trade. Data have been tabulated by quarter years of employment, as well as by industry, race, sex, and geographical region. Separate data also show earnings in the worker's industry of greatest earnings combined with his earnings in other employment.

Tables B-1 to B-28 provide data for selected three-digit industry groups, and for purposes of ready reference, also provide totals for each division and for all private nonagricultural industries as a whole. Workers are counted in each industry in which they had any earnings. Consequently, employment data for three-digit industries (as defined in the Standard Industrial Classification Manual) do not add to the total for individual two-digit industry groups, and data at the two-digit level do not add to the total at the division level. Nevertheless, data for all major earners at any level of industry classification (e.g. division) do, except for rounding, add to the total for the private nonagricultural economy.

The data, though available only for white-collar and blue-collar workers combined, are unique because, unlike annual earnings data from other sources, they permit an analysis of the distribution of wage and salary earnings and employment patterns of workers by industry and quarters of employment. Attention is directed to explanations and definitions of differences in these methods given in the Technical Notes at the end of this bulletin.

Annual Earnings and Employment Patterns

Earnings

Total average annual earnings of workers in the private nonagricultural economy who were employed in four quarters of the year in their industry of major earnings in 1967 were \$6,256. (See table A-4.) However, the earnings were dispersed widely around the mean. The middle one-third of these workers earned \$4,000 to \$7,000. (See table A-14.) In 1965 the corresponding average earnings were \$5,733, and the middle one-third earned from \$3,700 to \$6,400. The median annual earnings of four-quarter workers increased from \$4,920 in 1965 to \$5,372 in 1967. (See table A-2.) Average annual earnings in the private nonagricultural sector, of workers employed in four quarters of the year in their industry of major earnings, were 9.1 percent higher in 1967 than in 1965. The greatest gains were in contract construction (13.3 percent) and services (12 percent). Other industry divisions with greater than average percentage gains were wholesale trade (9.2), utilities (10.8), transportation (10.7), and finance, insurance, and real estate (9.7). The remainder had gains which were below the overall: retail trade (8.6), mining (8.3), manufacturing (8.1), and communications (7.3).

During 1967 all workers, including those employed fewer than four quarters, averaged \$4,614, or one-fourth less than four-quarter workers. (See tables A-4 and A-8.) Earnings of one-third of the workers, who were employed in any quarter in their industry of major earnings, were less than \$1,800 in 1967; one-half earned less than \$3,700, one-fourth more than \$6,700, and 8.7 percent earned more than \$10,000. (See table A-10.)

The lowest levels of total average annual earnings of workers who worked during any quarter in their industry of major earnings in 1967 were reported by the retail trade (\$2,807) and services divisions (\$3,436), which together provided more than two-fifths of private nonagricultural employment. (See table A-18.) One-half of such workers in retail trade received less than \$1,629 in all employment in 1967, compared with \$1,525 in 1965, while one-half of those in services received \$2,203, compared with \$2,009 in 1965. (See table A-2.) These industry divisions also reported the lowest averages for workers who had earnings in all four quarters of

the year. (See tables A-1 and A-2.) Lowest average earnings from all employment of four quarter workers were made in private households (\$1,499) and in eating and drinking places (\$3,201). Average total earnings of workers in these industries who worked in any quarter were \$1,115 and \$1,670 respectively. (See table A-4.)

Of all workers in the private economy, 9 percent earned at least \$10,000 in 1967 compared with 6 percent in 1965. (See table A-10.) Industry divisions with a smaller than average proportion of workers who earned \$10,000 or more were retail trade (3 percent) and services (6 percent); the low level of wages reflected the high incidence of part-time and transient employment. The proportion of four-quarter workers at this earnings level in these, as in all industry divisions, was much higher: 6 percent in retail trades, 9 percent in services. (See tables A-10 and A-14.)

In the private nonagricultural sector, average annual earnings of black four-quarter workers as a percent of the earnings of whites increased by 2 percentage points, from 61.3 in 1965 to 63.3 in 1967. In every division but manufacturing the ratio increased by amounts which ranged from .5 percentage points in contract construction and in communications to 3.9 in services. The greatest gains in the earnings of blacks in relation to those of whites were made in the low-paid services division (3.9 percentage points), followed by retail trade (3.6), utilities (3.2), and wholesale trade (3.0). Gains in these divisions are especially significant in view of the large employment of black workers. Percentage increases in earnings of black workers were smaller in employment in any quarter than in four-quarters. However, the earnings ratio of blacks to whites for both four-quarter and any quarter work was higher in 1967 than in 1965.

In manufacturing the proportion of earnings of black workers to those of white workers dropped 2.1 percentage points from 1965 to 1967. Overall employment or earnings developments in the manufacturing division do not explain this drop. Employment in the division increased 9 percent from 1965 to 1967, compared with 8 percent in the private nonagricultural sector. Division earnings of four-quarter workers increased 8 percent, sector earnings 9 percent. Earnings of whites increased 9 percent, those of blacks 5 percent on the division level.

The drop of 7.7 percentage points in the relative earnings of blacks was greatest in the important motor vehicle industry which in 1967 employed 1.2 million workers. (See table B-4.) Large industry groups with significant percentage points drops included transportation equipment (6.5 points), apparel and textile (4.5 points), primary metals (3.5 points), nonelectrical machinery (3.2 points), electrical equipment (2.9 points), and chemicals (1.6 points). (See table A-4.) The transportation equipment group's development was unique, in that not only were earnings of blacks relative to earnings of whites lower in 1967 than 1965, but actual average earnings of black four quarter workers declined from an average of \$6,755 in 1965 to \$6,534 in 1967. (See table A-4.)

Table 1 shows that in the motor vehicle and equipment group, employment of white workers declined, but their average earnings increased; employment of blacks increased sharply, but their average earnings dropped considerably.

The increased employment of blacks, as well as the sharp drop in their average earnings, appears to be tied to the relatively high turnover in employment during the 1965-67 period, involving high percentage rates for hirings and rehiring, and layoffs and quits. In the aggregate blacks were more affected than whites, shown by the fluctuations in table 2.⁴

The decrease in average annual earnings of black workers in this industry appears to be due to a percentage increase of blacks in low level entry jobs and probably, also to a reduction in overtime pay. Overtime of all production workers in this industry dropped from a weekly average of 6.2 hours in 1965 to 4.9 in 1966, and 3.4 in 1967.⁵

Median-four-quarter earnings in 1967 for the private nonagricultural sector as a whole were highest in the

Table 2. Average employment and earnings of production workers in motor vehicles and equipment, 1965 and 1967

Year	Monthly Employment (in thousands)		Weekly Earnings	
	Low	High	Low	High
1965	560.4	696.4	\$136.45	\$156.18
1966	518.0	709.6	140.42	154.86
1967	534.0	686.8	133.86	158.98

North Central region, followed by the West, the North East, and the South. Again, the South ranked lowest among the industry divisions as shown in table 3.

Except in the South, the order of median earnings of industry divisions varied from that of the entire sector. In the West, which ranked second as a region, seven of the industry divisions ranked first, but in the North East and North Central regions fewer than half of the industry divisions were in the same order as the entire private nonagricultural sector.

Median annual earnings in the three highest regions were grouped between \$5,690 and \$6,032. The South trailed with \$4,452. (See table 3.) Among regions, the rank of median earnings of workers employed in any quarter in their industry of major earnings was reversed in the West and the Northeast.

As shown in table 4, median earnings for the entire private nonagricultural sector were 12 percent above the national level in the North Central and Western regions, 6 percent above in the Northeast, and 17 percent below in the South. Median earnings in the three major

Table 1. Employment and earnings of four-quarter workers in motor vehicles and equipment, by race, 1965 and 1967

Item	1965	1967	Percent change
Employment (in thousands)			
All workers	1,048	1,029	-1.8
Whites	931	897	-3.7
Blacks	117	132	+12.8
Earnings			
All workers	\$8,095	\$8,173	+1.0
Whites	8,215	8,382	+2.0
Blacks	7,104	6,607	-7.0

Table 3. Median annual earnings of four-quarter workers, ranked by industry division and region, 1967

Industry	Region			
	North East	South	North Central	West
All private nonagricultural industries	3	4	1	2
Mining	3	4	2	1
Contract construction	3	4	2	1
Manufacturing	3	4	2	1
Transportation	2	4	3	1
Communications ...	1	4	3	2
Utilities	3	4	2	1
Wholesale trade	2	4	3	1
Retail trade	2	4	3	1
Services	1	4	3	2

Table 4. Median earnings ratios of four-quarter workers by region, total sector, and three largest industry divisions, 1967

Industry	Region				
	United States	North-east	South	North Central	West
Total, private nonagricultural . . .	100	105.9	82.9	112.3	112.2
Manufacturing	100	99.2	79.6	108.0	109.8
Services	100	115.5	81.0	96.8	114.7
Retail trades	100	107.6	90.9	97.9	115.1

divisions in the West were 10 percent to 15 percent above the national division medians, while the division medians for the South were 9 percent to 20 percent below the national division medians. Between these extremes, in the Northeast the median for manufacturing was about the national division median, and the medians for services and retail trades were above the national division medians, while in the North Central region the median for manufacturing was above, and the medians for services and retail trades were below the national division medians.

The bottom rank of median four-quarter earnings in the manufacturing division in the South does not apply to all groups in the division. Workers in the South had higher earnings in ordnance and accessories industries than workers in the Northeast; in tobacco industries than those in the Northeast and the West, and in petroleum industries than those in the North Central region. (See table A-6.)

A comparison of the rate of change of the regional means with the national mean, for annual earnings of workers employed four quarters in their industry of major earnings in 1965 and 1967, shows increases of 0.9 percentage points in the Northeast and 1.3 in the South, and decreases of 1.4 in the North Central and 1.5 in the West regions. The increases were due chiefly to percentage point increases of 2.8 in services, 1.6 in retail

trade, and 1.0 in manufacturing in the South, and 1.6 in manufacturing in the Northeast, while decreases were due chiefly to percentage point declines of 3.1 in services, 2.8 in retail trade, and 1.2 in manufacturing in the West, and 1.8 in manufacturing in the North Central region.

From 1965 to 1967 a comparison of changes in the level of regional median annual earnings to national median earnings from all wage and salary employment in any quarter shows that the earnings position of workers in the South improved greatly, in the North Central region to a lesser degree, while in the Northeast it was unchanged, and in the West it decreased. (See table 5.)

The greatest change in the relationship occurred in retail trade in the North Central region, where median earnings increased from 84.3 percent of the national median in 1965 to 96.3 percent in 1967, and in services in the same region where the increase was from 88.5 percent to 99.8 percent.

Inequality of earnings distribution⁶

A comparison of the Gini ratios available at the present time for both 1966 and 1967 indicates that the earnings of workers who were employed in one, two, or three quarters were distributed more unequally than those of four-quarter workers. Therefore, in all industries for both years, the Gini ratios were markedly higher for any quarter workers than for four-quarter workers. Industry divisions with irregular employment, such as retail trade and services, generally had higher Gini ratios, while industries with regular, year-round employment, such as transportation and communications, had low Gini ratios.

Gini ratios also reveal considerable variation in the equality of the distribution of annual earnings by industry, region, sex, and race. Table 6 shows the distribution of wage and salary earners while chart 1 shows the Lorenz Curve formed by the distribution of these earnings, and the corresponding Gini ratio of .486461.

Table 5. Index changes in median earnings, by sector and selected industry division, 1965-67

Industry	1965				1967			
	North-east	South	North Central	West	North-east	South	North Central	West
Private nonagricultural	112.5	75.0	112.4	104.7	112.5	82.4	114.7	103.8
Manufacturing	96.4	75.2	112.8	111.5	100.8	79.1	116.2	112.0
Retail trade	117.7	87.5	84.3	112.2	112.9	93.1	96.3	107.9
Services	127.5	76.4	88.5	110.8	128.8	80.7	99.8	112.9

Table 6. Distribution of earners and earnings at estimated mean levels, 1966

Earnings	Cumulative percent	
	Earners	Earnings
Under \$600	16.2	1.1
Under \$1,200	25.7	3.0
Under \$1,800	33.1	4.2
Under \$2,400	39.1	7.0
Under \$3,000	45.1	10.7
Under \$3,600	50.9	15.0
Under \$4,200	56.4	19.9
Under \$4,800	61.6	25.2
Under \$5,400	66.6	31.0
Under \$6,000	71.2	36.9
Under \$6,600	75.6	43.2
Under \$7,200	80.5	50.9
Under \$7,800	83.9	56.7
Under \$8,400	86.8	62.0
Under \$9,000	89.5	67.3
Under \$9,600	91.6	71.8
Under \$10,200	93.1	75.1
Under \$10,800	94.4	78.2
Under \$11,400	95.4	80.7
Under \$12,000	96.1	82.6
\$12,000 and over	100.0	100.0

In the major industries and regions, Gini ratios in 1967 were much higher for white four-quarter workers than for black four-quarter workers, except in the North Central region. There was no discernible trend from 1966 to 1967 in the ratios for four-quarter black workers or for any quarter white workers. However, the inequality of the earnings' distribution for four-quarter white workers from 1966 to 1967 increased in all regions and major divisions but decreased for any quarter black workers in all these categories.

The wide range of Gini ratios is indicated by table 7 showing low and peak ratios for various categories of workers.

Upon request, the Bureau will furnish copies of Gini

tables of annual employment, by industry, single and multiple employer, quarters of work, region, sex, and race for 1966 and 1967. More detailed analysis will be undertaken for publication in future studies. As data become available for successive years, the analysis will include a search for longitudinal trends.

Increases, from 1965 to 1967, in the number of workers employed in the largest divisions, manufacturing, services, and retail trades in table 8, apply not only to major earners, but also to workers who had only some earnings in these divisions.

The percentage decrease in employment in mining was about the same for workers with major earnings as for those with only some earnings in the division; however, in contract construction the slight decrease in the number of major earners was accompanied by an increase in the number of workers who had some earnings in the division.

The proportion of workers in the private non-agricultural industries who had four quarters of employment decreased from 68.5 percent in 1965 to 67.6 percent in 1967. (See table A-22.) Only the contract construction division showed an increase of 1.7 percent to 65.3 percent in 1967. Decreases in the other divisions ranged from .6 percent in mining to 2.0 percent in finance, insurance, and real estate. Utilities (86.0 percent) and communications (80.2 percent) had the highest proportion of four-quarter workers in 1967. The one-third of the workers in the sector, who had fewer than four quarters of earnings in 1967, were divided about evenly among those who had earnings in one, two, and three quarters. The proportion of one-quarter workers did not change from 1965 to 1967; that of two-quarter and three-quarter workers increased .3 and .6 percentage points respectively.

Analysis of table A-20 reveals that the rate of increase in employment in the private nonagricultural sector from 1965 to 1967 was more than twice as high for women as for men, and higher for blacks than for

Table 8. Workers having major proportion of earnings in each industry division and percent change, 1965 and 1967¹

Industry division	1965 (Employees in thousands)	Percent of total	1967 (Employees in thousands)	Percent of total	Percent change, 1965-67
Private nonfarm	68,448	100.0	73,907	100.0	+8.0
Mining	725	1.1	713	1.0	-1.7
Contract construction	4,527	6.6	4,505	6.1	-.5
Manufacturing	22,046	32.2	23,995	32.4	+8.8
Transportation	3,138	4.6	3,247	4.4	+3.5
Communications	1,025	1.5	1,138	1.5	+11.0
Public utilities	762	1.1	789	1.1	+3.5
Wholesale trade	4,312	6.3	4,594	6.2	+6.5
Retail trade	13,337	19.5	14,090	19.1	+5.6
Finance, insurance and real estate	3,659	5.3	3,936	5.3	+7.6
Services	14,919	21.8	16,901	22.9	+13.3

¹ Although the numbers of workers differ from those in *Employment and Earnings—United States, 1909-71*, BLS Bulletin 1312-8, the percentage changes generally agree with those for the sector and the industry divisions from the Employment and Earnings data.

whites. Percentage increases for workers who had some earnings were:

All private nonagricultural workers	7.6
Men	5.5
Whites	5.2
Blacks	8.4
Women	12.0
Whites	11.5
Blacks	15.9

Black women in manufacturing scored the greatest employment gains: 182,000, or nearly 30 percent.

Although this impressive percentage gain was distributed fairly evenly among the major industries in this division, the participation rate of black women in manufacturing employment was still low after the rise from 2.5 percent in 1965 to 2.9 percent in 1967. Black men in retail trade had the lowest rate of increase among the three divisions with 1.1 percent, but their relative position at 5.9 percent of total employment in the division was nearly twice as high as the ratio of black women to total employment. Percentage gains of the race-sex groups of 12.0 percent to 16.7 percent in services were the least dispersed among the three major divisions. (See table 9.)

Table 9. Employment increases in selected industry divisions, by sex and race, 1965 and 1967

Sex and race	Manufacturing		Retail Trade		Services	
	Number (employees in thousands)	Percent	Number (employees in thousands)	Percent	Number (employees in thousands)	Percent
Men	1,329	7.6	485	5.1	1,047	12.7
Whites	1,026	6.5	473	5.5	847	12.0
Blacks	303	17.7	12	1.1	200	16.7
Women	1,021	14.2	786	10.4	1,540	15.4
Whites	839	12.8	692	10.0	1,303	15.9
Blacks	182	29.9	94	15.8	237	13.0

From 1965 to 1967, employment of women increased 12 percent, compared with 5.5 percent for men. In manufacturing and retail trade, as in the entire private nonagricultural sector, the percentage increase in the employment of women was twice that of men. In services, the increase for women was only a fourth more than that of men.

In the distribution of four-quarter employment in the United States in 1967 by region, the North Central region has 30.0 percent, the Northeast 27.8 percent, the South 26.8 percent, and the West 14.7 percent. Some major deviations from the general pattern occur in various industry divisions and groups, as shown in table 10. A fifth region, called "Others," has been added to the four major regions to cover employment distribution in U.S. territories, on foreign soil, and aboard ocean-going vessels.

In the Northeast, mining employment was much underrepresented on the division level, but the region provided all of the employment in the anthracite coal industry. The South, on the other hand, provided more than one-half of the total employment in mining, because it had three-fifths of employment in bituminous coal, seven-tenths in gas and oil extraction, and almost two-fifth in nonmetallic minerals. The South also provided three-fourths of all employment in the tobacco industries, two-thirds in textile manufacturing, and nearly one-half of the national employment in private households.

The Northeast provided more than one-half of the total employment in leather industries, instruments, and miscellaneous manufacturing groups. The North Central region furnished nearly one-half of all employment in the fabricated metal and transportation equipment

industries, as well as one-half in the machinery industries. This region was credited with having almost one-half of total employment in transportation, chiefly because all railroad employment is treated as existing in the region. The West gave employment to more than one-half of all workers in the ordnance and accessories industries, nearly one-half in mining, one-third in the lumber and wood products industries, and one-third in the motion picture industry.

The percentage share of the regions in private nonagricultural employment changed slightly from 1965 to 1967, as follows:

Northeast	-.4 percentage points
South	+.4 percentage points
North Central	-.1 percentage point
West	+.1 percentage point
Other	no change

Major changes occurred in the tobacco industries, where the share in employment decreased 2.9 percentage points in the Northeast, and increased 4.1 percentage points in the South. Employment of security brokers—involving 33 percent more persons than the tobacco industry—shifted to the Northeast, which had an increase of 3.0 percentage points at the expense of the West and the North Central regions. The number of workers involved in regional employment from 1965 to 1967 changed in percentage points as follows:

	<i>North- east</i>	<i>South</i>	<i>North Central</i>	<i>West</i>
Manufacturing	-.6	--	-.4	+.5
Retail trade	-.6	+.1	+.5	--
Services	-.8	+.3	+.3	+.1

Table 10. Distribution of four-quarter employment, by selected industry division or group and region, 1967

Industry Division, group or industry	Regions					
	United States	Northeast	South	North Central	West	Others ¹
Private nonagricultural industries	100	27.8	26.8	30.0	14.7	.7
Mining	100	10.9	52.6	17.7	18.0	.8
Construction	100	21.4	35.6	26.0	16.0	1.0
Tobacco	100	15.1	74.4	2.0	.9	7.6
Textiles	100	26.8	68.0	3.0	1.5	.7
Leather	100	53.8	17.1	22.5	3.5	3.1
Machines—nonelectric	100	29.8	11.3	50.1	8.6	.2
Security brokers	100	56.8	13.3	17.0	12.8	.1
Private household	100	23.8	47.2	16.8	11.4	.8
Water transportation	100	25.4	23.4	6.7	15.8	28.7
Motion pictures	100	31.1	20.1	15.4	32.9	.5

¹ Although the "Others" region constitutes only .7 percent of total sector employment, it amounts to 28.7 percent in water transportation, 7.6 percent in tobacco, and 3.1 percent in leather manufacturing.

In summary, both overall annual median earnings and employment in the private nonagricultural sector increased about 8 percent from 1965 to 1967. More precisely, median annual earnings of all workers employed in the private nonagricultural sector in 1967 were 7.7 percent higher than in 1965. Among these workers 9 percent earned at least \$10,000 in 1967, compared with 6 percent in 1965. Median annual earnings of black workers employed in all four-quarters,

as a percent of the earnings of whites, rose from 63.7 in 1965 to 64.9 in 1967.

Overall employment in the private nonagricultural sector increased 8.0 percent from 1965 to 1967. The rate of increase in employment was twice as high for women as for men. Black workers made gains in employment of 11.4 percent, compared with 7.6 percent for white workers. The rate of increase for black women was 15.9 percent, that for black men, 8.4 percent.

Technical Note

Sources of data

Data for this study were developed by the Bureau of Labor Statistics from the individual employer and employee records maintained by the Social Security Administration and the Railroad Retirement Board. Under social security, each employer reports the industry, place of employment, and amount of wages or salary paid during a calendar quarter to the maximum annual limit of \$6,600 in 1966 and 1967. Each applicant furnishes demographic information (date of birth, sex, and race) for a social security number. Under the Railroad Retirement system, each employer reports the occupation and monthly earnings of each worker to a maximum limit of \$550 in 1966 and 1967.

Estimation of Earnings

As actual earnings of employees may be substantially greater than the "taxable limit" earnings reportable under the Social Security Act (\$6,600 annually in 1966 and 1967) and the Railroad Retirement Act (\$550 a month in 1966 and 1967), the Social Security Administration (SSA) and the Railroad Retirement Board have devised procedures for estimating the total earnings of covered employees. These estimated total quarterly and annual earnings are used in this report.

The SSA in its procedure determines the quarter in which the taxable limit is reached ("limit quarter"). If wages in the prior quarter are equal to or greater than the "limit quarter" wages, they are substituted for those in the "limit quarter" and in all subsequent quarters. Limit quarter earnings, however, are used to estimate earnings in the limit and subsequent quarters, if limit quarter earnings were higher than earnings in previous quarters. After these substitutions, the sum of the quarterly wages becomes the estimated annual total unless the taxable limit is reached in the first quarter. Then \$42,000 for men and \$33,000 for women was used by the Social Security Administration as the estimated total for 1966 and 1967.

Employers covered by the Railroad Retirement Act are required to provide information about the monthly earnings of each employee up to the maximum credit-

able limit subject to Railroad Retirement Act taxes. Hence, even earnings reported at the maximum level for each month may be substantially lower than total earnings. The Railroad Retirement Board, however, collects information from employer records about the total annual earnings of a sample of workers covered by the act. To raise creditable compensation to total railroad earnings, total earnings data for individuals collected in the special study are compared with the aggregated monthly earnings data for the same individuals. The incremental factors for workers in the same broad occupational categories are then averaged. The resulting factors, developed by the Railroad Retirement Board, are applied by the Bureau of Labor Statistics to the credited monthly earnings of each individual in this study according to his occupational category.

Definition of terms and method of classification

Terms used in this report and the methods used to classify employees by industry and region of major earnings are described briefly below.

Annual earnings. For this study, annual earnings are defined as gross wages, salaries, and other payments (such as bonuses) received by employees, before deductions of any type, in employment covered under the Social Security Act or the Railroad Retirement Act. Such payments may be received in cash, cash equivalents, or goods or services.

Earnings and employment data, for work covered under the Acts, in agriculture, governmental functions, military service, and self-employment, as well as for work not covered, have been excluded from this study. Also excluded from earnings are most payments made by employers to or on behalf of employees, or for employees and their dependents for retirement, death, sickness, accidental disability, or medical and hospitalization expense under the provisions of a plan or system meeting certain general criteria, and employer payments to a trust fund, such as a pension trust, exempt from tax under the Internal Revenue Code.

Workers with some earnings in the industry. All workers who had at least \$1 in earnings in an industry during the

year are counted in each industry in which they had any earnings. For example, a worker who had some earnings in each of five three-digit industries, as defined in the *Standard Industrial Classification Manual*, is counted in each of these industries as well as in each two-digit industry and in each division of which the three-digit industries are a part. Because a worker is counted in each three-digit industry, each two-digit industry, and in each division in which he had \$1 in covered wage and salary earnings or more, the aggregate count of workers at each level (three-digit, two-digit, or division) is greater than the total number at each broader industry level (two-digit, division, private nonagricultural economy).

Industry of major earnings

The industry of major earnings, in this study, is the industry in which a worker earned more of his annual wages and salary than in any other industry. As many workers have earnings in several industry divisions or at several levels of one industry group, determination of a worker's industry of major earnings involves a plurality earnings test which is applied separately to earnings at each industry level.

The employment and quarterly earnings pattern of a hypothetical worker who shifts employment several times a year is illustrated in table 11.

In table 11 the worker had greater earnings at the three-digit level in industry 412 than in any other three-digit industry; at the two-digit level he had greater earnings in industry 53 than in either 41, 61, or 63, and at the division level he earned more in division G than in either E or F. Therefore, applying the plurality earnings

concept, this worker's industry of major earnings was industry group 412 at the three-digit level, major industry group 53 at the two-digit level, and G at the industry division level.

Quarters of work. For social security coverage, a quarter of work is defined as a calendar quarter in which a worker earned any pay in covered employment; household workers must earn at least \$50. Workers who reach their maximum taxable earnings limits in a single employment before the fourth quarter of the year are considered to have worked in each quarter, although earnings above the maximum are not reported.

Employer. An employer is defined here as an individual, partnership, or corporation recognized as a separate legal entity meeting certain criteria. However, since a firm may incorporate separately each of its locations and each corporation may be considered to be a separate employer, a worker transferred by his firm from one location to another that is separately incorporated may be classified as having more than one employer in the same year even though he continued to work for the same firm.

Industrial classification. The employment and earnings data presented in this report, which are based on the Social Security Administration's (SSA) data file, are classified according to the Administration's industrial classification system, which differs slightly from that developed by the U.S. Bureau of the Budget and published in the *Standard Industrial Classification Manual*, 1967 (SIC), and employed in most other

Table 11. Hypothetical worker's employment and earnings by industry and quarters

Industry	Quarters					
	No.	Total	1st	2d	3d	4th
Private nonagricultural economy	-----	\$2,650	\$400	\$650	\$750	\$850
Division	E	750	-----	300	450	-----
2-digit group	41	750	-----	300	450	-----
3-digit group	412	750	-----	300	450	-----
Division	F	900	300	250	-----	350
2-digit group	53	900	300	250	-----	350
3-digit group	531	650	50	250	-----	350
3-digit group	533	250	250	-----	-----	-----
Division	G	1,000	100	100	300	500
2-digit group	61	500	100	100	300	-----
3-digit group	612	500	100	100	300	-----
2-digit group	63	500	-----	-----	-----	500
3-digit group	633	500	-----	-----	-----	500

statistical series. The major difference is in the assignment of industry codes to nonpolicymaking governmental units. All separable nonpolicymaking units are assigned nongovernmental SSA industry classifications appropriate to their activity. Employment and earnings data presented in this report which are based on the Railroad Retirement Board's data file are classified into the following industries as defined in the *SIC Manual*: Railroads, SIC 401; sleeping car companies, SIC 402; express companies, SIC 404; rental of rail cars companies, SIC 474; and other companies performing services in railroad transportation and certain railway labor organizations, SIC 861 and 863. A worker is assigned on the basis of the industrial classification of his last employer under the Railroad Retirement Act.

Single and multi-industry workers. At each level of industry classification (i.e., three-digit, two-digit, and division) the employment experience of each sample member was examined to see if all of his earnings during the year were in one industry or in more than one industry. Those with earnings in more than one industry were classified as multi-industry workers. This conceptual approach may be seen for a worker who was employed by an employer in each of two three-digit industries within the same two-digit industry. At the three-digit level, the worker is classified as a multi-industry worker. However, at the two-digit and at the divisional level he is classified as a single industry worker. This classification is assigned because both three-digit industries in which he was employed are part of the same two-digit industry and therefore, he worked in only one industry division.

Regions. In this study, the United States and other areas are divided into five regions. Four regions covering the 50 States and the District of Columbia are: *Northeast*—Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont; *South*—Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia; *North Central*—Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin; and *West*—Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming. The fifth region includes all employment covered under the provisions of the acts in U.S. territories, on foreign soil, or aboard ocean-going vessels.

Because the data file for this study does not indicate the location of the work covered by the Railroad Retirement Act, a convention was adopted ascribing all employment covered under the Railroad Retirement Act

to the North Central region where many railroads and related organizations have headquarters.

Race. All workers in this study have been divided into two groups by race: "white" and "black." The white category includes all workers, except Negroes. Other non-white minorities, for whom the sample was not large enough to permit separate presentation of data, have been assigned to the white category; this minimizes their effect in the distribution of data by race.

Median annual earnings in this study were computed from data grouped into \$250 intervals. Minor differences in medians for the same grouping of workers as shown on different tables result from rounding and from minor differences among the methods of entering the data at various stages of processing into the computer file.

Average (mean) annual earnings were computed by summing the earnings of each worker in the entire distribution and dividing the sum by the number of workers in the distribution.

The Gini Index of Concentration is used in this report to measure inequality in the distribution of income. The Gini Index expresses the ratio of the area between a Lorenz curve and the "line of equality" to the area of the triangle as shown in chart 1. The X-axis shows the cumulative percent distribution of wage and salary earners; the Y-axis shows the cumulative percent of earnings. The diagonal line of equality (A-B) represents a Lorenz curve on which all units have exactly the same earnings. The Gini Index of Concentration therefore is the ratio of the total area formed by the Lorenz Curve and the diagonal line of equality to the area of the triangle formed by the X and Y-axis and the diagonal line of equality. Thus, the lower the Gini Index number, the more equal the distribution, and vice versa.

Sample design

The sample used for this series of studies was selected on the basis of a multistage systematic cluster sampling procedure. It includes 1 percent of all social security numbers. Any individual, once selected, remains permanently in the sample and is identified by his social security number.⁷ To preserve confidentiality and facilitate statistical processing, the Social Security Administration combines data from various employments and assigns each individual and employer a permanent control number, different from his social security and employee identification numbers.

Sampling variability⁸

Estimates based on samples can be expected to differ because of sampling variability from figures that would

have been obtained had all rather than specified samples of the records been used for the compilations. The standard error is a measure of sampling variability. The chances are about 68 out of 100 that the difference due to sampling variability between a sample estimate and the figure that would have been obtained from a compilation of all records is less than the standard error. The chances are 95 out of 100 that the difference is less than twice the standard error and about 99 out of 100 that it is less than $2\frac{1}{2}$ times the standard error. The standard error of an estimate depends on the sample design elements such as the method of sampling, the sample size, and on the estimation process.

No exact calculation of standard errors of estimates based on the stratified cluster continuous work history samples has been carried out. However, approximate standard errors of estimates utilizing the assumption of simple random sampling are likely to be reasonably close to those for the actual sample design used for many attribute statistics. While the actual method of selection (stratified cluster sampling) differs from simple random sampling, there is evidence that, for most statistics, the several factors affecting the sampling variability give a joint factor close to unity relative to the sampling variability of simple random sampling.

Sampling variability of estimated number of persons.—For the convenience of the reader, table 12 provides approximate estimates of sampling variability (95 percent confidence level) for estimates of the

Table 12. Rough approximation of sampling variability of estimated number of persons

(Range of 95 chances out of 100)	
500	500
800	600
1,000	700
3,000	1,100
5,000	1,400
8,000	1,800
10,000	2,000
30,000	3,300
50,000	4,500
80,000	5,600
100,000	6,300
300,000	10,800
500,000	14,000
800,000	17,600
1,000,000	20,000
3,000,000	33,000
5,000,000	44,500
8,000,000	55,500
10,000,000	63,000
30,000,000	108,000
50,000,000	110,000
80,000,000	112,000
100,000,000	115,000

number of persons with given characteristics. The estimates and approximate sampling variability shown are for data which have been inflated by 100. Linear interpolation may be used for estimated numbers not shown in the table.

Sampling variability of estimated percentage of persons.—The reliability of an estimated percentage depends on both the size of the percentage and on the size of the total upon which the percentage is based. Table 13 shows the approximate sampling variability (95 percent confidence level) for percentages (of persons with a given characteristic). The body of the table is expressed in percentage points. The bases shown are expressed in terms of data inflated by 100. Linear interpolation may be used for percentages and base figures not shown in table 13.

Sampling variability of estimated mean earnings.—A rough approximation to the standard error of an estimated mean can be calculated from the distribution from which it was obtained. The formula can be found in elementary statistics texts (for example, p. 218, *Applied General Statistics*, by Croxton and Cowden, Prentice Hall, 2nd Ed. 1955).

Nonsampling variability

Because of the nature of the OASDHI program and the manner in which it is administered, certain aspects of the program lead to variability that would be present in a complete compilation of records as well as in a sample. For example, the data relate to covered employment rather than people (minimized by use of precise definition); changes in earnings records may not be reflected promptly because of time-lag in posting and processing cutoff date, and errors in classification and compilation.

Table 13. Rough approximation to sampling variability of estimated percentages

Base of percentage (inflated sample)	Range of 95 chances out of 100				
	Estimated percentage				
	2 or 98	5 or 95	10 or 90	25 or 75	50
500	12.5	19.5	26.8	38.7	44.7
1,000	8.9	13.8	19.0	27.4	31.6
5,000	4.0	6.2	8.5	12.2	14.1
10,000	2.8	4.4	5.9	8.8	10.0
100,000	.9	1.4	1.9	2.7	3.1
1,000,000	.3	.5	.6	.9	1.0
10,000,000	.1	.2	.2	.3	.3
100,000,000	(1)	.1	.1	.1	.1

¹ Less than 0.05.

These problems are byproducts of the administrative processes and the errors introduced are probably negligible.

In this context, the factors contributing to the nonsampling variability are: (1) the scope of covered employment; (2) duplication in the estimation of workers because of persons receiving wage credits from different employers on more than one account number; (3) the extent to which covered earnings are reported, taxed, and credited; and (4) the distribution of workers and aggregate wages above the maximum earnings base.

Relation to other studies. Data presented in this bulletin have been developed, as previously described, from information reported by employers about the earnings of individuals up to an earnings limit and estimates of earnings higher than this limit. Although annual earnings and employment data are available in the *Current*

Population Reports of the Bureau of the Census, they are based on a different concept of industry attachment (i.e. industry of longest job, rather than industry of major earnings, as used in the AEE system), and provide only for the industry division data, while AEE data cover industry divisions, major two-digit SIC groups, and the most important three-digit groups. Moreover, other differences in methods or approach may result in important differences in sampling and nonsampling variances between this and other studies. For example, CPS data are based on household interviews, whereas the AEE data are based on employer tax returns. Furthermore, CPS 1967 data are not comparable with data for prior years because of changes in methodology in the CPS. Therefore, caution must be exercised in using the data presented in this bulletin in conjunction with other annual earnings and employment patterns data.

¹ For purposes of this study, and because information about their actual place of employment was not available in the files studied, employees of railroads and railroad related organizations covered by the Railroad Retirement Act were considered to have been employed in the North Central Region.

NOTE: A dash (-) indicates either the sample did not include any workers with these characteristics, or that the data did not meet the Bureau's publication criteria.

¹ For purposes of this study, and because information about their actual place of employment was not available in the files studied, employees of railroads and railroad related organizations covered by the Railroad Retirement Act were considered to have been employed in the North Central Region.

NOTE: A dash (-) indicates either the sample did not include any workers with these characteristics, or that the data did not meet the Bureau's publication criteria.

¹ Workers who had some earnings in more than 1 industry group and in more than 1 industry division, are included in the count of those with some earnings in each such industry group and division. Thus, some workers are counted more than once and, therefore, detail does not add to total.

² The number of workers who received the major proportion of their earnings in each industry group is an unduplicated count of workers, as is the count of major earners at the divisional level. Therefore, detail by industry group and detail by division do (except for rounding) equal the total for the private nonagricultural economy. However, because the test used to assign workers to an industry is applied independently at each level of industry classification (e.g., industry group or division) the number of workers in the major industry groups that comprise a division may not equal the total for the division.

³ Less than 0.05 percent.

¹ Workers who had some earnings in more than 1 industry group and in more than 1 industry division, are included in the count of those with some earnings in each such industry group and division. Thus, some workers are counted more than once and, therefore, detail does not add to total.

² The number of workers who received the major proportion of their earnings in each industry group is an unduplicated count of workers, as is the count of major earners at the divisional level. Therefore, detail by industry group and detail by division do (except for rounding) equal the total for the private nonagricultural economy. However, because the test used to assign workers to an industry is applied independently at each level of industry classification (e.g., industry group or division) the number of workers in the major industry groups that comprise a division may not equal the total for the division.

³ Includes workers of all races other than Negro.

NOTE: A dash (-) indicates either the sample did not include any workers with these characteristics, or that the data did not meet the Bureau's publication criteria.

¹ Workers who had some earnings in more than 1 industry group and in more than 1 industry division, are included in the count of those with some earnings in each such industry group and division. Thus, some workers are counted more than once and, therefore, detail does not add to total.

² The number of workers who received the major proportion of their earnings in each industry group is an unduplicated count of workers, as is the count of major earners at the divisional level. Therefore, detail by industry group and detail by division do (except for rounding) equal the total for the private nonagricultural economy. However, because the test used to assign workers to an industry is applied independently at each level of industry classification (e.g., industry group or division) the number of workers in the major industry groups that comprise a division may not equal the total for the division.

³ Includes workers of all races other than Negro.

NOTE: A dash(-) indicates either the sample did not include any workers with these characteristics, or that the data did not meet the Bureau's publication criteria.

¹ For purposes of this study, and because information about their actual place of employment was not available in the files studied, employees of railroads and railroad related organizations covered by the Railroad Retirement Act were considered to have been employed in the North Central Region.

NOTE: A dash (-) indicates either the sample did not include any workers with these characteristics, or that the data did not meet the Bureau's publication criteria.

¹ For purposes of this study, and because information about their actual place of employment was not available in the files studied, employees of railroads and railroad related organizations covered by the Railroad Retirement Act were considered to have been employed in the North Central Region.

NOTE: A dash (-) indicates either the sample did not include any workers with these characteristics, or that the data did not meet the Bureau's publication criteria.

Table B-7. Average annual earnings from all wage and salary employment of workers employed in any quarter and in four quarters by industry and region of major earnings, 1966

¹ For purposes of this study, and because information about their actual place of employment was not available in the files studied, employees of railroads and railroad related organizations covered by the Railroad Retirement Act were considered to have been employed in the North Central Region.

NOTE: A dash (-) indicates either the sample did not include any workers with these characteristics, or that the data did not meet the Bureau's publication criteria.

Table B-8. Average annual earnings from all wage and salary employment of workers employed in any quarter and in four quarters by industry and region of major earnings, 1967

¹ For purposes of this study, and because information about their actual place of employment was not available in the files studied, employees of railroads and railroad related organizations covered by the Railroad Retirement Act were considered to have been employed in the North Central Region.

NOTE: A dash (-) indicates either the sample did not include any workers with these characteristics, or that the data did not meet the Bureau's publication criteria.

Table B-9. Distribution of workers by annual earnings from all wage and salary employment by industry of major earnings, 1966

¹ Workers who had some earnings in more than 1 industry group and in more than 1 industry division, are included in the count of those with some earnings in each such industry group and division. Thus, some workers are counted more than once and, therefore, detail does not add to total.

² The number of workers who received the major proportion of their earnings in each industry group is an unduplicated count of workers, as is the count of major earners at the divisional level. Therefore, detail by industry group and detail by division do (except for rounding) equal the total for the private nonagricultural economy. However, because the test used to assign workers to an industry is applied independently at each level of industry classification (e.g., industry group or division) the number of workers in the major industry groups that comprise a division may not equal the total for the division.

¹ Workers who had some earnings in more than 1 industry group and in more than 1 industry division, are included in the count of those with some earnings in each such industry group and division. Thus, some workers are counted more than once and, therefore, detail does not add to total.

² The number of workers who received the major proportion of their earnings in each industry group is an unduplicated count of workers, as is the count of major earners at the divisional level. Therefore, detail by industry group and detail by division do (except for rounding) equal the total for the private nonagricultural economy. However, because the test used to assign workers to an industry is applied independently at each level of industry classification (e.g., industry group or division) the number of workers in the major industry groups that comprise a division may not equal the total for the division.

¹ Workers who had some earnings in more than 1 industry group and in more than 1 industry division, are included in the count of those with some earnings in each such industry group and division. Thus, some workers are counted more than once and, therefore, detail does not add to total.

² The number of workers who received the major proportion of their earnings in each industry group is an unduplicated count of workers, as is the count of major earners at the divisional level. Therefore, detail by industry group and detail by division do (except for rounding) equal the total for the private nonagricultural economy. However, because the test used to assign workers to an industry is applied independently at each level of industry classification (e.g., industry group or division) the number of workers in the major industry groups that comprise a division may not equal the total for the division.

NOTE: A dash (-) indicates either the sample did not include any workers with these characteristics, or that the data did not meet the Bureau's publication criteria.

¹ For purposes of this study, and because information about their actual place of employment was not available in the files studied, employees of railroads and railroad related organizations covered by the Railroad Retirement Act were considered to have been employed in the North Central Region.

NOTE: A dash (-) indicates either the sample did not include any workers with these characteristics, or that the data did not meet the Bureau's publication criteria.

¹ For purposes of this study, and because information about their actual place of employment was not available in the files studied, employees of railroads and railroad related organizations covered by the Railroad Retirement Act were considered to have been employed in the North Central Region.

NOTE: A dash (-) indicates either the sample did not include any workers with these characteristics, or that the data did not meet the Bureau's publication criteria.
