Preface

This bulletin presents in tabular form data on a key statistical series of the Bureau of Labor Statistics, the Hourly Earnings Index. The series was first published in 1971 and has attracted wide attention as being the best available measure of wage-rate change. Data in current dollars are presented in tables 1 through 12, covering the private nonfarm economy and various industrial sectors. Data in constant (1967) dollars are presented for the private nonfarm economy in table 13.

This bulletin was prepared in the Bureau's Division of Trends in Employee Compensation by Charles R. Heflin.

13. Private nonfarm economy (1967 dollars), 1964--August 1975	31
Appendixes:	
A. Industry weights used to construct the Hourly Earnings Index	33
B. Method of index construction for manufacturing sector for period before 1964	39

Introduction

This bulletin presents historical data for one of the Bureau's key economic indicators, the Hourly Earnings Index. This series, which was first published in 1971, is derived from basic hourly earnings data that are developed from payroll information supplied by a representative panel of industrial and commercial establishments to State agencies participating in the Current Employment Statistics Program.¹ In computing the Hourly Earnings Index, basic average hourly earnings are adjusted to exclude the effects of two types of changes that are unrelated to underlying wage-rate developments: Fluctuations in overtime premiums in manufacturing (the only sector for which overtime data are available) and the effects of changes in the proportion of workers in high-wage and low-wage industries. In addition, seasonal adjustment factors are applied to eliminate the effect of changes that normally occur at the same time and in about the same magnitude each year. After these adjustments are made, the index more closely reflects underlying wage-rate movements than do other available monthly measures.

The Hourly Earnings Index has the advantage of being both timely and comprehensive in industry detail. However, it also has certain shortcomings. For example, the index provides no occupational or regional detail; it is not adjusted for the influence of overtime premium pay in the nonmanufacturing sector, which encompasses two-thirds of the employment; it is restricted to the earnings of production and nonsupervisory employees in the private nonfarm economy; and wage supplements, obviously, are excluded. Furthermore, although employment shifts among 3-digit industries² are eliminated, shifts within these groups (i.e., at the 4-digit level) affect the data as do employment shifts within establishments.

The index is constructed by weighting the average hourly earnings in each industry (essentially at the 3-

digit level of detail) by the hours paid for in that industry in 1967. (Appendix A presents the industry weights used to construct the index.) The weighted average for a given month is then compared with the average for 1967.

Data are available monthly starting with January 1964 in both current and deflated (1967) dollars for the private nonfarm economy and for seven broad industry divisions: mining; contract construction; manufacturing; transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services. (Subcategories under manufacturing include indexes for durable and nondurable goods, and indexes are also presented for the wholesale trade and retail trade industries separately.) For the manufacturing sector as a whole, monthly data are available back to 1947; for its subdivisions, back to 1959. (See appendix B for methodology for these earlier years.)

Data are published in a variety of periodicals, including *Current Wage Developments* and the *Monthly Labor Review*. Initial presentation appears in the Bureau's monthly release entitled, *The Employment Situation*.

The following tables present unadjusted monthly data and annual averages, seasonal factors, seasonally adjusted data, and quarterly averages of the seasonally adjusted data. In addition, annual rates of change for the various series are presented from the previous quarter, from the same quarter a year earlier, from 6 months earlier, and 12 months earlier.

¹ Current hourly earnings data, in available industry detail, are published in the Bureau's monthly report, *Employment and Earnings*. Historical data will appear in *Employment and Earnings, United States, 1909-75*, Bulletin 1312-10, 1976. (Bureau of Labor Statistics.)

² As defined in the *Standard Industrial Classification Manual*.

Caution

Periodically, the Bureau adjusts its industry employment series to a recent benchmark to improve its accuracy. These adjustments may affect basic hourly earnings data because employment levels are used as weights. Therefore, the Hourly Earnings Index data for periods after March 1974, the present benchmark date, are subject to revision. In future editions of the present publication, the series will be adjusted to new benchmark levels.

In addition, seasonally adjusted data for the period beginning in 1971 are subject to revision after annual recomputations of seasonal adjustment factors.

NOTE: SIC 99, nonclassifiable establishments, excluded because of lack of data.

Appendix B. Method of Index Construction for Manufacturing Sector for Period Before 1964

These indexes for 1959 through 1963 were compiled by assigning constant weights, based upon 1966 production employment, to the earnings figures for these workers excluding overtime premium pay for each (3-digit SIC) industry. Industry classification was based on the 1967 *Standard Industrial Classification Manual*. Data were not available for all 3-digit industries before 1959. Hence, indexes for earlier years were compiled by assigning constant (hours) weights to the earnings figures excluding overtime premium pay for each major industry (2-digit SIC)

group, except for two industry groups (transportation equipment and electrical machinery). These two groups had separate constant weights assigned in several important 3-digit SIC industries. These indexes exclude the effects of shifts among major (2-digit level) industry groups, but are affected by any shifts among industries within these groups. Industry classification was based on the 1945 *Standard Industrial Classification Manual* and the weights were average 1954 production hours.

**A Looseleaf Directory and Factbook
on Union and Employee Association
Membership and Structure from the
Bureau of Labor Statistics**

Directory of National Unions and Employee Associations 1973

New, loose-leaf format ensures up-to-date information on listed unions and associations. Subscribers receive the basic volume and three complete revisions of the listing section during the two-year interval between Directories.

*Directory lists names, addresses of:
National and international unions
State labor organizations
Professional and public employee associations,
their officers and key officials, publications, information about their conventions, membership, and number of locals.*

Factbook section of the publication includes a report on developments in the labor movement, 1971-73, and facts about the structure of the labor movement. Information about the level, trend, and composition of membership is supplied by the participating organizations. Extensive statistical appendixes.

Please enter my subscription to the *Directory of National Unions and Employee Associations, 1973*, Catalog Number L 2.2:Un 33/9/973, @ \$4.45. Price is set by the Government Printing Office, an agency of the U.S. Congress. Additional fee required for mailing to most foreign addresses will be furnished upon request. Allow approximately six weeks for arrival of basic volume.
