Preface

This bulletin presents statistics on annual earnings and employment in the United States in 1971 and 1972. The Bureau of Labor Statistics developed the data from a 1-percent random sample of the records of the Social Security Administration and the Railroad Retirement Board. The data provide a more accurate picture of annual earnings and employment patterns by industry than is available from any other source. The data are the latest available from the Social Security Administration and provide historical continuity with the other published data in the series.

Previous BLS bulletins in this series were published for the years 1964, 1965, 1966-67, and 1970. A summary report for 1971 was issued in October 1975 and for 1972 in August 1976. Data for 1968-69 have not been published but are being stored by BLS and will be available for future processing and time series analysis.

The bulletin was prepared in the Bureau's Division of General Compensation Structures by Melvin Eggleston, under the general direction of Alvin Bauman.

Material in this publication is in the public domain and may be reproduced without the permission of the Federal Government. Please credit the Bureau of Labor Statistics and cite the name and number of the publication.

Introduction

The Bureau initiated a new program of data collection in the 1960's to fill a gap in knowledge concerning annual earnings of private nonagricultural employees by industry.[1] Hourly and weekly earnings data reported in other studies cannot be converted to annual earnings estimates with any degree of precision because annual earnings are determined by the interaction of variables such as straight-time rates of pay, number of hours worked, and hours worked at premium rates. These, in turn, depend on other variables such as occupation, union status, industry, and area. Moreover, some workers move into and out of the labor force during the year. In addition, a substantial portion work for more than one employer in the same industry or for one or more employers in different industries.

The first study in this series covered 1964, and was limited to wage and salary earnings subject to social security taxation only. Subsequent studies included data on wage and salary earnings covered under either the Social Security Act or the Railroad Retirement Act. The 1971-72 study continues this extended earnings coverage and in addition presents much more industry detail than was previously given. The reference tables contain industry information on means, medians, and frequency distributions of the annual earnings of wage and salary earners by selected worker characteristics. These include race, sex, age, region, industry of major earnings, and the number of quarters worked during the year. Earnings and employment data are provided by industry division, by 2-digit Standard Industrial Classification (SIC) industry groups,[2] and by most 3-digit SIC industries. Two types of earnings information were tabulated for each worker: Earnings in the industry of major earnings during a given year, and total earnings, regardless of industry, in that year. The A tables provide data for 1971; the B tables, 1972.

The data are unique because, unlike annual earnings data from other sources, they permit an analysis of the distribution of wage and salary earnings and employment patterns of workers by industry and quarters of employment. If an interdepartmental effort to obtain data on the occupational group of individual workers in the social security sample is successful, data in this series will take on an added dimension and be even more useful.

The technical notes following the analysis define the terms used in this study, describe the methods used to classify workers, and discuss sample design, reliability of the estimates, and the relation of the data to other studies.

[1] Annual earnings and employment data based on the Current Population Survey and published by the Bureau of the Census in the *Current Population Reports* series include less industry detail and differ in concept and method of collection from data in this study. See Technical Notes, p. 15.

[2] Major industry division E (transportation, communication, and public utilities) is divided into three separate industry groupings in this report. Similarly, wholesale and retail trade are separated in this report, although they are listed as a single industry division in the *Standard Industrial Classification Manual.*

Earnings

Median annual earnings of workers employed in all four quarters of the year (about 2 out of 3 workers employed in private nonagricultural industries) rose 5.7 percent between 1971 and 1972, to $7,228. Because this increase was greater than the increase in the prices of consumer goods and services, as measured by the Consumer Price Index of the Bureau of Labor Statistics, real earnings were 2.5 percent higher in 1972 than in 1971—a somewhat greater gain than the 1.6-percent increase in the previous year.

Median earnings of all private nonagricultural employees, including those working in fewer than four calendar quarters, were only $4,640. This low level stemmed chiefly from the small earnings of workers employed in only one quarter ($243), two quarters ($948), or three quarters ($2,184). Nearly all employed in only one or two quarters (about one-fifth of the total) were out of the labor force during most of the year. They included workers who, during the year, retired, died, or entered or reentered the labor force. Of course, unemployment, which averaged 5.7 percent of the labor force, also accounted for low earnings. Since, on the average, less than 1½ percent of the workers were unemployed for over 15 weeks, few workers who were in the labor force for the entire year worked as little as one or two quarters.

Text table 1. Median and average annual earnings and percent change from previous year, four-quarter workers, by industry of major earnings, 1972

Industry	Median earnings		Average earnings	
	Dollars	Percent change	Dollars	Percent change
Private nonagricultural economy	$ 7,228	5.7	$ 8,504	6.9
Mining	10,284	10.9	11,333	10.1
Contract construction	9,953	4.1	11,050	5.6
Manufacturing	8,654	9.7	9,628	8.1
Transportation	10,982	12.9	11,267	10.1
Communication	8,997	16.0	10,516	16.0
Public utilities	10,785	8.9	11,150	8.1
Wholesale trade	9,005	8.0	10,853	6.1
Retail trade	4,698	5.7	6,186	6.9
Finance, insurance, and real estate	6,984	5.6	9,329	7.6
Services	5,846	4.6	7,409	6.1

The contrast between the median earnings of all workers, regardless of their amount of employment, and those working in four quarters is shown by industry in chart 1.

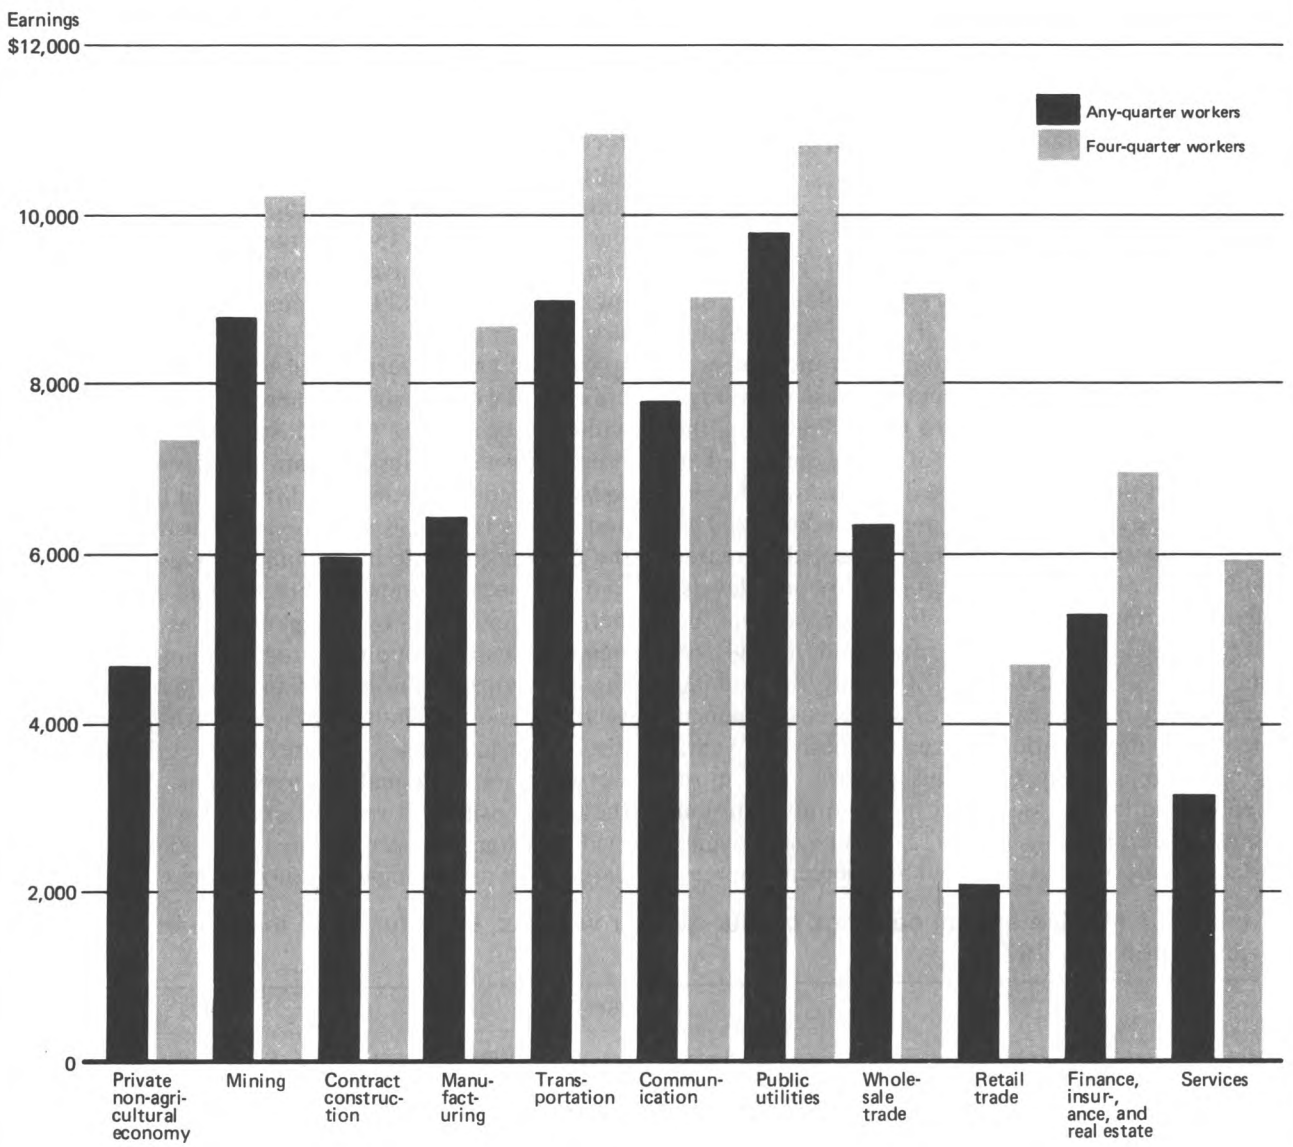

Because primary interest attaches to four-quarter workers, who include nearly all those available for year-round employment, this analysis is largely limited to their annual earnings and employment patterns. However, the reference tables generally also include separate data for workers employed in any quarter. This allows a comparison of two groups with considerably different economic characteristics. The earnings of a worker employed in four quarters of the year provide a more or less realistic estimate of the earnings of a year-round worker. In contrast, the earnings of "any-quarter" workers more fully reflect such factors as worker availability, unemployment, and seasonality of employment.

Earnings by industry

Median earnings of workers employed in four quarters of the year in 1972 ranged from $4,698 in retail trade to $10,982 in transportation. Increases from the previous year ranged from 4.1 percent in contract construction to 16.0 percent in communication, with corresponding real increases ranging from 0.9 percent to 12.5 percent. Because average (mean) earnings are more affected than the median by the presence of workers with either high or low earnings, they differ by a considerable amount from the medians in each of the ten major industry groupings (text table 1).

Increases in median earnings of four-quarter workers from 1966—the first year for which such data are available—to 1972 have varied widely from industry to industry. These increases averaged 42.2 percent for the entire private nonagricultural economy, and ranged from 33.1 percent in retail trade to 57.3 percent in transportation. As a result, transportation shifted from third to first place in the ranking of industries by median earnings level (text table 2). Over the same period, average earnings of four-quarter workers increased 41.7 percent, varying from a 38.7-percent increase in retail trade to 52.3 percent in transportation. These varying changes altered the rank of industries by

Chart 1. Median annual earnings of workers employed in any quarter and in four quarters, by industry, 1972

Text table 2. Ranking of industries by median and average annual earnings, 1966, 1971, 1972

Industry	Rank by median earnings			Rank by average earnings		
	1966	1971	1972	1966	1971	1972
Mining	2	4	3	3	3	1
Contract construction	4	3	4	4	1	4
Manufacturing	6	6	7	7	7	7
Transportation	3	2	1	5	5	2
Communication	7	7	6	6	6	6
Public utilities	1	1	2	2	2	3
Wholesale trade	5	5	5	1	4	5
Retail trade	10	10	10	10	10	10
Finance, insurance, and real estate	8	8	8	8	8	8
Services	9	9	9	9	9	9

average earnings levels, moving mining from third to first place and transportation from fifth to second. Wholesale trade, on the other hand, dropped from first to fifth place.

Earnings by race

Median earnings of white workers employed in four quarters of the year increased from $7,092 to $7,493 between 1971 and 1972. This 5.6-percent increase was somewhat less than the 6.8-percent increase in average earnings, which rose from $8,214 to $8,775 during the same period. Median earnings of those employed in any quarter of the year increased 3.5 percent to $4,694 while average earnings rose 5.9 percent to $6,002. The larger increases in average earnings reflected a greater concentration of earners in the upper income levels.

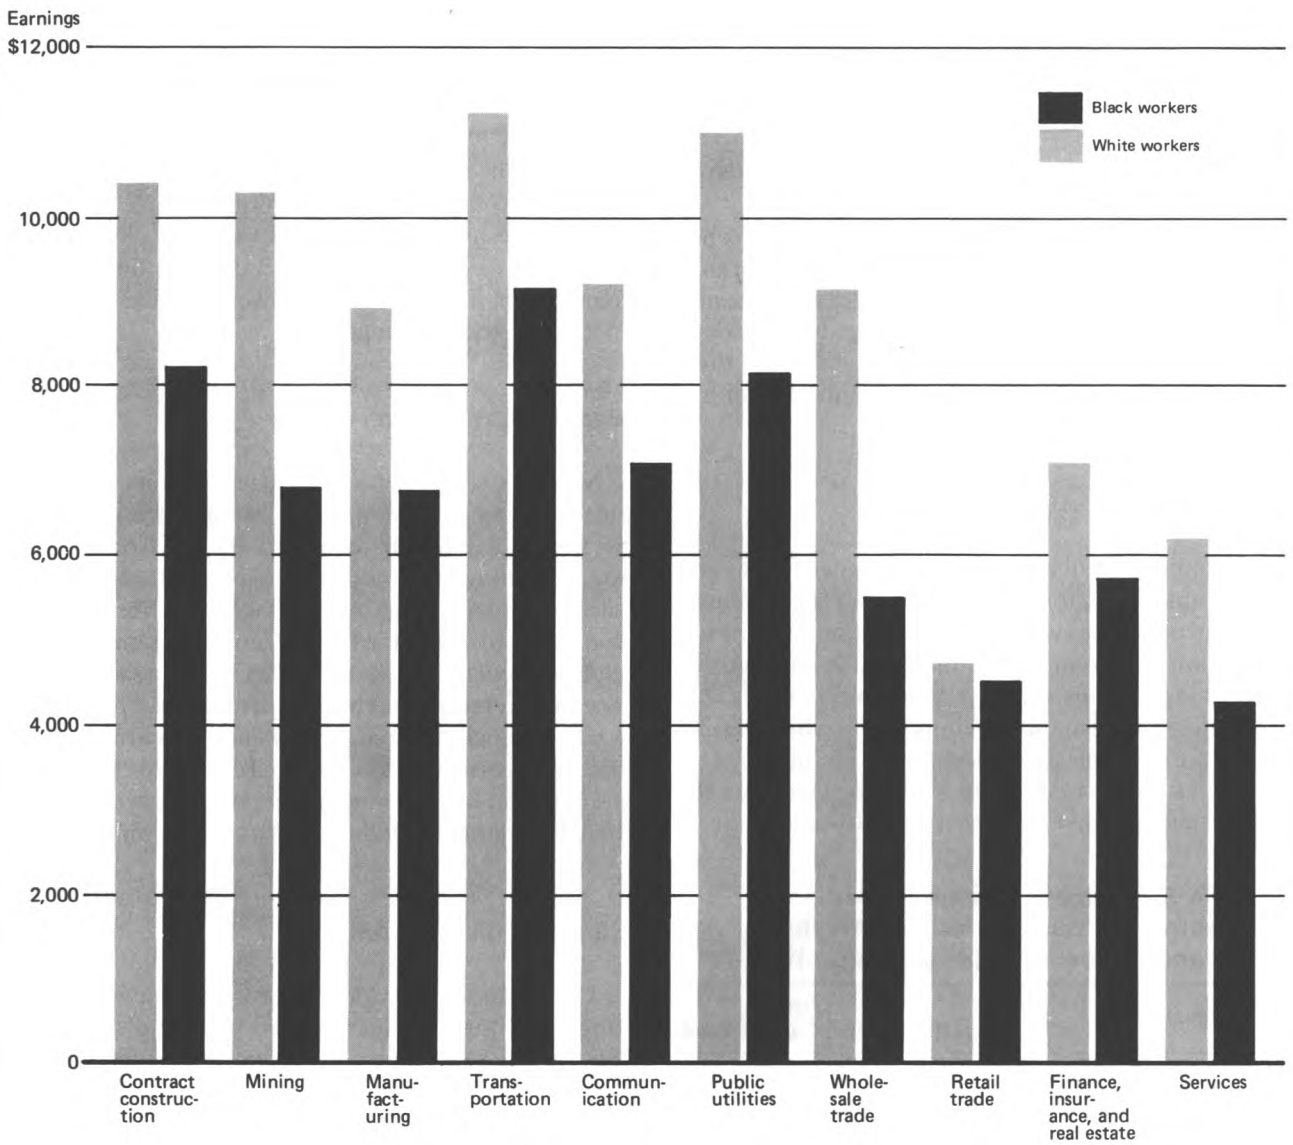

Median earnings of white four-quarter workers, by industry, ranged from $4,728 in retail trade to $11,168 in transportation (text table 3). Historically, the ranking of industries by median earnings of whites has remained constant, but the experience over the past few years indicates a trend away from this pattern. The most noticeable change has occurred in the transportation industry. Between 1966 and 1972, earnings of white workers in transportation increased 57.0 percent, thereby moving that industry from third to first place. The ranking by average earnings has similarly altered over the recent period, particularly among industries with high earnings. Transportation once again showed the most dramatic increase, with average earnings increasing 52 percent from 1966, thereby raising it from fifth to first place. In contrast, average earnings in wholesale trade increased so little (39.1 percent) that it dropped from first to fifth place.

Median annual earnings of black four-quarter workers in 1972 were $5,463—27 percent lower than those of whites. (See chart 2 for industry detail.) Though this represents a considerable gap, there is some evidence to suggest that the earnings differential between blacks and whites is narrowing. For all industries combined, the percent increase in median earnings between 1971 and 1972 was greater for blacks than for whites; 6.7 percent compared to 5.7 percent. Moreover, in all major industry groupings except mining, manufacturing, and transportation, median earnings of blacks rose relatively more than those of whites. Absolute increases also exceeded those of whites in three industries and were very nearly equal in three others. The change in the relationship between black and white earnings is evident when the earnings in 1966 and 1972 are compared. The narrowing differential is seen as an increase

Text table 3. Median annual earnings of four-quarter workers, by industry of major earnings and race, 1966 and 1972

Industry	1966			1972		
	Black workers	White workers	Black/white ratio	Black workers	White workers	Black/white ratio
Private nonagricultural economy	$3,465	$5,519	0.628	$5,463	$ 7,493	0.729
Mining	5,035	7,054	.714	8,278	10,360	.799
Contract construction	4,076	7,244	.563	6,782	10,329	.657

Chart 2. Median annual earnings of four-quarter workers, by industry and race, 1972

Text table 4. Median annual earnings and percent change from previous year, four-quarter workers, by industry of major earnings and sex, 1972

Industry	Women		Men		Female/ male ratio
	Earnings	Percent change	Earnings	Percent change	
Private nonagricultural economy	$4,747	5.6	$ 9,280	7.1	0.512
Mining	6,821	4.9	10,479	10.7	.651
Contract construction	5,769	5.6	10,338	4.1	.558
Manufacturing	5,319	7.3	9,920	8.9	.536
Transportation	7,517	6.5	11,377	12.2	.661
Communication	6,932	14.7	11,992	12.1	.578
Public utilities	7,175	7.7	11,382	8.5	.630
Wholesale trade	5,692	4.7	10,078	6.1	.565
Retail trade	3,387	4.8	7,118	6.1	.476
Finance, insurance, and real estate	5,565	5.3	10,164	5.4	.548
Services	4,752	5.4	8,667	5.9	.548

in the black/white ratio in every industry from 1966 to 1972 (text table 3).

In addition to the difference in median earnings between black and white workers there is a considerable difference in their earnings distributions. The greater closeness of average to median earnings for blacks in all industries except public utilities suggests that their earnings are more symmetrically distributed than are earnings of whites.

Earnings by sex

The gap in median earnings between men and women employed in four quarters of the year increased in all industry divisions with the exception of contract construction and communication. Median earnings for men working in four quarters rose to $9,280—a 7.1-percent increase from the previous year—while median earnings for women increased only 5.6 percent, to $4,747 (text table 4). Median earnings increases for women ranged from 4.7 percent in wholesale trade to 14.7 percent in communication and for men from 4.1 percent in contract construction to 12.2 percent in transportation. Percent increases were larger for women in only two industries—contract construction and communication; actual dollar increases were less for women in all industry groupings.

Text table 5. Percent change in median annual earnings, four-quarter workers, by industry and region of major earnings, 1971-72

Industry	Northeast	South	North Central	West
Private nonagricultural economy	6.5	5.8	6.3	5.0
Mining	10.0	9.4	9.4	11.2
Contract construction	3.2	5.7	.7	5.1

Earnings by region

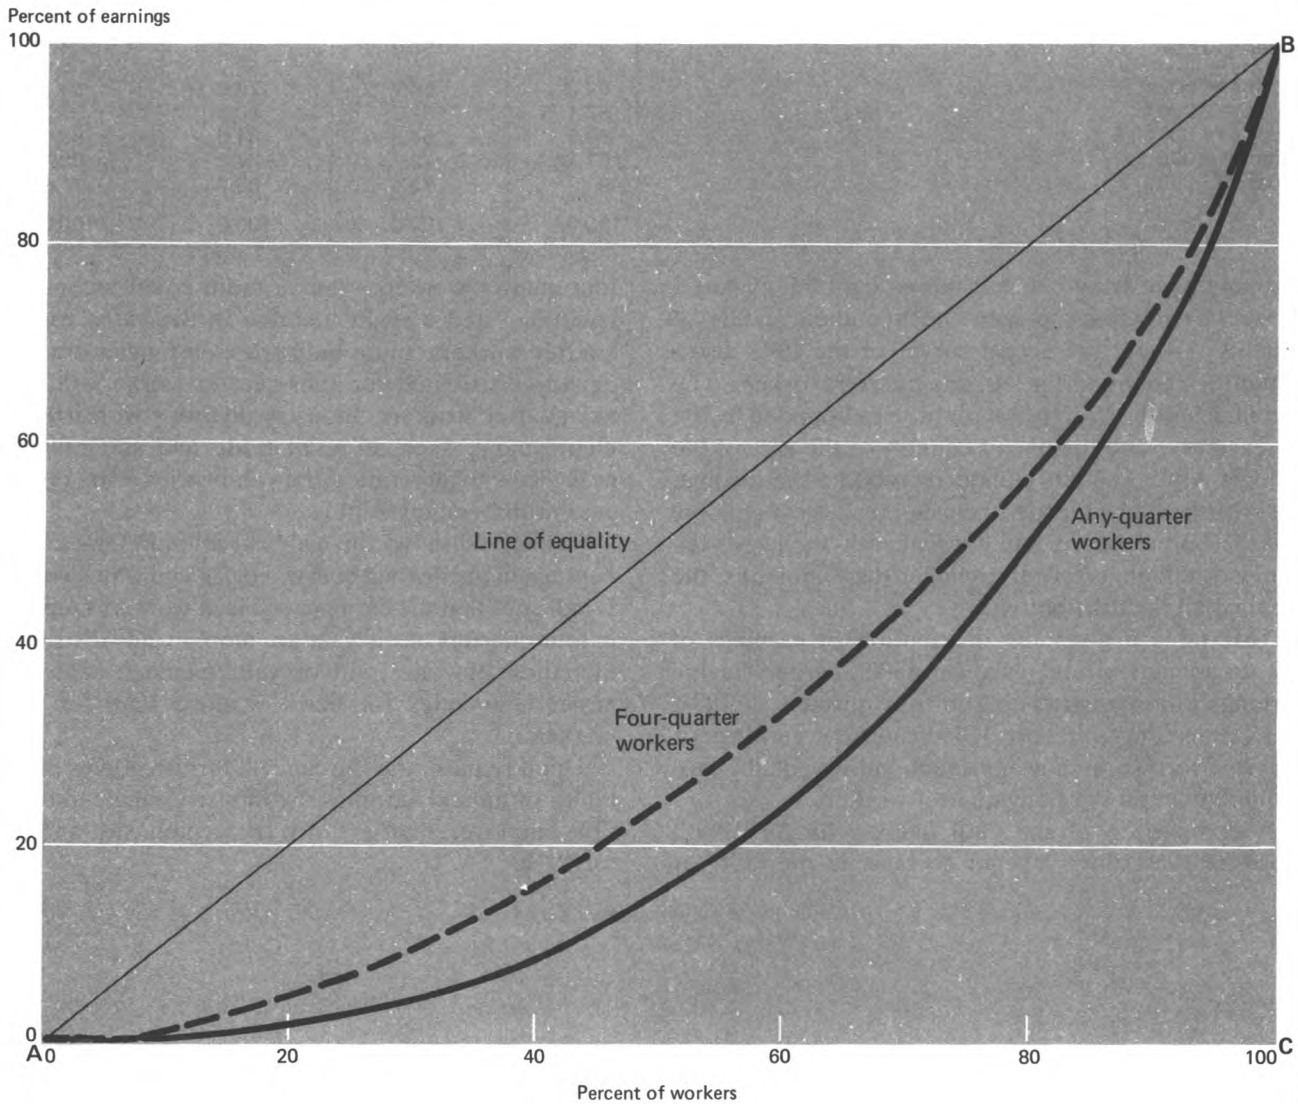

Median earnings of four-quarter workers varied considerably by region in 1972, ranging from a low of $6,104 in the South to $8,027 in the North Central region. Though this range approximates that for average earnings, the ranking of regions was different for the two measures, with the North Central region having the highest median and the Northeast the highest average earnings (reference tables B-17 and B-35). This indicates a larger concentration of workers with earnings above the average in the Northeast. Text table 5 shows the percent increases in median incomes between 1971 and 1972 by region and industry of major earnings.

Earnings distributions

One of the most widely accepted methods of evaluating the equality of earnings or income distribution is through the use of the Gini index. This index measures the cumulative percent of total income received by cumulative percentages of the population. The graphic representation of this relationship, a Lorenz curve, provides the concept from which the index is derived. When a situation of complete income equality exists (all units receiving the same income), the Lorenz curve for the distribution becomes a straight line (line of equality). This indicates that any percentage of the total population, as plotted on the X-axis, receives a like percentage of total earnings as shown on the Y-axis. An actual income distribution (i.e., one lacking complete equality) appears as a curve with the same

Chart 3. Income distribution (Lorenz) curves, 1972

Earnings from major industry of employment for workers with earnings in any quarter and in four quarters

Text table 6. Cumulative distribution of workers and earnings at estimated mean levels, any-quarter and four-quarter workers, 1972

Earnings	Any-quarter workers, cumulative percent		Four-quarter workers, cumulative percent	
	Workers	Earnings	Workers	Earnings
Under $ 1,000	19.4	1.6	2.2	0.0
Under $ 2,000	30.4	4.3	7.9	.1
Under $ 3,000	38.2	7.5	14.3	2.0
Under $ 4,000	45.5	11.7	22.2	5.3
Under $ 5,000	52.5	16.8	31.0	10.0
Under $ 6,000	59.2	22.8	39.9	15.8
Under $ 7,000	65.3	29.3	48.2	22.2
Under $ 8,000	70.7	35.9	55.9	29.0
Under $ 9,000	75.6	42.7	63.0	36.1
Under $10,000	80.5	50.3	70.3	44.3
Under $11,000	84.2	56.7	75.9	51.2
Under $12,000	87.1	62.2	80.4	57.3
Under $13,000	89.9	67.9	84.6	63.5
Under $14,000	91.8	72.1	87.5	68.1
Under $15,000	93.2	75.4	89.7	71.9
TOTAL	100.0	100.0	100.0	100.0

end points but lying beneath this straight line. Chart 3 shows this relationship with the hypothetical line of equality AB and the actual curves of the 1972 distributions for four-quarter and any-quarter workers. The Gini index is the proportion of the area bounded by the Lorenz curve and the line of equality to the area of the triangle ABC. The less equally distributed the income, the greater will be the area between the line of equality and the Lorenz curve, and consequently the larger the Gini index. Conversely, the smaller the Gini index, the more equal the distribution.

Text table 6 gives the distribution of earnings of private nonagricultural wage and salary earners having earnings in any quarter and in four quarters of 1972. The Lorenz curves (chart 3) indicate that earnings of four-quarter workers were much more equally distributed than those of any-quarter workers.

A comparison of the Gini indexes for 1972 with those for 1966 shows a slight decrease in the ratio for four-quarter workers—thus a more equal income distribution—and a slight increase in the index for any-quarter workers. In all industries, earnings were more equally distributed for four-quarter workers than for any-quarter workers. Industry divisions with irregular employment, such as retail trade and services, generally had higher ratios than industries with regular, year-round employment.

Table B-60 shows the wide variation in Gini indexes between industries and between black and white workers. It indicates that the earnings of black workers employed in four quarters of the year are more evenly distributed than those of whites, with only three industries having a larger Gini index for black workers than for white workers.

Upon request, the Bureau will furnish copies of Gini tables of annual earnings, by industry, single and multiple employer, quarters of work, region, sex, and race for 1972.

Employment

Employment by industry

The total number of workers with some earnings in 1972 was 82,030,000, a 2.8-percent increase from the previous year. Sixty-five percent of these workers had earnings in four quarters of the year—a slight decrease from the previous year and a continuation of a longer trend downwards from the 67.4 percent in 1966.

The manufacturing sector employed the largest proportion of workers when classified by industry of major earnings—28.7 percent of all workers and 32.2 percent of the workers employed in all four quarters. These figures indicate a gradual decline since 1966 (when the present series began) in the concentration of employment in manufacturing. In that year 33.0 percent of all workers and 37.0 percent of the four-quarter workers had their major earnings in manufacturing.

Changes in labor force participation between 1966 and 1972 are reflected by the decrease, in all industries except communication, in the percent of workers employed in four quarters of the year (text table 7). While some of the decrease is probably due to the increase in the unemployment rate—from 3.6 percent in 1966 to 5.6 percent in 1972—most of it is probably due to the greater prevalence of workers who are not available for jobs for part of the year.

Text table 7. Four-quarter workers as a percent of all workers, by industry of major earnings, 1966 and 1972

Industry	1966	1972
Private nonagricultural economy	67.4	65.0
Mining	78.9	76.4
Contract construction	65.4	61.4
Manufacturing	75.7	73.1
Transportation	78.3	75.6
Communication	78.8	84.8
Public utilities	86.0	85.3
Wholesale trade	73.3	70.7
Retail trade	54.5	53.0
Finance, insurance, and real estate	73.3	71.5
Services	59.2	59.1

Employment by race

The employment of white workers with some earnings in the industry was largely concentrated in three industry groupings—manufacturing (32.2 percent), retail trade (26.3 percent), and services (28.9 percent). This concentration was also found when workers were classified by their industry of major earnings, with these three industries employing 73.2 percent of the total. The employment of black workers in these industries was even more concentrated, both for workers with some earnings and those with their major earnings in the industry (text table 8).

Total employment of white workers increased 2.8 percent between 1971 and 1972, with increases in all major industry groupings except transportation and communication. The largest proportional increase was in contract construction—5.3 percent; the largest employment increase was in retail trade—619,000. The trend for white workers since 1966 shows a movement away from the manufacturing sector and into the more service-oriented industries (retail trade, services, and finance, insurance, and real estate).

The employment of black workers increased 3.5 percent between 1971 and 1972, with increases in each major industry grouping. The range of these increases was from 0.8 percent in communication to 6.9 percent

Text table 8. Industry distribution of workers with some earnings in the industry and with major earnings in the industry, by race, 1972

[Percent]

Industry	Some earnings[1]		Major earnings	
	White workers	Black workers	White workers	Black workers
Private nonagricultural economy	100.0	100.0	100.0	100.0
Mining	1.2	.5	1.0	.3
Contract construction	8.2	8.0	6.4	5.9
Manufacturing	32.2	33.8	28.6	29.1
Transportation	5.1	5.7	4.0	4.2
Communication	1.7	1.5	1.6	1.3
Public utilities	1.2	.9	1.1	.8
Wholesale trade	8.5	6.9	6.5	4.8
Retail trade	26.3	20.5	20.8	14.7
Finance, insurance, and real estate	7.5	6.2	6.1	4.4
Services	28.9	41.6	23.8	34.5

[1] Because some workers have earnings in more than one industry, the sum of the percentages does not equal 100.

Text table 9. Employment and percent change by industry of major earnings and race, 1966, 1971, 1972

Race and industry	Employment (thousands)			Percent change	
	1966	1971	1972	1971-72	1966-72
White workers					
Private nonagricultural economy	64,561	71,107	73,095	2.8	13.1

Transportation	338	368	375	1.9	10.9
Communication	53	118	119	.8	124.5
Public utilities	43	65	70	6.2	60.5
Wholesale trade	372	405	426	5.2	14.5
Retail trade	1,226	1,269	1,311	3.3	6.9
Finance, insurance, and real estate	239	379	397	4.7	66.1
Services	2,704	3,048	3,081	1.1	13.9

Text table 10. Black workers as a percent of all workers, by industry of major earnings, 1966 and 1972

Industry	1966	1972
Private nonagricultural economy	10.8	10.8
Mining	3.4	4.2
Contract construction	11.4	10.0
Manufacturing	9.6	11.1
Transportation	10.6	11.3
Communication	4.8	9.2
Public utilities	5.6	7.9
Wholesale trade	8.2	8.2
Retail trade	8.9	8.0
Finance, insurance, and real estate	6.3	8.1
Services	16.9	15.0

in mining (text table 9). The changes since 1966 shown in text table 10 indicate a considerable alteration in the racial composition of most industrial groupings; presumably this is at least partly the result of efforts to provide a more equitable distribution of employment opportunities.

Employment by sex

The employment of women has risen proportionately more than that of men in recent years (text table 11). Between 1971 and 1972 employment of men increased 2.2 percent compared to 3.8 percent for women. Over the longer period from 1966 to 1972 the increase was 9.4 percent for men and 19.1 percent for women. Similar disparities in the rates of increase were found in the major industry groupings. In seven of the ten industry groupings, between 1971 and 1972, employment increases for women with some earnings were greater than for men. When grouped by the industry of major earnings, employment of women increased more than that of men in six of the ten major groupings between 1971 and 1972. The increases were even greater when measured over the 1966 to 1972 period. Proportional increases in the number of women with some earnings were greater than for men among all earners in all industries except communication. Similarly, among industries of major earnings relative employment increases were greater for women in all except communication and services.

The largest concentration of men was in manufacturing (33 percent); of women, in services (37 percent) (text table 12).

Employment of both men and women reflected the decreasing importance of manufacturing and the increasing importance of services between 1966 and 1972. The employment of men in manufacturing decreased from 37.4 percent of total private nonagricultural employment in 1966 to 33.2 percent in 1972 while that of women decreased from 26.0 to 22.3 percent. Most of this employment loss was offset by increases

Text table 11. Employment and percent change by industry of major earnings and sex, 1966, 1971, 1972

Industry	Employment (thousands)			Percent change	
	1966	1971	1972	1971-72	1966-72

Text table 12. Industry distribution of employment, by sex, 1966 and 1972

[Percent]

Industry	Men		Women	
	1966	1972	1966	1972
Private nonagricultural economy	100.0	100.0	100.0	100.0
Mining	1.5	1.4	.2	.2
Contract construction	9.8	10.0	.9	1.0
Manufacturing	37.4	33.2	26.0	22.3
Transportation	6.4	5.9	1.2	1.3
Communication	1.2	1.4	2.1	1.9
Public utilities	1.5	1.5	.4	.4
Wholesale trade	7.7	7.9	4.0	4.1
Retail trade	16.1	17.2	23.8	24.2
Finance, insurance, and real estate	4.2	4.8	6.9	7.6
Services	14.3	16.7	34.5	37.0

in the services industry. Employment of men increased from 14.3 percent to 16.7 percent while employment of women increased from 34.5 percent to 37.0 percent.

Employment increases have been consistently greater for women than men with the major exception of communication. This industry, which has had the largest growth in workers in recent years, is the only industry in which the employment of men has increased more rapidly than that of women.

Technical Notes

Sources of data

Data for the Annual Earnings and Employment Patterns program are obtained from a 1-percent random sample of the earnings records of individual employees maintained by the Social Security Administration and the Railroad Retirement Board. Each employer covered by the Social Security Act is required to report the industry, place of employment, and amount of wages or salary paid to each employee during the calendar year up to the maximum taxable limit—$7,800 in 1971 and $9,000 in 1972. All individuals covered under the system provide demographic information (date of birth, sex, and race) when applying for a social security number. Employers with workers whose earnings come under the jurisdiction of the Railroad Retirement Board are required to report earnings up to a monthly limit—$650 in 1971 and $750 in 1972.

Estimation of earnings

To eliminate the gap between actual earnings and reported (taxable) earnings, the Social Security Administration uses a "limit-quarter" concept. The limit-quarter is that quarter of the year in which the taxable limit is reached. An individual's earnings in the limit-quarter become the estimated figure for all subsequent quarters if they are higher than the earnings of the previous quarters. If earnings are lower in the limit-quarter, earnings in the previous quarter would be substituted in the limit-quarter and all subsequent quarters. After these computations, the sum of the quarterly earnings becomes the estimated annual total unless the taxable limit is reached in the first quarter. In that case, $51,000 for men and $45,000 for women was used by the Social Security Administration as the estimated total for 1971 with $56,100 and $50,300 used in 1972.

Employers with workers covered under the Railroad Retirement Act are similarly required to report earnings, but on a monthly maximum basis as opposed to an annual maximum. To eliminate the gap between actual and reported monthly earnings, "step-up factors" are used. They are calculated for each occupational group by the Railroad Retirement Board and are applied by the Bureau of Labor Statistics to the credited monthly earnings of each individual in this study according to occupation. To determine the occupational step-ups, the Board takes a 1-percent sample of earnings records. The actual aggregate earnings of individuals in the sample are compared, by occupation, to the aggregate earnings of the same individuals when taxable limits are used. This comparison yields the step-up factor, as in the following illustrative example which assumes a monthly limit of $650.

	Sample employees			*Occupation, total*
	1	*2*	*3*	
Actual earnings	$750	$600	$675	$2,025
Reported earnings	650	600	650	1,900

$2025 ÷ 1900 = 1.066 = step-up factor

Definitions of terms and methods of classification

Annual earnings. Annual earnings are defined as gross wages, salaries, and other payments received by employees in employment covered under the Social Security Act or the Railroad Retirement Act. Such payments may be cash, cash equivalents, or other media such as goods, clothing, board, or lodging. Most payments by employers which fall under the general heading of supplements to wages and salaries are not counted as earnings in this series.

Earnings and employment data for self-employed individuals, workers in agriculture, and most government workers are not included.

Workers with some earnings in the industry. Individuals are counted in each industry in which they earned $1 or more during the year. For example, an individual who had some earnings in two 3-digit industries, both within the same 2-digit industry grouping, is counted two times at the 3-digit level but only once at the 2-digit level. It follows that employment estimates at increasing levels of aggregation are smaller than the total at the next lower level.

Industry of major earnings. The concept of industry of major earnings was developed to provide industry data which excluded individuals who were only casually employed in that industry during the year. As each employee-employer combination within the sample has a separate record, data for an individual worker can be included for several different industries, depending on

work experience. To avoid this duplication of data and provide more representative industry information, workers are assigned to an "industry of major earnings" at the 3-digit SIC level. This is the industry from which the worker received the largest portion of total wage and salary earnings. This assignment does not change at higher levels of aggregation, thus preventing a worker from being identified as one with major earnings in different industries at different SIC levels.

Median and average earnings. Median annual earnings, the midpoints of earnings distributions, were computed from data grouped into $250 intervals. Minor differences in medians for the same grouping of workers as shown on different tables result from rounding and from slightly different methods of entering the data into the computer file at various stages of processing. *Average* (mean) annual earnings were computed by summing the earnings of each worker in the entire distribution and dividing the sum by the number of workers in the distribution.

Both the mean and the average (arithmetic mean) contain properties useful in the analysis of earnings, and therefore, both are presented in the tables at the end of this bulletin. Medians are generally considered the more useful measure largely because they are not influenced by extremely low or high earnings. But they have the undesirable characteristic of being difficult to calculate and, consequently, of not being easily utilized in problems involving statistical inference. The average, on the other hand, is easy to calculate but is strongly influenced by extreme values. For example, the mean would be deceptively high for a distribution where most earnings are low but a small percentage are very high. In this study, the mean also has the disadvantage of being affected by rough estimates for earnings above the reporting limit.

Quarters of work. For social security coverage, a quarter of work is defined as a calendar quarter in which a worker earned any pay in covered employment; household workers must earn at least $50. Workers who reach their maximum taxable earnings limits in a single employment before the fourth quarter of the year are considered to have worked in each quarter, although earnings above the maximum are not reported.

Employer. An employer is defined here as an individual, partnership, or corporation recognized as a separate legal entity meeting certain criteria. However, since a firm may have a separate corporation for each of its locations and each corporation may be considered to be a separate employer, a worker transferred by the firm from one location to another may be classified as having more than one employer in the same year even though continuing to work for the same firm.

Industrial classification. The employment and earnings data presented in this report which are based on the Social Security Administration's data file are classified according to the Administration's industrial classification system. This classification differs slightly from that developed by the U.S. Bureau of the Budget and published in the *Standard Industrial Classification Manual, 1967* (SIC), which is employed in most other statistical series. The major difference is in the assignment of industry codes to nonpolicymaking governmental units. In this study, all such separable units are assigned industry classifications appropriate to their activity.

Employment and earnings data presented in this report which are based on the Railroad Retirement Board's data file are classified into the following industries as defined in the *SIC Manual:* railroads, SIC 401; sleeping car companies, SIC 402; express companies, SIC 404; rail car rental companies, SIC 474; other companies performing services in railroad transportation, SIC 861; and certain railway labor organizations, SIC 863. Workers are assigned on the basis of the industrial classification of their last employer under the Railroad Retirement Act.

Single- and multi-industry workers. At each level of industry classification (i.e., 3-digit, 2-digit, and division) the employment experience of each sample member was examined to see if all earnings during the year were in one industry or in more than one industry. Those with earnings in more than one industry were classified as multi-industry workers. This conceptual approach may be seen for a worker who was employed in each of two 3-digit industries within the same 2-digit industry. At the 3-digit level, the worker is classified as a multi-industry worker. However, at the 2-digit and at the divisional level the worker is classified as a single-industry worker; both 3-digit industries in which the worker was employed are part of the same 2-digit industry and the same industry division.

Regions. Data are given separately for five regions. The regions covering the 50 States and the District of Columbia are: *Northeast*—Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont; *South*—Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia; *North Central*—Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin; and *West*—Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming. The fifth region includes all employment covered under the provisions of the Social Security Act

in U.S. territories, on foreign soil, or aboard ocean-going vessels.

Because the data file for this study does not indicate the location of the work covered by the Railroad Retirement Act, a convention was adopted ascribing all employment covered under the Railroad Retirement Act to the North Central region where many railroads and related organizations have headquarters.

Race. All workers in this study have been divided into two groups by race: "white "and "black." The white category includes all races other than black. The sample for minority races other than black was not large enough to permit separate presentation of data.

Sample design

The sample, selected by a multistage systematic cluster sampling procedure, includes 1 percent of all social security numbers.[3] Any individual, once selected, remains permanently in the sample and is identified by social security number. To preserve confidentiality and facilitate statistical processing, the Social Security Administration combines data from various employers and assigns each individual and employer a permanent control number, different from the social security and employer identification numbers.

Sampling variability

Estimates based on samples can be expected to differ from figures that would have been obtained had all records been used for the compilations. This difference is measured by the standard error. The chances are about 68 out of 100 that the difference due to sampling variability between a sample estimate and the figure that would have been obtained from a compilation of all records is less than the standard error. The chances are 95 out of 100 that the difference is less than twice the standard error and about 99 out of 100 that it is less than 2½ times the standard error. The standard error of an estimate depends on the sample design elements such as the method of sampling, the sample size, and on the estimation process.

No exact calculation has been made of standard errors of estimates based on the stratified cluster continuous work history samples. However, approximate standard errors of estimates utilizing the assumption of simple random sampling are likely to be reasonably close to those for the actual sample design used for many attribute statistics. While the actual method of selection (stratified cluster sampling) differs from simple random sampling, there is evidence that, for most statistics, the several factors affecting the sampling variability give a joint factor close to that for simple random sampling.

Text table 13. Approximate sampling variability of estimated number of persons

Estimated number	Range of 95 chances out of 100
500	500
800	600
1,000	700
3,000	1,100
5,000	1,400
8,000	1,800
10,000	2,000
30,000	3,300
50,000	4,500
80,000	5,600
100,000	6,300
300,000	10,800
500,000	14,000
800,000	17,600
1,000,000	20,000
3,000,000	33,000
5,000,000	44,000
8,000,000	55,500
10,000,000	63,000
30,000,000	108,000
50,000,000	110,000
80,000,000	112,000
100,000,000	115,000

Sampling variability of estimated number of persons. For the convenience of the reader, text table 13 provides approximations of sampling variability (95-percent confidence level) for estimates of the number of persons with given characteristics. The estimates and approximate sampling variability shown for the data which have been inflated by 100. Linear interpolation may be used for estimated numbers not shown.

Sampling variability of estimated percentage of persons. The reliability of an estimated percentage depends on both the size of the percentage and the size of the total upon which the percentage is based. Text table 14 shows the approximate sampling variability (95-percent confidence level) for percentages (of persons with a given characteristic). The body of the table is expressed in percentage points. The bases shown are expressed in terms of data inflated by 100. Linear interpolation may be used for percentages and base figures not shown.

Sampling variability of estimated mean earnings. A rough approximation of the standard error of an estimated mean can be calculated from the distribution

For a detailed discussion of the sampling procedure as well as reporting criteria and coverage under the social security and railroad retirement systems, see U.S. Department of Health, Education, and Welfare, Social Security Administration, *Workers Under Social Security, 1960* (1968) and *Social Security Handbook*; also see *Handbook on Railroad Retirement and Unemployment Insurance Systems.* The discussions on sampling and nonsampling variability have been taken from *Earnings, Distribution in the United States 1967* (U.S. Department of Health, Education, and Welfare, Social Security Administration, Office of Research and Statistics, 1971), pp. 317-18.

Text table 14. Approximate sampling variability of estimated percentages

Base of percentage (inflated sample)	Range of 95 chances out of 100				
	Estimated percentage				
	2 or 98	5 or 95	10 or 90	25 or 75	50
500	12.5	19.5	26.8	38.7	44.7
1,000	8.9	13.8	19.0	27.4	31.6
5,000	4.0	6.2	8.5	12.2	14.1
10,000	2.8	4.4	5.9	8.8	10.0
100,000	.9	1.4	1.9	2.7	3.1
1,000,000	.3	.5	.6	.9	1.0
10,000,000	.1	.2	.2	.3	.3
100,000,000	(1)	.1	.1	.1	.1

1 Less than 0.05.

from which it was obtained. The formula can be found in elementary statistics texts (for example, *Applied General Statistics,* by Croxton and Cowden, Prentice Hall, 2nd Ed. 1955, p. 218).

Nonsampling variability

Because of the nature of the social security program and the manner in which it is administered, some variability would be present in a complete compilation of records as well as in a sample. For example, the data relate to covered employment rather than all employment, changes in earnings records may not be reflected promptly because of time-lags in posting and processing, and errors may occur in classification and compilation. The errors introduced as a result of these factors are probably negligible, however.

Additional factors contributing to nonsampling variability are: (1) duplication in the estimates of workers because of persons receiving wage credits from different employers on more than one account number; (2) the extent to which covered earnings are reported, taxed, and credited; and (3) the distribution of workers and aggregate wages above the maximum earnings base.

Relation to other studies

Data presented in this bulletin have been developed, as previously described, from information reported by employers about the earnings of individuals up to an earnings limit and agency estimates of earnings above this limit. Although annual earnings and employment data are available from the Current Population Survey (CPS) of the Bureau of the Census, they are based on a different concept of industry attachment (i.e., industry of longest job, rather than industry of major earnings), and provide only for industry division data, while data in the study presented here cover industry divisions, major 2-digit SIC groups, and the most important 3-digit groups. Moreover, other differences in methods or approach may result in important differences in sampling and nonsampling variances between this and other studies. For example, CPS data are based on household interviews, whereas the data in this bulletin are based on employer tax returns. Furthermore, CPS data for recent years are not comparable with data for years prior to 1967 because of changes in methodology in the CPS. Therefore, caution must be exercised in using the data presented in this bulletin in conjunction with other annual earnings and employment data.

[1] Because the data file for this study does not indicate the place of employment of workers covered by the Railroad Retirement Act, employees of railroads and railroad-related organizations were considered to be employed in the North Central Region where many railroads and related organizations have headquarters.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

[1] Because the data file for this study does not indicate the place of employment of workers covered by the Railroad Retirement Act, employees of railroads and railroad-related organizations were considered to be employed in the North Central Region where many railroads and related organizations have headquarters.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

[1] Workers who had some earnings in more than one industry group and in more than one industry division are included in the count of those with some earnings in each such industry group and division. Thus, some workers are counted more than once, and, therefore, detail does not add to total.

Small differences may exist between employment totals of individual two-digit industries and the sum of their three-digit components because data are not sufficient to permit assigning some workers to a three-digit industry.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

[1] Workers who had some earnings in more than one industry group and in more than one industry division are included in the count of those with some earnings in each such industry group and division. Thus, some workers are counted more than once, and, therefore, detail does not add to total.

Small differences may exist between employment totals of individual two-digit industries and the sum of their three-digit components because data are not sufficient to permit assigning some workers to a three-digit industry.

[2] White includes workers of all races other than black.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

[1] Workers who had some earnings in more than one industry group and in more than one industry division are included in the count of those with some earnings in each such industry group and division. Thus, some workers are counted more than once, and, therefore, detail does not add to total.

Small differences may exist between employment totals of individual two-digit industries and the sum of their three-digit components because data are not sufficient to permit assigning some workers to a three-digit industry.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

[1] Small differences may exist between employment totals of individual two-digit industries and the sum of their three-digit components because data are not sufficient to permit assigning some workers to a three-digit industry.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

[1] Workers who had some earnings in more than one industry group and in more than one industry division are included in the count of those with some earnings in each such industry group and division. Thus, some workers are counted more than once, and, therefore, detail does not add to total.

Small differences may exist between employment totals of individual two-digit industries and the sum of their three-digit components because data are not sufficient to permit assigning some workers to a three-digit industry.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

Table A-49. Percent of workers, by quarters of work, 1971

[1] Small differences may exist between employment totals of individual two-digit industries and the sum of their three-digit components because data are not sufficient to permit assigning some workers to a three-digit industry.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

[1] Because the data file for this study does not indicate the place of employment of workers covered by the Railroad Retirement Act, employees of railroads and railroad-related organizations were considered to be employed in the North Central Region where many railroads and related organizations have headquarters.

The United States total includes data not included in any of the regional totals for employment outside the continental United States. Therefore, the sum of the regional data is less than the total for the United States.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

[1] Small differences may exist between employment totals of individual two-digit industries and the sum of their three-digit components because data are not sufficient to permit assigning some workers to a three-digit industry.

[2] White includes workers of all races other than black.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

[1] Small differences may exist between employment totals of individual two-digit industries and the sum of their three-digit components because data are not sufficient to permit assigning some workers to a three-digit industry.

[2] White includes workers of all races other than black.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

Table A-55. Single- and multi-industry employment of all workers in industry of major earnings, by number of employers in the industry, 1971

[1] White includes workers of all races other than blacks.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

[1] Because the data file for this study does not indicate the place of employment of workers covered by the Railroad Retirement Act, employees of railroads and railroad-related organizations were considered to be employed in the North Central Region where many railroads and related organizations have headquarters.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

[1] White includes workers of all races other than blacks.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

[1] Because the data file for this study does not indicate the place of employment of workers covered by the Railroad Retirement Act, employees of railroads and railroad-related organizations were considered to be employed in the North Central Region where many railroads and related organizations have headquarters.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

[1] Workers who had some earnings in more than one industry group and in more than one industry division are included in the count of those with some earnings in each such industry group and division. Thus, some workers are counted more than once, and, therefore, detail does not add to total.

Small differences may exist between employment totals of individual two-digit industries and the sum of their three-digit components because data are not sufficient to permit assigning some workers to a three-digit industry.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

[1] Workers who had some earnings in more than one industry group and in more than one industry division are included in the count of those with some earnings in each such industry group and division. Thus, some workers are counted more than once, and, therefore, detail does not add to total.

Small differences may exist between employment totals of individual two-digit industries and the sum of their three-digit components because data are not sufficient to permit assigning some workers to a three-digit industry.

[2] White includes workers of all races other than blacks.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

[1] Workers who had some earnings in more than one industry group and in more than one industry division are included in the count of those with some earnings in each such industry group and division. Thus, some workers are counted more than once, and, therefore, detail does not add to total.

Small differences may exist between employment totals of individual two-digit industries and the sum of their three-digit components because data are not sufficient to permit assigning some workers to a three-digit industry.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

[1] Small differences may exist between employment totals of individual two-digit industries and the sum of their three-digit components because data are not sufficient to permit assigning some workers to a three-digit industry.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

[1] Workers who had some earnings in more than one industry group and in more than one industry division are included in the count of those with some earnings in each such industry group and division. Thus, some workers are counted more than once, and, therefore, detail does not add to total.

Small differences may exist between employment totals of individual two-digit industries and the sum of their three-digit components because data are not sufficient to permit assigning some workers to a three-digit industry.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

Table B-49. Percent of workers, by quarters of work, 1972

[1] Small differences may exist between employment totals of individual two-digit industries and the sum of their three-digit components because data are not sufficient to permit assigning some workers to a three-digit industry.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

[1] The United States total includes data not included in any of the regional totals for employment outside the continental United States. Therefore, the sum of the regional data is less than the total for the United States.

[2] Because the data file for this study does not indicate the place of employment of workers covered by the Railroad Retirement Act, employees of Railroads and Railroad-related organizations were considered to be employed in the North Central Region where many railroads and related organizations have headquarters.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

[1]Small differences may exist between employment totals of individual two-digit industries and the sum of their three-digit components because data are not sufficient to permit assigning some workers to a three-digit industry.

[2]White includes workers of all races other than blacks.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

[1] Small differences may exist between employment totals of individual two-digit industries and the sum of their three-digit components because data are not sufficient to permit assigning some workers to a three-digit industry.

[2] White includes workers of all races other than blacks.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

Table B-55. Single- and multi-industry employment of all workers in industry of major earnings, by number of employers in the industry, 1972

INDUSTRY	PERCENT OF WORKERS EMPLOYED DURING ANY QUARTER: ALL WORKERS	SINGLE-INDUSTRY WORKERS: TOTAL	NUMBER OF EMPLOYERS: ONE	TWO	MORE THAN TWO	MULTI-INDUSTRY WORKERS: TOTAL	NUMBER OF EMPLOYERS: ONE	TWO	MORE THAN TWO	PERCENT OF WORKERS EMPLOYED DURING FOUR QUARTERS: ALL WORKERS	SINGLE-INDUSTRY WORKERS: TOTAL	NUMBER OF EMPLOYERS: ONE	TWO	MORE THAN TWO	MULTI-INDUSTRY WORKERS: TOTAL	NUMBER OF EMPLOYERS: ONE	TWO	MORE THAN TWO

[1] White includes workers of all races other than blacks.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

KEEP UP TO DATE WITH:

MAJOR COLLECTIVE BARGAINING AGREEMENTS SERIES

A basic reference source showing how negotiators in different industries handle specific problems, complete with illustrative clauses identified by the company and union signatories, and detailed tabulations on prevalence of clauses.

Based on an analysis of about 1800 major agreements, 15 bulletins dealing with key issues in collective bargaining have been completed by the Bureau of Labor Statistics.

ORDER FORM

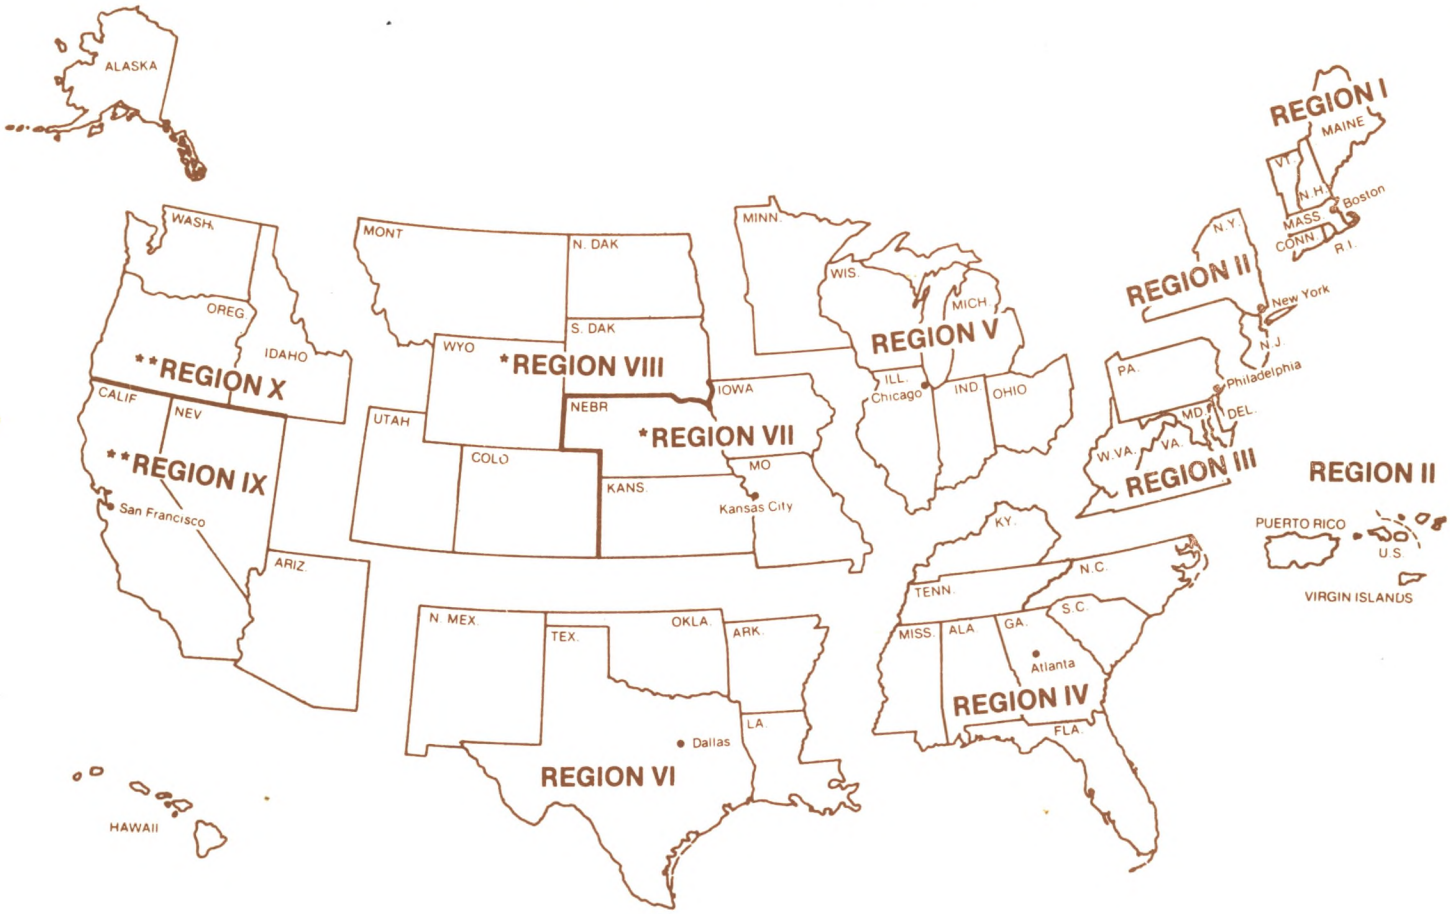

Check the Publication Desired	Title	Bulletin Number	Date of Publication	Price
	Major Collective Bargaining Agreements:
