Preface

This bulletin presents expenditure and income data collected in the quarterly interview component of the 1972-73 Consumer Expenditure Survey. The data, which appear in two volumes, are in the most detailed form that will be published. Greater detail is available from the public use tapes.

This bulletin was prepared in the Division of Living Conditions Studies, Eva E. Jacobs, Chief, under the general direction of Stephen Baer, Chief of the Branch of Consumer Expenditure Studies. The bulletin was prepared under the supervision of George Weeden. Major contributions to the bulletin were made by Cheryl McMahon Anderson, for preparation of the tables and glossary; by William Passero, for preparation of the text; by Cathryn Dippo, for preparation of the statements on sampling design and data reliability; and by Eugene Owens, for development of the computer data file.

Material in this publication is in the public domain and may be reproduced without permission of the Federal Government. Please credit the Bureau of Labor Statistics and cite Consumer Expenditure Survey: Interview Survey, 1972-73, Bulletin 1997.

Introduction

This bulletin presents expenditure, income, and other financial data which were collected in the quarterly interview component of the 1972-73 Consumer Expenditure Survey (CEX). These data, derived from reports of over 20,000 sample families who participated in the survey for either the 1972 or 1973 calendar years, are shown in the most detailed form presented to date. Data on expenditures, sources of income, net changes in assets and liabilities, and personal taxes are presented, as well as information on goods and services received without direct expense, mortgage principal paid on owned property, and market value of financial assets. Income and expenditure data are shown as annual averages, while asset/liability data and other financial data are shown as averages of end-of-year values. The collection of data was carried out by the U.S. Bureau of the Census under contract to the Bureau of Labor Statistics.

This bulletin is composed of two volumes. In Volume I, four tables classify all U.S. families by family income before taxes (income classes), family income before taxes (decile classes), age of family head, and race of family head. Six additional tables classify families by family income before taxes (income classes) for six family size groupings. Volume II contains four tables which cross-classify families by family income before taxes for four geographical regions—Northeast, North Central, South, and West. Each volume also contains an historical background section, a description of the survey, a statement on data reliability, a section on data collection and processing procedures, and a glossary which consists of (a) a list of stub items shown in the tables and sets of corresponding item codes, and (b) a description for each of these item codes.

The primary purpose for undertaking the 1972-73 Consumer Expenditure Survey was to gather data necessary to revise the Consumer Price Index. Aside from this important objective, the survey provides the only comprehensive body of income and expenditure information available for satisfying the broad range of analytical activities that exists in this area. For example, the data can be used in the analyses of consumer demand and income, in social welfare planning for poor and low-income families, in market research analyses of demand for different products or market areas, and in consumer counseling designed to assist families in evaluating their household budgets.

Historical Background

Expenditure surveys undertaken by the Bureau of Labor Statistics (BLS) date back to the late 19th century. The first survey was conducted from 1888 to 1891 to provide the U.S. Government with cost-of-living data for American wage earners. This information was examined in conjunction with a study of industry production costs and the setting of tariffs. The surveys of 1901 and 1917-19 were conducted in response to rapid price changes occurring at the turn of the century and during the first World War. It was from these two surveys, which focused on wage earners and salaried workers living in urban areas, that BLS first produced a Cost-of-Living Index, which eventually evolved into the Consumer Price Index (CPI).

During the period 1934-36 the BLS participated in two separate surveys: (1) the Survey of Money Disbursements of wage earners and clerical workers living in large urban areas; and (2) a comprehensive Consumer Purchases Study of all native-born husband/wife families. The data derived from these surveys permitted the revision of the CPI, the selection of a new list of items to be priced in the index, and more extensive analyses of income and expenditure behavior of American families.

During 1941-42 the BLS cooperated with the Department of Agriculture in conducting a nationwide survey of the civilian noninstitutional population. The purpose of the survey was to provide a body of data on

which to base governmental decisions affecting the civilian economy during the second World War. This was the first nationwide survey that permitted the estimation of national consumption expenditures and savings classified by income class.

From 1944 to 1949, the BLS tested alternative techniques and methodologies designed to improve subsequent expenditure surveys. From these tests, many improvements were incorporated in the expenditure survey of 1950, which addressed the civilian noninstitutional population living in urban areas. The 1950 survey provided data for revision of the weights of the CPI and for analyses of consumption patterns.

The 1960-61 Survey of Consumer Expenditures was more ambitious than any of its predecessors. Covering all urban and rural families and single consumers, the survey followed an extensive testing of the latest collection and processing methodology. The primary purpose of the survey was to support the revision of the Consumer Price Index. However, the survey was also valuable in satisfying the growing interest of market researchers, government officials, and private users of data on income, expenditures, and assets and liabilities of American families. While food expenditure data were collected by a 7-day recall questionnaire, all other data were collected by interviewer-administered annual recall techniques.

Description of the survey

The 1972-73 Consumer Expenditure Survey consisted of two separate components, each with its own questionnaire and independent sample: (1) An interview panel survey in which each consumer unit¹ in the sample was visited by an interviewer every 3 months over a 15-month period and (2) a diary or recordkeeping survey completed by respondents for two consecutive 1-week periods. The decision to adopt the diary/quarterly-interview design was based on collection methodology developed by the BLS and the Survey Research Laboratory of the University of Illinois. These tests and the experience of other countries revealed that high quality data could be obtained in the 1972-73 CEX if questionnaires were tailored so that information on larger and more easily recalled expenditures was collected by periodic recall and information on small, less expensive items was collected by day-to-day recordkeeping.

Quarterly Interview Survey

The quarterly interview survey was designed to collect data on major items of expense as well as on income and family characteristics. Panels of sample households were established to allow for the collection of data throughout each quarter. Covering the calendar years 1972 and 1973, interviewing commenced in the first quarter of each year and was conducted over five consecutive quarters.

Interviews in the first quarter provided socioeconomic characteristics of the consumer unit and an inventory of durable items owned by the CU. The inventory items were recorded to prevent the duplication of expenditures in subsequent interviews. The first-quarter interview also recorded data covering a great variety of regularly-purchased items bought since the first of the year. The recall period for reporting data varied according to the difficulty of recall for a class of items. Data on housing, major equipment, vehicles, subscriptions and insurance were

collected annually. A semi-annual recall period was used to collect data on minor equipment, housefurnishings, renting and leasing of vehicles, and education. The following items were covered each quarter: repairs, alterations and maintenance of owned property; utilities, fuels, and household help; clothing and household textiles; equipment repairs; vehicle operating expenses; and out-of-town trips. The final interview in the fifth quarter provided the regularly-recorded expenses, plus information on housing expenses (i.e., ownership costs), work experience, changes in assets and liabilities, estimates of consumer unit income, and other selected financial information.

Some families moved away from the sample address during the interview period. These families were not followed to their new addresses, but were dropped from the survey. New families which moved into sample addresses during the survey period were screened for eligibility and included in the survey if found qualified. A family entering the survey after the first quarter was screened to determine whether or not the family existed as a consumer unit prior to residing at the sample address. If it did, all expenses at previous residences during the survey year were included in the survey. If it did not, data were collected for that portion of the survey period in which the family was eligible. Regardless of the period of eligibility, all families entering the survey after the first quarter were given a special questionnaire to record expenditure and income information.

Sample selection

The Nation was divided into 216 geographic areas defined in accordance with the sampling frame used for the Current Population

¹A description of the consumer unit concept appears in the glossary. (In Volume II.)

Survey. Thirty of these areas were self-representing, i.e., selected with certainty, primarily because of the size of the population areas represented. Half of the housing units in each of these self-representing areas were covered in the first survey year and half in the second survey year. The remaining 186 areas, comprising less populated areas and nonmetropolitan areas, were divided into two 93-area groups, each of which was covered in one of the two survey years. For each of these 186 areas, a primary sampling unit (PSU)² was selected with probability proportional to size using a controlled selection procedure to insure proper geographic distribution.

Housing units within the 216 geographical areas were further assigned to housing unit strata. Occupied housing units were stratified by income level, housing tenure, and size of primary family. Vacant housing units were assigned to certain other strata as were institutional persons, i.e., that portion of the population living in rooming or boarding houses or in doctors' or nurses' quarters of general hospitals. The selection of housing units was independent from the selection of institutional persons.

The actual sample of housing units was selected by computer from the 1970 Census 20-percent sample data file, which included those households completing the long form questionnaires. Approximately 25,000 housing units were designated for interview over the two-year quarterly interview survey collection period. A number of newly constructed housing units were included to update the sample for the period from the 1970 Census to the time of the interview. These new units were selected from reports of building permits issued for privately financed residential construction and were sampled independently within each PSU.

At the time of selection, housing units within a PSU were distributed by month within the quarter to allow for data collection throughout each quarter. Each sample unit was visited once each quarter, at approximately the same time in the quarter. To avoid duplication of reporting, data from all previous quarters were available at each interview.

Cooperation levels

Levels of cooperation were relatively high for each year of the interview survey, as shown in the tabulation below. This tabulation summarizes the types and levels of response for each survey year.

A total of 12,613 housing units were designated for interview in the first-year quarterly interview survey, and 13,014 were designated for interview in the second-year. Of these totals, 1,401 units in the first-year survey and 1,679 units in the second-year survey were determined to be Type B or C noninterview—that is, vacant, nonexistent, or ineligible for the period. The remaining housing units, 11,212 in the first-year survey and 11,335 in the second-year survey, were designated as the eligible units for the survey. Of all the eligibles, 1,298 in the first-year survey and 1,177 in the second-year survey were found to be Type A noninterview—that is, unable to contact, refusals, or temporary absences.

The table of cooperation levels shows that the total number of interviewed families was 9,914 in the first survey year and 10,158 in the second survey year. Some of these families were not included in the data tabulations, however, because they were temporarily absent during the fifth quarter collection period, making their questionnaires incomplete for tabulation purposes. The total number of sample families represented by the data tabulations in this bulletin are 9,869 in the first survey year and 10,106 in the second survey year.

Estimation of weights

Several factors were involved in determining the weight for each consumer unit for which a usable report was received from the field. One factor in assigning weights was the value of the inverse of the probability of selection of the housing unit. This value was equal to two times the initial sampling rate, and reflected the splitting of the sample into two 1-year components. For interviews which could not be conducted in occupied sample households because of refusals or because no one was home, or from CU's within households where there was more than one CU, a complex noninterview adjustment was made to correct for these deficiencies. Additional factors included ratio estimation in non-self-representing PSU's for color and residence; ratio estimation in all geographic areas for age, sex, and color to known civilian noninstitutional population controls; and a CU adjustment based upon family composition.³

²A PSU was usually a county or group of contiguous counties, except in certain areas of the Northeast, where a PSU was defined as a cluster of towns. PSU's included both urban and rural areas as well as farm and nonfarm areas.

³A technical description of the estimation procedure is available upon request.

Reliability of the data

Sample surveys are subject to two types of errors, nonsampling and sampling. Nonsampling errors can be attributed to many sources, such as definitional difficulties, differences in the interpretation of questions, inability or unwillingness of the respondent to provide correct information, mistakes in coding the data obtained, and other errors of collection, response, processing, coverage, and estimation for missing data.

Sampling errors occur because observations are not taken from the entire population. The standard error, which is the accepted measure for sampling error, is an estimate of the difference between the sample data and the data that would have been obtained from a complete census. The chances that an estimate from a given sample would differ from a complete census figure by less than one standard error (one sigma) are 68 out of 100. The chances that the difference would be less than 1.6 times the standard error are 90 out of 100, and the chances that the difference would be less than two times the standard error are 95 out of 100.

Estimating sampling error

Table A presents generalized constants which can be used to produce standard errors of mean values for income and expenditure categories. A single set of constants is provided for all classifications of families. In the computation of standard errors, the user is cautioned that the constants are applicable only at the category level described in table A, and that the reliability of standard error estimates is unknown for subclasses of the categories. The user is further cautioned that the mean estimates for blacks and other nonwhites in table 9, columns 3 and 4, tend to be less reliable than the estimates in columns 1 and 2 or than estimates shown in other tables.

The technique employed for the computation of standard errors varies according to whether a standard error is desired for a family characteristic or for an expenditure or income category. Various computation techniques are described below, all computations being

applicable within the range of 71,000 to 71,220,00 families.

The same A and B generalized constants can be used to compute standard errors for any family characteristic other than those expressed in percentages. The following formula should be used in conjunction with the constants:

$$(1) \quad \hat{\sigma}_k = K \sqrt{A + \frac{B}{N}}$$

where $A = -0.0000533663$ and $B = 5299.7$, $\hat{\sigma}_k$ is the standard error of the characteristic, N is the number of families having the characteristic, and K is the characteristic such as age or family size. As an example, the average family size for the 3,991,000 families in the \$3,000-\$3,999 income range was 1.9 persons during the survey period. Inserting the constants and the appropriate values for K and N into formula (1), the standard error is computed as 0.069. This means that the 68-percent confidence interval for family size is from 1.831 to 1.969, and the 95-percent confidence interval, from 1.762 to 2.038. It can, therefore, be asserted at a 68-percent level of confidence that the sample mean of 1.9 will differ by less than 0.069 from a mean obtained from a complete census. At a 95-percent level of confidence, it will differ by less than 0.138.

Standard errors can be computed for expenditure and income categories through use of the A and B constants in table A and the following formula:

$$(2) \quad \hat{\sigma}_{\bar{x}} = \bar{X} \sqrt{A + \frac{B}{2\bar{X}N}}$$

where $\hat{\sigma}_{\bar{x}}$ is the standard error of the mean value, \bar{X} is the mean value and A and B are the generalized constants for the specific category.

Standard errors can readily be computed through use of formula (2) and the generalized constants. For example, the mean expenditure for major appliances for all 71,220,000 families in the United States was \$89.48 during the survey period. Employing the appropriate A and B constants in conjunction with formula (2), the standard error is computed as \$1.65. This means that the 68-percent confidence interval around \$89.48 is from \$87.83 to \$91.13, and the 95-percent confidence interval, from \$86.18 to \$92.78. It can therefore be asserted at a 68-percent level of confidence that the sample mean of \$89.48 will differ by less than \$1.65 from a mean obtained from a complete census. At a 95-percent level of confidence, it will differ by less than \$3.30.

Standard errors can also be used to test the statistical significance of the difference between two sample values. Such a test will determine the probability that an observed difference between two means is real and has not occurred simply by chance because the data were drawn from a sample and not the entire population. For example, the mean expenditure for gasoline for all families in the West (12,953,000 families) was \$356.19 and for all families in the Northeast (17,138,000 families) was \$311.69. The question is whether the observed difference between the two mean expenditures, or \$356.19 - \$311.69 = \$44.50, is a real difference—in other words, that families in the West really do spend more for gasoline, on average, than families in the Northeast—or whether the observed \$44.50 difference has occurred by chance. This can be tested statistically by using the standard errors of each mean expenditure in conjunction with the following formula:

$$(3) \quad \hat{\sigma}_{\bar{x}_1 - \bar{x}_2} = \sqrt{\hat{\sigma}_{\bar{x}_1}^2 + \hat{\sigma}_{\bar{x}_2}^2}$$

where $\hat{\sigma}_{\bar{x}_1 - \bar{x}_2}$ is the standard error of the difference; $\hat{\sigma}_{\bar{x}_1}$ is the standard error of one mean; and $\hat{\sigma}_{\bar{x}_2}$ is the standard error of the other mean. This

formula is applicable only to the means of two disjoint populations (i.e., one population is not a subset of the other).

Through use of formula (2), standard errors of the two mean expenditures for gasoline are computed as \$5.98 and \$4.98 for families in the West and Northeast, respectively. Inserting these data into formula (3), the standard error of the \$44.50 difference between the two means is computed as \$7.78, i.e.,

$$\hat{\sigma}_{\bar{x}_1 - \bar{x}_2} = \sqrt{(5.98)^2 + (4.98)^2} = 7.78$$

The 68-percent confidence interval around \$44.50 is from \$36.72 to \$52.28, or \$44.50 plus or minus \$7.78; and 95-percent interval is from \$28.94 to \$60.06. Since the 95-percent interval does not include zero, it can be asserted at a 95-percent level of confidence that the estimated difference between the two means is not an accidental occurrence or the result of random influence. In other words, the difference between the two expenditure means is statistically significant.

Analyses of the difference between two means can also be performed on nondisjoint populations, where one population is a subset of the other. The formula for computing the standard error of the difference between two nondisjoint means is:

$$(4) \quad \hat{\sigma}_{\bar{x}_1 - \bar{x}_2} = \sqrt{\hat{\sigma}_{\bar{x}_1}^2 + \hat{\sigma}_{\bar{x}_2}^2 - 2\rho\hat{\sigma}_{\bar{x}_1}\hat{\sigma}_{\bar{x}_2}}$$

where $\hat{\sigma}_{\bar{x}_1 - \bar{x}_2}$ is the standard error of the difference; $\hat{\sigma}_{\bar{x}_1}$ and $\hat{\sigma}_{\bar{x}_2}$ are the standard errors of the two means; and ρ is the correlation coefficient, which averages about 0.2 for computations in this formulation.

Data collection and processing

Census activities

The 1972-73 Consumer Expenditure Survey marks the first time in Bureau of Labor Statistics (BLS) history that the collection of consumer expenditure data was contracted out to the U.S. Bureau of the Census. In addition to its collection duties, the Census Bureau was responsible for initial processing of the interview data. The family characteristic components of each family record were screened for coding completeness. Computer adjustments were made to expenditure data in some sections, e.g., housing and transportation, to separate the business portion of expense entries from the consumption portion. Missing information in the liability section of the questionnaire was derived from special computer edits. In addition, the Census Bureau supplied special nonresponse codes which were entered in expenditure fields when purchases were indicated, but no expenditure data were reported. The Census Bureau also was responsible for quality control and the production of weights based on BLS specifications. Final tapes of the edited and coded data were then transmitted to the Bureau of Labor Statistics.

BLS activities

The BLS created special codes for data classification purposes, e.g., family size codes from family member data. Programs were written to arrange the expenditure data into expenditure classes suitable for publication. Tolerance listings were produced to expose keypunching errors or questionable reports of large magnitude. However, only limited updates could be undertaken, and only a limited number of corrections could be made because of the enormous volume of data. Hence, the data base may contain unusual entries.

The income data reported in the interview were inspected for completeness. While no imputation was conducted, incomplete income

reports were identified and coded. The value of income reported from major sources, such as income from unincorporated business and from wages and salaries, was cross-referenced with reports of weeks worked by each family member. Families were coded as incomplete reporters if the head reported weeks worked but failed to report income from such employment. For cases in which the family head did not work, the same procedure was applied to the spouse or other family members who did work. A number of questionnaires contained no members who were employed during the income reference period—most typically, retired couples. These families were assigned incomplete income codes if they reported receiving pension, annuity, or Social Security income but did not provide dollar reports for these income items. Similarly, families reporting no work experience but indicating receipt of nonemployment income such as welfare benefits or alimony payments were coded as incomplete income respondents if no dollar values for such items were reported.

Using special Census nonresponse codes, procedures were developed and implemented by the BLS to impute values in expenditure fields when purchases were indicated by a respondent but no expenditure data were reported. The imputed values were obtained from like-classified survey families reporting complete information for an item. Due to the relatively high degree of completeness in expenditure reporting, very little imputation was required.

The last major processing step for the quarterly interview survey was the development and implementation of an extensive program to convert the expenditure data obtained for the various recall collection periods to annual estimates. At the same time, estimates of sales taxes were produced for expenditure items. At the conclusion of these processing activities, a set of tabulations was produced to review for reasonableness and statistical reliability.

Presentation of survey results

This volume contains 10 tables which present expenditure, income, and other financial data from the quarterly interview component of the 1972-73 Consumer Expenditure Survey. In four tables, all U.S. families are classified by family income before taxes (income classes), family income before taxes (decile classes), age of family head, and race of family head. Six additional tables classify families by family income before taxes for six family size groupings.

The data in this bulletin represent all expenditure categories in the quarterly interview survey. However, they do not constitute total expenditures because not all items of expense were collected in the quarterly interview survey. For example, the household operations category does not include housekeeping supplies, which were reported exclusively in the diary survey. For the same reason, the quarterly interview survey includes only limited information on personal care products and does not include nonprescription drugs in medical care. In addition, it should be noted that food at home is not the sum of item detail, as it is in the diary survey, but is the response to a set of individual, global questions. A more detailed account for food is available from the diary component and has been published in BLS Bulletin 1959. The user should also be aware that expenditures for owned dwellings exclude payments on the mortgage principal, which appear as a separate line item and are also included as a reduction in liabilities.

Some values presented in this bulletin may differ from the preliminary, combined-year averages presented in previous BLS publications due to additional processing of the interview data base and slight differences in the underlying concept of certain survey categories.

The data shown for individual expenditure items do not include gifts to organizations or to persons outside the family. Gift expenditures are summed and tabulated in a separate category as gifts and contributions. Gift expenditures as a proportion of consumption expenditures tend to

vary by consumption category. For example, the proportion of total clothing expenditures devoted to gifts is likely to be greater than the proportion of total furniture expenditures devoted to gifts.

Certain expenditures are tabulated by function. For example, gasoline appears under transportation and also under recreation as part of vacations and trips. Total gasoline is the sum of the two parts. Other components that are treated similarly are food, alcoholic beverages, lodging, and other transportation.

The average annual expenditure data shown are for all families with specified characteristics, regardless of whether the families incurred an expense for a given product or service during the survey period. Thus, table 1 shows the average annual expenditure for television sets over the 2-year survey period to be \$46.54. However, only 15.8 percent of the families reported purchases of a TV set. By dividing \$46.54 by 15.8 percent, it can be determined that the average expenditure for those families making the purchases was \$294.55.

An individual family may spend more or less than the average, depending on its particular set of characteristics. For example, tables 1 and 4 show that all families in the U. S. spent, on average, \$89.48 per year on major appliances, while the average for all three-person families was \$117.53. Even among families having similar characteristics, expenditures may differ substantially. Users should also keep in mind that prices for many goods and services have risen sharply since the survey was conducted.

Some income and financial data contain values with negative signs. These occur either because of special processing requirements, or because losses or reductions in value were recorded. For example, net income from own business and own farm have negative signs when losses were experienced; and data for assets and liabilities may have negative signs to reflect reductions in these items. To compute the net

change in assets and liabilities as a group, the user should subtract the liability, with its sign, from the asset value, with its sign. The items which have negative signs only because of special processing requirements are personal taxes, union dues, occupational expenses, and mortgage principal payments.

Users may wish to examine the change in consumption patterns that took place between the 1960-61 Survey of Consumer Expenditures and the 1972-73 CEX. A concordance of major expenditure categories from these two surveys appears in BLS Bulletin 1992 (Consumer Expenditure Survey: Integrated Diary and Interview Survey Data, 1972-73).

Caution

Data in columns which represent less than 218,000 families or in cells which represent less than 18,500 families are likely to have large sampling errors. The number of families represented in a column is shown at the head of each column of data. The number of families in a cell can be determined by multiplying the percent reporting figure in each cell times the number of families shown at the head of the column. See the section on Reliability of Data, p.vii, for a more complete discussion of sampling and nonsampling errors.

¹ Data in columns which represent less than 218,000 consumer units or in cells which represent less than 18,500 consumer units are likely to have large sampling errors.

² Percents may not sum to 100 due to rounding.

³ Data represent only those expenditures collected in the interview survey, not the total of all family expenditures. Current consumption excludes personal insurance, gifts and contributions.

¹ Data in columns which represent less than 218,000 consumer units or in cells which represent less than 18,500 consumer units are likely to have large sampling errors.

² Value less than 0.05 percent.

³ Percents may not sum to 100 due to rounding.

⁴ Data represent only those expenditures collected in the interview survey, not the total of all family expenditures. Current consumption excludes personal insurance, gifts and contributions.

** Data not available.

¹ Data in columns which represent less than 218,000 consumer units or in cells which represent less than 18,500 consumer units are likely to have large sampling errors.

² Percents may not sum to 100 due to rounding.

³ Data represent only those expenditures collected in the interview survey, not the total of all family expenditures. Current consumption excludes personal insurance, gifts and contributions.

⁴ Value less than 0.05 percent.

** Data not available.

¹ Data in columns which represent less than 218,000 consumer units or in cells which represent less than 18,500 consumer units are likely to have large sampling errors.

² Percents may not sum to 100 due to rounding.

³ Data represent only those expenditures collected in the interview survey, not the total of all family expenditures. Current consumption excludes personal insurance, gifts and contributions.

⁴ Value less than 0.05 percent.

** Data not available.

¹ Data in columns which represent less than 218,000 consumer units or in cells which represent less than 18,500 consumer units are likely to have large sampling errors.

² Percents may not sum to 100 due to rounding.

³ Data represent only those expenditures collected in the interview survey, not the total of all family expenditures. Current consumption excludes personal insurance, gifts and contributions.

** Data not available.

¹ Data in columns which represent less than 218,000 consumer units or in cells which represent less than 18,500 consumer units are likely to have large sampling errors.

² Value less than 0.05 percent.

³ Percents may not sum to 100 due to rounding.

⁴ Data represent only those expenditures collected in the interview survey, not the total of all family expenditures. Current consumption excludes personal insurance, gifts and contributions.

** Data not available.

¹ Data in columns which represent less than 218,000 consumer units or in cells which represent less than 18,500 consumer units are likely to have large sampling errors.

² Percents may not sum to 100 due to rounding.

³ Data represent only those expenditures collected in the interview survey, not the total of all family expenditures. Current consumption excludes personal insurance, gifts and contributions.

⁴ Value less than 0.05 percent.

** Data not available.

¹ Data in columns which represent less than 218,000 consumer units or in cells which represent less than 18,500 consumer units are likely to have large sampling errors.

² Value less than 0.05 percent.

³ Percents may not sum to 100 due to rounding.

⁴ Data represent only those expenditures collected in the interview survey, not the total of all family expenditures. Current consumption excludes personal insurance, gifts and contributions.

¹ Data in columns which represent less than 218,000 consumer units or in cells which represent less than 18,500 consumer units are likely to have large sampling errors.

² Percents may not sum to 100 due to rounding.

³ Data represent only those expenditures collected in the interview survey, not the total of all family expenditures. Current consumption excludes personal insurance, gifts and contributions.

⁴ Value less than 0.05 percent.

** Data not available.

¹ Data in columns which represent less than 218,000 consumer units or in cells which represent less than 18,500 consumer units are likely to have large sampling errors.

² Percents may not sum to 100 due to rounding.

³ Data represent only those expenditures collected in the interview survey, not the total of all family expenditures. Current consumption excludes personal insurance, gifts and contributions.

Glossary

Family characteristics

Population coverage. The eligible population included the civilian noninstitutional population of the United States as well as that portion of the institutional population living in rooming or boarding houses or in doctors' and nurses' quarters of general hospitals. Armed Forces personnel living outside military installations were included in the coverage while Armed Forces personnel living on post were excluded. Also excluded from the address sample were college dormitories, fraternity or sorority houses, prisons, monasteries, ships, or other quarters containing five unrelated persons or more.

Some sample families moved out during the survey period and were replaced by a new family at the same address. If the replacement family existed as a family unit from the beginning of the survey year, the family was considered a full-year family, and expenditures for that period were reconstructed. If, on the other hand, the replacement family was newly formed during the survey year, each member of the family was considered a part-year person, and all data reported by the replacement family were adjusted to reflect the family's part-year participation. A more complete description of the treatment of fractional persons can be found in the family size section of this glossary.

A consumer unit (CU) is defined as (1) a group of two persons or more, usually living together, who pool their income and draw from a common fund for their major items of expense, or (2) a person living alone or sharing a household with others, or as a roomer in a private home, lodging house or hotel, but who is financially independent—that is, the person's income and expenditures were not pooled with other residents.

Head of consumer unit refers to the husband in husband/wife families. In other than husband/wife families, the head was considered to be the

person designated as such by the other consumer unit members. This is in accordance with Bureau of the Census practice at the time the survey was conducted.

Family Income is defined in detail later in this glossary.

Complete and incomplete reporting of income. This bulletin contains tables in which families are classified by income. In the dollar class tables, each income class contains families whose combined income falls within the class range shown. Families that participated in the survey but failed to report sufficient income information for classification are shown separately in the tables. In general, when the primary family earner indicated being employed but did not report income from such employment, the family was tabulated as an incomplete income reporter. For cases in which no members were employed during the income reference period—most typically, small families with retired heads—families were assigned incomplete income codes if they reported receiving pension, annuity, or Social Security income but did not provide dollar values for these income items. It is important to note that even complete income reporting families may not have provided a full accounting of all sources and levels income but might have met the criteria for being designated as complete reporters.

For tables employing income dollar classes as a sorting variable, families from each year of the survey were classified according to their reported income estimates. Users should be aware that families reporting a particular level of income for 1972 may not be at the same point in the 1972 income distribution as families in the 1973 income distribution reporting an identical level of income. No attempt was made to adjust incomes or expenditures to a common annual period.

In Table 10 of this bulletin, families are arrayed by income deciles. Columns in this table contain families from each year of the survey

whose incomes were at the same points of their respective survey year income distributions. This format should help users make comparisons over time.

Family size refers to the number of persons in the consumer unit during the survey period. Some family members may not have been in the consumer unit for the entire survey period and were considered part-year persons. This could have occurred when (1) a survey family added or lost family members due to births, deaths, marriages, etc., occurring during the survey period; or (2) a survey family moved out during the survey period and was replaced by a newly formed family for the remainder of the survey period. Each member of the replacement family was considered a part-year person. For example, consider a consumer unit consisting of a husband and wife that participated in the survey for 3 months. Each member would have been considered 1/4 person, so that together, the consumer unit would have been made up of 1/2, or of 0.5, persons. The general rule for computing family size was to sum the number of family member weeks for all eligible persons and divide that total by 52 weeks.

For classification purposes, the tables in this report define one person families as 0-1.0 persons, two person families as 1.1-2.0 persons, three person families as 2.1-3.0 persons, four person families as 3.1-4.0 persons, five person families as 4.1-5.0 persons, and six or more person families as 5.1 persons and over.

Age of family head refers to the age in years of the head of the consumer unit at the time of the first interview.

Geographic regions. Data are presented in this report for four regions of the United States—Northeast, North Central, South, and West. Families represented in the tables are grouped under one of the four regions depending on the address at which the family was residing during the survey period.

Housing tenure refers to the family's principal place of residence during the survey. Owner includes families living in their own homes, cooperatives, or condominium apartments or townhouses for the entire

survey year. Renter includes families paying rent as well as families living rent free for the entire survey year. Other and not reported includes consumer units who were both owners and renters during the survey, and CU's who did not report.

Education of family head refers to the years of formal education of the CU head on the basis of the highest grade completed. If enrolled at the time of the interview, the grade being attended was the one recorded. Persons not reporting the extent of their education were classified under 'no school or not reported.'

Race of family head refers to the race of the head of the consumer unit. All families were included in one of three racial groups: white, black, or other. Families of mixed race were classified according to the race of the family head.

Automobile ownership refers to the percent of families owning at least one automobile at any time during the year in which the family participated in the survey.

Expenditures and income

This bulletin contains the most detailed glossary of quarterly interview expenditures and income items presented to date. For convenience and clarity to the user, this part of the glossary is divided into two parts:

- (a) Table B-1, which includes a list of stub items shown in the publication tables along with corresponding item codes or ranges of item codes; and
- (b) Table B-2, which includes a list of item codes followed by a description of each code.

These two parts of table B permit the user to easily determine the exact description of any published stub item. For example, table B-1 shows that the item, Outdoor Furniture, comprises the item codes 07058 through 07061. By reference to table B-2, it can be determined that the item codes specify wooden (07058), metal (07059), plastic and vinyl (07060), and other (07061) outdoor furniture.
