Preface

This bulletin presents statistics on annual earnings and employment in the United States in 1973, 1974, and 1975. The Bureau of Labor Statistics (BLS) developed the data from a 1-percent random sample of records of the Social Security Administration and the Railroad Retirement Board. The data provide a more accurate picture of annual earnings and employment patterns by industry than is available from any other source. The data are the latest available from the Social Security Administration and provide historical continuity with the other published data in the series.

Previous BLS bulletins in this series were published for 1964, 1965, 1966-67, 1970, and 1971-72. Data for 1968 and 1969 have been tabulated and stored by BLS for future

analysis. Because of delays in data availability and processing, the 1973 and 1974 reports have been combined with 1975 data -- in a reduced format -- in this publication. Tables included in Bulletin 1928 for 1971-72 but excluded from this publication are available upon request from BLS.

This bulletin was prepared in the Bureau's Division of General Compensation Structures by Melvin Eggleston, under the general direction of Alvin Bauman.

Material in this publication is in the public domain and may be reproduced without the permission of the Federal Government. Please credit the Bureau and cite *Annual Earnings and Employment Patterns of Private Nonagricultural Employees, 1973-75*, Bulletin 2031.

Introduction

BLS initiated a program of data collection in the 1960's to fill a gap in knowledge about annual earnings of private nonagricultural employees by industry. Hourly and weekly earnings data reported in other studies cannot be converted to annual earnings estimates with any degree of precision because annual earnings are determined by the interaction of variables such as straight-time rates of pay, number of hours worked, and hours worked at premium rates. These, in turn, depend on other variables such as occupation, union status, industry, and area. Moreover, some workers move into and out of the labor force during the year. In addition, a substantial portion work for more than one employer in the same industry or for one or more employers in different industries.

The first study in this series covered 1964, and was limited to wage and salary earnings subject to social security taxation only. Subsequent studies included data on wage and salary earnings covered under either the Social Security Act or the Railroad Retirement Act.

This publication continues the extended earnings cover-

age. The reference tables for this bulletin contain industry information on medians and frequency distributions of the annual earnings of wage and salary earners by selected worker characteristics. These include race, sex, age, region, industry of major earnings, and the number of quarters worked during the year. Earnings and employment data are provided for industry divisions, 2-digit Standard Industrial Classification (SIC) industry groups, and most 3-digit SIC industries. Table format changes between 1973 and 1974 reflect the industry classification changes introduced in the *Standard Industrial Classification Manual, 1972*. Two types of earnings information were tabulated for each worker: Earnings in the industry of major earnings during a given year; and total earnings, regardless of industry, in that year.

The data are unique because, unlike annual earnings data from other sources, they permit an analysis of the distribution of wage and salary earnings and employment patterns of workers by industry.

Technical Notes

Sources of data

Data for the Annual Earnings and Employment Patterns program are obtained from a 1-percent random sample of the earnings records of individual employees maintained by the Social Security Administration and the Railroad Retirement Board. Each employer covered by the Social Security Act is required to report the industry, place of employment, and amount of wages or salary paid to each employee during the calendar year up to the maximum taxable limit--\$10,800 for 1973, \$13,200 for 1974, and \$14,100 for 1975. All individuals covered under the system provide demographic information (date of birth, sex, and race) when applying for a social security number. Employers with workers whose earnings come under the jurisdiction of the Railroad Retirement Board are required to report earnings up to a monthly limit--\$900 in 1973, \$1,100 in 1974, and \$1,175 in 1975.

Estimation of earnings

To eliminate the gap between actual and reported (taxable) earnings, the Social Security Administration uses a "limit-quarter" concept--that quarter in which the taxable limit is reached. Earnings in the limit-quarter become the estimated figure for all subsequent quarters if they are higher than earnings in the previous quarters. If earnings are lower in the limit-quarter, earnings in the previous quarter are substituted in the limit-quarter and all subsequent quarters. After these computations, the sum of quarterly earnings becomes the estimated annual total unless the taxable limit is reached in the first quarter. In that case, the Social Security Administration uses \$73,500 for men and \$60,900 for women as the estimated total for 1973, with \$93,200 and \$91,500 for 1974, and \$101,400 and \$98,100 for 1975.

Employers whose workers are covered under the Railroad Retirement Act are similarly required to report earnings but on a monthly maximum basis rather than on an annual maximum. To eliminate the gap between actual and reported monthly earnings, the BLS applies "step-up factors", calculated for each occupational group by the Railroad Retirement Board, to credited monthly earnings of each individual in this study. To determine occupational step-ups, the Board takes a 1-percent sample of earnings records. Actual aggregate earnings of individuals in the sample are compared, by occupation, to aggregate earnings of the same individual when taxable limits are used. This comparison yields the step-up factor, as the following example, which assumes a monthly limit of \$650, illustrates:

	<i>Sample employees</i>			<i>Occupation, total</i>
	<i>1</i>	<i>2</i>	<i>3</i>	
Actual earnings	\$750	\$600	\$675	\$2,025
Reported earnings . . .	650	600	650	1,900

$$\$2025 \div 1900 = 1.066 = \text{step-up factor}$$

Definitions of terms and methods of classification

Annual earnings. Annual earnings are defined as gross wages, salaries, and other payments received by employees in employment covered under the Social Security Act or the Railroad Retirement Act. Such payments may be cash, cash equivalents, or other media such as goods, clothing, board, or lodging. Most payments by employers which fall under the general heading of supplements to wages and salaries are not counted as earnings in this series.

Earnings and employment data for self-employed individuals, workers in agriculture, and most government workers are not included.

Workers with some earnings in the industry. Individuals are counted in each industry in which they earned \$1 or more during the year. For example, an individual who had some earnings in two 3-digit industries, both within the same 2-digit industry grouping is counted two times at the 3-digit level but only once at the 2-digit level. It follows that employment estimates at increasing levels of aggregation are smaller than the total at the next lower level.

Industry of major earnings. The concept of industry of major earnings was developed to provide industry data which excluded individuals who were only casually employed in that industry during the year. As each employee-employer combination within the sample has a separate record, data for an individual worker can be included for several different industries, depending on work experience. To avoid this duplication of data and provide more representative industry information, workers are assigned to an "industry of major earnings" at the 3-digit SIC level. This is the industry from which the worker received the largest portion of total wage and salary earnings. This assignment does not change at higher levels of aggregation. Thus, a worker is prevented from being identified as one with major earnings in different industries at different SIC levels.

Median earnings. Median annual earnings, the midpoints of earnings distributions, were computed from data grouped into \$250 intervals. Minor differences in medians for the same grouping of workers as shown on different tables result from rounding and from slightly different methods of entering the data into the computer file at various stages of processing.

Quarters of work. For social security coverage, a quarter of work is defined as a calendar quarter in which a worker earned any pay in covered employment; household workers must earn at least \$50. Workers who reach their maximum taxable earnings limit in a single employment before the fourth quarter of the year are considered to have worked in each quarter, although earnings above the maximum are not reported.

Employer. An employer is defined here as an individual, partnership, or corporation recognized as a separate legal entity meeting certain criteria. However, since a firm may have a separate corporation for each of its locations and each corporation may be considered to be a separate employer, a worker transferred by the firm from one location to another may be classified as having more than one employer in the same year even though continuing to work for the same firm.

Industrial classification. The employment and earnings data in this report are based on the Social Security Administration's data file and classified according to the Administration's industrial classification system. This classification differs slightly from that developed by the U.S. Bureau of the Budget and published in the *Standard Industrial Classification Manual, 1972* (SIC), which is employed in most other statistical series. The major difference is in the assignment of industry codes to nonpolicymaking governmental units. In this study, all such separable units are assigned industry classifications appropriate to their activity.

Employment and earnings data in this report based on the Railroad Retirement Board's data file are classified into the following industries as defined in the *SIC Manual*: Railroads, SIC 401; sleeping car companies, SIC 478; express companies, SIC 404; rail car rental companies, SIC 474; other companies performing services in railroad transportation, SIC 861; and certain railway labor organizations, SIC 863. Workers are assigned on the basis of the industrial classification of their last employer under the Railroad Retirement Act.

Single- and multi-industry workers. At each level of industry classification (i.e., 3-digit, 2-digit, and division) the employment experience of each sample member was examined to see if all earnings during the year were in one or more than one industry. Those with earnings in more than one industry were classified as multi-industry workers. This conceptual approach may be seen for a worker who

was employed in each of two 3-digit industries within the same 2-digit industry. At the 3-digit level, the worker is classified as a multi-industry worker. However, at the 2-digit and the divisional level the worker is classified as a single-industry worker; both 3-digit industries in which the worker was employed are part of the same 2-digit industry and the same industry division.

Regions. Data are given separately for five regions. Regions covering the 50 States and the District of Columbia are: *Northeast*—Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont; *South*—Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia; *North Central*—Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin; and *West*—Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming. The fifth region includes all employment covered under the Social Security Act in U.S. territories, on foreign soil, or aboard ocean-going vessels.

Because the data file for this study does not indicate the location of the work covered by the Railroad Retirement Act, a convention was adopted ascribing all employment covered under the Railroad Retirement Act to the North Central region where many railroads and related organizations have headquarters.

Race. All workers in this study have been divided into two groups by race: "white" and "black." The white category includes all races other than black. The sample was not large enough to permit separate presentation of data for minority races other than black.

Sample design

The sample, selected by a multistage systematic cluster sampling procedure, includes 1 percent of all social security numbers¹. Any individual, once selected, remains permanently in the sample and is identified by social security number. To preserve confidentiality and facilitate statistical processing, the Social Security Administration combines data from various employers and assigns each individual and employer a permanent control number, different from the social security and employer identification numbers.

¹ For a detailed discussion of the sampling procedure as well as reporting criteria and coverage under the social security and railroad retirement systems, see U.S. Department of Health, Education, and Welfare, Social Security Administration, *Workers Under Social Security, 1960 (1968)* and *Social Security Handbook*; also see *Handbook on Railroad Retirement and Unemployment Insurance Systems*. The discussions on sampling and nonsampling variability have been taken from *Earnings Distribution in the United States 1967* (U.S. Department of Health, Education, and Welfare, Social Security Administration, Office of Research and Statistics, 1971), pp. 317-18.

Sampling variability

Estimates based on samples can be expected to differ from figures that would have been obtained had all records been used for the compilations. This difference is measured by the standard error. The chances are about 68 out of 100 that the difference due to sampling variability between a sample estimate and the figure that would have been obtained from a compilation of all records is less than the standard error. The chances are 95 out of 100 that the difference is less than twice the standard error and about 99 out of 100 that it is less than $2\frac{1}{2}$ times the standard error. The standard error of an estimate depends on the sample design elements such as the method of sampling, the sample size, and on the estimation process.

No exact calculation has been made of standard errors of estimates based on the stratified cluster continuous work history samples. However, approximate standard errors of estimates utilizing the assumption of simple random sampling are likely to be reasonably close to those for the actual sample design used for many attribute statistics. While the actual method of selection (stratified cluster sampling) differs from simple random sampling, there is evidence that, for most statistics, the several factors affecting the sampling variability give a joint factor close to that for simple random sampling.

Sampling variability of estimated number of persons.
For the convenience of the reader, table 1 provides approxi-

Table 1. Approximate sampling variability of estimated number of persons

Estimated number	Range of 95 chances out of 100
500	500
800	600
1,000	700
3,000	1,100
5,000	1,400
8,000	1,800
10,000	2,000
30,000	3,300
50,000	4,500
80,000	5,600
100,000	6,300
300,000	10,800
500,000	14,000
800,000	17,600
1,000,000	20,000
3,000,000	33,000
5,000,000	44,000
8,000,000	55,500
10,000,000	63,000
30,000,000	108,000
50,000,000	110,000
80,000,000	112,000
100,000,000	115,000

mations of sampling variability (95-percent confidence level) for estimates of the number of persons with given characteristics. The estimates and approximate sampling variability shown for the data have been inflated by 100. Linear interpolation may be used for estimated numbers not shown.

Sampling variability of estimated percentage of persons.
The reliability of an estimated percentage depends on both the size of the percentage and the size of the total upon which the percentage is based. Table 2 shows the approximate sampling variability (95-percent confidence level) for percentages (of persons with a given characteristic). The body of the table is expressed in percentage points. The bases shown are expressed in terms of data inflated by 100. Linear interpolation may be used for percentages and base figures not shown.

Table 2. Approximate sampling variability of estimated percentages

Base of percentage (inflated sample)	Range of 95 chances out of 100				
	Estimated percentage				
	2 or 98	5 or 95	10 or 90	25 or 75	50
500	12.5	19.5	26.8	38.7	44.7
1,000	8.9	13.8	19.0	27.4	31.6
5,000	4.0	6.2	8.5	12.2	14.1
10,000	2.8	4.4	5.9	8.8	10.0
100,000	.9	1.4	1.9	2.7	3.1
1,000,000	.3	.5	.6	.9	1.0
10,000,000	.1	.2	.2	.3	.3
100,000,000	(¹)	.1	.1	.1	.1

¹ Less than 0.05.

Sampling variability of estimated mean earnings. A rough approximation of the standard error of an estimated mean can be calculated from the distribution from which it was obtained. The formula can be found in elementary statistics texts (for example, *Applied General Statistics*, by Croxton and Cowden, Prentice Hall, 2nd Ed. 1955, p. 218).

Nonsampling variability

Because of the nature of the social security program and the manner in which it is administered, some variability would be present in a complete compilation of records as well as in a sample. For example, the data relate to covered employment rather than all employment, changes in earnings records may not be reflected promptly because of time-lags in posting and processing, and errors may occur in classification and compilation. The errors introduced as a result of these factors are probably negligible, however.

Additional factors contributing to nonsampling variability are: (1) duplication in the estimates of workers because of persons receiving wage credits from different employers on more than one account number; (2) the extent to which covered earnings are reported, taxed, and credited; and (3) the distribution of workers and aggregate wages above the maximum earnings base.

Relation to other studies

Data in this bulletin have been developed, as previously described, from information reported by employers about the earnings of individuals up to an earnings limit and agency estimates of earnings above the limit. Although annual earnings and employment data are available from the Current Population Survey (CPS) of the Bureau of the

Census, they are based on a different concept of industry attachment (i.e., industry of longest job, rather than industry of major earnings), and provide only for industry division data, while data in the study presented here cover industry divisions, major 2-digit SIC groups, and the most important 3-digit groups. Moreover, other differences in methods or approach may result in important differences in sampling and nonsampling variances between this and other studies. For example, CPS data are based on household interviews, whereas the data in this bulletin are based on employer tax returns. Furthermore, CPS data for recent years are not comparable with data for years prior to 1967 because of changes in methodology in the CPS. Therefore, caution must be exercised in using the data presented in this bulletin in conjunction with other annual earnings and employment data.

Table A-1. All workers, by race

INDUSTRY	EARNINGS FROM MAJOR INDUSTRY BY QUARTERS WORKED IN THE INDUSTRY						EARNINGS FROM ALL WAGE AND SALARY EMPLOYMENT BY QUARTERS WORKED IN THE INDUSTRY

¹ White includes workers of all races other than Black.

NOTE: A dash (-) indicates either that the sample did not include

any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

¹ Because the data file for this study does not indicate the place of employment of workers covered by the Railroad Retirement Act, employees of railroads and railroad-related organizations were considered to be employed in the North Central region where many railroads and related organizations have headquarters.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics or that the data did not meet the Bureau publication criteria.

¹ Workers who had some earnings in more than one industry group and in more than one industry division are included in the count of those with some earnings in each industry group and division. Thus, some workers are counted more than once, and, therefore, detail does not add to total. Small differences may exist between employment totals of individual two-digit industries and the sum of their three-digit components because data

are not sufficient to permit assigning some workers to a three-digit industry.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

¹ White includes workers of all races other than Black.

² Workers who had some earnings in more than one industry group and in more than one industry division are included in the count of those with some earnings in each such industry group and division. Thus, some workers are counted more than once, and, therefore, detail does not add to total. Small differences may exist between employment totals of individual

two-digit industries and the sum of their three-digit components because data are not sufficient to permit assigning some workers to a three-digit industry.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

¹ Workers who had some earnings in more than one industry group and in more than one industry division are included in the count of those with some earnings in each such industry group and division. Thus, some workers are counted more than once, and, therefore, detail does not add to total.

Small differences may exist between employment totals of individual two-digit industries and the

sum of their three-digit components because data are not sufficient to permit assigning some workers to a three-digit industry.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

¹ Small differences may exist between employment totals of individual two-digit industries and the sum of their three-digit components because data are not sufficient to permit assigning some workers to a three-digit industry.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.

¹ Because the data file for this study does not indicate the place of employment of workers covered by the Railroad Retirement Act, employees of railroads and railroad-related organizations were considered to be employed in the North Central region where many railroads and related organizations have headquarters.

NOTE: A dash (-) indicates either that the sample did not include any workers with these characteristics, or that the data did not meet the Bureau publication criteria.
