# Preface

This bulletin on children of working mothers in March 1981 is part of the Special Labor Force Report series. It discusses the increase in the number of children with working mothers and the two major reasons for this growth. This bulletin consists of an article first published in the *Monthly Labor Review*, February 1982, additional tables providing more detailed data, and explanatory notes.

The data were compiled from supplementary questions to the March 1981 Current Population Survey, conducted and tabulated for the Bureau of Labor Statistics by the Bureau of the Census.

Material in this publication is in the public domain and may, with appropriate credit, be reproduced without permission.

# More than half of all children have working mothers

ALLYSON SHERMAN GROSSMAN

More children than ever before have mothers who are in the labor force. In March 1981, 31.8 million youngsters below age 18—54 percent of the Nation's total—had mothers who were either employed or looking for work. (See table 1.) Since 1970, the number of children with working mothers has grown by 6.2 million despite a 6.6-million decline in the children's population.<sup>1</sup>

By March 1981, a record 8.2 million children below age 6—45 percent of all preschoolers—had working mothers. A year earlier, these figures were 7.7 million or 43 percent. Two major factors accounted for this growth. First, the long-term increase in labor force activity among mothers below age 35 accelerated over the year. Their participation rate advanced by more than 2 percentage points, to reach 49 percent. Second, as the number of births among these women increased,<sup>2</sup> the population below age 6 grew by nearly 400,000. At the same time, the population of school-age children (6-to-17-year-olds) dropped substantially over the year, and the number of these children with working mothers also declined. Thus, preschoolers accounted for all of the year's net increase in the number of children with working mothers.

## More young mothers working

Reflected in these patterns are the changing work and marital profiles of women born during the post-World War II baby boom. For instance, between March 1980 and March 1981, the number of working mothers increased by 600,000 to reach 18.4 million, and those with children below age 6 were responsible for 60 percent of the gain. Within this group, women between the ages of 25 and 34 registered the greatest increases. These women have generally been showing a propensity to delay marriage, postpone childbearing, and ultimately to have fewer children than women of comparable ages in the past. As a result, many of those who eventu-

ally become mothers have spent more years in the labor force than many of their predecessors, and they often choose to remain in the work force or return to it soon after childbearing. In contrast, the early marriage and prolific childbearing patterns of a generation ago resulted in the almost automatic and prolonged withdrawal of young mothers from the labor force.<sup>3</sup>

Because of these trends, the traditional concept of a family with the father as the only earner has changed dramatically. For example, both parents were earners in about 60 percent of all married-couple families with children under 18 years in 1981. (See table 2.) On average, these dual-earner families were smaller than comparable single-earner families. Fewer than 6 of 10 had more than one child, compared with nearly 7 of 10 of the one-earner families. Among families maintained by women, the presence of earners was affected by the number of children. For instance, of families with children, 65 percent of those without earners had more than one child compared with less than half of those with earners.

Other sociological changes of the 1970's also contributed to the growing number of children with working mothers. Two of these were the increase in the divorce rate and the growing occurrence of unwed mothers. In 1981, 11.6 million youngsters—1 of every 5—were living with their mother or their father only. This was almost 60 percent more than in 1970, when 1 of every 9 youngsters lived with only one parent. Most lived with their mothers; however, small increases have been posted in the number of children living only with their father. Black children were far more likely than white children to be living with one parent (50 percent of black children, compared with 15 percent of white children).

Despite the recent surge into the labor force of mothers with younger children, older children remain more likely than younger ones to have working mothers. For example, of all children between the ages of 14 through 17 who lived in two-parent families in March 1981, 60 percent had mothers in the labor force, compared with 56 percent of the 6-to-13-year-olds and 45 percent of

---

<sup>1</sup> Children are defined as "own" children of the family. Included are never-married daughters, sons, stepchildren and adopted children. Excluded are other related children such as grandchildren, nieces, nephews, cousins, and unrelated children.

<sup>2</sup> Includes only divorced, separated, widowed, or never-married persons.

NOTE: Due to rounding, sums of individual items may not equal totals.

the children under 6. Among children living with their mother only, the proportion whose mothers worked was two-thirds for those between the ages of 6 and 17 and one-half for those below age 6. (See table 3.)

### Socioeconomic characteristics

Proportionately more black (59 percent) than white children (53 percent) had working mothers in 1981.

This difference has been narrowing in recent years as white mothers have joined the work force at a faster pace than black mothers. Nevertheless, at every age level, black children in 2-parent families were still more likely than white children to have a working mother. In one-parent families, however, the situation was reversed; a larger share of white than black children had a working mother. Hispanic children were less apt than either white or black children to have working mothers.

Regardless of race, ethnic origin, or family type, children with a working mother were in families with considerably higher incomes, on average, than were children whose mother was out of the labor force. The median income in 1980 for all two-parent families with children was \$26,500 when the mother worked and \$21,300 when she did not.

Generally, white children live in families with higher incomes than black children. Family income for white, two-parent families with children averaged \$26,900 when the mother was in the labor force and \$21,700 when she was not. Comparable median incomes for black families were \$23,000 when the mother worked and \$14,900 when she did not. (See table 4.)

For some mothers, work is a necessity. It provides economic benefits that may constitute a major share of their offspring's support. In March 1981, one-fourth of all children—14.8 million in all—were living in families in which their father was absent (10.5 million), unemployed (2.4 million), or out of the labor force (1.9 million). More than half of all black children and nearly one-fifth of all white children lived in one of these circumstances. Between March 1980 and 1981, the total number of children in these situations remained steady as the increase in the number with unemployed fathers was offset by a decline in the numbers whose fathers were absent or out of the labor force. In each of these

cases, family income in 1980 was substantially greater when the mother was in the labor force.

— FOOTNOTES —

<sup>1</sup> Unless otherwise indicated, the data in this report are from information collected in the March supplement to the Current Population Survey conducted and tabulated for the Bureau of Labor Statistics by the Bureau of Labor Statistics by the Bureau of the Census. The data have been inflated using population weights based on results from the 1980 census of population. The March 1980 data also have been revised to bring them in line with the new population weights and to make them comparable with the March 1981 data. Previously published 1980 data reflected population weights projected forward from the 1970 Census. The effect of the revision on the 1980 data is shown in table 1, which presents the original as well as the revised estimates for 1980.

As the table shows, the number of children with working mothers in March 1980 was revised upward by 866,000. Despite this, and sim-

# Appendix A. Explanatory Note

Estimates in this bulletin are based on Supplementary questions in the March 1981 and 1980 Current Population Survey conducted and tabulated for the Bureau of Labor Statistics by the Bureau of the Census. Basic labor force concepts, sample design, estimating methods, and reliability of the data are described briefly in the following sections.<sup>1</sup>

## Definitions and concepts

*Population coverage.* In March 1980 and 1981, trained interviewers collected information from a sample of about 65,000 households in 629 areas in 1,133 counties and independent cities with coverage in every State and the District of Columbia. Estimates in this bulletin include persons 16 years old and over in the civilian non-institutional population in the calendar week ended March 14, 1981. Male members of the Armed Forces living off post or with their families on post (817,000 in March 1981) were also included, but all other members of the Armed Forces were excluded.

*Marital status.* Persons are classified into the following categories according to their marital status at the time of interview: Single; married, spouse present; and other marital status. The classification "married, spouse present," applies to husband and wife if both are reported as members of the same household even though one may be temporarily absent on business, vacation, on a visit, in a hospital, or the like at the time of the interview. The term "other marital status" applies to persons who are married, spouse absent; widowed; or divorced.

*Family.* A family is a group of two or more persons residing together who are related by blood, marriage, or adoption. The number of families as shown in this report includes both primary families and unrelated subfamilies. A primary family includes among its members the married couple or person maintaining the household and all other related individuals within the household. An unrelated subfamily includes no members related to the person or persons maintaining the household and includes lodgers, guests, or resident employees.

<sup>1</sup> For a more complete description of methodology, see *Concepts and Methods Used in Labor Force Statistics Derived from the Current Population Survey*. U.S. Department of Commerce and U.S. Department of Labor, BLS Report 463, October 1976.

*Children.* Data on children refer to "own" children of the husband, wife, or person maintaining the family and include sons and daughters, stepchildren, and adopted children. Excluded are other related children, such as grandchildren, nieces, nephews, and cousins, and unrelated children.

*Age.* The age classification is based on the age of the person at his/her last birthday.

*Race.* The population is divided into three groups on the basis of race: White, black, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except white and black.

*Hispanic origin.* Persons of Hispanic origin in this bulletin are those persons who indicated that their origin was Mexican, Puerto Rican, Cuban, Central or South American, or some other Hispanic origin. The latter category includes persons from Spain as well as persons with combinations of types of Spanish origins. Persons who reported that they were of one of the specific Hispanic-origin categories and a non-Hispanic category were included in the specific category. Persons of Hispanic origin may be of any race.

*Employed.* Employed persons are all those who during the survey week (a) did any work at all as paid employees or in their own business or profession, or on their own farm, or worked 15 hours or more as unpaid workers in an enterprise operated by a member of the family; or (b) did not work but had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacations, labor-management dispute, or personal reasons, whether or not they were paid by their employers for the time off, or were seeking other jobs.

*Unemployed.* Unemployed persons are all those who did not work during the survey week, made specific efforts to find a job within the preceding 4 weeks, and were available for work during the survey week or would have been available except for temporary illness. Also included as unemployed are those who did not work at all, were available for work, and (a) were waiting to be called back to a job from which they had been laid off, or (b) were waiting to report to a new wage or salary job within 30 days.

*Labor force.* The labor force comprises all persons classified as employed or unemployed according to the above definitions.

*Not in the labor force.* All persons not classified as employed or unemployed are defined as "not in the labor force." Persons doing only incidental, unpaid family work (less than 15 hours) are also classified as not in the civilian labor force.

*Income.* Income is the total amount of money received in the preceding calendar year from (1) money wages and salaries; (2) net income from self-employment; (3) social security; (4) dividends, interest (on savings and bonds), net rental income, and income from estates and trusts; (5) public assistance; (6) unemployment and workers' compensation, government employee pensions, and veterans' payments; and (7) private pensions, annuities, alimony, regular contributions from persons not living in the same household, net royalties, and other periodic income. The amount received represents income before deductions for personal taxes, social security, savings bonds, union dues, health insurance, and the like. The total income of a family is the algebraic sum of the amount received by all persons in the family.

*Earnings.* Earnings are all money income of \$1 or more from wages and salaries, and net money income of \$1 or more from farm and nonfarm self-employment.

*Median.* The median is the value which divides the distribution into two equal parts, one part having values above the median, and the other having values below the median.

The medians as shown in this bulletin are calculated from the corresponding distributions by linear interpolation within the interval in which the median falls. Therefore, because of this interpolation, the median value depends not only on the distribution of income but also on the income intervals used in calculating the median.

*Sums of distribution.* Sums of individual items, whether absolute numbers or percentages, may not equal totals because of independent rounding of totals and components. Percentage totals, however, are always shown as 100 percent.

## Reliability of the estimates

*Estimating procedure.* The estimating procedure used in this survey inflates weighted sample results to independent estimates of the civilian noninstitutional population by age, sex, and race. These independent estimates are based on statistics from the 1980 Census of Population and other data on births, deaths, immigration, emigration, and strength of the Armed Forces. To

these figures were added the male members of the Armed Forces living off post or with their families on post.

*Variability.* Since the estimates are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same schedules and procedures. As in any survey, the results are also subject to errors of response and reporting. These may be relatively large in the case of persons with irregular attachment to the labor force. Particular care should be exercised in the interpretation of figures based on relatively small estimates as well as small differences between estimates.

The standard error is primarily a measure of sampling variability; that is, of the variations that might occur by chance because a sample rather than the entire population is surveyed. As calculated for this report, the standard error also partially measures the effect of response and enumeration errors but does not measure any systematic biases in the data. The chances are about 68 out of 100 that an estimate differs from a complete census by less than the standard error. The chances are about 95 out of 100 that the difference would be less than twice the standard error.

*Note when using small estimates.* Summary measures (such as medians, means, and percent distributions) are shown in this bulletin only when the base of the measure is 75,000 or greater. Because of the large standard errors involved, there is little chance that summary measures would reveal useful information when computed on a smaller base. Estimated numbers are shown, however, even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each user's needs.

*Computation of standard errors.* The figures presented in tables A-1 and A-2 provide approximations of the standard errors of estimated numbers and percentages. Standard errors for intermediate values may be found by interpolation. Estimated standard errors for specific characteristics cannot be obtained from tables A-1 and A-2 without the use of factors in table A-3. These factors must be applied to the standard errors in order to adjust for the combined effect of sample design and estimating procedure on the value of the characteristics. The determination of the proper factor for a percentage depends upon the subject matter of the numerator of the percentage, not the denominator. The following examples illustrate the use of the standard error tables. An estimated 31,785,000 children had mothers who were in the labor force in March 1981. Two steps, using both tables A-1 and A-3, are required to derive an estimate of

the standard error for this figure. First, from table A-1, a preliminary estimate of the error (301,000) is found by interpolation. Next, this estimate is multiplied by the factor 0.63 from table A-3. Thus, the changes are about 68 out of 100 that the difference between the sample estimate and a complete census count would be less than 190,000. The chances are about 95 out of 100 that the difference would be less than 379,000. The 31,785,000 children represented 53.7 percent of all children in the

population. The standard error for this percent is found by multiplying the standard error (0.38) from table A-2 by the appropriate factor from table A-3 (0.63):  $0.38 \times 0.63 = 0.24$ . Thus, the chances are 68 out of 100 that a complete census count would have resulted in a figure between 53.9 and 53.5 percent, and 95 out of 100 that the figure would have been between 54.9 and 53.2 percent.

**Table A-1. Standard errors of estimated numbers**

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
25	9	5,000	131
50	13	10,000	182
100	19	15,000	221
250	30	25,000	277
500	42	50,000	364
1,000	59	100,000	424
2,500	93		

NOTE: For a particular characteristic, see table A-3 for the appropriate factor to apply to the above standard errors.

**Table A-2. Standard errors of estimated percentages**

(68 chances out of 100)

Base of estimated percentage (thousands)	Estimated percentage					
	1 or 99	2 or 98	5 or 95	10 or 90	25 or 75	50
75	2.1	3.0	4.7	6.5	9.4	10.8
100	1.9	2.6	4.1	5.6	8.1	9.4
250	1.2	1.7	2.6	3.5	5.1	5.9
500	.8	1.2	1.8	2.5	3.6	4.2
1,000	.6	.8	1.3	1.8	2.6	3.0
2,500	.4	.5	.8	1.1	1.6	1.9
5,000	.3	.4	.6	.8	1.1	1.3
10,000	.2	.3	.4	.6	.8	.9
15,000	.15	.2	.3	.5	.7	.8
25,000	.12	.2	.3	.4	.5	.6
50,000	.08	.12	.2	.3	.4	.4
100,000	.06	.08	.13	.2	.3	.3

NOTE: For a particular characteristic, see table A-3 for the appropriate factor to apply to the above standard errors.

**Table A-3. Factors to be applied to generalized standard errors in tables A-1 and A-2**

Characteristic	CPS data collected January 1967 to present								
	Persons						Families and unrelated individuals, households, householders, or primary individuals		
	Some household members secondary individuals			All household members					
	Total or white	Black	Hispanic origin	Total or white	Black	Hispanic origin	Total or white	Black	Hispanic origin
Total or nonfarm:									
Total, regional or metropolitan	1.00	1.20	1.13	1.10	1.45	1.60	0.63	0.60	0.64
Nonmetropolitan	1.22	1.47	1.38	1.35	1.78	1.95	.77	.73	.78
Education, tenure	1.0	1.0	1.0	1.0	1.0	1.0	.63	.60	.64
Employment status and occupation	1.0	1.0	1.0	1.0	1.0	1.0	1.0	1.0	1.0
Farm	1.38	1.66	1.56	1.52	2.01	2.21	.85	.81	.86

<sup>1</sup> Apply this factor to table A-2 to obtain standard errors of estimated percentages; for standard errors of estimated levels, use  $a = 0.000481$ ,  $b = 1096$ , and formula (2).
