Advancement. With experience, operators may advance to more demanding assignments or to positions with larger or network television stations. Advancement for ENG operators may mean moving to larger media markets. Other camera operators and editors may become directors of photography for movie studios, advertising agencies, or television programs. Some teach at technical schools, film schools, or universities.

Employment

Television, video, and motion picture camera operators and editors held about 51,900 jobs in 2008. About 26,300 were camera operators, and film and video editors held about 25,500 jobs.

Many are employed by independent television stations, local affiliate stations of television networks or broadcast groups, large cable and television networks, or smaller, independent production companies. There also are a large number of self-employed camera operators and film editors. Some self-employed

camera operators contract with television networks, documentary or independent filmmakers, advertising agencies, or trade show or convention sponsors to work on individual projects for a set fee, often at a daily rate.

Most of the salaried camera operators and editors were employed by television broadcasting stations or motion picture studios. 37 percent of the salaried camera operators and editors worked for motion picture and video industry while 18 percent worked in television broadcasting. Most camera operators and editors worked in large metropolitan areas.

Job Outlook

Keen competition for jobs is expected due to the large number of people who wish to enter the broadcasting and motion picture industries, in which many camera operators and editors are employed. Those with the most experience and the most advanced computer skills will have the best job opportunities. Employment is expected to grow about as fast as the average for all occupations.

Employment change. Employment of camera operators and editors is expected to grow 11 percent over the 2008–18 decade, which is as fast as the average for all occupations through 2018. As the motion picture industry expands, demand for camera operators and editors will expand also. Camera operators will be needed to film made-for-Internet broadcasts, such as music videos, digital movies, sports features, and general entertainment programming. As the market for professional Internet video grows, camera operators may see increases in employment. Growth will be tempered, however, by the increased offshore production of motion pictures. Job growth for studio camera operators in television broadcasting will be slowed by the use of automated cameras under the control of a single person working either on the studio floor or in a director's booth. For ENG camera operators and editors, growth may be tempered by the combination of roles and other cost-cutting measures at broadcast stations. For videographers, computer and Internet services will provide new outlets for interactive productions.

Job prospects. Television, video, and motion picture camera operators and editors can expect keen competition for job openings because of the large number of people who wish to enter the broadcasting and motion picture industries, in which many of these workers are employed. The number of individuals interested in positions as videographers and movie camera operators usually is much greater than the number of openings. Those who succeed in landing a salaried job or attracting enough work to earn a living by freelancing are likely to be the most creative and highly motivated people, able to adapt to rapidly changing technologies and adept at operating a business. The change to digital cameras has increased the importance of strong com-

puter skills. Those with the most experience and the most advanced computer skills will have the best job opportunities.

Earnings

Median annual wages for television, video, and motion picture camera operators were \$41,670 in May 2008. The middle 50 percent earned between \$29,020 and \$59,970. The lowest 10 percent earned less than \$21,710, and the highest 10 percent earned more than \$79,440. Median annual wages were \$40,910 in the motion picture and video industries and \$36,250 in radio and television broadcasting.

Median annual wages for film and video editors were \$50,560 in May 2008. The middle 50 percent earned between \$33,060 and \$77,700. The lowest 10 percent earned less than \$24,640, and the highest 10 percent earned more than \$112,410. Median annual wages were \$56,170 in the motion picture and video industries, which employed the largest numbers of film and video editors.

Freelance camera operators' earnings tend to fluctuate each year. Because most freelance camera operators purchase their own equipment, they incur considerable expense acquiring and maintaining cameras and accessories. Some camera operators belong to unions, including the International Alliance of Theatrical Stage Employees and the National Association of Broadcast Employees and Technicians.

Health Diagnosing and Treating Practitioners

Audiologists

Significant Points

- About 64 percent worked in health care facilities; many others were employed by educational services.
- All States regulate licensure of audiologists; requirements vary by State.
- A master's degree in audiology (hearing) is the standard level of education required; however, a doctoral degree is becoming more common for new entrants.
- Job prospects will be favorable for those possessing the doctoral (Au.D.) degree.

Nature of the Work

Audiologists work with people who have hearing, balance, and related ear problems. They examine individuals of all ages and identify those with the symptoms of hearing loss and other auditory, balance, and related sensory and neural problems. They then assess the nature and extent of the problems and help the individuals manage them. Using audiometers, computers, and other testing devices, they measure the loudness

at which a person begins to hear sounds, the ability to distinguish between sounds, and the impact of hearing loss on an individual's daily life. In addition, audiologists use computer equipment to evaluate and diagnose balance disorders. Audiologists interpret these results and may coordinate them with medical, educational, and psychological information to make a diagnosis and determine a course of treatment.

Hearing disorders can result from a variety of causes including trauma at birth, viral infections, genetic disorders, exposure to loud noise, certain medications, or aging. Treatment may include examining and cleaning the ear canal, fitting and dispensing hearing aids, and fitting and programming cochlear implants. Audiologic treatment also includes counseling on adjusting to hearing loss, training on the use of hearing instruments, and teaching communication strategies for use in a variety of environments. For example, they may provide instruction in listening strategies. Audiologists also may recommend, fit, and dispense personal or large-area amplification systems and alerting devices.

In audiology clinics, audiologists may independently develop and carry out treatment programs. They keep records on the initial evaluation, progress, and discharge of patients. In other settings, audiologists may work with other health and education providers as part of a team in planning and implementing services for children and adults. Audiologists who diagnose and

treat balance disorders often work in collaboration with physicians, and physical and occupational therapists.

Some audiologists specialize in work with the elderly, children, or hearing-impaired individuals who need special treatment programs. Others develop and implement ways to protect workers' hearing from on-the-job injuries. They measure noise levels in workplaces and conduct hearing protection programs in factories and in schools and communities.

Audiologists who work in private practice also manage the business aspects of running an office, such as developing a patient base, hiring employees, keeping records, and ordering equipment and supplies.

Some audiologists conduct research on types of, and treatment for, hearing, balance, and related disorders. Others design and develop equipment or techniques for diagnosing and treating these disorders.

Work environment. Audiologists usually work at a desk or table in clean, comfortable surroundings. The job is not physically demanding but does require attention to detail and intense concentration. The emotional needs of patients and their families may be demanding. Most full-time audiologists work about 40 hours per week, which may include weekends and evenings to meet the needs of patients. Those who work on a contract basis may spend a substantial amount of time traveling between facilities.

Training, Other Qualifications, and Advancement

All States regulate licensure of audiologists; requirements vary by State. At least a master's degree in audiology is required, but a doctoral degree is increasingly necessary.

Education and training. Individuals pursuing a career will need to earn a doctoral degree. In 2009, 18 States required a doctoral degree or its equivalent for new applicants to practice audiology. The doctoral degree in audiology is a graduate program typically lasting 4 years and resulting in the Au.D. designation.

The Council on Academic Accreditation (CAA) is an entity of the American Speech-Language-Hearing Association (ASHA) that accredits education programs in audiology. In 2009, the CAA accredited 70 doctoral programs in audiology. Graduation

Audiologists examine individuals and identify symptoms of hearing loss and other auditory, balance, and related sensory and neural problems.

from an accredited program may be required to obtain a license in some States and professional credentialing.

Requirements for admission to programs in audiology include courses in English, mathematics, physics, chemistry, biology, psychology, and communication. Graduate coursework in audiology includes anatomy; physiology; physics; genetics; normal and abnormal communication development; auditory, balance, and neural systems assessment and treatment; diagnosis and treatment; pharmacology; and ethics. Graduate curriculums also include supervised clinical practicum and externships.

Licensure and certification. Audiologists are regulated by licensure in all 50 States. Eighteen of those States require a doctoral degree for licensure. Some States regulate the practice of audiology and the dispensing of hearing aids separately, meaning some States will require an additional license called a Hearing Aid Dispenser license. Many States require that audiologists complete continuing education for license renewal. Eligibility requirements, hearing aid dispensing requirements, and continuing education requirements vary from State to State. For specific requirements, contact your State's medical or health board.

Audiologists can earn the Certificate of Clinical Competence in Audiology (CCC-A) offered by the American Speech-Language-Hearing Association; they may also be credentialed through the American Board of Audiology. Professional credentialing may satisfy some or all of the requirements for State licensure.

Other qualifications. Audiologists should be able to effectively communicate diagnostic test results, diagnoses, and proposed treatments in a manner easily understood by their patients. They must be able to approach problems objectively and provide support to patients and their families. Because a patient's progress may be slow, patience, compassion, and good listening skills are necessary.

It is important for audiologists to be aware of new diagnostic and treatment technologies. Most audiologists participate in continuing education courses to learn new methods and technologies.

Advancement. With experience, audiologists can advance to open their own private practice. Audiologists working in hospitals and clinics can advance to management or supervisory positions.

Employment

Audiologists held about 12,800 jobs in 2008. About 64 percent of all jobs were in healthcare facilities—offices of physicians or other health practitioners, including audiologists; hospitals; and outpatient care centers. About 14 percent of jobs were in educational services. Other jobs for audiologists were in health and personal care stores and in State and local governments.

Job Outlook

Much faster than average employment growth is projected. However, because of the small size of the occupation, few job openings are expected. Job prospects will be favorable for those possessing the Au.D. degree.

Employment change. Employment of audiologists is expected to grow 25 percent from 2008 to 2018, much faster than

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Audiologists	29-1121	12,800	16,000	3,200	25

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

average for all occupations. Hearing loss is strongly associated with aging, so increased growth in older population groups will cause the number of people with hearing and balance impairments to increase markedly.

Medical advances also are improving the survival rate of premature infants and trauma victims, who then need assessment and sometimes treatment. Greater awareness of the importance of early identification and diagnosis of hearing disorders in infants also will increase employment. In addition to medical advances, technological advances in hearing aids may drive demand. Digital hearing aids have become smaller in size and also have quality improving technologies like reducing feedback. Demand may be spurred by those who switch from analog to digital hearing aids, as well as those who will desire new or first-time hearing aids because they are becoming less visible.

Employment in educational services will increase along with growth in elementary and secondary school enrollments, including enrollment of special education students.

Growth in employment of audiologists will be moderated by limitations on reimbursements made by third-party payers for the tests and services they provide.

Job prospects. Job prospects will be favorable for those possessing the Au.D. degree. Only a few job openings for audiologists will arise from the need to replace those who leave the occupation, because the occupation is relatively small and workers tend to stay in this occupation until they retire. Demand may be greater in areas with large numbers of retirees, so audiologists who are willing to relocate may have the best job prospects.

Earnings

Median annual wages of audiologists were \$62,030 in May 2008. The middle 50 percent earned between \$50,470 and \$78,380. The lowest 10 percent earned less than \$40,360, and the highest 10 percent earned more than \$98,880. Some employers may pay for continuing education courses. About 15 percent of audiologists were union members or covered under union contracts in 2008.

Related Occupations

Audiologists specialize in the prevention, diagnosis, and treatment of hearing problems. Workers who treat other problems related to physical or mental health include:

Chiropractors**Significant Points**

- Job prospects should be good.
- Chiropractors must be licensed, requiring 2 to 4 years of undergraduate education, the completion of a 4-year chiropractic college course, and passing scores on national and State examinations.
- About 44 percent of chiropractors are self-employed.
- Earnings typically are relatively low in the beginning but increase as the practice grows.

Nature of the Work

Chiropractors, also known as *doctors of chiropractic* or *chiropractic physicians*, diagnose and treat patients with health problems of the musculoskeletal system and treat the effects of those problems on the nervous system and on general health. Many chiropractic treatments deal specifically with the spine and the manipulation of the spine. Chiropractic is based on the principle that spinal joint misalignments interfere with the nervous system and can result in lower resistance to disease and many different conditions of diminished health.

The chiropractic approach to healthcare focuses on the patient's overall health. Chiropractors provide natural, drugless, nonsurgical health treatments, relying on the body's inherent recuperative abilities. They also recognize that many factors

Chiropractors analyze the patient's posture and spine and may manually adjust the spinal column.

affect health, including exercise, diet, rest, environment, and heredity. Chiropractors recommend changes in lifestyle that affect those factors. In some situations, chiropractors refer patients to or consult with other health practitioners.

Like other health practitioners, chiropractors follow a standard routine to get information needed to diagnose and treat patients. They take the patient's health history; conduct physical, neurological, and orthopedic examinations; and may order laboratory tests. X rays and other diagnostic images are important tools because of the chiropractor's emphasis on the spine and its proper function. Chiropractors also analyze the patient's posture and spine using a specialized technique. For patients whose health problems can be traced to the musculoskeletal system, chiropractors manually adjust the spinal column.

Some chiropractors use additional procedures in their practices, including therapies using heat, water, light, massage, ultrasound, electric currents, and acupuncture. They may apply supports such as straps, tape, braces, or shoe inserts. Chiropractors often counsel patients about health concepts such as nutrition, exercise, changes in lifestyle, and stress management, but chiropractors do not prescribe drugs or perform surgery.

In addition to general chiropractic practice, some chiropractors specialize in sports injuries, neurology, orthopedics, pediatrics, nutrition, internal disorders, or diagnostic imaging.

Many chiropractors are solo or group practitioners who also have the administrative responsibilities of running a practice. In larger offices, chiropractors delegate these tasks to office managers and chiropractic assistants. Chiropractors in private practice are responsible for developing a patient base, hiring employees, and keeping records.

Work environment. Chiropractors work in clean, comfortable offices. Like other health practitioners, chiropractors are sometimes on their feet for long periods. Chiropractors who take X rays must employ appropriate precautions against the dangers of repeated exposure to radiation.

Chiropractors work, on average, about 40 hours per week, although longer hours are not uncommon. Solo practitioners set their own hours but may work evenings or weekends to accommodate patients. Like other healthcare practitioners, chiropractors in a group practice will sometimes be on call or treat patients of other chiropractors in the group.

Training, Other Qualifications, and Advancement

Chiropractors must be licensed, which requires 2 to 4 years of undergraduate education, the completion of a 4-year chiropractic college course, and passing scores on national and State examinations.

Education and training. In 2009, 16 chiropractic programs in the United States were accredited by the Council on Chiropractic Education. Applicants must have at least 90 semester hours of undergraduate study leading toward a bachelor's degree, including courses in English, the social sciences or humanities, organic and inorganic chemistry, biology, physics, and psychology. Many applicants have a bachelor's degree, which may eventually become the minimum entry requirement. Several chiropractic colleges offer prechiropractic study, as well as a bachelor's degree program. Recognition of prechiropractic education offered by chiropractic colleges varies among the States.

Chiropractic programs require a minimum of 4,200 hours of combined classroom, laboratory, and clinical experience. During the first 2 years, most chiropractic programs emphasize classroom and laboratory work in sciences such as anatomy, physiology, public health, microbiology, pathology, and biochemistry. The last 2 years focus on courses in manipulation and spinal adjustment and provide clinical experience in physical and laboratory diagnosis, neurology, orthopedics, geriatrics, physiotherapy, and nutrition. Chiropractic programs and institutions grant the degree of Doctor of Chiropractic (D.C.).

Chiropractic colleges also offer postdoctoral training in orthopedics, neurology, sports injuries, nutrition, rehabilitation, radiology, industrial consulting, family practice, pediatrics, and applied chiropractic sciences. Once such training is complete, chiropractors may take specialty exams leading to "diplomate" status in a given specialty. Exams are administered by chiropractic specialty boards.

Licensure. All States and the District of Columbia regulate the practice of chiropractic and grant licenses to chiropractors who meet the educational and examination requirements estab-

Projections data from the National Employment Matrix

				Number	Percent
Chiropractors.....	29-1011	49,100	58,700	9,600	20

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

lished by the State. Chiropractors can practice only in States where they are licensed. Some States have agreements permitting chiropractors licensed in one State to obtain a license in another without further examination, provided that their educational, examination, and practice credentials meet State specifications.

Most State licensing boards require at least 2 years of undergraduate education, but an increasing number are requiring a 4-year bachelor's degree. All boards require the completion of a 4-year program at an accredited chiropractic college leading to the Doctor of Chiropractic degree.

For licensure, most State boards recognize either all or part of the four-part test administered by the National Board of Chiropractic Examiners. State examinations may supplement the National Board tests, depending on State requirements. All States except New Jersey require the completion of a specified number of hours of continuing education each year in order to maintain licensure. Chiropractic associations and accredited chiropractic programs and institutions offer continuing education programs.

Other qualifications. Chiropractic requires keen observation to detect physical abnormalities. It also takes considerable manual dexterity, but not unusual strength or endurance, to perform adjustments. Chiropractors should be able to work independently and handle responsibility. As in other health-related occupations, empathy, understanding, and the desire to help others are good qualities for dealing effectively with patients.

Advancement. Newly licensed chiropractors can set up a new practice, purchase an established one, or enter into partnership with an established practitioner. They also may take a salaried position with an established chiropractor, a group practice, or a healthcare facility.

Employment

Chiropractors held about 49,100 jobs in 2008. Most chiropractors work in a solo practice, although some are in group practice or work for other chiropractors. A small number teach, conduct research at chiropractic institutions, or work in hospitals and clinics. Approximately 44 percent of chiropractors were self-employed.

Many chiropractors are located in small communities. However, the distribution of chiropractors is not geographically uniform. This occurs primarily because new chiropractors frequently establish their practices in close proximity to one of the few chiropractic educational institutions.

Job Outlook

Employment is projected to grow much faster than average. Job prospects should be good.

Employment change. Employment of chiropractors is expected to increase 20 percent between 2008 and 2018, much faster than the average for all occupations. Projected job growth

stems from increasing consumer demand for alternative health care. Because chiropractors emphasize the importance of healthy lifestyles and do not prescribe drugs or perform surgery, chiropractic care is appealing to many health-conscious Americans. Chiropractic treatment of the back, neck, extremities, and joints has become more accepted as a result of research and changing attitudes about alternative, noninvasive healthcare practices. Chiropractors who specialize in pediatric care will be in demand as chiropractic spinal treatment is very gentle and children enjoy subsequent visits. The rapidly expanding older population, with its increased likelihood of mechanical and structural problems, also will increase demand for chiropractors.

Demand for chiropractic treatment, however, is related to the ability of patients to pay, either directly or through health insurance. Although more insurance plans now cover chiropractic services, the extent of such coverage varies among plans. Chiropractors must educate communities about the benefits of chiropractic care in order to establish a successful practice.

Job prospects. Job prospects for new chiropractors are expected to be good, especially for those who enter a multi-disciplined practice, consisting of, for example, a chiropractor, physical therapist, and medical doctor. Multi-disciplined practices are cost effective and allow patients to remain in-house. Should a patient be referred to a medical doctor, they may use the "in-house" doctor or one of their own choosing. Chiropractors usually remain in the occupation until they retire and few transfer to other occupations, so replacement needs arise almost entirely from retirements. Establishing a new practice will be easiest in areas with a low concentration of chiropractors.

Earnings

Median annual wages of salaried chiropractors were \$66,490 in May 2008. The middle 50 percent earned between \$45,540 and \$96,700 a year.

In 2009, the mean salary for chiropractors was \$94,454 according to a survey conducted by *Chiropractic Economics* magazine.

In chiropractic, as in other types of independent practice, earnings are relatively low in the beginning and increase as the practice grows. Geographic location and the characteristics and qualifications of the practitioner also may influence earnings.

Salaried chiropractors typically receive health insurance and retirement benefits from their employers, whereas self-employed chiropractors must provide for their own health insurance and retirement.

Dentists

Significant Points

- About 3 out of 4 dentists are solo practitioners.
- Dentists must graduate from an accredited dental school and pass written and practical examinations; competition for admission to dental school is keen.
- Faster than average employment growth is projected.
- Job prospects should be good, reflecting the need to replace the large number of dentists expected to retire.

Nature of the Work

Dentists diagnose and treat problems with teeth and tissues in the mouth, along with giving advice and administering care to help prevent future problems. They provide instruction on diet, brushing, flossing, the use of fluorides, and other aspects of dental care. They remove tooth decay, fill cavities, examine x rays, place protective plastic sealants on children's teeth, straighten teeth, and repair fractured teeth. They also perform corrective surgery on gums and supporting bones to treat gum diseases. Dentists extract teeth and make models and measurements for dentures to replace missing teeth. They also administer anesthetics and write prescriptions for antibiotics and other medications.

Dentists use a variety of equipment, including x-ray machines, drills, mouth mirrors, probes, forceps, brushes, and scalpels. Lasers, digital scanners, and other computer technologies also may be used. Dentists wear masks, gloves, and safety glasses to protect themselves and their patients from infectious diseases.

Dentists in private practice oversee a variety of administrative tasks, including bookkeeping and the buying of equipment and supplies. They may employ and supervise dental hygienists, dental assistants, dental laboratory technicians, and reception-

Dentists remove tooth decay, fill cavities, and repair fractured teeth.

ists. (These occupations are described elsewhere in the *Handbook*.)

Most dentists are general practitioners, handling a variety of dental needs. Other dentists practice in any of nine specialty areas. *Orthodontists*, the largest group of specialists, straighten teeth by applying pressure to the teeth with braces or other appliances. The next largest group, *oral and maxillofacial surgeons*, operates on the mouth, jaws, teeth, gums, neck, and head. The remainder may specialize as *pediatric dentists* (focusing on dentistry for children and special-needs patients); *periodontists* (treating gums and bone supporting the teeth); *prosthodontists* (replacing missing teeth with permanent fixtures, such as crowns and bridges, or with removable fixtures such as dentures); *endodontists* (performing root-canal therapy); *oral pathologists* (diagnosing oral diseases); *oral and maxillofacial radiologists* (diagnosing diseases in the head and neck through the use of imaging technologies); or *dental public health specialists* (promoting good dental health and preventing dental diseases within the community).

Work environment. Most dentists are solo practitioners, meaning that they own their own businesses and work alone or with a small staff. Some dentists have partners, and a few work for other dentists as associate dentists.

Most dentists work 4 or 5 days a week. Some work evenings and weekends to meet their patients' needs. The number of hours worked varies greatly among dentists. Most full-time dentists work between 35 and 40 hours a week. However, others, especially those who are trying to establish a new practice, work more. Also, experienced dentists often work fewer hours. It is common for dentists to continue in part-time practice well beyond the usual retirement age.

Dentists usually work in the safety of an office environment. However, work-related injuries can occur, such as those resulting from the use of hand-held tools when performing dental work on patients.

Training, Other Qualifications, and Advancement

All 50 States and the District of Columbia require dentists to be licensed. To qualify for a license in most States, candidates must graduate from an accredited dental school and pass written and practical examinations.

Education and training. In 2008, there were 57 dental schools in the United States accredited by the American Dental Association's (ADA's) Commission on Dental Accreditation. Dental schools require a minimum of 2 years of college-level pre-dental education prior to admittance. Most dental students

have at least a bachelor's degree before entering dental school, although a few applicants are accepted to dental school after 2 or 3 years of college and complete their bachelor's degree while attending dental school. According to the ADA, 85 percent of dental students had a bachelor's degree prior to beginning their dental program in the 2006-07 academic year.

High school and college students who want to become dentists should take courses in biology, chemistry, physics, health, and mathematics. College undergraduates planning on applying to dental school are required to take many science courses. Because of this, some choose a major in a science, such as biology or chemistry, whereas others take the required science coursework while pursuing a major in another subject.

All dental schools require applicants to take the Dental Admissions Test (DAT). When selecting students, schools consider scores earned on the DAT, applicants' grade point averages, and information gathered through recommendations and interviews. Competition for admission to dental school is keen.

Dental school usually lasts 4 academic years. Studies begin with classroom instruction and laboratory work in science, including anatomy, microbiology, biochemistry, and physiology. Beginning courses in clinical sciences, including laboratory techniques, are also completed. During the last 2 years, students treat patients, usually in dental clinics, under the supervision of licensed dentists. Most dental schools award the degree of Doctor of Dental Surgery (DDS). Others award an equivalent degree, Doctor of Dental Medicine (DMD).

Licensure. Licensing is required to practice as a dentist. In most States, licensure requires passing written and practical examinations in addition to having a degree from an accredited dental school. Candidates may fulfill the written part of the State licensing requirements by passing the National Board Dental Examinations. Individual States or regional testing agencies administer the written or practical examinations.

Individuals can be licensed to practice any of the 9 recognized specialties in all 50 States and the District of Columbia. Requirements include 2 to 4 years of postgraduate education and, in some cases, the completion of a special State examination. A postgraduate residency term also may be required, usually lasting up to 2 years. Most State licenses permit dentists to engage in both general and specialized practice.

Other qualifications. Dentistry requires diagnostic ability and manual skills. Dentists should have good visual memory; excellent judgment regarding space, shape, and color; a high degree of manual dexterity; and scientific ability. Good busi-

Orthodontists.....	29-1023	7,700	9,200	1,500	20
Prosthodontists.....	29-1024	500	700	100	28
Dentists, all other specialists.....	29-1029	6,900	7,900	1,000	15

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

ness sense, self-discipline, and good communication skills are helpful for success in private practice.

Advancement. Dentists and aspiring dentists who want to teach or conduct research full time usually spend an additional 2 to 5 years in advanced dental training, in programs operated by dental schools or hospitals. Many private practitioners also teach part time, including supervising students in dental school clinics. (See the statement on teachers—postsecondary elsewhere in the *Handbook*.)

Some dental school graduates work for established dentists as associates for 1 to 2 years to gain experience and save money to equip an office of their own. Most dental school graduates, however, purchase an established practice or open a new one immediately after graduation.

Employment

Dentists held about 141,900 jobs in 2008. Employment was distributed among general practitioners and specialists as follows:

Dentists, general.....	120,200
Orthodontists.....	7,700
Oral and maxillofacial surgeons.....	6,700
Prosthodontists.....	500
Dentists, all other specialists.....	6,900

Approximately 15 percent of all dentists were specialists. About 28 percent of dentists were self-employed and not incorporated. Very few salaried dentists worked in hospitals and offices of physicians. Almost all dentists work in private practice. According to the American Dental Association, about 3 out of 4 dentists in private practice are solo proprietors, and almost 15 percent belonged to a partnership.

Job Outlook

Employment is projected to grow faster than the average. Job prospects should be good, reflecting the need to replace the large number of dentists expected to retire.

Employment change. Employment of dentists is projected to grow by 16 percent through 2018, which is faster than the average for all occupations. The demand for dental services is expected to continue to increase. The overall U.S. population is growing, and the elderly segment of the population is growing even faster; these phenomena will increase the demand for dental care. Many members of the baby-boom generation will need complicated dental work. In addition, elderly people are more likely to retain their teeth than were their predecessors, so they will require much more care than in the past. The younger generation will continue to need preventive checkups despite an overall increase in the dental health of the public over the last few decades. Recently, some private insurance providers have increased their dental coverage. If this trend continues, people with new or expanded dental insurance will be more likely to visit a dentist than in the past. Also, although they are currently a small proportion of dental expenditures, cosmetic dental services, such as providing teeth-whitening treatments, will become increasingly popular. This trend is expected to continue as new technologies allow these procedures to take less time and be much less invasive.

However, employment of dentists is not expected to keep pace with the increased demand for dental services. Productivity increases from new technology, as well as the tendency to assign more tasks to dental hygienists and assistants, will allow dentists to perform more work than they have in the past. As their practices expand, dentists are likely to hire more hygienists and dental assistants to handle routine services.

Dentists will increasingly provide care and instruction aimed at preventing the loss of teeth, rather than simply providing treatments such as fillings. Improvements in dental technology also will allow dentists to offer more effective and less painful treatment to their patients.

Job prospects. As an increasing number of dentists from the baby-boom generation reach retirement age, many of them will retire or work fewer hours and stop taking on new patients. Furthermore, the number of applicants to, and graduates from, dental schools has increased in recent years. Job prospects should be good, because younger dentists will be able to take over the work of older dentists who retire or cut back on hours, as well as provide dental services to accommodate the growing demand.

Demand for dental services tends to follow the business cycle, primarily because these services usually are paid for either by the patient or by private insurance companies. As a result, during slow times in the economy, demand for dental services can decrease; consequently, dentists may have difficulty finding employment, or if already in an established practice, they may work fewer hours because of reduced demand.

Earnings

Median annual wages of salaried general dentists were \$142,870 in May 2008. Earnings vary according to number of years in practice, location, hours worked, and specialty. Self-employed dentists in private practice tend to earn more than salaried dentists.

Dentists who are salaried often receive benefits paid by their employer, with health insurance and malpractice insurance being among the most common. However, like other business owners, self-employed dentists must provide their own health insurance, life insurance, retirement plans, and other benefits.

Dietitians and Nutritionists

Significant Points

- Most jobs are in hospitals, nursing care facilities, outpatient care centers, and offices of physicians or other health practitioners.
- Dietitians and nutritionists need at least a bachelor's degree; licensure, certification, or registration requirements vary by State.
- Applicants with specialized training, an advanced degree, or certifications beyond the particular State's minimum requirement should enjoy the best job opportunities.

Nature of the Work

Dietitians and nutritionists plan food and nutrition programs, supervise meal preparation, and oversee the serving of meals. They prevent and treat illnesses by promoting healthy eating habits and recommending dietary modifications. For example, dietitians might teach a patient with high blood pressure how to use less salt when preparing meals, or create a diet reduced in fat and sugar for an overweight patient.

Dietitians manage food service systems for institutions such as hospitals and schools, promote sound eating habits through education, and conduct research. Many dietitians specialize, becoming a clinical dietitian, community dietitian, management dietitian, or consultant.

Clinical dietitians provide nutritional services to patients in hospitals, nursing care facilities, and other institutions. They assess patients' nutritional needs, develop and implement nutrition programs, and evaluate and report the results. They also

Dietitians counsel individuals and groups on nutritional practices designed to prevent disease and promote health.

confer with doctors and other healthcare professionals to coordinate medical and nutritional needs. Some clinical dietitians specialize in managing the weight of overweight patients or in the care of renal (kidney), diabetic, or critically ill patients. In addition, clinical dietitians in nursing care facilities, small hospitals, or correctional facilities may manage the food service department.

Community dietitians counsel individuals and groups on nutritional practices designed to prevent disease and promote health. Working in places such as public health clinics, home health agencies, and health maintenance organizations, community dietitians evaluate individual needs, develop nutritional care plans, and instruct individuals and their families. Dietitians working in home health agencies provide instruction on grocery shopping and food preparation to the elderly, children, and individuals with special needs.

Increased public interest in nutrition has led to job opportunities in food manufacturing, advertising, and marketing. In these areas, dietitians analyze foods, prepare literature for distribution, or report on issues such as dietary fiber, vitamin supplements, or the nutritional content of recipes.

Management dietitians oversee large-scale meal planning and preparation in healthcare facilities, company cafeterias, prisons, and schools. They hire, train, and direct other dietitians and food service workers; budget for and purchase food, equipment, and supplies; enforce sanitary and safety regulations; and prepare records and reports.

Consultant dietitians work under contract with healthcare facilities or in their own private practice. They perform nutrition screenings for their clients and offer advice on diet-related concerns such as weight loss and cholesterol reduction. Some work for wellness programs, sports teams, supermarkets, and other nutrition-related businesses. They may consult with food service managers, providing expertise in sanitation, safety procedures, menu development, budgeting, and planning.

Work environment. Dietitians and nutritionists usually work in clean, well-lighted, and well-ventilated areas. However, some work in hot, congested kitchens. Many dietitians and nutritionists are on their feet for much of the workday.

Most full-time dietitians and nutritionists work a standard 40-hour week, although some work weekends. About 19 percent worked part time in 2008.

Training, Other Qualifications, and Advancement

Dietitians and nutritionists need at least a bachelor's degree. Licensure, certification, or registration requirements vary by State.

Education and training. Becoming a dietitian or nutritionist usually requires at least a bachelor's degree in dietetics, foods and nutrition, food service systems management, or a related area. Graduate degrees also are available. College students in these majors take courses in foods, nutrition, institution management, chemistry, biochemistry, biology, microbiology, and physiology. Other suggested courses include business, mathematics, statistics, computer science, psychology, sociology, and economics. High school students interested in becoming a dietitian or nutritionist should take courses in biology, chemistry, mathematics, health, and communications.

As of 2008, there were 279 bachelor's degree programs and 18 master's degree programs approved by the American Dietetic Association's Commission on Accreditation for Dietetics Education.

Licensure. Of the 48 States and jurisdictions with laws governing dietetics, 35 require licensure, 12 require statutory certification, and 1 require registration. Specific requirements vary by State. As a result, interested candidates should determine the requirements of the State in which they want to work before sitting for any exam.

In States that require licensure, only people who are licensed can work as dietitians and nutritionists. States that require statutory certification limit the use of occupational titles to people who meet certain requirements; individuals without certification can still practice as a dietitian or nutritionist but without using certain titles. Registration is the least restrictive form of State regulation of dietitians and nutritionists. Unregistered people are permitted to practice as a dietitian or nutritionist.

Certification and other qualifications. Although not required, the Commission on Dietetic Registration of the American Dietetic Association awards the Registered Dietitian credential to those who pass an exam after completing academic coursework and a supervised internship. This certification is different from the statutory certification regulated by some States and discussed in the previous section. To maintain a Registered Dietitian status, workers must complete at least 75 credit hours in approved continuing education classes every 5 years.

A supervised internship, required for certification, can be completed in one of two ways. The first requires the completion of a program accredited by the Commission on Dietetic Registration. As of September 2009, there were 51 accredited programs that combined academic and supervised practice experience and generally lasted 4 to 5 years. The second option requires the completion of 900 hours of supervised practice experience in any of the 243 accredited internships. These internships may be full-time programs lasting 6 to 12 months or part-time programs lasting 2 years.

Advancement. Experienced dietitians may advance to management positions, such as assistant director, associate director, or director of a dietetic department, or may become self-employed. Some dietitians specialize in areas such as renal, diabetic, cardiovascular, or pediatric dietetics. Others leave the occupation to become sales representatives for equipment, pharmaceutical, or food manufacturers. A master's degree can help some workers to advance their careers, particularly in career paths related to research, advanced clinical positions, or public health.

Employment

Dietitians and nutritionists held about 60,300 jobs in 2008. More than half of all jobs were in hospitals, nursing care facilities, outpatient care centers, or offices of physicians and other health practitioners. State and local government agencies provided additional jobs—mostly in correctional facilities, health departments, and other public-health-related areas. Some dietitians and nutritionists were employed in special food services, an industry made up of firms providing food services on con-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Dietitians and nutritionists	29-1031	60,300	65,800	5,600	9

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

tract to facilities such as colleges and universities, airlines, correctional facilities, and company cafeterias.

Other jobs were in public and private educational services, community care facilities for the elderly (which includes assisted-living facilities), individual and family services, home healthcare services, and the Federal Government—mostly in the U.S. Department of Veterans Affairs. Some dietitians were self-employed, working as consultants to facilities such as hospitals and nursing care facilities or providing dietary counseling to individuals.

Job Outlook

Average employment growth is projected. Applicants with specialized training, an advanced degree, or certifications beyond the particular State’s minimum requirement should enjoy the best job opportunities.

Employment change. Employment of dietitians and nutritionists is expected to increase 9 percent during the 2008–18 projection decade, about as fast as the average for all occupations. Job growth will result from an increasing emphasis on disease prevention through improved dietary habits. A growing and aging population will boost demand for nutritional counseling and treatment in hospitals, residential care facilities, schools, prisons, community health programs, and home healthcare agencies. Public interest in nutrition and increased emphasis on health education and prudent lifestyles also will spur demand, especially in food service management.

Also, with increased public awareness of obesity and diabetes, Medicare coverage has been expanded to include medical nutrition therapy for renal and diabetic patients, creating job growth for dietitians and nutritionists specializing in those diseases.

Employment growth, however, may be constrained if some employers substitute other workers, such as health educators, food service managers, and dietetic technicians, to do work related to nutrition. Also, demand for nutritional therapy services is related to the ability of patients to pay, either out-of-pocket or through health insurance, and although more insurance plans now cover nutritional therapy services, the extent of such coverage varies among plans. Growth may be curbed by limitations on insurance reimbursement for dietetic services.

Hospitals will continue to employ a large number of dietitians and nutritionists to provide medical nutritional therapy and plan meals. But hospitals also will continue to contract with outside agencies for food service and move medical nutritional therapy to outpatient care facilities, slowing job growth in hospitals relative to food service, outpatient facilities, and other employers.

Finally, the number of dietitian positions in nursing care facilities is expected to decline, as these establishments continue to contract with outside agencies for food services. However, employment is expected to grow rapidly in contract providers

of food services, in outpatient care centers, and in offices of physicians and other health practitioners.

Job prospects. In addition to employment growth, job openings will result from the need to replace experienced workers who retire or leave the occupation for other reasons. Applicants with specialized training, an advanced degree, or certifications beyond the particular State’s minimum requirement should enjoy the best job opportunities. Demand for dietitians should be particularly strong in outpatient care facilities, offices of physicians, and food service management. Applicants without a bachelor’s degree will face keen competition for jobs.

Dietitians with specialized training, an advanced degree, or certifications beyond the particular State’s minimum requirement will experience the best job opportunities. Those specializing in renal and diabetic nutrition or gerontological nutrition will benefit from the growing number of diabetics and the aging of the population.

Earnings

Median annual wages of dietitians and nutritionists were \$50,590 in May 2008. The middle 50 percent earned between \$41,060 and \$61,790. The lowest 10 percent earned less than \$31,460, and the highest 10 percent earned more than \$73,410. Median annual wages in the industries employing the largest numbers of dietitians and nutritionists in May 2008 were:

Outpatient care centers.....	\$52,120
General medical and surgical hospitals.....	51,390
Nursing care facilities	51,110
Local government.....	47,390
Special food services.....	45,410

According to the American Dietetic Association, median annual wages for registered dietitians in 2007 varied by practice area as follows: \$60,008 in consultation and business; \$64,002 in food and nutrition management; \$66,061 in education and research; \$52,000 in clinical nutrition/ambulatory care; \$53,997 in clinical nutrition/long-term care; \$48,006 in community nutrition; and \$48,984 in clinical nutrition/acute care. Salaries also vary by years in practice, education level, and geographic region.

Occupational Therapists

Significant Points

- Employment is expected to grow much faster than average, and job opportunities should be good, especially for therapists treating the elderly.
- Occupational therapists are regulated in all 50 States; requirements vary by State.
- Occupational therapists are increasingly taking on supervisory roles, allowing assistants and aides to work more closely with clients under the guidance of a therapist.

Nature of the Work

Occupational therapists help patients improve their ability to perform tasks in living and working environments. They work with individuals who suffer from a mentally, physically, developmentally, or emotionally disabling condition. Occupational therapists use treatments to develop, recover, or maintain the daily living and work skills of their patients. The therapist helps clients not only to improve their basic motor functions and reasoning abilities, but also to compensate for permanent loss of function. The goal is to help clients have independent, productive, and satisfying lives.

Occupational therapists help clients to perform all types of activities, from using a computer to caring for daily needs such as dressing, cooking, and eating. Physical exercises may be used to increase strength and dexterity, while other activities may be chosen to improve visual acuity or the ability to discern patterns. For example, a client with short-term memory loss might be encouraged to make lists to aid recall, and a person with coordination problems might be assigned exercises to improve hand-eye coordination. Occupational therapists also use computer programs to help clients improve decision-making, abstract-reasoning, problem-solving, and perceptual skills, as well as memory, sequencing, and coordination—all of which are important for independent living.

Occupational therapists help patients learn to perform all types of activities, from using a computer to caring for daily needs such as dressing, cooking, and eating.

Patients with permanent disabilities, such as spinal cord injuries, cerebral palsy, or muscular dystrophy, often need special instruction to master certain daily tasks. For these individuals, therapists demonstrate the use of adaptive equipment, including wheelchairs, orthoses, eating aids, and dressing aids. They also design or build special equipment needed at home or at work, including computer-aided adaptive equipment. They teach clients how to use the equipment to improve communication and control various situations in their environment.

Some occupational therapists treat individuals whose ability to function in a work environment has been impaired. These practitioners might arrange employment, evaluate the work space, plan work activities, and assess the client's progress. Therapists also may collaborate with the client and the employer to modify the work environment so that the client can succeed at work.

Assessing and recording a client's activities and progress is an important part of an occupational therapist's job. Accurate records are essential for evaluating clients, for billing, and for reporting to physicians and other healthcare providers.

Occupational therapists may work exclusively with individuals in a particular age group or with a particular disability. In schools, for example, they evaluate children's capabilities, recommend and provide therapy, modify classroom equipment, and help children participate in school activities. A therapist may work with children individually, lead small groups in the classroom, consult with a teacher, or serve on an administrative committee. Some therapists provide early intervention therapy to infants and toddlers who have, or are at risk of having, developmental delays. Therapies may include facilitating the use of the hands and promoting skills for listening, following directions, social play, dressing, or grooming.

Other occupational therapists work with elderly patients. These therapists help the elderly lead more productive, active, and independent lives through a variety of methods. Therapists with specialized training in driver rehabilitation assess an individual's ability to drive using both clinical and on-the-road tests. The evaluations allow the therapist to make recommendations for adaptive equipment, training to prolong driving independence, and alternative transportation options. Occupational therapists also work with clients to assess their homes for hazards and to identify environmental factors that contribute to falls.

Occupational therapists in mental health settings treat individuals who are mentally ill, developmentally challenged, or emotionally disturbed. To treat these problems, therapists choose activities that help people learn to engage in and cope with daily life. Activities might include time management skills, budgeting, shopping, homemaking, and the use of public transportation. Occupational therapists also work with individuals who are dealing with alcoholism, drug abuse, depression, eating disorders, or stress-related disorders.

Work environment. In large rehabilitation centers, therapists may work in spacious rooms equipped with machines, tools, and other devices generating noise. The work can be tiring because therapists are on their feet much of the time. Therapists also face hazards such as back strain from lifting and moving clients and equipment.

Occupational therapists working for one employer full-time usually work a 40-hour week. Around 31 percent of occupational therapists worked part-time. It is not uncommon for occupational therapists to work for more than one employer at multiple facilities, which may involve significant travel time. Those in schools may participate in meetings and other activities during and after the school day.

Training, Other Qualifications, and Advancement

Occupational therapists are regulated in all 50 States. Individuals pursuing a career as an occupational therapist usually need to earn a post-baccalaureate degree from an accredited college or university or education deemed equivalent.

Education and training. A master's degree or higher in occupational therapy is the typical minimum requirement for entry into the field. In addition, occupational therapists must attend an academic program accredited by the Accreditation Council for Occupational Therapy Education (ACOTE) in order to sit for the national certifying exam. In 2009, 150 master's degree programs or combined bachelor's and master's degree programs were accredited, and 4 doctoral degree programs were accredited. Most schools have full-time programs, although a growing number are offering weekend or part-time programs as well. Coursework in occupational therapy programs include the physical, biological, and behavioral sciences as well as the ap-

plication of occupational therapy theory and skills. All accredited programs require at least 24 weeks of supervised fieldwork as part of the academic curriculum.

People considering this profession should take high school courses in biology, chemistry, physics, health, art, and the social sciences. College admissions offices also look favorably on paid or volunteer experience in the healthcare field. Relevant undergraduate majors include biology, psychology, sociology, anthropology, liberal arts, and anatomy.

Licensure. All States regulate the practice of occupational therapy. To obtain a license, applicants must graduate from an accredited educational program and pass a national certification examination. Those who pass the exam are awarded the title "Occupational Therapist Registered (OTR)." Specific eligibility requirements for licensure vary by State; contact your State's licensing board for details.

Some States have additional requirements for therapists who work in schools or early intervention programs. These requirements may include education-related classes, an education practice certificate, or early intervention certification.

Certification and other qualifications. Certification is voluntary. The National Board for Certifying Occupational Therapy certifies occupational therapists through a national certifying exam. Those who pass the test are awarded the title Occupational Therapist Registered (OTR). In some States, the national certifying exam meets requirements for regulation while other States have their own licensing exam.

Occupational therapists are expected to continue their professional development by participating in continuing education courses and workshops. In fact, a number of States require continuing education as a condition of maintaining licensure.

Occupational therapists need patience and strong interpersonal skills to inspire trust and respect in their clients. Patience is necessary because many clients may not show immediate improvement. Ingenuity and imagination in adapting activities to individual needs are assets. Those working in home healthcare services also must be able to adapt to a variety of settings.

Advancement. Therapists are increasingly taking on supervisory roles in addition to their supervision of occupational therapy assistants and aides. Occupational therapists may advance their careers by taking on administrative duties at hospitals or rehabilitation centers.

Occupational therapists also can advance by specializing in a clinical area and gaining expertise in treating a certain type of patient or ailment. Therapists may specialize in gerontology, mental health, pediatrics, and physical rehabilitation. In addition, some occupational therapists choose to teach classes in accredited occupational therapy educational programs.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018		Change, 2008-2018	
			2018	Number	Percent	
Occupational therapists.....	29-1122	104,500	131,300	26,800	26	

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Employment

Occupational therapists held about 104,500 jobs in 2008. The largest number of occupational therapist jobs was in ambulatory health care services, which employed about 29 percent of occupational therapists. Other major employers were hospitals, offices of other health practitioners (including offices of occupational therapists), public and private educational services, and nursing care facilities. Some occupational therapists were employed by home health care services, outpatient care centers, offices of physicians, individual and family services, community care facilities for the elderly, and government agencies.

A small number of occupational therapists were self-employed in private practice. These practitioners treated clients referred by other health professionals. They also provided contract or consulting services to nursing care facilities, schools, adult day care programs, and home healthcare agencies.

Job Outlook

Employment is expected to grow much faster than average. Job opportunities should be good, especially for occupational therapists treating the elderly.

Employment change. Employment of occupational therapists is expected to increase by 26 percent between 2008 and 2018, much faster than the average for all occupations. The increasing elderly population will drive growth in the demand for occupational therapy services. The demand for occupational therapists should continue to rise as a result of the increasing number of individuals with disabilities or limited function who require therapy services. Older persons have an increased incidence of heart attack and stroke, which will spur demand for therapeutic services. Growth in the population 75 years and older—an age group that suffers from high incidences of disabling conditions—also will increase demand for therapeutic services. In addition, medical advances now enable more patients with critical problems to survive—patients who ultimately may need extensive therapy. However, growth may be dampened by the impact of Federal legislation imposing limits on reimbursement for therapy services.

Hospitals will continue to employ a large number of occupational therapists to provide therapy services to acutely ill inpatients. Hospitals also will need occupational therapists to staff their outpatient rehabilitation programs.

Employment growth in schools will result from the expansion of the school-age population and the federally funded extension of services for disabled students. Therapists will be needed to help children with disabilities prepare to enter special education programs.

Job prospects. Job opportunities should be good for licensed occupational therapists in all settings, particularly in acute hospital, rehabilitation, and orthopedic settings because the elderly receive most of their treatment in these settings. Occupational therapists with specialized knowledge in a treatment area also will have increased job prospects. Driver rehabilitation, training for the elderly, and ergonomic consulting are emerging practice areas for occupational therapy.

Earnings

Median annual wages of occupational therapists were \$66,780 in May 2008. The middle 50 percent earned between \$55,090

and \$81,290. The lowest 10 percent earned less than \$42,820, and the highest 10 percent earned more than \$98,310. Median annual wages in the industries employing the largest numbers of occupational therapists in May 2008 were:

Home health care services.....	\$74,510
Nursing care facilities	72,790
Offices of other health care practitioners	69,360
General medical and surgical hospitals.....	68,100
Elementary and secondary schools	60,020

Related Occupations

Occupational therapists use specialized knowledge to help individuals perform daily living skills and achieve maximum independence. Other occupations performing similar duties include:

	Page
Athletic trainers.....	405
Physical therapists.....	377
Recreational therapists	389
Respiratory therapists.....	397
Speech-language pathologists	399

Optometrists

Significant Points

- Admission to optometry school is competitive; only about 1 in 3 applicants was accepted in 2007.
- Graduation from an accredited college of Optometry and a State license administered by the National Board of Examiners in Optometry are required.
- Employment is expected to grow much faster than the average in response to the vision care needs of a growing and aging population.
- Job opportunities are likely to be excellent.

Nature of the Work

Optometrists, also known as *doctors of optometry*, or ODs, are the main providers of vision care. They examine people's eyes to diagnose vision problems, such as nearsightedness and farsightedness, and they test patients' depth and color percep-

The Doctor of Optometry degree requires the completion of a 4-year program at an accredited optometry school.

tion and ability to focus and coordinate the eyes. Optometrists may prescribe eyeglasses or contact lenses, or they may provide other treatments, such as vision therapy or low-vision rehabilitation.

Optometrists also test for glaucoma and other eye diseases and diagnose conditions caused by systemic diseases such as diabetes and high blood pressure, referring patients to other health practitioners as needed. They prescribe medication to treat vision problems or eye diseases, and some provide pre-operative and postoperative care to cataract patients, as well as to patients who have had corrective laser surgery. Like other physicians, optometrists encourage preventative measures by promoting nutrition and hygiene education to their patients to minimize the risk of eye disease.

Although most work in a general practice as a primary care optometrist, some optometrists prefer to specialize in a particular field, such as contact lenses, geriatrics, pediatrics, or vision therapy. As a result, an increasing number of optometrists are forming group practices in which each group member specializes in a specific area while still remaining a full scope practitioner. For example, an expert in low-vision rehabilitation may help legally blind patients by custom fitting them with a magnifying device that will enable them to read.

Some may specialize in occupational vision, developing ways to protect workers' eyes from on-the-job strain or injury. Others may focus on sports vision, head trauma, or ocular disease and special testing. A few optometrists teach optometry, perform research, or consult.

Most optometrists are private practitioners who also handle the business aspects of running an office, such as developing a patient base, hiring employees, keeping paper and electronic records, and ordering equipment and supplies. Optometrists who operate franchise optical stores also may have some of these duties.

Optometrists should not be confused with ophthalmologists or dispensing opticians. Ophthalmologists are physicians who perform eye surgery, as well as diagnose and treat eye diseases and injuries. Like optometrists, they also examine eyes and prescribe eyeglasses and contact lenses. Dispensing opticians fit and adjust eyeglasses and, in some States, may fit contact lenses according to prescriptions written by ophthalmologists or optometrists. (See the sections on physicians and surgeons; and opticians, dispensing, elsewhere in the *Handbook*.)

Work environment. Optometrists usually work in their own offices that are clean, well lighted, and comfortable. Although most full-time optometrists work standard business hours, some work weekends and evenings to suit the needs of patients. Emergency calls, once uncommon, have increased with the passage of therapeutic-drug laws expanding optometrists' ability to prescribe medications.

Training, Other Qualifications, and Advancement

The Doctor of Optometry degree requires the completion of a 4-year program at an accredited school of optometry, preceded by at least 3 years of preoptometric study at an accredited college or university. All States require optometrists to be licensed.

Education and training. Optometrists need a Doctor of Optometry degree, which requires the completion of a 4-year program at an accredited school of optometry. In 2009, there were 19 colleges of optometry in the U.S. and 1 in Puerto Rico that offered programs accredited by the Accreditation Council on Optometric Education of the American Optometric Association. Requirements for admission to optometry schools include college courses in English, mathematics, physics, chemistry, and biology. Because a strong background in science is important, many applicants to optometry school major in a science, such as biology or chemistry, as undergraduates. Other applicants major in another subject and take many science courses offering laboratory experience.

Admission to optometry school is competitive; about 1 in 3 applicants was accepted in 2007. All applicants must take the Optometry Admissions Test (OAT), a standardized exam which measures academic ability and scientific comprehension. The OAT consists of four tests: survey of the natural sciences, such as biology, general chemistry, and organic chemistry; reading comprehension; physics; and quantitative reasoning. As a result, most applicants take the test after their sophomore or junior year in college, allowing them an opportunity to take the test again and raise their score. A few applicants are accepted to optometry school after 3 years of

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Optometrists.....	29-1041	34,800	43,200	8,500	24

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

college and complete their bachelor's degree while attending optometry school. However, most students accepted by a school or college of optometry have completed an undergraduate degree. Each institution has its own undergraduate prerequisites, so applicants should contact the school or college of their choice for specific requirements.

Optometry programs include classroom and laboratory study of health and visual sciences and clinical training in the diagnosis and treatment of eye disorders. Courses in pharmacology, optics, vision science, biochemistry, and systemic diseases are included.

One-year postgraduate clinical residency programs are available for optometrists who wish to obtain advanced clinical competence within a particular area of optometry. Specialty areas for residency programs include family practice optometry, pediatric optometry, geriatric optometry, vision therapy and rehabilitation, low-vision rehabilitation, cornea and contact lenses, refractive and ocular surgery, primary eye care optometry, and ocular disease.

Licensure. All States and the District of Columbia require that optometrists be licensed. Applicants for a license must have a Doctor of Optometry degree from an accredited optometry school and must pass both a written National Board examination and a National, regional, or State clinical examination. The written and clinical examinations of the National Board of Examiners in Optometry usually are taken during the student's academic career. Many States also require applicants to pass an examination on relevant State laws. Licenses must be renewed every 1 to 3 years and, in all States, continuing education credits are needed for renewal.

Other qualifications. Business acumen, self-discipline, and the ability to deal tactfully with patients are important for success. The work of optometrists also requires attention to detail and manual dexterity.

Advancement. Optometrists who wish to teach or conduct research may study for a master's degree or Ph.D. in visual science, physiological optics, neurophysiology, public health, health administration, health information and communication, or health education.

Employment

Optometrists held about 34,800 jobs in 2008. Salaried jobs for optometrists were primarily in offices of optometrists; offices of physicians, including ophthalmologists; and health and personal care stores, including optical goods stores. A few salaried jobs for optometrists were in hospitals, the Federal Government, or outpatient care centers, including health maintenance organizations. About 25 percent of optometrists are self-employed. According to a 2008 survey by the American Optometric Association, most self-employed optometrists worked in private practice or in partnership with other health

care professionals. A small number worked for optical chains or franchises or as independent contractors.

Job Outlook

Employment of optometrists is expected to grow much faster than the average for all occupations through 2018, in response to the vision care needs of a growing and aging population. Excellent job opportunities are expected.

Employment change. Employment of optometrists is projected to grow 24 percent between 2008 and 2018. A growing population that recognizes the importance of good eye care will increase demand for optometrists. Also, an increasing number of health insurance plans that include vision care should generate more job growth.

As the population ages, there will likely be more visits to optometrists and ophthalmologists because of the onset of vision problems that occur at older ages, such as cataracts, glaucoma, and macular degeneration. In addition, increased incidences of diabetes and hypertension in the general population as well as in the elderly will generate greater demand for optometric services as these diseases often affect eyesight.

Employment of optometrists would grow more rapidly if not for productivity gains expected to allow each optometrist to see more patients. These expected gains stem from greater use of optometric assistants and other support personnel, who can reduce the amount of time optometrists need with each patient.

The increasing popularity of laser surgery to correct some vision problems was previously thought to have an adverse effect on the demand for optometrists as patients often do not require eyeglasses afterward. However, optometrists will still be needed to provide preoperative and postoperative care for laser surgery patients, therefore laser eye surgery will likely have little to no impact on the employment of optometrists.

Job prospects. Excellent job opportunities are expected over the next decade because there are only 19 schools of optometry in the United States, resulting in a limited number of graduates—about 1,200—each year. This number is not expected to keep pace with demand. However, admission to optometry school is competitive.

In addition to job growth, the need to replace optometrists who retire will also create many employment opportunities. According to the American Optometric Association, nearly one-quarter of practicing optometrists are approaching retirement age. As they begin to retire, many opportunities will arise, particularly in individual and group practices.

Earnings

Median annual wages of salaried optometrists were \$96,320 in May 2008. The middle 50 percent earned between \$70,140 and \$125,460. Median annual wages of salaried optometrists

in offices of optometrists were \$92,670. Salaried optometrists tend to earn more initially than do optometrists who set up their own practices. In the long run, however, those in private practice usually earn more.

According to the American Optometric Association, average annual income for self-employed optometrists was \$175,329 in 2007.

Self-employed optometrists, including those in individual, partnerships, and group practice, continue to earn higher income than those in other settings. Earnings also vary by group size. For example, practitioners in large groups—six or more—earn \$159,300; practitioners in mid-sized groups—three to five people—earn \$179,205; those in small practices—two people—earn \$176,944; and individual practitioners earn an average of \$134,094. Self-employed optometrists must also provide their own benefits. Practitioners associated with optical chains earn \$100,704 on average. However, they typically enjoy paid vacation, sick leave, and pension contributions.

Pharmacists

Significant Points

- Excellent job opportunities are expected.
- Earnings are relatively high, but some pharmacists are required to work nights, weekends, and holidays.
- Pharmacists are becoming more involved in counseling patients and planning drug therapy programs.
- Pharmacists must graduate from an accredited college of pharmacy and pass a series of examinations to be licensed.

Nature of the Work

Pharmacists distribute prescription drugs to individuals. They also advise their patients, physicians, and other health practitioners on the selection, dosages, interactions, and side effects of medications, as well as monitor the health and progress of those patients to ensure that they are using their medications safely and effectively. Compounding—the actual mixing of ingredients to form medications—is a small part of a pharmacist's practice, because most medicines are produced by pharmaceutical companies in standard dosages and drug delivery forms. Most pharmacists work in a community setting, such as a retail drugstore, or in a healthcare facility, such as a hospital.

Pharmacists in community pharmacies dispense medications, counsel patients on the use of prescription and over-the-counter medications, and advise physicians about medication therapy. They also advise patients about general health topics, such as diet, exercise, and stress management, and provide information on products, such as durable medical equipment or home healthcare supplies. In addition, they often complete third-party insurance forms and other paperwork. Those who own or manage community pharmacies may sell non-health-related merchandise, hire and supervise personnel, and oversee the general operation of the pharmacy. Some community pharmacists provide specialized services to help patients with conditions such as diabetes, asthma, smoking cessation, or high

Pharmacists provide prescription medications to patients in hospitals, grocery stores, and a variety of other settings.

blood pressure. Some pharmacists are trained to administer vaccinations.

Pharmacists in healthcare facilities dispense medications and advise the medical staff on the selection and effects of drugs. They may make sterile solutions to be administered intravenously. They also plan, monitor, and evaluate drug programs or regimens. They may counsel hospitalized patients on the use of drugs before the patients are discharged.

Some pharmacists specialize in specific drug therapy areas, such as intravenous nutrition support, oncology (cancer), nuclear pharmacy (used for chemotherapy), geriatric pharmacy, and psychiatric pharmacy (the use of drugs to treat mental disorders).

Most pharmacists keep confidential computerized records of patients' drug therapies to prevent harmful drug interactions. Pharmacists are responsible for the accuracy of every prescription that is filled, but they often rely upon pharmacy technicians to assist them in the dispensing medications. (Pharmacy technicians are covered elsewhere in the *Handbook*.) Thus, the pharmacist may delegate prescription-filling and administrative tasks and supervise their completion. Pharmacists also frequently oversee pharmacy students serving as interns.

Some pharmacists are involved in research for pharmaceutical manufacturers, developing new drugs and testing their effects. Others work in marketing or sales, providing clients with expertise on the use, effectiveness, and possible side effects of drugs. Some pharmacists work for health insurance companies, developing pharmacy benefit packages and carrying out cost-benefit analyses on certain drugs. Other pharmacists work for the government, managed care organizations, public healthcare services, or the armed services. Finally, some pharmacists are employed full time or part time as college faculty, teaching classes and performing research in a wide range of areas.

Work environment. Pharmacists work in clean, well-lighted, and well-ventilated areas. Many pharmacists spend most of their workday on their feet. When working with sterile or dangerous pharmaceutical products, pharmacists wear gloves, masks, and other protective equipment.

Most pharmacists work about 40 hours a week, but about 12 percent worked more than 50 hours per week in 2008. In addition, about 19 percent of pharmacists worked part-time. Many community and hospital pharmacies are open for extended hours, so pharmacists may be required to work nights, weekends, and holidays. Consultant pharmacists may travel to healthcare facilities to monitor patients' drug therapies.

Training, Other Qualifications, and Advancement

A license is required in all States and the District of Columbia, as well as in Guam, Puerto Rico, and the U.S. Virgin Islands. In order to obtain a license, pharmacists generally must earn a

Doctor of Pharmacy (Pharm.D.) degree from a college of pharmacy and pass several examinations.

Education and training. Pharmacists who are trained in the United States must earn a Pharm.D. degree from an accredited college or school of pharmacy. The Pharm.D. degree has replaced the Bachelor of Pharmacy degree, which is no longer being awarded. To be admitted to a Pharm.D. program, an applicant must have completed at least 2 years of specific professional study. This requirement generally includes courses in mathematics and natural sciences, such as chemistry, biology, and physics, as well as courses in the humanities and social sciences. In addition, most applicants have completed 3 or more years at a college or university before moving on to a Pharm.D. program, although this is not specifically required.

Pharm.D. programs generally take 4 years to complete. The courses offered are designed to teach students about all aspects of drug therapy. In addition, students learn how to communicate with patients and other healthcare providers about drug information and patient care. Students also learn professional ethics, concepts of public health, and business management. In addition to receiving classroom instruction, students in Pharm.D. programs spend time working with licensed pharmacists in a variety of practice settings.

Some Pharm.D. graduates obtain further training through 1-year or 2-year residency programs or fellowships. Pharmacy residencies are postgraduate training programs in pharmacy practice and usually require the completion of a research project. The programs are often mandatory for pharmacists who wish to work in a clinical setting. Pharmacy fellowships are highly individualized programs that are designed to prepare participants to work in a specialized area of pharmacy, such as clinical practice or research laboratories. Some pharmacists who own their own pharmacy obtain a master's degree in business administration (MBA). Others may obtain a degree in public administration or public health.

Licensure. A license to practice pharmacy is required in all States and the District of Columbia, as well as in Guam, Puerto Rico, and the U.S. Virgin Islands. To obtain a license, a prospective pharmacist generally must obtain a Pharm.D. degree from a college of pharmacy that has been approved by the Accreditation Council for Pharmacy Education. After obtaining the Pharm.D. degree, the individual must pass a series of examinations. All States, U.S. territories, and the District of Columbia require the North American Pharmacist Licensure Exam (NAPLEX), which tests pharmacy skills and knowledge. Forty-four States and the District of Columbia also require the Multistate Pharmacy Jurisprudence Exam (MPJE), which tests pharmacy law. Both exams are administered by the National Association of Boards of Pharmacy (NABP). Each of the eight States and territories that do not require the MJPE has its own pharmacy law exam. Besides requiring the NAPLEX and law examina-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Pharmacists	29-1051	269,900	315,800	45,900	17

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

tion, some States and territories require additional exams that are unique to their jurisdictions. All jurisdictions also require a specified number of hours of experience in a practice setting before a license is awarded. In most jurisdictions, this requirement can be met while obtaining the Pharm.D. In many States, applicants must meet an age requirement before a license can be obtained, and some States require a criminal background check.

All States and U.S. territories except Puerto Rico permit licensure for graduates of foreign pharmacy schools. These individuals must apply for certification from the Foreign Pharmacy Graduate Examination Committee (FPGEC). Once certified, they must pass the Foreign Pharmacy Graduate Equivalency Examination (FPGEE), Test of English as a Foreign Language (TOEFL) exam, and Test of Spoken English (TSE) exam. Then they must pass all of the exams required by the licensing jurisdiction, such as the NAPLEX and MJPE, and meet the requirements for practical experience. In some States, applicants who graduated from programs accredited by the Canadian Council for Accreditation of Pharmacy Programs (CCAPP) between 1993 and 2004 are exempt from FPGEC certification and examination requirements.

Other qualifications. Prospective pharmacists should have scientific aptitude, good interpersonal skills, and a desire to help others. They also must be conscientious and pay close attention to detail, because the decisions they make affect human lives.

Advancement. In community pharmacies, pharmacists usually begin at the staff level. Pharmacists in chain drugstores may be promoted to pharmacy supervisor or store manager. Some pharmacists may be promoted to manager at the district or regional level and, later, to an executive position within the chain's headquarters. Hospital pharmacists may advance to supervisory or administrative positions. Some pharmacists become owners or part owners of independent pharmacies. Pharmacists in the pharmaceutical industry may advance in marketing, sales, research, quality control, production, or other areas.

Employment

Pharmacists held about 269,900 jobs in 2008. About 65 percent worked in retail settings. Most of these were salaried employees, but a small number were self-employed owners. About 22 percent of pharmacists worked in hospitals. A small proportion worked in mail-order and Internet pharmacies, pharmaceutical wholesalers, offices of physicians, and the Federal Government.

Job Outlook

Employment is expected to increase faster than the average. As a result of job growth, the need to replace workers who leave the occupation, and the limited capacity of training programs, job prospects should be excellent.

Employment change. Employment of pharmacists is expected to grow by 17 percent between 2008 and 2018, which is faster than the average for all occupations. The increasing numbers of middle-aged and elderly people—who use more prescription drugs than younger people—will continue to spur demand for pharmacists throughout the projection period. In addition, as scientific advances lead to new drug products, and as an increasing number of people obtain prescription drug coverage, the need for these workers will continue to expand.

Pharmacists also are becoming more involved in patient care. As prescription drugs become more complex, and as the number of people taking multiple medications increases, the potential for dangerous drug interactions will grow. Pharmacists will be needed to counsel patients on the proper use of medication, assist in drug selection and dosage, and monitor complex drug regimens. This need will lead to rapid growth for pharmacists in medical care establishments, such as doctors' offices, outpatient care centers, and nursing care facilities.

Demand also will increase in mail-order pharmacies, which often are more efficient than pharmacies in other practice settings. Employment also will continue to grow in hospitals, drugstores, grocery stores, and mass retailers, because pharmacies in these settings will continue to process the majority of all prescriptions and increasingly will offer patient care services, such as the administration of vaccines.

Job prospects. Job prospects are expected to be excellent over the 2008–18 period. Employers in many parts of the country report difficulty in attracting and retaining adequate numbers of pharmacists—primarily the result of the limited training capacity of Pharm.D. programs. In addition, as a larger percentage of pharmacists elects to work part time, more individuals will be needed to fill the same number of prescriptions. Job openings also will result from faster than average employment growth and from the need to replace workers who retire or leave the occupation for other reasons.

Earnings

Median annual wages of wage and salary pharmacists in May 2008 were \$106,410. The middle 50 percent earned between \$92,670 and \$121,310 a year. The lowest 10 percent earned less than \$77,390, and the highest 10 percent earned more than \$131,440 a year.

Physical Therapists

Significant Points

- Employment is expected to grow much faster than average.
- Job opportunities should be good.
- Today's entrants to this profession need a post-baccalaureate degree from an accredited physical therapist program.
- About 60 percent of physical therapists work in hospitals or in offices of other health practitioners.

Nature of the Work

Physical therapists, sometimes referred to as simply *PTs*, are healthcare professionals who diagnose and treat individuals of all ages, from newborns to the very oldest, who have medical problems or other health-related conditions, illnesses, or injuries that limits their abilities to move and perform functional activities as well as they would like in their daily lives. Physical therapists examine each individual and develop a plan using treatment techniques to promote the ability to move, reduce pain, restore function, and prevent disability. In addition, PTs work with individuals to prevent the loss of mobility before it occurs by developing fitness and wellness-oriented programs for healthier and more active lifestyles.

Physical therapists provide care to people of all ages who have functional problems resulting from, for example, back and neck injuries, sprains/strains and fractures, arthritis, burns, amputations, stroke, multiple sclerosis, conditions such as cerebral palsy and spina bifida, and injuries related to work and sports. Physical therapy care and services are provided by physical therapists and physical therapist assistants who work under the direction

and supervision of a physical therapist. Physical therapists evaluate and diagnose movement dysfunction and use interventions to treat patient/clients. Interventions may include therapeutic exercise, functional training, manual therapy techniques, assistive and adaptive devices and equipment, and physical agents and electrotherapeutic modalities.

Physical therapists often consult and practice with a variety of other professionals, such as physicians, dentists, nurses, educators, social workers, occupational therapists, speech-language pathologists, and audiologists.

Work environment. Physical therapists practice in hospitals, outpatient clinics, and private offices that have specially equipped facilities. These jobs can be physically demanding, because therapists may have to stoop, kneel, crouch, lift, and stand for long periods. In addition, physical therapists move heavy equipment and lift patients or help them turn, stand, or walk.

In 2008, most full-time physical therapists worked a 40-hour week; some worked evenings and weekends to fit their patients' schedules. About 27 percent of physical therapists worked part-time.

Training, Other Qualifications, and Advancement

Today's entrants to this profession need a post-baccalaureate degree from an accredited physical therapy program. All States regulate the practice of physical therapy, which usually requires passing scores on national and State examinations.

Education and training. The American Physical Therapy Association's accrediting body, called the Commission on Accreditation of Physical Therapy Education (CAPTE), accredits entry-level academic programs in physical therapy. In 2009, there were 212 physical therapist education programs. Of these accredited programs, 12 awarded master's degrees; and 200 awarded doctoral degrees. Currently, only graduate degree physical therapist programs are accredited. Master's degree programs typically are

Physical therapists may practice in hospitals, clinics, private offices, private homes, or schools.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Physical therapists.....	29-1123	185,500	241,700	56,200	30

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

2 to 2.5 years in length, while doctoral degree programs last 3 years.

Physical therapist education programs include foundational science courses, such as biology, anatomy, physiology, cellular histology, exercise physiology, neuroscience, biomechanics, pharmacology, pathology, and radiology/imaging, as well as behavioral science courses, such as evidence-based practice and clinical reasoning. Some of the clinically-based courses include medical screening, examination tests and measures, diagnostic process, therapeutic interventions, outcomes assessment, and practice management. In addition to classroom and laboratory instruction, students receive supervised clinical experience.

Among the undergraduate courses that are useful when one applies to a physical therapist education program are anatomy, biology, chemistry, physics, social science, mathematics, and statistics. Before granting admission, many programs require volunteer experience in the physical therapy department of a hospital or clinic.

Licensure. All States regulate the practice of physical therapy. Eligibility requirements vary by State. Typical requirements for physical therapists include graduation from an accredited physical therapy education program; passing the National Physical Therapy Examination; and fulfilling State requirements such as jurisprudence exams. A number of States require continuing education as a condition of maintaining licensure.

Other qualifications. Physical therapists should have strong interpersonal and communication skills, so they can educate patients about their condition and physical therapy treatments and communicate with patients' families. Physical therapists also should be compassionate and possess a desire to help patients.

Advancement. Physical therapists are expected to continue their professional development by participating in continuing education courses and workshops. Some physical therapists become board certified in a clinical specialty. Opportunities for physical therapists exist in academia and research. Some become self-employed, providing contract services or opening a private practice.

Employment

Physical therapists held about 185,500 jobs in 2008. The number of physical therapist jobs is probably greater than the number of practicing physical therapists, because some physical therapists work part time, holding two or more jobs. For example, some may work in a private practice, but also work part time in another healthcare facility.

About 60 percent of physical therapists worked in hospitals or in offices of other health practitioners. Other jobs were in the home health care services industry, nursing care facilities, outpatient care centers, and offices of physicians. Some physical therapists were self-employed in private practices, seeing individual patients and contracting to provide services in hospitals, rehabili-

tation centers, nursing care facilities, home healthcare agencies, adult day care programs, and schools. Physical therapists also teach in academic institutions and conduct research.

Job Outlook

Employment is expected to grow much faster than average. Job opportunities should be good.

Employment change. Employment of physical therapists is expected to grow by 30 percent from 2008 to 2018, much faster than the average for all occupations. Changes to restrictions on reimbursement for physical therapy services by third-party payers will increase patient access to services and, thus, increase demand. The increasing elderly population will drive growth in the demand for physical therapy services. The elderly population is particularly vulnerable to chronic and debilitating conditions that require therapeutic services. Also, the baby-boom generation is entering the prime age for heart attacks and strokes, increasing the demand for cardiac and physical rehabilitation. Medical and technological developments will permit a greater percentage of trauma victims and newborns with birth defects to survive, creating additional demand for rehabilitative care. In addition, growth may result from advances in medical technology and the use of evidence-base practices, which could permit the treatment of an increasing number of disabling conditions that were untreatable in the past.

In addition, the federally mandated Individuals with Disabilities Education Act guarantees that students have access to services from physical therapists and other therapeutic and rehabilitative services. Demand for physical therapists will continue in schools.

Job prospects. Job opportunities will be good for licensed physical therapists in all settings. Job opportunities should be particularly good in acute hospital, skilled nursing, and orthopedic settings, where the elderly are most often treated. Job prospects should be especially favorable in rural areas as many physical therapists tend to cluster in highly populated urban and suburban areas.

Earnings

Median annual wages of physical therapists were \$72,790 in May 2008. The middle 50 percent earned between \$60,300 and \$85,540. The lowest 10 percent earned less than \$50,350, and the highest 10 percent earned more than \$104,350. Median annual wages in the industries employing the largest numbers of physical therapists in May 2008 were:

Home health care services.....	\$77,630
Nursing care facilities	76,680
General medical and surgical hospitals.....	73,270
Offices of physicians	72,790
Offices of other health practitioners.....	71,400

Related Occupations

Physical therapists rehabilitate people with physical disabilities and provide wellness and prevention programs. Others who work in the rehabilitation field include:

	Page
Audiologists	358
Chiropractors.....	360
Occupational therapists	369
Recreational therapists	389
Speech-language pathologists	399

Physician Assistants

Significant Points

- Requirements for admission to training programs vary; most applicants have a college degree and some health-related work experience.
- Physician assistants must complete an accredited education program and pass a national exam in order to obtain a license.
- Employment is projected to grow much faster than the average.
- Job opportunities should be good, particularly in rural and inner-city healthcare facilities.

Nature of the Work

Physician assistants (PAs) practice medicine under the supervision of physicians and surgeons. They should not be confused with medical assistants, who perform routine clinical and clerical tasks. (Medical assistants are discussed elsewhere in the *Handbook*.) PAs are formally trained to provide diagnostic, therapeutic, and preventive healthcare services, as delegated by a physician. Working as members of a healthcare team, they take medical histories, examine and treat patients, order and interpret laboratory tests and x rays, and make diagnoses. They also treat minor injuries by suturing, splinting, and casting. PAs record progress notes, instruct and counsel patients, and order or carry out therapy. Physician assistants also may prescribe

certain medications. In some establishments, a PA is responsible for managerial duties, such as ordering medical supplies or equipment and supervising medical technicians and assistants.

Physician assistants work under the supervision of a physician. However, PAs may be the principal care providers in rural or inner-city clinics where a physician is present for only 1 or 2 days each week. In such cases, the PA confers with the supervising physician and other medical professionals as needed and as required by law. PAs also may make house calls or go to hospitals and nursing care facilities to check on patients, after which they report back to the physician.

The duties of physician assistants are determined by the supervising physician and by State law. Aspiring PAs should investigate the laws and regulations in the States in which they wish to practice.

Many PAs work in primary care specialties, such as general internal medicine, pediatrics, and family medicine. Other specialty areas include general and thoracic surgery, emergency medicine, orthopedics, and geriatrics. PAs specializing in surgery provide preoperative and postoperative care and may work as first or second assistants during major surgery.

Work environment. Although PAs usually work in a comfortable, well-lighted environment, those in surgery often stand for long periods. At times, the job requires a considerable amount of walking.

PA's work schedules may vary according to the practice setting and often depend on the hours of the supervising physician. The workweek of hospital-based PAs may include weekends, nights, or early morning hospital rounds to visit patients. These workers also may be on call. PAs in clinics usually work about a 40-hour week.

Physician assistants are formally trained to provide diagnostic, therapeutic, and preventive healthcare services, under the supervision of a physician.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Physician assistants.....	29-1071	74,800	103,900	29,200	39

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Training, Other Qualifications, and Advancement

Requirements for admission to training programs vary; most applicants have a college degree and some health-related work experience. All States require physician assistants to complete an accredited, formal education program and pass a national exam to obtain a license.

Education and training. Physician assistant educational programs usually take at least 2 years to complete for full-time students. Most programs are at schools of allied health, academic health centers, medical schools, or 4-year colleges; a few are at community colleges, are part of the military, or are at hospitals. Many accredited PA programs have clinical teaching affiliations with medical schools.

In 2008, 142 education programs for physician assistants were accredited or provisionally accredited by the Accreditation Review Commission on Education for the Physician Assistant. Eighty percent, or 113, of these programs offered the option of a master's degree, 21 of them offered a bachelor's degree, 3 awarded associate degrees, and 5 awarded a certificate.

Most applicants to PA educational programs already have a college degree and some health-related work experience; however, admissions requirements vary from program to program. Many PAs have prior experience as registered nurses, emergency medical technicians, and paramedics.

PA education includes classroom and laboratory instruction in subjects like biochemistry, pathology, human anatomy, physiology, clinical pharmacology, clinical medicine, physical diagnosis, and medical ethics. PA programs also include supervised clinical training in several areas, including family medicine, internal medicine, surgery, prenatal care and gynecology, geriatrics, emergency medicine, and pediatrics. Sometimes, PA students serve in one or more of these areas under the supervision of a physician who is seeking to hire a PA. The rotation may lead to permanent employment in one of the areas where the student works.

Licensure. All States and the District of Columbia have legislation governing the practice of physician assistants. All jurisdictions require physician assistants to pass the Physician Assistant National Certifying Examination, administered by the National Commission on Certification of Physician Assistants (NCCPA) and open only to graduates of accredited PA education programs. Only those who have successfully completed the examination may use the credential "Physician Assistant-Certified." To remain certified, PAs must complete 100 hours of continuing medical education every 2 years. Every 6 years, they must pass a recertification examination or complete an alternative program combining learning experiences and a take-home examination.

Other qualifications. Physician assistants must have a desire to serve patients and be self-motivated. PAs also must have a good bedside manner, emotional stability, and the ability to

make decisions in emergencies. Physician assistants should have an enthusiasm for lifelong learning, because their eligibility to practice depends on continuing education.

Advancement. Some PAs pursue additional education in a specialty. PA postgraduate educational programs are available in areas such as internal medicine, rural primary care, emergency medicine, surgery, pediatrics, neonatology, and occupational medicine. Candidates must be graduates of an accredited program and be certified by the NCCPA.

As they attain greater clinical knowledge and experience, PAs can earn new responsibilities and higher wages. However, by the very nature of the profession, clinically practicing PAs always are supervised by physicians.

Employment

Physician assistants held about 74,800 jobs in 2008. The number of jobs is greater than the number of practicing PAs because some hold two or more jobs. For example, some PAs work with a supervising physician but also work in another healthcare facility. According to the American Academy of Physician Assistants, about 15 percent of actively practicing PAs worked in more than one clinical job concurrently in 2008.

More than 53 percent of jobs for PAs were in the offices of physicians. About 24 percent were in general medical and surgical hospitals, public or private. The rest were mostly in outpatient care centers, including health maintenance organizations; the Federal Government; and public or private colleges, universities, and professional schools. Very few were self-employed.

Job Outlook

Employment is expected to grow much faster than the average for all occupations. Job opportunities for PAs should be good, particularly in rural and inner-city healthcare facilities.

Employment change. Employment of physician assistants is expected to grow by 39 percent from 2008 to 2018, much faster than the average for all occupations. Projected rapid job growth reflects the expansion of healthcare industries and an emphasis on cost containment, which results in increasing use of PAs by healthcare establishments.

Physicians and institutions are expected to employ more PAs to provide primary care and to assist with medical and surgical procedures because PAs are cost-effective and productive members of the healthcare team. Physician assistants can relieve physicians of routine duties and procedures. Healthcare providers will use more physician assistants as States continue to expand PAs' scope of practice by allowing them to perform more procedures.

Besides working in traditional office-based settings, PAs should find a growing number of jobs in institutional settings such as hospitals, academic medical centers, public clinics, and prisons.

Job prospects. Job opportunities for PAs should be good, particularly in rural and inner-city clinics because those settings have difficulty attracting physicians. Job openings will result both from employment growth and from the need to replace physician assistants who retire or leave the occupation permanently. Opportunities will be best in States that allow PAs a wider scope of practice.

Earnings

The median annual wage of physician assistants was \$81,230 in May 2008. The middle 50 percent of physician assistants earned between \$68,210 and \$97,070. The lowest 10 percent earned less than \$51,360, and the highest 10 percent earned more than \$110,240. Median annual wages in the industries employing the largest numbers of physician assistants in May 2008 were:

General medical and surgical hospitals.....	\$84,550
Outpatient care centers.....	84,390
Offices of physicians.....	80,440
Federal Executive Branch.....	78,200
Colleges, universities, and professional schools.....	74,200

According to the American Academy of Physician Assistants' 2008 Census Report, median income for physician assistants in full-time clinical practice was \$85,710 in 2008; median income for first-year graduates was \$74,470. Income varies by specialty, practice setting, geographical location, and years of experience. Employers often pay for their employees' professional liability insurance, registration fees with the Drug Enforcement Administration, State licensing fees, and credentialing fees.

acteristics. Links to O*NET appear at the end of the Internet version of this occupational statement, accessible at <http://www.bls.gov/ooh/ocos081.htm>

Physicians and Surgeons

Significant Points

- Many physicians and surgeons work long, irregular hours.
- Acceptance to medical school is highly competitive.
- Formal education and training requirements—typically 4 years of undergraduate school, 4 years of medical school, and 3 to 8 years of internship and residency—are among the most demanding of any occupation, but earnings are among the highest.
- Job opportunities should be very good, particularly in rural and low-income areas.

Nature of the Work

Physicians and surgeons diagnose illnesses and prescribe and administer treatment for people suffering from injury or disease. Physicians examine patients, obtain medical histories, and order, perform, and interpret diagnostic tests. They counsel patients on diet, hygiene, and preventive health care.

There are two types of physicians: *M.D. (Medical Doctor)* and *D.O. (Doctor of Osteopathic Medicine)*. M.D.s also are known as *allopathic physicians*. While both M.D.s and D.O.s may use all accepted methods of treatment, including drugs and surgery, D.O.s place special emphasis on the body's musculoskeletal system, preventive medicine, and holistic patient care. D.O.s are most likely to be primary care specialists although they can be found in all specialties. About half of D.O.s practice general or family medicine, general internal medicine, or general pediatrics.

Physicians work in one or more of several specialties, including, but not limited to, anesthesiology, family and general medicine, general internal medicine, general pediatrics, obstetrics and gynecology, psychiatry, and surgery.

Anesthesiologists focus on the care of surgical patients and pain relief. Like other physicians, they evaluate and treat patients and direct the efforts of their staffs. Through continual monitoring and assessment, these critical care specialists are responsible for maintenance of the patient's vital life functions—heart rate, body temperature, blood pressure, breathing—during surgery. They also work outside of the operating room, providing pain relief in the intensive care unit, during labor and delivery, and for those who suffer from chronic pain. Anesthesiologists confer with other physicians and surgeons about appropriate treatments and procedures before, during, and after operations.

Family and general physicians often provide the first point of contact for people seeking health care, by acting as the traditional family physician. They assess and treat a wide range of conditions, from sinus and respiratory infections to broken bones. Family and general physician typically have a base of

Physicians examine patients, obtain medical histories, and order, perform, and interpret diagnostic tests.

regular, long-term patients. These doctors refer patients with more serious conditions to specialists or other health care facilities for more intensive care.

General internists diagnose and provide nonsurgical treatment for a wide range of problems that affect internal organ systems, such as the stomach, kidneys, liver, and digestive tract. Internists use a variety of diagnostic techniques to treat patients through medication or hospitalization. Like general practitioners, general internists commonly act as primary care specialists. They treat patients referred from other specialists and, in turn, they refer patients to other specialists when more complex care is required.

General pediatricians care for the health of infants, children, teenagers, and young adults. They specialize in the diagnosis and treatment of a variety of ailments specific to young people and track patients' growth to adulthood. Like most physicians, pediatricians work with different health care workers, such as nurses and other physicians, to assess and treat children with various ailments. Most of the work of pediatricians involves treating day-to-day illnesses—minor injuries, infectious diseases, and immunizations—that are common to children, much as a general practitioner treats adults. Some pediatricians specialize in pediatric surgery or serious medical conditions, such as autoimmune disorders or serious chronic ailments.

Obstetricians and gynecologists (OB/GYNs) specialize in women's health. They are responsible for women's general medical care, and they also provide care related to pregnancy and the reproductive system. Like general practitioners, OB/GYNs attempt to prevent, diagnose, and treat general health problems, but they focus on ailments specific to the female anatomy, such as cancers of the breast or cervix, urinary tract and pelvic disorders, and hormonal disorders. OB/GYNs also specialize in childbirth, which includes treating and counseling women throughout their pregnancy, from giving prenatal diagnoses to assisting with delivery and providing postpartum care.

Psychiatrists are the primary mental health caregivers. They assess and treat mental illnesses through a combination of psychotherapy, psychoanalysis, hospitalization, and medication. Psychotherapy involves regular discussions with patients about their problems; the psychiatrist helps them find solutions through changes in their behavioral patterns, the exploration of

their past experiences, or group and family therapy sessions. Psychoanalysis involves long-term psychotherapy and counseling for patients. In many cases, medications are administered to correct chemical imbalances that cause emotional problems.

Surgeons specialize in the treatment of injury, disease, and deformity through operations. Using a variety of instruments, and with patients under anesthesia, a surgeon corrects physical deformities, repairs bone and tissue after injuries, or performs preventive surgeries on patients with debilitating diseases or disorders. Although a large number perform general surgery, many surgeons choose to specialize in a specific area. One of the most prevalent specialties is orthopedic surgery: the treatment of the musculoskeletal system. Others include neurological surgery (treatment of the brain and nervous system), cardiovascular surgery, otolaryngology (treatment of the ear, nose, and throat), and plastic or reconstructive surgery. Like other physicians, surgeons also examine patients, perform and interpret diagnostic tests, and counsel patients on preventive health care.

Other physicians and surgeons work in a number of other medical and surgical specialties, including allergists, cardiologists, dermatologists, emergency physicians, gastroenterologists, ophthalmologists, pathologists, and radiologists.

Work environment. Many physicians—primarily general and family practitioners, general internists, pediatricians, OB/GYNs, and psychiatrists—work in small private offices or clinics, often assisted by a small staff of nurses and other administrative personnel. Increasingly, physicians are practicing in groups or health care organizations that provide backup coverage and allow for more time off. Physicians in a group practice or health care organization often work as part of a team that coordinates care for a number of patients; they are less independent than the solo practitioners of the past. Surgeons and anesthesiologists usually work in well-lighted, sterile environments while performing surgery and often stand for long periods. Most work in hospitals or in surgical outpatient centers.

Many physicians and surgeons work long, irregular hours. In 2008, 43 percent of all physicians and surgeons worked 50 or more hours a week. Nine percent of all physicians and surgeons worked part-time. Physicians and surgeons travel between office and hospital to care for their patients. While on call, a physician will deal with many patients' concerns over the phone and make emergency visits to hospitals or nursing homes.

Training, Other Qualifications, and Advancement

The common path to practicing as a physician requires 8 years of education beyond high school and 3 to 8 additional years of internship and residency. All States, the District of Columbia, and U.S. territories license physicians.

Education and training. Formal education and training requirements for physicians are among the most demanding of any occupation—4 years of undergraduate school, 4 years of medical school, and 3 to 8 years of internship and residency, depending on the specialty selected. A few medical schools offer combined undergraduate and medical school programs that last 6 or 7 years rather than the customary 8 years.

Premedical students must complete undergraduate work in physics, biology, mathematics, English, and inorganic and

organic chemistry. Students also take courses in the humanities and the social sciences. Some students volunteer at local hospitals or clinics to gain practical experience in the health professions.

The minimum educational requirement for entry into medical school is 3 years of college; most applicants, however, have at least a bachelor's degree, and many have advanced degrees. In 2008, there were 129 medical schools accredited by the Liaison Committee on Medical Education (LCME). The LCME is the national accrediting body for M.D. medical education programs. The American Osteopathic Association accredits schools that award a D.O. degree; there were 25 schools accredited in 31 locations in 2008.

Acceptance to medical school is highly competitive. Most applicants must submit transcripts, scores from the Medical College Admission Test, and letters of recommendation. Schools also consider an applicant's character, personality, leadership qualities, and participation in extracurricular activities. Most schools require an interview with members of the admissions committee.

Students spend most of the first 2 years of medical school in laboratories and classrooms, taking courses such as anatomy, biochemistry, physiology, pharmacology, psychology, microbiology, pathology, medical ethics, and laws governing medicine. They also learn to take medical histories, examine patients, and diagnose illnesses. During their last 2 years, students work with patients under the supervision of experienced physicians in hospitals and clinics, learning acute, chronic, preventive, and rehabilitative care. Through rotations in internal medicine, family practice, obstetrics and gynecology, pediatrics, psychiatry, and surgery, they gain experience in the diagnosis and treatment of illness.

Following medical school, almost all M.D.s enter a residency—graduate medical education in a specialty that takes the form of paid on-the-job training, usually in a hospital. Most D.O.s serve a 12-month rotating internship after graduation and before entering a residency, which may last 2 to 6 years.

A physician's training is costly. According to the Association of American Medical Colleges, in 2007 85 percent of public medical school graduates and 86 percent of private medical school graduates were in debt for educational expenses.

Licensure and certification. To practice medicine as a physician, all States, the District of Columbia, and U.S. territories require licensing. All physicians and surgeons practicing in the United States must pass the United States Medical Licensing Examination (USMLE). To be eligible to take the USMLE in its entirety, physicians must graduate from an accredited medical school. Although physicians licensed in one State usually can get a license to practice in another without further examination, some States limit reciprocity. Graduates of foreign medical schools generally can qualify for licensure after passing an examination and completing a U.S. residency. For specific information on licensing in a given State, contact that State's medical board.

M.D.s and D.O.s seeking board certification in a specialty may spend up to 7 years in residency training, depending on the specialty. A final examination immediately after residency or after 1 or 2 years of practice is also necessary for certification by a member board of the American Board of Medical Special-

ists (ABMS) or the American Osteopathic Association (AOA). The ABMS represents 24 boards related to medical specialties ranging from allergy and immunology to urology. The AOA has approved 18 specialty boards, ranging from anesthesiology to surgery. For certification in a subspecialty, physicians usually need another 1 to 2 years of residency.

Other qualifications. People who wish to become physicians must have a desire to serve patients, be self-motivated, and be able to survive the pressures and long hours of medical education and practice. Physicians also must have a good bedside manner, emotional stability, and the ability to make decisions in emergencies. Prospective physicians must be willing to study throughout their career to keep up with medical advances.

Advancement. Some physicians and surgeons advance by gaining expertise in specialties and subspecialties and by developing a reputation for excellence among their peers and patients. Physicians and surgeons may also start their own practice or join a group practice. Others teach residents and other new doctors, and some advance to supervisory and managerial roles in hospitals, clinics, and other settings.

Employment

Physicians and surgeons held about 661,400 jobs in 2008; approximately 12 percent were self-employed. About 53 percent of wage-and-salary physicians and surgeons worked in offices of physicians, and 19 percent were employed by hospitals. Others practiced in Federal, State, and local governments, educational services, and outpatient care centers.

According to 2007 data from the American Medical Association (AMA), 32 percent of physicians in patient care were in primary care, but not in a subspecialty of primary care. (See table 1.)

Table 1. Percent distribution of active physicians in patient care by specialty, 2007

Specialty	Percent
Internal medicine	20
Family medicine/general practice	12
Pediatrics.....	10
Obstetrics and gynecology	6
Anesthesiology.....	6
Psychiatry.....	5
General Surgery	5
Emergency Medicine	4

SOURCE: American Medical Association, 2009 Physician Characteristic and Distribution in the US.

A growing number of physicians are partners or wage-and-salary employees of group practices. Organized as clinics or as associations of physicians, medical groups can more easily afford expensive medical equipment, share support staff, and benefit from other business advantages.

According to the AMA, the New England and Middle Atlantic States have the highest ratios of physicians to population; the South Central and Mountain States have the lowest. Physicians tend to locate in urban areas, close to hospitals and education centers. AMA data showed that in 2007, about 75 percent of physicians in patient care were located in metropolitan areas while the remaining 25 percent were located in rural areas.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Physicians and surgeons.....	29-1060	661,400	805,500	144,100	22

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Job Outlook

Employment is expected to grow much faster than the average for all occupations. Job opportunities should be very good, particularly in rural and low-income areas.

Employment change. Employment of physicians and surgeons is projected to grow 22 percent from 2008 to 2018, much faster than the average for all occupations. Job growth will occur because of continued expansion of health care-related industries. The growing and aging population will drive overall growth in the demand for physician services, as consumers continue to demand high levels of care using the latest technologies, diagnostic tests, and therapies. Many medical schools are increasing their enrollments based on perceived new demand for physicians.

Despite growing demand for physicians and surgeons, some factors will temper growth. For example, new technologies allow physicians to be more productive. This means physicians can diagnose and treat more patients in the same amount of time. The rising cost of health care can dramatically affect demand for physicians' services. Physician assistants and nurse practitioners, who can perform many of the routine duties of physicians at a fraction of the cost, may be increasingly used. Furthermore, demand for physicians' services is highly sensitive to changes in health care reimbursement policies. If changes to health coverage result in higher out-of-pocket costs for consumers, they may demand fewer physician services.

Job prospects. Opportunities for individuals interested in becoming physicians and surgeons are expected to be very good. In addition to job openings from employment growth, openings will result from the need to replace the relatively high number of physicians and surgeons expected to retire over the 2008–18 decade.

Job prospects should be particularly good for physicians willing to practice in rural and low-income areas because these medically underserved areas typically have difficulty attracting these workers. Job prospects will also be especially good for physicians in specialties that afflict the rapidly growing elderly population. Examples of such specialties are cardiology and radiology because the risks for heart disease and cancer increase as people age.

Earnings

Earnings of physicians and surgeons are among the highest of any occupation. According to the Medical Group Management Association's Physician Compensation and Production Survey, median total compensation for physicians varied by their type of practice. In 2008, physicians practicing primary care had total median annual compensation of \$186,044, and physicians practicing in medical specialties earned total median annual compensation of \$339,738.

Self-employed physicians—those who own or are part owners of their medical practice—generally have higher median incomes than salaried physicians. Earnings vary according to number of years in practice, geographic region, hours worked, skill, personality, and professional reputation. Self-employed physicians and surgeons must provide for their own health insurance and retirement.

Podiatrists

Significant Points

- Podiatrists must be licensed, requiring 3 to 4 years of undergraduate education, the completion of a 4-year podiatric college program, and passing scores on national and State examinations.
- Job opportunities should be good for entry-level graduates of accredited podiatric medicine programs.
- Opportunities will be better in group medical practices, clinics, and health networks than in traditional, solo practices.
- Podiatrists enjoy very high earnings.

Nature of the Work

Americans spend a great deal of time on their feet. As the Nation becomes more active across all age groups, the need for foot care will become increasingly important. *Podiatrists*, also known as *doctors of podiatric medicine* (DPMs), diagnose and treat disorders, diseases, and injuries of the foot and lower leg.

Podiatrists treat corns, calluses, ingrown toenails, bunions, heel spurs, and arch problems; ankle and foot injuries, deformities, and infections; and foot complaints associated with diabetes and other diseases. To treat these problems, podiatrists prescribe drugs and physical therapy, set fractures, and perform surgery. They also fit corrective shoe inserts called orthotics, design plaster casts and strappings to correct deformities, and design custom-made shoes. Podiatrists may use a force plate or scanner to help design the orthotics: patients walk across a plate connected to a computer that “reads” their feet, picking up pressure points and weight distribution. From the computer readout, podiatrists order the correct design or recommend another kind of treatment.

To diagnose a foot problem, podiatrists also may order X rays and laboratory tests. The foot may be the first area to show signs

Podiatrists diagnose and treat disorders, diseases, and injuries of the foot and lower leg.

of serious conditions such as arthritis, diabetes, and heart disease. For example, patients with diabetes are prone to foot ulcers and infections because of poor circulation. Podiatrists consult with and refer patients to other health practitioners when they detect symptoms of these disorders.

Most podiatrists have a solo practice, although more are forming group practices with other podiatrists or health practitioners. Some specialize in surgery, orthopedics, primary care, or public health. Besides these board-certified specialties, podiatrists may practice other specialties, such as sports medicine, pediatrics, dermatology, radiology, geriatrics, or diabetic foot care.

Podiatrists who are in private practice are responsible for running a small business. They may hire employees, order supplies, and keep records, among other tasks. In addition, some educate the community on the benefits of foot care through speaking engagements and advertising.

Work environment. Podiatrists usually work in small private offices or clinics, sometimes supported by a small staff of assistants and other administrative personnel. They also may spend time visiting patients in nursing homes or performing surgery at hospitals or ambulatory surgical centers. Work hours vary from 30-60 hours per week. Podiatrists with private practices may set their own hours but may work evenings and weekends to accommodate their patients. Podiatrists usually treat fewer emergencies than other doctors.

Training, Other Qualifications, and Advancement

Podiatrists must be licensed, requiring 3 to 4 years of undergraduate education, the completion of a 4-year podiatric college program, and passing scores on national and State examinations.

Education and training. Prerequisites for admission to a college of podiatric medicine include the completion of at least 90 semester hours of undergraduate study, an acceptable grade point average, and suitable scores on the Medical College Admission Test. (Some colleges also may accept the Dental Admission Test or the Graduate Record Exam.)

Admission to podiatric colleges usually requires at least 8 semester hours each of biology, inorganic chemistry, organic chemistry, and physics and at least 6 hours of English. The science courses should be those designed for premedical students. Extracurricular and community activities, personal interviews, and letters of recommendation are also important. About 95 percent of podiatric students have at least a bachelor's degree.

In 2008, there were eight colleges of podiatric medicine fully accredited by the Council on Podiatric Medical Education. Colleges of podiatric medicine offer a 4-year program whose core curriculum is similar to that in other schools of medicine. During the first 2 years, students receive classroom instruction in basic sciences, including anatomy, chemistry, pathology, and pharmacology. Third-year and fourth-year students have clinical rotations in private practices, hospitals, and clinics. During these rotations, they learn how to take general and podiatric histories, perform routine physical examinations, interpret tests and findings, make diagnoses, and perform therapeutic procedures. Graduates receive the degree of Doctor of Podiatric Medicine (DPM).

Most graduates complete a hospital-based residency program after receiving a DPM. Residency programs last from 2 to 4 years. Residents receive advanced training in podiatric medicine and surgery and serve clinical rotations in anesthesiology, internal medicine, infectious disease, pediatrics, emergency medicine, and orthopedic and general surgery. Residencies lasting more than 1 year provide more extensive training in specialty areas.

Licensure. All States and the District of Columbia require a license for the practice of podiatric medicine. Each State defines its own licensing requirements, although many States grant reciprocity to podiatrists who are licensed in another State. Applicants for licensure must be graduates of an accredited college of podiatric medicine and must pass written and oral examinations. Some States permit applicants to substitute the examination of the National Board of Podiatric Medical Examiners, given in the second and fourth years of podiatric medical college, for part or all of the written State examination. In general, States require a minimum of 2 years of postgraduate residency training in an approved healthcare institution. For licensure renewal, most States require continuing education.

Other qualifications. People planning a career in podiatry should have scientific aptitude, manual dexterity, interpersonal skills, and a friendly bedside manner. In private practice, podiatrists also should have good business sense.

Certification and advancement. There are a number of certifying boards for the podiatric specialties of orthopedics, primary medicine, and surgery. Certification has requirements beyond licensure. Each board requires advanced training, the completion of written and oral examinations, and experience as a practicing podiatrist. Most managed-care organizations prefer board-certified podiatrists.

Podiatrists may advance to become professors at colleges of podiatric medicine, department chiefs in hospitals, or general health administrators.

Employment

Podiatrists held about 12,200 jobs in 2008. About 19 percent of podiatrists were self-employed. Most podiatrists were solo practitioners, although more are entering group practices with other podiatrists or other health practitioners. Solo practitioners were either unincorporated self-employed workers or incorporated wage and salary workers in offices of other health practitioners. Other podiatrists were employed by hospitals and the Federal Government.

Job Outlook

Employment is expected to increase about as fast as average. Job prospects should be good.

Employment change. Employment of podiatrists is expected to increase by 9 percent from 2008 to 2018, about as fast as the average for all occupations. More people will turn to podiatrists for foot care because of the rising number of injuries sustained by a more active and increasingly older population. Also, demand for podiatrists will increase because of the rising number of Americans who are diagnosed with diabetes and who are severely overweight. People with diabetes have circulatory problems that create the need for them to seek the aid of podiatrists; persons who experience rapid weight gain may have intense pressure on the foot and ankle, and therefore need the services of podiatrists.

Medicare and most private health insurance programs cover acute medical and surgical foot services, as well as diagnostic X rays and leg braces. Details of such coverage vary among plans. However, routine foot care, including the removal of corns and calluses, is not usually covered unless the patient has a systemic condition that has resulted in severe circulatory problems or areas of desensitization in the legs or feet. Like dental services, podiatric care is often discretionary and, therefore, more dependent on disposable income than some other medical services.

Employment of podiatrists would grow even faster were it not for continued emphasis on controlling the costs of specialty

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018		Change, 2008-2018	
			Number	Percent	Number	Percent
Podiatrists.....	29-1081	12,200	13,300	1,100	9	

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

healthcare. Insurers will balance the cost of sending patients to podiatrists against the cost and availability of substitute practitioners, such as physicians, chiropractors, and physical therapists.

Job prospects. Although the occupation is small and most podiatrists continue to practice until retirement, job opportunities should be good for entry-level graduates of accredited podiatric medicine programs. Job growth, coupled with the need to replace podiatrists who stop practicing, should create enough job openings for the supply of new podiatric medicine graduates. Opportunities will be better for board-certified podiatrists because many managed-care organizations require board certification. Newly trained podiatrists will find more opportunities in group medical practices, clinics, and health networks than in traditional solo practices. Establishing a practice will be most difficult in the areas surrounding colleges of podiatric medicine, where podiatrists concentrate.

Earnings

Podiatrists enjoy very high earnings. Median annual wages of salaried podiatrists were \$113,560 in May 2008. Additionally, a survey by *Podiatry Management Magazine* reported median net income of \$114,768 in 2008. Podiatrists in partnerships tended to earn higher net incomes than those in solo practice. Salaried podiatrists typically receive health insurance and retirement benefits from their employer, whereas self-employed podiatrists must provide for their own health insurance and retirement. Also, solo practitioners must absorb the costs of running their own offices.

acteristics. Links to O*NET appear at the end of the Internet version of this occupational statement, accessible at <http://www.bls.gov/ooh/ocos075.htm>

Radiation Therapists

Significant Points

- A bachelor's degree, associate degree, or certificate in radiation therapy is generally required.
- Employment is projected to grow much faster than the average for all occupations.
- Good job opportunities are expected.
- Earnings are relatively high.

Nature of the Work

Radiation therapy is used to treat cancer in the human body. As part of a medical radiation oncology team, radiation therapists use machines called linear accelerators to administer radiation treatment to patients. Linear accelerators are most commonly used in a procedure called external beam therapy, which projects high-energy x-rays at targeted cancer cells. As the X-rays collide with human tissue, they produce highly energized ions that can shrink and eliminate cancerous tumors. Radiation therapy is sometimes used as the sole treatment for cancer, but it is usually used in conjunction with chemotherapy or surgery.

Before treatment can begin, the oncology team has to develop a treatment plan. To create this plan, the radiation therapist must first use an X-ray imaging machine or computer tomography (CT) scan to pinpoint the location of the tumor. Then, a radiation oncologist (a physician who specializes in therapeutic radiology) and a radiation physicist (a worker who calibrates the linear accelerator) determine the best way to administer treatment. The therapist completes the plan by positioning the patient and adjusting the linear accelerator to the specifications developed by the team, recording the details so that these conditions can be replicated during treatment. The

Radiation therapists have good job prospects.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Radiation therapists.....	29-1124	15,200	19,400	4,100	27

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

therapist later explains the treatment plan to the patient and answers any questions that the patient may have.

The next step in the process is treatment. To begin each treatment session, the radiation therapist uses the guidelines developed during the planning phase to position the patient and adjust the linear accelerator. Then, from a separate room that is protected from the X-ray radiation, the therapist operates the linear accelerator and monitors the patient's condition through a TV monitor and an intercom system. Treatment can take anywhere from 10 to 30 minutes.

During the treatment phase, the radiation therapist monitors the patient's physical condition to determine whether the patient is having any adverse reactions to the treatment. The therapist must also be aware of the patient's emotional well-being. Because many patients are under stress and are emotionally fragile, it is important for the therapist to maintain a positive attitude and provide emotional support.

Radiation therapists keep detailed records of their patients' treatments. These records include information such as the dose of radiation used for each treatment, the total amount of radiation used to date, the area treated, and the patient's reactions. Radiation oncologists and dosimetrists (technicians who calculate the dose of radiation that will be used for treatment) review these records to ensure that the treatment plan is working, to monitor the amount of radiation exposure that the patient has received, and to keep side effects to a minimum. Therapists also may assist dosimetrists with routine aspects of dosimetry, the process used to calculate radiation dosages.

Work environment. Radiation therapists work in hospitals or in cancer treatment centers. These places are clean, well lighted, and well ventilated. Therapists do a considerable amount of lifting and must be able to help disabled patients get on and off treatment tables. They spend most of their time on their feet.

Radiation therapists generally work 40 hours a week, and unlike workers in some other healthcare occupations, they normally work only during the day. However, because radiation therapy emergencies do occur, some therapists are required to be on call and may have to work outside of their normal hours.

Working with cancer patients can be stressful, but many radiation therapists also find it rewarding. Because they work around radioactive materials, radiation therapists take great care to ensure that they are not exposed to dangerous levels of radiation. By following standard safety procedures, radiation therapists can prevent overexposure.

Training, Other Qualifications, and Advancement

A bachelor's degree, associate degree, or certificate in radiation therapy generally is required. Many States require radiation therapists to be licensed, and most employers re-

quire certification. With experience, therapists can advance to managerial positions.

Education and training. Employers usually require applicants to complete an associate or a bachelor's degree program in radiation therapy. Individuals also may become qualified by completing an associate or a bachelor's degree program in radiography, which is the study of radiological imaging, and then by completing a 12-month certificate program in radiation therapy. Radiation therapy programs include core courses on radiation therapy procedures and the scientific theories behind them. In addition, such programs often include courses on human anatomy and physiology, physics, algebra, precalculus, writing, public speaking, computer science, and research methodology. In 2009, there were 102 radiation therapy programs in the U.S. that were accredited by the American Registry of Radiologic Technologists (ARRT).

Licensure. In 2009, 33 States required radiation therapists to be licensed by a State accrediting board. Licensing requirements vary by State, but many States require applicants to pass the ARRT certification examination. Further information is available from individual State licensing offices.

Certification and other qualifications. Some States, as well as many employers, require radiation therapists to be certified by ARRT. To become ARRT-certified, an applicant must complete an accredited radiation therapy program, adhere to ARRT ethical standards, and pass the ARRT certification examination. The examination covers radiation protection and quality assurance, clinical concepts in radiation oncology, treatment planning, treatment delivery, and patient care and education. Candidates also must demonstrate competency in several clinical practices including patient care activities; simulation procedures; dosimetry calculations; fabrication of beam modification devices; low-volume, high-risk procedures; and the application of radiation.

ARRT certification is valid for 1 year, after which therapists must renew their certification. Requirements for renewal include abiding by the ARRT ethical standards, paying annual dues, and satisfying continuing education requirements. Continuing education requirements must be met every 2 years and include either the completion of 24 course credits related to radiation therapy or the attainment of ARRT certification in a discipline other than radiation therapy. Certification renewal, however, may not be required by all States or employers that require initial certification.

All radiation therapists need good communication skills because their work involves a great deal of interaction with patients. Individuals interested in becoming radiation therapists should be psychologically capable of working with cancer patients. They should be caring and empathetic be-

cause they work with patients who are ill and under stress. They should be able to keep accurate, detailed records. They also should be physically fit because they work on their feet for long periods and lift and move disabled patients.

Advancement. Experienced radiation therapists may advance to manage radiation therapy programs in treatment centers or other health care facilities. Managers generally continue to treat patients while taking on management responsibilities. Other advancement opportunities include teaching, technical sales, and research. With additional training and certification, therapists also can become dosimetrists, who use complex mathematical formulas to calculate proper radiation doses.

Employment

Radiation therapists held about 15,200 jobs in 2008. About 70 percent worked in hospitals, and about 18 percent worked in the offices of physicians. A small proportion worked in outpatient care centers and medical and diagnostic laboratories.

Job Outlook

Employment is expected to increase much faster than the average, and job prospects should be good.

Employment change. Employment of radiation therapists is projected to grow by 27 percent between 2008 and 2018, which is much faster than the average for all occupations. The growing elderly population is expected to cause an increase in the number of people needing treatment. In addition, as radiation technology becomes safer and more effective, it will be prescribed more often, leading to an increased demand for radiation therapists. Growth is likely to be rapid across all practice settings, including hospitals, physicians' offices, and outpatient centers.

Job prospects. Job prospects are expected to be good. Job openings will result from employment growth and from the need to replace workers who retire or leave the occupation for other reasons. Applicants with a bachelor's degree and related work experience may have the best opportunities.

Earnings

Median annual wages of radiation therapists were \$72,910 in May 2008. The middle 50 percent earned between \$59,050 and \$87,910. The lowest 10 percent earned less than \$47,910, and the highest 10 percent earned more than \$104,350. Some employers also reimburse their employees for the cost of continuing education.

Recreational Therapists

Significant Points

- Applicants for recreational therapist jobs will experience competition.
- A bachelor's degree in therapeutic recreation is the usual educational requirement.
- Some States regulate recreational therapists through licensure, registration, or regulation of titles, but requirements vary.
- Recreational therapists should be comfortable working with persons who are ill or who have disabilities.

Nature of the Work

Recreational therapists, also referred to as *therapeutic recreation specialists*, provide treatment services and recreation activities for individuals with disabilities or illnesses. Using a variety of techniques, including arts and crafts, animals, sports, games, dance and movement, drama, music, and community outings, therapists improve and maintain the physical, mental, and emotional well-being of their clients. Therapists help individuals reduce depression, stress, and anxiety; recover basic motor functioning and reasoning abilities; build confidence; and socialize effectively so that they can enjoy greater independence and reduce or eliminate the effects of their illness or disability. In addition, therapists help people with disabilities integrate into the community by teaching them how to use community resources and recreational activities. Recreational therapists are different from *recreation workers*, who organize recreational activities primarily for enjoyment. (Recreation workers are discussed elsewhere in the *Handbook*.)

In acute healthcare settings, such as hospitals and rehabilitation centers, recreational therapists treat and rehabilitate individuals with specific health conditions, usually in conjunction or collaboration with physicians, nurses, psychologists, social workers, and physical and occupational therapists. In long-term and residential care facilities, recreational therapists use leisure

activities—especially structured group programs—to improve and maintain their clients’ general health and well-being. They also may provide interventions to prevent the client from suffering further medical problems and complications.

Recreational therapists assess clients using information from observations, medical records, standardized assessments, the medical staff, the clients’ families, and the clients themselves. They then develop and carry out therapeutic interventions consistent with the clients’ needs and interests. For example, they may encourage clients who are isolated from others or who have limited social skills to play games with others, and they may teach right-handed people with right-side paralysis how to use their unaffected left side to throw a ball or swing a racket. Recreational therapists may instruct patients in relaxation techniques to reduce stress and tension, stretching and limbering exercises, proper body mechanics for participation in recreational activities, pacing and energy conservation techniques, and team activities. As they work, therapists observe and document a patient’s participation, reactions, and progress.

Community-based recreational therapists may work in park and recreation departments, special education programs for school districts, or assisted living, adult day care, and substance abuse rehabilitation centers. In these programs, therapists use interventions to develop specific skills, while providing opportunities for exercise, mental stimulation, creativity, and fun. Those few who work in schools help counselors, teachers, and parents address the special needs of students, including easing disabled students’ transition into adult life.

Work environment. Recreational therapists provide services in special activity rooms but also plan activities and prepare documentation in offices. When working with clients during community integration programs, they may travel locally to teach clients how to use public transportation and other pub-

lic areas, such as parks, playgrounds, swimming pools, restaurants, and theaters. Therapists often lift and carry equipment.

Recreational therapists generally work a 40-hour week. Work hours may include some evenings, weekends, and holidays. Some therapists may work part time and for more than one employer, requiring travel.

Training, Other Qualifications, and Advancement

A bachelor’s degree with a major or concentration in therapeutic recreation is the usual requirement. Some States regulate recreational therapists, but requirements vary.

Education and training. Most entry-level recreational therapists need a bachelor’s degree in therapeutic recreation, or in recreation with a concentration in therapeutic recreation. A few may qualify with some combination of education, training, and work experience that would be equivalent to what is considered competent in the field. There are more than 100 academic programs that prepare students to become recreational therapists. Most offer bachelor’s degrees, although some offer associate’s, master’s, or doctoral degrees. Therapeutic recreation programs include courses in assessment, treatment and program planning, intervention design, and evaluation. Students also study human anatomy, physiology, abnormal psychology, medical and psychiatric terminology, characteristics of illnesses and disabilities, professional ethics, and the use of assistive devices and technology. Bachelor’s degree programs include an internship in the field as part of their curriculum.

Licensure. Some States regulate recreational therapists through licensure, registration, or regulation of titles. Requirements vary by State. In 2009, Oklahoma, North Carolina, Utah, and New Hampshire required licensure to practice as a recreational therapist. For specifics on regulations and requirements, contact the State’s medical board.

Certification and other qualifications. Although certification is voluntary, most employers prefer to hire candidates who are certified therapeutic recreation specialists. Work in clinical settings often requires certification by the National Council for Therapeutic Recreation Certification. The council offers the Certified Therapeutic Recreation Specialist credential to candidates who pass a written certification examination and complete a supervised internship of at least 480 hours. A minimum of a bachelor’s degree in recreational therapy from an accredited institution is required for credentialing, but some may qualify with equivalent education, training, and experience. Therapists must meet additional requirements to maintain certification. For specific details on credentialing, contact the National Council for Therapeutic Recreation Certification. (See Sources of Additional Information below for address.)

Recreational therapists may dedicate themselves to a certain type of therapy. Therapists wanting to practice a concentration can also earn certifications in specific therapies, such as art therapy and aquatic therapy.

Recreational therapists must be comfortable working with people who are ill or disabled. Therapists must be patient, tactful, and persuasive when working with people who have a variety of special needs. Ingenuity, a sense of humor, and imagination are needed to adapt activities to individual needs, and good

Recreational therapists observe and document a patient’s participation, reaction, and progress.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Recreational therapists	29-1125	23,300	26,700	3,400	15

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

physical coordination is necessary to demonstrate or participate in recreational activities.

Advancement. Therapists may advance to supervisory or administrative positions. Some teach, conduct research, or consult for health or social services agencies.

Employment

Recreational therapists held about 23,300 jobs in 2008. About 24 percent were in nursing care facilities. Others worked primarily in hospitals, residential care facilities, and State and local government agencies.

Job Outlook

Employment is projected to grow faster than the average. Applicants will face competition for jobs.

Employment change. Employment of recreational therapists is expected to increase 15 percent from 2008 to 2018, faster than the average for all occupations. Job growth will stem from the therapy needs of the aging population. With age comes an inevitable decrease in physical ability and, in some cases, mental ability, which can be limited or managed with recreation therapy. In nursing care facilities—the largest industry employing recreational therapists—employment will grow faster than the occupation as a whole as the number of older adults continues to grow.

Employment growth in schools will result from the expansion of the school-age population and the federally funded extension of services for disabled students.

Reimbursement for recreational therapy services will continue to affect how and where therapeutic recreation is provided. As payers and employers try to contain costs, recreation therapy services will shift to outpatient settings and away from hospitals.

Job prospects. Recreational therapists will experience competition for jobs. Lower paid recreational therapy aides may be increasingly used in an effort to contain costs. Job opportunities should be best for people with a bachelor's degree in therapeutic recreation and the Certified Therapeutic Recreation Specialist credential. Recreational therapists might experience more competition for jobs in certain regions of the country as jobs in therapeutic recreation tend to cluster in more densely populated areas.

Earnings

Median annual wages of recreational therapists were \$38,370 in May 2008. The middle 50 percent earned between \$29,660 and \$49,140. The lowest 10 percent earned less than \$23,150,

and the highest 10 percent earned more than \$60,280. Median annual wages in the industries employing the largest numbers of recreational therapists in May 2008 were:

General medical and surgical hospitals	\$42,210
State government	40,310
Psychiatric and substance abuse hospitals	40,150
Nursing care facilities	33,920
Community care facilities for the elderly	33,490

Related Occupations

Recreational therapists primarily design activities to help people with disabilities lead more fulfilling and independent lives. Other occupations in therapy and rehabilitation include:

	Page
Counselors	234
Occupational therapists	369
Physical therapists	377
Speech-language pathologists	399
Teachers—special education	294

Registered Nurses

Significant Points

- Registered nurses (RNs) constitute the largest health-care occupation, with 2.6 million jobs.
- About 60 percent of RN jobs are in hospitals.
- The three typical educational paths to registered nursing are a bachelor's degree, an associate degree, and a diploma from an approved nursing program; advanced practice nurses—clinical nurse specialists, nurse anesthetists, nurse-midwives, and nurse practitioners—need a master's degree.
- Overall job opportunities are expected to be excellent, but may vary by employment and geographic setting; some employers report difficulty in attracting and retaining an adequate number of RNs.

Nature of the Work

Registered nurses (RNs), regardless of specialty or work setting, treat patients, educate patients and the public about various medical conditions, and provide advice and emotional support to patients' family members. RNs record patients' medical histories and symptoms, help perform diagnostic tests and analyze results, operate medical machinery, administer treatment and medications, and help with patient follow-up and rehabilitation.

RNs teach patients and their families how to manage their illnesses or injuries, explaining post-treatment home care needs; diet, nutrition, and exercise programs; and self-administration of medication and physical therapy. Some RNs may work to promote general health by educating the public on warning signs and symptoms of disease. RNs also might run general health screening or immunization clinics, blood drives, and public seminars on various conditions.

When caring for patients, RNs establish a care plan or contribute to an existing plan. Plans may include numerous activities, such as administering medication, including careful checking of dosages and avoiding interactions; starting, maintaining, and discontinuing intravenous (IV) lines for fluid, medication, blood, and blood products; administering therapies and treatments; observing the patient and recording those observations; and consulting with physicians and other healthcare clinicians. Some RNs provide direction to licensed practical nurses and nursing aides regarding patient care. (See the statements on licensed practical and licensed vocational nurses; nursing and psychiatric aides; and home health aides elsewhere in the Handbook). RNs with advanced educational preparation and training may perform diagnostic and therapeutic procedures and may have prescriptive authority.

Specific work responsibilities will vary from one RN to the next. An RN's duties and title are often determined by their work setting or patient population served. RNs can specialize in one or more areas of patient care. There generally are four ways to specialize. RNs may work a particular setting or type of treatment, such as *perioperative nurses*, who work in operating rooms and assist surgeons. RNs may specialize in

specific health conditions, as do *diabetes management nurses*, who assist patients to manage diabetes. Other RNs specialize in working with one or more organs or body system types, such as *dermatology nurses*, who work with patients who have skin disorders. RNs may also specialize with a well-defined population, such as *geriatric nurses*, who work with the elderly. Some RNs may combine specialties. For example, *pediatric oncology nurses* deal with children and adolescents who have cancer. The opportunities for specialization in registered nursing are extensive and are often determined on the job.

There are many options for RNs who specialize in a work setting or type of treatment. *Ambulatory care nurses* provide preventive care and treat patients with a variety of illnesses and injuries in physicians' offices or in clinics. Some ambulatory care nurses are involved in telehealth, providing care and advice through electronic communications media such as videoconferencing, the Internet, or by telephone. *Critical care nurses* provide care to patients with serious, complex, and acute illnesses or injuries that require very close monitoring and extensive medication protocols and therapies. Critical care nurses often work in critical or intensive care hospital units. *Emergency, or trauma, nurses* work in hospital or stand-alone emergency departments, providing initial assessments and care for patients with life-threatening conditions. Some emergency nurses may become qualified to serve as *transport nurses*, who provide medical care to patients who are transported by helicopter or airplane to the nearest medical facility. *Holistic nurses* provide care such as acupuncture, massage and aroma therapy, and biofeedback, which are meant to treat patients' mental and spiritual health in addition to their physical health. *Home health care nurses* provide at-home nursing care for patients, often as follow-up care after discharge from a hospital or from a rehabilitation, long-term care, or skilled nursing facility. *Hospice and palliative care nurses* provide care, most often in home or hospice settings, focused on maintaining quality of life for terminally ill patients. *Infusion nurses* administer medications, fluids, and blood to patients through injections into patients' veins. *Long-term care nurses* provide healthcare services on a recurring basis to patients with chronic physical or mental disorders, often in long-term care or skilled nursing facilities. *Medical-surgical nurses* provide health promotion and basic medical care to patients with various medical and surgical diagnoses. *Occupational health nurses* seek to prevent job-related injuries and illnesses, provide monitoring and emergency care services, and help employers implement health and safety standards. *Perianesthesia nurses* provide preoperative and postoperative care to patients undergoing anesthesia during surgery or other procedure. Perioperative nurses assist surgeons by selecting and handling instruments, controlling bleeding, and suturing incisions. Some of these nurses also can specialize in plastic and reconstructive surgery. *Psychiatric-mental health nurses* treat patients with personality and mood disorders. *Radiology nurses* provide care to patients undergoing diagnostic radiation procedures such as ultrasounds, magnetic resonance imaging, and radiation therapy for oncology diagnoses. *Rehabilitation nurses* care for patients with temporary and permanent disabilities. *Transplant nurses* care for both transplant recipients and living donors and monitor signs of organ rejection.

Registered nurses teach patients and their families how to manage their illness or injury.

RNs specializing in a particular disease, ailment, or health-care condition are employed in virtually all work settings, including physicians' offices, outpatient treatment facilities, home healthcare agencies, and hospitals. *Addictions nurses* care for patients seeking help with alcohol, drug, tobacco, and other addictions. *Intellectual and developmental disabilities nurses* provide care for patients with physical, mental, or behavioral disabilities; care may include help with feeding, controlling bodily functions, sitting or standing independently, and speaking or other communication. *Diabetes management nurses* help diabetics to manage their disease by teaching them proper nutrition and showing them how to test blood sugar levels and administer insulin injections. *Genetics nurses* provide early detection screenings, counseling, and treatment of patients with genetic disorders, including cystic fibrosis and Huntington's disease. *HIV/AIDS nurses* care for patients diagnosed with HIV and AIDS. *Oncology nurses* care for patients with various types of cancer and may assist in the administration of radiation and chemotherapies and follow-up monitoring. *Wound, ostomy, and continence nurses* treat patients with wounds caused by traumatic injury, ulcers, or arterial disease; provide postoperative care for patients with openings that allow for alternative methods of bodily waste elimination; and treat patients with urinary and fecal incontinence.

RNs specializing in treatment of a particular organ or body system usually are employed in hospital specialty or critical care units, specialty clinics, and outpatient care facilities. *Cardiovascular nurses* treat patients with coronary heart disease and those who have had heart surgery, providing services such as postoperative rehabilitation. *Dermatology nurses* treat patients with disorders of the skin, such as skin cancer and psoriasis. *Gastroenterology nurses* treat patients with digestive and intestinal disorders, including ulcers, acid reflux disease, and abdominal bleeding. Some nurses in this field also assist in specialized procedures such as endoscopies, which look inside the gastrointestinal tract using a tube equipped with a light and a camera that can capture images of diseased tissue. *Gynecology nurses* provide care to women with disorders of the reproductive system, including endometriosis, cancer, and sexually transmitted diseases. *Nephrology nurses* care for patients with

kidney disease caused by diabetes, hypertension, or substance abuse. *Neuroscience nurses* care for patients with dysfunctions of the nervous system, including brain and spinal cord injuries and seizures. *Ophthalmic nurses* provide care to patients with disorders of the eyes, including blindness and glaucoma, and to patients undergoing eye surgery. *Orthopedic nurses* care for patients with muscular and skeletal problems, including arthritis, bone fractures, and muscular dystrophy. *Otorhinolaryngology nurses* care for patients with ear, nose, and throat disorders, such as cleft palates, allergies, and sinus disorders. *Respiratory nurses* provide care to patients with respiratory disorders such as asthma, tuberculosis, and cystic fibrosis. *Urology nurses* care for patients with disorders of the kidneys, urinary tract, and male reproductive organs, including infections, kidney and bladder stones, and cancers.

RNs who specialize by population provide preventive and acute care in all healthcare settings to the segment of the population in which they specialize, including newborns (neonatology), children and adolescents (pediatrics), adults, and the elderly (gerontology or geriatrics). RNs also may provide basic healthcare to patients outside of healthcare settings in such venues as including correctional facilities, schools, summer camps, and the military. Some RNs travel around the United States and throughout the world providing care to patients in areas with shortages of healthcare workers.

Most RNs work as staff nurses as members of a team providing critical healthcare. However, some RNs choose to become advanced practice nurses, who work independently or in collaboration with physicians, and may focus on the provision of primary care services. *Clinical nurse specialists* provide direct patient care and expert consultations in one of many nursing specialties, such as psychiatric-mental health. *Nurse anesthetists* provide anesthesia and related care before and after surgical, therapeutic, diagnostic and obstetrical procedures. They also provide pain management and emergency services, such as airway management. *Nurse-midwives* provide primary care to women, including gynecological exams, family planning advice, prenatal care, assistance in labor and delivery, and neonatal care. *Nurse practitioners* serve as primary and specialty care providers, providing a blend of nursing and healthcare services to patients and families. The most common specialty areas for nurse practitioners are family practice, adult practice, women's health, pediatrics, acute care, and geriatrics. However, there are a variety of other specialties that nurse practitioners can choose, including neonatology and mental health. Advanced practice nurses can prescribe medications in all States and in the District of Columbia.

Some nurses have jobs that require little or no direct patient care, but still require an active RN license. *Forensics nurses* participate in the scientific investigation and treatment of abuse victims, violence, criminal activity, and traumatic accident. *Infection control nurses* identify, track, and control infectious outbreaks in healthcare facilities and develop programs for outbreak prevention and response to biological terrorism. *Nurse educators* plan, develop, implement, and evaluate educational programs and curricula for the professional development of student nurses and RNs. *Nurse informaticists* manage and communicate nursing data and information to improve decision

making by consumers, patients, nurses, and other healthcare providers. RNs also may work as healthcare consultants, public policy advisors, pharmaceutical and medical supply researchers and salespersons, and medical writers and editors.

Work environment. Most RNs work in well-lit, comfortable healthcare facilities. Home health and public health nurses travel to patients' homes, schools, community centers, and other sites. RNs may spend considerable time walking, bending, stretching, and standing. Patients in hospitals and nursing care facilities require 24-hour care; consequently, nurses in these institutions may work nights, weekends, and holidays. RNs also may be on call—available to work on short notice. Nurses who work in offices, schools, and other settings that do not provide 24-hour care are more likely to work regular business hours. About 20 percent of RNs worked part time in 2008.

RNs may be in close contact with individuals who have infectious diseases and with toxic, harmful, or potentially hazardous compounds, solutions, and medications. RNs must observe rigid, standardized guidelines to guard against disease and other dangers, such as those posed by radiation, accidental needle sticks, chemicals used to sterilize instruments, and anesthetics. In addition, they are vulnerable to back injury when moving patients.

Training, Other Qualifications, and Advancement

The three typical educational paths to registered nursing are a bachelor's degree, an associate degree, and a diploma from an approved nursing program. Nurses most commonly enter the occupation by completing an associate degree or bachelor's degree program. Individuals then must complete a national licensing examination in order to obtain a nursing license. Advanced practice nurses—clinical nurse specialists, nurse anesthetists, nurse-midwives, and nurse practitioners—need a master's degree.

Education and training. There are three typical educational paths to registered nursing—a bachelor's of science degree in nursing (BSN), an associate degree in nursing (ADN), and a diploma. BSN programs, offered by colleges and universities, take about 4 years to complete. ADN programs, offered by community and junior colleges, take about 2 to 3 years to complete. Diploma programs, administered in hospitals, last about 3 years. Generally, licensed graduates of any of the three types of educational programs qualify for entry-level positions as a staff nurse. There are hundreds of registered nursing programs that result in an ADN or BSN; however, there are relatively few diploma programs.

Individuals considering a career in nursing should carefully weigh the advantages and disadvantages of enrolling in each type of education program. Advancement opportunities may be more limited for ADN and diploma holders compared to RNs who obtain a BSN or higher. Individuals who complete a bach-

elor's degree receive more training in areas such as communication, leadership, and critical thinking, all of which are becoming more important as nursing practice becomes more complex. Additionally, bachelor's degree programs offer more clinical experience in nonhospital settings. A bachelor's or higher degree is often necessary for administrative positions, research, consulting, and teaching

Many RNs with an ADN or diploma later enter bachelor's degree programs to prepare for a broader scope of nursing practice. Often, they can find an entry-level position and then take advantage of tuition reimbursement benefits to work toward a BSN by completing an RN-to-BSN program. Accelerated master's degree in nursing (MSN) programs also are available. They typically take 3-4 years to complete full time and result in the award of both the BSN and MSN.

There are education programs available for people interested in switching to a career in nursing as well. Individuals who already hold a bachelor's degree in another field may enroll in an accelerated BSN program. Accelerated BSN programs last 12 to 18 months and provide the fastest route to a BSN for individuals who already hold a degree. MSN programs also are available for individuals who hold a bachelor's or higher degree in another field; master's degree programs usually last 2 years.

All nursing education programs include classroom instruction and supervised clinical experience in hospitals and other healthcare facilities. Students take courses in anatomy, physiology, microbiology, chemistry, nutrition, psychology and other behavioral sciences, and nursing. Coursework also includes the liberal arts for ADN and BSN students.

Supervised clinical experience is provided in hospital departments such as pediatrics, psychiatry, maternity, and surgery. A number of programs include clinical experience in nursing care facilities, public health departments, home health agencies, and ambulatory clinics.

Licensure and certification. In all States, the District of Columbia, and U.S. territories, students must graduate from an approved nursing program and pass a national licensing examination, known as the National Council Licensure Examination, or NCLEX-RN, in order to obtain a nursing license. Other eligibility requirements for licensure vary by State. Contact your State's board of nursing for details.

Other qualifications. Nurses should be caring, sympathetic, responsible, and detail oriented. They must be able to direct or supervise others, correctly assess patients' conditions, and determine when consultation is required. They need emotional stability to cope with human suffering, emergencies, and other stresses.

RNs should enjoy learning because continuing education credits are required by some States and/or employers at regular intervals. Career-long learning is a distinct reality for RNs.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018		Change, 2008-2018	
			2018	Number	Percent	
Registered nurses	29-1111	2,618,700	3,200,200	581,500	22	

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Some nurses may become credentialed in specialties such as ambulatory care, gerontology, informatics, pediatrics, and many others. Credentialing for RNs is available from the American Nursing Credentialing Center, the National League for Nursing, and many others. Although credentialing is usually voluntary, it demonstrates adherence to a higher standard and some employers may require it.

Advancement. Most RNs begin as staff nurses in hospitals and, with experience and good performance, often move to other settings or are promoted to positions with more responsibility. In management, nurses can advance from assistant unit manager or head nurse to more senior-level administrative roles of assistant director, director, vice president, or chief of nursing. Increasingly, management-level nursing positions require a graduate or an advanced degree in nursing or health services administration. Administrative positions require leadership, communication and negotiation skills, and good judgment.

Some RNs choose to become advanced practice nurses, who work independently or in collaboration with physicians, and may focus on providing primary care services. There are four types of advanced practice nurses: clinical nurse specialists, nurse anesthetists, nurse-midwives, and nurse practitioners. Clinical nurse specialists provide direct patient care and expert consultations in one of many nursing specialties, such as psychiatric-mental health. Nurse anesthetists provide anesthesia and related care before and after surgical, therapeutic, diagnostic, and obstetrical procedures. They also provide pain management and emergency services, such as airway management. Nurse-midwives provide primary care to women, including gynecological exams, family planning advice, prenatal care, assistance in labor and delivery, and neonatal care. Nurse practitioners serve as primary and specialty care providers, providing a blend of nursing and healthcare services to patients and families.

All four types of advanced practice nurses require at least a master's degree. In addition, all States specifically define requirements for registered nurses in advanced practice roles. Advanced practice nurses may prescribe medicine, but the authority to prescribe varies by State. Contact your State's board of nursing for specific regulations regarding advanced practice nurses.

Some nurses move into the business side of healthcare. Their nursing expertise and experience on a healthcare team equip them to manage ambulatory, acute, home-based, and chronic care businesses. Employers—including hospitals, insurance companies, pharmaceutical manufacturers, and managed care organizations, among others—need RNs for health planning and development, marketing, consulting, policy development, and quality assurance. Other nurses work as college and university faculty or conduct research.

Employment

As the largest healthcare occupation, registered nurses held about 2.6 million jobs in 2008. Hospitals employed the majority of RNs, with 60 percent of such jobs. About 8 percent of jobs were in offices of physicians, 5 percent in home health care services, 5 percent in nursing care facilities, and 3 percent in employment services. The remainder worked mostly in gov-

ernment agencies, social assistance agencies, and educational services.

Job Outlook

Overall job opportunities for registered nurses are expected to be excellent, but may vary by employment and geographic setting. Some employers report difficulty in attracting and retaining an adequate number of RNs. Employment of RNs is expected to grow much faster than the average and, because the occupation is very large, 581,500 new jobs will result, among the largest number of new jobs for any occupation. Additionally, hundreds of thousands of job openings will result from the need to replace experienced nurses who leave the occupation.

Employment change. Employment of registered nurses is expected to grow by 22 percent from 2008 to 2018, much faster than the average for all occupations. Growth will be driven by technological advances in patient care, which permit a greater number of health problems to be treated, and by an increasing emphasis on preventive care. In addition, the number of older people, who are much more likely than younger people to need nursing care, is projected to grow rapidly.

However, employment of RNs will not grow at the same rate in every industry. The projected growth rates for RNs in the industries with the highest employment of these workers are:

Offices of physicians	48%
Home health care services.....	33
Nursing care facilities	25
Employment services	24
Hospitals, public and private.....	17

Employment is expected to grow more slowly in hospitals—healthcare's largest industry—than in most other healthcare industries. While the intensity of nursing care is likely to increase, requiring more nurses per patient, the number of inpatients (those who remain in the hospital for more than 24 hours) is not likely to grow by much. Patients are being discharged earlier, and more procedures are being done on an outpatient basis, both inside and outside hospitals. Rapid growth is expected in hospital outpatient facilities, such as those providing same-day surgery, rehabilitation, and chemotherapy.

More and more sophisticated procedures, once performed only in hospitals, are being performed in physicians' offices and in outpatient care centers, such as freestanding ambulatory surgical and emergency centers. Accordingly, employment is expected to grow fast in these places as healthcare in general expands.

Employment in nursing care facilities is expected to grow because of increases in the number of older persons, many of whom require long-term care. Many elderly patients want to be treated at home or in residential care facilities, which will drive demand for RNs in those settings. The financial pressure on hospitals to discharge patients as soon as possible should produce more admissions to nursing and residential care facilities and referrals to home healthcare. Job growth also is expected in units that provide specialized long-term rehabilitation for stroke and head injury patients, as well as units that treat Alzheimer's victims.

Employment in home healthcare is expected to increase in response to the growing number of older persons with functional disabilities, consumer preference for care in the home, and technological advances that make it possible to bring increasingly complex treatments into the home. The type of care demanded will require nurses who are able to perform complex procedures.

Job prospects. Overall job opportunities are expected to be excellent for registered nurses. Employers in some parts of the country and in certain employment settings report difficulty in attracting and retaining an adequate number of RNs, primarily because of an aging RN workforce and a lack of younger workers to fill positions. Qualified applicants to nursing schools are being turned away because of a shortage of nursing faculty. The need for nursing faculty will only increase as many instructors near retirement. Despite the slower employment growth in hospitals, job opportunities should still be excellent because of the relatively high turnover of hospital nurses. To attract and retain qualified nurses, hospitals may offer signing bonuses, family-friendly work schedules, or subsidized training. Although faster employment growth is projected in physicians' offices and outpatient care centers, RNs may face greater competition for these positions because they generally offer regular working hours and more comfortable working environments. Generally, RNs with at least a bachelor's degree will have better job prospects than those without a bachelor's. In addition, all four advanced practice specialties—clinical nurse specialists, nurse practitioners, nurse-midwives, and nurse anesthetists—will be in high demand, particularly in medically underserved areas such as inner cities and rural areas. Relative to physicians, these RNs increasingly serve as lower-cost primary care providers.

Earnings

Median annual wages of registered nurses were \$62,450 in May 2008. The middle 50 percent earned between \$51,640 and \$76,570. The lowest 10 percent earned less than \$43,410, and the highest 10 percent earned more than \$92,240. Median annual wages in the industries employing the largest numbers of registered nurses in May 2008 were:

Employment services	\$68,160
General medical and surgical hospitals.....	63,880
Offices of physicians	59,210
Home health care services.....	58,740
Nursing care facilities	57,060

Many employers offer flexible work schedules, child care, educational benefits, and bonuses. About 21 percent of registered nurses are union members or covered by union contract.

Related Occupations

Because of the number of specialties for registered nurses, and the variety of responsibilities and duties, many other healthcare occupations are similar in some aspects of their job. Some

healthcare occupations with similar levels of responsibility that work under the direction of physicians or dentists are:

	Page
Dental hygienists.....	414
Diagnostic medical sonographers	416
Emergency medical technicians and paramedics	419
Licensed practical and licensed vocational nurses.....	421
Physician assistants	379

ternet version of this occupational statement, accessible at <http://www.bls.gov/ooh/ocos083.htm>

Respiratory Therapists

Significant Points

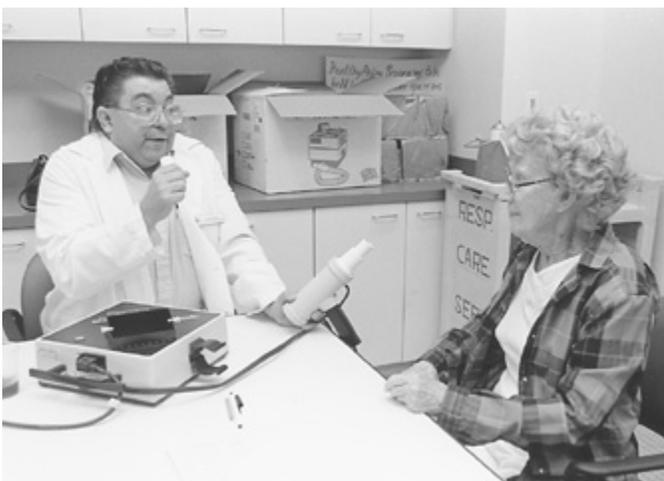

- Job opportunities should be very good.
- Hospitals will account for the vast majority of job openings, but a growing number of openings will arise in other settings.
- An associate degree is the minimum educational requirement, but a bachelor's or master's degree may be important for advancement.
- All States, except Alaska and Hawaii, require respiratory therapists to be licensed.

Nature of the Work

Respiratory therapists—also known as *respiratory care practitioners*—evaluate, treat, and care for patients with breathing or other cardiopulmonary disorders. Practicing under the direction of a physician, respiratory therapists assume primary responsibility for all respiratory care therapeutic treatments and diagnostic procedures, including the supervision of respiratory therapy technicians. They consult with physicians and other healthcare staff to help develop and modify patient care plans. Therapists also provide complex therapy requiring considerable independent judgment, such as caring for patients on life support in intensive-care units of hospitals.

Respiratory therapists evaluate and treat all types of patients, ranging from premature infants whose lungs are not fully developed to elderly people whose lungs are diseased. They provide temporary relief to patients with chronic asthma or emphysema and give emergency care to patients who are victims of a heart attack, stroke, drowning, or shock.

Respiratory therapists interview patients, perform limited physical examinations, and conduct diagnostic tests. For ex-

Respiratory therapists interview patients, perform limited physical examinations, and conduct diagnostic tests.

ample, respiratory therapists test a patient's breathing capacity and determine the concentration of oxygen and other gases in a patient's blood. They also measure a patient's pH, which indicates the acidity or alkalinity of the blood. To evaluate a patient's lung capacity, respiratory therapists have the patient breathe into an instrument that measures the volume and flow of oxygen during inhalation and exhalation. By comparing the reading with the norm for the patient's age, height, weight, and sex, respiratory therapists can provide information that helps determine whether the patient has any lung deficiencies. To analyze oxygen, carbon dioxide, and blood pH levels, therapists draw an arterial blood sample, place it in a blood gas analyzer, and relay the results to a physician, who then makes treatment decisions.

To treat patients, respiratory therapists use oxygen or oxygen mixtures, chest physiotherapy, and aerosol medications—liquid medications suspended in a gas that forms a mist which is inhaled. They teach patients how to inhale the aerosol properly to ensure its effectiveness. When a patient has difficulty getting enough oxygen into his or her blood, therapists increase the patient's concentration of oxygen by placing an oxygen mask or nasal cannula on the patient and setting the oxygen flow at the level prescribed by a physician. Therapists also connect patients who cannot breathe on their own to ventilators that deliver pressurized oxygen into the lungs. The therapists insert a tube into the patient's trachea, or windpipe; connect the tube to the ventilator; and set the rate, volume, and oxygen concentration of the oxygen mixture entering the patient's lungs.

Therapists perform regular assessments of patients and equipment. If a patient appears to be having difficulty breathing or if the oxygen, carbon dioxide, or pH level of the blood is abnormal, therapists change the ventilator setting according to the doctor's orders or check the equipment for mechanical problems.

Respiratory therapists perform chest physiotherapy on patients to remove mucus from their lungs and make it easier for them to breathe. Therapists place patients in positions that help drain mucus, and then vibrate the patients' rib cages, often by tapping on the chest, and tell the patients to cough. Chest physiotherapy may be needed after surgery, for example, because anesthesia depresses respiration. As a result, physiotherapy may be prescribed to help get the patient's lungs back to normal and to prevent congestion. Chest physiotherapy also helps patients suffering from lung diseases, such as cystic fibrosis, that cause mucus to collect in the lungs.

Therapists who work in home care teach patients and their families to use ventilators and other life-support systems. In addition, these therapists visit patients in their homes to inspect and clean equipment, evaluate the home environment, and ensure that patients have sufficient knowledge of their diseases and the proper use of their medications and equipment. Therapists also make emergency visits if equipment problems arise.

In some hospitals, therapists perform tasks that fall outside their traditional role. Therapists are becoming involved in areas such as pulmonary rehabilitation, smoking-cessation counseling, disease prevention, case management, and poly-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Respiratory therapists.....	29-1126	105,900	128,100	22,100	21

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

somnography—the diagnosis of breathing disorders during sleep, such as apnea. Respiratory therapists also increasingly treat critical-care patients, either as part of surface and air transport teams or as part of rapid-response teams in hospitals.

Work environment. Respiratory therapists generally work between 35 and 40 hours a week. Because hospitals operate around the clock, therapists can work evenings, nights, or weekends. They spend long periods standing and walking between patients' rooms. In an emergency, therapists work under the stress of the situation. Respiratory therapists employed in home healthcare must travel frequently to patients' homes.

Respiratory therapists are trained to work with gases stored under pressure. Adherence to safety precautions and regular maintenance and testing of equipment minimize the risk of injury. As in many other health occupations, respiratory therapists are exposed to infectious diseases, but by carefully following proper procedures, they can minimize these risks.

Training, Other Qualifications, and Advancement

An associate degree is the minimum educational requirement, but a bachelor's or master's degree may be important for advancement. All States, except Alaska and Hawaii, require respiratory therapists to be licensed.

Education and training. An associate degree is required to become a respiratory therapist. Training is offered at the post-secondary level by colleges and universities, medical schools, vocational-technical institutes, and the Armed Forces. Most programs award associate or bachelor's degree and prepare graduates for jobs as advanced respiratory therapists. A limited number of associate degree programs lead to jobs as entry-level respiratory therapists. According to the Commission on Accreditation of Allied Health Education Programs (CAA-HEP), 31 entry-level and 346 advanced respiratory therapy programs were accredited in the United States in 2008.

Among the areas of study in respiratory therapy programs are human anatomy and physiology, pathophysiology, chemistry, physics, microbiology, pharmacology, and mathematics. Other courses deal with therapeutic and diagnostic procedures and tests, equipment, patient assessment, cardiopulmonary resuscitation, the application of clinical practice guidelines, patient care outside of hospitals, cardiac and pulmonary rehabilitation, respiratory health promotion and disease prevention, and medical recordkeeping and reimbursement.

High school students interested in applying to respiratory therapy programs should take courses in health, biology, mathematics, chemistry, and physics. Respiratory care involves basic mathematical problem solving and an understanding of chemical and physical principles. For example, respiratory care workers must be able to compute dosages of medication and calculate gas concentrations.

Licensure and certification. A license is required to practice as a respiratory therapist, except in Alaska and Hawaii. Also, most employers require respiratory therapists to maintain a cardiopulmonary resuscitation (CPR) certification.

Licensure is usually based, in large part, on meeting the requirements for certification from the National Board for Respiratory Care (NBRC). The board offers the Certified Respiratory Therapist (CRT) credential to those who graduate from entry-level or advanced programs accredited by CAA-HEP or the Committee on Accreditation for Respiratory Care (CoARC) and who also pass an exam.

The board also awards the Registered Respiratory Therapist (RRT) to CRTs who have graduated from advanced programs and pass two separate examinations. Supervisory positions and intensive-care specialties usually require the RRT.

Other qualifications. Therapists should be sensitive to a patient's physical and psychological needs. Respiratory care practitioners must pay attention to detail, follow instructions, and work as part of a team. In addition, operating advanced equipment requires proficiency with computers.

Advancement. Respiratory therapists advance in clinical practice by moving from general care to the care of critically ill patients who have significant problems in other organ systems, such as the heart or kidneys. Respiratory therapists, especially those with a bachelor's or master's degree, also may advance to supervisory or managerial positions in a respiratory therapy department. Respiratory therapists in home healthcare and equipment rental firms may become branch managers. Some respiratory therapists advance by moving into teaching positions. Some others use the knowledge gained as a respiratory therapist to work in another industry, such as developing, marketing, or selling pharmaceuticals and medical devices.

Employment

Respiratory therapists held about 105,900 jobs in 2008. About 81 percent of jobs were in hospitals, mainly in departments of respiratory care, anesthesiology, or pulmonary medicine. Most of the remaining jobs were in offices of physicians or other health practitioners, consumer-goods rental firms that supply respiratory equipment for home use, nursing care facilities, employment services, and home healthcare services.

Job Outlook

Much faster than average growth is projected for respiratory therapists. Job opportunities should be very good.

Employment change. Employment of respiratory therapists is expected to grow by 21 percent from 2008 to 2018, much faster than the average for all occupations. The increasing demand will come from substantial growth in the middle-aged and elderly population—a development that will heighten the incidence of cardiopulmonary disease. Growth in

demand also will result from the expanding role of respiratory therapists in case management, disease prevention, emergency care, and the early detection of pulmonary disorders.

Older Americans suffer most from respiratory ailments and cardiopulmonary diseases, such as pneumonia, chronic bronchitis, emphysema, and heart disease. As the number of older persons increases, the need for respiratory therapists is expected to increase as well. In addition, advances in inhalable medications and in the treatment of lung transplant patients, heart attack and accident victims, and premature infants—many of whom depend on a ventilator during part of their treatment—will increase the demand for the services of respiratory care practitioners.

Job prospects. Job opportunities are expected to be very good, especially for those with a bachelor's degree and certification, and those with cardiopulmonary care skills or experience working with infants. The vast majority of job openings will continue to be in hospitals. However, a growing number of openings are expected to be outside of hospitals, especially in home health care services, offices of physicians or other health practitioners, consumer-goods rental firms, or in the employment services industry as a temporary worker in various settings.

Earnings

Median annual wages of wage-and-salary respiratory therapists were \$52,200 in May 2008. The middle 50 percent earned between \$44,490 and \$61,720. The lowest 10 percent earned less than \$37,920 and the highest 10 percent earned more than \$69,800.

Related Occupations

Under the supervision of a physician, respiratory therapists administer respiratory care and life support to patients with heart and lung difficulties. Other workers who care for, treat, or train people to improve their physical condition include:

Speech-Language Pathologists

Significant Points

- About 48 percent worked in educational services; most others were employed by health care and social assistance facilities.
- A master's degree in speech-language pathology is the standard educational requirement; almost all States regulate these workers, and licensing requirements vary.
- Favorable job opportunities are expected.

Nature of the Work

Speech-language pathologists, sometimes called *speech therapists*, assess, diagnose, treat, and help to prevent disorders related to speech, language, cognitive-communication, voice, swallowing, and fluency.

Speech-language pathologists work with people who cannot produce speech sounds or cannot produce them clearly; those with speech rhythm and fluency problems, such as stuttering; people with voice disorders, such as inappropriate pitch or harsh voice; those with problems understanding and producing language; those who wish to improve their communication skills by modifying an accent; and those with cognitive communication impairments, such as attention, memory, and problem-solving disorders. They also work with people who have swallowing difficulties.

Speech, language, and swallowing difficulties can result from a variety of causes including stroke, brain injury or deterioration, developmental delays or disorders, learning disabilities, cerebral palsy, cleft palate, voice pathology, mental retardation, hearing loss, or emotional problems. Problems can be congenital, developmental, or acquired. Speech-language pathologists use special instruments and qualitative and quantitative assessment methods, including standardized tests, to analyze and diagnose the nature and extent of impairments.

Speech-language pathologists develop an individualized plan of care, tailored to each patient's needs. For individuals with little or no speech capability, speech-language pathologists may select augmentative or alternative communication methods, in-

Speech-language pathologists usually work at desks or tables in clean comfortable surroundings.

cluding automated devices and sign language, and teach their use. They teach patients how to make sounds, improve their voices, or increase their oral or written language skills to communicate more effectively. They also teach individuals how to strengthen muscles or use compensatory strategies to swallow without choking or inhaling food or liquid. Speech-language pathologists help patients develop, or recover, reliable communication and swallowing skills so patients can fulfill their educational, vocational, and social roles.

Speech-language pathologists keep records on the initial evaluation, progress, and discharge of clients. This helps pinpoint problems, tracks client progress, and justifies the cost of treatment when applying for reimbursement. They counsel individuals and their families concerning communication disorders and how to cope with the stress and misunderstanding that often accompany them. They also work with family members to recognize and change behavior patterns that impede communication and treatment and show them communication-enhancing techniques to use at home.

Most speech-language pathologists provide direct clinical services to individuals with communication or swallowing disorders. In medical facilities, they may perform their job in conjunction with physicians, social workers, psychologists, and other therapists. Speech-language pathologists in schools collaborate with teachers, special educators, interpreters, other school personnel, and parents to develop and implement individual or group programs, provide counseling, and support classroom activities.

Some speech-language pathologists conduct research on how people communicate. Others design and develop equipment or techniques for diagnosing and treating speech problems.

Work environment. Speech-language pathologists usually work at a desk or table in clean comfortable surroundings. In

medical settings, they may work at the patient’s bedside and assist in positioning the patient. In schools, they may work with students in an office or classroom. Some work in the client’s home.

Although the work is not physically demanding, it requires attention to detail and intense concentration. The emotional needs of clients and their families may be demanding. Most full-time speech-language pathologists work 40 hours per week. About 20 percent of speech-language pathologists worked part-time in 2008. Those who work on a contract basis may spend a substantial amount of time traveling between facilities.

Training, Other Qualifications, and Advancement

A master’s degree is the most common level of education among speech-language pathologists. Licensure or certification requirements also exist, but vary by State.

Education and training. Most speech-language pathologist jobs require a master’s degree. The Council on Academic Accreditation is an entity of the American Speech-Language-Hearing Association; it accredits postsecondary academic programs in speech-language pathology. While graduation from an accredited program is not always required, it is required by some States for licensure and is mandatory for professional credentialing from the American Speech-Language-Hearing Association. In 2009, about 240 colleges and universities offered graduate programs, at both the master’s and doctoral levels, in speech-language pathology accredited by the Council on Academic Accreditation. Speech-language pathology courses cover anatomy, physiology, and the development of the areas of the body involved in speech, language, and swallowing; the nature of disorders; principles of acoustics; and psychological aspects of communication. Graduate students may also learn to evaluate and treat speech, language, and swallowing disorders as part of curriculum in supervised clinical practicum.

Licensure and certification. In 2009, 47 States regulated speech-language pathologists. Typical licensing requirements are a master’s degree from an accredited college or university; a passing score on the national examination on speech-language pathology, offered through the Praxis Series of the Educational Testing Service; 300 to 375 hours of supervised clinical experience; and 9 months of postgraduate professional clinical experience. Most States have continuing education requirements for licensure renewal. Medicaid, Medicare, and private health insurers generally require a practitioner to be licensed to qualify for reimbursement. For specific regulation and eligibility requirements contact your State’s regulatory board.

State regulation of speech-language pathologists may differ for pathologists practicing in schools. For information on State regulation of speech-language pathologists in public schools contact your State’s Department of Education. The Certificate of Clinical Competence in Speech-Language Pathology (CCC-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Speech-language pathologists.....	29-1127	119,300	141,400	22,100	19

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

SLP) credential offered by the American Speech-Language-Hearing Association is a voluntary credential; however, the CCC-SLP meets some or all of the requirements for licensure in some States. To earn a CCC, a person must have a graduate degree from an accredited university, which typically includes a 400-hour supervised clinical practicum, complete a 36-week full-time postgraduate clinical fellowship, and pass the Praxis Series examination in speech-language pathology administered by the Educational Testing Service.

Other qualifications. Speech-language pathologists should be able to effectively communicate diagnostic test results, diagnoses, and proposed treatment in a manner easily understood by their patients and their families. They must be able to approach problems objectively and be supportive. Because a patient's progress may be slow, patience, compassion, and good listening skills are necessary.

Advancement. As speech-language pathologists gain clinical experience and engage in continuing professional education, many develop expertise with certain populations, such as preschoolers and adolescents, or disorders, such as aphasia and learning disabilities. Some may obtain board recognition in a specialty area, such as child language, fluency, or feeding and swallowing. Experienced clinicians may become mentors or supervisors of other therapists or be promoted to administrative positions.

Employment

Speech-language pathologists held about 119,300 jobs in 2008. About 48 percent were employed in educational services. Others were employed in hospitals; offices of other health practitioners, including speech-language pathologists; nursing care facilities; home health care services; individual and family services; outpatient care centers; and child day care centers.

Nine percent of speech-language pathologists were self-employed in 2008. They contract to provide services in schools, offices of physicians, hospitals, or nursing care facilities, or work as consultants to industry.

Job Outlook

Faster than average employment growth is projected. Job opportunities are expected to be favorable.

Employment change. Employment of speech-language pathologists is expected to grow by 19 percent from 2008 to 2018, faster than the average for all occupations. As the members of the baby-boom generation continue to age, the possibility of neurological disorders and associated speech, language, and swallowing impairments increases. Medical advances also are improving the survival rate of premature infants and trauma and stroke victims, who then need assessment and sometimes treatment.

Employment in educational services will increase with the growth in elementary and secondary school enrollments, including enrollment of special education students. The 2004 Individuals with Disabilities Education Act is a Federal law that guarantees special education and related services to all eligible children with disabilities. Greater awareness of the importance of early identification and diagnosis of speech and language disorders in young children will also increase employment.

In healthcare facilities, restrictions on reimbursement for therapy services may limit the growth of speech-language pathologist jobs in the near term. However, the long-run demand for therapists should continue to rise as growth in the number of individuals with disabilities or limited function spurs demand for therapy services.

The number of speech-language pathologists in private practice should increase because hospitals, schools, and nursing care facilities will contain costs by increasingly contracting out for these services.

Job prospects. In addition to job growth, a number of job openings in speech-language pathology will be due to retirements. Opportunities should be favorable, particularly for those with the ability to speak a second language, such as Spanish. Demand for speech-language pathologists can be regional so job prospects are expected to be favorable for those who are willing to relocate, particularly to areas experiencing difficulty in attracting and hiring speech-language pathologists.

Earnings

Median annual wages of speech-language pathologists were \$62,930 in May 2008. The middle 50 percent earned between \$50,330 and \$79,620. The lowest 10 percent earned less than \$41,240, and the highest 10 percent earned more than \$99,220. Median annual wages in the industries employing the largest numbers of speech-language pathologists were:

Nursing care facilities	\$79,120
Home health care services.....	77,030
General medical and surgical hospitals.....	68,430
Offices of other health practitioners.....	67,910
Elementary and secondary schools	58,140

Some employers may reimburse speech-language pathologists for their required continuing education credits. About 40 percent of speech-language pathologists were union members or covered by union contract in 2008.

Related Occupations

Speech-language pathologists specialize in the prevention, diagnosis, and treatment of speech and language problems. Workers who treat other physical and mental health problems include:

	Page
Audiologists	358
Occupational therapists.....	369
Physical therapists.....	377
Psychologists.....	215
Recreational therapists	389

Sources of Additional Information

State licensing boards can provide information on licensure requirements. State departments of education can supply information on certification requirements for those who wish to work in public schools.

Veterinarians

Significant Points

- Veterinarians should love animals and be able to get along with their owners.
- Graduation from an accredited college of veterinary medicine and a State license are required; admission to veterinary school is competitive.
- Job opportunities should be excellent.
- About 80 percent of veterinarians work in private practice.

Nature of the Work

Veterinarians diagnose and treat diseases and dysfunctions of animals. Specifically, they care for the health of pets, livestock, and animals in zoos, racetracks, and laboratories. Some veterinarians use their skills to protect humans against diseases carried by animals and conduct clinical research on human and animal health problems. Others work in basic research, broadening our knowledge of animals and medical science, and in applied research, developing new ways to use knowledge.

Most veterinarians diagnose animal health problems, vaccinate against diseases, medicate animals suffering from infections or illnesses, treat and dress wounds, set fractures, perform surgery, and advise owners about animal feeding, behavior, and breeding.

According to the American Medical Veterinary Association, 77 percent of veterinarians who work in private medical practices treat pets. These practitioners usually care for dogs and cats but also treat birds, reptiles, rabbits, ferrets, and other animals that can be kept as pets. About 16 percent of veterinarians work in private mixed and food animal practices, where they see pigs, goats, cattle, sheep, and some wild animals in addition to farm animals. A small proportion of private-practice veterinarians, about 6 percent, work exclusively with horses.

Veterinarians who work with food animals or horses usually drive to farms or ranches to provide veterinary services for herds or individual animals. These veterinarians test for and vaccinate against diseases and consult with farm or ranch owners and managers regarding animal production, feeding, and housing issues. They also treat and dress wounds, set fractures, and perform surgery, including cesarean sections on birthing animals. Other veterinarians care for zoo, aquarium, or laboratory animals. Veterinarians of all types euthanize animals when necessary.

Veterinarians who treat animals use medical equipment such as stethoscopes, surgical instruments, and diagnostic equipment, including radiographic and ultrasound equipment. Veterinarians working in research use a full range of sophisticated laboratory equipment.

Some veterinarians contribute to human as well as animal health. A number of veterinarians work with physicians and scientists as they research ways to prevent and treat various human health problems. For example, veterinarians contributed greatly to conquering malaria and yellow fever, solved the mystery of botulism, produced an anticoagulant used to treat some people with heart disease, and defined and developed surgical techniques for humans, such as hip and knee joint replacements and limb and organ transplants. Today, some determine the effects of drug therapies, antibiotics, or new surgical techniques by testing them on animals.

Some veterinarians are involved in food safety and inspection. Veterinarians who are livestock inspectors, for example, check animals for transmissible diseases such as E. coli, advise owners on the treatment of their animals, and may quarantine animals. Veterinarians who are meat, poultry, or egg product inspectors examine slaughtering and processing plants, check live animals and carcasses for disease, and enforce government regulations regarding food purity and sanitation. More veterinarians are finding opportunities in food security as they ensure that the Nation has abundant and safe food supplies. Veterinarians involved in food security often work along the country's borders as animal and plant health inspectors, where they examine imports and exports of animal products to prevent disease here and in foreign countries. Many of these workers are employed by the Department of Agriculture's Animal and Plant Health Inspection Service division, or the U.S. Food and Drug Administration's Center for Veterinary Medicine.

Work environment. Veterinarians in private or clinical practice often work long hours in a noisy indoor environment. Sometimes they have to deal with emotional or demanding pet owners. When working with animals that are frightened or in pain, veterinarians risk being bitten, kicked, or scratched.

Veterinarians who work with food animals or horses spend time driving between their offices and farms or ranches. They

Employment opportunities for veterinarians are expected to be very good, but competition for admission to veterinary school is keen.

work outdoors in all kinds of weather and may have to treat animals or perform surgery, often under unsanitary conditions.

Veterinarians working in nonclinical areas, such as public health and research, work in clean, well-lit offices or laboratories and have working conditions similar to those of other professionals who work in these environments. Veterinarians in nonclinical areas spend much of their time dealing with people rather than animals.

Veterinarians often work long hours. Those in group practices may take turns being on call for evening, night, or weekend work; solo practitioners may work extended hours (including weekend hours), responding to emergencies or squeezing in unexpected appointments.

Training, Other Qualifications, and Advancement

Veterinarians must obtain a Doctor of Veterinary Medicine degree and a State license. Admission to veterinary school is competitive.

Education and training. Prospective veterinarians must graduate with a Doctor of Veterinary Medicine (D.V.M. or V.M.D.) degree from a 4-year program at an accredited college of veterinary medicine. There are 28 colleges in 26 States that meet accreditation standards set by the Council on Education of the American Veterinary Medical Association (AVMA).

The prerequisites for admission to veterinary programs vary. Many programs do not require a bachelor's degree for entrance, but all require a significant number of credit hours—ranging from 45 to 90 semester hours—at the undergraduate level. However, most of the students admitted have completed an undergraduate program and earned a bachelor's degree. Applicants without a degree face a difficult task in gaining admittance.

Preveterinary courses should emphasize the sciences. Veterinary medical colleges typically require applicants to have taken classes in organic and inorganic chemistry, physics, biochemistry, general biology, animal biology, animal nutrition, genetics, vertebrate embryology, cellular biology, microbiology, zoology, and systemic physiology. Some programs require calculus; some require only statistics, college algebra and trigonometry, or pre-calculus. Most veterinary medical colleges also require some courses in English or literature, other humanities, and the social sciences. Increasingly, courses in general business management and career development have become a standard part of the curriculum to teach new graduates how to effectively run a practice.

In addition to satisfying preveterinary course requirements, applicants must submit test scores from the Graduate Record Examination (GRE), the Veterinary College Admission Test (VCAT), or the Medical College Admission Test (MCAT), depending on the preference of the college to which they are applying. Currently, 22 schools require the GRE, 4 require the VCAT, and 2 accept the MCAT.

Admission to veterinary school is competitive. The number of accredited veterinary colleges has remained largely the same since 1983, but the number of applicants has risen significantly. Only about 1 in 3 applicants was accepted in 2007.

New graduates with a Doctor of Veterinary Medicine degree may begin to practice veterinary medicine once they receive their license, but many new graduates choose to enter a 1-year internship. Interns receive a small salary but often find that their internship experience leads to better paying opportunities later, relative to those of other veterinarians. Veterinarians who then seek board certification also must complete a 3-year to 4-year residency program that provides intensive training in one of the 39 AVMA-recognized veterinary specialties including internal medicine, oncology, pathology, dentistry, nutrition, radiology, surgery, dermatology, anesthesiology, neurology, cardiology, ophthalmology, preventive medicine, and exotic-small-animal medicine.

Licensure. All States and the District of Columbia require that veterinarians be licensed before they can practice. The only exemptions are for veterinarians working for some Federal agencies and some State governments. Licensing is controlled by the States and is not uniform, although all States require the successful completion of the D.V.M. degree—or equivalent education—and a passing grade on a national board examination, the North American Veterinary Licensing Exam. This 8-hour examination consists of 360 multiple-choice questions covering all aspects of veterinary medicine as well as visual materials designed to test diagnostic skills.

The Educational Commission for Foreign Veterinary Graduates grants certification to individuals trained outside the United States who demonstrate that they meet specified requirements for English language and clinical proficiency. This certification fulfills the educational requirement for licensure in all States.

Most States also require candidates to pass a State jurisprudence examination covering State laws and regulations. Some States do additional testing on clinical competency as well. There are few reciprocal agreements between States, so veterinarians who wish to practice in a different State usually must first pass that State's examinations.

Other qualifications. When deciding whom to admit, some veterinary medical colleges place heavy consideration on candidates' veterinary and animal experience. Formal experience, such as work with veterinarians or scientists in clinics, agribusiness, research, or some area of health science, is particularly advantageous. Less formal experience, such as working with animals on a farm, or at a stable or animal shelter, also can be helpful. Students must demonstrate ambition and an eagerness to work with animals.

Prospective veterinarians should love animals and have the ability to get along with their owners, especially pet owners,

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Veterinarians	29-1131	59,700	79,400	19,700	33

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

who usually have strong bonds with their pets. They need good manual dexterity. Veterinarians who intend to go into private practice should possess excellent communication and business skills, because they will need to successfully manage their practice and employees and promote, market, and sell their services.

Advancement. Most veterinarians begin as employees in established group practices. Despite the substantial financial investment in equipment, office space, and staff, many veterinarians with experience eventually set up their own practice or purchase an established one.

Newly trained veterinarians can become U.S. Government meat and poultry inspectors, disease-control workers, animal welfare and safety workers, epidemiologists, research assistants, or commissioned officers in the U.S. Public Health Service or various branches of the U.S. Armed Forces. A State license may be required.

Nearly all States have continuing education requirements for licensed veterinarians. Requirements differ by State and may involve attending a class or otherwise demonstrating knowledge of recent medical and veterinary advances.

Employment

Veterinarians held about 59,700 jobs in 2008. According to the American Veterinary Medical Association, 80 percent of veterinarians were employed in a solo or group practice. Most others were salaried employees of colleges or universities; medical schools; private industry, such as research laboratories and pharmaceutical companies; and Federal, State, or local government.

The Federal Government employed about 1,300 civilian veterinarians, chiefly in the U.S. Department of Agriculture and the U.S. Food and Drug Administration’s Center for Veterinary Medicine. A few veterinarians work for zoos, but most veterinarians caring for zoo animals are private practitioners who contract with the zoos to provide services, usually on a part-time basis.

In addition, many veterinarians hold veterinary faculty positions in colleges and universities and are classified as teachers. (See the statement on teachers—postsecondary elsewhere in the *Handbook*.)

Job Outlook

Employment is expected to increase much faster than average. Excellent job opportunities are expected.

Employment change. Employment of veterinarians is expected to increase 33 percent over the 2008–18 decade, much faster than the average for all occupations. Veterinarians usually practice in animal hospitals or clinics and care primarily for small pets. Recent trends indicate particularly strong interest in cats as pets. Faster growth of the cat population is expected to increase the demand for feline medicine and veterinary services, while demand for veterinary care for dogs should continue to grow at a more modest pace.

Many pet owners consider their pets as members of the family, which serves as evidence that people are placing a higher value on their pets and is an example of the *human-animal bond*. These pet owners are becoming more aware of the availability of advanced care and are more willing to pay for intensive veterinary care than owners in the past. Furthermore,

the number of pet owners purchasing pet insurance is rising, increasing the likelihood that considerable money will be spent on veterinary care.

More pet owners also will take advantage of nontraditional veterinary services, such as cancer treatment and preventive dental care. Modern veterinary services have caught up to human medicine; certain procedures, such as hip replacement, kidney transplants, and blood transfusions, which were once only available for humans, are now available for animals.

Continued support for public health and food and animal safety, national disease control programs, and biomedical research on human health problems will contribute to the demand for veterinarians, although the number of positions in these areas is smaller than the number in private practice. Homeland security also may provide opportunities for veterinarians involved in efforts to maintain abundant food supplies and minimize animal diseases in the United States and in foreign countries.

Job prospects. Excellent job opportunities are expected because there are only 28 accredited schools of veterinary medicine in the United States, resulting in a limited number of graduates—about 2,500—each year. However, admission to veterinary school is competitive.

New graduates continue to be attracted to companion-animal medicine because they usually prefer to deal with pets and to live and work near heavily populated areas, where most pet owners live. Employment opportunities are very good in cities and suburbs but even better in rural areas because fewer veterinarians compete to work there.

Beginning veterinarians may take positions requiring evening or weekend work to accommodate the extended hours of operation that many practices are offering. Some veterinarians take salaried positions in retail stores offering veterinary services. Self-employed veterinarians usually have to work hard and long to build a sufficient client base.

The number of jobs for farm-animal veterinarians is likely to grow more slowly than the number of jobs for companion-animal veterinarians. Nevertheless, job prospects should be excellent for farm-animal veterinarians because of their lower earnings and because many veterinarians do not want to work outside or in rural or isolated areas.

Veterinarians with training in food safety and security, animal health and welfare, and public health and epidemiology should have the best opportunities for a career in the Federal Government.

Earnings

Median annual wages of veterinarians were \$79,050 in May 2008. The middle 50 percent earned between \$61,370 and \$104,110. The lowest 10 percent earned less than \$46,610, and the highest 10 percent earned more than \$143,660.

The average annual salary for veterinarians in the Federal Government was \$93,398 in March 2009.

According to a survey by the American Veterinary Medical Association, average starting salaries of veterinary medical college graduates in 2008 varied by type of practice as follows:

Small animals, exclusively	\$64,744
Large animals, exclusively	62,424
Small animals, predominantly.....	61,753

Mixed animals.....	58,522
Large animals, predominantly.....	57,745
Equine (horses).....	41,636

Health Technologists and Technicians

Athletic Trainers

Significant Points

- A bachelor’s degree is usually the minimum requirement, but many athletic trainers hold a master’s or doctoral degree.
- Long hours, sometimes including nights and weekends, are common.
- Job prospects should be good in the healthcare industry and in high schools, but competition is expected for positions with professional and college sports teams.

Nature of the Work

Athletic trainers help prevent and treat injuries for people of all ages. Their patients and clients include everyone from professional athletes to industrial workers. Recognized by the American Medical Association as allied health professionals, athletic trainers specialize in the prevention, diagnosis, assessment, treatment, and rehabilitation of muscle and bone injuries and illnesses. Athletic trainers, as one of the first healthcare providers on the scene when injuries occur, must be able to recognize, evaluate, and assess injuries and provide immediate care when needed. Athletic trainers should not be confused with fitness trainers or personal trainers, who are not healthcare workers, but rather train people

to become physically fit. (Fitness workers are discussed elsewhere in the *Handbook*.)

Athletic trainers try to prevent injuries by educating people on how to reduce their risk for injuries and by advising them on the proper use of equipment, exercises to improve balance and strength, and home exercises and therapy programs. They also help apply protective or injury-preventive devices such as tape, bandages, and braces.

Athletic trainers may work under the direction of a licensed physician, and in cooperation with other healthcare providers. The extent of the direction ranges from discussing specific injuries and treatment options with a physician to performing evaluations and treatments as directed by a physician. Some athletic trainers meet with the team physician or consulting physician once or twice a week; others interact with a physician every day. Athletic trainers often have administrative responsibilities. These may include regular meetings with an athletic director, physician practice manager, or other administrative officer to deal with budgets, purchasing, policy implementation, and other business-related issues.

Work environment. The industry and individual employer are significant in determining the work environment of athletic trainers. Many athletic trainers work indoors most of the time; others, especially those in some sports-related jobs, spend much of their time working outdoors. The job also might require standing for long periods, working with medi-

Athletic trainers apply protective devices such as tape, bandages, and braces.

cal equipment or machinery, and being able to walk, run, kneel, stoop, or crawl. Travel may be required.

Schedules vary by work setting. Athletic trainers in non-sports settings generally have an established schedule—usually about 40 to 50 hours per week—with nights and weekends off. Athletic trainers working in hospitals and clinics may spend part of their time working at other locations doing outreach services. The most common outreach programs include conducting athletic training services and speaking at high schools, colleges, and commercial businesses.

Athletic trainers in sports settings have schedules that are longer and more variable. These athletic trainers must be present for team practices and competitions, which often are on evenings and weekends, and their schedules can change on short notice when games and practices have to be rescheduled. In high schools, athletic trainers who also teach may work 60 to 70 hours a week, or more. In National Collegiate Athletic Association Division I colleges and universities, athletic trainers generally work with one team; when that team’s sport is in season, working at least 50 to 60 hours a week is common. Athletic trainers in smaller colleges and universities often work with several teams and have teaching responsibilities. During the off-season, a 40-hour to 50-hour work week may be normal in most settings. Athletic trainers for professional sports teams generally work the most hours per week. During training camps, practices, and competitions, they may be required to work up to 12 hours a day.

There is some stress involved with being an athletic trainer. The work of athletic trainers requires frequent interaction with others. They consult with physicians as well as have frequent contact with athletes and patients to discuss and administer treatments, rehabilitation programs, injury-preventive practices, and other health-related issues.

Athletic trainers are responsible for their clients’ health, and sometimes have to make quick decisions that could affect the health or career of their clients. Athletics trainers also can be affected by the pressure to win that is typical of competitive sports teams.

Training, Other Qualifications, and Advancement

A bachelor’s degree is usually the minimum requirement, but many athletic trainers hold a master’s or doctoral degree. In 2009, 47 States required athletic trainers to be licensed or hold some form of registration.

Education and training. A bachelor’s degree from an accredited college or university is required for almost all jobs as an athletic trainer. In 2009, there were about 350 accredited undergraduate programs nationwide. Students in these programs are educated both in the classroom and in clinical settings. Formal education includes many science and health-related courses, such as human anatomy, physiology, nutrition, and biomechanics.

According to the National Athletic Trainers’ Association, almost 70 percent of athletic trainers have a master’s degree or higher. Athletic trainers may need a master’s or higher degree to be eligible for some positions, especially those in colleges and universities, and to increase their advancement opportunities. Because some positions in high schools involve teaching along with athletic trainer responsibilities, a teaching certificate or license could be required.

Licensure and certification. In 2009, 47 States required athletic trainers to be licensed or registered; this requires certification from the Board of Certification, Inc. (BOC). For BOC certification, athletic trainers need a bachelor’s or master’s degree from an accredited athletic training program and must pass a rigorous examination. To retain certification, credential holders must continue taking medical-related courses and adhere to the BOC standards of practice. In Alaska, California, West Virginia, and the District of Columbia where licensure is not required, certification is voluntary but may be helpful for those seeking jobs and advancement.

Other qualifications. Because all athletic trainers deal directly with a variety of people, they need good social and communication skills. They should be able to manage difficult situations and the stress associated with them, such as when disagreements arise with coaches, patients, clients, or parents regarding suggested treatment. Athletic trainers also should be organized, be able to manage time wisely, be inquisitive, and have a strong desire to help people.

Advancement. There are a few ways for athletic trainers to advance. Some athletic trainers advance by switching teams or sports to gain additional responsibility or pay. Assistant athletic trainers may become head athletic trainers and, eventually, athletic directors or physician, hospital or clinic practice

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Athletic trainers.....	29-9091	16,300	22,400	6,000	37

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

administrators where they assume a management role. Some athletic trainers move into sales and marketing positions, using their expertise to sell medical and athletic equipment.

Employment

Athletic trainers held about 16,300 jobs in 2008 and are found in every part of the country. Most athletic trainer jobs are related to sports, although an increasing number also work in nonsports settings. About 39 percent were found in public and private educational services, primarily in colleges, universities, and high schools. Another 38 percent of athletic trainers worked in healthcare, including jobs in hospitals, offices of physicians, and offices of other health practitioners. About 13 percent worked in fitness and recreational sports centers. Around 5 percent work in spectator sports.

Job Outlook

Employment is projected to grow much faster than average. Job prospects should be good in the healthcare industry and in high schools, but competition is expected for positions with professional and college sports teams.

Employment change. Employment of athletic trainers is projected to grow 37 percent from 2008 to 2018, much faster than the average for all occupations, because of their role in preventing injuries and reducing healthcare costs. Job growth will be concentrated in the healthcare industry, including hospitals and offices of health practitioners. Fitness and recreation sports centers also will provide new jobs, as these establishments grow and continue to need additional athletic trainers to provide support for their clients. Growth in positions with sports teams will be somewhat slower, however, as most professional sports clubs and colleges and universities already have complete athletic training staffs.

The demand for healthcare, with an emphasis on preventive care, should grow as the population ages and as a way to reduce healthcare costs. Increased licensure requirements and regulation has led to a greater acceptance of athletic trainers as qualified healthcare providers. As a result, third-party reimbursement is expected to continue to grow for athletic training services. Athletic trainers will benefit from this expansion because they provide a cost-effective way to increase the number of health professionals in an office or other setting.

In some States, there are efforts underway to have an athletic trainer in every high school to work with student-athletes, which may lead to growth in the number of athletic trainers employed in high schools. In addition, as more young athletes specialize in certain sports, there is increasing demand for athletic trainers to deal with repetitive stress injuries.

As athletic trainers continue to expand their services, more employers are expected to use these workers to reduce healthcare costs by preventing work-related injuries. Athletic trainers can help prevent injuries and provide immediate treatment for many injuries that do occur. For example, some athletic trainers may be hired to increase the fitness and performance of police and firefighters.

Job prospects. Job prospects should be good for athletic trainers in the healthcare industry and in high schools. Those looking for a position with a professional or college sports team may face competition.

Because of relatively low turnover, the settings with the best job prospects will be the ones that are expected to have the most job growth, primarily positions in the healthcare and fitness and recreational sports centers industries. Additional job opportunities may arise in elementary and secondary schools as more positions are created. Some of these positions also will require teaching responsibilities.

There are relatively few positions for professional and collegiate sports teams in comparison to the number of applicants. Turnover among professional sports team athletic trainers is also limited. Many athletic trainers prefer to continue to work with the same coaches, administrators, and players when a good working relationship already exists.

There also are opportunities for athletic trainers to join the military, although they would not be classified as an athletic trainer. Enlisted soldiers and officers who are athletic trainers are usually placed in another program, such as health educator or training specialist, in which their skills are useful. (For information on military careers, see the *Handbook* statement on job opportunities in the Armed Forces.)

This occupation is expected to continue to change over the next decade, including more administrative responsibilities, adapting to new technology, and working with larger populations, and jobseekers must be prepared to adapt to these changes.

Earnings

Most athletic trainers work in full-time positions, and typically receive benefits. The salary of an athletic trainer depends on experience and job responsibilities, and varies by job setting. Median annual wages for athletic trainers were \$39,640 in May 2008. The middle 50 percent earned between \$32,070 and \$49,250. The lowest 10 percent earned less than \$23,450, while the top 10 percent earned more than \$60,960.

Many employers pay for some of the continuing education required for athletic trainers to remain certified, although the amount covered varies from employer to employer.

Cardiovascular Technologists and Technicians

Significant Points

- Employment is expected to grow much faster than average.
- Technologists and technicians with multiple professional credentials, trained to perform a wide range of procedures, will have the best prospects.
- About 77 percent of jobs are in hospitals.
- Workers typically need a 2-year associate degree at a junior or community college; most employers also require a professional credential.

Nature of the Work

Cardiovascular technologists and technicians assist physicians in diagnosing and treating cardiac (heart) and peripheral vascular (blood vessel) ailments.

Cardiovascular technologists and technicians schedule appointments, review physicians' interpretations and patient files, and monitor patients' heart rates. They also operate and care for testing equipment, explain test procedures, and compare findings to a standard to identify problems. Other day-to-day activities vary significantly between specialties.

Technologists may specialize in different areas of practice: invasive cardiology, non-invasive—which includes echocardiography—or vascular technology. Technicians specialize in electrocardiograms and stress testing.

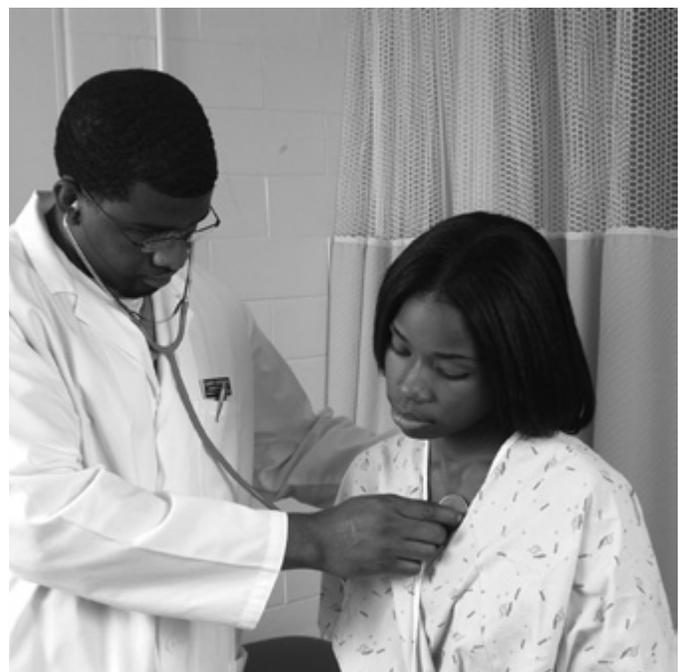

Invasive cardiology. Cardiovascular technologists specializing in invasive procedures are called *cardiology technologists*. They assist physicians with cardiac catheterization procedures in which a small tube, or catheter, is threaded through a patient's artery from a spot on the patient's groin to the heart. The procedure can determine whether a blockage exists in the blood vessels that supply the heart muscle or help to diagnose other problems. Some of these procedures may involve balloon angioplasty, which can be used to treat blockages of blood vessels or heart valves without the need for heart surgery. Cardiology technologists assist physicians as they insert a catheter with a balloon on the end to the point of the obstruction. Catheters are

also used in electrophysiology tests, which help locate the specific areas of heart tissue that give rise to the abnormal electrical impulses that cause arrhythmias.

Technologists prepare patients for cardiac catheterization by first positioning them on an examining table and then shaving, cleaning, and administering anesthesia to the top of their leg near the groin. During the procedures, they monitor patients' blood pressure and heart rate with EKG equipment and notify the physician if something appears to be wrong. Some cardiology technologists also prepare and monitor patients during open-heart surgery and during the insertion of pacemakers and stents that open up blockages in arteries to the heart and major blood vessels.

Noninvasive technology. Technologists who specialize in echocardiography or vascular technology perform noninvasive tests. Tests are called "noninvasive" if they do not require the insertion of probes or other instruments into the patient's body. For example, procedures such as Doppler ultrasound transmit high-frequency sound waves into areas of the patient's body and then processes reflected echoes of the sound waves to form an image. Technologists view the ultrasound image on a screen and may record the image on videotape or photograph it for interpretation and diagnosis by a physician. (See the statement on diagnostic medical sonographers elsewhere in the *Handbook* to learn more about other sonographers.)

Echocardiographers. Technologists who use ultrasound to examine the heart chambers, valves, and vessels are referred to as *cardiac sonographers*, or *echocardiographers*. They use ultrasound instrumentation to create images called echocardiograms. An echocardiogram may be performed while the patient is either resting or physically active. Technologists may administer medication to physically active patients to assess their heart function. Cardiac sonographers also may assist physicians who perform other procedures.

Cardiovascular technologists may specialize in invasive cardiology, echocardiography, and vascular technology.

Vascular technologists. Technologists who assist physicians in the diagnosis of disorders affecting the circulation are known as *vascular technologists* or *vascular sonographers*. Vascular technologists complete patients' medical history, evaluate pulses and assess blood flow in arteries and veins by listening to the vascular flow sounds for abnormalities, and assure the appropriate vascular test has been ordered. Then they perform a noninvasive procedure using ultrasound instruments to record vascular information such as vascular blood flow, blood pressure, oxygen saturation, cerebral circulation, peripheral circulation, and abdominal circulation. Many of these tests are performed during or immediately after surgery. Vascular technologists then provide a summary of findings to the physician to aid in patient diagnosis and management.

Cardiographic technicians. Technicians who specialize in electrocardiography, or EKG, stress testing, and perform Holter monitor procedures are known as *cardiographic* or *electrocardiograph* (or *EKG*) technicians.

Technicians take EKGs, which trace electrical impulses transmitted by the heart, attach electrodes to the patient's chest, arms, and legs, and then manipulate switches on an EKG machine to obtain a reading. An EKG is printed out for interpretation by the physician. This test is done before most kinds of surgery or as part of a routine physical examination.

EKG technicians with advanced training perform Holter monitor and stress testing. For Holter monitoring, technicians place electrodes on the patient's chest and attach a portable EKG monitor to the patient's belt. Following 24 or more hours of normal activity by the patient, the technician removes a tape from the monitor and places it in a scanner. After checking the quality of the recorded impulses on an electronic screen, the technician usually prints the information from the tape for analysis by a physician. Physicians use the output from the scanner to diagnose heart ailments, such as heart rhythm abnormalities or problems with pacemakers.

For a treadmill stress test, EKG technicians document the patient's medical history, explain the procedure, connect the patient to an EKG monitor, and obtain a baseline reading and resting blood pressure. Next, they monitor the heart's performance while the patient is walking on a treadmill, gradually increasing the treadmill's speed to observe the effect of increased exertion. Like vascular technologists and cardiac sonographers, cardiographic technicians who perform EKGs, Holter monitoring, and stress tests are known as "noninvasive" technicians.

Work environment. Cardiovascular technologists and technicians spend a lot of time walking and standing. Heavy lifting may be involved to move equipment or transfer patients. Those who work in catheterization laboratories may face stressful working conditions because they are in close contact with patients with serious heart ailments. For example, some patients may encounter complications that have life-or-death implications.

Some cardiovascular technologists and technicians may have the potential for radiation exposure. However, exposure is kept to a minimum by strict adherence to radiation safety guidelines, such as wearing heavy protective aprons while conducting certain procedures. In addition, those who use sonography can be at an increased risk for musculoskeletal disorders such as carpal tunnel syndrome, neck and back strain, and eye strain. However, greater use of ergonomic equipment and an increasing awareness will continue to minimize such risks.

Technologists and technicians generally work a 5-day, 40-hour week that may include weekends. Those in catheterization laboratories tend to work longer hours and may work evenings. They also may be on call during the night and on weekends. About 18 percent worked part-time in 2008.

Training, Other Qualifications, and Advancement

Cardiovascular technologists typically need an associate degree for entry-level employment. Most employers also require a professional credential. Technicians also receive on-the-job training.

Education and training. The majority of cardiovascular technologists, vascular technologists, and cardiac sonographers complete a 2-year junior or community college program resulting in an associate degree. However, 4-year programs are increasingly available. The first year is dedicated to core courses and is followed by a year of specialized instruction in either invasive cardiovascular, noninvasive cardiovascular, or noninvasive vascular technology. Those who are qualified in an allied health profession need to complete only the year of specialized instruction.

The Commission on Accreditation of Allied Health Professions (CAAHEP) accredits cardiovascular technology education programs. In January 2009, there were 34 accredited programs. Similarly, those who want to study echocardiography or vascular sonography may also attend CAAHEP-accredited programs in diagnostic medical sonography. In 2009, there were 168 such accredited programs. Those who attend these accredited programs are eligible to obtain professional certification.

Unlike most other cardiovascular technologists and technicians, most EKG technicians are trained on the job by an EKG supervisor or a cardiologist. On-the-job training for EKG technicians usually takes about 4 to 6 weeks. Most employers prefer to train people already in the healthcare field—nursing aides, for example. Some EKG technicians are students enrolled in 2-year programs to become technologists, working part time to gain experience and make contact with employers. For technicians who perform Holter monitoring on-the-job training may last around 18 to 24 months. One-year certification programs also exist for basic EKGs, Holter monitoring, and stress testing and can be an alternative to on-the-job training.

Licensure and certification. Credentialing is voluntary. However, it is the professional standard and most employ-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Cardiovascular technologists and technicians.....	29-2031	49,500	61,400	11,900	24

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

ers require credentialing. Credentialing for cardiovascular technologists is available from Cardiovascular Credentialing International (CCI) and the American Registry of Diagnostic Medical Sonographers (ARDMS). Most credentials require that technologists complete an accredited education program to qualify to sit for credentialing examination. Continuing education is required in most cases to maintain certification. For specific requirements, contact the credentialing body.

Other qualifications. Cardiovascular technologists and technicians must be reliable, have mechanical aptitude, and be able to follow detailed instructions. A pleasant, relaxed manner for putting patients at ease is an asset. They must be articulate as they must communicate technically with physicians and also explain procedures simply to patients.

Advancement. Technicians may advance to the technologist level of practice with supplemental formal education and credentialing.

Technologists can advance to higher levels of the profession as many institutions structure the occupation with multiple levels, each having an increasing amount of responsibility. Advancement may occur through multiple credentialing in more than one cardiovascular specialty or through work experience. Technologists may also advance into supervisory or management positions. Other possibilities include working in an educational setting or conducting laboratory work.

Employment

Cardiovascular technologists and technicians held about 49,500 jobs in 2008. About 77 percent of jobs were in hospitals (public and private), primarily in cardiology departments. The remaining jobs were mostly in offices of physicians, including cardiologists, or in medical and diagnostic laboratories, including diagnostic imaging centers.

Job Outlook

Employment is expected to grow much faster than the average; technologists and technicians with multiple professional credentials, trained to perform a wide range of procedures, will have the best prospects.

Employment change. Employment of cardiovascular technologists and technicians is expected to increase 24 percent through the year 2018, much faster than the average for all occupations. Demand will stem from the prevalence of heart disease and the aging population, because older people have a higher incidence of heart disease and other complications of the heart and vascular system. Procedures such as ultrasound imaging and radiology are being performed more often as a replacement for more expensive and more invasive procedures. Due to advances in medicine and greater public awareness, signs of vascular disease can be detected earlier, creating demand for cardiovascular technologists and technicians to perform various procedures.

Employment of vascular technologists and echocardiographers will grow as advances in vascular technology and sonography reduce the need for more costly and invasive procedures. However, fewer EKG technicians will be needed, as hospitals train nursing aides and others to perform basic EKG procedures. Individuals trained in Holter monitoring and stress testing are expected to have more favorable job prospects than those who can perform only a basic EKG.

The rules governing reimbursement by Medicare and Medicaid for medical procedures will affect the frequency of their use and demand for imaging technologists.

Job prospects. In addition to job growth, job openings for cardiovascular technologists and technicians will arise from replacement needs as individuals transfer to other jobs or leave the labor force. Job prospects will be best for those with multiple professional credentials, trained to perform a wide range of procedures. Those willing to relocate or work irregular hours also will have better job opportunities.

It is not uncommon for cardiovascular technologists and technicians to move between the specialties within the occupation by obtaining certification in more than one specialty. Technologists with multiple credentials will be the most marketable to employers.

Earnings

Median annual wages of cardiovascular technologists and technicians were \$47,010 in May 2008. The middle 50 percent earned between \$32,800 and \$61,580. The lowest 10 percent earned less than \$25,510, and the highest 10 percent earned more than \$74,760. Median annual wages of cardiovascular technologists and technicians in 2008 were \$48,590 in offices of physicians and \$46,670 in general medical and surgical hospitals.

Clinical Laboratory Technologists and Technicians

Significant Points

- Excellent job opportunities are expected.
- Clinical laboratory technologists usually have a bachelor's degree with a major in medical technology or in one of the life sciences; clinical laboratory technicians generally need either an associate degree or a certificate.
- Most jobs will continue to be in hospitals, but employment will grow rapidly in other settings, as well.

Clinical laboratory personnel examine and analyze body fluids and cells.

Nature of the Work

Clinical laboratory testing plays a crucial role in the detection, diagnosis, and treatment of disease. *Clinical laboratory technologists*, also referred to as clinical laboratory scientists or medical technologists, and clinical laboratory technicians, also known as medical technicians or medical laboratory technicians, perform most of these tests.

Clinical laboratory personnel examine and analyze body fluids, and cells. They look for bacteria, parasites, and other microorganisms; analyze the chemical content of fluids; match blood for transfusions; and test for drug levels in the blood that show how a patient is responding to treatment. Technologists also prepare specimens for examination, count cells, and look for abnormal cells in blood and body fluids. They use microscopes, cell counters, and other sophisticated laboratory equipment. They also use automated equipment and computerized instruments capable of performing a number of tests simultaneously. After testing and examining a specimen, they analyze the results and relay them to physicians.

With increasing automation and the use of computer technology, the work of technologists and technicians has become less hands-on and more analytical. The complexity of tests performed, the level of judgment needed, and the amount of responsibility workers assume depend largely on the amount of education and experience they have. Clinical laboratory technologists usually do more complex tasks than clinical laboratory technicians do.

Clinical laboratory technologists perform complex chemical, biological, hematological, immunologic, microscopic, and bacteriological tests. Technologists microscopically examine blood and other body fluids. They make cultures of body fluid and tissue samples, to determine the presence of bacteria, fungi, parasites, or other microorganisms. Technologists analyze samples for chemical content or a chemical reaction and determine concentrations of compounds such as blood glucose and cholesterol levels. They also type and cross match blood samples for transfusions.

Clinical laboratory technologists evaluate test results, develop and modify procedures, and establish and monitor programs, to ensure the accuracy of tests. Some technologists supervise clinical laboratory technicians.

Technologists in small laboratories perform many types of tests, whereas those in large laboratories generally specialize. Clinical chemistry technologists, for example, prepare specimens and analyze the chemical and hormonal contents of body fluids. Microbiology technologists examine and identify bacteria and other microorganisms. Blood bank technologists, or immunohematology technologists, collect, type, and prepare blood and its components for transfusions. Immunology technologists examine elements of the human immune system and its response to foreign bodies. Cytotechnologists prepare slides of body cells and examine these cells microscopically for abnormalities that may signal the beginning of a cancerous growth. Molecular biology technologists perform complex protein and nucleic acid testing on cell samples.

Clinical laboratory technicians perform less complex tests and laboratory procedures than technologists do. Technicians may prepare specimens and operate automated analyzers, for example, or they may perform manual tests in accordance with

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Clinical laboratory technologists and technicians.....	29-2010	328,100	373,600	45,600	14
Medical and clinical laboratory technologists	29-2011	172,400	193,000	20,500	12
Medical and clinical laboratory technicians	29-2012	155,600	180,700	25,000	16

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

detailed instructions. They usually work under the supervision of medical and clinical laboratory technologists or laboratory managers. Like technologists, clinical laboratory technicians may work in several areas of the clinical laboratory or specialize in just one. Phlebotomists collect blood samples, for example, and *histotechnicians* cut and stain tissue specimens for microscopic examination by pathologists.

Work environment. Clinical laboratory personnel are trained to work with infectious specimens. When proper methods of infection control and sterilization are followed, few hazards exist. Protective masks, gloves, and goggles often are necessary to ensure the safety of laboratory personnel.

Working conditions vary with the size and type of employment setting. Laboratories usually are well lighted and clean; however, specimens, solutions, and reagents used in the laboratory sometimes produce fumes. Laboratory workers may spend a great deal of time on their feet.

Hours of clinical laboratory technologists and technicians vary with the size and type of employment setting. In large hospitals or in independent laboratories that operate continuously, personnel usually work the day, evening, or night shift and may work weekends and holidays. Laboratory personnel in small facilities may work on rotating shifts, rather than on a regular shift. In some facilities, laboratory personnel are on call several nights a week or on weekends, in case of an emergency.

Training, Other Qualifications, and Advancement

Clinical laboratory technologists generally require a bachelor's degree in medical technology or in one of the life sciences; clinical laboratory technicians usually need an associate degree or a certificate.

Education and training. The usual requirement for an entry-level position as a clinical laboratory technologist is a bachelor's degree with a major in medical technology or one of the life sciences; however, it is possible to qualify for some jobs with a combination of education and on-the-job and specialized training. Universities and hospitals offer medical technology programs.

Bachelor's degree programs in medical technology include courses in chemistry, biological sciences, microbiology, mathematics, and statistics, as well as specialized courses devoted to knowledge and skills used in the clinical laboratory. Many programs also offer or require courses in management, business, and computer applications. The Clinical Laboratory Improvement Act requires technologists who perform highly complex tests to have at least an associate degree.

Medical and clinical laboratory technicians generally have either an associate degree from a community or junior college or

a certificate from a hospital, a vocational or technical school, or the Armed Forces. A few technicians learn their skills on the job.

The National Accrediting Agency for Clinical Laboratory Sciences (NAACLS) fully accredits about 479 programs for medical and clinical laboratory technologists, medical and clinical laboratory technicians, histotechnologists and histotechnicians, cytogenetic technologists, and diagnostic molecular scientists. NAACLS also approves about 60 programs in phlebotomy and clinical assisting. Other nationally recognized agencies that accredit specific areas for clinical laboratory workers include the Commission on Accreditation of Allied Health Education Programs and the Accrediting Bureau of Health Education Schools.

Licensure. Some States require laboratory personnel to be licensed or registered. Licensure of technologists often requires a bachelor's degree and the passing of an exam, but requirements vary by State and specialty. Information on licensure is available from State departments of health or boards of occupational licensing.

Certification and other qualifications. Many employers prefer applicants who are certified by a recognized professional association. Associations offering certification include the Board of Registry of the American Society for Clinical Pathology, the American Medical Technologists, the National Credentialing Agency for Laboratory Personnel, and the Board of Registry of the American Association of Bioanalysts. These agencies have different requirements for certification and different organizational sponsors.

In addition to certification, employers seek clinical laboratory personnel with good analytical judgment and the ability to work under pressure. Technologists in particular are expected to be good at problem solving. Close attention to detail is also essential for laboratory personnel because small differences or changes in test substances or numerical readouts can be crucial to a diagnosis. Manual dexterity and normal color vision are highly desirable, and with the widespread use of automated laboratory equipment, computer skills are important.

Advancement. Technicians can advance and become technologists through additional education and experience. Technologists may advance to supervisory positions in laboratory work or may become chief medical or clinical laboratory technologists or laboratory managers in hospitals. Manufacturers of home diagnostic testing kits and laboratory equipment and supplies also seek experienced technologists to work in product development, marketing, and sales.

Professional certification and a graduate degree in medical technology, one of the biological sciences, chemistry, management, or education usually speeds advancement. A doctorate usually is needed to become a laboratory director. Federal regulation

requires directors of moderately complex laboratories to have either a master’s degree or a bachelor’s degree, combined with the appropriate amount of training and experience.

Employment

Clinical laboratory technologists and technicians held about 328,100 jobs in 2008. More than half of jobs were in hospitals. Most of the remaining jobs were in offices of physicians and in medical and diagnostic laboratories. A small proportion was in educational services and in all other ambulatory health care services.

Job Outlook

Rapid job growth and excellent job opportunities are expected. Most jobs will continue to be in hospitals, but employment will grow rapidly in other settings, as well.

Employment change. Employment of clinical laboratory workers is expected to grow by 14 percent between 2008 and 2018, faster than the average for all occupations. The volume of laboratory tests continues to increase with both population growth and the development of new types of tests.

Technological advances will continue to have opposing effects on employment. On the one hand, new, increasingly powerful diagnostic tests and advances in genomics—the study of the genetic information of a cell or organism—will encourage additional testing and spur employment. On the other hand, research and development efforts targeted at simplifying and automating routine testing procedures may enhance the ability of nonlaboratory personnel—physicians and patients in particular—to perform tests now conducted in laboratories.

Although hospitals are expected to continue to be the major employer of clinical laboratory workers, employment is expected also to grow rapidly in medical and diagnostic laboratories, offices of physicians, and all other ambulatory health care services.

Job prospects. Job opportunities are expected to be excellent because the number of job openings is expected to continue to exceed the number of jobseekers. Although significant, job growth will not be the only source of opportunities. As in most occupations, many additional openings will result from the need to replace workers who transfer to other occupations, retire, or stop working for some other reason. Willingness to relocate will further enhance one’s job prospects.

Earnings

Median annual wages of medical and clinical laboratory technologists were \$53,500 in May 2008. The middle 50 percent earned between \$44,560 and \$63,420. The lowest 10 percent earned less than \$36,180, and the highest 10 percent earned more than \$74,680. Median annual wages in the industries employing the largest numbers of medical and clinical laboratory technologists were:

Federal Executive Branch	\$59,800
General medical and surgical hospitals.....	54,220
Medical and diagnostic laboratories.....	53,360
Offices of physicians	49,080
Colleges, universities, and professional schools	47,890

Median annual wages of medical and clinical laboratory technicians were \$35,380 in May 2008. The middle 50 percent

earned between \$28,420 and \$44,310. The lowest 10 percent earned less than \$23,480, and the highest 10 percent earned more than \$53,520. Median annual wages in the industries employing the largest numbers of medical and clinical laboratory technicians were:

General medical and surgical hospitals.....	\$36,840
Colleges, universities, and professional schools	36,290
Offices of physicians	33,980
Medical and diagnostic laboratories.....	32,630
Other ambulatory health care services	31,320

According to the American Society for Clinical Pathology, median hourly wages of staff clinical laboratory technologists and technicians, in various specialties and laboratory types, in 2007 were:

Table 1. Median hourly wages by specialties and laboratory type, 2007.

Occupation	Hospital	Private clinic	Physician office laboratory
Cytotechnologist	\$27.55	\$28.75	\$26.24
Histotechnologist	22.93	23.35	25.00
Medical technologist.....	23.45	23.00	20.00
Histotechnician	20.00	20.00	21.00
Medical laboratory technician	18.54	17.00	16.96
Phlebotomist	12.50	12.50	13.00

Dental Hygienists

Significant Points

- A degree from an accredited dental hygiene school and a State license are required for this job.
- Dental hygienists rank among the fastest growing occupations.
- Job prospects are expected to be favorable in most areas, but strong competition for jobs is likely in some areas.
- About half of all dental hygienists work part time, and flexible scheduling is a distinctive feature of this job.

Nature of the Work

Dental hygienists remove soft and hard deposits from teeth, teach patients how to practice good oral hygiene, and provide other preventive dental care. They examine patients' teeth and gums, recording the presence of diseases or abnormalities.

Dental hygienists use an assortment of tools to complete their tasks. Hand and rotary instruments and ultrasonic devices are used to clean and polish teeth, which includes removing tartar, stains, and plaque. Hygienists use x-ray machines to take dental pictures, and sometimes develop the film. They may use models of teeth to explain oral hygiene, perform root planning as a periodontal therapy, or apply cavity-preventative agents such as fluorides and pit and fissure sealants.

Other tasks hygienists may perform vary by State. In some States, hygienists are allowed to administer anesthetics, while in others they administer local anesthetics using syringes. Some States also allow hygienists to place and carve filling materials, temporary fillings, and periodontal dressings; remove sutures; and smooth and polish metal restorations.

Dental hygienists also help patients develop and maintain good oral health. For example, they may explain the relationship between diet and oral health or inform patients

how to select toothbrushes and show them how to brush and floss their teeth.

Hygienists sometimes make a diagnosis and other times prepare clinical and laboratory diagnostic tests for the dentist to interpret. Hygienists sometimes work chair-side with the dentist during treatment.

Work environment. Dental hygienists work in clean, well-lit offices. Important health safeguards include strict adherence to proper radiological procedures and the use of appropriate protective devices when administering anesthetic gas. Dental hygienists also wear safety glasses, surgical masks, and gloves to protect themselves and patients from infectious diseases. Dental hygienists also should be careful to avoid possible shoulder and neck injury from sitting for long periods of time while working with patients.

Flexible scheduling is a distinctive feature of this job. Full-time, part-time, evening, and weekend schedules are common. Dentists frequently hire hygienists to work only 2 or 3 days a week, so hygienists may hold jobs in more than one dental office. In 2008, about half of all dental hygienists worked part time—less than 35 hours a week.

Training, Other Qualifications, and Advancement

A degree from an accredited dental hygiene school and a State license are required for this job.

Education and training. A high school diploma and college entrance test scores are usually required for admission to a dental hygiene program. High school students interested in becoming dental hygienists should take courses in biology, chemistry, and mathematics. Some dental hygiene programs also require applicants to have completed at least one year of college. Specific entrance requirements typically vary from one school to another.

Dental hygienists remove soft and hard deposits from teeth and teach patients how to practice good oral hygiene.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Dental hygienists.....	29-2021	174,100	237,000	62,900	36

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

In 2008, there were 301 dental hygiene programs accredited by the Commission on Dental Accreditation. Most dental hygiene programs grant an associate degree, although some also offer a certificate, a bachelor's degree, or a master's degree. A minimum of an associate degree or certificate in dental hygiene is generally required for practice in a private dental office. A bachelor's or master's degree usually is required for research, teaching, or clinical practice in public or school health programs.

Schools offer laboratory, clinical, and classroom instruction in subjects such as anatomy, physiology, chemistry, microbiology, pharmacology, nutrition, radiography, histology (the study of tissue structure), periodontology (the study of gum diseases), pathology, dental materials, clinical dental hygiene, and social and behavioral sciences.

Licensure. Dental hygienists must be licensed by the State in which they practice. Nearly all States require candidates to graduate from an accredited dental hygiene school and pass both a written and clinical examination. The American Dental Association's (ADA) Joint Commission on National Dental Examinations administers the written examination, which is accepted by all States and the District of Columbia. State or regional testing agencies administer the clinical examination. In addition, most States require an examination on the legal aspects of dental hygiene practice. Alabama is the only State that does not require candidates to take the ADA written exam. Instead, they require that candidates meet the requirements of the Alabama Dental Hygiene Program, which mandates taking courses, completing on-the-job training at a dentist's office, and passing a separate State administered licensing examination.

Other qualifications. Dental hygienists should work well with others because they work closely with dentists and dental assistants, as well as dealing directly with patients. Hygienists also need good manual dexterity, because they use dental instruments within patients' mouths, with little room for error.

Advancement. Advancement opportunities usually come from working outside a typical dentist's office, and usually require a bachelor's or master's degree in dental hygiene. Some dental hygienists may choose to pursue a career teaching at a dental hygiene program, working in public health, or working in a corporate setting.

Employment

Dental hygienists held about 174,100 jobs in 2008. Because multiple job holding is common in this field, the number of jobs exceeds the number of hygienists. About 51 percent of dental hygienists worked part time. Almost all jobs for dental hygienists—about 96 percent—were in offices of dentists. A very small number worked for employment services, in physicians' offices, or in other industries.

Job Outlook

Dental hygienists rank among the fastest growing occupations. Job prospects are expected to be favorable in most areas, but competition for jobs is likely in some areas.

Employment change. Employment of dental hygienists is expected to grow 36 percent through 2018, which is much faster than the average for all occupations. This projected growth ranks dental hygienists among the fastest growing occupations, in response to increasing demand for dental care and more use of hygienists.

The demand for dental services will grow because of population growth, older people increasingly retaining more teeth, and a growing emphasis on preventative dental care. To help meet this demand, facilities that provide dental care, particularly dentists' offices, will increasingly employ dental hygienists, often to perform services that have been performed by dentists in the past. Ongoing research indicating a link between oral health and general health also will spur the demand for preventative dental services, which are typically provided by dental hygienists.

Job prospects. Job prospects are expected to be favorable in most areas, but will vary by geographical location. Because graduates are permitted to practice only in the State in which they are licensed, hygienists wishing to practice in areas that have an abundance of dental hygiene programs may experience strong competition for jobs.

Older dentists, who have been less likely to employ dental hygienists, are leaving the occupation and will be replaced by recent graduates, who are more likely to employ one or more hygienists. In addition, as dentists' workloads increase, they are expected to hire more hygienists to perform preventive dental care, such as cleaning, so that they may devote their own time to more complex procedures.

Earnings

Median annual wages of dental hygienists were \$66,570 in May 2008. The middle 50 percent earned between \$55,220 and \$78,990. The lowest 10 percent earned less than \$44,180, and the highest 10 percent earned more than \$91,470.

Earnings vary by geographic location, employment setting, and years of experience. Dental hygienists may be paid on an hourly, daily, salary, or commission basis.

Benefits vary substantially by practice setting and may be contingent upon full-time employment. According to a 2009 survey conducted by the American Dental Hygienist Association, about half of all hygienists reported receiving some form of employment benefits. Of those receiving benefits, paid vacation, sick leave, and retirement plans were the most common.

Diagnostic medical sonographers usually use diagnostic imaging machines in dark rooms, but may also perform procedures at a patient's bedside.

Diagnostic Medical Sonographers

Significant Points

- Job opportunities should be favorable.
- Employment will grow as sonography becomes an increasingly attractive alternative to radiological procedures.
- Hospitals employed about 59 percent of all sonographers.
- Sonographers may receive education and training in hospitals, vocational-technical institutions, colleges or universities, or the Armed Forces.

Nature of the Work

Diagnostic imaging embraces several procedures that aid in diagnosing ailments. The most familiar procedures are the x ray and magnetic resonance imaging; however, not all imaging technologies use ionizing, radiation, or radio waves. Sonography, or ultrasonography, is the use of sound waves to generate an image for the assessment and diagnosis of various medical conditions. Sonography is commonly associated with obstetrics and the use of ultrasound imaging during pregnancy, but this technology has many other applications in the diagnosis and treatment of medical conditions throughout the body.

Diagnostic medical sonographers use special equipment to direct high frequency sound waves into areas of the patient's body. Sonographers operate the equipment, which collects reflected echoes and forms an image that may be videotaped, transmitted, or photographed for interpretation and diagnosis by a physician.

Sonographers begin by explaining the procedure to the patient and recording any medical history that may be relevant to the condition being viewed. They then select appropriate equipment settings and direct the patient to move into positions that will provide the best view. To perform the exam, sonographers use a transducer, which transmits sound waves in a cone-shaped or rectangle-shaped beam. Although techniques vary by the area being examined, sonographers usually spread a special gel on the skin to aid the transmission of sound waves.

Viewing the screen during the scan, sonographers look for subtle visual cues that contrast healthy areas with unhealthy ones. They decide whether the images are satisfactory for diagnostic purposes and select which ones to store and show to the physician. Sonographers take measurements, calculate values, and analyze the results in preliminary findings for the physicians.

In addition to working directly with patients, diagnostic medical sonographers keep patient records and adjust and maintain equipment. They also may prepare work schedules, evaluate equipment purchases, or manage a sonography or diagnostic imaging department.

Diagnostic medical sonographers may specialize in obstetric and gynecologic sonography (images of the female reproduc-

tive system), abdominal sonography (images of the liver, kidneys, gallbladder, spleen, and pancreas), neurosonography (images of the brain and other parts of the nervous system), or breast sonography. In addition, sonographers may specialize in vascular sonography or cardiac sonography. (Vascular sonographers and cardiac sonographers are covered in the Handbook statement on cardiovascular technologists and technicians.)

Obstetric and gynecologic sonographers specialize in the imaging of the female reproductive system. Included in the discipline is one of the more well-known uses of sonography: examining the fetus of a pregnant woman to track the baby's growth and health.

Abdominal sonographers inspect a patient's abdominal cavity to help diagnose and treat conditions primarily involving the gallbladder, bile ducts, kidneys, liver, pancreas, spleen, and male reproductive system. Abdominal sonographers also are able to scan parts of the chest, although studies of the heart using sonography usually are done by echocardiographers.

Neurosonographers focus on the nervous system, including the brain. In neonatal care, neurosonographers study and diagnose neurological and nervous system disorders in premature infants. Like other sonographers, neurosonographers operate transducers to perform the sonogram, but they use frequencies and beam shapes different from those used by obstetric and abdominal sonographers.

Breast sonographers use sonography to study diseases of the breasts. Sonography aids mammography in the detection of breast cancer. Breast sonography also is used to track tumors, monitor blood supply conditions, and assist in the accurate biopsy of breast tissue. Breast sonographers use high-frequency transducers made exclusively to study breast tissue.

Work environment. Sonographers typically work in health-care facilities that are clean. They usually work at diagnostic imaging machines in darkened rooms, but they also may perform procedures at patients' bedsides. Sonographers may be on their feet for long periods of time and may have to lift or turn disabled patients.

Some sonographers work as contract employees and may travel to several health-care facilities in an area. Similarly, some sonographers work with mobile imaging service providers and travel to patients and use mobile diagnostic imaging equipment to provide service in areas that otherwise would not have access to such services.

Most full-time sonographers work about 40 hours a week. Some sonographers work overtime. Also, sonographers may have evening and weekend hours when they are on call and must be ready to report to work on short notice.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Diagnostic medical sonographers	29-2032	50,300	59,500	9,200	18

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Training, Other Qualifications, and Advancement

Diagnostic medical sonography is an occupation to which there are multiple paths of entry. Formal education in sonography, training, or a combination of these are accepted by employers. Employers do prefer sonographers who have received education from an accredited program or completed training in an accredited practice, and who are registered.

Education and training. There are several avenues for entry into the field of diagnostic medical sonography. Sonographers may train in hospitals, vocational-technical institutions, colleges or universities, or the Armed Forces. Some training programs prefer applicants with experience in other health care professions or high school graduates with courses in mathematics, health, and science.

Colleges and universities offer formal training in both 2-year and 4-year programs, resulting in either an associate or a bachelor's degree. Two-year programs are the most prevalent. Coursework includes classes in anatomy, physiology, instrumentation, basic physics, patient care, and medical ethics. In 2008, the Commission on Accreditation of Allied Health Education Programs (CAAHEP) accredited over 150 training programs. Accredited programs are offered by colleges and universities. Some hospital programs are accredited as well.

A few 1-year programs that typically result in a vocational certificate also are accepted as proper education by employers. These programs are useful usually only for workers already employed in a health-care occupation who seek to increase their marketability by training in sonography. One-year vocational-certificate programs are not accredited by the CAAHEP.

Certification and other qualifications. No States require licensure in diagnostic medical sonography. However, sonographers may become credentialed by one of the professional certifying bodies. Most employers prefer to hire registered sonographers because registration provides an objective measure of an individual's professional standing. To become registered, one must first become eligible to take the examination by completing the proper education, training, or work experience. The exam typically includes a physics and instrumentation exam in a sonography specialty. Typically, sonographers must complete a required number of continuing-education hours to maintain registration. For specific details on credentialing, contact the certifying organization.

The American Registry for Diagnostic Medical Sonography (ARDMS) certifies each person who passes the exam as a Registered Diagnostic Medical Sonographer (RDMS). This credential can be obtained for several different specialty areas like the abdomen, breast, or nervous system. The ARDMS also credentials cardiac and vascular sonographers. The American Registry of Radiologic Technologist offers credentials in breast and vascular sonography. The Cardiovascular

Credentialing International credentials cardiac sonographers. (Vascular sonographers and cardiac sonographers are covered in the *Handbook* statement on cardiovascular technologists and technicians.)

Sonographers should have good communication and interpersonal skills, because they must be able to explain technical procedures and results to their patients, some of whom may be nervous. Good hand-eye coordination is particularly important to obtaining quality images. It is very important that sonographers enjoy lifelong learning, because continuing education is crucial to workers in the ever-changing field of diagnostic medicine.

Advancement. Sonographers can seek advancement by obtaining competency in more than one specialty. For example, obstetric sonographers might seek training in abdominal sonography to broaden their opportunities and increase their marketability. Sonographers also may seek multiple credentials—for example, being both a registered diagnostic medical sonographer and a registered diagnostic cardiac sonographer.

Sonographers may advance by taking supervisory, managerial, or administrative positions.

Employment

Diagnostic medical sonographers held about 50,300 jobs in 2008. About 59 percent of all sonographer jobs were in public and private hospitals. The remaining jobs were typically in offices of physicians, medical and diagnostic laboratories, and outpatient care centers.

Job Outlook

Faster than average employment growth is expected. Job opportunities should be favorable.

Employment change. Employment of diagnostic medical sonographers is expected to increase by about 18 percent through 2018—faster than the average for all occupations. As the population continues to age, there will be an increasing demand for diagnostic imaging. Additional job growth is expected as healthcare providers increasingly utilize ultrasound imaging as a safer and more cost-effective alternative to radiological procedures. Ultrasound imaging technology is expected to evolve rapidly and spawn many new sonography procedures, enabling sonographers to scan and image areas of the body where ultrasound has not traditionally been used.

Hospitals will remain the principal employer of diagnostic medical sonographers. However, employment is expected to grow more rapidly in offices of physicians and in medical and diagnostic laboratories. Health care facilities such as these are expected to increase in number because of the strong shift toward outpatient care, encouraged by third-party payers and made possible by technological advances and less expensive ultrasound equipment that permit more procedures to be performed outside of hospitals.

Job prospects. Job opportunities should be favorable. In addition to job openings from growth, some openings will arise from the need to replace sonographers who retire or leave the occupation permanently. However, job opportunities will vary by geographic area. Sonographers willing to relocate will have the best job opportunities. Sonographers with mul-

iple specialties or multiple credentials also will have good prospects.

Earnings

The median annual wage of diagnostic medical sonographers was \$61,980 in May 2008. The middle 50 percent of sonographers earned wages between \$52,570 and \$73,680 a year. The lowest 10 percent earned less than \$43,600, and the highest 10 percent earned more than \$83,950. Median annual wages of diagnostic medical sonographers in May 2008 were \$62,340 in offices of physicians and \$61,870 in general medical and surgical hospitals.

Emergency Medical Technicians and Paramedics

Significant Points

- Employment is projected to grow as fast as the average for all occupations.
- Emergency medical technicians and paramedics need formal training and certification or licensure, but requirements vary by State.
- Emergency services function 24 hours a day, so emergency medical technicians and paramedics have irregular working hours.
- Opportunities will be best for those who have earned advanced certifications.

Nature of the Work

People's lives often depend on the quick reaction and competent care of *emergency medical technicians (EMTs)* and *paramedics*. Incidents as varied as automobile accidents, heart attacks, slips and falls, childbirth, and gunshot wounds require immediate medical attention. EMTs and paramedics provide this vital service as they care for and transport the sick or injured to a medical facility.

In an emergency, EMTs and paramedics are typically dispatched by a 911 operator to the scene, where they often work with police and fire fighters. (Police and fire fighters are discussed elsewhere in the Handbook.) Once they arrive, EMTs and paramedics assess the nature of the patient's condition, while trying to determine whether the patient has any pre-existing medical conditions. Following protocols and guidelines, they provide emergency care and transport the patient to a medical facility. EMTs and paramedics operate in emergency medical services systems where a physician provides medical direction and oversight.

EMTs and paramedics use special equipment, such as backboards, to immobilize patients before placing them on stretchers and securing them in the ambulance for transport to a medical facility. These workers generally work in teams. During the transport of a patient, one EMT or paramedic drives, while the other monitors the patient's vital signs and gives additional care, as needed. Some paramedics work as part of a helicopter's flight crew to quickly transport critically ill or injured patients to hospital trauma centers.

At the medical facility, EMTs and paramedics help transfer patients to the emergency department, report their observations and actions to emergency department staff, and may provide additional emergency treatment. After each run, EMTs and paramedics document the trip, replace used supplies and check equipment. If a transported patient has a contagious disease, EMTs and paramedics decontaminate the interior of the ambulance and report cases to the proper authorities.

EMTs and paramedics also provide transportation for patients from one medical facility to another, particularly if they work for private ambulance services. Patients often need to be transferred to a hospital that specializes in treating their injury or

illness or to facility that provides long-term care, like nursing homes.

Beyond these general duties, the specific responsibilities of EMTs and paramedics depend on their level of qualification and training. The National Registry of Emergency Medical Technicians (NREMT) certifies emergency medical service providers at five levels: First Responder; EMT-Basic; EMT-Intermediate (which has two levels called 1985 and 1999) and Paramedic. Some States, however, have their own certification programs and use distinct names and titles.

The EMT-Basic represents the first response of the emergency medical system. An EMT trained at this level is prepared to care for patients at the scene of an accident and while transporting patients by ambulance to the hospital under the direction of more highly trained medical personnel. The EMT-Basic has the emergency skills to assess a patient's condition and manage respiratory, cardiac, and trauma emergencies.

The EMT-Intermediate has more advanced training. However, the specific tasks that those certified at this level are allowed to perform varies greatly from State to State.

Paramedics provide more extensive pre-hospital care than do EMTs. In addition to carrying out the procedures of the other levels, paramedics administer medications orally and intravenously, interpret electrocardiograms (EKGs), perform endotracheal intubations, and use monitors and other complex equipment. However, like the EMT-Intermediate level, what paramedics are permitted to do varies by State.

Work environment. EMTs and paramedics work both indoors and out, in all types of weather. They are required to do considerable kneeling, bending, and heavy lifting. These workers are at a higher risk for contracting illnesses or experiencing injuries on the job than workers in other occupations. They risk noise-induced hearing loss from sirens and back injuries from lifting patients. In addition, EMTs and paramedics may be exposed to communicable diseases, such as hepatitis-B and AIDS, as well as to violence from mentally unstable or combative patients. The work is not only physically strenuous but can be stressful, sometimes involving life-or-death situations and suffering patients. Nonetheless, many people find the

Lives often depend on the quick reaction and competent care of emergency medical technicians and paramedics.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Emergency medical technicians and paramedics.....	29-2041	210,700	229,700	19,000	9

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

work exciting and challenging and enjoy the opportunity to help others. These workers experienced a larger than average number of work-related injuries or illnesses

Many EMTs and paramedics are required to work more than 40 hours a week. Because emergency services function 24 hours a day, EMTs and paramedics may have irregular working hours.

Training, Other Qualifications, and Advancement

Generally, a high school diploma is required to enter a training program to become an EMT or paramedic. Workers must complete a formal training and certification process.

Education and training. A high school diploma is usually required to enter a formal emergency medical technician training program. Training is offered at progressive levels: EMT-Basic, EMT-Intermediate, and Paramedic.

At the EMT-Basic level, coursework emphasizes emergency skills, such as managing respiratory, trauma, and cardiac emergencies, and patient assessment. Formal courses are often combined with time in an emergency department or ambulance. The program provides instruction and practice in dealing with bleeding, fractures, airway obstruction, cardiac arrest, and emergency childbirth. Students learn how to use and maintain common emergency equipment, such as backboards, suction devices, splints, oxygen delivery systems, and stretchers. Graduates of approved EMT-Basic training programs must pass a written and practical examination administered by the State licensing agency or the NREMT.

At the EMT-Intermediate level, training requirements vary by State. The nationally defined levels, EMT-Intermediate 1985 and EMT-Intermediate 1999, typically require 30 to 350 hours of training based on scope of practice. Students learn advanced skills such the use of advanced airway devices, intravenous fluids, and some medications.

The most advanced level of training for this occupation is Paramedic. At this level, the caregiver receives training in anatomy and physiology as well as advanced medical skills. Most commonly, the training is conducted in community colleges and technical schools and may result in an associate's degree. These programs may take up to one to two years. Such education prepares the graduate to take the NREMT examination to become certified as a Paramedic. Extensive related coursework and clinical and field experience is required. Refresher courses and continuing education are available for EMTs and paramedics at all levels.

Licensure. All 50 States require EMTs and Paramedics to be licensed, but the levels and titles vary from State to State. In most States and the District of Columbia certification by the NREMT is required at some or all levels. Some States administer their own certification examination or provide the option of taking either the NREMT or State examination. In most States, licensure renewal is required every two to

three years and generally, EMTs and Paramedics must take refresher training courses or complete continuing education requirements. Many States restrict licensure based on an individual's criminal history.

Other qualifications. EMTs and paramedics should be emotionally stable, have good dexterity, agility, and physical coordination, and be able to lift and carry heavy loads. They also need good eyesight (corrective lenses may be used) with accurate color vision. Many employers require a criminal background check.

Advancement. Paramedics can become supervisors, operations managers, administrative directors, or executive directors of emergency services. Some EMTs and paramedics become instructors, dispatchers, or physician assistants; others move into sales or marketing of emergency medical equipment. A number of people become EMTs and paramedics to test their interest in health care before training as registered nurses, physicians, or other health workers.

Employment

EMTs and paramedics held about 210,700 jobs in 2008. Most career EMTs and paramedics work in metropolitan areas. Volunteer EMTs and paramedics are more common in small cities, towns, and rural areas. These individuals volunteer for fire departments, emergency medical services, or hospitals and may respond to only a few calls per month.

Paid EMTs and paramedics were employed in a number of industries. About 45 percent worked as employees of ambulance services. About 29 percent worked in local government. Another 20 percent worked in hospitals.

Job Outlook

Employment for EMTs and paramedics is expected to grow about as fast as the average for all occupations through 2018. Job prospects should be good, particularly in cities and private ambulance services.

Employment change. Employment of emergency medical technicians and paramedics is expected to grow 9 percent between 2008 and 2018, which is about as fast as the average for all occupations. Growth in this occupation is due in large part to increasing call volume due to aging population. As a large segment of the population—aging members of the baby boom generation—becomes more likely to have medical emergencies, demand will increase for EMTs and paramedics. In addition, the time that EMTs and paramedics must spend with each patient is increasing as emergency departments across the country are experiencing overcrowding. As a result, when an ambulance arrives, it takes longer to transfer the patient from the care of the EMTs and paramedics to the staff of the emergency department. In addition, some emergency departments divert ambulances to other hospitals when they

are too busy to take on new patients. As a result, ambulances may not be able to go to the nearest hospital, which increases the amount of time spent in transit. Both these factors result in EMTs and paramedics spending more time with each patient, which means more workers are needed to meet demand.

In addition, hospitals are increasingly specializing in treating a particular illness or injury. This results in more patients needing to be transferred to the hospital best able to treat them. Most patients must be transferred by ambulance, so their condition can be monitored en route. Therefore, more demand for transfers between hospitals increases the demand for the services of EMTs and paramedics.

There also still will be demand for part-time, volunteer EMTs and paramedics in rural areas and smaller metropolitan areas.

Job prospects. Job prospects should be favorable. Many job openings will arise from growth and from the need to replace workers who leave the occupation because of the limited potential for advancement, as well as the modest pay and benefits in private-sector jobs. In addition, full-time paid EMTs and paramedics will be needed to replace unpaid volunteers. Emergency medical service agencies find it increasingly difficult to recruit and retain unpaid volunteers because of the amount of training and the large time commitment these positions require. As a result, more paid EMTs and paramedics are needed.

Competition will be greater for jobs in local government, including fire, police, and independent third-service rescue squad departments that tend to have better salaries and benefits. EMTs and paramedics who have advanced education and certifications should enjoy the most favorable job prospects, as clients and patients demand higher levels of care before arriving at the hospital.

Earnings

Earnings of EMTs and paramedics depend on the employment setting and geographic location of their jobs, as well as their training and experience. Median hourly wages of EMTs and paramedics were \$14.10 in May 2008. The middle 50 percent earned between \$11.13 and \$18.28. The lowest 10 percent earned less than \$9.08, and the highest 10 percent earned more than \$23.77. Median hourly wages in the industries employing the largest numbers of EMTs and paramedics in May 2008 were \$12.99 in other ambulatory health care services and \$15.45 in local government.

In 2008, about 27 percent of EMTs and paramedics belonged to a union or were covered by a union contract.

Related Occupations

Other workers in occupations that require quick and level-headed reactions to life-or-death situations are:

	Page
Air traffic controllers.....	784
Fire fighters	470
Physician assistants	379
Police and detectives	473
Registered nurses	392

Licensed practical nurses may assist patients with bathing, dressing, standing, and walking.

Licensed Practical and Licensed Vocational Nurses

Significant Points

- Most training programs last about 1 year and are offered by vocational or technical schools or community or junior colleges.
- Overall job prospects are expected to be very good, but job outlook varies by industry.
- Replacement needs will be a major source of job openings, as many workers leave the occupation permanently.

Nature of the Work

Licensed practical nurses (LPNs), or licensed vocational nurses (LVNs), care for people who are sick, injured, convalescent, or disabled under the direction of physicians and registered nurses. (The work of physicians and surgeons and of registered nurses

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Licensed practical and licensed vocational nurses.....	29-2061	753,600	909,200	155,600	21

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

is described elsewhere in the Handbook.) The nature of the direction and supervision required varies by State and job setting.

LPNs care for patients in many ways. Often, they provide basic bedside care. Many LPNs measure and record patients' vital signs such as height, weight, temperature, blood pressure, pulse, and respiration. They also prepare and give injections and enemas, monitor catheters, dress wounds, and give alcohol rubs and massages. To help keep patients comfortable, they assist with bathing, dressing, and personal hygiene, moving in bed, standing, and walking. They might also feed patients who need help eating. Experienced LPNs may supervise nursing assistants and aides.

As part of their work, LPNs collect samples for testing, perform routine laboratory tests, and record food and fluid intake and output. They clean and monitor medical equipment. Sometimes, they help physicians and registered nurses perform tests and procedures. Some LPNs help to deliver, care for, and feed infants.

LPNs also monitor their patients and report adverse reactions to medications or treatments. LPNs gather information from patients, including their health history and how they are currently feeling. They may use this information to complete insurance forms, pre-authorizations, and referrals, and they share information with registered nurses and doctors to help determine the best course of care for a patient. LPNs often teach family members how to care for a relative or teach patients about good health habits.

Most LPNs are generalists and will work in any area of healthcare. However, some work in a specialized setting, such as a nursing home, a doctor's office, or in home health care. LPNs in nursing care facilities help to evaluate residents' needs, develop care plans, and supervise the care provided by nursing aides. In doctors' offices and clinics, they may be responsible for making appointments, keeping records, and performing other clerical duties. LPNs who work in home health care may prepare meals and teach family members simple nursing tasks.

In some States, LPNs are permitted to administer prescribed medicines, start intravenous fluids, and provide care to ventilator-dependent patients.

Work environment. Most licensed practical nurses work a 40-hour week. In some work settings where patients need round-the-clock care, LPNs may have to work nights, weekends, and holidays. About 18 percent of LPNs and LVN's worked part-time in 2008. They often stand for long periods and help patients move in bed, stand, or walk.

LPNs may face hazards from caustic chemicals, radiation, and infectious diseases. They are subject to back injuries when moving patients. They often must deal with the stress of heavy workloads. In addition, the patients they care for may be confused, agitated, or uncooperative.

Training, Other Qualifications, and Advancement

Most practical nursing training programs last about 1 year, and are offered by vocational and technical schools or community or junior colleges. LPNs must be licensed to practice.

Education and training. LPNs must complete a State-approved training program in practical nursing to be eligible for licensure. Contact your State's board of nursing for a list of approved programs. Most training programs are available from technical and vocational schools or community and junior colleges. Other programs are available through high schools, hospitals, and colleges and universities. A high school diploma or its equivalent usually is required for entry, although some programs accept candidates without a diploma, and some programs are part of a high school curriculum.

Most year-long practical nursing programs include both classroom study and supervised clinical practice (patient care). Classroom study covers basic nursing concepts and subjects related to patient care, including anatomy, physiology, medical-surgical nursing, pediatrics, obstetrics nursing, pharmacology, nutrition, and first aid. Clinical practice usually is in a hospital but sometimes includes other settings.

Licensure. The National Council Licensure Examination, or NCLEX-PN, is required in order to obtain licensure as an LPN. The exam is developed and administered by the National Council of State Boards of Nursing. The NCLEX-PN is a computer-based exam and varies in length. The exam covers four major *Client Needs* categories: safe and effective care environment, health promotion and maintenance, psychosocial integrity, and physiological integrity. Eligibility for licensure may vary by State; for details, contact your State's board of nursing.

Other qualifications. LPNs should have a caring, sympathetic nature. They should be emotionally stable because working with the sick and injured can be stressful. They also need to be observant, and to have good decision-making and communication skills. As part of a healthcare team, they must be able to follow orders and work under close supervision.

LPNs should enjoy learning because continuing education credits are required by some States and/or employers at regular intervals. Career-long learning is a distinct reality for LPNs.

Advancement. In some employment settings, such as nursing homes, LPNs can advance to become charge nurses who oversee the work of other LPNs and nursing aides.

LPNs may become credentialed in specialties like IV therapy, gerontology, long-term care, and pharmacology.

Some LPNs also choose to become registered nurses through LPN-to-RN training programs.

Employment

Licensed practical and licensed vocational nurses held about 753,600 jobs in 2008. About 25 percent of LPNs worked in hospitals, 28 percent in nursing care facilities, and another 12 percent in offices of physicians. Others worked for home health care services; employment services; residential care facilities; community care facilities for the elderly; outpatient care centers; and Federal, State, and local government agencies.

Job Outlook

Employment of LPNs is projected to grow much faster than average. Overall job prospects are expected to be very good, but job outlook varies by industry. The best job opportunities will occur in nursing care facilities and home health care services.

Employment change. Employment of LPNs is expected to grow by 21 percent between 2008 and 2018, much faster than the average for all occupations, in response to the long-term care needs of an increasing elderly population and the general increase in demand for healthcare services.

Demand for LPNs will be driven by the increase in the share of the older population. Older persons have an increased incidence of injury and illness, which will increase their demand for healthcare services. In addition, with better medical technology, people are living longer, increasing the demand for long-term healthcare. Job growth will occur over all healthcare settings but especially those that service the geriatric population like nursing care facilities, community care facilities, and home health care services.

In order to contain healthcare costs, many procedures once performed only in hospitals are being performed in physicians' offices and in outpatient care centers, largely because of advances in technology. As a result, the number of LPNs should increase faster in these facilities than in hospitals. Nevertheless, hospitals will continue to demand the services of LPNs and will remain one of the largest employer of these workers.

Job prospects. In addition to projected job growth, job openings will result from replacement needs, as many workers leave the occupation permanently. Very good job opportunities are expected. Rapid employment growth is projected in most health care industries, with the best job opportunities occurring in nursing care facilities and in home health care services. There is a perceived inadequacy of available healthcare in many rural areas, so LPNs willing to locate in rural areas should have good job prospects.

Earnings

Median annual wages of licensed practical and licensed vocational nurses were \$39,030 in May 2008. The middle 50 percent earned between \$33,360 and \$46,710. The lowest 10 percent earned less than \$28,260, and the highest 10 percent earned more than \$53,580. Median annual wages in the industries employing the largest numbers of licensed practical and licensed vocational nurses in May 2008 were:

Employment services	\$44,690
Nursing care facilities	40,580
Home health care services.....	39,510
General medical and surgical hospitals.....	38,080
Offices of physicians	35,020

Related Occupations

LPNs work closely with people while helping them. Other healthcare occupations that work closely with patients include:

	Page
Athletic trainers.....	405
Emergency medical technicians and paramedics.....	419
Home health aides and personal and home care aides	449
Medical assistants	455
Nursing and psychiatric aides	460
Registered nurses	392

Lists of State-approved LPN programs are available from individual State boards of nursing.

The Occupational Information Network (O*NET) provides information on a wide range of occupational characteristics. Links to O*NET appear at the end of the Internet version of this occupational statement, accessible at <http://www.bls.gov/ooh/ocos102.htm>

Medical Records and Health Information Technicians

Significant Points

- Employment is expected to grow much faster than the average.
- Job prospects should be very good, particularly for technicians with strong computer software skills.
- Entrants usually have an associate degree.
- This is one of the few health-related occupations in which there is no direct hands-on patient care.

Nature of the Work

Medical records and health information technicians assemble patients' health information including medical history, symptoms, examination results, diagnostic tests, treatment methods, and all other healthcare provider services. Technicians organize and manage health information data by ensuring its quality, accuracy, accessibility, and security. They regularly

communicate with physicians and other healthcare professionals to clarify diagnoses or to obtain additional information.

The increasing use of electronic health records (EHR) will continue to broaden and alter the job responsibilities of health information technicians. For example, with the use of EHRs, technicians must be familiar with EHR computer software, maintaining EHR security, and analyzing electronic data to improve healthcare information. Health information technicians use EHR software to maintain data on patient safety, patterns of disease, and disease treatment and outcome. Technicians also may assist with improving EHR software usability and may contribute to the development and maintenance of health information networks.

Medical records and health information technicians' duties vary with the size of the facility where they work. Technicians can specialize in many aspects of health information.

Some medical records and health information technicians specialize in codifying patients' medical information for reimbursement purposes. Technicians who specialize in coding are called medical coders or coding specialists. Medical coders assign a code to each diagnosis and procedure by using classification systems software. The classification system determines the amount for which healthcare providers will be reimbursed if the patient is covered by Medicare, Medicaid, or other insurance programs using the system. Coders may use several coding systems, such as those required for ambulatory settings, physician offices, or long-term care.

Medical records and health information technicians also may specialize in cancer registry. Cancer (or tumor) registrars maintain facility, regional, and national databases of cancer patients. Registrars review patient records and pathology reports, and assign codes for the diagnosis and treatment of different cancers and selected benign tumors. Registrars conduct annual followups to track treatment, survival, and recovery. This information is used to calculate survivor rates and success rates of various types of treatment, to locate geographic areas with high incidences of certain cancers, and to identify potential participants for clinical drug trials.

Work environment. Medical records and health information technicians work in pleasant and comfortable offices.

Some medical records and health information technicians specialize in coding medical information for insurance purposes.

This is one of the few health-related occupations in which there is no direct hands-on patient care.

Medical records and health information technicians usually work a typical 40-hour week. Some overtime may be required. In health facilities that are open 24 hours a day, 7 days a week, technicians may work day, evening, and night shifts. About 14 percent of technicians worked part-time in 2008.

Training, Other Qualifications, and Advancement

Entry-level medical records and health information technicians usually have an associate degree. Many employers favor technicians who have a Registered Health Information Technicians (RHIT) credential.

Education and training. Medical records and health information technicians generally have an associate degree. Typical coursework in health information technology includes medical terminology, anatomy and physiology, health data requirements and standards, clinical classification and coding systems, data analysis, health care reimbursement methods, database security and management, and quality improvement methods. Applicants can improve their chances of admission into a postsecondary program by taking biology, math, chemistry, health, and computer science courses in high school.

Certification and other qualifications. Most employers prefer to hire credentialed medical record and health information technicians. A number of organizations offer credentials typically based on passing a credentialing exam. Most credentialing programs require regular recertification and continuing education to maintain the credential. Many coding credentials require an amount of time in coding experience in the work setting.

The American Health Information Management Association (AHIMA) offers credentialing as a Registered Health Information Technicians (RHIT). To obtain the RHIT credential, an individual must graduate from a 2-year associate degree program accredited by the Commission on Accreditation for Health Informatics and Information Management Education (CAHIIM) and pass an AHIMA-administered written examination. In 2008, there were more than 200 CAHIIM-accredited health information technology colleges and universities programs.

The American Academy of Professional Coders (AAPC) offers coding credentials. The Board of Medical Specialty Coding (BMSC) and Professional Association of Health Care Coding Specialists (PAHCS) both offer credentialing in specialty coding. The National Cancer Registrars Association (NCRA) offers a credential as a Certified Tumor Registrar (CTR). To learn more about the credentials available and their specific requirements, contact the credentialing organization.

Health information technicians and coders should possess good oral and written communication skills as they often serve as liaisons between healthcare facilities, insurance companies, and other establishments. Candidates proficient with computer software and technology will be appealing to employers as healthcare facilities continue to adopt electronic health records. Medical records and health informa-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Medical records and health information technicians	29-2071	172,500	207,600	35,100	20

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

tion technicians should enjoy learning, as continuing education is important in the occupation.

Advancement. Experienced medical records and health information technicians usually advance their careers by obtaining a bachelor's or master's degree or by seeking an advanced specialty certification. Technicians with a bachelor's or master's degree can advance and become a health information manager. (See the statement on medical and health services managers elsewhere in the *Handbook* for more information on health information managers.) Technicians can also obtain advanced specialty certification. Advanced specialty certification is typically experience-based, but may require additional formal education depending on the certifying organization.

Employment

Medical records and health information technicians held about 172,500 jobs in 2008. About 39 percent of jobs were in hospitals. Health information technicians work at a number of health care providers such as offices of physicians, nursing care facilities, outpatient care centers, and home health care services. Technicians also may be employed outside of health care facilities, such as in Federal Government agencies.

Job Outlook

Employment is expected to grow much faster than the average. Job prospects should be very good; technicians with a strong understanding of technology and computer software will be in particularly high demand.

Employment change. Employment of medical records and health information technicians is expected to increase by 20 percent, much faster than the average for all occupations through 2018. Employment growth will result from the increase in the number of medical tests, treatments, and procedures that will be performed. As the population continues to age, the occurrence of health-related problems will increase. Cancer registrars should experience job growth as the incidence of cancer increases from an aging population.

In addition, with the increasing use of electronic health records, more technicians will be needed to complete the new responsibilities associated with electronic data management.

Job prospects. Job prospects should be very good. In addition to job growth, numerous openings will result from the need to replace medical record and health information technicians who retire or leave the occupation permanently. Technicians that demonstrate a strong understanding of technology and computer software will be in particularly high demand.

Earnings

The median annual wage of medical records and health information technicians was \$30,610 in May 2008. The middle 50

percent earned between \$24,290 and \$39,490. The lowest 10 percent earned less than \$20,440, and the highest 10 percent earned more than \$50,060. Median annual wages in the industries employing the largest numbers of medical records and health information technicians in May 2008 were:

Federal Executive Branch	\$42,760
General medical and surgical hospitals.....	32,600
Nursing care facilities	30,660
Outpatient care centers.....	29,160
Offices of physicians.....	26,210

Related Occupations

Health care occupations with similar responsibilities include:

The Occupational Information Network (O*NET) provides information on a wide range of occupational characteristics. Links to O*NET appear at the end of the Internet version of this occupational statement, accessible at <http://www.bls.gov/ooh/ocos103.htm>

Nuclear Medicine Technologists

Significant Points

- Keen competition is expected for most positions.
- Technologists with training in multiple diagnostic methods, or in nuclear cardiology, should have the best prospects.
- Nuclear medicine technology programs range in length from 1 to 4 years and lead to a certificate, an associate degree, or a bachelor's degree.
- About 66 percent of nuclear medicine technologists work in hospitals.

Nature of the Work

Diagnostic imaging embraces several procedures that aid in diagnosing ailments, the most familiar imaging being the x ray. In nuclear medicine, radionuclides—unstable atoms that emit radiation spontaneously—are used to diagnose and treat disease. Radionuclides are purified and compounded to form radiopharmaceuticals. *Nuclear medicine technologists* administer radiopharmaceuticals to patients and then monitor the characteristics and functions of tissues or organs in which the drugs localize. Abnormal areas show higher-than-expected or lower-than-expected concentrations of radioactivity. Nuclear medicine differs from other diagnostic imaging technologies because it determines the presence of disease on the basis of metabolic changes, rather than changes in organ structure.

Nuclear medicine technologists operate cameras that detect and map the radioactive drug in a patient's body to create diagnostic images. After explaining test procedures to patients, technologists prepare a dosage of the radiopharmaceutical and administer it by mouth, injection, inhalation, or other means. They position patients and start a gamma scintillation camera, or "scanner," which creates images of the distribution of a radiopharmaceutical as it localizes in and emits signals from the patient's body. The images are produced on a computer screen or on film for a physician to interpret.

When preparing radiopharmaceuticals, technologists adhere to safety standards that keep the chance of radiation exposure as low as possible to workers and patients. Technologists keep patient records and document the amount and type of radionuclides that they receive, use, and discard.

There are two areas of specialty for nuclear medicine technologists—nuclear cardiology and positron emission tomography (PET). Nuclear cardiology typically involves myocardial perfusion imaging, which, like most nuclear medicine, uses radiopharmaceuticals and cameras to image the body. Myocardial perfusion imaging, however, requires that patients perform exercise so the technologist can image the heart and blood flow. Technologists specializing in PET operate a special medical imaging device that produces a 3-D image of the body.

Work environment. Physical stamina is important because nuclear medicine technologists are on their feet much of the

Nuclear medicine technologists operate complicated equipment that requires mechanical ability and manual dexterity.

day and may have to lift or turn disabled patients. In addition, technologists must operate complicated equipment that requires mechanical ability and manual dexterity.

Although the potential for radiation exposure exists in this field, it is minimized by the use of shielded syringes, gloves, and other protective devices and by adherence to strict radiation safety guidelines. The amount of radiation in a nuclear medicine procedure is comparable to that received during a diagnostic x ray procedure. Technologists also wear badges that measure radiation levels. Because of safety precautions, badge measurements rarely exceed established safety levels.

Nuclear medicine technologists generally work a 40-hour week. Some technologists also may have on-call hours, including evening or weekend hours, in departments that operate on an extended schedule. Opportunities for part-time and shift work also are available. Those employed by mobile imaging services may be required to travel to several locations.

Training, Other Qualifications, and Advancement

Nuclear medicine technology programs range in length from 1 to 4 years and lead to a certificate, an associate degree, or a bachelor's degree. Many employers and an increasing number of States require certification or licensure. Aspiring nuclear medicine technologists should check the requirements of the State in which they plan to work.

Education and training. Generally, certificate programs are offered in hospitals, associate degree programs in community colleges, and bachelor's degree programs in 4-year colleges and universities. Courses cover the physical sciences, biological effects of radiation exposure, radiation protection and procedures, the use of radiopharmaceuticals, imaging techniques, and computer applications.

One-year certificate programs are typically for health professionals who already possess an associate or bachelor's degree—especially radiologic technologists and diagnostic medical sonographers—but who wish to specialize in nuclear medicine. The programs also attract medical technologists, registered nurses, and others who wish to change fields or specialize.

The Joint Review Committee on Education Programs in Nuclear Medicine Technology accredits associate and bach-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Nuclear medicine technologists	29-2033	21,800	25,400	3,600	16

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

elor's degree training programs in nuclear medicine technology. In 2008, there were more than 100 accredited programs available.

Licensure. Requirements for licensure of nuclear medicine technologists vary from State to State, so it is important that aspiring technologists check the requirements of the State in which they plan to work. In 2008, 25 States licensed nuclear medicine technologists. In addition, many third-party payers require nuclear medicine technologists to be certified in order for the healthcare facility to receive reimbursement for imaging procedures.

Certification and other qualifications. Certification is voluntary but it has become the generally accepted standard for nuclear medicine technologists and those who employ them. Certification is available from the American Registry of Radiologic Technologists (ARRT) and from the Nuclear Medicine Technology Certification Board (NMTCB). Some technologists receive certification from both agencies. ARRT and NMTCB have different eligibility requirements, but both require that workers pass a comprehensive exam to become certified.

In addition to the general certification requirements, certified technologists also must complete a certain number of continuing education hours to retain certification. Continuing education is required primarily because of the frequent technological and innovative changes in the field of nuclear medicine.

Technologists must have good communication skills to effectively interact with patients and their families and should be sensitive to patients' physical and psychological needs. Nuclear medicine technologists must be able to work independently as they may have little direct supervision. Technologists also need to be detailed-oriented and meticulous when performing procedures to assure that all regulations are being followed.

Advancement. Technologists may advance to supervisory positions or to chief technologist with significant work experience. With advanced education, it is possible for some technologists to become department administrators or directors.

Some technologists specialize in clinical areas, such as nuclear cardiology or PET scanning. Some become instructors in, or directors of, nuclear medicine technology programs, a step that usually requires a bachelor's or master's degree in the subject. Others may leave the occupation to work as sales or training representatives for medical equipment or radio-pharmaceutical manufacturing firms; some become radiation safety officers in regulatory agencies or hospitals.

Employment

Nuclear medicine technologists held about 21,800 jobs in 2008. About 66 percent of all nuclear medicine technologist jobs were

in hospitals—private and public. A majority of the rest were in offices of physicians or in medical and diagnostic laboratories, including diagnostic imaging centers.

Job Outlook

Faster than average job growth is projected. However, keen competition is expected for most positions.

Employment change. Employment of nuclear medicine technologists is expected to increase by 16 percent from 2008 to 2018, faster than the average for all occupations. Growth will arise from technological advancement, the development of new nuclear medicine treatments, and an increase in the number of middle-aged and elderly persons, who are the primary users of diagnostic and treatment procedures.

Technological innovations may increase the diagnostic uses of nuclear medicine. New nuclear medical imaging technologies, including PET and single photon emission computed tomography (SPECT), are expected to be used increasingly. Cost considerations will affect the speed with which these new applications of nuclear medicine grow. Healthcare facilities contemplating these procedures will have to consider equipment costs, reimbursement policies, and the number of potential users. Although these new imaging technologies will be used more often, they will likely replace older technologies, not supplement them. Thus, only a small amount of job growth will stem from the adoption of new technologies.

Job prospects. In spite of growth in nuclear medicine, the number of openings into the occupation each year will be relatively low. Job competition will be keen because the supply of properly trained nuclear medicine technologists is expected to exceed the number of job openings for technologists. Technologists who have training in multiple diagnostic methods, such as radiologic technology and diagnostic medical sonography, or in nuclear cardiology, should have the best prospects.

Earnings

The median annual wage of nuclear medicine technologists was \$66,660 in May 2008. The middle 50 percent earned between \$57,270 and \$78,240. The lowest 10 percent earned less than \$48,450, and the highest 10 percent earned more than \$87,770. The median annual wage of nuclear medicine technologists in general medical and surgical hospitals was \$66,320.

Occupational Health and Safety Specialists

Significant Points

- About 41 percent of occupational health and safety specialists work in Federal, State, and local government agencies that enforce rules on safety, health, and the environment.
- Most jobs require a bachelor's degree in occupational health, safety, or a related field; some require advanced degrees.
- Projected average employment growth reflects a balance of continuing public demand for a safe and healthy work environment against the desire for smaller government and fewer regulations.
- Individuals with a well-rounded breadth of knowledge in more than one health and safety specialty will have the best job prospects.

Nature of the Work

Occupational health and safety specialists, also known as safety and health professionals or *occupational health and safety inspectors*, help prevent harm to workers, property, the environment, and the general public. For example, they may design safe work spaces, inspect machines, or test air quality. In addition to making workers safer, specialists aim to increase worker productivity by reducing absenteeism and equipment downtime—and to save money by lowering insurance premiums and workers' compensation payments, and preventing government fines.

Occupational health and safety specialists may conduct inspections and inform an organization's managers of areas not in compliance with State and Federal laws and employer policies.

Specialists working for governments conduct safety inspections and impose fines. Specialists often work with occupational health and safety technicians to ensure work place safety. (See the statement on occupational health and safety technicians elsewhere in the Handbook.)

Occupational health and safety specialists analyze work environments and design programs to control, eliminate, and prevent disease or injury. They look for chemical, physical, radiological, and biological hazards. They also work to make more equipment ergonomic—designed to promote proper body positioning, increase worker comfort, and decrease fatigue. Specialists may conduct inspections and inform an organization's management of areas not in compliance with State and Federal laws or employer policies. They also advise management on the cost and effectiveness of safety and health programs. Some provide training on new regulations and policies or on how to recognize hazards.

Some specialists develop methods to predict hazards from historical data and other information sources. They use these methods and their own knowledge and experience to evaluate current equipment, products, facilities, or processes and those planned for future use. For example, they might uncover patterns in injury data that show that many injuries are caused by a specific type of system failure, human error, or weakness in procedures. They

evaluate the probability and severity of accidents and identify where controls need to be implemented to reduce or eliminate risk. If a new program or practice is required, they propose it to management and monitor results if it is implemented. Specialists may also conduct safety training. Training sessions might show how to recognize hazards, for example, or explain new regulations, production processes, and safe work methods. If an injury or illness occurs, occupational health and safety specialists help investigate, studying its causes and recommending remedial action. Some occupational health and safety specialists help workers to return to work after accidents and injuries.

Some specialists, often called loss prevention specialists, work for insurance companies, inspecting the facilities that they insure and suggesting and helping to implement improvements.

Occupational health and safety specialists frequently communicate with management about the status of health and safety programs. They also might consult with engineers or physicians.

Specialists monitor safety measurements in order to advise management of safety performance to correct existing safety hazards and to avoid future hazards; they write reports, including accident reports, and enter information on Occupational Safety and Health Administration recordkeeping forms. They also may prepare documents used in legal proceedings and give testimony in court. Those who develop expertise in specific areas may develop occupational health and safety systems, including policies, procedures, and manuals. Some specialists plan budgets needed to implement programs that help achieve safe work practices.

The responsibilities of occupational health and safety specialists vary by industry, workplace, and types of hazards affecting employees. Environmental protection officers evaluate and coordinate the storage and handling of hazardous waste, the cleanup of contaminated soil or water, or other activities that affect the environment. Ergonomists consider the design of industrial, office, and other equipment to maximize worker comfort, safety, and productivity. Health physicists work in places that use radiation and radioactive material, helping to protect people and the environment from hazardous radiation exposure. Industrial hygienists examine the workplace for health hazards, such as exposure to lead, asbestos, noise, pesticides, or communicable diseases.

Work environment. Occupational health and safety specialists work in a variety of settings such as offices, factories, and mines. Their jobs often involve considerable fieldwork and travel.

Occupational health and safety specialists may be exposed to many of the same strenuous, dangerous, or stressful conditions faced by industrial employees. The majority of occupational health and safety specialist work the typical 40 hour week. Some specialists may work over-time, and often irregular, hours.

Training, Other Qualifications, and Advancement

Most jobs require a bachelor's degree in occupational health, safety, or a related field; some require advanced degrees. All spe-

cialists are trained in the applicable laws or inspection procedures through some combination of classroom and on-the-job training.

Education and training. Most employers require occupational health and safety specialists to have a bachelor's degree in occupational health, safety, or a related field, such as engineering, biology, or chemistry. For some positions, a master's degree in industrial hygiene, health physics, or a related subject is required. High school students interested in enrolling in a college program should complete courses in English, mathematics, chemistry, biology, and physics. College courses may include radiation science, hazardous material management and control, risk communications, principles of ergonomics, and respiratory protection. Course work will vary depending on the degree pursued. For example, course requirements for students seeking a degree in industrial hygiene will differ from course requirements for health physics degree seekers.

In order to become credentialed, most accrediting bodies require that specialists have attended either a regional or nationally accredited educational institution. Work experience is important in this occupation; it is typically beneficial for prospective students to select an education program that offers opportunities to complete internships.

All occupational health and safety specialists are trained in the applicable laws or inspection procedures through some combination of classroom and on-the-job training.

Certification and other qualifications. Credentialing is voluntary, although many employers encourage it. Credentialing is available through several organizations depending on the specialists' field of work. Organizations credentialing health and safety professionals include the American Board of Health Physicists; the American Indoor Air Quality Council; the American Board of Industrial Hygiene; and the Board of Certified Safety Professionals.

Requirements for credentials vary. Most require specific education and experience in order to be eligible to sit for the certification exam. Once certified, specialists are usually required to complete periodic continuing education for recertification. For information on credentials offered and requirements contact the credentialing organization.

People interested in this occupation should be responsible and enjoy detailed work. Occupational health and safety specialists also should be able to communicate well. Work experience as an occupational health and safety professional may also be a prerequisite for many positions.

Advancement. Occupational health and safety specialists who work for the Federal Government advance through their career ladder to a specified full-performance level if their work is satisfactory. For positions above this level, usually supervisory positions, advancement is competitive and based on agency needs and individual merit. Advancement opportunities in State

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Occupational health and safety specialists.....	29-9011	55,800	62,000	6,200	11

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

and local governments and the private sector are often similar to those in the Federal Government.

Specialists with broad education and experience and those who are well versed in numerous business functions usually have the best advancement opportunities. One way to keep up with current professional developments is to join a professional membership society. These organizations offer journals, continuing education courses, and conferences, which provide learning and networking opportunities and can help workers and students to advance.

Typically an advanced degree and substantial work experience are needed to compete for leadership or senior roles

Employment

Occupational health and safety specialists held about 55,800 jobs in 2008. While the majority of jobs were spread throughout the private sector; about 41 percent of specialists worked for Federal, State, and local government agencies.

Within the Federal Government, most jobs are as Occupational Safety and Health Administration inspectors, who enforce U.S. Department of Labor regulations and impose fines. Within the U.S. Department of Health and Human Services, the National Institute of Occupational Safety and Health hires occupational health and safety specialists to offer companies help in evaluating safety without the risk of fines. Most large government agencies also employ occupational health and safety specialists who work to protect agency employees.

Most private companies either employ their own occupational health and safety workers or contract with them. Most contract work is done through consulting companies, but some specialists are self-employed.

In addition to working for governments, occupational health and safety specialists were employed in manufacturing firms; hospitals; educational services; scientific and technical consulting services; mining, quarrying, and oil and gas extraction, and construction.

Job Outlook

Average employment growth is expected; additional opportunities will arise from the need to replace workers who leave the occupation. Individuals with a well-rounded breadth of knowledge in more than one health and safety specialty will have the best job prospects.

Employment change. Employment of occupational health and safety specialists is expected to increase 11 percent during the 2008-18 decade, about as fast as the average for all occupations, reflecting a balance of continuing public demand for a safe and healthy work environment against the desire for fewer government regulations.

More specialists will be needed to cope with technological advances in safety equipment and threats, changing regulations, and increasing public expectations. In private industry, employment growth will reflect continuing self-enforcement of government and company regulations and policies.

Insurance and worker's compensation costs have become a financial concern for many employers and insurance companies. As a result, job growth should be good for those specializing in loss prevention, especially in construction safety and in ergonomics.

Growth for occupational health and safety specialists may be hampered by the number of manufacturing and other industry firms offshoring their operations. In addition, the number of

workers who telecommute is increasing. Since occupational health and safety specialists do not have access to home offices, their ability to ensure health and safety of workers in home offices is limited.

Job prospects. In addition to job openings from growth, job openings will arise from the need to replace workers who transfer to other occupations, retire, or leave for other reasons.

As the lines continue to blur between specific health and safety specialties like industrial hygiene, health physics, and loss prevention, individuals with a well-rounded breadth of knowledge in more than one health and safety specialty will have the best job prospects.

Employment of occupational health and safety specialists in the private sector is somewhat affected by general economic fluctuations. Federal, State, and local governments provide considerable job security; these workers are less likely to be affected by changes in the economy.

Earnings

Median annual wages of occupational health and safety specialists were \$62,250 in May 2008. The middle 50 percent earned between \$47,490 and \$77,880. The lowest 10 percent earned less than \$35,870, and the highest 10 percent earned more than \$93,620. Median annual wages in the industries employing the largest numbers of occupational health and safety specialists in May 2008 were:

Federal Executive Branch	\$73,180
General medical and surgical hospitals.....	63,910
Management, scientific, and technical consulting services	57,600
Local government.....	56,300
State government.....	55,600

Most occupational health and safety specialists work in large private firms or for Federal, State, and local governments, most of which generally offer benefits more generous than those offered by smaller firms.

Related Occupations

Occupational health and safety specialists help to ensure that safety and health laws and regulations are obeyed. Other occupations that inspect and enforce laws and regulations include:

	Page
Agricultural inspectors.....	612
Construction and building inspectors.....	628
Fire inspectors and investigators	525
Occupational health and safety technicians	431

Occupational Health and Safety Technicians

Significant Points

- About 22 percent of technicians worked in government agencies that enforce rules on safety, health, and the environment.
- Technicians attend postsecondary school or enter the occupation through work experience and training.
- Individuals with a well-rounded breadth of knowledge in more than one health and safety specialty will have the best job prospects.

Nature of the Work

Occupational health and safety technicians work with occupational health and safety specialists to help prevent harm to workers, property, the environment, and the general public. (See the statement on occupational health and safety

Occupational health and safety technicians prepare and calibrate scientific equipment.

specialists elsewhere in the Handbook.) For example, they might help design safe work spaces, inspect machines, or test air quality. In addition to making workers safer, technicians work with specialists to increase worker productivity by reducing absenteeism and equipment downtime, and to save money by lowering insurance premiums and workers' compensation payments, and preventing government fines. Some technicians work for governments conducting safety inspections and imposing fines.

Occupational health and safety technicians take measurements and collect workplace data either for routine inspection or as directed by a specialist. Technicians often focus on testing air, water, machines, and other elements of the work environment. They collect data that occupational health and safety specialists then analyze. Usually working under the supervision of specialists, they also help to implement and evaluate safety programs.

To measure hazards, such as noise or radiation, occupational health and safety technicians prepare and calibrate scientific equipment. They must properly collect and handle samples of dust, gases, vapors, and other potentially toxic materials to ensure personal safety and accurate test results.

To ensure that machinery and equipment complies with appropriate safety regulations, occupational health and safety technicians may examine and test machinery and equipment, such as lifting devices, machine guards, or scaffolding. They may check that personal protective equipment, such as masks, respirators, protective eyewear, or hardhats, is being used according to regulations. They also check that hazardous materials are stored correctly. They test and identify work areas for potential accident and health hazards, such as toxic vapors, mold, mildew, and explosive gas-air mixtures and help implement appropriate control measures, such as adjustments to ventilation systems. Their inspection of the

workplace might involve talking with workers and observing their work, as well as inspecting elements in their work environment, such as lighting, tools, and equipment.

The responsibilities of occupational health and safety technicians vary by industry, workplace, and types of hazards affecting employees. Mine examiners, for example, are technicians who inspect mines for proper air flow and health hazards such as the buildup of methane or other noxious gases. Environmental protection technicians evaluate and coordinate the storage and handling of hazardous waste, the cleanup of contaminated soil or water, or other activities that affect the environment. Health physics technicians work in places that use radiation and radioactive material, helping to protect people and the environment from hazardous radiation exposure. Industrial hygiene technicians examine the workplace for health hazards, such as exposure to lead, asbestos, pesticides, or communicable diseases.

Work environment. Occupational health and safety technicians work in a variety of settings from offices and factories to mines. Their jobs often involve considerable fieldwork, and some require frequent travel.

Occupational health and safety technicians may be exposed to many of the same strenuous, dangerous, or stressful conditions faced by industrial employees. They may find themselves in an adversarial role if an organization disagrees with their recommendations. Most technicians work the typical 40 hour week. Some occupational health and safety technicians may be required to work overtime, and often irregular, hours.

Training, Other Qualifications, and Advancement

Technicians attend postsecondary school or enter the occupation through work experience and training. All occupational health and safety technicians are trained in the applicable laws or inspection procedures through some combination of classroom and on-the-job training.

Education and training. There are multiple paths to entry-level employment as an occupational health and safety technicians. Some technicians attend postsecondary school and typically earn an associate degree or certificate. Other technicians enter the occupation through work experience and training. In this case, an individual typically already works in the industry and may volunteer with their employer to take on health and safety responsibilities. These workers then usually receive on-the-job training coupled with some formal education. All occupational health and safety technicians are trained in the applicable laws or inspection procedures through some combination of classroom and on-the-job training.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018		Change, 2008-2018	
			2018	Number	Percent	
Occupational health and safety technicians	29-9012	10,900	12,500	1,600	14	

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Recommended high school courses include English, mathematics, chemistry, biology, and physics.

Certification and other qualifications. Although voluntary, many employers encourage credentialing. The Council on Certification of Health, Environmental, and Safety Technologists offers credentialing at the technician level. For specific requirements for each credential, contact the certifying body. Most certifications require completing periodic continuing education for recertification.

In general, people who want to enter this occupation should be responsible and like detailed work. Occupational health and safety technicians also should be able to communicate well.

Advancement. Occupational health and safety technicians who work for the Federal Government advance through their career ladder to a specified full-performance level if their work is satisfactory. For positions above this level, usually supervisory positions, advancement is competitive and based on agency needs and individual merit. Advancement opportunities in State and local governments and the private sector are often similar to those in the Federal Government.

Technicians with broad education and experience and those who are well versed in numerous business functions usually have the best advancement opportunities. One way to keep up with current professional developments is to join a professional society. These organizations offer journals, continuing education courses, and conferences that provide learning and networking opportunities and can help workers and students to advance.

With a bachelor's or advanced degree, technicians can become occupational health and safety specialists.

Employment

Occupational health and safety technicians held about 10,900 jobs in 2008. While the majority of jobs were spread throughout the private sector, about 22 percent of technicians worked for government agencies.

Most private companies either employ their own occupational health and safety workers or contract with them. Most contract work is done through consulting companies.

In addition to working for governments, occupational health and safety technicians were employed in manufacturing firms; public and private hospitals; educational services; scientific and technical consulting services; administrative and support services; and support activity for mining.

Job Outlook

Faster than average employment growth is expected; additional opportunities will arise from the need to replace workers who leave the occupation. Individuals with a well-

rounded breadth of knowledge in more than one health and safety specialty will have the best job prospects.

Employment change. Employment of occupational health and safety technicians is expected to increase 14 percent during the 2008-18 decade, faster than the average for all occupations, reflecting a balance of continuing public demand for a safe and healthy work environment against the desire for fewer government regulations.

More technicians will be needed to cope with technological advances in safety equipment and threats, changing regulations, and increasing public expectations. In private industry, employment growth will reflect overall business growth and continuing self-enforcement of government and company regulations and policies.

Although most occupational health and safety technicians work under supervision of specialists, technicians can complete many of the routine job tasks with little or no supervision. As a result in order to contain costs, some employers operate with more technicians and fewer specialists.

Growth for occupational health and safety technicians may be hampered by the number of manufacturing and other industry firms offshoring their operations. Also, the increasing popularity of telecommuting, or working at home, will result in less work space for technicians to inspect.

Job prospects. In addition to job openings from growth, job openings will arise from the need to replace workers who transfer to other occupations, retire, or leave for other reasons. Health and safety technicians with a wide breadth of knowledge in more than one area of health and safety along with general business functions will have the best prospects.

Employment of occupational health and safety technicians in the private sector is somewhat affected by general economic fluctuations. Federal, State, and local governments provide considerable job security; workers are less likely to be affected by changes in the economy.

Earnings

Median annual wages of occupational health and safety technicians were \$45,360 in May 2008. The middle 50 percent earned between \$35,160 and \$57,110. The lowest 10 percent earned less than \$26,540, and the highest 10 percent earned more than \$73,050. Median annual wages in the industries employing the largest numbers of occupational health and safety specialists and technicians in May 2008 were:

Support activities for mining	\$56,060
Local government	45,320
Colleges, universities, and professional schools	44,990
General medical and surgical hospitals	41,490
Management, scientific, and technical consulting	41,100

Most occupational health and safety technicians work in large private firms or for Federal, State, and local governments, most of which generally offer benefits more generous than those offered by smaller firms.

Related Occupations

Occupational health and safety technicians help to inspect and ensure that safety and health laws and regulations are obeyed. Others who enforce regulations include:

	Page
Agricultural inspectors	612
Construction and building inspectors	628
Fire inspectors and investigators	525
Occupational health and safety specialists	428

Opticians, Dispensing

Significant Points

- Employers increasingly prefer dispensing opticians to complete certification or graduate from an accredited 2-year associate's degree program in opticianry; some large employers may provide an apprenticeship.
- A license to practice is required by 22 States.
- Employment growth is projected to be average and reflect the steady demand for corrective lenses and fashionable eyeglass frames.
- Job opportunities are likely to be very good.

Nature of the Work

Helping people see better and look good at the same time is the job of a dispensing optician. *Dispensing opticians* help select and fit eyeglasses and contact lenses for people with eye problems, following prescriptions written by ophthalmologists or optometrists. (The work of optometrists is described elsewhere in the *Handbook*. See the section on physicians and surgeons for information about ophthalmologists.) Dispensing opticians recommend eyeglass frames, lenses, and lens coatings after considering the prescription and the customer's occupation, habits, and facial features. When fitting new eyeglasses, opticians use sophisticated diagnostic instruments to measure various characteristics of a client's eyes, including the thickness, width, curvature, and surface topography of the cornea. They also obtain a customer's prescription history to re-make eyeglasses or contact lenses, or they may verify a prescription with the examining optometrist or ophthalmologist.

Dispensing opticians prepare work orders that give ophthalmic laboratory technicians the information they need to grind and insert lenses into a frame. (See the section on ophthalmic laboratory technicians elsewhere in the *Handbook*.) The work order includes prescriptions for lenses and information on their size, material, color, and style. Some dispensing opticians grind and insert lenses themselves. They may also apply tint to lenses. After the glasses are made, dispensing opticians verify that the lenses meet the specifications, and then they may reshape or bend the frames with pliers for a custom fit.

Many opticians also spend time fixing and refitting broken frames, as well as instructing clients about wearing or caring for eyeglasses. Additionally, administrative duties have become a major part of their work, including keeping records on customers' prescriptions, work orders, and payments, and tracking inventory and sales.

Some dispensing opticians, after additional education and training, specialize in fitting contacts, artificial eyes, or cosmetic shells to cover blemished eyes. To fit contact lenses, dispensing opticians measure the shape and size of the eye, select the type of contact lens material, and prepare work orders specifying the prescription and lens size. Dispensing opticians observe customers' eyes, corneas, lids, and contact lenses with sophisticated instruments and microscopes. During several

followup visits, opticians teach proper insertion, removal, and care of contact lenses.

Work environment. Dispensing opticians work indoors mainly in medical offices, optical stores, or in large department or club stores. Opticians spend a fair amount of time on their feet. If they prepare lenses, they need to take precautions against the hazards of glass cutting, chemicals, and machinery. Although most dispensing opticians work during regular business hours, those in retail stores may work evenings and weekends. Some work part time.

Training, Other Qualifications, and Advancement

Many employers increasingly prefer dispensing opticians to complete certification or graduate from an accredited 2-year associate's degree program in opticianry; some large employers may provide an apprenticeship that may last two years or longer.

Education and training. Although a high school diploma is all that is required to get into this occupation, most workers have completed at least some college courses or a degree. Classes in physics, basic anatomy, algebra, and trigonometry as well as experience with computers are particularly valuable. These classes prepare dispensing opticians to learn job skills, including optical mathematics, optical physics, and the use of precision measuring instruments and other machinery and tools.

Structured apprenticeship programs are more commonly available in States where licensing is not mandatory, and these programs are usually offered by large employers. Apprentices receive technical instruction along with training in office management and sales. Under the supervision of an experienced optician, optometrist, or ophthalmologist, apprentices work directly with patients, fitting eyeglasses and contact lenses.

Formal training in the field is offered in community colleges and in a few 4-year colleges and universities. As of 2008, the Commission on Opticianry Accreditation accredited 22 associate degree programs in 13 states. Graduation from an accredited program in opticianry can be advantageous as it provides a nationally recognized credential.

Licensure. As of 2009, twenty-two States require dispensing opticians to be licensed. States may require individuals to pass one or more of the following for licensure: a State practi-

Dispensing opticians deal directly with the public, so they should be tactful, pleasant, and communicate well.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Opticians, dispensing	29-2081	59,800	67,800	8,000	13

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

cal examination, a State written examination, and certification examinations offered by the American Board of Opticianry (ABO) and the National Contact Lens Examiners (NCLE). To qualify for the examinations, States often require applicants to complete postsecondary training or work as apprentices for 2 to 4 years.

Some States allow graduates of opticianry programs to take the licensure exam immediately upon graduation; others require a few months to a year of experience. Continuing education is commonly required for licensure renewal. Information about specific licensing requirements is available from the State board of occupational licensing.

Certification and other qualifications. Any optician can apply to the ABO and the NCLE for certification of their skills. Certification signifies to customers and employers that an optician has a certain level of expertise. Certification must be renewed every 3 years through continuing education. The State of Texas offers voluntary registration for the occupation.

Dispensing opticians deal directly with the public, so they should be tactful, pleasant, and able to communicate well. Fitting contact lenses requires considerable skill, care, and patience, so manual dexterity and the ability to do precision work are essential.

Advancement. A few experienced dispensing opticians open their own optical stores. Some become managers of optical stores or sales representatives for wholesalers or manufacturers of eyeglasses or lenses.

Employment

Dispensing opticians held about 59,800 jobs in 2008. About 40 percent worked in offices of optometrists. Another 33 percent worked in health and personal care stores, including optical goods stores. Many of these stores offer one-stop shopping where customers can have their eyes examined, choose frames, and have glasses made on the spot. Some opticians work in optical departments of department stores or other general merchandise stores, such as warehouse clubs and superstores. About 13 percent worked in offices of physicians, primarily ophthalmologists, who sell glasses directly to patients. One percent were self-employed and ran their own unincorporated businesses.

Job Outlook

Employment of dispensing opticians is expected to grow about as fast as average for all occupations through 2018, as the population ages and demand for corrective lenses increases. Very good job prospects are expected.

Employment change. Employment in this occupation is expected to rise 13 percent over the 2008–18 decade. Middle age is a time when many individuals use corrective lenses for the first time, and elderly persons generally require more vision care than others. As the share of the population in these older

age groups increases and as people live longer, more opticians will be needed to provide service to them. In addition, awareness of the importance of regular eye exams is increasing across all age groups, especially children and those over the age of 65. Recent trends indicate a movement toward a “low vision” society, where a growing number of people view things that are closer in distance, such as computer monitors, over the course of an average day. This trend is expected to increase the need for eye care services. Fashion also influences demand. Frames come in a growing variety of styles, colors, and sizes, encouraging people to buy more than one pair.

Somewhat moderating the need for optician services is the increasing use of laser surgery to correct vision problems. Although the surgery remains relatively more expensive than eyewear, patients who successfully undergo this surgery may not require glasses or contact lenses for several years. Also, new technology is allowing workers to make the measurements needed to fit glasses and therefore allowing dispensing opticians to work faster, limiting the need for more workers.

Job prospects. Overall, the need to replace dispensing opticians who retire or leave the occupation will result in very good job prospects. Employment opportunities for opticians in offices of optometrists—the largest employer—will be particularly good as an increasing number of ophthalmologists are expected to utilize better trained opticians to handle more tasks, allowing ophthalmologists to see more patients.

Job opportunities also will be good at general merchandise stores because this segment is expected to experience much faster than average growth, as well as high turnover due to less favorable working conditions, such as long hours and mandatory weekend shifts.

Nonetheless, the number of job openings overall will be somewhat limited because the occupation is small. Also, dispensing opticians are vulnerable to changes in the business cycle because eyewear purchases often can be deferred for a time. Job prospects will be best for those who have certification and those who have completed a formal opticianry program. Job candidates with extensive knowledge of new technology, including new refraction systems, framing materials, and edging techniques, should also experience favorable conditions.

Earnings

Median annual wages of dispensing opticians were \$32,810 in May 2008. The middle 50 percent earned between \$26,170 and \$41,930. The lowest 10 percent earned less than \$21,250, and the highest 10 percent earned more than \$50,580. Median an-

nual wages in the industries employing the largest numbers of dispensing opticians in May 2008 were:

Other general merchandise stores	\$40,080
Health and personal care stores.....	34,700
Offices of physicians	34,090
Department stores.....	33,750
Offices of optometrists	30,460

Benefits for opticians are generally determined by the industries in which they are employed. In general, those who work part-time or in small retail shops have fewer benefits than those who may work for large optical chains or department stores. Self-employed opticians must provide their own benefits.

Related Occupations

Other workers who deal with customers and perform delicate work include the following:

	Page
Jewelers and precious stone and metal workers.....	770
Ophthalmic laboratory technicians	774
Orthotists and prosthetists	825

Pharmacy Technicians and Aides

Significant Points

- Job opportunities are expected to be good, especially for those with certification or previous work experience.
- Many technicians and aides work evenings, weekends, and holidays.
- About 75 percent of jobs were in a retail setting.

Pharmacy technicians and aides answer phones, operate cash registers, and prepare medications for patients.

Nature of the Work

Pharmacy technicians and aides help licensed pharmacists prepare prescription medications, provide customer service, and perform administrative duties within a pharmacy setting. Pharmacy technicians generally are responsible for receiving prescription requests, counting tablets, and labeling bottles, while pharmacy aides perform administrative functions such as answering phones, stocking shelves, and operating cash registers. In organizations that do not have aides, however, pharmacy technicians may be responsible for these clerical duties.

Pharmacy technicians who work in retail or mail-order pharmacies have various responsibilities, depending on State rules and regulations. Technicians receive written prescription requests from patients. They also may receive prescriptions sent electronically from doctors' offices, and in some States they are permitted to process requests by phone. They must verify that the information on the prescription is complete and accurate. To prepare the prescription, technicians retrieve, count, pour, weigh, measure, and sometimes mix the medication. Then they prepare the prescription labels, select the type of container, and affix the prescription and auxiliary labels to the container. Once the prescription is filled, technicians price and file the prescription, which must be checked by a pharmacist before it is given to the patient. Technicians may establish and maintain patient profiles, as well as prepare insurance claim forms. Technicians always refer any questions regarding prescriptions, drug information, or health matters to a pharmacist. (See the section on pharmacists elsewhere in the Handbook.)

In hospitals, nursing homes, and assisted-living facilities, technicians have added responsibilities, including preparing sterile solutions and delivering medications to nurses or physicians. Technician may also record the information about the prescribed medication onto the patient's profile.

Pharmacy aides work closely with pharmacy technicians. They primarily perform administrative duties such as answering telephones, stocking shelves, and operating cash registers. They also may prepare insurance forms and maintain patient profiles. Unlike pharmacy technicians, pharmacy aides do not prepare prescriptions or mix medications.

Work environment. Pharmacy technicians and aides work in clean, organized, well-lighted, and well-ventilated areas. Most

of their workday is spent on their feet. They may be required to lift heavy boxes or to use stepladders to retrieve supplies from high shelves.

Technicians and aides often have varying schedules that include nights, weekends, and holidays. In facilities that are open 24 hours a day, such as hospital pharmacies, technicians and aides may be required to work nights. Many technicians and aides work part time.

Training, Other Qualifications, and Advancement

There is no national training standard for pharmacy technicians, but employers favor applicants who have formal training, certification, or previous experience. There also are no formal training requirements for pharmacy aides, but a high school diploma may increase an applicant's prospects for employment.

Education and training. There are no standard training requirements for pharmacy technicians, but some States require a high school diploma or its equivalent. Although most pharmacy technicians receive informal on-the-job training, employers favor those who have completed formal training and certification. On-the-job training generally ranges between 3 and 12 months.

Formal technician education programs are available through a variety of organizations, including community colleges, vocational schools, hospitals, and the military. These programs range from 6 months to 2 years and include classroom and laboratory work. They cover a variety of subject areas, such as medical and pharmaceutical terminology, pharmaceutical calculations, pharmacy recordkeeping, pharmaceutical techniques, and pharmacy law and ethics. Technicians also are required to learn the names, actions, uses, and doses of the medications they work with. Many training programs include internships, in which students gain hands-on experience in actual pharmacies. After completion, students receive a diploma, a certificate, or an associate's degree, depending on the program.

There are no formal education requirements for pharmacy aides, but employers may favor applicants with a high school diploma or its equivalent. Experience operating a cash register, interacting with customers, managing inventory, and using computers may be helpful. Pharmacy aides also receive informal on-the-job training that generally lasts less than 3 months.

Certification and other qualifications. In most States, pharmacy technicians must be registered with the State board of pharmacy. Eligibility requirements vary, but in some States applicants must possess a high school diploma or its equivalent and pay an application fee.

Most States do not require technicians to be certified, but voluntary certification is available through several private organizations. The Pharmacy Technician Certification Board (PTCB) and the Institute for the Certification of Pharmacy Technicians

(ICPT) administer national certification examinations. Certification through such programs may enhance an applicant's prospects for employment and is required by some States and employers. To be eligible for either exam, candidates must have a high school diploma or its equivalent and no felony convictions of any kind. In addition, applicants for the PTCB exam must not have had any drug-related or pharmacy-related convictions, including misdemeanors. Many employers will reimburse the cost of the exams.

Under these programs, technicians must be recertified every 2 years. Recertification requires 20 hours of continuing education within the 2-year certification period. Continuing education hours can be earned from several different sources, including colleges, pharmacy associations, and pharmacy technician training programs. Up to 10 hours of continuing education also can be earned on the job under the direct supervision and instruction of a pharmacist.

Good customer service and communication skills are needed because pharmacy technicians and aides interact with patients, coworkers, and healthcare professionals. Basic mathematics, spelling, and reading skills also are important, as technicians must interpret prescription orders and verify drug doses. Technicians also must be precise: details are sometimes a matter of life and death.

Advancement. Advancement opportunities generally are limited, but in large pharmacies and health systems pharmacy technicians and aides with significant training or experience can be promoted to supervisory positions. Some may advance into specialty positions such as chemotherapy technician or nuclear pharmacy technician. Others may move into sales. With a substantial amount of formal training, some technicians and aides go on to become pharmacists.

Employment

Pharmacy technicians and aides held about 381,200 jobs in 2008. Of these, about 326,300 were pharmacy technicians and about 54,900 were pharmacy aides. About 75 percent of jobs were in a retail setting, and about 16 percent were in hospitals.

Job Outlook

Employment is expected to increase much faster than the average, and job opportunities are expected to be good.

Employment change. Employment of pharmacy technicians and aides is expected to increase by 25 percent from 2008 to 2018, which is much faster than the average for all occupations. The increased number of middle-aged and elderly people—who use more prescription drugs than younger people—will spur demand for pharmacy workers throughout the projection period. In addition, as scientific advances lead to new drugs,

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Pharmacy technicians and aides.....	—	381,200	477,500	96,300	25
Pharmacy technicians.....	29-2052	326,300	426,000	99,800	31
Pharmacy aides	31-9095	54,900	51,500	-3,500	-6

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

and as more people obtain prescription drug coverage, pharmacy workers will be needed in growing numbers.

Employment of pharmacy technicians is expected to increase by 31 percent. As cost-conscious insurers begin to use pharmacies as patient-care centers and pharmacists become more involved in patient care, pharmacy technicians will continue to see an expansion of their role in the pharmacy. In addition, they will increasingly adopt some of the administrative duties that were previously performed by pharmacy aides, such as answering phones and stocking shelves. As a result of this development, demand for pharmacy aides should decrease, and employment is expected to decline moderately, decreasing by 6 percent over the projection period.

Job prospects. Job opportunities for pharmacy technicians are expected to be good, especially for those with previous experience, formal training, or certification. Job openings will result from employment growth, as well as the need to replace workers who transfer to other occupations or leave the labor force.

Despite declining employment, job prospects for pharmacy aides also are expected to be good. As people leave this occupation, new applicants will be needed to fill the positions that remain.

Earnings

Median hourly wages of wage and salary pharmacy technicians in May 2008 were \$13.32. The middle 50 percent earned between \$10.95 and \$15.88. The lowest 10 percent earned less than \$9.27, and the highest 10 percent earned more than \$18.98.

Median hourly wages of wage and salary pharmacy aides were \$9.66 in May 2008. The middle 50 percent earned between \$8.47 and \$11.62. The lowest 10 percent earned less than \$7.69, and the highest 10 percent earned more than \$14.26.

Certified technicians may earn more than non-certified technicians. Some technicians and aides belong to unions representing hospital or grocery store workers.

Radiologic Technologists and Technicians

Significant Points

- Employment is projected to grow faster than average; those with knowledge of more than one diagnostic imaging procedure will have the best employment opportunities.
- Formal training programs in radiography are offered in hospitals or colleges and universities and lead to a certificate, an associate degree, or a bachelor's degree.
- Most States require licensure, and requirements vary.
- Although hospitals will remain the primary employer, a number of new jobs will be found in physicians' offices and diagnostic imaging centers.

Nature of the Work

Radiologic technologists and technicians perform diagnostic imaging examination. Radiologic technicians perform imaging examinations like x rays while technologists use other imaging modalities such as computed tomography, magnetic resonance imaging, and mammography.

Radiologic technicians, sometimes referred to as radiographers, produce x-ray films (radiographs) of parts of the human body for use in diagnosing medical problems. They prepare patients for radiologic examinations by explaining the procedure, removing jewelry and other articles through which x rays cannot pass, and positioning patients so that the parts of the body can be appropriately radiographed. To prevent unnecessary exposure to radiation, these workers surround the exposed area with radiation protection devices, such as lead shields, or limit the size of the x-ray beam. Radiographers position radiographic equipment at the correct angle and height over the appropriate area of a patient's body. Using instruments similar to a measuring tape they may measure the thickness of the section to be radiographed and set controls on the x-ray machine to produce radiographs of the appropriate density, detail, and contrast.

Radiologic technologists and technicians must follow physicians' orders precisely and conform to regulations concerning

the use of radiation to protect themselves, their patients, and their coworkers from unnecessary exposure.

In addition to preparing patients and operating equipment, radiologic technologists and technicians keep patient records and adjust and maintain equipment. They also may prepare work schedules, evaluate purchases of equipment, or manage a radiology department.

Radiologic technologists perform more complex imaging procedures. When performing fluoroscopies, for example, radiologic technologists prepare a solution for the patient to drink, allowing the radiologist (a physician who interprets radiographs) to see soft tissues in the body.

Some radiologic technologists specialize in computed tomography (CT), as CT technologists. CT scans produce a substantial amount of cross-sectional x rays of an area of the body. From those cross-sectional x rays, a three-dimensional image is made. The CT uses ionizing radiation; therefore, it requires the same precautionary measures that are used with x rays.

Radiologic technologists also can specialize in Magnetic Resonance Imaging (MR) as *MR technologists*. MR, like CT, produces multiple cross-sectional images to create a 3-dimensional image. Unlike CT and x rays, MR uses non-ionizing radio frequency to generate image contrast.

Radiologic technologists might also specialize in mammography. Mammographers use low dose x-ray systems to produce images of the breast.

In addition to radiologic technologists, others who conduct diagnostic imaging procedures include cardiovascular technologists and technicians, diagnostic medical sonographers, and nuclear medicine technologists. (Each is discussed elsewhere in the Handbook.)

Work environment. Physical stamina is important in this occupation because technologists and technicians are on their feet for long periods and may lift or turn disabled patients. Technologists and technicians work at diagnostic machines but also may perform some procedures at patients' bedsides. Some travel to patients in large vans equipped with sophisticated diagnostic equipment.

Although radiation hazards exist in this occupation, they are minimized by the use of lead aprons, gloves, and other shielding devices, and by instruments monitoring exposure to radiation. Technologists and technicians wear badges measuring radiation levels in the radiation area, and detailed records are kept on their cumulative lifetime dose.

Most full-time radiologic technologists and technicians work about 40 hours a week. They may, however, have evening, weekend, or on-call hours. Some radiologic technologists and technicians work part time for more than one employer; for those, travel to and from facilities must be considered.

Training, Other Qualifications, and Advancement

There are multiple paths to entry into this profession offered in hospitals or colleges and universities. Most States require licensure, and requirements vary.

Education and training. Formal training programs in radiography lead to a certificate, an associate degree, or a bachelor's degree. An associate degree is the most prevalent form of educational attainment among radiologic technologists and tech-

Radiologic technologists prepare patients for radiologic examinations by explaining the procedures, removing jewelry, and positioning patients.

nicians. Some may receive a certificate. Certificate programs typically last around 21-24 months.

The Joint Review Committee on Education in Radiologic Technology accredits formal training programs in radiography. The committee accredited 213 programs resulting in a certificate, 397 programs resulting in an associate degree, and 35 resulting in a bachelor's degree in 2009. The programs provide both classroom and clinical instruction in anatomy and physiology, patient care procedures, radiation physics, radiation protection, principles of imaging, medical terminology, positioning of patients, medical ethics, radiobiology, and pathology.

Students interested in radiologic technology should take high school courses in mathematics, physics, chemistry, and biology.

Licensure. Federal legislation protects the public from the hazards of unnecessary exposure to medical and dental radiation by ensuring that operators of radiologic equipment are properly trained. However, it is up to each State to require licensure of radiologic technologists. Most States require licensure for practicing radiologic technologists. Licensing requirements vary by State; for specific requirements contact your State's health board.

Certification and other qualifications. The American Registry of Radiologic Technologists (ARRT) offers voluntary certification for radiologic technologists. In addition, a number of States use ARRT-administered exams for State licensing purposes. To be eligible for certification, technologists must graduate from an ARRT-approved accredited program and pass an examination. Many employers prefer to hire certified radiologic technologists. In order to maintain an ARRT certification, 24 hours of continuing education must be completed every 2 years.

Radiologic technologists should be sensitive to patients' physical and psychological needs. They must pay attention to detail, follow instructions, and work as part of a team. In ad-

dition, operating complicated equipment requires mechanical ability and manual dexterity.

Advancement. With experience and additional training, staff technologists may become specialists, performing CT scanning, MR, mammography, or bone densitometry. Technologists also may advance, with additional education and certification, to become a radiologist assistant. The ARRT offers specialty certification in many radiologic specialties as well as a credentialing for radiologist assistants.

Experienced technologists also may be promoted to supervisor, chief radiologic technologist, and, ultimately, department administrator or director. Depending on the institution, courses or a master's degree in business or health administration may be necessary for the director's position.

Some technologists progress by specializing in the occupation to become instructors or directors in radiologic technology educational programs; others take jobs as sales representatives or instructors with equipment manufacturers.

Employment

Radiologic technologists held about 214,700 jobs in 2008. About 61 percent of all jobs were in hospitals. Most other jobs were in offices of physicians; medical and diagnostic laboratories, including diagnostic imaging centers; and outpatient care centers.

Job Outlook

Employment is projected to grow faster than average. Those with knowledge of more than one diagnostic imaging procedure—such as CT, MR, and mammography—will have the best employment opportunities.

Employment change. Employment of radiologic technologists is expected to increase by about 17 percent from 2008 to 2018, faster than the average for all occupations. As the population grows and ages, there will be an increasing demand for diagnostic imaging. With age comes increased incidence of illness and injury, which often requires diagnostic imaging for diagnosis. In addition to diagnosis, diagnostic imaging is used to monitor the progress of disease treatment. With the increasing success of medical technologies in treating disease, diagnostic imaging will increasingly be needed to monitor progress of treatment.

The extent to which diagnostic imaging procedures are performed depends largely on cost and reimbursement considerations. However, accurate early disease detection allows for lower cost of treatment in the long run, which many third-party payers find favorable.

Although hospitals will remain the principal employer of radiologic technologists, a number of new jobs will be found in offices of physicians and diagnostic imaging centers. As tech-

nology advances many imaging modalities are becoming less expensive and more feasible to have in a physician's office

Job prospects. In addition to job growth, job openings also will arise from the need to replace technologists who leave the occupation. Those with knowledge of more than one diagnostic imaging procedure—such as CT, MR, and mammography—will have the best employment opportunities as employers seek to control costs by using multi-credentialed employees.

Demand for radiologic technologists and technicians can tend to be regional with some areas having large demand, while other areas are saturated. Technologists and technicians willing to relocate may have better job prospects.

CT is continuing to become a frontline diagnosis tool. Instead of taking x rays to decide whether a CT is needed, as was the practice before, it is often the first choice for imaging because of its accuracy. MR also is increasingly used. Technologists with credentialing in either of these specialties will be very marketable to employers.

Earnings

The median annual wage of radiologic technologists was \$52,210 in May 2008. The middle 50 percent earned between \$42,710 and \$63,010. The lowest 10 percent earned less than \$35,100, and the highest 10 percent earned more than \$74,970. Median annual wages in the industries employing the largest numbers of radiologic technologists in 2008 were:

Medical and diagnostic laboratories.....	\$55,210
Federal Executive Branch	53,650
General medical and surgical hospitals.....	52,890
Outpatient care centers.....	50,840
Offices of physicians	48,530

Related Occupations

Radiologic technologists operate sophisticated equipment to help physicians, dentists, and other health practitioners diagnose and treat patients. Workers in related healthcare occupations include:

	Page
Cardiovascular technologists and technicians.....	408
Diagnostic medical sonographers	416
Nuclear medicine technologists	426
Radiation therapists.....	387

Surgical Technologists

Significant Points

- Employment is expected to grow much faster than average.
- Job opportunities will be best for technologists who are certified and for those who are willing to relocate.
- Training programs last 9 to 24 months and lead to a certificate, diploma, or associate's degree.
- Hospitals will continue to be the primary employer, although much faster employment growth is expected in other healthcare industries.

Nature of the Work

Surgical technologists, also called scrubs and surgical or operating room technicians, assist in surgical operations under the supervision of surgeons, registered nurses, or other surgical personnel. Surgical technologists are members of operating room teams, which most commonly include surgeons, anesthesiologists, and circulating nurses.

Before an operation, surgical technologists help prepare the operating room by setting up surgical instruments and equipment, sterile drapes, and sterile solutions. They assemble both sterile and nonsterile equipment, as well as check and adjust it to ensure that it is working properly. Technologists also get patients ready for surgery by washing, shaving, and disinfecting incision sites. They transport patients to the operating room, help position them on the operating table, and cover them with sterile surgical drapes. Technologists also observe patients' vital signs, check charts, and help the surgical team put on sterile gowns and gloves.

During surgery, technologists pass instruments and other sterile supplies to surgeons and surgical assistants. They may hold retractors, cut sutures, and help count sponges, needles, supplies, and instruments. Surgical technologists help prepare, care for, and dispose of specimens taken for laboratory analysis and help apply dressings. Some operate sterilizers, lights, or suction machines and help operate diagnostic equipment.

After an operation, surgical technologists may help transfer patients to the recovery room and clean and restock the operating room.

Before an operation, surgical technologists help prepare the operating room by setting up surgical instruments and equipment, sterile drapes, and sterile solutions.

Certified surgical technologists with additional specialized education or training also may act in the role of the surgical first assistant or circulator. Under the surgeon's direction, the surgical first assistant, as defined by the American College of Surgeons (ACS), provides aid in exposure, hemostasis (controlling blood flow and stopping or preventing hemorrhage), and other technical functions that help the surgeon carry out a safe operation. A circulating technologist is the "unsterile" member of the surgical team who interviews the patient before surgery, prepares the patient for surgery, helps with anesthesia, obtains and opens packages for the "sterile" people to remove the sterile contents during the procedure, keeps a written account of the surgical procedure, and answers the surgeon's questions about the patient during the surgery.

Work environment. Surgical technologists work in clean, well-lighted, cool environments. They must stand for long periods and remain alert during operations. At times, they may be exposed to communicable diseases and unpleasant sights, odors, and materials.

Most surgical technologists work a regular 40-hour week, although they may be on call or work nights, weekends, and holidays on a rotating basis.

Training, Other Qualifications, and Advancement

Training programs last 9 to 24 months and lead to a certificate, diploma, or associate's degree. Professional certification can help in getting jobs and promotions.

Education and training. Surgical technologists receive their training in formal programs offered by community and junior colleges, vocational schools, universities, hospitals, and the military. In 2008, the Commission on Accreditation of Allied Health Education Programs (CAAHEP) recognized more than 450 accredited training programs. Programs last from 9 to 24 months and lead to a certificate, diploma, or associate's degree. High school graduation normally is required for admission. Recommended high school courses include health, biology, chemistry, and mathematics.

Programs provide classroom education and supervised clinical experience. Students take courses in anatomy, physiology, microbiology, pharmacology, professional ethics, and medical

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Surgical technologists	29-2055	91,500	114,700	23,200	25

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

terminology. Other topics covered include the care and safety of patients during surgery, sterile techniques, and surgical procedures. Students also learn to sterilize instruments; prevent and control infection; and handle special drugs, solutions, supplies, and equipment.

Certification and other qualifications. Most employers prefer to hire certified technologists. Technologists may obtain voluntary professional certification from the Liaison Council on Certification for the Surgical Technologist by graduating from a CAAHEP-accredited program and passing a national certification examination. They may then use the Certified Surgical Technologist (CST) designation. In order to maintain certification, certified surgical technologists must earn 60 hours of approved continuing education over a 4-year period or retake and pass the certifying exam at the end of the 4-year period.

Certification also may be obtained from the National Center for Competency Testing (NCCT). To qualify to take the exam, candidates follow one of three paths: complete an accredited training program, undergo a 2-year hospital on-the-job training program, or acquire 7 years of experience working in the field. After passing the exam, individuals may use the designation Tech in Surgery-Certified, TS-C (NCCT). This certification must be renewed every 5 years through either continuing education or reexamination.

Surgical technologists need manual dexterity to handle instruments quickly. They also must be conscientious, orderly, and emotionally stable to handle the demands of the operating room environment. Technologists must respond quickly and must be familiar with operating procedures in order to have instruments ready for surgeons without having to be told to do so. They are expected to keep abreast of new developments in the field.

Advancement. Technologists advance by specializing in a particular area of surgery, such as neurosurgery or open-heart surgery. They also may work as circulating technologists. With additional training, some technologists advance to first assistant. Some surgical technologists manage central supply departments in hospitals or take positions with insurance companies, sterile supply services, and operating equipment firms.

Employment

Surgical technologists held about 91,500 jobs in 2008. About 71 percent of jobs for surgical technologists were in hospitals, mainly in operating and delivery rooms. Other jobs were in offices of physicians or dentists who perform outpatient surgery and in outpatient care centers, including ambulatory surgical centers. A few technologists, known as private scrubs, are employed directly by surgeons who have special surgical teams, such as those for liver transplants.

Job Outlook

Employment is expected to grow much faster than average. Job opportunities will be best for technologists who are certified and for those who are willing to relocate.

Employment change. Employment of surgical technologists is expected to grow 25 percent between 2008 and 2018, much faster than the average for all occupations, as the volume of surgeries increases. The number of surgical procedures is expected to continue to rise as the population grows and ages. Older people, including the baby-boom generation, which generally requires more surgical procedures, will continue to account for a larger portion of the U.S. population. In addition, technological advances, such as fiber optics and laser technology, have permitted an increasing number of new surgical procedures to be performed and also have allowed surgical technologists to assist with a greater number of procedures.

Hospitals will continue to be the primary employer of surgical technologists, as they try to reduce costs by replacing nurses in the operating room. However, because of better paying opportunities, much faster employment growth is expected in offices of physicians and in outpatient care centers, including ambulatory surgical centers.

Job prospects. Job opportunities will be best for technologists who are certified and for those who are willing to relocate.

Earnings

Median annual wages of wage-and-salary surgical technologists were \$38,740 in May 2008. The middle 50 percent earned between \$32,490 and \$46,910. The lowest 10 percent earned less than \$27,510, and the highest 10 percent earned more than \$54,300. Median annual wages in the industries employing the largest numbers of surgical technologists were as follows:

Specialty (except psychiatric and substance abuse) hospitals.....	\$40,880
Outpatient care centers.....	39,660
General medical and surgical hospitals.....	38,640
Offices of physicians.....	38,520
Offices of dentists.....	36,380

Wages of surgical technologists vary with their experience and education, the responsibilities of the position, the working hours, and the economy of a given region of the country. Benefits provided by most employers include paid vacation and sick leave; health, medical, vision, dental, and life insurance; and a retirement program. A few employers also provide tuition reimbursement and child care benefits.

Related Occupations

Other health occupations requiring approximately 1 year of training after high school include the following:

	Page
Clinical laboratory technologists and technicians.....	411
Dental assistants.....	447
Licensed practical and licensed vocational nurses.....	421
Medical assistants	455

Veterinary Technologists and Technicians

Significant Points

- Animal lovers get satisfaction from this occupation, but aspects of the work can be unpleasant, physically and emotionally demanding, and sometimes dangerous.
- There are primarily two levels of education and training for entry to this occupation: a 2-year program for veterinary technicians and a 4-year program for veterinary technologists.
- Employment is expected to grow much faster than average.
- Overall job opportunities should be excellent; however, keen competition is expected for jobs in zoos and aquariums.

Nature of the Work

Owners of pets and other animals today expect superior veterinary care. To provide this service, veterinarians use the skills of *veterinary technologists* and technicians, who perform many of the same duties for a veterinarian that a nurse would for a

Veterinary technologists and technicians often assist veterinarians by conducting tests.

physician. Although specific job duties vary by employer, there is often little difference between the tasks carried out by technicians and technologists, despite differences in formal education and training. However, most technicians work in private clinical practice while many technologists have the option to work in more advanced research-related jobs.

Veterinary technologists and technicians typically conduct clinical work in a private practice under the supervision of a licensed veterinarian. Veterinary technologists and technicians often perform various medical tests and treat and diagnose medical conditions and diseases in animals. For example, they may perform laboratory tests such as urinalysis and blood counts, assist with dental care, prepare tissue samples, take blood samples, and assist veterinarians in a variety of other diagnostic tests. While most of these duties are performed in a laboratory setting, many are not. For example, some veterinary technicians record patients' case histories, expose and develop x rays and radiographs, and provide specialized nursing care. In addition, experienced veterinary technicians may discuss a pet's condition with its owners and train new clinic personnel. Veterinary technologists and technicians assisting small-animal practitioners usually care for small pets, such as cats and dogs, but can perform a variety of duties with mice, rats, sheep, pigs, cattle, monkeys, birds, fish, and frogs. Very few veterinary technologists work in mixed animal practices where they care for both small pets and large, nondomestic animals.

Besides working in private clinics and animal hospitals, some veterinary technologists and technicians work in research facilities under the guidance of veterinarians or physicians. In this role, they may administer medications, prepare samples for laboratory examinations, or record information on an animal's genealogy, diet, weight, medications, food intake, and clinical signs of pain and distress. Some may sterilize laboratory and surgical equipment and provide routine postoperative care. Occasionally, veterinary technologists vaccinate newly admitted animals and may have to euthanize seriously ill, severely injured, or unwanted animals.

While the goal of most veterinary technologists and technicians is to promote animal health, some contribute to human health, as well. Veterinary technologists occasionally assist veterinarians in implementing research projects as they work with

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Veterinary technologists and technicians	29-2056	79,600	108,100	28,500	36

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

other scientists in medical-related fields such as gene therapy and cloning. Some find opportunities in biomedical research, wildlife medicine, livestock management, pharmaceutical sales, and increasingly, in biosecurity and disaster preparedness.

Work environment. While people who love animals get satisfaction from helping them, some of the work may be unpleasant, physically and emotionally demanding, and sometimes dangerous. Data from the U.S. Bureau of Labor Statistics show that full-time veterinary technologists and technicians experienced a work-related injury and illness rate that was much higher than the national average. At times, veterinary technicians must clean cages and lift, hold, or restrain animals, risking exposure to bites or scratches. These workers must take precautions when treating animals with germicides or insecticides. The work setting can be noisy.

Veterinary technologists and technicians who witness abused animals or who euthanize unwanted, aged, or hopelessly injured animals may experience emotional stress. Those working for humane societies and animal shelters often deal with the public, some of whom might react with hostility to any implication that the owners are neglecting or abusing their pets. Such workers must maintain a calm and professional demeanor while they enforce the laws regarding animal care.

In some animal hospitals, research facilities, and animal shelters, a veterinary technician is on duty 24 hours a day, which means that some work night shifts. Most full-time veterinary technologists and technicians work about 40 hours a week, although some work 50 or more hours a week.

Training, Other Qualifications, and Advancement

There are primarily two levels of education and training for entry to this occupation: a 2-year program for veterinary technicians and a 4-year program for veterinary technologists.

Education and training. Most entry-level veterinary technicians have a 2-year associate degree from an American Veterinary Medical Association (AVMA)-accredited community college program in veterinary technology in which courses are taught in clinical and laboratory settings using live animals. Currently, about 20 colleges offer veterinary technology programs that are longer and that culminate in a 4-year bachelor's degree in veterinary technology. These 4-year colleges, in addition to some vocational schools, also offer 2-year programs in laboratory animal science. About 10 schools offer distance learning.

In 2009, about 160 veterinary technology programs in 45 States were accredited by the American Veterinary Medical Association (AVMA). Graduation from an AVMA-accredited veterinary technology program allows students to take the credentialing exam in any State in the country.

Those interested in careers as veterinary technologists and technicians should take as many high school science, biology,

and math courses as possible. Science courses taken beyond high school, in an associate or bachelor's degree program, should emphasize practical skills in a clinical or laboratory setting.

Technologists and technicians usually begin work as trainees under the direct supervision of a veterinarian. Entry-level workers whose training or educational background encompasses extensive hands-on experience with diagnostic and medical equipment usually require a shorter period of on-the-job training.

Licensure and certification. Each State regulates veterinary technicians and technologists differently; however, all States require them to pass a credentialing exam following coursework. Passing the State exam assures the public that the technician or technologist has sufficient knowledge to work in a veterinary clinic or hospital. Candidates are tested for competency through an examination that includes oral, written, and practical portions and that is regulated by the State Board of Veterinary Examiners or the appropriate State agency. Depending on the State, candidates may become registered, licensed, or certified. Most States, however, use the National Veterinary Technician (NVT) exam. Prospects usually can have their passing scores transferred from one State to another, so long as both States use the same exam.

Employers recommend American Association for Laboratory Animal Science (AALAS) certification for those seeking employment in a research facility. AALAS offers certification for three levels of technician competence, with a focus on three principal areas—animal husbandry, facility management, and animal health and welfare. Those who wish to become certified must satisfy a combination of education and experience requirements prior to taking the AALAS examination. Work experience must be directly related to the maintenance, health, and well-being of laboratory animals and must be gained in a laboratory animal facility as defined by AALAS. Candidates who meet the necessary criteria can begin pursuing the desired certification on the basis of their qualifications. The lowest level of certification is Assistant Laboratory Animal Technician (ALAT), the second level is Laboratory Animal Technician (LAT), and the highest level of certification is Laboratory Animal Technologist (LATG). The AALAS examination consists of multiple-choice questions and is longer and more difficult for higher levels of certification, ranging from 2 hours and 120 multiple choice questions for the ALAT, to 3 hours and 180 multiple choice questions for the LATG.

Other qualifications. As veterinary technologists and technicians often deal with pet owners, communication skills are very important. In addition, technologists and technicians should be able to work well with others, because teamwork with veterinarians and other veterinary technicians is common.

Organizational ability and the ability to pay attention to detail also are important.

Advancement. As they gain experience, technologists and technicians take on more responsibility and carry out more assignments with little veterinary supervision. Some eventually may become supervisors.

Employment

Veterinary technologists and technicians held about 79,600 jobs in 2008. About 91 percent worked in veterinary services. The remainder worked in boarding kennels, animal shelters, rescue leagues, and zoos.

Job Outlook

Excellent job opportunities will stem from the need to replace veterinary technologists and technicians who leave the occupation and from the limited output of qualified veterinary technicians from 2-year programs, which are not expected to meet the demand over the 2008-18 period. Employment is expected to grow much faster than average.

Employment change. Employment of veterinary technologists and technicians is expected to grow 36 percent over the 2008-18 projection period, which is much faster than the average for all occupations. Pet owners are becoming more affluent and more willing to pay for advanced veterinary care because many of them consider their pet to be part of the family. This growing affluence and view of pets will continue to increase the demand for veterinary care. The vast majority of veterinary technicians work at private clinical practices under veterinarians. As the number of veterinarians grows to meet the demand for veterinary care, so will the number of veterinary technicians needed to assist them.

The number of pet owners who take advantage of veterinary services for their pets is expected to grow over the projection period, increasing employment opportunities. The availability of advanced veterinary services, such as preventive dental care and surgical procedures, also will provide opportunities for workers specializing in those areas as they will be needed to assist licensed veterinarians. The growing number of cats kept as companion pets is expected to boost the demand for feline medicine and services. Further demand for these workers will stem from the desire to replace veterinary assistants with more highly skilled technicians in animal clinics and hospitals, shelters, boarding kennels, animal control facilities, and humane societies.

Continued support for public health, food and animal safety, and national disease control programs, as well as biomedical research on human health problems, also will contribute to the demand for veterinary technologists, although the number of positions in these areas is fewer than in private practice.

Job prospects. Excellent job opportunities are expected because of the relatively few veterinary technology graduates each year. The number of 2-year programs has recently grown to about 160, but due to small class sizes, fewer than 3,800 graduates are anticipated each year, a number that is not expected to meet demand. Additionally, many veterinary technicians remain in the field less than 10 years, so the need to replace workers who leave the occupation each year also will produce many job opportunities.

Veterinary technologists also will enjoy excellent job opportunities due to the relatively few graduates from 4-year programs—about 500 annually. However, unlike veterinary technicians who usually work in private clinical practice, veterinary technologists will have better opportunities for research jobs in a variety of settings, including biomedical facilities, diagnostic laboratories, wildlife facilities, drug and food manufacturing companies, and food safety inspection facilities.

Despite the relatively few number of graduates each year, keen competition is expected for veterinary technician jobs in zoos and aquariums, due to expected slow growth in facility capacity, low turnover among workers, the limited number of positions, and the fact that the work in zoos and aquariums attracts many candidates.

Employment of veterinary technicians and technologists is relatively stable during periods of economic recession. Lay-offs are less likely to occur among veterinary technologists and technicians than in some other occupations because animals will continue to require medical care.

Earnings

Median annual wages of veterinary technologists and technicians were \$28,900 in May 2008. The middle 50 percent earned between \$23,580 and \$34,960. The bottom 10 percent earned less than \$19,770, and the top 10 percent earned more than \$41,490. Veterinary technologists in research jobs may earn more than veterinary technicians in other types of jobs.

Other Professional and Related Occupations

Epidemiologists

Nature of the Work

Epidemiologists investigate and describe the causes and spread of disease, and develop the means for prevention or control. *Applied epidemiologists*, who usually work for State health agencies, respond to disease outbreaks, determining their causes and helping to contain them. *Research epidemiologists* study diseases in laboratories and in the field to determine how to prevent future outbreaks.

Education and Training

Most applied epidemiologists are required to have a master's degree from a school of public health. Some research epidemiologists may need a Ph.D. or medical degree, depending on the work they perform.

Job Outlook

Current and projected employment:

2008 Employment	4,800
2018 Employment	5,500
Employment change.....	700
Growth rate.....	15%

Employment change. Faster than average employment growth is projected for epidemiologists. A heightened awareness of bioterrorism and rare but infectious diseases, such as West Nile Virus or Avian flu, should spur demand for these workers.

Job prospects. Epidemiologists can expect excellent opportunities. Many States report shortages of qualified workers for applied epidemiology positions. There is greater competition for jobs as research epidemiologists.

Earnings

Median annual wages for epidemiologists were \$61,360 in May 2008.

Respiratory Therapy Technicians

Nature of the Work

Respiratory therapy technicians follow specific, well-defined respiratory care procedures under the direction of respiratory therapists and physicians. They help to evaluate, treat, and care for patients with breathing or other cardiopulmonary disorders.

Education and Training

An associate degree generally is required to work as a respiratory therapy technician. However, the entry-level requirement is a postsecondary certificate from an accredited school.

Job Outlook

Current and projected employment:

2008 Employment	16,500
2018 Employment	16,400
Employment change.....	-200
Growth rate.....	-1%

Employment change. Little or no change in employment growth is projected for respiratory therapy technicians. Most work in respiratory care is being done by respiratory therapists, resulting in limited demand for respiratory therapy technicians.

Job prospects. Respiratory therapy technicians can expect keen competition. Very few openings for respiratory therapy technicians are expected, as the work is increasingly performed by respiratory therapists.

Earnings

Median annual wages for respiratory therapy technicians were \$42,430 in May 2008.

Service Occupations

Healthcare Support Occupations

Dental Assistants

Significant Points

- Job prospects should be excellent.
- Dentists are expected to hire more assistants to perform routine tasks so dentists may devote their time to more complex procedures.
- Many assistants learn their skills on the job, although an increasing number are trained in dental-assisting programs; most programs take 1 year or less to complete.
- More than one-third of dental assistants worked part time in 2008.

Nature of the Work

Dental assistants perform a variety of patient care, office, and laboratory duties. They sterilize and disinfect instruments and equipment, prepare and lay out the instruments and materials required to treat each patient, and obtain and update patients' dental records. Assistants make patients comfortable in the dental chair and prepare them for treatment. During dental procedures, assistants work alongside the dentist to provide assistance. They hand instruments and materials to dentists and keep patients' mouths dry and clear by using suction hoses or other devices. They also instruct patients on postoperative and general oral health care.

Dental assistants may prepare materials for impressions and restorations, and process dental x rays as directed by a dentist. They also may remove sutures, apply topical anesthetics to gums or cavity-preventive agents to teeth, remove excess cement used in the filling process, and place dental dams to isolate teeth for treatment. Many States are expanding dental assistants' duties to include tasks such as coronal polishing and restorative dentistry functions for those assistants who meet specific training and experience requirements.

Dental assistants with laboratory duties make casts of the teeth and mouth from impressions, clean and polish removable appliances, and make temporary crowns. Those with office duties schedule and confirm appointments, receive patients, keep treatment records, send bills, receive payments, and order dental supplies and materials.

Dental assistants must work closely with, and under the supervision of, dentists. (See the statement on dentists elsewhere in the *Handbook*.) Additionally, dental assistants should not be confused with dental hygienists, who are licensed to perform a different set of clinical tasks. (See the statement on dental hygienists elsewhere in the *Handbook*.)

Work environment. Dental assistants work in a well-lit, clean environment. Their work area is usually near the dental chair so that they can arrange instruments, materials, and

medication and hand them to the dentist when needed. Dental assistants must wear gloves, masks, eyewear, and protective clothing to protect themselves and their patients from infectious diseases. Assistants also follow safety procedures to minimize the risks associated with the use of x-ray machines.

Almost half of dental assistants had a 35- to 40-hour work-week in 2008. More than one-third worked part time, or less than 35 hours per week, and many others have variable schedules. Depending on the hours of the dental office where they work, assistants may have to work on Saturdays or evenings. Some dental assistants hold multiple jobs by working at dental offices that are open on different days or by scheduling their work at a second office around the hours they work at their primary office.

Training, Other Qualifications, and Advancement

Many assistants learn their skills on the job, although an increasing number are trained in dental-assisting programs offered by community and junior colleges, trade schools, technical institutes, or the Armed Forces. Most programs take 1 year to complete. For assistants to perform more advanced functions, or to have the ability to complete radiological procedures, many States require assistants to obtain a license or certification.

Education and training. In most States, there are no formal education or training requirements to become an entry-level dental assistant. High school students interested in a career as a dental assistant should take courses in biology, chemistry, health, and office practices. For those wishing to pursue further education, the Commission on Dental Accreditation (CODA) approved 281 dental-assisting training programs in 2009. Programs include classroom, laboratory, and preclinical instruction in dental-assisting skills and related theory. Most programs take close to 1 year to complete and lead to a certificate or diploma. Two-year programs offered in community and junior colleges lead to an associate degree. All programs require a high school diploma or its equivalent, and some require science or computer-related courses for admission. A number of private vocational schools offer 4- to 6-month courses in dental assisting, but the Commission on Dental Accreditation does not accredit these programs.

A large number of dental assistants learn through on-the-job training. In these situations, the employing dentist or other dental assistants in the dental office teach the new assistant dental terminology, the names of the instruments, how to perform daily duties, how to interact with patients, and other things necessary to help keep the dental office running smoothly. While some things can be picked up easily, it may be a few months before new dental assistants are completely knowledgeable about their duties and comfortable doing all their tasks without assistance.

A period of on-the-job training is often required even for those who have completed a dental-assisting program or have some previous experience. Different dentists may have their own styles of doing things that need to be learned before an assistant can be comfortable working with them. Office-specific information, such

Dental assistants sterilize and disinfect instruments and equipment.

as where files and instruments are kept, will need to be learned at each new job. Also, as dental technology changes, dental assistants need to stay familiar with the instruments and procedures that they will be using or helping dentists to use. On-the-job training may be sufficient to keep assistants up-to-date on these matters.

Licensure and certification. Most States regulate the duties that dental assistants are allowed to perform. Some States require licensure or registration to perform expanded functions or to perform radiological procedures within a dentist's office. Licensure may include attending an accredited dental assisting program and passing a written or practical examination. Many States also require continuing education to maintain licensure or registration. However, a few States allow dental assistants to perform any function delegated to them by the dentist. Since requirements vary widely by State, it is recommended to contact the appropriate State board directly for specific requirements.

The Certified Dental Assistant (CDA) credential, administered by the Dental Assisting National Board (DANB), is recognized or required in more than 37 States toward meeting various requirements. Candidates may qualify to take the DANB certification examination by graduating from a CODA-accredited dental assisting education program or by having 2 years of full-time, or 4 years of part-time, experience as a dental assistant. In addition, applicants must have current certification in cardiopulmonary resuscitation. For annual recertification, individuals must earn continuing education credits. Other organizations offer registration, most often at the State level.

Individual States have also adopted different standards for dental assistants who perform certain advanced duties. In some States, dental assistants who perform radiological procedures must complete additional training distinct from that required to perform other expanded functions. Completion of the Radiation Health and Safety examination or the Certified Dental

Assistant examination offered by Dental Assisting National Board (DANB) meets the standards in 30 States and the District of Columbia. Some States require completion of a State-approved course in radiology as well. Twelve States have no formal requirements to perform radiological procedures.

Other qualifications. Dental assistants must be a second pair of hands for a dentist; therefore, dentists look for people who are reliable, work well with others, and have good manual dexterity.

Certification and advancement. Without further education, advancement opportunities are limited. Some dental assistants become office managers, dental-assisting instructors, dental product sales representatives, or insurance claims processors for dental insurance companies. Others go back to school to become dental hygienists. For many, this entry-level occupation provides basic training and experience and serves as a steppingstone to more highly skilled and higher paying jobs. Assistants wishing to take on expanded functions or perform radiological procedures may choose to complete coursework in those functions allowed under State regulation or, if required, obtain a State-issued license.

Employment

Dental assistants held about 295,300 jobs in 2008. About 93 percent of all jobs for dental assistants were in offices of dentists. A small number of jobs were in the Federal, State, and local governments or in offices of physicians.

Job Outlook

Employment is expected to increase much faster than average; job prospects are expected to be excellent.

Employment change. Employment is expected to grow 36 percent from 2008 to 2018, which is much faster than the average for all occupations. In fact, dental assistants are expected to be among the fastest growing occupations over the 2008–18 projection period. Population growth, greater retention of natural teeth by middle-aged and older people, and an increased focus on preventative dental care for younger generations will fuel demand for dental services. Older dentists, who have been less likely to employ assistants or have employed fewer, are leaving the occupation and will be replaced by recent graduates, who are more likely to use one or more assistants. In addition, as dentists' workloads increase, they are expected to hire more assistants to perform routine tasks, so that they may devote their own time to more complex procedures.

Job prospects. Job prospects should be excellent, as dentists continue to need the aid of qualified dental assistants. There will be many opportunities for entry-level positions, but some dentists prefer to hire experienced assistants, those who have completed a dental-assisting program, or have met State requirements to take on expanded functions within the office.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018		Change, 2008-2018	
			2018	Number	Percent	
Dental assistants.....	31-9091	295,300	400,900	105,600	36	

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

In addition to job openings due to employment growth, some job openings will arise out of the need to replace assistants who transfer to other occupations, retire, or leave for other reasons.

Earnings

Median annual wages of dental assistants were \$32,380 in May 2008. The middle 50 percent earned between \$26,980 and \$38,960. The lowest 10 percent earned less than \$22,270, and the highest 10 percent earned more than \$46,150.

Benefits vary substantially by practice setting and may be contingent upon full-time employment. According to a 2008 survey conducted by the Dental Assisting National Board (DANB), 86 percent of Certified Dental Assistants (CDA) reported receiving paid vacation from their employers, and more than half of CDAs received health benefits.

Home Health Aides and Personal and Home Care Aides

Significant Points

- Job opportunities are expected to be excellent because of rapid growth in home healthcare and high replacement needs.
- Training requirements vary from State to State, the type of home services agency, and funding source covering the costs of services.
- Many of these workers work part time and weekends or evenings to suit the needs of their clients.

Nature of the Work

Home health aides and personal and home care aides help people who are disabled, chronically ill, or cognitively impaired and older adults, who may need assistance, live in their own homes or in residential facilities instead of in health facilities or institutions. They also assist people in hospices and day programs and help individuals with disabilities go to work and remain engaged in their communities. Most aides work with elderly or physically or mentally disabled clients who need more care than family or friends can provide. Others help discharge hospital patients who have relatively short-term needs.

Aides provide light housekeeping and homemaking tasks such as laundry, change bed linens, shop for food, plan and prepare meals. Aides also may help clients get out of bed, bathe, dress, and groom. Some accompany clients to doctors' appointments or on other errands.

Home health aides and personal and home care aides provide instruction and psychological support to their clients. They may advise families and patients on nutrition, cleanliness, and household tasks.

Aides' daily routine may vary. They may go to the same home every day or week for months or even years, and often visit four or five clients on the same day. However, some aides may work solely with one client who is in need of more care and attention. In some situations, this may involve working with other aides in shifts so that the client has an aide throughout the day and night. Aides also work with clients, particularly younger adults at schools or at the client's work site.

In general, home health aides and personal and home care aides have similar job duties. However, there are some small differences.

Home health aides typically work for certified home health or hospice agencies that receive government funding and therefore must comply with regulations from to receive funding. This means that they must work under the direct supervision of a medical professional, usually a nurse. These aides keep records of services performed and of clients' condition and progress. They report changes in the client's condition to the supervisor or case manager. Aides also work with therapists and other medical staff.

Home health aides may provide some basic health-related services, such as checking patients' pulse rate, temperature, and

Home health aides and personal and home care aides help people in their own homes or in residential facilities.

respiration rate. They also may help with simple prescribed exercises and assist with medications administration. Occasionally, they change simple dressings, give massages, provide skin care, or assist with braces and artificial limbs. With special training, experienced home health aides also may assist with medical equipment such as ventilators, which help patients breathe.

Personal and home care aides—also called homemakers, caregivers, companions, and personal attendants—work for various public and private agencies that provide home care services. In these agencies, caregivers are likely supervised by a licensed nurse, social worker, or other non-medical managers. Aides receive detailed instructions explaining when to visit clients and what services to perform for them. However, personal and home care aides work independently, with only periodic visits by their supervisors. These caregivers may work with only one client each day or five or six clients once a day every week or every 2 weeks.

Some aides are hired directly by the patient or the patient's family. In these situations, personal and home care aides are supervised and assigned tasks directly by the patient or the patient's family.

Aides may also work with individuals who are developmentally or intellectually disabled. These workers are often called direct support professionals and they may assist in implementing a behavior plan, teaching self-care skills and providing employment support, as well as providing a range of other personal assistance services.

Work environment. Work as an aide can be physically demanding. Aides must guard against back injury because they may have to move patients into and out of bed or help them to stand or walk. Aides also may face hazards from minor infections and exposure to communicable diseases, such as hepatitis, but can avoid infections by following proper procedures. Because mechanical lifting devices available in institutional

settings are not as frequently available in patients' homes, home health aides must take extra care to avoid injuries resulting from overexertion when they assist patients. These workers experienced a larger than average number of work-related injuries or illnesses

Aides also perform tasks that some may consider unpleasant, such as emptying bedpans and changing soiled bed linens. The patients they care for may be disoriented, irritable, or uncooperative. Although their work can be emotionally demanding, many aides gain satisfaction from assisting those in need.

Most aides work with a number of different patients, each job lasting a few hours, days, or weeks. They often visit multiple patients on the same day. Surroundings differ by case. Some homes are neat and pleasant, whereas others are untidy and depressing. Some clients are pleasant and cooperative; others are angry, abusive, depressed, or otherwise difficult.

Home health aides and personal and home care aides generally work alone, with periodic visits from their supervisor. They receive detailed instructions explaining when to visit patients and what services to perform. Aides are responsible for getting to patients' homes, and they may spend a good portion of the work day traveling from one patient to another.

Many of these workers work part time and weekends or evenings to suit the needs of their clients.

Training, Other Qualifications, and Advancement

Home health aides must receive formal training and pass a competency test to work for certified home health or hospice agencies that receive reimbursement from Medicare or Medicaid. Personal and home care aides, however, face a wide range of requirements, which vary from State to State.

Education and training. Home health aides and personal and home care aides are generally not required to have a high school diploma. They usually are trained on the job by registered nurses, licensed practical nurses, experienced aides, or their supervisor. Aides are instructed on how to cook for a client, including on special diets. Furthermore, they may be trained in basic housekeeping tasks, such as making a bed and keeping the home sanitary and safe for the client. Generally, they are taught how to respond to an emergency, learning basic safety techniques. Employers also may train aides to conduct themselves in a professional and courteous manner while in a client's home. Some clients prefer that tasks are done a certain way and will teach the aide. A competency evaluation may be required to ensure that the aide can perform the required tasks.

Licensure. Home health aides who work for agencies that receive reimbursement from Medicare or Medicaid must receive a minimum level of training. They must complete both a training program consisting of a minimum of 75 hours and a competency evaluation or state certification program. Training includes information regarding personal hygiene, safe transfer techniques, reading and recording vital signs, infection control, and basic nutrition. Aides may take a competency exam to become certified without taking any of the training. At a minimum, 16 hours of supervised practical training are required before an aide has direct contact with a resident. These certification requirements represent the minimum, as outlined by the Federal Government. Some States may require additional hours of training to become certified.

Personal and home care aides are not required to be certified.

Other qualifications. Aides should have a desire to help people. They should be responsible, compassionate, patient, emotionally stable, and cheerful. In addition, aides should be tactful, honest, and discreet, because they work in private homes. Aides also must be in good health. A physical examination, including State-mandated tests for tuberculosis and other diseases, may be required. A criminal background check and a good driving record also may be required for employment.

Certification and advancement. The National Association for Home Care and Hospice (NAHC) offers national certification for aides. Certification is a voluntary demonstration that the individual has met industry standards. Certification requires the completion of 75 hours of training; observation and documentation of 17 skills for competency, assessed by a registered nurse; and the passing of a written exam developed by NAHC.

Advancement for home health aides and personal and home care aides is limited. In some agencies, workers start out performing homemaker duties, such as cleaning. With experience and training, they may take on more personal care duties. Some aides choose to receive additional training to become nursing aides, licensed practical nurses, or registered nurses. Some may start their own home care agency or work as a self-employed aide. Self-employed aides have no agency affiliation or supervision and accept clients, set fees, and arrange work schedules on their own.

Employment

Home health aides and personal and home care aides held about 1.7 million jobs in 2008. The majority of jobs were in home healthcare services, individual and family services, residential care facilities, and private households.

Job Outlook

Excellent job opportunities are expected for this occupation because rapid employment growth and high replacement needs are projected to produce a large number of job openings.

Employment change. Employment of home health aides is projected to grow by 50 percent between 2008 and 2018, which is much faster than the average for all occupations. Employment of personal and home care aides is expected to grow by 46 percent from 2008 to 2018, which is much faster than the average for all occupations. For both occupations, the expected growth is due, in large part, to the projected rise in the number of elderly people, an age group that often has mounting health problems and that needs some assistance with daily activities. The elderly and other clients, such as the mentally disabled, increasingly rely on home care.

This trend reflects several developments. Inpatient care in hospitals and nursing homes can be extremely expensive, so

more patients return to their homes from these facilities as quickly as possible in order to contain costs. Patients, who need assistance with everyday tasks and household chores rather than medical care, can reduce medical expenses by returning to their homes. Furthermore, most patients—particularly the elderly—prefer care in their homes rather than in nursing homes or other in-patient facilities. This development is aided by the realization that treatment can be more effective in familiar surroundings.

Job prospects. In addition to job openings created by the increased demand for these workers, replacement needs are expected to lead to many openings. The relatively low skill requirements, low pay, and high emotional demands of the work result in high replacement needs. For these same reasons, many people are reluctant to seek jobs in the occupation. Therefore, persons who are interested in and suited for this work—particularly those with experience or training as personal care, home health, or nursing aides—should have excellent job prospects.

Earnings

Median hourly wages of wage-and-salary personal and home care aides were \$9.22 in May 2008. The middle 50 percent earned between \$7.81 and \$10.98 an hour. The lowest 10 percent earned less than \$6.84, and the highest 10 percent earned more than \$12.33 an hour. Median hourly wages in the industries employing the largest numbers of personal and home care aides were as follows:

Individual and family services	\$9.77
Employment services	9.76
Residential mental retardation, mental health and substance abuse facilities.....	9.70
Vocational rehabilitation services.....	9.58
Home health care services.....	7.94

Median hourly wages of home health aides were \$9.84 in May 2008. The middle 50 percent earned between \$8.52 and \$11.69 an hour. The lowest 10 percent earned less than \$7.65, and the highest 10 percent earned more than \$13.93 an hour. Median hourly wages in the industries employing the largest numbers of home health aides in May 2008 were:

Nursing care facilities	\$10.20
Residential mental retardation, mental health and substance abuse facilities.....	10.02
Home health care services.....	9.70
Individual and family services	9.48
Community care facilities for the elderly.....	9.44

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Home health aides and personal and home care aides	—	1,738,800	2,575,600	836,700	48
Home health aides	31-1011	921,700	1,382,600	460,900	50
Personal and home care aides	39-9021	817,200	1,193,000	375,800	46

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Aides receive slight pay increases with experience and added responsibility. Usually, they are paid only for the time worked in the home, not for travel time between jobs, and must pay for their travel costs from their earnings. Most employers hire only on-call hourly workers.

Related Occupations

Home health aides and personal and home care aides combine the duties of caregivers and social service workers. Workers in related occupations that involve personal contact to help others include:

Massage Therapists

Significant Points

- This occupation includes a large percentage of part-time and self-employed workers.
- Many States require formal training and licensure in order to practice massage therapy.
- Employment is expected to grow faster than average as more people learn about the benefits of massage therapy.

Nature of the Work

Massage therapy is the practice of using touch to manipulate the soft-tissue muscles of the body. It is performed for a variety of reasons, including treating painful ailments, decompressing tired and overworked muscles, reducing stress, rehabilitating

sports injuries, and promoting general health. Clients often seek massage for its medical benefit and for relaxation purposes, and there is a wide range of massage treatments available.

Massage therapists can specialize in more than 80 different types of massage, called modalities. Swedish massage, deep-tissue massage, reflexology, acupressure, sports massage, and neuromuscular massage are just a few of the many approaches to massage therapy. Most massage therapists specialize in several modalities, which require different techniques. Some use exaggerated strokes ranging the length of a body part, while others use quick, percussion-like strokes with a cupped or closed hand. A massage can be as long as 2 hours or as short as 5 or 10 minutes. Usually, the type of massage given depends on the client's needs and physical condition. For example, therapists may use special techniques for elderly clients that they would not use for athletes, and they would use approaches for clients with injuries that would not be appropriate for clients seeking relaxation. Also, some forms of massage are given solely to one type of client; for example, prenatal massage and infant massage are given to pregnant women and new mothers, respectively.

Massage therapists work by appointment. Before beginning a massage therapy session, therapists conduct an informal interview with the client to learn the person's medical history and desired results from the massage. This interview gives therapists a chance to discuss which techniques could be beneficial to the client and which could be harmful. Because massage therapists tend to specialize in only a few areas of massage, customers will often be referred to or seek a therapist with a certain type of massage in mind. Based on the person's goals, ailments, medical history, and stress-related or pain-related problem areas, a massage therapist will conclude whether a massage would be harmful and if not, move forward with the session. While giving the massage, therapists alter their approach or concentrate on areas of particular discomfort as necessary.

Many modalities of massage therapy use massage oils, lotions, or creams to massage and rub the client's muscles. Most massage therapists, particularly those who are self-employed, supply their own table or chair, sheets, pillows, and body lotions or oils. Most modalities of massage require clients to be covered in a sheet or blanket and to be undressed or wear loose-

Massage therapists apply pressure to relieve stress and promote health.

fitting clothing. The therapist exposes only the body part being massaged. Some types of massage are done without oils or lotions and are performed with the client fully clothed.

Massage therapists must develop a rapport with their clients if repeat customers are to be secured. Because those who seek a therapist tend to make regular visits, developing a loyal clientele is an important part of becoming successful.

Work environment. Massage therapists work in an array of settings, both private and public: private offices, studios, hospitals, nursing homes, fitness centers, sports medicine facilities, airports, and shopping malls, for example. Some massage therapists also travel to clients' homes or offices to provide a massage. It is common for full-time massage therapists to divide their time among several different settings, depending on the clients and locations scheduled.

Most massage therapists give massages in dimly lit settings. Using candles and/or incense is not uncommon. Ambient or other calm, soothing music is often played. The dim lighting, smells, and background noise are meant to put clients at ease. However, when visiting a client's office, a massage therapist may not have those amenities. The working conditions depend heavily on a therapist's location and what the client wants.

Because massage is physically demanding, massage therapists can succumb to injury if the proper technique is not used. Repetitive-motion problems and fatigue from standing for extended lengths of time are most common. These risks can be limited by the use of good techniques, proper spacing between sessions, exercise, and, in many cases, by the therapists themselves receiving a massage on a regular basis.

Because of the physical nature of the work and the time needed in between sessions, massage therapists typically work less than 40 hours per week. Most therapists who work 15 to 30 hours per week consider themselves to be full-time workers, because when time for travel, for setting up equipment, and for completing business functions, such as billing, are added, a massage therapist's hours per week may very well be more than 40 hours. About 48 percent of all massage therapists worked part time and 19 percent had variable schedules in 2008.

Training, Other Qualifications, and Advancement

In 2009, 42 States and the District of Columbia had laws regulating massage therapy in some way. Most of the boards governing massage therapy in these States require practicing massage therapists to complete a formal education program and pass an examination. As of 2009, States without licensure requirements were Alaska, Idaho, Kansas, Minnesota, Montana, Oklahoma, Vermont, and Wyoming. In these States, massage therapy may be regulated at the local level. Because laws often change, it is best to check information on licensing, certification, and accreditation on a State-by-State basis.

Education and training. Training standards and requirements for massage therapists vary greatly by State and locality. Education programs are typically found in private or public postsecondary institutions and can require 500 hours of study or more to complete. A high school diploma or equivalent degree is usually required for admission. Massage therapy programs generally cover subjects such as anatomy; physiology, the study of organs and tissues; kinesiology, the study of motion and body mechanics; business management; ethics; and the

hands-on practice of massage techniques. Training programs may concentrate on certain modalities of massage. Several programs also provide alumni services such as post-graduate job placement and continuing educational services. Both full-time and part-time programs are available.

Massage therapy programs vary in accreditation. Generally, they are approved by a State board, and they also may be accredited by an independent accrediting agency. In States that regulate massage therapy, graduation from an approved school or training program usually is required in order to practice. Some State regulations require that therapists keep up on their knowledge and technique through continuing education.

Licensure. In States with massage therapy regulations, workers must obtain a license after graduating from a training program and prior to practicing massage. Passage of an examination is usually required for licensure. The examination may be solely a State exam or one of two nationally recognized tests: the National Certification Examination for Therapeutic Massage and Bodywork (NCETMB) and the Massage and Bodywork Licensing Examination (MBLEx). Massage therapy licensure boards decide which certifications and tests to accept on a State-by-State basis. Therefore, those wishing to practice massage therapy should look into legal requirements for the State and locality in which they intend to practice. A fee and periodic renewal of licensure also may be required.

Other qualifications. Strong communication skills and a friendly, empathetic personality are extremely helpful qualities for fostering a trusting relationship with clients and, in turn, expanding one's client base. Massage can be a delicate issue for some clients, and because of this, making clients feel comfortable is one of the most important skills for massage therapists.

Advancement. Because of the nature of massage therapy, opportunities for advancement are limited. However, with increased experience and an expanding client base, there are opportunities for therapists to increase client fees and, therefore, income. Therapists also may become managers of the office in which they work and may teach in a training program. In addition, those who are well organized and have an entrepreneurial spirit may go into business for themselves. Self-employed massage therapists with a large client base have the highest earnings.

Employment

Massage therapists held about 122,400 jobs in 2008. About 57 percent were self-employed. Many more people practice massage therapy as a secondary source of income. Of those who were self-employed, most owned their own businesses or worked as independent contractors. Others found employment in personal care services establishments, the offices of physicians and chiropractors, fitness and recreational sports centers and hotels. Although massage therapists can find jobs throughout the country, employment is concentrated in metropolitan areas, as well as resort and destination locales.

Job Outlook

Employment of massage therapists is expected to grow faster than average. Opportunities should be available to those who complete formal training programs and pass a professionally recognized examination, but new massage therapists should ex-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Massage therapists	31-9011	122,400	145,600	23,200	19

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

pect to work only part time until they can build a client base of their own.

Employment change. Employment of massage therapists is expected to increase by 19 percent from 2008 to 2018, faster than the average for all occupations. Employment will grow as more people learn about the benefits of massage therapy.

Continued growth in the demand for massage services will lead to new openings for massage therapists. The number of spas, which employ a large number of therapists, has increased in recent years and will continue to do so. At the same time, there are an increasing number of massage clinic franchises, many of which offer massages cheaper than at spas and resorts, making them available to a wider range of customers. In addition, as an increasing number of States adopt licensing requirements and standards for therapists, the practice of massage is likely to be respected and accepted by more and more people.

Massage also offers specific benefits to particular groups of people, whose continued demand for massage services will lead to overall growth for the occupation. For example, as workplaces try to distinguish themselves as employee-friendly, providing professional in-office, seated massages for employees is becoming a popular on-the-job benefit. Older citizens in nursing homes or assisted-living facilities also are finding benefits from massage, such as increased energy levels and reduced health problems. Demand for massage therapy should grow among older age groups because they increasingly are enjoying longer, more active lives and persons aged 55 years and older are projected to be the most rapidly growing segment of the U.S. population over the next decade. However, demand for massage therapy is presently greatest among young adults, who lack the concerns about massage that previous generations had.

Job prospects. In States that regulate massage therapy, opportunities should be available to those who complete formal training programs and pass a professionally recognized examination. However, new massage therapists should expect to work only part time in spas, hotels, hospitals, physical therapy centers, and other businesses until they can build a client base of their own. Because referrals are a very important source of work for massage therapists, networking will increase the number of job opportunities. Joining a professional association also can help build strong contacts and further increase the likelihood of steady work.

Earnings

Median hourly wages of massage therapists, including gratuities, were \$16.78 in May 2008. The middle 50 percent earned between \$11.36 and \$25.14. The lowest 10 percent earned less than \$8.01, and the highest 10 percent earned more than \$33.47.

Because many therapists work part time, yearly earnings can vary considerably, depending on the therapist's schedule. Generally, massage therapists earn some portion of their income as gratuities. For those who work in a hospital or other clinical setting, however, tipping is not common.

As is typical for most workers who are self-employed and work part time, few benefits are provided.

Medical Assistants

Significant Points

- Employment is projected to grow much faster than average, ranking medical assistants among the fastest growing occupations over the 2008–18 decade.
- Job prospects should be excellent.
- About 62 percent of medical assistants work in offices of physicians.
- Some medical assistants are trained on the job, but many complete 1-year or 2-year programs.

Nature of the Work

Medical assistants perform administrative and clinical tasks to keep the offices of physicians, podiatrists, chiropractors, and other health practitioners running smoothly. The duties of medical assistants vary from office to office, depending on the location and size of the practice and the practitioner's specialty. In small practices, medical assistants usually do many different kinds of tasks, handling both administrative and clinical duties and reporting directly to an office manager, physician, or other health practitioner. Those in large practices tend to specialize in a particular area, under the supervision of department administrators. Medical assistants should not be confused with physician assistants, who examine, diagnose, and treat patients under the direct supervision of a physician. (Physician assistants are discussed elsewhere in the *Handbook*.)

Administrative medical assistants update and file patients' medical records, fill out insurance forms, and arrange for hospital admissions and laboratory services. They also perform tasks less specific to medical settings, such as answering telephones, greeting patients, handling correspondence, scheduling appointments, and handling billing and bookkeeping.

Clinical medical assistants have various duties, depending on State law. Some common tasks include taking medical histories and recording vital signs, explaining treatment procedures to patients, preparing patients for examinations, and assisting physicians during examinations. Medical assistants collect and prepare

Medical assistants often take medical histories and record vital signs of patients.

laboratory specimens and sometimes perform basic laboratory tests, dispose of contaminated supplies, and sterilize medical instruments. As directed by a physician, they might instruct patients about medications and special diets, prepare and administer medications, authorize drug refills, telephone prescriptions to a pharmacy, draw blood, prepare patients for x rays, take electrocardiograms, remove sutures, and change dressings. Medical assistants also may arrange examining room instruments and equipment, purchase and maintain supplies and equipment, and keep waiting and examining rooms neat and clean.

Ophthalmic medical assistants, optometric assistants, and podiatric medical assistants are examples of specialized assistants who have additional duties. Ophthalmic medical assistants help ophthalmologists provide eye care. They conduct diagnostic tests, measure and record vision, and test eye muscle function. They apply eye dressings and also show patients how to insert, remove, and care for contact lenses. Under the direction of the physician, ophthalmic medical assistants may administer eye medications. They also maintain optical and surgical instruments and may assist the ophthalmologist in surgery. Optometric assistants also help provide eye care, working with optometrists. They provide chair-side assistance, instruct patients about contact lens use and care, conduct preliminary tests on patients, and otherwise provide assistance while working directly with an optometrist. Podiatric medical assistants make castings of feet, expose and develop x rays, and assist podiatrists in surgery.

Work environment. Medical assistants work in well-lighted, clean environments. They constantly interact with other people and may have to handle several responsibilities at once. Most full-time medical assistants work a regular 40-hour week. However, medical assistants may work part time, evenings, or weekends.

Training, Other Qualifications, and Advancement

Some medical assistants are trained on the job, but many complete 1- or 2-year programs. Almost all medical assistants have at least a high school diploma, although there are no formal education or training requirements.

Education and training. Medical assisting programs are offered in vocational-technical high schools, postsecondary vocational schools, and community and junior colleges. Postsecondary programs usually last either 1 year and result in a certificate or diploma, or 2 years and result in an associate degree. Courses cover anatomy, physiology, and medical terminology, as well as keyboarding, transcription, recordkeeping, accounting, and insurance processing. Students learn laboratory techniques, clinical and diagnostic procedures, pharmaceutical principles, the administration of medications, and first aid. They study office practices, patient relations, medical law, and ethics. There are two accrediting bodies that accredit medical assisting programs. Accredited programs often include an internship that provides practical experience in physicians' offices or other healthcare facilities.

Formal training in medical assisting, while generally preferred, is not required. Many medical assistants are trained on the job, and usually only need to have a high school diploma or the equivalent. Recommended high school courses include mathematics, health, biology, keyboarding, bookkeeping, computers, and office skills. Volunteer experience in the healthcare field also is helpful. Medical assistants who are trained on the

job usually spend their first few months attending training sessions and working closely with more experienced workers.

Some States allow medical assistants to perform more advanced procedures, such as giving injections or taking x rays, after passing a test or taking a course.

Other qualifications. Medical assistants deal with the public; therefore, they must be neat and well groomed and have a courteous, pleasant manner and they must be able to put patients at ease and explain physicians' instructions. They must respect the confidential nature of medical information. Clinical duties require a reasonable level of manual dexterity and visual acuity.

Certification and advancement. Although not required, certification indicates that a medical assistant meets certain standards of knowledge. It may also help to distinguish an experienced or formally trained assistant from an entry-level assistant, which may lead to a higher salary or more employment opportunities. There are various associations—such as the American Association of Medical Assistants (AAMA) and Association of Medical Technologists (AMT)—that award certification credentials to medical assistants. The certification process varies by association. It is also possible to become certified in a specialty, such as podiatry, optometry, or ophthalmology.

Medical assistants may also advance to other occupations through experience or additional training. For example, some may go on to teach medical assisting, and others pursue additional education to become nurses or other healthcare workers. Administrative medical assistants may advance to office managers, or qualify for a variety of administrative support occupations.

Employment

Medical assistants held about 483,600 jobs in 2008. About 62 percent worked in offices of physicians; 13 percent worked in public and private hospitals, including inpatient and outpatient facilities; and 11 percent worked in offices of other health practitioners, such as chiropractors and optometrists. Most of the remainder worked in other health care industries, such as outpatient care centers and nursing and residential care facilities.

Job Outlook

Employment is projected to grow much faster than average, ranking medical assistants among the fastest growing occupations over the 2008–18 decade. Job opportunities should be excellent, particularly for those with formal training or experience, and certification.

Employment change. Employment of medical assistants is expected to grow 34 percent from 2008 to 2018, much faster than the average for all occupations. As the health care industry expands because of technological advances in medicine and the growth and aging of the population, there will be an increased need for all health care workers. The increasing prevalence of certain conditions, such as obesity and diabetes, also will increase demand for health care services and medical assistants.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018		Change, 2008-2018	
			2018	Number	Percent	
Medical assistants	31-9092	483,600	647,500	163,900	34	

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Increasing use of medical assistants to allow doctors to care for more patients will further stimulate job growth.

Helping to drive job growth is the increasing number of group practices, clinics, and other health care facilities that need a high proportion of support personnel, particularly medical assistants who can handle both administrative and clinical duties. In addition, medical assistants work mostly in primary care, a consistently growing sector of the health care industry.

Job prospects. Jobseekers who want to work as a medical assistant should find excellent job prospects. Medical assistants are projected to account for a very large number of new jobs, and many other opportunities will come from the need to replace workers leaving the occupation. Medical assistants with formal training or experience—particularly those with certification—should have the best job opportunities, since employers generally prefer to hire these workers.

Earnings

The earnings of medical assistants vary, depending on their experience, skill level, and location. Median annual wages of wage-and-salary medical assistants were \$28,300 in May 2008. The middle 50 percent earned between \$23,700 and \$33,050. The lowest 10 percent earned less than \$20,600, and the highest 10 percent earned more than \$39,570. Median annual wages in the industries employing the largest numbers of medical assistants in May 2008 were:

General medical and surgical hospitals	\$29,720
Colleges, universities, and professional schools	28,820
Offices of physicians	28,710
Outpatient care centers	28,570
Offices of other health practitioners	25,240

Related Occupations

Medical assistants perform work similar to the tasks completed by other workers in medical support occupations. Administrative medical assistants do work similar to that of:

	Page
Medical records and health information technicians	423
Medical secretaries	583
Medical transcriptionists	457
Clinical medical assistants perform duties similar to those of:	
Dental assistants	447
Dental hygienists	414

Medical Transcriptionists

Significant Points

- Job opportunities will be good, especially for those who are certified.
- Employers prefer medical transcriptionists who have completed a postsecondary training program.
- Many medical transcriptionists telecommute from home-based offices.
- About 36 percent worked in hospitals, and another 23 percent worked in offices of physicians.

Nature of the Work

Medical transcriptionists listen to dictated recordings made by physicians and other healthcare professionals and transcribe them into medical reports, correspondence, and other administrative material. They generally listen to recordings on a headset, using a foot pedal to pause the recording when necessary, and key the text into a personal computer or word processor, editing as necessary for grammar and clarity. The documents they produce include discharge summaries, medical history and physical examination reports, operative reports, consultation reports, autopsy reports, diagnostic-imaging studies, progress notes, and referral letters. Medical transcriptionists return transcribed documents to the physicians or other healthcare professionals who dictated them for review and signature or correction. These documents eventually become part of patients' permanent files.

To understand and accurately transcribe dictated reports, medical transcriptionists must understand medical terminology, anatomy and physiology, diagnostic procedures, pharmacology, and treatment assessments. They also must be able to translate medical jargon and abbreviations into their expanded forms. To help identify terms appropriately, transcriptionists refer to standard medical reference materials—both printed and electronic; some of these are available over the Internet. Medical transcriptionists must comply with specific standards that apply to the style of medical records and to the legal and ethical requirements for keeping patient information confidential.

Experienced transcriptionists spot mistakes or inconsistencies in a medical report and check to correct the information. Their ability to understand and correctly transcribe patient assessments and treatments reduces the chance of patients receiving ineffective or even harmful treatments and ensures high-quality patient care.

Currently, most healthcare providers use either digital or analog dictating equipment to transmit dictation to medical transcriptionists. The Internet has grown to be a popular mode for transmitting documentation. Many transcriptionists receive dictation over the Internet and are able to quickly return transcribed documents to clients for approval. Also, because of the popularity of using the Internet to transmit documentation, many medical transcription departments are beginning to work closely with programmers and information systems staff to stream in voice communication that provides seamless data transfers through network interfaces. This practice allows medical transcriptionists the convenience of having hand-held personal computers or personal data assistants (PDAs) that utilize software for dictation.

Another increasingly popular method uses speech recognition technology, which electronically translates sound into text and creates drafts of reports. Transcriptionists then format the reports; edit them for mistakes in translation, punctuation, or grammar; and check for consistency and any wording that doesn't make sense medically. Transcriptionists working in specialties such as radiology or pathology, which have standardized terminology, are more likely to use speech recognition technology, a medium that will become more widespread in all specialties as it becomes more sophisticated and is better

Transcriptionists receive dictation over the Internet and are able to quickly return transcribed documents to clients for approval.

able to recognize and more accurately transcribe diverse modes of speech.

Medical transcriptionists who work in physicians' offices may have other office duties, such as receiving patients, scheduling appointments, answering the telephone, and handling incoming and outgoing mail. Medical secretaries, discussed in the statement on *secretaries and administrative assistants* elsewhere in the *Handbook*, also may perform transcription as part of their jobs.

Work environment. The majority of these workers are employed in comfortable settings, such as hospitals, physicians' offices, transcription service offices, clinics, laboratories, medical libraries, government medical facilities, or their own homes. Many medical transcriptionists telecommute from home-based offices.

Workers usually sit in the same position for long periods. They can suffer wrist, back, neck, or eye problems caused by strain and risk repetitive motion injuries such as carpal tunnel syndrome. The constant pressure to be accurate and productive also can be stressful.

Many medical transcriptionists work a standard 40-hour week. Self-employed medical transcriptionists are more likely to work irregular hours—including part time, evenings, and weekends. Some may be on call at any time.

Training, Other Qualifications, and Advancement

Postsecondary training in medical transcription is preferred by employers; writing and computer skills also are important.

Education and training. Employers prefer to hire transcriptionists who have completed postsecondary training in medical transcription offered by many vocational schools, community colleges, and distance-learning programs.

Completion of a 2-year associate's degree or 1-year certificate program—including coursework in anatomy, medical terminology, legal issues relating to healthcare documentation, and English grammar and punctuation—is highly recommended, but not always required. Many of these programs include supervised on-the-job experience. Some transcriptionists, especially those already familiar with medical terminology from previous experience as a nurse or medical secretary, become proficient through refresher courses and training.

Formal accreditation is not required for medical transcription programs. However, the Approval Committee for Certificate Programs (ACCP)—established by the Association for Healthcare Documentation Integrity (AHDI) and the American Health Information Management Association—offers voluntary accreditation for medical transcription programs. Although voluntary, the completion of an ACCP-approved program may be required for transcriptionists seeking certification.

Certification and other qualifications. The AHDI awards two voluntary designations; Registered Medical Transcriptionist (RMT) and Certified Medical Transcriptionist (CMT). Medical transcriptionists who are recent graduates of medical transcription educational programs or who have fewer than 2 years' experience in acute care may become a registered RMT. The credential is awarded upon successfully passing the AHDI level-1 registered medical transcription exam. The CMT designation requires at least 2 years of acute care experience using different format, report, and dictation types in multiple-specialty surgery areas. Candidates also must earn a passing score on a certification examination. Because medicine is constantly evolving, medical transcriptionists are encouraged to update their skills regularly. In order to be recertified, RMTs and CMTs must pay a recertification fee. In addition to the fee, RMTs must earn a minimum of 30 continuing education credits in required categories during their 3-year cycle. CMTs must successfully complete an online course and final exam during the 3-year cycle. As in many other fields, certification is recognized as a sign of competence.

Graduates of an ACCP-approved program who earn the RMT credential are eligible to participate in the Registered Apprenticeship Program sponsored by the Medical Transcription Industry Association through the U.S. Department of Labor. The program offers structured on-the-job learning and related technical instruction for qualified medical transcriptionists entering the profession.

In addition to understanding medical terminology, transcriptionists must have good English grammar and punctuation skills and proficiency with personal computers and word-processing software. Normal hearing acuity and good listening skills also are necessary. Employers usually require applicants to take pre-employment tests.

Advancement. With experience, medical transcriptionists can advance to supervisory positions, home-based work, editing, consulting, or teaching. Some become owners of medical transcription businesses. With additional education or training, some become medical records and health information techni-

cians, medical coders, or medical records and health information administrators.

Employment

Medical transcriptionists held about 105,200 jobs in 2008. About 36 percent worked in hospitals and another 23 percent worked in offices of physicians. Others worked for business support services; medical and diagnostic laboratories; outpatient care centers; offices of physical, occupational, and speech therapists; and offices of audiologists.

Job Outlook

Employment of medical transcriptionists is projected to grow about as fast as the average; job opportunities should be good, especially for those who are certified.

Employment change. Employment of medical transcriptionists is projected to grow by 11 percent from 2008 to 2018, about as fast as the average for all occupations. Demand for medical transcription services will continue to be spurred by a growing and aging population. Older age groups receive proportionally greater numbers of medical tests, treatments, and procedures that require documentation. A high level of demand for transcription services also will be sustained by the continued need for electronic documentation that can be shared easily among providers, third-party payers, regulators, consumers, and health information systems. Growing numbers of medical transcriptionists will be needed to amend patients' records, edit documents from speech recognition systems, and identify discrepancies in medical reports.

Contracting out transcription work overseas and advancements in speech recognition technology are not expected to significantly reduce the need for well-trained medical transcriptionists. Outsourcing transcription work abroad—to countries such as India, Pakistan, Philippines, Barbados, and Canada—has grown more popular as transmitting confidential health information over the Internet has become more secure; however, the demand for overseas transcription services is expected only to supplement the demand for well-trained domestic medical transcriptionists. In addition, reports transcribed by overseas medical transcription services usually require editing for accuracy by domestic medical transcriptionists before they meet U.S. quality standards.

Speech recognition technology allows physicians and other health professionals to dictate medical reports to a computer, which immediately creates an electronic document. In spite of the advances in this technology, the software has been slow to grasp and analyze the human voice, the English language, and the medical vernacular with all its diversity. As a result, there will continue to be a need for skilled medical transcriptionists to identify and appropriately edit the inevitable errors

created by speech recognition systems and to create a final document.

Job prospects. Job opportunities will be good, especially for those who are certified. Hospitals will continue to employ a large percentage of medical transcriptionists, but job growth will be in other industries. An increasing demand for standardized records should result in rapid employment growth in physicians' offices, especially in large group practices.

Earnings

Wage-and-salary medical transcriptionists had median hourly wages of \$15.41 in May 2008. The middle 50 percent earned between \$13.02 and \$18.55. The lowest 10 percent earned less than \$10.76, and the highest 10 percent earned more than \$21.81. Median hourly wages in the industries employing the largest numbers of medical transcriptionists were as follows:

Medical and diagnostic laboratories.....	\$17.26
General medical and surgical hospitals.....	15.88
Outpatient care centers.....	15.46
Offices of physicians.....	15.02
Business support services.....	14.52

Compensation arrangements for medical transcriptionists vary. Some are paid on the basis of the number of hours they work or the number of lines they transcribe. Others receive a base pay per hour, with incentives for extra production. Employees of transcription services and independent contractors almost always receive production-based pay. Independent contractors earn more than do transcriptionists who work for others, but independent contractors have higher expenses than their corporate counterparts, receive no benefits, and may face a higher risk of termination than do wage-and-salary transcriptionists.

Related Occupations

Workers in other occupations also type, record information, and process paperwork. Among these workers are the following:

	Page
Court reporters	250
Human resources assistants, except payroll and timekeeping	592
Receptionists and information clerks.....	570
Secretaries and administrative assistants	583
Other workers who provide medical support include the following:	
Medical assistants	455
Medical records and health information technicians	423

Nursing and Psychiatric Aides

Significant Points

- Numerous job openings and excellent job opportunities are expected.
- Most jobs are in nursing and residential care facilities and in hospitals.
- A high school diploma is required for many jobs; specific qualifications vary by occupation, State laws, and work setting.
- This occupation is characterized by modest entry requirements, low pay, high physical and emotional demands, and limited advancement opportunities.

Nature of the Work

Nursing and psychiatric aides help care for physically or mentally ill, injured, disabled, or infirm individuals in hospitals, nursing care facilities, and mental health settings. Nursing aides and home health aides are among the occupations commonly referred to as direct care workers, due to their role in working with patients who need long-term care. The specific care they give depends on their specialty.

Nursing aides, also known as *nurse aides*, *nursing assistants*, *certified nursing assistants*, *geriatric aides*, *unlicensed assistive personnel*, *orderlies*, or *hospital attendants*, provide hands-on care and perform routine tasks under the supervision of nursing and medical staff. Specific tasks vary, with aides handling many aspects of a patient's care. They often help patients to eat, dress, and bathe. They also answer calls for help, deliver messages, serve meals, make beds, and tidy up rooms. Aides sometimes are responsible for taking a patient's temperature, pulse rate, respiration rate, or blood pressure. They also may help provide care to patients by helping them get out of bed and walk, escorting them to operating and examining rooms, or providing skin care. Some aides help other medical staff by setting up equipment, storing and moving supplies, and assisting with some procedures. Aides also observe patients' physical, mental, and emotional conditions and report any change to the nursing or medical staff.

Nursing aides employed in nursing care facilities often are the principal caregivers and have more contact with residents

than do other members of the staff. Because some residents may stay in a nursing care facility for months or even years, aides develop positive, caring relationships with their patients.

Psychiatric aides, also known as mental health assistants or psychiatric nursing assistants, care for mentally impaired or emotionally disturbed individuals. They work under a team that may include psychiatrists, psychologists, psychiatric nurses, social workers, and therapists. In addition to helping patients to dress, bathe, groom themselves, and eat, psychiatric aides socialize with them and lead them in educational and recreational activities. Psychiatric aides may play card games or other games with patients, watch television with them, or participate in group activities, such as playing sports or going on field trips. They observe patients and report any physical or behavioral signs that might be important for the professional staff to know. They accompany patients to and from therapy and treatment. Because they have such close contact with patients, psychiatric aides can have a great deal of influence on their outlook and treatment.

Work environment. Work as an aide can be physically demanding. Aides spend many hours standing and walking, and they often face heavy workloads. Aides must guard against back injury, because they may have to move patients into and out of bed or help them stand or walk. It is important for aides to be trained in and to follow the proper procedures for lifting and moving patients. Aides also may face hazards from minor infections and major diseases, such as hepatitis, but can avoid infections by following proper procedures. Nursing aides, orderlies, and attendants and psychiatric aides have some of the highest non-fatal injuries and illness rates for all occupations, in the 98th and 99th percentiles in 2007.

Aides also perform tasks that some may consider unpleasant, such as emptying bedpans and changing soiled bed linens. The patients they care for may be disoriented, irritable, or uncooperative. Psychiatric aides must be prepared to care for patients whose illnesses may cause violent behavior. Although their work can be emotionally demanding, many aides gain satisfaction from assisting those in need.

Most full-time aides work about 40 hours per week, but because patients need care 24 hours a day, some aides work evenings, nights, weekends, and holidays. In 2008 about 24 percent

Nursing aides often help patients to eat, dress, and bathe.

of nursing aides, orderlies, and attendants and psychiatric aides worked part-time.

Training, Other Qualifications, and Advancement

In many cases, a high school diploma or equivalent is necessary for a job as a nursing or psychiatric aide. Specific qualifications vary by occupation, State laws, and work setting. Advancement opportunities are limited.

Education and training. Nursing and psychiatric aide training is offered in high schools, vocational-technical centers, some nursing care facilities, and some community colleges. Courses cover body mechanics, nutrition, anatomy and physiology, infection control, communication skills, and resident rights. Personal care skills, such as how to help patients bathe, eat, and groom themselves, also are taught. Hospitals may require previous experience as a nursing aide or home health aide. Some States also require psychiatric aides to complete a formal training program. However, most psychiatric aides learn their skills on the job from experienced workers.

Some employers provide classroom instruction for newly hired aides, while others rely exclusively on informal on-the-job instruction by a licensed nurse or an experienced aide. Such training may last from several days to a few months. Aides also may attend lectures, workshops, and in-service training.

Licensure and certification. Federal Government requirements exist for nursing aides who work in nursing care facilities. These aides must complete a minimum of 75 hours of State-approved training and pass a competency evaluation. Aides who complete the program are known as certified nurse assistants (CNAs) and are placed on the State registry of nurse aides. Additional requirements may exist, but vary by State. Therefore, individuals should contact their State board directly for applicable information.

Other qualifications. Aides must be in good health. A physical examination, including State-regulated disease tests, may be required. A criminal background check also is usually required for employment.

Applicants should be tactful, patient, understanding, emotionally stable, and dependable and should have a desire to help people. They also should be able to work as part of a team, have good communication skills, and be willing to perform repetitive, routine tasks.

Advancement. Opportunities for advancement within these occupations are limited. Aides generally need additional formal training or education to enter other health occupations. The most common healthcare occupations for former aides are licensed practical nurse, registered nurse, and medical assistant.

For some individuals, these occupations serve as entry-level jobs. For example, some high school and college students gain experience working in these occupations while attending school. And experience as an aide can help individuals decide whether to pursue a career in healthcare.

Employment

Nursing and psychiatric aides held about 1.5 million jobs in 2008. Nursing aides, orderlies, and attendants held the most jobs—approximately 1.5 million, and psychiatric aides held about 62,500 jobs. About 41 percent of nursing aides, orderlies, and attendants worked in nursing care facilities and another 29 percent worked in hospitals. About 50 percent of all psychiatric aides worked in hospitals. Others were employed in residential care facilities, government agencies, outpatient care centers, and individual and family services.

Job Outlook

Employment is projected to grow faster than the average. Excellent job opportunities are expected.

Employment change. Overall employment of nursing and psychiatric aides is projected to grow 18 percent between 2008 and 2018, faster than the average for all occupations. However, growth will vary for individual occupations. Employment for nursing aides, orderlies, and attendants will grow 19 percent, faster than the average for all occupations, predominantly in response to the long-term care needs of an increasing elderly population. Financial pressures on hospitals to discharge patients as soon as possible should boost admissions to nursing care facilities. As a result, new jobs will be more numerous in nursing and residential care facilities than in hospitals, and growth will be especially strong in community care facilities for the elderly. Modern medical technology will also drive demand for nursing aides, because as the technology saves and extends more lives, it increases the need for long-term care provided by aides. However, employment growth is not expected to be as fast as for other healthcare support occupations, largely because nursing aides are concentrated in the relatively slower growing nursing and residential care facilities industry sector. In addition, growth will be hindered by nursing facilities' reliance on government funding, which does not increase as fast as the cost of patient care. Government funding limits the number of nursing aides nursing facilities can afford to have on staff.

Psychiatric aides are expected to grow 6 percent, more slowly than average. Psychiatric aides are a small occupation compared to nursing aides, orderlies, and attendants. Most psychiatric aides currently work in hospitals, but the industries most likely to see growth will be residential facilities for people with developmental

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Nursing and psychiatric aides	—	1,532,300	1,811,800	279,600	18
Nursing aides, orderlies, and attendants	31-1012	1,469,800	1,745,800	276,000	19
Psychiatric aides.....	31-1013	62,500	66,100	3,600	6

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

disabilities, mental illness, and substance abuse problems. There is a long-term trend toward treating psychiatric patients outside of hospitals, because it is more cost effective and allows patients greater independence. Demand for psychiatric aides in residential facilities will rise in response to increases in the number of older persons, many of whom will require mental health services. Demand for these workers will also grow as an increasing number of mentally disabled adults, formerly cared for by their elderly parents, will need care. Job growth also could be affected by changes in government funding of programs for the mentally ill.

Job prospects. High replacement needs for nursing and psychiatric aides reflect modest entry requirements, low pay, high physical and emotional demands, and limited opportunities for advancement within the occupation. For these same reasons, the number of people looking to enter the occupation will be limited. Many aides leave the occupation to attend training programs for other healthcare occupations. Therefore, people who are interested in, and suited for, this work should have excellent job opportunities.

Earnings

Median hourly wages of nursing aides, orderlies, and attendants were \$11.46 in May 2008. The middle 50 percent earned between \$9.71 and \$13.76 an hour. The lowest 10 percent earned less than \$8.34, and the highest 10 percent earned more than \$15.97 an hour. Median hourly wages in the industries employing the largest numbers of nursing aides, orderlies, and attendants in May 2008 were:

Employment services	\$12.10
General medical and surgical hospitals.....	12.05
Nursing care facilities	11.13
Community care facilities for the elderly	10.91
Home health care services.....	10.58

Median hourly wages of psychiatric aides were \$12.77 in May 2008. The middle 50 percent earned between \$10.00 and \$15.63 an hour. The lowest 10 percent earned less than \$8.35, and the highest 10 percent earned more than \$18.77 an hour. Median hourly wages in the industries employing the largest numbers of psychiatric aides in May 2008 were:

Psychiatric and substance abuse hospitals	\$13.43
General medical and surgical hospitals.....	13.29
Nursing care facilities	11.66
Individual and family services	10.78
Residential mental retardation, mental health and substance abuse facilities.....	9.89

Occupational Therapist Assistants and Aides

Significant Points

- Typical entry-level education for occupational therapist assistants is an associate degree; in contrast, occupational therapist aides usually receive their training on the job.
- Many States regulate the practice of occupational therapist assistants either by licensing, registration, or certification; requirements vary by State.
- Employment is projected to grow much faster than average as demand for occupational therapist services rises and as occupational therapists increasingly use assistants and aides.
- Job prospects should be very good for occupational therapist assistants; jobseekers holding only a high school diploma might face keen competition for occupational therapist aide jobs.

Nature of the Work

Occupational therapist assistants and aides work under the supervision of occupational therapists to provide rehabilitative services to persons with mental, physical, emotional, or developmental impairments. The ultimate goal is to improve clients'

quality of life and ability to perform daily activities. For example, occupational therapist assistants help injured workers re-enter the labor force by teaching them how to compensate for lost motor skills or help individuals with learning disabilities increase their independence.

Occupational therapist assistants help clients with rehabilitative activities and exercises outlined in a treatment plan developed in collaboration with an occupational therapist. Activities range from teaching the proper method of moving from a bed into a wheelchair to the best way to stretch and limber the muscles of the hand. Assistants monitor an individual's activities to make sure that they are performed correctly and to provide encouragement. They also record their client's progress for the occupational therapist. If the treatment is not having the intended effect, or the client is not improving as expected, the therapist may alter the treatment program in hopes of obtaining better results. In addition, occupational therapist assistants document the billing of the client's health insurance provider.

Occupational therapist aides typically prepare materials and assemble equipment used during treatment. They are responsible for a range of clerical tasks, including scheduling appointments, answering the telephone, restocking or ordering depleted supplies, and filling out insurance forms or other paperwork. Aides are not regulated by States, so the law does not allow them to perform as wide a range of tasks as occupational therapist assistants.

Work environment. Occupational therapist assistants and aides need to have a moderate degree of strength because of the physical exertion required to assist patients. For example, assistants and aides may need to lift patients. Constant kneeling, stooping, and standing for long periods also are part of the job.

The hours and days that occupational therapist assistants and aides work vary by facility and whether they are full time or part time. For example, many outpatient therapy offices and clinics have evening and weekend hours to coincide with patients' schedules.

Training, Other Qualifications, and Advancement

An associate degree from an accredited academic program is generally required to qualify for occupational therapist assistant jobs. In contrast, occupational therapist aides usually receive most of their training on the job. Many States regulate the practice of occupational therapist assistants either by licensing, registration, or certification; requirements vary by State.

Education and training. Occupational therapist assistants must attend a school accredited by the Accreditation Council for Occupational Therapy Education (ACOTE) in order to sit for the national certifying exam for occupational therapist assistants. There were 135 ACOTE accredited occupational therapist assistant programs in 2009.

The first year of study typically involves an introduction to healthcare, basic medical terminology, anatomy, and physiology. In the second year, courses are more rigorous and usually include occupational therapy courses in areas such as mental health, adult physical disabilities, gerontology, and pediatrics. Students also must complete at least 16 weeks of supervised fieldwork in a clinic or community setting.

Applicants to occupational therapist assistant programs can improve their chances of admission by taking high school courses in biology and health and by performing volunteer

Occupational therapy assistants and aides need a moderate degree of strength because of the physical exertion required to assist patients.

work in nursing care facilities, occupational or physical therapists' offices, or other healthcare settings.

Occupational therapist aides usually receive most of their training on the job. Qualified applicants must have a high school diploma, strong interpersonal skills, and a desire to help people in need. Applicants may increase their chances of getting a job by volunteering their services, thus displaying initiative and aptitude to the employer.

Licensure. Forty States, Guam, Puerto Rico, and the District of Columbia regulate the practice of occupational therapist assistants either by licensing, registration, or certification. In addition, eligibility requirements vary by State. Contact your State's licensing board for specific regulatory requirements on occupational therapist assistants.

Some States have additional requirements for therapist assistants who work in schools or early intervention programs. These requirements may include education-related classes, an education practice certificate, or early intervention certification.

Certification and other qualifications. Certification is voluntary. The National Board for Certifying Occupational Therapy certifies occupational therapist assistants through a national certifying exam. Those who pass the test are awarded the title Certified Occupational Therapy Assistant (COTA). In some States, the national certifying exam meets requirements for regulation, but other States have their own licensing exam.

Occupational therapist assistants are expected to continue their professional development by participating in continuing education courses and workshops in order to maintain certification. A number of States require continuing education as a condition of maintaining licensure.

Assistants and aides must be responsible, patient, and willing to take directions and work as part of a team. Furthermore, they should be caring and want to help people who are not able to help themselves.

Advancement. Occupational therapist assistants may advance into administration positions. They might organize all the assistants in a large occupational therapy department or act as the director for a specific department such as sports medicine. Some assistants go on to teach classes in accredited occupational therapist assistant academic programs or lead health risk reduction classes for the elderly.

With proper formal education, occupational therapist aides can become occupational therapist assistants.

Employment

Occupational therapist assistants and aides held about 34,400 jobs in 2008, with assistants holding about 26,600 jobs and aides holding approximately 7,800 jobs. About 28 percent of jobs for assistants and aides were in offices of other health practitioners, 27 percent were in hospitals, and 20 percent were in nursing care facilities. The rest were primarily in community care facilities for the elderly, home healthcare services, individual and family services, and government agencies.

Job Outlook

Employment is expected to grow much faster than average as demand for occupational therapy services rises and as occupational therapists increasingly use assistants and aides. Job prospects should be very good for occupational therapist assistants. Jobseekers holding only a high school diploma might face keen competition for occupational therapist aide jobs.

Employment change. Employment of occupational therapist assistants and aides is expected to grow by 30 percent from 2008 to 2018, much faster than the average for all occupations. Demand for occupational therapist assistants and aides will continue to rise because of the increasing number of individuals with disabilities or limited function.

The growing elderly population is particularly vulnerable to chronic and debilitating conditions that require therapeutic services. These patients often need additional assistance in their treatment, making the roles of assistants and aides vital. Also, the large baby-boom generation is entering the prime age for heart attacks and strokes, further increasing the demand for cardiac and physical rehabilitation. In addition, future medical developments should permit an increased per-

centage of trauma victims to survive, creating added demand for therapy services. Demand for therapy may be dampened by Federal legislation imposing limits on reimbursement for therapy services.

Demand from adolescents will increase due to expansion of the school-age population and Federal legislation mandating funding for education for the disabled.

Occupational therapists are expected to increasingly employ assistants to reduce the cost of occupational therapy services. Once a patient is evaluated and a treatment plan is designed by the therapist, the occupational therapist assistant can provide many aspects of treatment, as prescribed by the therapist.

Job prospects. Opportunities for occupational therapist assistants should be very good. However, individuals with only a high school diploma may face keen competition for occupational therapist aide jobs. Occupational therapist assistants and aides with prior experience working in an occupational therapy office or other healthcare setting will have the best job opportunities. In addition to employment growth, job openings will result from the need to replace occupational therapist assistants and aides who leave the occupation permanently over the 2008–18 period.

Earnings

Median annual wages of occupational therapist assistants were \$48,230 in May 2008. The middle 50 percent earned between \$39,240 and \$57,810. The lowest 10 percent earned less than \$31,150, and the highest 10 percent earned more than \$65,160. Median annual wages in the industries employing the largest numbers of occupational therapist assistants in May 2008 were:

Home health care services.....	\$53,090
Offices of other health practitioners.....	50,810
Nursing care facilities	50,790
General medical and surgical hospitals.....	45,760
Elementary and secondary schools	41,850

Median annual wages of occupational therapist aides were \$26,960 in May 2008. The middle 50 percent earned between \$21,930 and \$33,340. The lowest 10 percent earned less than \$17,850, and the highest 10 percent earned more than \$46,910. Median annual wages in the industries employing the largest numbers of occupational therapist aides in May 2008 were:

Specialty (except psychiatric and substance abuse) hospitals.....	\$30,400
General medical and surgical hospitals.....	27,750
Offices of other health practitioners.....	26,850
Elementary and secondary schools	26,820
Nursing care facilities	25,790

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Occupational therapist assistants and aides	31-2010	34,400	44,800	10,300	30

Physical Therapist Assistants and Aides

Significant Points

- Employment is projected to grow much faster than average.
- Physical therapist assistants should have very good job prospects; on the other hand, aides may face keen competition from the large pool of qualified applicants.
- Aides usually learn skills on the job, while physical therapist assistants have an associate degree; most States require licensing for assistants.
- Most jobs are in offices of other health practitioners and in hospitals.

Nature of the Work

Physical therapist assistants and aides help physical therapists to provide treatment that improves patient mobility, relieves pain, and prevents or lessens physical disabilities of patients. A physical therapist might ask a physical therapist assistant to help patients exercise or learn to use crutches, for example, or an aide to gather and prepare therapy equipment. Patients include accident victims and individuals with disabling conditions such as lower-back pain, arthritis, heart disease, fractures, head injuries, and cerebral palsy.

Physical therapist assistants assist physical therapists in providing care to patients. Under the direction and supervision of physical therapists, they provide exercise, instruction; therapeutic methods like electrical stimulation, mechanical traction, and ultrasound; massage; and gait and balance training. Physical ther-

apist assistants record the patient's responses to treatment and report the outcome of each treatment to the physical therapist.

Physical therapist aides help make therapy sessions productive, under the direct supervision of a physical therapist or physical therapist assistant. They usually are responsible for keeping the treatment area clean and organized and for preparing for each patient's therapy. When patients need assistance moving to or from a treatment area, aides assist in their transport. Because they are not licensed, aides do not perform the clinical tasks of a physical therapist assistant in States where licensure is required.

The duties of aides include some clerical tasks, such as ordering depleted supplies, answering the phone, and filling out insurance forms and other paperwork. The extent to which an aide or an assistant performs clerical tasks depends on the needs and organization of the facility.

Work environment. Physical therapist assistants and aides need a moderate degree of strength because of the physical exertion required in assisting patients with their treatment. In some cases, assistants and aides need to lift patients. Frequent kneeling, stooping, bending, and standing for long periods also are part of the job.

The hours and days that physical therapist assistants and aides work vary with the facility. About 28 percent of all physical therapist assistants and aides work part-time. Many outpatient physical therapy offices and clinics have evening and weekend hours, to coincide with patients' personal schedules.

Training, Other Qualifications, and Advancement

Most physical therapy aides are trained on the job, while almost all physical therapist assistants earn an associate degree from an accredited physical therapist assistant program. Most States require licensing for physical therapist assistants.

Education and training. Employers typically require physical therapy aides to have a high school diploma. They are trained on the job, and most employers provide clinical on-the-job training.

In most States, physical therapist assistants are required by law to hold an associate degree. The American Physical Therapy Association's Commission on Accreditation in Physical

Physical therapist assistants and aides provide treatment that improves patient mobility, relieves pain, and prevents or lessens physical disabilities, under the direction of physical therapists.

Therapy Education accredits postsecondary physical therapy assistant programs. In 2009, there were 223 accredited programs, which usually last 2 years and culminate in an associate degree.

Programs are divided into academic coursework and hands-on clinical experience. Academic coursework includes algebra, English, anatomy and physiology, and psychology. Clinical work includes certifications in cardiopulmonary resuscitation (CPR) and other first aid, and field experience in treatment centers. Both educators and prospective employers view clinical experience as essential to ensuring that students understand the responsibilities of a physical therapist assistant.

Licensure. Licensing is not required to practice as a physical therapy aide. However, most States regulate physical therapist assistants through licensure, registration, or certification. Most States require physical therapist assistants to graduate from an accredited education program and pass the National Physical Therapy Exam. Some States may require physical therapy assistants to pass State exams. Many States also require continuing education credits for physical therapist assistants to maintain licensure. Complete information on regulations can be obtained from State licensing boards.

Other qualifications. Physical therapist assistants and aides should be well-organized, detail oriented, and caring. They should be able to take direction and work well in a team situation. They usually have strong interpersonal skills and a desire to help people in need.

Advancement. Some physical therapist aides advance to become therapist assistants after gaining experience and completing an accredited education program.

Some physical therapist assistants advance their knowledge and skills in a variety of clinical areas after graduation. The American Physical Therapy Association recognizes physical therapist assistants who have gained additional skills in geriatric, pediatric, musculoskeletal, neuromuscular, integumentary, and cardiopulmonary physical therapy. Physical therapist assistants may also advance in non-clinical areas, like administrative positions. These positions might include organizing all the assistants in a large physical therapy organization or acting as the director for a specific department such as aquatic therapy. Physical therapist assistants may also pursue a career in teaching at an accredited physical therapist assistant academic program.

Employment

Physical therapist assistants and aides held about 109,900 jobs in 2008. Physical therapist assistants held about 63,800 jobs; physical therapist aides held 46,100. Both work with physical therapists in a variety of settings. About 72 percent of jobs were

in offices of other health practitioners and in hospitals. Others worked primarily in nursing care facilities, home health care services, and outpatient care centers.

Job Outlook

Employment is expected to grow much faster than average because of increasing demand for physical therapy services. Job prospects for physical therapist assistants are expected to be very good. Aides may experience keen competition for jobs.

Employment change. Employment of physical therapist assistants and aides is expected to grow by 35 percent from 2008 through 2018, much faster than the average for all occupations. Changes to restrictions on reimbursement for physical therapy services by third-party payers will increase patient access to services and, thus, increase demand. The increasing number of people who need therapy reflects, in part, the increasing elderly population. The elderly population is particularly vulnerable to chronic and debilitating conditions that require therapeutic services. These patients often need additional assistance in their treatment, making the roles of assistants and aides vital. In addition, the large baby-boom generation is entering the prime age for heart attacks and strokes, further increasing the demand for cardiac and physical rehabilitation.

Medical and technological developments should permit an increased percentage of trauma victims and newborns with birth defects to survive, creating added demand for therapy and rehabilitative services.

Physical therapists are expected to increasingly use assistants and aides to reduce the cost of physical therapy services. Once a patient is evaluated and a treatment plan is designed by the physical therapist, the physical therapist assistant can provide many parts of the treatment, as directed by the therapist.

Job prospects. Opportunities for individuals interested in becoming physical therapist assistants are expected to be very good; with help from physical therapist assistants, physical therapists are able to manage more patients. However, physical therapy aides may face keen competition from the large pool of qualified individuals. In addition to employment growth, job openings will result from the need to replace workers who leave the occupation permanently. Job opportunities should be particularly good in acute hospital, skilled nursing, and orthopedic settings, where the elderly are most often treated. Job prospects should be especially favorable in rural areas, as many physical therapists tend to cluster in highly populated urban and suburban areas.

Earnings

Median annual wages of physical therapist assistants were \$46,140 in May 2008. The middle 50 percent earned between

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent

Protective Service Occupations

Correctional Officers

Significant Points

- The work can be stressful and hazardous; correctional officers have one of the highest rates of nonfatal on-the-job injuries.
- Most jobs are in State and local government prisons and jails.
- Job opportunities are expected to be favorable.

Nature of the Work

Correctional officers, also known as *detention officers* when they work in pretrial detention facilities, are responsible for overseeing individuals who have been arrested and are awaiting trial or who have been convicted of a crime and sentenced to serve time in a jail, reformatory, or penitentiary.

The jail population changes constantly as some prisoners are released, some are convicted and transferred to prison, and new offenders are arrested and enter the system. Correctional officers in local jails admit and process about 13 million people a year, with nearly 800,000 offenders in jail at any given time. Correctional officers in State and Federal prisons watch over the approximately 1.6 million offenders who are incarcerated there at any given time. Typically, offenders serving time at county jails are sentenced to a year or less. Those serving a year or more are usually housed in state or federal prisons.

Correctional officers maintain security and inmate accountability to prevent disturbances, assaults, and escapes. Officers

have no law enforcement responsibilities outside of the institution where they work. (For more information on related occupations, see the statements on police and detectives and on probation officers and correctional treatment specialists, elsewhere in the *Handbook*.)

Regardless of the setting, correctional officers maintain order within the institution and enforce rules and regulations. To help ensure that inmates are orderly and obey rules, correctional officers monitor the activities and supervise the work assignments of inmates. Sometimes, officers must search inmates and their living quarters for contraband like weapons or drugs, settle disputes between inmates, and enforce discipline. Correctional officers periodically inspect the facilities, checking cells and other areas of the institution for unsanitary conditions, contraband, fire hazards, and any evidence of infractions of rules. In addition, they routinely inspect locks, window bars, grilles, doors, and gates for signs of tampering. Finally, officers inspect mail and visitors for prohibited items.

Correctional officers report orally and in writing on inmate conduct and on the quality and quantity of work done by inmates. Officers also report security breaches, disturbances, violations of rules, and any unusual occurrences. They usually keep a daily log or record of their activities. Correctional officers cannot show favoritism and must report any inmate who violates the rules. If a crime is committed within their institution or an inmate escapes, they help the responsible law enforcement authorities investigate or search for the escapee. In jail and prison facilities with direct supervision of cellblocks, officers work unarmed. They are equipped with communications devices so that they can summon help if necessary. These

Correctional officers inspect mail and visitors for prohibited items.

officers often work in a cellblock alone, or with another officer, among the 50 to 100 inmates who reside there. The officers enforce regulations primarily through their interpersonal communication skills and through the use of progressive sanctions, such as the removal of some privileges.

In the highest security facilities, where the most dangerous inmates are housed, correctional officers often monitor the activities of prisoners from a centralized control center with closed-circuit television cameras and a computer tracking system. In such an environment, the inmates may not see anyone but officers for days or weeks at a time and may leave their cells only for showers, solitary exercise time, or visitors. Depending on the offenders' security classification, correctional officers may have to restrain inmates in handcuffs and leg irons to safely escort them to and from cells and other areas and to see authorized visitors. Officers also escort prisoners between the institution and courtrooms, medical facilities, and other destinations.

Bailiffs, also known as *marshals* or *court officers*, are law enforcement officers who maintain safety and order in courtrooms. Their duties, which vary by location, include enforcing courtroom rules, assisting judges, guarding juries from outside contact, delivering court documents, and providing general security for courthouses.

Work environment. Working in a correctional institution can be stressful and hazardous. Every year, correctional officers are injured in confrontations with inmates. Correctional officers and jailers have one of the highest rates of nonfatal on-the-job injuries. First-line supervisors/managers of correctional officers also face the risk of work-related injury. Correctional officers may work indoors or outdoors. Some correctional institutions are well lighted, temperature controlled, and ventilated, but others are old, overcrowded, hot, and noisy. Although both jails and prisons can be dangerous places to work, prison populations are more stable than jail populations, and correctional officers in prisons know the security and custodial requirements of the prisoners with whom they are dealing. Consequently, they tend to be safer places to work.

Correctional officers usually work an 8-hour day, 5 days a week, on rotating shifts. Some correctional facilities have longer shifts and more days off between scheduled work weeks.

Because prison and jail security must be provided around the clock, officers work all hours of the day and night, weekends, and holidays. In addition, officers may be required to work paid overtime.

Training, Other Qualifications, and Advancement

Correctional officers go through a training academy and then are assigned to a facility where they learn most of what they need to know for their work through on-the-job training. Qualifications vary by agency, but all agencies require a high school diploma or equivalent, and some also require some college education or full-time work experience. Military experience is often seen as a plus for corrections employment.

Education and training. A high school diploma or graduation equivalency degree is required by all employers. The Federal Bureau of Prisons requires entry-level correctional officers to have at least a bachelor's degree; 3 years of full-time experience in a field providing counseling, assistance, or supervision to individuals; or a combination of the two. Some State and local corrections agencies require some college credits, but law enforcement or military experience may be substituted to fulfill this requirement.

Federal, State, and some local departments of corrections provide training for correctional officers based on guidelines established by the American Correctional Association and the American Jail Association. Some States have regional training academies that are available to local agencies. At the conclusion of formal instruction, all State and local correctional agencies provide on-the-job training, including training on legal restrictions and interpersonal relations. Many systems require firearms proficiency and self-defense skills. Officer trainees typically receive several weeks or months of training in an actual job setting under the supervision of an experienced officer. However, on-the-job training varies widely from agency to agency.

Academy trainees generally receive instruction in a number of subjects, including institutional policies, regulations, and operations, as well as custody and security procedures. New Federal correctional officers must undergo 200 hours of formal training within the first year of employment. They also must complete 120 hours of specialized training at the U.S. Federal Bureau of Prisons residential training center at Glynco, Georgia, within 60 days of their appointment. Experienced officers receive annual in-service training to keep abreast of new developments and procedures.

Correctional officers that are members of prison tactical response teams are trained to respond to disturbances, riots, hostage situations, forced cell moves, and other potentially dangerous confrontations. Team members practice disarming prisoners wielding weapons, protecting themselves and inmates against the effects of chemical agents, and other tactics.

Other qualifications. All institutions require correctional officers to be at least 18 to 21 years of age, be a U.S. citizen or permanent resident, and have no felony convictions. New applicants for Federal corrections positions must be appointed before they are 37 years old. Some institutions require previous experience in law enforcement or the military, but college credits can be substituted to fulfill this requirement. Others require a record of previous job stability, usually accomplished through

2 years of work experience, which need not be related to corrections or law enforcement.

Correctional officers must be in good health. Candidates for employment are generally required to meet formal standards of physical fitness, eyesight, and hearing. In addition, many jurisdictions use standard tests to determine applicant suitability to work in a correctional environment. Good judgment and the ability to think and act quickly are indispensable. Applicants are typically screened for drug abuse, subject to background checks, and required to pass a written examination.

Advancement. Qualified officers may advance to the position of correctional sergeant. Correctional sergeants supervise correctional officers and usually are responsible for maintaining security and directing the activities of other officers during an assigned shift or in an assigned area. Ambitious and qualified correctional officers can be promoted to supervisory or administrative positions all the way up to warden. In some jurisdictions, corrections officers are given the opportunity to “bid” for a specialty assignment, such as working in correctional industries, correctional health or correctional counseling, and receive additional training. Promotion prospects may be enhanced by attending college. Officers sometimes transfer to related jobs, such as probation officer, parole officer, and correctional treatment specialist.

Employment

Correctional officers and jailers held about 454,500 jobs in 2008, while first-line supervisors and managers of correctional officers held about 43,500 jobs. An additional 20,200 workers were employed as bailiffs. The vast majority of correctional officers and jailers and their supervisors were employed by State and local government in correctional institutions such as prisons, prison camps, and youth correctional facilities.

Job Outlook

Employment growth is expected to be as fast as the average for all occupations, and job opportunities are expected to be favorable.

Employment change. Employment of correctional officers is expected to grow 9 percent between 2008 and 2018, about as fast as the average for all occupations. Increasing demand for correctional officers will stem from population growth and rising rates of incarceration. Mandatory sentencing guidelines calling for longer sentences and reduced parole for inmates are a primary reason for increasing incarceration rates. Some States are reconsidering mandatory sentencing guidelines because of budgetary constraints, court decisions, and doubts about their

effectiveness. Some employment opportunities also will arise in the private sector, as public authorities contract with private companies to provide and staff corrections facilities. Both State and Federal corrections agencies are increasingly using private prisons.

Job prospects. Job opportunities for correctional officers are expected to be favorable. The need to replace correctional officers who transfer to other occupations, retire, or leave the labor force, coupled with rising employment demand, will generate job openings. In the past, some local and State corrections agencies have experienced difficulty in attracting and keeping qualified applicants, largely because of low salaries, shift work, and the concentration of jobs in rural locations. This situation is expected to continue.

Earnings

Median annual wages of correctional officers and jailers were \$38,380 in May 2008. The middle 50 percent earned between \$29,660 and \$51,000. The lowest 10 percent earned less than \$25,300, and the highest 10 percent earned more than \$64,110. Median annual wages in the public sector were \$50,830 in the Federal Government, \$38,850 in State government, and \$37,510 in local government. In the facilities support services industry, where the relatively small number of officers employed by privately operated prisons is classified, median annual wages were \$28,790.

Median annual wages of first-line supervisors/managers of correctional officers were \$57,380 in May 2008. The middle 50 percent earned between \$41,740 and \$73,630. The lowest 10 percent earned less than \$32,300, and the highest 10 percent earned more than \$86,970. Median annual wages were \$57,050 in State government and \$57,300 in local government.

Median annual wages of bailiffs were \$37,820 in May 2008. The middle 50 percent earned between \$26,730 and \$51,470. The lowest 10 percent earned less than \$18,750, and the highest 10 percent earned more than \$61,500. Median annual wages were \$32,690 in local government.

In March 2009, the average salary for Federal correctional officers was \$53,459. Federal salaries were slightly higher in areas where prevailing local pay levels were higher.

In addition to typical benefits, correctional officers employed in the public sector are usually provided with uniforms or a clothing allowance to purchase their own uniforms. Civil service systems or merit boards cover officers employed by the Federal Govern-

Fire Fighters

Significant Points

- Fire fighting involves hazardous conditions and long, irregular hours.
- About 9 out of 10 fire fighters were employed by local governments.
- Applicants generally must pass written, physical, and medical examinations, and candidates with some postsecondary education are increasingly preferred.
- Keen competition for jobs is expected because this occupation attracts many qualified candidates.

Nature of the Work

Every year, fires and other emergencies take thousands of lives and destroy property worth billions of dollars. *Fire fighters* help protect the public against these dangers by responding to fires and a variety of other emergencies. Although they put out fires, fire fighters more frequently respond to other emergencies. They are often the first emergency personnel at the scene of a traffic accident or medical emergency and may be called upon to treat injuries or perform other vital functions.

During duty hours, fire fighters must be prepared to respond immediately to a fire or other emergency. Fighting fires is complex and dangerous, and requires organization and teamwork. At every emergency scene, fire fighters perform specific duties assigned by a superior officer. At fires, they connect hose lines to hydrants and operate a pump to send water to high-pressure hoses. Some carry hoses, climb ladders, and enter burning buildings—using systematic and careful procedures—to put out fires. At times, they may need to use tools to make their way through doors, walls, and debris, sometimes with the aid of information about a building's floor plan. Some find and rescue occupants who are unable to leave the building safely without assistance. They also provide emergency medical attention, ventilate smoke-filled areas and attempt to salvage the contents of buildings. Fire fighters' duties may change several times while the company is in action. Sometimes they remain at the site of a disaster for days at a time, rescuing trapped survivors, and assisting with medical treatment.

Fire fighters work in a variety of settings, including metropolitan areas, rural areas, airports, chemical plants and other industrial sites. They also have assumed a range of responsibilities, including providing emergency medical services. In fact, most calls to which fire fighters respond involve medical emergencies. In addition, some fire fighters work in hazardous materials units that are specially trained for the control, prevention, and cleanup of hazardous materials, such as oil spills or accidents involving the transport of chemicals. (For more information, see the *Handbook* section on hazardous materials removal workers.)

Workers specializing in forest fires utilize methods and equipment different from those of other fire fighters. When fires break out, crews of fire fighters are brought in to suppress the blaze with heavy equipment and water hoses. Fighting forest fires, like fighting urban fires, is rigorous work. One of the most effective means of fighting a forest fire is creating fire lines—cutting down trees and digging out grass and all other combustible vegetation in the path of the fire in order to deprive it of fuel. Elite fire fighters called *smoke jumpers* parachute from airplanes to reach otherwise inaccessible areas. This tactic, however, can be extremely hazardous.

When they aren't responding to fires and other emergencies, fire fighters clean and maintain equipment, learn additional skills related to their jobs, conduct practice drills, and participate in physical fitness activities. They also prepare written reports on fire incidents and review fire science literature to stay informed about technological developments and changing administrative practices and policies.

Work environment. Fire fighters spend much of their time at fire stations, which are usually similar to dormitories. When an

Fire fighters help protect the public by responding to fires and a variety of other emergencies.

alarm sounds, fire fighters respond, regardless of the weather or hour. Fire fighting involves a high risk of death or injury. Common causes include floors caving in, walls toppling, traffic accidents, and exposure to flame and smoke. Fire fighters also may come into contact with poisonous, flammable, or explosive gases and chemicals and radioactive materials, all of which may have immediate or long-term effects on their health. For these reasons, they must wear protective gear that can be very heavy and hot.

Work hours of fire fighters are longer and more varied than the hours of most other workers. Many fire fighters work about 50 hours a week, and sometimes they may work longer. In some agencies, fire fighters are on duty for 24 hours, then off for 48 hours, and receive an extra day off at intervals. In others, they work a day shift of 10 hours for 3 or 4 days, work a night shift of 14 hours for 3 or 4 nights, have 3 or 4 days off, and then repeat the cycle. In addition, fire fighters often work extra hours at fires and other emergencies and are regularly assigned to work on holidays. Fire lieutenants and fire captains frequently work the same hours as the fire fighters they supervise.

Training, Other Qualifications, and Advancement

Applicants for fire fighting jobs usually are required to have at least a high school diploma, but candidates with some postsecondary education are increasingly being preferred. Most municipal jobs require passing written and physical tests. All fire fighters receive extensive training after being hired.

Education and training. Most fire fighters have a high school diploma; however, the completion of community college courses or, in some cases, an associate's degree, in fire science may improve an applicant's chances for a job. A number of colleges and universities offer courses leading to 2-year or 4-year degrees in fire engineering or fire science. In recent years, an increasing proportion of new fire fighters have had some education after high school.

As a rule, entry-level workers in large fire departments are trained for several weeks at the department's training center or academy. Through classroom instruction and practical training, the recruits study fire fighting techniques, fire prevention, hazardous materials control, local building codes, and emergency medical procedures,

including first aid and cardiopulmonary resuscitation (CPR). They also learn how to use axes, chain saws, fire extinguishers, ladders, and other fire fighting and rescue equipment. After successfully completing training, the recruits are assigned to a fire company, where they undergo a period of probation.

Many fire departments have accredited apprenticeship programs lasting up to 4 years, including programs in fighting forest fires. These programs combine formal instruction with on-the-job training under the supervision of experienced fire fighters.

Almost all departments require fire fighters to be certified as emergency medical technicians. (For more information, see the section of the *Handbook* on emergency medical technicians and paramedics.) Although most fire departments require the lowest level of certification, Emergency Medical Technician-Basic (EMT-Basic), larger departments in major metropolitan areas increasingly are requiring paramedic certification. Some departments include this training in the fire academy, whereas others prefer that recruits earn EMT certification on their own, but will give them up to 1 year to do it.

In addition to participating in training programs conducted by local fire departments, some fire fighters attend training sessions sponsored by the U.S. National Fire Academy. These training sessions cover topics such as executive development, antiarson techniques, disaster preparedness, hazardous materials control, and public fire safety and education. Some States also have mandatory or voluntary fire fighter training and certification programs. Many fire departments offer fire fighters incentives, such as tuition reimbursement or higher pay, for completing advanced training.

Other qualifications. Applicants for municipal fire fighting jobs usually must pass a written exam; tests of strength, physical stamina, coordination, and agility; and a medical examination that includes a drug screening. Workers may be monitored on a random basis for drug use after accepting employment. Examinations are generally open to people who are at least 18 years of age and have a high school education or its equivalent. Those who receive the highest scores in all phases of testing have the best chances of being hired.

Among the personal qualities fire fighters need are mental alertness, self-discipline, courage, mechanical aptitude, endurance, strength, and a sense of public service. Initiative and good judgment also are extremely important, because fire fighters make quick decisions in emergencies. Members of a crew live and work closely together under conditions of stress and danger for extended periods, so they must be dependable and able to get along well with others. Leadership qualities are necessary for officers, who must establish and maintain discipline and efficiency, as well as direct the activities of the fire fighters in their companies.

Advancement. Most experienced fire fighters continue studying to improve their job performance and prepare for promotion examinations. To progress to higher level positions, they acquire expertise in advanced fire fighting equipment and techniques, building construction, emergency medical technology, writing, public speaking, management and budgeting procedures, and public relations.

Opportunities for promotion depend upon the results of written examinations, as well as job performance, interviews, and

seniority. Hands-on tests that simulate real-world job situations also are used by some fire departments.

Usually, fire fighters are first promoted to engineer, then lieutenant, captain, battalion chief, assistant chief, deputy chief, and, finally, chief. For promotion to positions higher than battalion chief, many fire departments now require a bachelor's degree, preferably in fire science, public administration, or a related field. An associate's degree is required for executive fire officer certification from the National Fire Academy.

Employment

In 2008, total paid employment in fire fighting occupations was about 365,600. Fire fighters held about 310,400 jobs, and first-line supervisors/managers of fire fighting and prevention workers held about 55,200. These employment figures include only paid career fire fighters—they do not cover volunteer fire fighters, who perform the same duties and may constitute the majority of fire fighters in a residential area. According to the U.S. Fire Administration, about 70 percent of fire companies were staffed entirely by volunteer fire fighters in 2007.

About 91 percent of fire fighting workers were employed by local governments. Some local and regional fire departments are being consolidated into countywide establishments to reduce administrative staffs, cut costs, and establish consistent training standards and work procedures. Some large cities have thousands of career fire fighters, while many small towns have only a few. Most of the fire fighters not employed by local governments worked in fire departments on Federal and State installations, including airports. Private fire fighting companies employ a small number of fire fighters.

Job Outlook

Although employment is expected to grow faster than the average for all jobs, candidates for these positions are expected to face keen competition because these positions are highly attractive and sought after.

Employment change. Employment of fire fighters is expected to grow by 19 percent over the 2008–18 decade, which is faster than the average for all occupations. Most job growth will stem from volunteer fire fighting positions being converted to paid positions. In recent years, it has become more difficult for volunteer fire departments to recruit and retain volunteers, perhaps because of the considerable amount of training and time commitment required. Furthermore, a trend toward more people living in and around cities has increased the demand for fire fighters. When areas develop and become more densely populated, emergencies and fires affect more buildings and more people and, therefore, require more fire fighters.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Fire fighting occupations.....	—	365,600	427,600	62,100	17
First-line supervisors/managers of fire fighting and prevention workers	33-1021	55,200	59,700	4,500	8
Fire fighters	33-2011	310,400	367,900	57,500	19

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Job prospects. Prospective fire fighters are expected to face keen competition for available job openings. Many people are attracted to fire fighting because (1) it is challenging and provides the opportunity to perform an essential public service, (2) a high school education is usually sufficient for entry, and (3) a pension is usually guaranteed after 25 years of service. Consequently, the number of qualified applicants in most areas far exceeds the number of job openings, even though the written examination and physical requirements eliminate many applicants. This situation is expected to persist in coming years. Applicants with the best chances are those who are physically fit and score the highest on physical-conditioning and mechanical aptitude exams. Those who have completed some fire fighter education at a community college and have EMT or paramedic certification will have an additional advantage.

Earnings

Median annual wages of fire fighters were \$44,260 in May 2008. The middle 50 percent earned between \$31,180 and \$58,440. The lowest 10 percent earned less than \$22,440, and the highest 10 percent earned more than \$72,210. Median annual wages were \$44,800 in local government, \$45,610 in the Federal Government, \$25,300 in other support services, and \$37,870 in State governments.

Median annual wages of first-line supervisors/managers of fire fighting and prevention workers were \$67,440 in May 2008. The middle 50 percent earned between \$53,820 and \$86,330. The lowest 10 percent earned less than \$40,850, and the highest 10 percent earned more than \$108,930. First-line supervisors/managers of fire fighting and prevention workers employed in local government earned a median of about \$69,000 a year.

According to the International City-County Management Association, average salaries in 2008 for sworn full-time positions were as follows:

Rank	Minimum annual base salary	Maximum annual base salary
Fire chief	\$78,672	\$104,780
Deputy chief	69,166	88,571
Battalion chief	66,851	81,710
Assistant fire chief	65,691	83,748
Fire captain	60,605	72,716
Fire lieutenant	50,464	60,772
Engineer	48,307	62,265

Fire fighters who average more than a certain number of work hours per week are required to be paid overtime. The threshold is determined by the department. Fire fighters often work extra

shifts to maintain minimum staffing levels and during special emergencies.

In 2008, 66 percent of all fire fighters were union members or covered by a union contract. Fire fighters receive benefits that usually include medical and liability insurance, vacation and sick leave, and some paid holidays. Almost all fire departments provide protective clothing (helmets, boots, and coats) and breathing apparatus, and many also provide dress uniforms. Fire fighters generally are covered by pension plans, often offering retirement at half pay after 25 years of service or if the individual is disabled in the line of duty.

Related Occupations

Other occupations that involve protecting the public and property are:

	Page
Emergency medical technicians and paramedics	419
Fire inspectors and investigators	525
Police and detectives	473

Sources of Additional Information

Information about a career as a fire fighter may be obtained from local fire departments and from either of the following organizations:

► International Association of Fire Fighters, 1750 New York Ave. NW., Washington, DC 20006. Internet: <http://www.iaff.org>

► U.S. Fire Administration, 16825 South Seton Ave., Emmitsburg, MD 21727. Internet: <http://www.usfa.dhs.gov>

Information about professional qualifications and a list of colleges and universities offering 2-year or 4-year degree programs in fire science or fire prevention may be obtained from:

► National Fire Academy, 16825 South Seton Ave., Emmitsburg, MD 21727. Internet: <http://www.usfa.dhs.gov/nfa>

The Occupational Information Network (O*NET) provides information on a wide range of occupational characteristics. Links to O*NET appear at the end of the Internet version of this occupational statement, accessible at <http://www.bls.gov/ooh/ocos329.htm>

Police and Detectives

Significant Points

- Police work can be dangerous and stressful.
- Education requirements range from a high school diploma to a college degree or higher.
- Job opportunities in most local police departments will be favorable for qualified individuals, while competition is expected for jobs in State and Federal agencies.
- Bilingual applicants with college training in police science or with military police experience will have the best opportunities.

Nature of the Work

Police officers and *detectives* protect lives and property. *Law enforcement officer's* duties depend on the size and type of their organizations.

Police and detectives pursue and apprehend individuals who break the law and then issue citations or give warnings. A large proportion of their time is spent writing reports and maintaining records of incidents they encounter. Most police officers patrol their jurisdictions and investigate any suspicious activity they notice. They also respond to calls from individuals. Detectives, who often are called *agents* or *special agents*, perform investigative duties such as gathering facts and collecting evidence.

The daily activities of police and detectives vary with their occupational specialty—such as police officer, *game warden*, or detective—and whether they are working for a local, State, or Federal agency. Duties also differ substantially among various Federal agencies, which enforce different aspects of the law. Regardless of job duties or location, police officers and detectives at all levels must write reports and maintain meticulous records that will be needed if they testify in court.

State and Local Law Enforcement. *Uniformed police officers* have general law enforcement duties. They maintain regular patrols and respond to calls for service. Much of their time is spent responding to calls and doing paperwork. They may direct traffic at the scene of an accident, investigate a burglary, or give first aid to an accident victim. In large police departments, officers usually are assigned to a specific type of duty.

Many urban police agencies are involved in community policing—a practice in which an officer builds relationships with the citizens of local neighborhoods and mobilizes the public to help fight crime.

Police agencies are usually organized into geographic districts, with uniformed officers assigned to patrol a specific area. *Officers* in large agencies often patrol with a partner. They attempt to become familiar with their patrol area and remain alert for anything unusual. Suspicious circumstances and hazards to public safety are investigated or noted, and officers are dispatched to individual calls for assistance within their district. During their shift, they may identify, pursue, and arrest suspected criminals; resolve problems within the community; and enforce traffic laws.

Some agencies have special geographic jurisdictions and enforcement responsibilities. Public college and university police forces, public school district police, and agencies serving transportation systems and facilities are examples. Most law enforcement workers in special agencies are uniformed officers.

Some police officers specialize in a particular field, such as chemical and microscopic analysis, training and firearms instruction, or handwriting and fingerprint identification. Others work with special units, such as horseback, bicycle, motorcycle, or harbor patrol; canine corps; special weapons and tactics (SWAT); or emergency response teams. A few local and special law enforcement officers primarily perform jail-related duties or work in courts. (For information on other officers who work in jails and prisons, see correctional officers, listed elsewhere in the *Handbook*.)

Sheriffs and *deputy sheriffs* enforce the law on the county level. Sheriffs usually are elected to their posts and perform duties similar to those of a local or county police chief. Sheriffs'

departments tend to be relatively small, most having fewer than 50 sworn officers. Deputy sheriffs have law enforcement duties similar to those of officers in urban police departments. Police and sheriffs' deputies who provide security in city and county courts are sometimes called *bailiffs*.

State police officers, sometimes called *State troopers* or *highway patrol officers*, arrest criminals Statewide and patrol highways to enforce motor vehicle laws and regulations. State police officers often issue traffic citations to motorists. At the scene of accidents, they may direct traffic, give first aid, and call for emergency equipment. They also write reports used to determine the cause of the accident. State police officers frequently are called upon to render assistance to other law enforcement agencies, especially those in rural areas or small towns.

State highway patrols operate in every State except Hawaii. Most full-time sworn personnel are uniformed officers who regularly patrol and respond to calls for service. Others work as investigators, perform court-related duties, or carry out administrative or other assignments.

Detectives are plainclothes investigators who gather facts and collect evidence for criminal cases. Some are assigned to interagency task forces to combat specific types of crime. They conduct interviews, examine records, observe the activities of suspects, and participate in raids or arrests. Detectives usually specialize in investigating one type of violation, such as homicide or fraud. They are assigned cases on a rotating basis and work on them until an arrest and conviction is made or until the case is dropped.

Fish and game wardens enforce fishing, hunting, and boating laws. They patrol hunting and fishing areas, conduct search and rescue operations, investigate complaints and accidents, and aid in prosecuting court cases.

Federal Law Enforcement. *Federal Bureau of Investigation (FBI) agents* are the Government's principal investigators, responsible for investigating violations of more than 200 categories of Federal law and conducting sensitive national security investigations. Agents may conduct surveillance, monitor court-authorized wiretaps, examine business records, investigate white-collar crime, or participate in sensitive undercover assignments. The FBI investigates a wide range of criminal activity, including organized crime, public corruption, financial crime, bank robbery, kidnapping, terrorism, espionage, drug trafficking, and cybercrime.

There are many other Federal agencies that enforce particular types of laws. *U.S. Drug Enforcement Administration (DEA) agents* enforce laws and regulations relating to illegal drugs. *U.S. marshals and deputy marshals* provide security for the Federal courts and ensure the effective operation of the judicial system. *Bureau of Alcohol, Tobacco, Firearms, and Explosives agents* enforce and investigate violations of Federal firearms and explosives laws, as well as Federal alcohol and tobacco tax regulations. The U.S. Department of State *Bureau of Diplomatic Security special agents* are engaged in the battle against terrorism.

The *Department of Homeland Security* also employs numerous law enforcement officers within several different agencies, including Customs and Border Protection, Immigration and Customs Enforcement, and the U.S. Secret Service. *U.S. Border Patrol agents* protect more than 8,000 miles of international

The daily activities of police and detectives vary with their occupational specialty.

land and water boundaries. *Immigration inspectors* interview and examine people seeking entry into the United States and its territories. *Customs inspectors* enforce laws governing imports and exports by inspecting cargo, baggage, and articles worn or carried by people, vessels, vehicles, trains, and aircraft entering or leaving the United States. *Federal Air Marshals* provide air security by guarding against attacks targeting U.S. aircraft, passengers, and crews. *U.S. Secret Service special agents* and *U.S. Secret Service uniformed officers* protect the President, the Vice President, their immediate families, and other public officials. Secret Service special agents also investigate counterfeiting, forgery of Government checks or bonds, and fraudulent use of credit cards.

Other Federal agencies employ police and special agents with sworn arrest powers and the authority to carry firearms. These agencies include the Postal Service, the Bureau of Indian Affairs Office of Law Enforcement, the Forest Service, and the National Park Service.

Work environment. Police and detective work can be very dangerous and stressful. Police officers and detectives have one of the highest rates of on-the-job injury and illness. In addition to the obvious dangers of confrontations with criminals, police officers and detectives need to be constantly alert and ready to deal appropriately with a number of other threatening situations. Many law enforcement officers witness death and suffering resulting from accidents and criminal behavior. A career in law enforcement may take a toll on their private lives.

Uniformed officers, detectives, agents, and inspectors usually are scheduled to work 40-hour weeks, but paid overtime is common. Shift work is necessary because protection must be provided around the clock. Junior officers frequently work weekends, holidays, and nights. Police officers and detectives are required to work whenever they are needed and may work long hours during investigations. Officers in most jurisdictions, whether on or off duty, are expected to be armed and to exercise their authority when necessary.

The jobs of some Federal agents, such as U.S. Secret Service and DEA special agents, require extensive travel, often on very short notice. These agents may relocate a number of times over the course of their careers. Some special agents, such as those in the U.S. Border Patrol, may work outdoors in rugged terrain and in all kinds of weather.

Training, Other Qualifications, and Advancement

Education requirements range from a high school diploma to a college degree or higher. Most police and detectives learn much of what they need to know on the job, often in their agency's training academy. Civil service regulations govern the appointment of police and detectives in most States, large municipalities, and special police agencies, as well as in many smaller jurisdictions. Candidates must be U.S. citizens, usually at least 21 years old, and meet rigorous physical and personal qualifications.

Education and training. Applicants usually must have at least a high school education, and some departments require 1 or 2 years of college coursework or, in some cases, a college degree. Physical education classes and participation in sports are also helpful in developing the competitiveness, stamina, and agility needed for many law enforcement positions. Knowledge of a foreign language is an asset in many Federal agencies and urban departments.

State and local agencies encourage applicants to take courses or training related to law enforcement subjects after high school. Many entry-level applicants for police jobs have completed some formal postsecondary education, and a significant number are college graduates. Many junior colleges, colleges, and universities offer programs in law enforcement or administration of justice. Many agencies pay all or part of the tuition for officers to work toward degrees in criminal justice, police science, administration of justice, or public administration and pay higher salaries to those who earn one of those degrees.

Before their first assignments, officers usually go through a period of training. In State and large local police departments, recruits get training in their agency's police academy, often for 12 to 14 weeks. In small agencies, recruits often attend a regional or State academy. Training includes classroom instruction in constitutional law and civil rights, State laws and local ordinances, and accident investigation. Recruits also receive training and supervised experience in patrol, traffic control, use of firearms, self-defense, first aid, and emergency response. Police departments in some large cities hire high school graduates who are still in their teens as police cadets or trainees. They do clerical work and attend classes, usually for 1 to 2 years, until they reach the minimum age requirement and can be appointed to the regular force.

Fish and game wardens also must meet specific requirements. Most States require at least 2 years of college study. Once hired, fish and game wardens attend a training academy lasting from 3 to 12 months, sometimes followed by further training in the field.

Federal agencies require a bachelor's degree, related work experience, or a combination of the two. Federal law enforcement agents undergo extensive training, usually at the U.S. Marine Corps base in Quantico, Virginia, or the Federal Law Enforcement Training Center in Glynco, Georgia. The specific educational requirements, qualifications, and training information for a particular Federal agency can be found on its Web site. Many of these agencies are listed as sources of additional information at the end of this statement.

To be considered for appointment as an FBI agent, an applicant must be a college graduate and have at least 3 years of profes-

sional work experience or must have an advanced degree plus 2 years of professional work experience. An applicant who meets these criteria also must have one of the following: a college major in accounting, electrical engineering, information technology, or computer science; fluency in a foreign language; a degree from an accredited law school; or 3 years of related full-time work experience. All new FBI agents undergo 18 weeks of training at the FBI Academy on the U.S. Marine Corps base in Quantico, Virginia.

Other qualifications. Civil service regulations govern the appointment of police and detectives in most States, large municipalities, and special police agencies, as well as in many smaller jurisdictions. Candidates must be U.S. citizens, usually must be at least 21 years old, and must meet rigorous physical and personal qualifications. Physical examinations for entry into law enforcement often include tests of vision, hearing, strength, and agility. Eligibility for appointment usually depends on one's performance in competitive written examinations and previous education and experience.

Candidates should enjoy working with people and meeting the public. Because personal characteristics such as honesty, sound judgment, integrity, and a sense of responsibility are especially important in law enforcement, candidates are interviewed by senior officers and their character traits and backgrounds are investigated. A history of domestic violence may disqualify a candidate. In some agencies, candidates are interviewed by a psychiatrist or a psychologist, or given a personality test. Most applicants are subjected to lie detector examinations or drug testing. Some agencies subject sworn personnel to random drug testing as a condition of continuing employment.

Although similar in nature, the requirements for Federal agents are generally more stringent and the background checks are more thorough. There are polygraph tests as well as interviews with references. Jobs that require security clearances have additional requirements.

Advancement. Police officers usually become eligible for promotion after a probationary period ranging from 6 months to 3 years. In large departments, promotion may enable an officer to become a detective or to specialize in one type of police work, such as working with juveniles. Promotions to corporal, sergeant, lieutenant, and captain usually are made according to a candidate's position on a promotion list, as determined by scores on a written examination and on-the-job performance.

Federal agents often are on the General Services (GS) pay scale. Most begin at the GS-5 or GS-7 level. As agents meet time-in-grade and knowledge and skills requirements, they move up the GS scale. Promotions at and above GS-13 are most often managerial positions. Many agencies hire internally for these supervisory positions. A few agents may be able to enter the Senior Executive Series ranks of upper management.

Continuing training helps police officers, detectives, and special agents improve their job performance. Through police department academies, regional centers for public safety employees established by the States, and Federal agency training centers, instructors provide annual training in self-defense tactics, firearms, use-of-force policies, sensitivity and communications skills, crowd-control techniques, relevant legal developments, and advances in law enforcement equipment.

Employment

Police and detectives held about 883,600 jobs in 2008. About 79 percent were employed by local governments. State police agencies employed about 11 percent. Various Federal agencies employ police and detectives.

According to the U.S. Bureau of Justice Statistics, police and detectives employed by local governments worked primarily in cities with more than 25,000 inhabitants. Some cities have very large police forces, while thousands of small communities employ fewer than 25 officers each.

Job Outlook

Job opportunities in most local police departments will be favorable for qualified individuals, whereas competition is expected for jobs in State and Federal agencies. As fast as average employment growth is expected.

Employment change. Employment of police and detectives is expected to grow 10 percent over the 2008–18 decade, about as fast as the average for all occupations. Population growth is the main source of demand for police services.

Job prospects. Overall opportunities in local police departments will be favorable for individuals who meet the psychological, personal, and physical qualifications. In addition to openings from employment growth, many openings will be created by the need to replace workers who retire and those who leave local agencies for Federal jobs and private-sector security jobs. Jobs in local police departments that offer relatively low salaries, or those in urban communities in which the crime rate is relatively high, may be the easiest to get. Some smaller departments may have fewer opportunities as budgets limit the ability to hire additional officers. Bilingual applicants with military experience or college training in police science will have the best opportunities in local and State departments.

There will be more competition for jobs in Federal and State law enforcement agencies than for jobs in local agencies. Bilingual applicants with a bachelor's degree and several years of law enforcement or military experience, especially investigative experience, will have the best opportunities in Federal agencies.

The level of government spending determines the level of employment for police and detectives. The number of job opportunities, therefore, can vary from year to year and from place to place. Layoffs are rare because retirements enable most staffing cuts to be handled through attrition. Trained law enforcement officers who lose their jobs because of budget cuts usually have little difficulty finding jobs with other agencies.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Police and detectives	—	883,600	968,400	84,700	10
First-line supervisors/managers of police and detectives	33-1012	97,300	105,200	7,800	8
Detectives and criminal investigators.....	33-3021	112,200	130,900	18,700	17
Fish and game wardens	33-3031	8,300	9,000	700	8
Police officers.....	33-3050	665,700	723,300	57,500	9
Police and sheriff's patrol officers	33-3051	661,500	718,800	57,300	9
Transit and railroad police	33-3052	4,300	4,500	200	5

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Earnings

Police and sheriff's patrol officers had median annual wages of \$51,410 in May 2008. The middle 50 percent earned between \$38,850 and \$64,940. The lowest 10 percent earned less than \$30,070, and the highest 10 percent earned more than \$79,680. Median annual wages were \$46,620 in Federal Government, \$57,270 in State government, \$51,020 in local government and \$43,350 in educational services.

In May 2008, median annual wages of police and detective supervisors were \$75,490. The middle 50 percent earned between \$59,320 and \$92,700. The lowest 10 percent earned less than \$46,000, and the highest 10 percent earned more than \$114,300. Median annual wages were \$89,930 in Federal Government, \$75,370 in State government, and \$74,820 in local government.

In May 2008, median annual wages of detectives and criminal investigators were \$60,910. The middle 50 percent earned between \$45,930 and \$81,490. The lowest 10 percent earned less than \$36,500, and the highest 10 percent earned more than \$97,870. Median annual wages were \$73,170 in Federal Government, \$53,910 in State government, and \$55,930 in local government.

In May 2008, median annual wages of fish and game wardens were \$48,930. The middle 50 percent earned between \$37,500 and \$61,290. The lowest 10 percent earned less than \$30,400, and the highest 10 percent earned more than \$81,710. Median annual wages were \$48,960 in Federal Government, \$50,440 in State government, and \$35,810 in local government.

In May 2008, median annual wages of parking enforcement workers were \$32,390. The middle 50 percent earned between \$25,400 and \$42,000. The lowest 10 percent earned less than \$20,510, and the highest 10 percent earned more than \$50,470. Median annual wages were \$33,130 in local government and \$27,640 in educational services.

In May 2008, median annual wages of transit and railroad police were \$46,670. The middle 50 percent earned between \$37,640 and \$57,830. The lowest 10 percent earned less than \$31,300, and the highest 10 percent earned more than \$72,700. Median annual wages were \$49,370 in State government, \$43,720 in local government, and \$56,300 in rail transportation.

Federal law provides special salary rates to Federal employees who serve in law enforcement. Additionally, Federal special agents and inspectors receive law enforcement availability pay (LEAP)—equal to 25 percent of the agent's grade and step—awarded because of the large amount of overtime that these agents are expected to work. Salaries were slightly

higher in selected areas where the prevailing local pay level was higher. Because Federal agents may be eligible for a special law enforcement benefits package, applicants should ask their recruiter for more information.

Total earnings for local, State, and special police and detectives frequently exceed the stated salary because of payments for overtime, which can be significant.

According to the International City-County Management Association's annual Police and Fire Personnel, Salaries, and Expenditures Survey, average salaries for sworn full-time positions in 2008 were as follows:

Rank	Minimum salary	Maximum salary w/o longevity
Police chief.....	\$90,570	\$113,930
Deputy chief.....	74,834	96,209
Police captain.....	72,761	91,178
Police lieutenant.....	65,688	79,268
Police sergeant.....	58,739	70,349
Police corporal.....	49,421	61,173

In addition to the common benefits—paid vacation, sick leave, and medical and life insurance—most police and sheriffs' departments provide officers with special allowances for uniforms. Many police officers retire at half-pay after 20 years of service; others often are eligible to retire with 30 or fewer years of service.

Private Detectives and Investigators

Significant Points

- Work hours are often irregular, and the work can be dangerous.
- About 21 percent are self-employed.
- Keen competition is expected for most jobs.
- Most private detectives and investigators have some college education and previous experience in investigative work.

Nature of the Work

Private detectives and investigators assist individuals, businesses, and attorneys by finding and analyzing information. They connect clues to uncover facts about legal, financial, or personal matters. Private detectives and investigators offer many services, including executive, corporate, and celebrity protection; preemployment verification; and individual background profiles. Some investigate computer crimes, such as

identity theft, harassing e-mails, and illegal downloading of copyrighted material. They also provide assistance in criminal and civil liability cases, insurance claims and fraud cases, child custody and protection cases, missing-persons cases, and premarital screening. They are sometimes hired to investigate individuals to prove or disprove infidelity.

Private detectives and investigators may use many methods to determine the facts in a case. Much of their work is done with a computer. For example, they often recover deleted e-mails and documents. They also may perform computer database searches or work with someone who does. Computers allow investigators to quickly obtain huge amounts of information, such as records of a subject's prior arrests, convictions, and civil legal judgments; telephone numbers; information about motor vehicle registrations; records of association and club memberships; social networking site details; and even photographs.

Detectives and investigators also perform various other types of surveillance or searches. To verify facts, such as an individual's income or place of employment, they may make phone calls or visit a subject's workplace. In other cases, especially those involving missing persons and background checks, investigators interview people to gather as much information as possible about an individual. Sometimes investigators go undercover, pretending to be someone else in order to get information or to observe a subject inconspicuously. They even arrange to be hired in businesses to observe workers for wrongdoing.

Most detectives and investigators are trained to perform physical surveillance, which may be high tech or low tech. They may observe a site, such as the home of a subject, from an inconspicuous location or a vehicle. Using photographic and video cameras, binoculars, cell phones, and GPS systems, detectives gather information on an individual. Surveillance can be time consuming.

The duties of private detectives and investigators depend on the needs of their clients. In cases that involve fraudulent workers' compensation claims, for example, investigators may carry out long-term covert observation of a person suspected of fraud. If an investigator observes the person performing an activity that contradicts injuries stated in a worker's compensation

claim, the investigator would take video or still photographs to document the activity and report it to the client.

Detectives and investigators must be mindful of the law in conducting investigations. They keep up with Federal, State, and local legislation, such as privacy laws and other legal issues affecting their work. The legality of certain methods may be unclear, and investigators and detectives must make judgment calls in deciding how to pursue a case. They must also know how to collect evidence properly so that they do not compromise its admissibility in court.

Private detectives and investigators often specialize. Those who focus on intellectual property theft, for example, investigate and document acts of piracy, help clients stop illegal activity, and provide intelligence for prosecution and civil action. Other investigators specialize in developing financial profiles and carrying out asset searches. Their reports reflect information gathered through interviews, investigation and surveillance, and research, including reviews of public documents.

Computer forensic investigators specialize in recovering, analyzing, and presenting data from computers for use in investigations or as evidence. They determine the details of intrusions into computer systems, recover data from encrypted or erased files, and recover e-mails and deleted passwords.

Legal investigators assist in preparing criminal defenses, locating witnesses, serving legal documents, interviewing police and prospective witnesses, and gathering and reviewing evidence. Legal investigators also may collect information on the parties to a litigation, take photographs, testify in court, and assemble evidence and reports for trials. They often work for law firms or lawyers.

Corporate investigators conduct internal and external investigations for corporations. In internal investigations, they may investigate drug use in the workplace, ensure that expense accounts are not abused, or determine whether employees are stealing assets, merchandise, or information. External investigations attempt to thwart criminal schemes from outside the corporation, such as fraudulent billing by a supplier. Investigators may spend months posing as employees of the company in order to find misconduct.

Financial investigators may be hired to develop confidential financial profiles of individuals or companies that are prospective parties to large financial transactions. These investigators often are certified public accountants (CPAs) who work closely with investment bankers and other accountants. They also might search for assets in order to recover damages awarded by a court in fraud or theft cases.

Detectives who work for retail stores or hotels are responsible for controlling losses and protecting assets. *Store detectives*, also known as *loss prevention agents*, safeguard the assets of retail stores by apprehending anyone attempting to steal merchandise or destroy store property. They prevent theft by shoplifters, vendor representatives, delivery personnel, and store employees. Store detectives also conduct periodic inspections of stock areas, dressing rooms, and rest rooms, and sometimes assist in opening and closing the store. They may prepare loss prevention and security reports for management and testify in court against people they apprehend. *Hotel detectives* protect guests of the establishment from theft of their belongings and preserve

Private detectives and investigators may use many methods to determine the facts in a case.

order in hotel restaurants and bars. They also may keep undesirable individuals, such as known thieves, off the premises.

Work environment. Many detectives and investigators spend time away from their offices conducting interviews or doing surveillance, but some work in the office most of the day conducting computer searches and making phone calls. When an investigator is working on a case, the environment might range from plush boardrooms to seedy bars. Store and hotel detectives work in the businesses that they protect.

Investigators generally work alone, but they sometimes work with others, especially during surveillance or when they follow a subject. Some of the work involves confrontation, so the job can be stressful and dangerous. Some situations, such as certain bodyguard assignments for corporate or celebrity clients, call for the investigator to be armed. In most cases, however, a weapon is not necessary, because the purpose of the work is gathering information and not law enforcement or criminal apprehension. Owners of investigative agencies have the added stress of having to deal with demanding and sometimes distraught clients. Although considered a dangerous occupation, private detectives and investigators have a relatively low incidence of nonfatal work-related injuries.

Private detectives and investigators often work irregular hours because of the need to conduct surveillance and contact people who are not available during normal working hours. Early morning, evening, weekend, and holiday work is common.

Training, Other Qualifications, and Advancement

Most private detectives and investigators have some college education and previous experience in investigative work. In the majority of States, they are required to be licensed.

Education and training. There are no formal education requirements for most private detective and investigator jobs, although many have postsecondary degrees. Courses in criminal justice and police science are helpful to aspiring private detectives and investigators. Although related experience is usually required, some people enter the occupation directly after graduation from college, generally with an associate's or bachelor's degree in criminal justice or police science. Experience in police investigation is viewed favorably.

Most corporate investigators must have a bachelor's degree, preferably in a business-related field. Some corporate investigators have a master's degree in business administration or a law degree; others are CPAs.

For computer forensics work, a computer science or accounting degree is more helpful than a criminal justice degree. An accounting degree provides good background knowledge for investigating computer fraud. Either of these two degrees provides a good starting point, after which investigative techniques can be learned on the job. Alternatively, many colleges and universities now offer certificate programs, requiring from 15 to 21 credits, in computer forensics. These programs are most beneficial to law enforcement officers, paralegals, or others who already are involved in investigative work. A few colleges and universities now offer bachelor's or master's degrees in computer forensics, and others are planning to begin offering such degrees. Most computer forensic investigators learn their trade while working for a law enforcement agency, either as a sworn officer or a civilian computer forensic analyst. They are trained

at their agency's computer forensics training program. Many people enter law enforcement specifically to get this training and establish a reputation before moving to the private sector.

Most of the work of private detectives and investigators is learned on the job. New investigators will usually start by learning how to use databases to gather information. The training they receive depends on the type of firm. At an insurance company, a new investigator will learn to recognize insurance fraud. At a firm that specializes in domestic cases, a new worker might observe a senior investigator performing surveillance. Learning by doing, in which new investigators are put on cases and gain skills as they go, is a common approach. Corporate investigators hired by large companies, however, may receive formal training in business practices, management structure, and various finance-related topics.

Because they work with changing technologies, computer forensic investigators never stop training. They learn the latest methods of fraud detection and new software programs and operating systems by attending conferences and courses offered by software vendors and professional associations.

Licensure. Most States and the District of Columbia require private detectives and investigators to be licensed. Licensing requirements vary, however. Seven States—Alabama, Alaska, Colorado, Idaho, Mississippi, South Dakota, and Wyoming—have no Statewide licensing requirements. Some States have few requirements, and many others have stringent regulations. For example, the Bureau of Security and Investigative Services of the California Department of Consumer Affairs requires private investigators to be 18 years of age or older; have a combination of education in police science, criminal law, or justice and experience equaling 3 years (6,000 hours); pass a criminal history background check by the California Department of Justice and the FBI (in most States, convicted felons cannot be issued a license); and receive a qualifying score on a 2-hour written examination covering laws and regulations. In all States, detectives and investigators who carry handguns must meet additional requirements. Because laws change, it is important to verify the licensing laws related to private investigators with the State and locality where work will be performed.

There are no licenses specifically for computer forensic investigators, but some States require them to be licensed private investigators. Even where licensure is not required, a private investigator license is useful to some because it allows them to perform followup or related tasks.

Other qualifications. Private detectives and investigators typically have previous experience in other occupations. Some have worked in other occupations for insurance or collections companies, in the private security industry, or as paralegals. Many investigators enter the field after serving in law enforcement, the military, government auditing and investigative positions, or Federal intelligence jobs. Former law enforcement officers, military investigators, and government agents, who frequently are able to retire after 25 years of service, often become private detectives or investigators in a second career. Others enter from jobs in finance, accounting, commercial credit, investigative reporting, insurance, and law. These individuals often can apply their previous work experience in a related investigative specialty.

For private detective and investigator jobs, most employers look for individuals with ingenuity, persistence, and assertiveness. A candidate must not be afraid of confrontation, should communicate well, and should be able to think on his or her feet. Good interviewing and interrogation skills also are important and usually are acquired in earlier careers in law enforcement or other fields. Because the courts often are the judge of a properly conducted investigation, the investigator must be able to present the facts in a manner that a jury will believe. The screening process for potential employees typically includes a background check for a criminal history.

Certification and advancement. Some investigators receive certification from a professional organization to demonstrate competency in a field. For example, the National Association of Legal Investigators confers the Certified Legal Investigator designation upon licensed investigators who devote a majority of their practice to negligence or criminal defense investigations. To receive the designation, applicants must have 5 years of investigations experience. They also must satisfy educational requirements and continuing-training requirements and must pass written and oral exams.

ASIS International, a trade organization for the security industry, offers the Professional Certified Investigator certification. To qualify, applicants must have a high school diploma or the equivalent; must have 5 years of investigations experience, including 2 years managing investigations; and must pass an exam.

Most private detective agencies are small, with little room for advancement. Usually, there are no defined ranks or steps, so advancement takes the form of increases in salary and assignment status. Many detectives and investigators start their own firms after gaining a few years of experience. Corporate and legal investigators may rise to supervisor or manager of the security or investigations department.

Employment

Private detectives and investigators held about 45,500 jobs in 2008. About 21 percent were self-employed, including many for whom investigative work was a second job. Around 41 percent of detective and investigator jobs were in investigation and security services, including private detective agencies. The rest worked mostly in State and local government, legal services firms, department or other general merchandise stores, employment services companies, insurance agencies, and credit mediation establishments, including banks and other depository institutions.

Job Outlook

Keen competition is expected for most jobs despite much faster than average employment growth.

Employment change. Employment of private detectives and investigators is expected to grow 22 percent over the 2008–18

decade, much faster than the average for all occupations. Increased demand for private detectives and investigators will result from heightened security concerns, increased litigation, and the need to protect confidential information and property of all kinds. The proliferation of criminal activity on the Internet, such as identity theft, spamming, e-mail harassment, and illegal downloading of copyrighted materials, also will increase the demand for private investigators. Employee background checks, conducted by private investigators, have become standard for an increasing number of jobs. Growing financial activity worldwide will increase the demand for investigators to control internal and external financial losses, to monitor competitors, and to prevent industrial spying. More individuals are investigating care facilities, such as childcare providers, hospices, and hospitals.

Job prospects. Keen competition is expected for most jobs because private detective and investigator careers attract many qualified people, including relatively young retirees from law enforcement and military careers. The best opportunities for new jobseekers will be in entry-level jobs in detective agencies. Opportunities are expected to be favorable for qualified computer forensic investigators.

Earnings

Median annual wages of salaried private detectives and investigators were \$41,760 in May 2008. The middle 50 percent earned between \$30,870 and \$59,060. The lowest 10 percent earned less than \$23,500, and the highest 10 percent earned more than \$76,640. Wages of private detectives and investigators vary greatly by employer, specialty, and geographic area.

Security Guards and Gaming Surveillance Officers

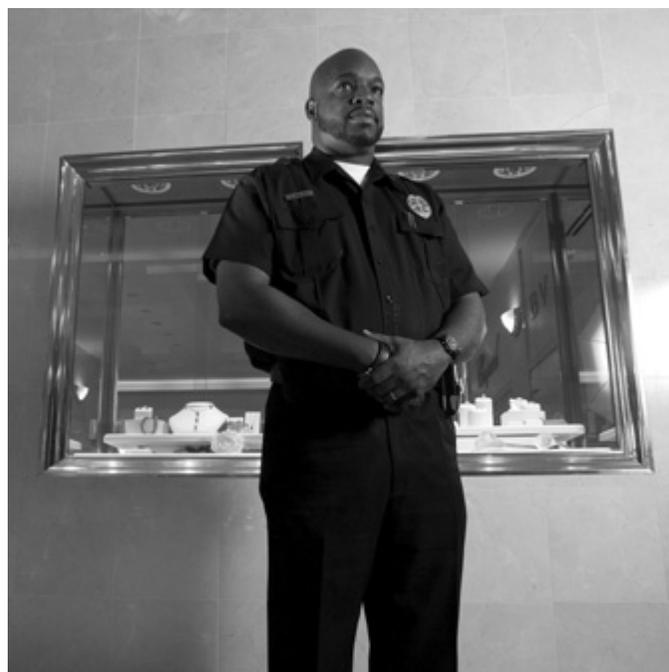

Significant Points

- Job opportunities should be favorable, but competition is expected for some higher paying jobs.
- Because of limited formal training requirements and flexible hours, this occupation attracts many individuals seeking a second or part-time job.
- These jobs can be hazardous.

Nature of the Work

Security guards, also called *security officers*, patrol and inspect property to protect against fire, theft, vandalism, terrorism, and illegal activity. They protect their employer's property, enforce laws on the property, deter criminal activity, and other problems. These workers may be armed. They use various forms of telecommunications to call for assistance from police, fire, or emergency medical services. Security guards write comprehensive reports outlining their observations and activities during their assigned shift. They also may interview witnesses or victims, prepare case reports, and testify in court.

Although all security guards perform essentially the same function, their specific tasks depend on whether they work in a "static," or stationary, security position or on a mobile patrol. Guards assigned to static security positions usually stay at one location for a specified length of time. These guards must become closely acquainted with the property and people associated with their station and must often monitor alarms and closed-circuit TV cameras. In contrast, guards assigned to mobile patrol drive or walk from one location to another and conduct security checks within an assigned area. They may detain or arrest criminal violators, answer service calls concerning

Guards assigned to static security positions usually stay at one location for a specified length of time.

criminal activity or other safety concerns, and issue traffic violation warnings.

The security guard's job responsibilities also vary from one employer to another. In department stores, guards protect people, records, merchandise, money, and equipment. They often work with undercover store detectives to prevent theft by customers or employees, and help apprehend shoplifting suspects prior to the arrival of the police. Some shopping centers and theaters have officers who patrol their parking lots to deter assaults, car thefts, and robberies. In office buildings, banks, and hospitals, guards maintain order and protect the institution's customers, staff, and property. At air, sea, and rail terminals and other transportation facilities, guards and *screeners* protect people, freight, property, and equipment. Using metal detectors and other identification equipment, they may screen passengers and visitors for weapons and explosives, ensure that nothing is stolen while a vehicle is being loaded or unloaded, and watch for fires and criminals.

Guards who work in public buildings such as museums or art galleries protect paintings and exhibits by watching people and inspecting packages entering and leaving the building. In factories, laboratories, government buildings, data processing centers, and military bases, security officers protect information, products, computer codes, and defense secrets, and check the credentials of people and vehicles entering and leaving the premises. Guards working at universities, parks, and sports stadiums perform crowd control, supervise parking and seating, and direct traffic. Security guards stationed at the entrance to bars and nightclubs, prevent access by minors, collect cover charges at the door, maintain order among customers, and protect patrons and property.

Armored car guards protect money and valuables during transit. They also protect individuals responsible for making commercial bank deposits from theft or injury. They pick up

money or other valuables from businesses and transport them to another location. Carrying money between the truck and the business can be extremely hazardous. As a result, armored car guards usually wear bulletproof vests and often carry firearms.

Gaming surveillance officers, also known as *surveillance agents*, and *gaming investigators* act as security agents for casino employees, managers, and patrons. Using primarily audio and video equipment in an observation room, they observe casino operations for irregular activities, such as cheating or theft, and monitor compliance with rules, regulations, and laws. They maintain and organize recordings from security cameras, since these are sometimes used as evidence in police investigations. Some casinos use a catwalk over one-way mirrors located above the casino floor to augment electronic surveillance equipment. Surveillance agents occasionally leave the surveillance room and walk the casino floor.

All security officers must show good judgment and common sense, follow directions, testify accurately in court, and follow company policy and guidelines. In an emergency, they must be able to take charge and direct others to safety. In larger organizations, a security manager might oversee a group of security officers. In smaller organizations, however, a single worker may be responsible for all security.

Work environment. Most security guards and gaming surveillance officers spend considerable time on their feet, either assigned to a specific post or patrolling buildings and grounds. Guards may be stationed at a guard desk inside a building to monitor electronic security and surveillance devices or to check the credentials of people entering or leaving the premises. They also may be stationed at a guardhouse outside the entrance to a gated facility or community and may use a portable radio or cellular telephone to be in constant contact with a central station. Guards who work during the day may have a great deal of contact with other employees and the public. Gaming surveillance officers often work behind a bank of monitors controlling numerous cameras in a casino and thus can develop eyestrain.

Guards usually work shifts of 8 hours or longer and are often on call in case of an emergency. When employers need 24-hour coverage 7 days a week, guards may rotate work schedules for total coverage. In 2008, about 16 percent of security guards and gaming surveillance officers worked part time, and some held a second job as a guard to supplement their primary earnings.

The work usually is routine, but these jobs can be hazardous. Guards must be constantly alert for threats to themselves and the property they are protecting. In 2008, gaming surveillance workers had one of the highest rates of nonfatal on-the-job injuries.

Training, Other Qualifications, and Advancement

Generally, there are no specific education requirements for security guards, but employers usually prefer to fill armed guard positions with people who have at least a high school diploma. Gaming surveillance officers often need some education beyond high school. In most States, guards must be licensed.

Education and training. Many employers of unarmed guards do not have any specific educational requirements. For armed guards, employers usually prefer individuals who are high school graduates or who hold an equivalent certification.

Many employers give newly hired guards instruction before they start the job and provide on-the-job training. The amount of training guards receive varies. Training is more rigorous for armed guards because their employers are legally responsible for any use of force. Armed guards receive formal training in areas such as weapons retention and laws covering the use of force. They may be periodically tested in the use of firearms.

An increasing number of States are making ongoing training a legal requirement for retention of licensure. Guards may receive training in protection, public relations, report writing, crisis deterrence, first aid, and specialized training relevant to their particular assignment.

ASIS International has written voluntary training guidelines that are intended to provide regulating bodies consistent minimum standards for the quality of security services. These guidelines recommend that security guards receive at least 48 hours of training within the first 100 days of employment. The guidelines also suggest that security guards be required to pass a written or performance examination covering topics such as sharing information with law enforcement, crime prevention, handling evidence, the use of force, court testimony, report writing, interpersonal and communication skills, and emergency response procedures. In addition, they recommend annual retraining and additional firearms training for armed officers.

Some employers prefer to hire security guards with some higher education, such as a police science or criminal justice degree. In addition, there are other programs and courses available at some postsecondary schools that focus specifically on security guards.

Guards who are employed at establishments that place a heavy emphasis on security usually receive extensive formal training. For example, guards at nuclear power plants undergo several months of training before going on duty—and even then, they perform their tasks under close supervision for a significant period of time. They are taught to use firearms, administer first aid, operate alarm systems and electronic security equipment, and spot and deal with security problems.

Gaming surveillance officers and investigators usually need some training beyond high school but not usually a bachelor's degree. Several educational institutes offer certification programs. Classroom training usually is conducted in a casino-like atmosphere and includes the use of surveillance camera equipment. Previous security experience is a plus. Employers prefer either individuals with casino experience and significant knowledge of casino operations or those with law enforcement and investigation experience.

Licensure and certification. Most States require that guards be licensed. To be licensed as a guard, individuals must usually be at least 18 years old, pass a background check, and complete classroom training in such subjects as property rights, emergency procedures, and detention of suspected criminals. Drug testing often is required and may be ongoing and random. Guards who carry weapons must be licensed by the appropriate government authority, and some receive further certification as special police officers, allowing them to make limited types of arrests while on duty. Armed guard positions also have more stringent background checks and entry requirements than those of unarmed guards.

In addition to being licensed, some security guards can become certified. Certifications are not mandatory. ASIS International offers the Certified Protection Professional for security people who want a transferrable validation of their knowledge and skills.

Other qualifications. Most jobs require a driver's license. For positions as armed guards, employers often seek people who have had responsible experience in other occupations or former law enforcement officers.

Rigorous hiring and screening programs consisting of background, criminal record, and fingerprint checks are becoming the norm in the occupation. Applicants are expected to have good character references, no serious police record, and good health. They should be mentally alert, emotionally stable, and physically fit to cope with emergencies. Guards who have frequent contact with the public should have good communication skills.

Like security guards, gaming surveillance officers and gaming investigators must have keen observation skills and excellent verbal and writing abilities to document violations or suspicious behavior. They also need to be physically fit and have quick reflexes because they sometimes must detain individuals until local law enforcement officials arrive.

Advancement. Compared with unarmed security guards, armed guards and special police usually enjoy higher earnings and benefits, greater job security, and more potential for advancement. Because many people do not stay long in this occupation, opportunities for advancement are good for those who make a career in security. Most large organizations use a military type of ranking that offers the possibility of advancement in both position and salary. Some guards may advance to supervisor or security manager positions. Guards with postsecondary education often have an advantage in securing supervisory positions. Guards with management skills may open their own contract security guard agencies. Guards can also move to an organization that needs higher levels of security, which may result in more prestige or higher pay.

Employment

Security guards and gaming surveillance officers held 1.1 million jobs in 2008. About 55 percent of all jobs for security guards were in investigation and security services, including guard and armored car services. These organizations provide security on a contract basis, assigning their guards to buildings and other sites as needed. Most other security officers were employed directly by a wide variety of businesses and governments. Guard jobs are found throughout the country, most commonly in metropolitan areas.

Gaming surveillance officers work primarily in gambling industries; traveler accommodation, which includes casino

hotels; and local government. They are employed only in those States and on those Indian reservations where gambling is legal.

A significant number of law enforcement officers work as security guards when they are off duty, in order to supplement their incomes. Often working in uniform and with the official cars assigned to them, they add a high-profile security presence to the establishment with which they have contracted. At construction sites and apartment complexes, for example, their presence often deters crime. (Police and detectives are discussed elsewhere in the *Handbook*.)

Job Outlook

Opportunities for security guards and gaming surveillance officers should be favorable, although competition is expected for some higher paying jobs. Numerous job openings will stem from faster than average employment growth—driven by the demand for increased security—and from the need to replace those who leave this large occupation each year.

Employment change. Employment of security guards is expected to grow by 14 percent between 2008 and 2018, which is faster than the average for all occupations. This occupation will have a very large number of new jobs arise, about 152,500 over the projections decade. Concern about crime, vandalism, and terrorism continues to increase the need for security. Demand for guards also will grow as private security firms increasingly perform duties—such as providing security at public events and in residential neighborhoods—that were formerly handled by police officers. Additionally, private security firms are expected to provide more protection to facilities, such as hospitals and nursing homes.

Employment of gaming surveillance officers and gaming investigators is expected to grow by 12 percent between 2008 and 2018, as fast as the average for all occupations. Casinos will hire more surveillance officers if more States legalize gambling or if the number of casinos increases in States where gambling is already legal. In addition, casino security forces will employ more technically trained personnel as technology becomes increasingly important in thwarting casino cheating and theft.

Job prospects. Job opportunities for security guards should be favorable because of growing demand for these workers and the need to replace experienced workers who leave the occupation. In addition to full-time job opportunities, the limited training requirements and flexible hours attract many people seeking part-time or second jobs. However, competition is expected for higher paying positions that require longer periods of training; these positions usually are found at facilities that require a high level of security, such as nuclear power plants or weapons installations. Applicants with prior experience in the gaming industry should enjoy the best prospects for jobs as gaming surveillance officers.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Security guards and gaming surveillance officers.....	33-9030	1,086,000	1,239,500	153,600	14
Gaming surveillance officers and gaming investigators	33-9031	9,300	10,400	1,100	12
Security guards.....	33-9032	1,076,600	1,229,100	152,500	14

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Earnings

Median annual wages of security guards were \$23,460 in May 2008. The middle 50 percent earned between \$19,150 and \$30,100. The lowest 10 percent earned less than \$16,680, and the highest 10 percent earned more than \$39,360. Median annual wages in the industries employing the largest numbers of security guards were:

General medical and surgical hospitals.....	\$29,020
Elementary and secondary schools	27,980
Local government.....	27,660
Traveler accommodation.....	25,660
Investigation and security services.....	22,170

Gaming surveillance officers and gaming investigators had median annual wages of \$28,850 in May 2008. The middle 50 percent earned between \$23,000 and \$37,690. The lowest 10 percent earned less than \$19,290, and the highest 10 percent earned more than \$48,310.

Food Preparation and Serving Related Occupations

Chefs, Head Cooks, and Food Preparation and Serving Supervisors

Significant Points

- Most workers in these occupations have prior experience in the food service or hospitality industries.
- While most workers have some postsecondary training, many experienced workers with less education can still be promoted into these positions.
- Job opportunities are expected to be good, largely because of high turnover; however, keen competition is expected for jobs at upscale restaurants that generally pay more.

Nature of the Work

Chefs, head cooks, and food preparation and serving supervisors oversee the daily food service operation of a restaurant or other food service establishment. *Chefs and head cooks* are usually responsible for directing cooks in the kitchen, dealing with food-related concerns, and providing leadership. They are also the most skilled cooks in the kitchen and use their creativity and knowledge of food to develop and prepare recipes.

Food preparation and serving supervisors oversee the kitchen and non-kitchen staff in a restaurant or food service facility. They may also oversee food preparation workers in fast food, cafeteria, or casual dining restaurants, where the menu is fairly

standard from day to day, or in more formal restaurants, where a chef provides specific guidelines and exacting standards on how to prepare each item.

All of these workers—chefs, head cooks, and food preparation and serving supervisors—hire, train, and supervise staff, prepare cost estimates for food and supplies, set work schedules, order supplies, and ensure that the food service establishment runs efficiently and profitably. Additionally, these workers ensure that sanitation and safety standards are observed and comply with local regulations. Fresh food must be stored and cooked properly, work surfaces and dishes clean and sanitary, and staff and customers safe from illness or injury to avoid being closed by the health department or law enforcement.

While all chefs have a role in preparing the food, developing recipes, determining serving sizes, planning menus, ordering food supplies, and overseeing kitchen operations to ensure uniform quality and presentation of meals, different types of chefs may have unique roles to perform or specialize in certain aspects of the job. *Executive chefs, head cooks, and chefs de cuisine*, are primarily responsible for coordinating the work of the cooks and directing the preparation of meals. Executive chefs are in charge of all food service operations and also may supervise several kitchens of a hotel, restaurant or corporate dining operation. A *sous chef*, or sub chef, is the second-in-command and runs the kitchen in the absence of the chef. Many chefs earn fame both for themselves and for their kitchens because of the quality and distinctive nature of the food they serve.

As a greater variety of establishments prepare and serve food, chefs and head cooks and first-line supervisors of food

Chefs, head cooks, and food preparation and serving supervisors work long hours preparing ingredients before cooking.

preparation and serving workers can be found in a greater variety of places. Grocery and specialty food stores employ these workers to develop recipes and prepare meals for customers to carry out. They increasingly work in residential care facilities, such as nursing homes, and in schools and hospitals. Some chefs and head cooks work for individuals rather than for restaurants, cafeterias, or food manufacturers. *Personal chefs* and *private household cooks* plan and prepare meals in private homes according to the client's tastes or dietary needs. They order groceries and supplies, clean the kitchen, and wash dishes and utensils. They also may serve meals. Personal chefs usually prepare a week's worth of meals in the client's home for the client to heat and serve according to directions. They may be self-employed or work as part of a team of personal chefs and employed by a company that provides this service. Private household cooks typically work full time for one client, such as corporate executives, university presidents, or diplomats, who regularly entertain as a part of their official duties.

While the work of chefs and head cooks is concentrated in the kitchen or in providing overall guidance, food preparation and serving supervisors oversee specific areas of operation in food service establishments or the kitchen and counter areas of quick service restaurants. In fast food and casual dining restaurants, they may share many of the same functions with food service managers. They are responsible for dealing with customer complaints, balancing the books at the end of the day, scheduling workers, and ordering supplies. They also supervise and train kitchen and food preparation staff and ensure that these workers know how to gather food supplies, operate equipment, and assemble orders.

Work environment. Restaurants and other food service facilities where these workers are employed are required to be clean and sanitary. Although the seating areas of eating places are often attractive, kitchens can be crowded and hot and filled with potential dangers, such as hot ovens and slippery floors. Job hazards for those working in kitchens include slips and falls, cuts, and burns, but these injuries are seldom serious. Chefs, head cooks, and supervisors are under constant pressure to get meals prepared quickly, while ensuring quality is maintained and safety and sanitation guidelines are observed. Because the pace can be hectic

during peak dining times, workers must be able to communicate clearly so that food orders and service are done correctly.

Work hours in restaurants may include early mornings, late evenings, holidays, and weekends. Schedules for those working in offices, factories and school cafeterias may be more regular. In fine-dining restaurants, work schedules tend to be longer because of the time required to prepare ingredients in advance. Many executive chefs regularly work 12-hour days because they oversee the delivery of foodstuffs early in the day, plan the menu, and prepare those menu items that require the most skill. Depending upon the days of operation, some chefs or other supervisors may take less busy days off to offset the longer hours on other days.

Training, Other Qualifications, and Advancement

Most workers in these occupations have prior experience in the food service or hospitality industries. Most start as food preparation workers or line cooks in a full-service restaurant and work their way up to positions with more responsibility. Some attend cooking school or take vocational training classes and participate in internships or apprenticeship programs to acquire the additional skills needed to create menus and run a business.

Education and training. While most chefs, head cooks, and food preparation and serving supervisors have some postsecondary training, many experienced workers with less education can still be promoted. Formal training may take place at a community college, technical school, culinary arts school, or a 2-year or 4-year college with a degree in hospitality. A growing number of chefs participate in training programs sponsored by independent cooking schools, professional culinary institutes, 2-year or 4-year colleges with a hospitality or culinary arts department, or in the armed forces. Some large hotels and restaurants also operate their own training and job-placement programs for chefs and head cooks. Executive chefs, head cooks, and sous chefs who work in fine-dining restaurants require many years of training and experience.

For students in culinary training programs, most of their time is spent in kitchens learning to prepare meals by practicing cooking skills. They learn knife techniques and proper use and care of kitchen equipment. Training programs also include courses in nutrition, menu planning, portion control, purchasing and inventory methods, proper food storage procedures, and use of leftover food to minimize waste. Students also learn sanitation and public health rules for handling food. Training in food service management, computer accounting and inventory software, and banquet service are featured in some training programs. Most formal training programs also require students to get experience in a commercial kitchen through an internship, apprenticeship, or out-placement program.

Although formal training is an important way to enter the profession, many chefs are trained on the job, receiving real work experience and training from chef-mentors in the restaurants where they work. Others enter the profession through formal apprenticeship programs sponsored by professional culinary institutes, industry associations, and trade unions in coordination with the U.S. Department of Labor. The American Culinary Federation accredits more than 200 formal academic training programs and sponsors apprenticeship programs around the country. Typical apprenticeships last 2 years and combine classroom training and work experience. Accredita-

tion is an indication that a culinary program meets recognized standards regarding course content, facilities, and quality of instruction.

Other qualifications. Chefs, head cooks, and food preparation and serving supervisors must demonstrate strong leadership and communication skills and have the ability to motivate others. Chefs and head cooks also must have an intense desire to cook, be creative, and have a keen sense of taste and smell. Personal cleanliness is essential because most States require health certificates indicating that workers are free from communicable diseases. Knowledge of a foreign language can be an asset because it may improve communication with other restaurant staff, vendors, and the restaurant's clientele.

Certification and advancement. The American Culinary Federation certifies pastry professionals, personal chefs, and culinary educators in addition to various levels of chefs. Certification standards are based primarily on experience and formal training. Although certification is not required, it can help to prove accomplishment and lead to advancement and higher-paying positions.

Advancement opportunities for chefs, head cooks, and food preparation and serving supervisors depend on their training, work experience, ability to perform more responsible and sophisticated tasks, and their leadership abilities.

Food preparation and serving supervisors may advance to become food service managers while some chefs and head cooks may go into business as caterers or personal chefs or open their own restaurant. Others may become instructors in culinary training programs, consultants on kitchen design, or food product or equipment sales representatives. A number of chefs and head cooks advance to executive chef positions or food service management positions. When staying in the restaurant business, advancement usually involves moving to a better, busier, or bigger restaurant or working at the corporate level overseeing several restaurants or food service facilities or testing new recipe, menu, or design concepts. (See the section on food service managers elsewhere in the *Handbook*.)

Employment

Chefs, head cooks, and food preparation and serving supervisors held 941,600 jobs in 2008. Food preparation and serving supervisors held 88 percent of these jobs and chefs and head cooks held the remaining 12 percent. Nearly half of chefs and head cooks were employed at full-service restaurants (those that had table service). About nine percent each were employed by hotels and the special food services industry that includes caterers and food service contractors. Eight percent were self-employed.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Supervisors, food preparation and serving workers.....	35-1000	941,600	997,000	55,400	6
Chefs and head cooks.....	35-1011	108,300	108,500	200	0
First-line supervisors/managers of food preparation and serving workers	35-1012	833,300	888,500	55,100	7

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Forty-three percent of food preparation and serving supervisors were employed by limited-service eating places, made up mostly of cafeterias and fast food restaurants and other places that offer simple carry-out food items. Another 25 percent were employed by full-service restaurants. Supervisors are also found in schools, the special food services industry, and a wide variety of other places that serve food.

Job Outlook

Job opportunities are expected to be good, despite slower than average employment growth, due to the large numbers of workers who leave the occupation and need to be replaced. However, keen competition is expected for jobs at upscale restaurants that generally pay more.

Employment change. Employment of chefs, head cooks, and food preparation and serving supervisors is expected to increase by 6 percent over the 2008-18 decade, which is more slowly than the average for all occupations. Growth will be generated by increases in population, a growing variety of dining venues, and continued demand for convenience. As more people opt for the time-saving ease of letting others do the cooking, the need for workers to oversee food preparation and serving will increase. Also, there is a growing consumer desire for healthier, made-from-scratch meals that chefs and head cooks can better prepare.

Job prospects. Job openings for chefs, head cooks, and food preparation and serving supervisors are expected to be good through 2018; however, competition should be keen for jobs at the more upscale restaurants that tend to pay more. Workers with a good business sense will have better job prospects, especially at restaurant chains where attention to costs is very important. Although job growth will create many new positions, the majority of job openings will stem from the need to replace workers who leave the occupation. The fast pace, long hours, and high energy levels required for these jobs often lead to high turnover.

Earnings

Earnings of chefs, head cooks, and food preparation and serving supervisors vary greatly by region and the type of employer. Earnings are usually highest in upscale restaurants and hotels, where many executive chefs are employed, and in major metropolitan and resort areas.

Median annual wage-and-salary earnings of chefs and head cooks were \$38,770 in May 2008. The middle 50 percent earned between \$29,050 and \$51,540. The lowest 10 percent earned less than \$22,120, and the highest 10 percent earned more than

\$66,680. Median annual wages in May 2008 in the industries employing the largest number of chefs and head cooks were:

Other amusement and recreation industries	\$45,650
Traveler accommodation	44,660
Special food services.....	40,890
Full-service restaurants	36,700
Limited-service eating places.....	30,060

Median annual wage-and-salary earnings of food preparation and serving supervisors were \$28,970 in May 2008. The middle 50 percent earned between \$22,530 and \$37,290. The lowest 10 percent earned less than \$18,530, and the highest 10 percent earned more than \$46,810. Median annual wages in May 2008 were \$32,560 in full-service restaurants and \$25,420 in limited-service eating places, the industries employing the largest numbers of food preparation and serving supervisors.

Some employers provide employees with uniforms and free meals, but Federal law permits employers to deduct from their employees' wages the cost or fair value of any meals or lodging provided, and some employers do so. Chefs, head cooks, and food preparation and serving supervisors who work full time often receive typical benefits, but part-time workers usually do not.

In some large hotels and restaurants, kitchen workers belong to unions. The principal unions are the Hotel Employees and Restaurant Employees International Union and the Service Employees International Union.

Cooks and Food Preparation Workers

Significant Points

- Many cooks and food preparation workers are young—35 percent are below the age of 24.
- One-third of these workers are employed part time.
- Job openings are expected to be plentiful because many of these workers will leave the occupation for full-time employment or better wages.

Nature of the Work

Cooks and food preparation workers prepare, season, and cook a wide range of foods—from soups, snacks, and salads to entrees, side dishes, and desserts. They work in a variety of restaurants, as well as other places where food is served, such as grocery stores, schools and hospitals. Cooks prepare and cook meals while food preparation workers assist cooks by performing tasks, such as peeling and cutting vegetables, trimming meat, preparing poultry, and keeping work areas clean and monitoring temperatures of ovens and stovetops.

Specifically, *cooks* measure, mix, and cook ingredients according to recipes, using a variety of equipment, including pots, pans, cutlery, ovens, broilers, grills, slicers, grinders, and blenders. *Food preparation workers* perform routine, repetitive tasks under the direction of chefs, head cooks, or food preparation and serving supervisors. These workers prepare the ingredients for complex dishes by slicing and dicing vegetables, and making salads and cold items. They weigh and measure ingredients, retrieve pots and pans, and stir and strain soups and sauces. Food preparation workers may also cut and grind meats, poultry, and seafood in preparation for cooking. They also clean work areas, equipment, utensils, dishes, and silverware.

Larger restaurants and food service establishments tend to have varied menus and larger kitchen staffs. Teams of restaurant cooks, sometimes called *assistant or line cooks*, each work an assigned station that is equipped with the types of stoves, grills, pans, and ingredients needed for the foods prepared at that station. Job titles often reflect the principal ingredient prepared or the type of cooking performed—*vegetable cook*, *fry cook*, or *grill cook*, for example. Chefs, head cooks, or food preparation and serving supervisors generally direct the work of cooks and food preparation workers (information on chefs, head cooks,

Cooks and food preparation workers must perform their duties quickly to keep up with food orders.

and food preparation and serving supervisors is found elsewhere in the *Handbook*.)

The number, type, and responsibilities of cooks vary depending on where they work, the size of the facility, and the complexity and level of service offered. *Institution and cafeteria cooks*, for example, work in the kitchens of schools, cafeterias, businesses, hospitals, and other institutions. For each meal, they prepare a large quantity of a limited number of entrees, vegetables, and desserts according to preset menus. Meals are generally prepared in advance so diners seldom get the opportunity to special order a meal. *Restaurant cooks* usually prepare a wider selection of dishes, cooking most orders individually. *Short-order cooks* prepare foods in restaurants and coffee shops that emphasize fast service and quick food preparation. They grill and garnish hamburgers, prepare sandwiches, fry eggs, and cook French fries, often working on several orders at the same time. *Fast food cooks* prepare a limited selection of menu items in fast-food restaurants. They cook and package food, such as hamburgers and fried chicken, to be kept warm until served. (Combined food preparation and serving workers, who prepare and serve items in fast-food restaurants, are included with the material on food and beverage serving and related workers elsewhere in the *Handbook*.)

Work environment. Many restaurant and institutional kitchens have modern equipment, convenient work areas, and air conditioning, but kitchens in older and smaller eating places are often not as well designed. Kitchen staffs invariably work in small quarters against hot stoves and ovens. They are under constant pressure to prepare meals quickly, while ensuring quality is maintained and safety and sanitation guidelines are observed. Because the pace can be hectic during peak dining times, workers must be able to communicate clearly so that food orders are completed correctly.

Working conditions vary with the type and quantity of food prepared and the local laws governing food service operations. Workers usually must stand for hours at a time, lifting heavy pots and kettles, and working near hot ovens and grills. The incidence of reported injuries for institution and cafeteria cooks, restaurant cooks, and food preparation workers was comparatively high compared to all occupations, but job hazards, such as falls, cuts, and burns, are seldom serious.

Work hours in restaurants may include early mornings, late evenings, holidays, and weekends. Work schedules of cooks and food preparation workers in factory and school cafeterias may be more regular. In 2008, 31 percent of cooks and almost half of food preparation workers had part-time schedules, compared to 16 percent of workers throughout the economy. Work schedules in fine-dining restaurants, however, tend to be longer because of the time required to prepare ingredients in advance.

The wide range in dining hours and the need for fully-staffed kitchens during all open hours creates work opportunities for students, youth, and other individuals seeking supplemental income, flexible work hours, or variable schedules. Sixteen percent of cooks and food preparation workers were 16 to 19 years old in 2008 and another 18 percent were aged 20 to 24. Kitchen workers employed by schools may work during the school year only, usually for 9 or 10 months. Similarly, resort establishments usually only offer seasonal employment.

Training, Other Qualifications, and Advancement

On-the-job training is the most common method of learning for cooks and food preparation workers; however, restaurant cooks and other cooks who want to take on more advanced cooking duties often attend cooking school. Vocational training programs are available to many high school students and may lead to positions in restaurants. Experience, enthusiasm, and a desire to learn are the most common requirements for advancement to higher skilled cooking jobs or positions in higher paying restaurants.

Education and training. A high school diploma is not required for beginning jobs but is recommended for those planning a career in food services. Most fast-food or short-order cooks and food preparation workers learn their skills on the job. Training generally starts with basic sanitation and workplace safety regulations and continues with instruction on food handling, preparation, and cooking procedures.

Although most cooks and food preparation workers learn on the job, students with an interest in food service may be able to take high school or vocational school courses in kitchen basics and food safety and handling procedures. Additional training opportunities are also offered by many State employment services agencies and local job counseling centers. For example, many school districts, in cooperation with State departments of

education, provide on-the-job training and summer workshops for cafeteria kitchen workers who aspire to become cooks.

When hiring restaurant cooks, employers usually prefer applicants who have training after high school. These training programs range from a few months to 2 years or more. Vocational or trade-school programs typically offer basic training in food handling and sanitation procedures, nutrition, slicing and dicing methods for various kinds of meats and vegetables, and basic cooking techniques, such as baking, broiling, and grilling. Longer certificate or degree granting programs, through independent cooking schools, professional culinary institutes, or college degree programs, train cooks who aspire to more responsible positions in fine-dining or upscale restaurants. They offer a wider array of training specialties, such as advanced cooking techniques; cooking for banquets, buffets, or parties; and cuisines and cooking styles from around the world. Some large hotels, restaurants, and the Armed Forces operate their own training and job-placement programs.

Professional culinary institutes, industry associations, and trade unions may also sponsor formal apprenticeship programs for cooks in coordination with the U.S. Department of Labor. The American Culinary Federation accredits more than 200 formal academic training programs and sponsors apprenticeship programs around the country. Typical apprenticeships last 2 years and combine classroom training and work experience. Accreditation is an indication that a culinary program meets recognized standards regarding course content, facilities, and quality of instruction.

Other qualifications. Cooks and food preparation workers must be efficient, quick, and work well as part of a team. Manual dexterity is helpful for cutting, chopping, and plating. These workers also need creativity and a keen sense of taste and smell. Personal cleanliness is essential because most States require health certificates indicating that workers are free from communicable diseases. Knowledge of a foreign language can be an asset because it may improve communication with other restaurant staff, vendors, and the restaurant's clientele.

Certification and advancement. The American Culinary Federation certifies chefs in different skill levels. For cooks seeking certification and advancement to higher-level chef positions, certification can help to demonstrate accomplishment and lead to higher-paying positions.

Advancement opportunities for cooks and food preparation workers depend on their training, work experience, and ability to perform more responsible and sophisticated tasks. Many food preparation workers, for example, may move into assistant or line cook positions or take on more complex food preparation tasks. Cooks who demonstrate an eagerness to learn new cooking skills and to accept greater responsibility may also advance and be asked to train or supervise lesser skilled kitchen staff. Some may become head cooks, chefs, or food preparation and serving supervisors. (See the section on chefs, head cooks, and food preparation and serving supervisors elsewhere in the *Handbook*.) Others may find it necessary to move to other restaurants, often larger or more prestigious ones, in order to advance.

Employment

Cooks and food preparation workers held 3.0 million jobs in 2008. The distribution of jobs among the various types of cooks and food preparation workers was as follows:

Cooks, restaurant.....	914,200
Food preparation workers.....	891,900
Cooks, fast food	566,000
Cooks, institution and cafeteria.....	392,800
Cooks, short order	171,400
Cooks, private household	4,900
Cooks, all other	18,000

Two-thirds of all cooks and food preparation workers were employed in restaurants and other food services and drinking places. About 16 percent worked in institutions such as schools, universities, hospitals, and nursing care facilities. Grocery stores and hotels employed most of the remainder.

Job Outlook

Job opportunities for cooks and food preparation workers are expected to be good because of high turnover and the need to replace the workers who leave these occupations. The enjoyment of eating out and a preference for ready-made meals from a growing population will cause employment of these workers to increase, but slower than the average rate for all occupations over the 2008–18 decade.

Employment change. Employment of cooks and food preparation workers is expected to increase by 6 percent over

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Cooks and food preparation workers	35-2000	2,958,100	3,149,600	191,500	6
Cooks	35-2010	2,066,200	2,220,000	153,800	7
Cooks, fast food	35-2011	566,000	608,400	42,400	7
Cooks, institution and cafeteria.....	35-2012	391,800	429,700	37,900	10
Cooks, private household.....	35-2013	4,900	5,100	200	4
Cooks, restaurant.....	35-2014	914,200	984,400	70,300	8
Cooks, short order.....	35-2015	171,400	171,500	100	0
Cooks, all other	35-2019	18,000	20,900	2,900	16
Food preparation workers	35-2021	891,900	929,600	37,800	4

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

the 2008–18 decade, more slowly than the average for all occupations. People will continue to enjoy eating out and taking meals home. In response, more restaurants will open and nontraditional food service operations, such as those found inside grocery and convenience stores, will serve more prepared food items. Other places that have dining rooms and cafeterias—such as schools, hospitals, and residential care facilities for the elderly—will open new or expanded food service operations to meet the needs of their growing customer base.

Among food services and drinking places, special food services, which include caterers and food service operators who often provide meals in hospitals, office buildings, or sporting venues on a contract basis, are expected to grow the fastest during the projection period. These companies typically employ large numbers of cafeteria and institution cooks and other cooks who perform cooking duties; employment in these occupations is expected to grow 10 percent and 16 percent, respectively.

Full-service restaurants also will continue to attract patrons and grow in number, but not as fast as the previous decade. As restaurants increase their focus on the carryout business, cooks and food preparation workers will be needed to compete with limited service restaurants and grocery stores. Employment of restaurant cooks is expected to grow by 8 percent.

Limited service eating places, such as fast-food restaurants, sandwich and coffee shops, and other eating places without table service, also are expected to grow during the projection period, as people place greater emphasis on value, quick service, and carryout capability. This will generate greater demand for fast-food cooks. Employment of fast food cooks is expected to increase by 7 percent.

Employment of private household cooks should grow 4 percent, or more slowly than the average for all occupations, and employment of short-order cooks is expected to grow by less than 1 percent, which represents little to no change.

Food preparation workers are expected to grow more slowly than the average for all occupations, or 4 percent. As restaurants and quick service eating places find more efficient ways of preparing meals—such as at central kitchens that may serve multiple outlets or in wholesale and distribution facilities that wash, portion, and season ingredients—food preparation will become simpler, allowing these lower-skilled workers to take on more varied tasks in a growing number of eating places. Additionally, foods requiring simple preparation will increasingly be sold at convenience stores, snack shops, and in grocery stores, which also will employ food preparation workers.

Job prospects. In spite of slower-than-average employment growth, job opportunities for cooks and food preparation workers are expected to be good, primarily because of the very large number of workers that will need to be replaced because of high turnover. Because many of these jobs are part time, people often leave for full-time positions. Individuals seeking full-time positions at high-end restaurants might encounter competition as the number of job applicants exceeds the number of job openings. Generally, there is lower turnover for full-time jobs and at established restaurants that pay well.

Earnings

Earnings of cooks and food preparation workers vary greatly by region and the type of employer. Earnings usually are highest in

fine dining restaurants and nicer hotels that have more exacting work standards. These restaurants are usually found in greater numbers in major metropolitan and resort areas.

Median annual wages of cooks, private household were \$24,070 in May 2008. The middle 50 percent earned between \$19,030 and \$36,590. The lowest 10 percent earned less than \$16,230, and the highest 10 percent earned more than \$56,280.

Median annual wages of institution and cafeteria cooks were \$22,210 in May 2008. The middle 50 percent earned between \$17,850 and \$27,460. The lowest 10 percent earned less than \$15,220, and the highest 10 percent earned more than \$33,050. Median annual wages in the industries employing the largest numbers of institution and cafeteria cooks were:

General medical and surgical hospitals.....	\$25,070
Special food services.....	23,550
Community care facilities for the elderly.....	22,910
Nursing care facilities	22,140
Elementary and secondary schools	20,460

Median annual wages of restaurant cooks were \$21,990 in May 2008. The middle 50 percent earned between \$18,230 and \$26,150. The lowest 10 percent earned less than \$15,880, and the highest 10 percent earned more than \$31,330. Median annual wages in the industries employing the largest numbers of restaurant cooks were:

Traveler accommodation.....	\$25,570
Other amusement and recreation industries	24,760
Special food services.....	24,180
Drinking places (alcoholic beverages).....	22,210
Full-service restaurants	21,770
Limited-service eating places.....	19,060

Median annual wages of short-order cooks were \$19,260 in May 2008. The middle 50 percent earned between \$16,280 and \$23,450. The lowest 10 percent earned less than \$14,740, and the highest 10 percent earned more than \$27,630. Median annual wages in the industries employing the largest numbers of short-order cooks were:

Full-service restaurants	\$19,600
Drinking places (alcoholic beverages).....	19,550
Grocery stores	19,540
Other amusement and recreation industries	18,720
Limited-service eating places.....	17,910

Median annual wages of food preparation workers were \$18,630 in May 2008. The middle 50 percent earned between \$16,180 and \$22,500. The lowest 10 percent earned less than \$14,730, and the highest 10 percent earned more than \$27,440. Median annual wages in the industries employing the largest number of food preparation workers were:

Grocery stores	\$19,580
Full-service restaurants	18,580
Limited-service eating places.....	16,790

Median annual wages of fast-food cooks were \$16,880 in May 2008. The middle 50 percent earned between \$15,470 and \$19,240. The lowest 10 percent earned less than \$14,090, and the highest 10

percent earned more than \$22,080. Median annual wages in the industries employing the largest number of fast-food cooks were:

Grocery stores	\$19,180
Full-service restaurants	17,250
Limited-service eating places.....	16,820
Gasoline stations	16,640

Some employers provide employees with uniforms and free meals, but Federal law permits employers to deduct from their employees' wages the cost or fair value of any meals or lodging provided, and some employers do so. Cooks and food preparation workers who work full time often receive typical benefits, but part-time and hourly workers usually do not.

In some large hotels and restaurants, kitchen workers belong to unions. The principal unions are the Hotel Employees and Restaurant Employees International Union and the Service Employees International Union.

Food and Beverage Serving and Related Workers

Significant Points

- Most jobs are part time and have few educational requirements, attracting many young people to the occupation—21 percent of these workers were 16 to 19 years old in 2008, about six times the proportion for all workers.
- Job openings are expected to be abundant through 2018, which will create excellent opportunities for jobseekers.
- Tips comprise a major portion of earnings for servers, so keen competition is expected for jobs in fine dining and more popular restaurants where potential tips are greatest.

Nature of the Work

Food and beverage serving and related workers are the front line of customer service in full-service restaurants, casual dining eateries, and other food service establishments. These workers greet customers, escort them to seats and hand them menus, take food and drink orders, and serve food and beverages. They also answer questions, explain menu items and specials, and keep tables and dining areas clean and set for new diners. Most work as part of a team, helping coworkers to improve workflow and customer service.

Waiters and waitresses, also called *servers*, are the largest group of these workers. They take customers' orders, serve food and beverages, prepare itemized checks, and sometimes accept payment. Their specific duties vary considerably, depending on the establishment. In casual-dining restaurants serving routine, straightforward fare, such as salads, soups, and sandwiches, servers are expected to provide fast, efficient, and courteous service. In fine dining restaurants, where more complicated meals are prepared and often served over several courses, waiters and waitresses provide more formal service emphasizing personal, attentive treatment at a more leisurely pace. Waiters

Food and beverage serving workers assist diners at cafeterias.

and waitresses may meet with managers and chefs before each shift to discuss the menu and any new items or specials, review ingredients for potential food allergies, or talk about any food safety concerns. They also discuss coordination between the kitchen and the dining room and any customer service issues from the previous day or shift. In addition, waiters and waitresses usually check the identification of patrons to ensure they meet the minimum age requirement for the purchase of alcohol and tobacco products wherever those items are sold.

Waiters and waitresses sometimes perform the duties of other food and beverage service workers, including escorting guests to tables, serving customers seated at counters, clearing and setting up tables, or operating a cash register. However, full-service restaurants frequently hire other staff, such as hosts and hostesses, cashiers, or dining room attendants, to perform these duties.

Bartenders fill drink orders either taken directly from patrons at the bar or through waiters and waitresses who place drink orders for dining room customers. Bartenders check the identification of customers seated at the bar to ensure they meet the minimum age requirement for the purchase of alcohol and tobacco products. They prepare mixed drinks, serve bottled or draught beer, and pour wine or other beverages. Bartenders must know a wide range of drink recipes and be able to mix drinks accurately, quickly, and without waste. Some establishments, especially those with higher volume, use equipment that automatically measures, pours, and mixes drinks at the push of a button. Bartenders who use this equipment, however, still must work quickly to handle a large volume of drink orders and be familiar with the ingredients for special drink requests. Much of a bartender's work still must be done by hand.

Besides mixing and serving drinks, bartenders stock and prepare garnishes for drinks; maintain an adequate supply of ice, glasses, and other bar supplies; and keep the bar area clean for customers. They also may collect payment, operate the cash register, wash glassware and utensils, and serve food to customers who dine at the bar. Bartenders usually are responsible for ordering and maintaining an inventory of liquor, mixers, and other bar supplies.

Hosts and hostesses welcome guests and maintain reservation and waiting lists. They may direct patrons to coatrooms, restrooms, or to a place to wait until their table is ready. Hosts and hostesses assign guests to tables suitable for the size of their group, escort patrons to their seats, and provide menus. They also enter reservations, arrange parties, and assist with other special requests. In some restaurants, they act as cashiers.

Dining room and cafeteria attendants and bartender helpers—sometimes referred to collectively as the bus staff—assist waiters, waitresses, and bartenders by cleaning and setting tables, removing dirty dishes, and keeping serving areas stocked with supplies. They may also assist waiters and waitresses by bringing meals out of the kitchen, distributing dishes to individual diners, filling water glasses, and delivering condiments. *Cafeteria attendants* stock serving tables with food, trays, dishes, and silverware. They may carry trays to dining tables for patrons. Bartender helpers keep bar equipment clean and glasses washed. Dishwashers clean dishes, cutlery, and kitchen utensils and equipment.

Food also is prepared and served in limited-service eateries, which don't employ servers and specialize in simpler preparations that often are made in advance. Two occupations with large numbers of workers are common in these types of establishments: *combined food preparation and serving workers, including fast food*; and *counter attendants, cafeteria, food concession, and coffee shop*. Combined food preparation and serving workers are employed primarily by fast food restaurants. They take food and beverage orders, retrieve items when ready, fill drink cups, and accept payment. They also may heat food items and assemble salads and sandwiches, which constitutes food preparation. Counter attendants take orders and serve food in snack bars, cafeterias, movie theatres, and coffee shops over a counter or steam table. They may fill cups with coffee, soda, and other beverages and may prepare fountain specialties, such as milkshakes and ice cream sundaes. Counter attendants take carryout orders from diners and wrap or place items in containers. They clean counters, write itemized bills, and sometimes accept payment. Other workers, referred to as *foodservers, nonrestaurant*, serve food to patrons outside of a restaurant environment. They might deliver room service meals in hotels or meals to hospital rooms or act as carhops, bringing orders to parked cars.

Work environment. Food and beverage service workers are on their feet most of the time and often carry heavy trays of food, dishes, and glassware. During busy dining periods, they are under pressure to serve customers quickly and efficiently. The work is relatively safe, but injuries from slips, cuts, and burns often result from hurrying or mishandling sharp tools. Three occupations—food servers, nonrestaurant; dining room and cafeteria attendants and bartender helpers; and dishwashers—reported higher incident rates than many occupations throughout the economy.

Part-time work is more common among food and beverage serving and related workers than among workers in almost any other occupation. In 2008, those on part-time schedules included half of all waiters and waitresses and almost three-fourths of all hosts and hostesses.

Food service and drinking establishments typically maintain long dining hours and offer flexible and varied work opportunities. Many food and beverage serving and related workers work evenings, weekends, and holidays. The long business hours allow for more flexible schedules that appeal to many teenagers who can gain valuable work experience. More than one-fifth of all food and beverage serving and related workers were 16 to 19 years old in 2008—about six times the proportion for all workers.

Training, Other Qualifications, and Advancement

Most food and beverage service jobs are entry level and require a high school diploma or less. Generally, training is received on the job; however, those who wish to work at more upscale restaurants, where income from tips is greater and service standards are higher, may need previous experience or vocational training.

Education and training. There are no specific educational requirements for most food and beverage service jobs. Many employers prefer to hire high school graduates for waiter and waitress, bartender, and host and hostess positions, but completion of high school usually is not required for fast-food workers,

counter attendants, dishwashers, and dining room attendants and bartender helpers. Many entrants to these jobs are in their late teens or early twenties and have a high school education or less. Usually, they have little or no work experience. Food and beverage service jobs are a major source of part-time employment for high school and college students, multiple job holders, and those seeking supplemental incomes.

All new employees receive some training from their employer. They learn safe food handling procedures and sanitation practices, for example. Some employers, particularly those in fast-food restaurants, teach new workers using self-study programs, on-line programs, audiovisual presentations, and instructional booklets that explain food preparation and service skills. But most food and beverage serving and related workers pick up their skills by observing and working with more experienced workers. Some full-service restaurants also provide new dining room employees with some form of classroom training that alternates with periods of on-the-job work experience. These training programs communicate the operating philosophy of the restaurant, help establish a personal rapport with other staff, teach formal serving techniques, and instill a desire to work as a team. They also provide an opportunity to discuss customer service situations and the proper ways to handle unpleasant circumstances or unruly patrons.

Some food serving workers can acquire more skills by attending relevant classes offered by public or private vocational schools, restaurant associations, or large restaurant chains. Some bartenders acquire their skills through formal vocational training either by attending a school for bartending or a vocational and technical school where bartending classes are taught. These programs often include instruction on State and local laws and regulations, cocktail recipes, proper attire and conduct, and stocking a bar. Some of these schools help their graduates find jobs. Although few employers require any minimum level of educational attainment, some specialized training is usually needed in food handling and legal issues surrounding serving alcoholic beverages. Employers are more likely to hire and promote employees based on people skills and personal qualities than education.

Other qualifications. Restaurants rely on good food and customer service to retain loyal customers and succeed in a competitive industry. Food and beverage serving and related workers who exhibit excellent personal qualities—such as a neat appearance, an ability to work as part of a team, and a natural rapport with customers—will be highly sought after. Most States require workers who serve alcoholic beverages to be at least 18 years of age, but some States require servers to be older. For bartender jobs, many employers prefer to hire people who are 25 or older. All servers that serve alcohol need to be familiar with State and local laws concerning the sale of alcoholic beverages.

Waiters and waitresses need a good memory to avoid confusing customers' orders and to recall faces, names, and preferences of frequent patrons. Knowledge of a foreign language can be helpful to communicate with a diverse clientele and staff. Restaurants and hotels that have rigid table service standards often offer higher wages and have greater income potential from tips, but they may also have stiffer employment require-

ments, such as prior table service experience or higher education attainment than other establishments.

Advancement. Due to the relatively small size of most food-serving establishments, opportunities for promotion are limited. After gaining experience, some dining room and cafeteria attendants and bartender helpers advance to waiter, waitress, or bartender jobs. For waiters, waitresses, and bartenders, advancement usually is limited to finding a job in a busier or more expensive restaurant or bar where prospects for tip earnings are better. Some bartenders, hosts and hostesses, and waiters and waitresses advance to supervisory jobs, such as dining room supervisor, maitre d', assistant manager, or restaurant general manager. A few bartenders open their own businesses. In larger restaurant chains, food and beverage service workers who excel often are invited to enter the company's formal management training program. (For more information, see food service managers elsewhere in the *Handbook*.)

Employment

Food and beverage serving and related workers held 7.7 million jobs in 2008. The distribution of jobs among the various food and beverage serving occupations was as follows:

Combined food preparation and serving workers, including fast food.....	2,701,700
Waiters and waitresses	2,381,600
Counter attendants, cafeteria, food concession, and coffee shop.....	525,400
Dishwashers	522,900
Bartenders	508,700
Dining room and cafeteria attendants and bartender helpers	420,700
Hosts and hostesses, restaurant, lounge, and coffee shop.....	350,700
Food servers, nonrestaurant.....	189,800
All other food preparation and serving related workers	50,900

The overwhelming majority of jobs for food and beverage serving and related workers were found in food services and drinking places, such as restaurants, fast food outlets, bars, and catering or contract food service operations. Other jobs were in hotels, motels, and other traveler accommodation establishments; amusement, gambling, and recreation establishments; educational services; nursing care facilities; and civic and social organizations.

Jobs are located throughout the country but are more plentiful in larger cities and tourist areas. Vacation resorts offer seasonal employment.

Job Outlook

Average employment growth is expected, and job opportunities should be excellent for food and beverage serving and related workers as turnover is generally very high among these workers, but job competition is often keen for jobs at upscale restaurants.

Employment change. Overall employment of these workers is expected to increase by 10 percent over the 2008-18 decade, which is about as fast as the average for all occupations. Food and beverage serving and related workers are projected to have one of the largest numbers of new jobs arise, about 761,000,

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Food and beverage serving and related workers	—	7,652,400	8,413,100	760,700	10
Food and beverage serving workers.....	35-3000	6,307,200	6,962,300	655,100	10
Bartenders	35-3011	508,700	549,500	40,800	8
Fast food and counter workers	35-3020	3,227,100	3,670,400	443,300	14
Combined food preparation and serving workers, including fast food	35-3021	2,701,700	3,096,000	394,300	15
Counter attendants, cafeteria, food concession, and coffee shop	35-3022	525,400	574,400	49,000	9
Waiters and waitresses	35-3031	2,381,600	2,533,300	151,600	6
Food servers, nonrestaurant	35-3041	189,800	209,100	19,300	10

Hosts and hostesses, restaurant, lounge, and coffee shop.....	35-9031	350,700	373,400	22,800	6
Food preparation and serving related workers, all other.....	35-9099	50,900	50,000	-900	-2

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

over this period. The growth in jobs is expected to increase as the population continues to expand. However, employment will grow more slowly than in the past as people change their dining habits. The growing popularity of take-out food and the growing number and variety of places that offer carryout options, including at many full-service restaurants, will slow the growth of waiters and waitresses and other serving workers.

Projected employment growth will vary by job type. Employment of combined food preparation and serving workers, which includes fast-food workers, is expected to increase faster than the average for all occupations. The limited service segment of the food services and drinking places industry has a low price advantage, fast service, and has been adding healthier foods. Slower than average employment growth is expected for waiters and waitresses, hosts and hostesses, and dining room and cafeteria attendants and bartender helpers, as more people use take-out service. Employment of bartenders, dishwashers, and counter attendants, cafeteria, food concession, and coffee shop will grow about as fast as average. Nonrestaurant servers, such as those who deliver food trays in hotels, hospitals, residential care facilities, or catered events, are expected to have average employment growth.

Job prospects. Job opportunities at most eating and drinking places will be excellent because many people in these occupations change jobs frequently, which creates a large number of openings. Keen competition is expected, however, for jobs in popular restaurants and fine dining establishments, where potential earnings from tips are greatest.

Earnings

Food and beverage serving and related workers derive their earnings from a combination of hourly wages and customer tips. Earnings vary greatly, depending on the type of job and establishment. For example, fast-food workers and hosts and hostesses usually do not receive tips, so their wage rates may be higher than those of waiters and waitresses and bartenders in full-service restaurants, but their overall earnings might be lower. In many full-service restaurants, tips are higher than

wages. In some restaurants, workers contribute all or a portion of their tips to a tip pool, which is distributed among qualifying workers. Tip pools allow workers who don't usually receive tips directly from customers, such as dining room attendants, to feel a part of a team and to share in the rewards of good service.

In May 2008, median hourly wages (including tips) of waiters and waitresses were \$8.01. The middle 50 percent earned between \$7.32 and \$10.35. The lowest 10 percent earned less than \$6.73, and the highest 10 percent earned more than \$14.26 an hour. For most waiters and waitresses, higher earnings are primarily the result of receiving more in tips rather than higher hourly wages. Tips usually average between 10 percent and 20 percent of guests' checks; waiters and waitresses working in busy or expensive restaurants earn the most.

Bartenders had median hourly wages (including tips) of \$8.54. The middle 50 percent earned between \$7.53 and \$10.98. The lowest 10 percent earned less than \$7.00, and the highest 10 percent earned more than \$14.93 an hour. Like waiters and waitresses, bartenders employed in public bars may receive more than half of their earnings as tips. Service bartenders often are paid higher hourly wages to offset their lower tip earnings.

Median hourly wages (including tips) of dining room and cafeteria attendants and bartender helpers were \$8.05. The middle 50 percent earned between \$7.39 and \$9.44. The lowest 10 percent earned less than \$6.82, and the highest 10 percent earned more than \$11.67 an hour. Most received over half of their earnings as wages; the rest of their income was a share of the proceeds from tip pools.

Median hourly wages of hosts and hostesses were \$8.42. The middle 50 percent earned between \$7.50 and \$9.70. The lowest 10 percent earned less than \$6.88, and the highest 10 percent earned more than \$11.89 an hour. Wages comprised the majority of their earnings. In some cases, wages were supplemented by proceeds from tip pools.

Median hourly wages of combined food preparation and serving workers, including fast food, were \$7.90. The middle 50 percent earned between \$7.26 and \$9.12. The lowest 10 percent earned less than \$6.67, and the highest 10 percent earned

more than \$10.67 an hour. Although some combined food preparation and serving workers receive a part of their earnings as tips, fast-food workers usually do not.

Median hourly wages of counter attendants in cafeterias, food concessions, and coffee shops (including tips) were \$8.42. The middle 50 percent earned between \$7.57 and \$9.64 an hour. The lowest 10 percent earned less than \$6.97, and the highest 10 percent earned more than \$11.73 an hour.

Median hourly wages of dishwashers were \$8.19. The middle 50 percent earned between \$7.47 and \$9.35. The lowest 10 percent earned less than \$6.90, and the highest 10 percent earned more than \$10.74 an hour.

Median hourly wages of food servers outside of restaurants were \$9.32. The middle 50 percent earned between \$7.93 and \$11.64. The lowest 10 percent earned less than \$7.20, and the highest 10 percent earned more than \$14.69 an hour.

Many beginning or inexperienced workers earn the Federal minimum wage (\$7.25 per hour as of July 24, 2009), but many States set minimum wages higher than the Federal minimum. Also, various minimum wage exceptions apply under specific circumstances to disabled workers, full-time students, youth under age 20 in their first 90 days of employment, tipped employees, and student-learners. Tipped employees are those who customarily and regularly receive more than \$30 a month in tips. The employer may consider tips as part of wages, but the employer must pay at least \$2.13 an hour in direct wages.

Many employers provide free meals and furnish uniforms, but some may deduct from wages the cost, or fair value, of any meals or lodging provided. Food and beverage service workers who work full time often receive typical benefits, but part-time workers usually do not. In some large restaurants and hotels, food and beverage serving and related workers belong to

unions—principally the Unite HERE and the Service Employees International Union.

Building and Grounds Cleaning and Maintenance Occupations

Building Cleaning Workers

Significant Points

- Entry-level workers need no formal education and learn on the job.
- Most job openings result from the need to replace the many workers who leave this very large occupation.
- Job prospects are expected to be good.

Nature of the Work

Building cleaning workers keep office buildings, hospitals, stores, apartment houses, hotels, and residences clean, sanitary, and in good condition. Some do only cleaning, while others have a wide range of duties.

Janitors and cleaners perform a variety of heavy cleaning duties, such as cleaning floors, shampooing rugs, washing walls

and glass, and removing trash. They may fix leaky faucets, empty trash cans, do painting and carpentry, replenish bathroom supplies, mow lawns, and see that heating and air-conditioning equipment works properly. On a typical day, janitors may wet-or-dry-mop floors, clean bathrooms, vacuum carpets, dust furniture, make minor repairs, and exterminate insects and rodents. They may also clean snow or debris from sidewalks in front of buildings and notify management of the need for major repairs. While janitors typically perform most of the duties mentioned, cleaners tend to work for companies that specialize in one type of cleaning activity, such as washing windows.

Maids and housekeeping cleaners perform any combination of light cleaning duties to keep private households or commercial establishments, such as hotels, restaurants, hospitals, and nursing homes, clean and orderly. In private households, they dust and polish furniture; sweep, mop, and wax floors; vacuum; and clean ovens, refrigerators, and bathrooms. They also may wash dishes, polish silver, and change and make beds. Some

Building cleaning workers are employed in hospitals, office buildings, and other settings.

wash, fold, and iron clothes; a few wash windows. General houseworkers also may take clothes and laundry to the cleaners, buy groceries, and perform other errands. In hotels, aside from cleaning and maintaining the premises, maids and housekeeping cleaners may deliver ironing boards, cribs, and rollaway beds to guests' rooms. In hospitals, they also may wash bed frames, make beds, and disinfect and sanitize equipment and supplies with germicides. Janitors, maids, and cleaners use many kinds of equipment, tools, and cleaning materials. For one job, they may need standard cleaning implements; another may require an electric floor polishing machine and a special cleaning solution. Improved building materials, chemical cleaners, and power equipment have made many tasks easier and less time consuming, but cleaning workers must learn the proper use of equipment and cleaners to avoid harming floors, fixtures, building occupants, and themselves.

Cleaning supervisors coordinate, schedule, and supervise the activities of janitors and cleaners. They assign tasks and inspect building areas to see that work has been done properly; they also issue supplies and equipment and inventory stocks to ensure that supplies on hand are adequate. They may be expected to screen and hire job applicants; train new and experienced employees; and recommend promotions, transfers, or dismissals. Supervisors may prepare reports concerning the occupancy of rooms, hours worked, and department expenses. Some also perform cleaning duties.

Building cleaning workers in large office and residential buildings, and more recently in large hotels, often work in teams consisting of workers who specialize in vacuuming, picking up trash, and cleaning restrooms, among other things. Supervisors conduct inspections to ensure that the building is cleaned properly and the team is functioning efficiently. In hotels, one member of the team is responsible for reporting electronically to the supervisor when rooms are cleaned.

Work environment. Because office buildings generally are cleaned while they are empty, many cleaning workers work evening hours. Some, however, such as school and hospital custodians, work in the daytime. When there is a need for 24-hour maintenance, janitors may be assigned to shifts. Many full-time building cleaners worked about 40 hours a week in 2008, but a

substantial number worked part time. Part-time cleaners usually work in the evenings and on weekends.

Most building cleaning workers work indoors, but some work outdoors part of the time, sweeping walkways, mowing lawns, or shoveling snow. Working with machines can be noisy, and some tasks, such as cleaning bathrooms and trash rooms, can be dirty and unpleasant. Building cleaning workers experience injuries more frequently than workers in most other occupations. They may suffer cuts, bruises, and burns from machines, handtools, and chemicals. They spend most of their time on their feet, sometimes lifting or pushing heavy furniture or equipment. Many tasks, such as dusting or sweeping, require constant bending, stooping, and stretching. Lifting the increasingly heavier mattresses at nicer hotels in order to change the linens can cause back injuries and sprains.

Training, Other Qualifications, and Advancement

Most building cleaning workers, except supervisors, do not need any formal education and mainly learn their skills on the job or in informal training sessions sponsored by their employers. Supervisors, though, generally have at least a high school diploma and often some college.

Education and training. No special education is required for most entry-level janitorial or cleaning jobs, but workers should be able to perform simple arithmetic and follow instructions. High school shop courses are helpful for jobs involving repair work. Most building cleaners learn their skills on the job. Beginners usually work with an experienced cleaner, doing routine cleaning. As they gain more experience, they are assigned more complicated tasks. In some cities, programs run by unions, government agencies, or employers teach janitorial skills. Students learn how to clean buildings thoroughly and efficiently; how to select and safely use various cleansing agents; and how to operate and maintain machines, such as wet-and-dry vacuums, buffers, and polishers. Students learn to plan their work, to follow safety and health regulations, to interact positively with people in the buildings they clean, and to work without supervision. Instruction in minor electrical, plumbing, and other repairs also may be given.

Supervisors of building cleaning workers usually need at least a high school diploma, but many have completed some college or earned a degree, especially those who work at places where clean rooms and well-functioning buildings are a necessity, such as in hospitals and hotels. In many establishments, they are required to take some in-service training to improve their housekeeping techniques and procedures and to enhance their supervisory skills.

Other qualifications. Employers usually look for dependable, hard-working individuals who are in good health, follow directions well, and get along with other people.

Certification and advancement. A small number of cleaning supervisors and managers are members of the International Executive Housekeepers Association, which offers two kinds of certification programs for cleaning supervisors and managers: Certified Executive Housekeeper (CEH) and Registered Executive Housekeeper (REH). The CEH designation is offered to those with a high school education, while the REH designation is offered to those who have a 4-year college degree. Both designations are earned by attending courses and passing exams

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Building cleaning workers	–	4,139,000	4,343,300	204,300	5
First-line supervisors/managers of housekeeping and janitorial workers.....	37-1011	251,100	263,900	12,800	5
Building cleaning workers	37-2010	3,887,900	4,079,400	191,500	5
Janitors and cleaners, except maids and housekeeping cleaners.....	37-2011	2,375,300	2,479,400	104,100	4
Maids and housekeeping cleaners.....	37-2012	1,498,200	1,583,700	85,600	6
Building cleaning workers, all other	37-2019	14,500	16,200	1,700	12

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

and both must be renewed every 3 years to ensure that workers keep abreast of new cleaning methods. Those with the REH designation usually oversee the cleaning services of hotels, hospitals, casinos, and other large institutions that rely on well-trained experts for their cleaning needs.

Advancement opportunities for workers usually are limited in organizations where they are the only maintenance worker. Where there is a large maintenance staff, however, cleaning workers can be promoted to supervisor or to area supervisor or manager. Some janitors open their own maintenance or cleaning businesses.

Employment

Building cleaning workers held about 4.1 million jobs in 2008. About 299,000 were self-employed.

Janitors and cleaners worked in nearly every type of establishment and held about 2.4 million jobs. Around 33 percent of janitors worked for firms supplying services to buildings and dwellings, about 20 percent were employed in educational services, and 6 percent worked in government. About 132,700 were self employed.

Maids and housekeepers held about 1.5 million jobs. Private households employed about 30 percent of these workers, while hotels, motels, and other traveler accommodations employed 29 percent. Hospitals, nursing homes, and other residential care facilities employed about 17 percent. Although cleaning jobs can be found in all cities and towns, most are located in highly populated areas where there are many office buildings, schools, apartment houses, nursing homes, and hospitals. About 106,900 maids and housekeeping cleaners were self employed in 2008.

First-line supervisors of housekeeping and janitorial workers held 251,100 jobs. Approximately 22 percent worked in firms supplying services to buildings and dwellings, while approximately 15 percent were employed in educational services. About 12 percent worked in hotels, motels, and all other traveler accommodation while about 9 percent worked in health-care organizations. About 58,400 were self employed.

Job Outlook

Overall employment of building cleaning workers is expected to grow more slowly than the average, and job opportunities are expected to be good.

Employment change. The number of building cleaning workers is expected to grow by 5 percent from 2008 and 2018, more slowly than the average for all occupations. Unlike some occupations, increased productivity is not expected to

impact the employment of building cleaning workers. Despite small improvements in cleaning supplies, tools, and processes, roughly the same number of workers will be needed for any given building.

Employment of janitors and cleaners is projected to increase by 4 percent, more slowly than the average for all occupations. As the pace of construction contracts and fewer buildings are built, growth in this occupation should be relatively slow. Many new jobs are expected in healthcare, however, as this industry is expected to grow rapidly, and in administrative support firms as more claiming work is contracted out. Employment of maids and housekeeping cleaners is also expected to increase more slowly than the average, growing by 6 percent from 2008 to 2018. Many new jobs are expected in hotels as demand for accommodations increases, in private households as more people purchase residential cleaning services, and companies that supply maid services on a contract basis, as more of this work is contracted out. Employment of supervisors and managers of these workers, in addition, is expected to grow more slowly than the average, increasing by 5 percent. An increasing number of supervisors will be needed to manage the growing number of janitors, maids, and other cleaning workers.

Job prospects. Job prospects are expected to be good. Most job openings should result from the need to replace the many workers who leave this very large occupation.

Earnings

Median hourly wages of janitors and cleaners, except maids and housekeeping cleaners, were \$10.31 in May 2008. The middle 50 percent earned between \$8.42 and \$13.30. The lowest 10 percent earned less than \$7.41 and the highest 10 percent earned more than \$17.08. Median hourly wages in May 2008 in the industries employing the largest numbers of janitors and cleaners, except maids and housekeeping cleaners, were as follows:

Local government.....	\$12.82
Elementary and secondary schools	12.45
General medical and surgical hospitals.....	11.42
Colleges, universities, and professional schools	11.90
Services to buildings and dwellings.....	9.31

Median hourly wages of maids and housekeeping cleaners were \$9.13 in May 2008. The middle 50 percent earned between \$7.92 and \$11.10. The lowest 10 percent earned less than \$7.09, and the highest 10 percent earned more than \$13.72.

Median hourly wages in general medical and surgical hospitals were \$10.31, while median hourly wages in the traveler accommodation industry were \$8.75 in May 2008.

Median hourly wages of wage-and-salary first-line supervisors and managers of housekeeping and janitorial workers were \$16.34 in May 2008. The middle 50 percent earned between \$12.82 and \$21.07. The lowest 10 percent earned less than \$10.33, and the highest 10 percent earned more than \$26.29. Median hourly wages in May 2008 in the industries employing the largest numbers of first-line supervisors and managers of housekeeping and janitorial workers were as follows:

Local government.....	19.65
Elementary and secondary schools	18.84
Nursing care facilities	15.78
Services to buildings and dwellings.....	15.39
Traveler accommodation	14.07

Related Occupations

Workers who also specialize in one of the many job functions of janitors and cleaners include:

Grounds Maintenance Workers

Significant Points

- Most grounds maintenance workers need no formal education and are trained on the job; however, some workers may require formal education.
- Occupational characteristics include full-time and part-time jobs, seasonal jobs, physically demanding work, and low earnings.
- Job opportunities are expected to be good.

Nature of the Work

Grounds maintenance workers perform a variety of tasks necessary to achieve a pleasant and functional outdoor environment. They mow lawns, rake leaves, trim hedges and trees; plant flowers; and otherwise ensure that the grounds of houses, businesses, and parks are attractive, orderly, and healthy. They also

care for indoor gardens and plantings in commercial and public facilities, such as malls, hotels, and botanical gardens.

These workers use handtools such as shovels, rakes, pruning and handsaws, hedge and brush trimmers, and axes. They also use power lawnmowers, chain saws, leaf blowers, and electric clippers. Some use equipment such as tractors and twin-axle vehicles.

Grounds maintenance workers can be divided into several specialties, including landscaping workers, groundskeeping workers, pesticide handlers, tree trimmers, and grounds maintenance supervisors. In general, these specialties have varying job duties, but in many cases their responsibilities overlap.

Landscaping workers create new functional outdoor areas and upgrade existing landscapes, but also may help maintain landscapes. Their duties include planting bushes, trees, sod, and other forms of vegetation, as well as, edging, trimming, fertilizing, watering, and mulching lawns and grounds. They also grade property by creating or smoothing hills and inclines, install lighting or sprinkler systems, and build walkways, terraces, patios, decks, and fountains. Landscaping workers provide their services in a variety of residential and commercial settings, such as homes, apartment buildings, office buildings, shopping malls, and hotels and motels.

Groundskeeping workers, also called *groundskeepers*, usually focus on maintaining existing grounds. In addition to caring for sod, plants, and trees, they rake and mulch leaves, clear snow from walkways and parking lots, and use irrigation methods to adjust water consumption and prevent waste. These individuals work on athletic fields, golf courses, cemeteries, university campuses, and parks, as well as many of the same settings as landscaping workers. They also see to the proper upkeep and repair of sidewalks, parking lots, groundskeeping equipment, pools, fountains, fences, planters, and benches.

Groundskeeping workers who care for athletic fields keep natural and artificial turf in top condition, mark out boundaries, and paint turf with team logos and names before events. They mow, water, fertilize, and aerate the fields regularly. They must make sure that the underlying soil on fields with natural turf has the required composition to allow proper drainage and to support the grasses used on the field. In sports venues, they vacuum and disinfect synthetic turf after its use to prevent the growth of harmful bacteria, and they remove the turf and replace the cushioning pad periodically.

Groundskeepers in parks and recreation facilities care for lawns, trees, and shrubs; maintain playgrounds; clean buildings; and keep parking lots, picnic areas, and other public spaces free of litter. They also may erect and dismantle snow fences, and maintain swimming pools. These workers inspect buildings and equipment, make needed repairs, and keep everything freshly painted.

Workers who maintain golf courses are called *greenskeepers*. Greenskeepers do many of the same things as other groundskeepers, but they also periodically relocate the holes on putting greens to prevent uneven wear of the turf and to add interest and challenge to the game. Greenskeepers also keep canopies, benches, ball washers, and tee markers repaired and freshly painted.

Some groundskeepers specialize in caring for cemeteries and memorial gardens. They dig graves to specified depths, gener-

Grounds maintenance workers mow lawns and trim hedges and trees.

ally using a backhoe. They mow grass regularly, apply fertilizers and other chemicals, prune shrubs and trees, plant flowers, and remove debris from graves.

Pesticide handlers, sprayers, and applicators, vegetation mix herbicides, fungicides, or insecticides and apply them through sprays, dusts, or vapors into the soil or onto plants. Those working for chemical lawn service firms are more specialized, inspecting lawns for problems and applying fertilizers, pesticides, and other chemicals to stimulate growth and prevent or control weeds, diseases, or insect infestation. Many practice integrated pest-management techniques.

Tree trimmers and pruners, sometimes called *arborists*, cut away dead or excess branches from trees or shrubs to clear roads, sidewalks, or utilities' equipment, or to improve the appearance, health, and value of trees. Some specialize in diagnosing and treating tree diseases, and in performing preventive measures to keep trees healthy. Some may plant trees. Some of these workers also specialize in pruning, trimming and shaping ornamental trees and shrubs for private residences, golf courses, or other institutional grounds. Tree trimmers and pruners use handsaws, pole saws, shears, and clippers. When trimming near power lines, they usually work on truck-mounted lifts and use power pruners.

Supervisors of landscaping and groundskeeping workers oversee grounds maintenance work. They prepare cost estimates, schedule work for crews on the basis of weather conditions or the availability of equipment, perform spot checks to ensure the quality of the service, and suggest changes in work procedures. In addition, supervisors train workers; keep employees' time records and record work performed; and may assist workers when deadlines are near. Supervisors who own their own business are also known as *landscape contractors*. They also often call themselves *landscape designers* if they create landscape design plans. Landscape designers also design exterior floral displays by planting annual or perennial flowers. Some work with landscape architects. (Landscape architects, discussed elsewhere in the *Handbook*, create more technical architectural plans and usually work on larger projects.) Supervisors of workers on golf courses are known as *superintendents*.

Work environment. Many grounds maintenance jobs are seasonal, available mainly in the spring, summer, and fall, when most planting, mowing, trimming, and cleanup are necessary. Most of the work is performed outdoors in all kinds of weather. It can be physically demanding and repetitive, involving bending, lifting, and shoveling. This occupation offers opportunities for both part-time and full-time work.

According to BLS data, full-time landscaping and groundskeeping workers, tree trimmers and pruners, and the supervisors of these workers experienced a much higher than average rate of work-related injury and illness. Those who work with pesticides, fertilizers, and other chemicals, as well as dangerous equipment and tools such as power lawnmowers and chain saws, must exercise safety precautions. Workers who use motorized equipment must take care to protect their hearing.

Training, Other Qualifications, and Advancement

Most grounds maintenance workers need no formal education and are trained on the job. However, some workers may require formal education in areas such as landscape design, horticulture, or business management.

Education and training. There usually are no minimum educational requirements for entry-level positions in grounds maintenance. In 2008, most workers had no education beyond high school. A short period of on-the-job training generally is sufficient to teach new hires the necessary skills, which often include planting and maintenance procedures; the operation of mowers, trimmers, leaf blowers, small tractors and other equipment; and proper safety procedures. Large institutional employers such as golf courses or municipalities may supplement on-the-job training with coursework in subjects like horticulture or small engine repair. A bachelor's degree may be needed for those who want to become specialists.

Supervisors may need a high school diploma, and may receive several months of on-the-job training. Formal training in landscape design, horticulture, arboriculture, or business may improve an applicant's chances for employment. Landscape designers may be required to obtain such training.

Licensure. Most States require licensure or certification for workers who apply pesticides. Requirements vary but usually include passing a test on the proper use and disposal of insecti-

cides, herbicides, and fungicides. Some States also require that landscape contractors be licensed.

Other qualifications. Employers look for responsible, self-motivated individuals because grounds maintenance workers often work with little supervision. Employers want people who can learn quickly and follow instructions accurately so that time is not wasted and plants are not damaged. Driving a vehicle is often needed for these jobs. If driving is required, preference is given to applicants with a driver's license, a good driving record, and experience driving a truck.

Certification and advancement. Laborers who demonstrate a proficiency in the work and have good communication skills may advance to crew leader or other supervisory positions. Becoming a grounds manager or landscape contractor may require some formal education beyond high school in addition to several years of experience. Some workers with groundskeeping backgrounds may start their own businesses after several years of experience.

Certification from a professional organization may improve a worker's chances for advancement. The Professional Grounds Management Society offers voluntary certification to grounds managers who have a bachelor's degree in a relevant major with at least 4 years of experience, including 2 years as a supervisor; an associate degree in a relevant major with 6 years of experience, including 3 years as a supervisor; or 8 years of experience including 4 years as a supervisor, and no degree. Additionally, candidates for certification must pass two examinations covering subjects such as insects and diseases, soils, trees and shrubs, turf management, irrigation, and budgets and finances. This organization also offers certification for grounds technicians. Candidates for this program must have a high school diploma or GED as well as 2 years of work experience as a grounds technician.

The Professional Landcare Network offers six certifications for individuals with varying levels of experience, in landscaping and grounds maintenance. Each of these programs requires applicants to pass an examination, and some require self-study course work. The Tree Care Industry Association offers five levels of credentials. Currently available credentials include Tree Care Apprentice, Ground Operations Specialist, Tree Climber Specialist, Aerial Lift Specialist and Tree Care Specialist, as well as a certification program in safety. These programs are available to individuals with varying levels of experience, and require applicants to pass training courses.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Grounds maintenance workers.....	—	1,520,600	1,789,900	269,200	18
First-line supervisors/managers of landscaping, lawn service, and groundskeeping workers	37-1012	217,900	250,300	32,400	15
Grounds maintenance workers.....	37-3000	1,302,700	1,539,500	236,800	18
Landscaping and groundskeeping workers.....	37-3011	1,205,800	1,422,900	217,100	18
Pesticide handlers, sprayers, and applicators, vegetation	37-3012	30,800	36,300	5,400	18
Tree trimmers and pruners	37-3013	45,000	56,800	11,800	26
Grounds maintenance workers, all other.....	37-3019	21,100	23,600	2,500	12

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Employment

Grounds maintenance workers held about 1.5 million jobs in 2008. Employment was distributed as follows:

Landscaping and groundskeeping workers	1,205,800
First-line supervisors/managers of landscaping, lawn service, and groundskeeping workers.....	217,900
Tree trimmers and pruners	45,000
Pesticide handlers, sprayers, and applicators, vegetation.....	30,800
Grounds maintenance workers, all other.....	21,100

About 36 percent of all grounds maintenance workers were employed in companies providing landscaping services to buildings and dwellings. Others worked for educational institutions, public and private. Some were employed by local governments, installing and maintaining landscaping for parks, hospitals, and other public facilities. Around 402,000 grounds maintenance workers were self-employed, providing landscape maintenance directly to customers on a contract basis.

Job Outlook

Employment is expected to grow faster than average, and job opportunities should be good.

Employment change. Employment of grounds maintenance workers is expected to increase by 18 percent during the 2008–18 decade, which is faster than the average for all occupations. In addition, grounds maintenance workers will be among the occupations with largest numbers of new jobs, with around 269,200. More workers will be needed to keep up with increasing demand for lawn care and landscaping services both from large institutions and from individual homeowners.

Major institutions, such as universities and corporate headquarters, recognize the importance of good landscape design in attracting personnel and clients and are expected to continue to use grounds maintenance services to maintain and upgrade their properties. Homeowners are also a growing source of demand for grounds maintenance workers. Many two-income households lack the time to take care of their lawns so they increasingly hire people to maintain them. Also, as the population ages, more elderly homeowners will require lawn care services to help maintain their yards.

Employment of tree trimmers and pruners should grow by 26 percent from 2008-18, which is much faster than the average for all occupations. In order to improve the environment, mu-

municipalities across the country are planting more trees in urban areas, increasing demand for these workers.

Job prospects. Job opportunities are expected to be good. Openings will arise from faster-than-average growth and the need to replace workers who leave this large occupation.

Job opportunities for nonseasonal work are best in regions with temperate climates, where landscaping and lawn services are required all year. Opportunities may vary with local economic conditions.

Earnings

Wages of grounds maintenance workers are low. Median hourly wages of landscaping and groundskeeping workers were \$11.13 in May 2008. The middle 50 percent earned between \$9.09 and \$14.01 per hour. The lowest 10 percent earned less than \$7.98 per hour, and the highest 10 percent earned more than \$17.57. Median hourly wages in the largest employing industries of landscaping and groundskeeping workers in May 2008 were as follows:

Elementary and secondary schools	\$13.70
Local government.....	12.65
Services to buildings and dwellings	11.11
Other amusement and recreation industries	10.01
Employment services	9.92

Median hourly wages of pesticide handlers, sprayers, and applicators, vegetation were \$14.31 in May 2008. The middle 50 percent earned between \$11.61 and \$17.86 per hour. The lowest 10 percent earned less than \$9.53 per hour, and the highest 10 percent earned more than \$21.59. Median hourly wages in the services to buildings and dwellings industry were \$14.51 in May 2008.

Median hourly wages of tree trimmers and pruners were \$14.41 in May 2008. The middle 50 percent earned between \$11.50 and \$18.18 per hour. The lowest 10 percent earned less than \$9.62 per hour, and the highest 10 percent earned more than \$22.34. Median hourly wages in the services to buildings and dwellings industry were \$14.04 in May 2008.

Median hourly wages of first-line supervisors/managers of landscaping, lawn service, and groundskeeping workers were \$19.19 in May 2008. The middle 50 percent earned between \$15.22 and \$24.90 per hour. The lowest 10 percent earned less than \$12.57 per hour, and the highest 10 percent earned more than \$31.33. Median hourly wages in the largest employing industries of first-line supervisors/managers of landscaping, lawn service, and groundskeeping workers in May 2008 were as follows:

Local government.....	\$22.89
Other amusement and recreation industries	20.82
Services to buildings and dwellings	18.50

Pest Control Workers

Significant Points

- A high school diploma generally is the minimum educational requirement.
- States require pest control workers to be licensed through training and examination.
- Job prospects are expected to be very good.

Nature of the Work

Unwanted creatures that infest buildings or surrounding areas can pose serious risks to health and safety. *Pest control workers* remove these creatures from households, apartment buildings, places of businesses, and other structures, to protect people and maintain structural integrity.

Common pests include roaches, rats, mice, spiders, termites, ants, and bedbugs. Using information about pests' biology and habits, along with an arsenal of pest management techniques, pest control workers locate, identify, and remove pests. They set traps, apply pesticides, and even modify structures at the discretion of the customer.

Many pest problems require pesticide application. Pest control workers use two different types of pesticides—general use and restricted use. General use pesticides are the most widely used and are available in diluted concentrations to the public. Restricted use pesticides are used for the most severe infestations and are available only to licensed professionals. Because of their potential harm to pest control workers, customers, and the environment, restricted-use pesticides are heavily regulated by Federal law.

For some jobs, pest control workers use a combination of pest management techniques, a practice known as integrated pest management. One method involves using proper sanitat-

tion and creating physical barriers. Pests cannot survive without food and will not infest a building if they cannot enter it. Another method involves using baits that either destroy the pests or prevent them from reproducing. Yet another method involves using mechanical devices, such as traps, that remove pests from the immediate environment.

Some workers use pest-management technology to make home inspections more efficient. This technology, which uses microchips to identify areas of pest activity, is used most frequently for termites. The chips, which are placed in baiting stations, emit signals that can tell pest control workers if termites are present. Workers pick up the signals using a device similar to a metal detector, allowing them to quickly evaluate an entire building.

Pest control workers generally can be divided into three categories: technicians, applicators, and supervisors. Position titles and job duties vary by State, however.

Pest control technicians are usually entry-level workers who identify potential pest problems, conduct inspections, and design control strategies. They work directly with the customer and are permitted to apply a limited range of pesticides.

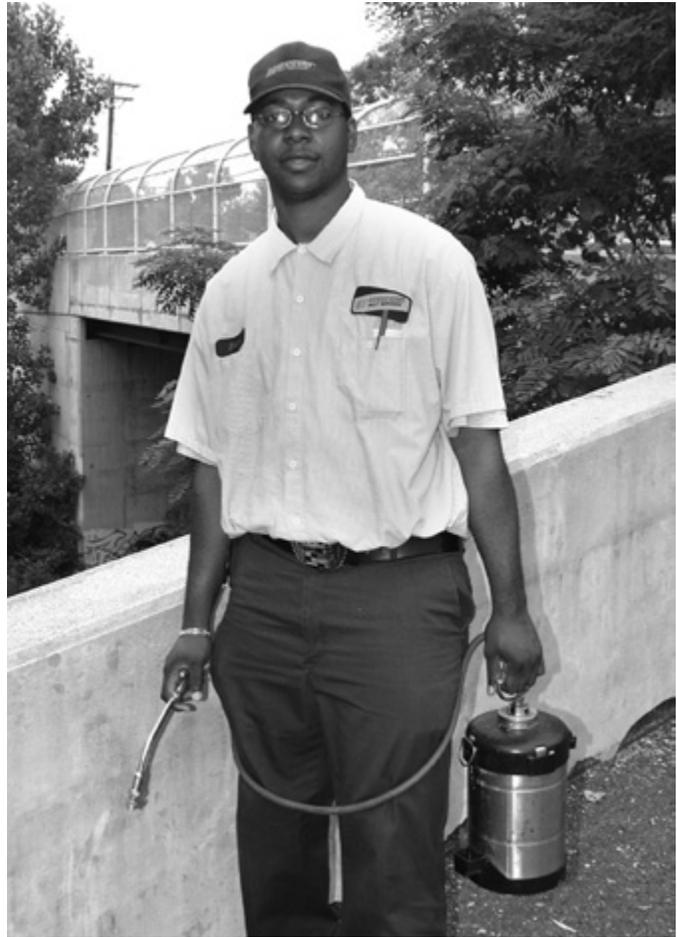

Applicators perform more complex tasks, are able to use a wider range of pesticides, and may specialize in a certain area of pest control. Those that specialize in controlling termites are called *termite control technicians*. They use chemicals and modify structures to eliminate termites and prevent future infestation. To treat infested areas, termite control technicians drill holes and cut openings into buildings to access infestations and install physical barriers or bait systems around the structure. Some termite control technicians even repair structural damage caused by termites.

Applicators that specialize in fumigation are called *Fumigators*. These workers use poisonous gases, called fumigants, to treat serious infestations. Fumigators pre-treat infested buildings by examining, measuring, and sealing the buildings. Then, using cylinders, hoses, and valves, they fill structures with the proper amount and concentration of fumigant. To prevent accidental fumigant exposure, fumigators padlock doors, post warning signs, and monitor buildings closely to detect and stop leaks.

Pest control supervisors, also known as operators, direct technicians and applicators. Supervisors are licensed to apply pesticides, but they usually are more involved in running the business. Many supervisors own their own business. Supervisors are responsible for ensuring that employees obey rules regarding pesticide use and resolving any problems that arise with regulatory officials or customers. Most States require each pest control establishment to have a supervisor.

Work environment. Because work must be done on site, pest control workers travel to visit clients. Pest control workers must kneel, bend, reach, and crawl to inspect and treat structures. They work both indoors and out, in all weather conditions. Applicators must wear heavy protective gear, including respirators, gloves, and goggles, when working with pesticides.

There are health risks associated with pesticide use. Various pest control chemicals are toxic and could be harmful, if not used properly. Health risks are limited by the extensive training required for licensure and the use of recommended protective

Pest control workers help to keep buildings free of insects, rodents, and other animals.

equipment. However, pest control workers still experience injuries more frequently than workers in many other occupations.

Most pest control workers work around 40 hours per week, but about 16 percent worked more than 50 hours per week in 2008. Pest control workers often work evenings and weekends, but many work consistent shifts.

Training, Other Qualifications, and Advancement

State laws require pest control workers to be licensed. Most workers need a high school diploma and receive training on the job.

Education and training. A high school diploma or equivalent is the minimum qualification for most pest control jobs, but some jobs may not require any formal education. A college degree may be required for other jobs. Most pest control workers may begin their careers as technicians. They often receive both formal classroom and on-the-job training provided by the employer, but they also may be required to study on their own. Training usually involves a combination of classroom study and on-the-job experience for each category of work that the pest control worker would like to perform. Categories may include general pest control, rodent control, termite control, fumigation, and ornamental and turf control. In addition, technicians must attend general training in pesticide safety and use. Pest control workers usually can complete this training in fewer than 3 months.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Pest control workers.....	37-2021	67,500	77,800	10,300	15

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

After completing the required training, workers can provide supervised pest control services. Because pest control methods change, workers often attend continuing education classes, which are frequently provided by product manufacturers.

Licensure. Pest control workers must be licensed. Requirements vary by State, but pest control workers generally must undergo training and pass an examination. Some States also require workers to have a high school diploma or equivalent and pass a background check; some also have additional requirements for applicators and operators. Most pest control firms provide training and help their employees prepare for the examination. In some States, individuals may be able to work as apprentices before becoming licensed.

Other qualifications. Pest control workers must be in good health, because of the physical demands of the job, and they also must be able to withstand uncomfortable conditions—such as the heat of climbing into an attic in the summertime or the chill of sliding into a crawlspace during winter. In addition, many pest control companies require their employees to have a good driving record.

Advancement. Advancement opportunities come with experience in the field. After a designated number of years on the job, technicians may advance to become applicators. Applicators with several years of experience often become supervisors. Some experienced workers may start their own pest management company. Pest control workers in large organizations may advance into administrative positions, although a college degree may be required for such opportunities.

Employment

Pest control workers held about 67,500 jobs in 2008; about 86 percent of workers were employed in the exterminating and pest control services industry. About 7 percent of workers were self-employed. Jobs are concentrated in States with warmer climates and larger cities, due to the greater number of pests in these areas.

Job Outlook

Employment growth is expected to be faster than the average, and job prospects should be very good.

Employment change. Employment of pest control workers is expected to grow by 15 percent between 2008 and 2018, which is faster than the average for all occupations. Demand for pest control workers is projected to increase for a number of reasons. More people are expected to use pest control services as environmental and health concerns and improvements in the standard of living convince more people to hire professionals, rather than attempt pest control work themselves. Growth in the population, particularly in Sunbelt States where pests are more common, also will generate new residential, commercial, and government buildings that will require treatment by pest con-

trol workers. However, if the rate of new building construction moderates, employment growth of pest control workers may slow down.

Job prospects. Job prospects should be very good for qualified applicants, due to the limited number of people seeking work in this occupation. In addition to job growth, opportunities also should arise from the need to replace workers who leave the occupation.

Earnings

Median hourly wages of pest control workers were \$14.37 in May 2008. The middle 50 percent earned between \$11.68 and \$17.67. The lowest 10 percent earned less than \$9.45, and the top 10 percent earned over \$21.34. Wages may vary by job function.

Personal Care and Service Occupations

Animal Care and Service Workers

Significant Points

- Animal lovers get satisfaction in this occupation, but the work can be unpleasant, physically and emotionally demanding, and sometimes dangerous.
- Most workers are trained on the job, but employers generally prefer to hire people who have experience with animals; some jobs require formal education.
- Most positions will present excellent employment opportunities; however, keen competition is expected for jobs as zookeepers and marine mammal trainers.
- Earnings are relatively low.

Nature of the Work

Many people like animals. But, as pet owners will admit, taking care of them is hard work. *Animal care and service workers*—who include *animal caretakers* and *animal trainers*—train, feed, water, groom, bathe, and exercise animals and clean, disinfect, and repair their cages. They also play with the animals, provide companionship, and observe behavioral changes that could indicate illness or injury. Boarding kennels, pet stores, animal shelters, rescue leagues, veterinary hospitals and clinics, stables, laboratories, aquariums and natural aquatic habitats, and zoological parks all house animals and employ animal care and service workers. Job titles and duties vary by employment setting.

Kennel attendants care for pets while their owners are working or traveling out of town. Beginning attendants perform basic

tasks, such as cleaning both the cages and the dog runs, filling food and water dishes, and exercising animals. Experienced attendants may provide basic animal health care, as well as bathe animals, trim nails, and attend to other grooming needs. Attendants who work in kennels also may sell pet food and supplies, assist in obedience training, or prepare animals for shipping.

Groomers are animal caretakers who specialize in maintaining a pet's appearance. Most groom dogs and a few groom cats. Some groomers work in kennels, veterinary clinics, animal shelters, or pet supply stores. Others operate their own grooming business, typically at a salon or, increasingly, by making house calls. Such mobile services are growing rapidly because they offer convenience for pet owners, flexibility of schedules for groomers, and minimal trauma for pets resulting from their being in unfamiliar surroundings. Groomers clean and sanitize equipment to prevent the spread of disease, as well as maintaining a clean and safe environment for the animals. Groomers also schedule appointments, discuss pets' grooming needs with clients, and collect general information on the pets' health and behavior. Groomers sometimes are the first to notice a medical problem, such as an ear or skin infection, that requires veterinary care.

Grooming the pet involves several steps: an initial brush-out is followed by a clipping of hair with combs and grooming shears; the groomer then cuts the animal's nails, cleans the ears, bathes and blow-dries the animal, and ends with a final trim and styling.

Animal caretakers in animal shelters work mainly with cats and dogs and perform a variety of duties typically determined by the worker's experience. In addition to attending to the basic needs of the animals, caretakers at shelters keep records of the animals, including information about any tests or treatments performed on them. Experienced caretakers may vaccinate newly admitted animals under the direction of a veterinarian or veterinary technician and euthanize (painlessly put to death) seriously ill, severely injured, or unwanted animals. Animal caretakers in animal shelters also interact with the public, answering telephone inquiries, screening applicants who wish to adopt an animal, or educating visitors on neutering and other animal health issues.

Pet sitters look after one or more animals when their owner is away. They do this by traveling to the pet owner's home to carry out the daily routine. Most pet sitters feed, walk, and play with the animal, but some more experienced sitters also may be required to bathe, train, or groom them. Most watch over dogs and a few take care of cats. By not removing the pet from its normal surroundings, trauma is reduced and the animal can maintain its normal diet and exercise regimen.

Grooms, or caretakers, care for horses in stables. They saddle and unsaddle horses, give them rubdowns, and walk them to cool them off after a ride. They also feed, groom, and exercise the horses; clean out stalls and replenish bedding; polish saddles; clean and organize the tack (harness, saddle, and bridle) room; and store supplies and feed. Experienced grooms may help train horses.

In zoos, animal care and service workers, called *keepers*, prepare the diets and clean the enclosures of animals and sometimes assist in raising them when they are very young. They watch for any

Animal caretakers who specialize in grooming or maintaining a pet's appearance are called groomers.

signs of illness or injury, monitor eating patterns or any changes in behavior and record their observations. Keepers also may answer questions and ensure that the visiting public behaves responsibly toward the exhibited animals. Depending on the zoo, keepers may be assigned to work with a broad group of animals, such as mammals, birds, or reptiles, or they may work with a limited collection of animals such as primates, large cats, or small mammals.

Animal trainers train animals for riding, security, performance, obedience, or assisting people with disabilities. Animal trainers do this by accustoming the animal to the human voice and human contact and teaching the animal to respond to commands. The three most commonly trained animals are dogs, horses, and marine mammals, including dolphins and sea lions. Trainers use several techniques to help them train animals. One technique, known as a bridge, is a stimulus that a trainer uses to communicate the precise moment an animal does something correctly. When the animal responds correctly, the trainer gives positive reinforcement in a variety of ways: offering food, toys, play, and rubdowns or speaking the word “good.” Animal training takes place in small steps and often takes months and even years of repetition. During the teaching process, trainers provide animals with mental stimulation, physical exercise, and husbandry. A relatively new form of training teaches animals to cooperate with workers giving medical care: animals learn “veterinary” behaviors, such as allowing for the collection of blood samples; physical, x-ray, ultrasonic, and dental exams; physical therapy; and the administration of medicines and replacement fluids.

Training also can be a good tool for facilitating the relocation of animals from one habitat to another, easing, for example, the process of loading horses onto trailers. Trainers often work in competitions or shows, such as circuses, marine parks, and aquariums; many others work in animal shelters, dog kennels and salons, or horse farms. Trainers in shows work to display the talent and ability of an animal, such as a dolphin, through interactive programs to educate and entertain the public.

In addition to their hands-on work with the animals, trainers often oversee other aspects of animals’ care, such as preparing their diet and providing a safe and clean environment and habitat.

Work environment. People who love animals get satisfaction from working with and helping them. However, some of the work may be unpleasant, physically or emotionally demanding, and, sometimes, dangerous. Data from the U.S. Bureau of Labor Statistics show that full-time animal care and service workers experienced a work-related injury and illness rate that was higher than the national average. Most animal care and service workers have to clean animal cages and lift, hold, or restrain animals, risking exposure to bites or scratches. Their work often involves kneeling, crawling, repeated bending, and, occasionally, lifting heavy supplies such as bales of hay or bags of feed. Animal caretakers must take precautions when treating animals with germicides or insecticides. They may work outdoors in all kinds of weather, and the work setting can be noisy. Caretakers of show and sports animals travel to competitions.

Animal care and service workers who witness abused animals or who assist in euthanizing unwanted, aged, or hopelessly injured animals may experience emotional distress. Those working for private humane societies and municipal animal shelters often deal with the public, some of whom may be hostile. Such

workers must maintain a calm and professional demeanor while helping to enforce the laws regarding animal care.

Animal care and service workers often work irregular hours. Most animals are fed every day, so caretakers often work week-end and holiday shifts. In some animal hospitals, research facilities, and animal shelters, an attendant is on duty 24 hours a day, which means night shifts.

Training, Other Qualifications, and Advancement

On-the-job training is the most common way animal care and service workers learn their work; however, employers generally prefer to hire people who have experience with animals. Some jobs require formal education.

Education and training. Animal trainers often need a high school diploma or GED equivalent. Some animal training jobs may require a bachelor’s degree and additional skills. For example, marine mammal trainers usually need a bachelor’s degree in biology, marine biology, animal science, psychology, or a related field. An animal health technician degree also may qualify trainers for some jobs.

Most equine trainers learn their trade by working as a groom at a stable. Some study at an accredited private training school.

Many dog trainers attend workshops and courses at community colleges and vocational schools. Topics include basic study of canines, learning theory of animals, teaching obedience cues, problem solving methods, and safety. Many such schools also offer business training.

Pet sitters are not required to have any specific training, but knowledge and some form of previous experience with animals often is recommended.

Many zoos require their caretakers to have a bachelor’s degree in biology, animal science, or a related field. Most require experience with animals, preferably as a volunteer or paid keeper in a zoo.

Pet groomers typically learn their trade by completing an informal apprenticeship, usually lasting 6 to 10 weeks, under the guidance of an experienced groomer. Prospective groomers also may attend one of the 50 State-licensed grooming schools throughout the country, with programs varying in length from 2 to 18 weeks. Beginning groomers often start by taking on one duty, such as bathing and drying the pet. They eventually assume responsibility for the entire grooming process, from the initial brush-out to the final clipping.

Animal caretakers in animal shelters are not required to have any specialized training, but training programs and workshops are available through the Humane Society of the United States, the American Humane Association, and the National Animal Control Association. Workshop topics include investigations of cruelty, appropriate methods of euthanasia for shelter animals, proper guidelines for capturing animals, techniques for preventing problems with wildlife, and dealing with the public.

Beginning animal caretakers in kennels learn on the job and usually start by cleaning cages and feeding animals.

Certification and other qualifications. Certifications are available in many animal service occupations. For dog trainers, certification by a professional association or one of the hundreds of private vocational or State-approved trade schools can be advantageous. The National Dog Groomers Association of America offers certification for master status as a groomer. To

earn certification, applicants must demonstrate their practical skills and pass two exams. The National Association of Professional Pet Sitters offers a two-stage, home-study certification program for those who wish to become pet care professionals. Topics include business management, animal care, and animal health issues, and applicants must pass a written exam to earn certification. The Pet Care Services Association offers a three-stage, home-study program for individuals interested in pet care. Levels I and II focus on basic principles of animal care and customer service, while Level III spotlights management and professional aspects of the pet care business. Those who complete the third stage and pass oral and written examinations become Certified Kennel Operators (CKO).

All animal care and service workers need patience, sensitivity, and problem-solving ability. Those who work in shelters also need tact and communication skills, because they often deal with individuals who abandon their pets. The ability to handle emotional people is vital for workers at shelters.

Animal trainers especially need problem-solving skills and experience in animal obedience. Successful marine mammal trainers also should have good-public speaking skills, because presentations are a large part of the job. Usually four to five trainers work with a group of animals at one time; therefore, trainers should be able to work as part of a team. Marine mammal trainers must also be good swimmers; certification in SCUBA is a plus.

Most horse-training jobs have minimum weight requirements for candidates.

Advancement. With experience and additional training, caretakers in animal shelters may become adoption coordinators, animal control officers, emergency rescue drivers, assistant shelter managers, or shelter directors. Pet groomers who work in large retail establishments or kennels may, with experience, move into supervisory or managerial positions. Experienced groomers often choose to open their own salons or mobile grooming business. Advancement for kennel caretakers takes the form of promotion to kennel supervisor, assistant manager, and manager; those with enough capital and experience may open up their own kennels. Zookeepers may advance to senior keeper, assistant head keeper, head keeper, and assistant curator, but very few openings occur, especially for the higher level positions.

Employment

Animal care and service workers held 220,400 jobs in 2008. Nearly 4 out of 5 worked as nonfarm animal caretakers; the remainder worked as animal trainers. Nonfarm animal caretakers often worked in boarding kennels, animal shelters, rescue leagues, stables, grooming shops, pet stores, animal hospi-

tals, and veterinary offices. A significant number of caretakers worked for animal humane societies, racing stables, dog and horse racetrack operators, zoos, theme parks, circuses, and other amusement and recreation services.

Employment of animal trainers is concentrated in animal services that specialize in training and in commercial sports, where racehorses and dogs are trained. About 54 percent of animal trainers were self-employed.

Job Outlook

Because many workers leave this occupation each year, there will be excellent job opportunities for most positions. Much faster than average employment growth also will add to job openings. However, keen competition is expected for jobs as zookeepers and marine mammal trainers.

Employment change. Employment of animal care and service workers is expected to grow 21 percent over the 2008–18 decade, much faster than the average for all occupations. The companion pet population, which drives employment of animal caretakers in kennels, grooming shops, animal shelters, and veterinary clinics and hospitals, is anticipated to increase. Pet owners—including a large number of baby boomers, whose disposable income is expected to increase as they age—are expected to increasingly purchase grooming services, daily and overnight boarding services, training services, and veterinary services, resulting in more jobs for animal care and service workers. As more pet owners consider their pets part of the family, demand for luxury animal services and the willingness to spend greater amounts of money on pets should continue to grow. Demand for marine mammal trainers, on the other hand, should grow slowly.

Demand for animal care and service workers in animal shelters is expected to grow as communities increasingly recognize the connection between animal abuse and abuse toward humans and continue to commit private funds to animal shelters, many of which are working hand in hand with social service agencies and law enforcement teams.

Job prospects. Due to employment growth and the need to replace workers who leave the occupation, job opportunities for most positions should be excellent. The need to replace pet sitters, dog walkers, kennel attendants, and animal control and shelter workers leaving the field will create the overwhelming majority of job openings. Many animal caretaker jobs require little or no training and have flexible work schedules, making them suitable for people seeking a first job or for temporary or part-time work. Prospective groomers also will face excellent opportunities as the companion dog population is expected to grow and services such as mobile grooming continue to grow in popularity. The outlook for caretakers in zoos and aquari-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Animal care and service workers	39-2000	220,400	265,900	45,500	21
Animal trainers.....	39-2011	47,100	56,700	9,600	20
Nonfarm animal caretakers.....	39-2021	173,300	209,100	35,900	21

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

ums, however, is not favorable, due to slow job growth and keen competition for the few positions.

Prospective mammal trainers also will face keen competition as the number of applicants greatly exceeds the number of available positions. Prospective horse trainers should anticipate an equally challenging labor market because the number of entry-level positions is limited. Dog trainers, however, should experience conditions that are more favorable, driven by their owners' desire to instill obedience in their pet. Opportunities for dog trainers should be best in large metropolitan areas.

Job opportunities for animal care and service workers may vary from year to year because the strength of the economy affects demand for these workers. Pet owners tend to spend more on animal services when the economy is strong.

Earnings

Wages are relatively low. Median annual wages of nonfarm animal caretakers were \$19,360 in May 2008. The middle 50 percent earned between \$16,720 and \$24,300. The bottom 10 percent earned less than \$15,140, and the top 10 percent earned more than \$31,590. Median annual wages in the industries employing the largest numbers of nonfarm animal caretakers in May 2008 were as follows:

Spectator sports	\$20,520
Other personal services	19,530
Social advocacy organizations	18,640
Veterinary services	18,380
Other miscellaneous store retailers	18,320

Median annual wages of animal trainers were \$27,270 in May 2008. The middle 50 percent earned between \$19,880 and \$38,280. The lowest 10 percent earned less than \$16,700, and the top 10 percent earned more than \$51,400.

Barbers, Cosmetologists, and Other Personal Appearance Workers

Significant Points

- Employment is expected to grow much faster than the average for all occupations.
- A State license is required for barbers, cosmetologists, and most other personal appearance workers, although qualifications vary by State.
- About 44 percent of workers are self employed; many also work flexible schedules.

Nature of the Work

Barbers and *cosmetologists* focus on providing hair care services to enhance the appearance of customers. Other personal appearance workers, such as *manicurists* and *pedicurists*, *shampooers*, and *skin care specialists*, provide specialized beauty services that help clients look and feel their best.

Barbers cut, trim, shampoo, and style hair mostly for male clients. They also may fit hairpieces and offer scalp treatments and facial shaving. In many States, barbers are licensed to color,

Nail technicians work in salons and provide various services including manicures.

bleach, and highlight hair, and to offer permanent-wave services. Barbers also may provide skin care and nail treatments.

Hairdressers, hairstylists, and cosmetologists offer a wide range of beauty services, such as shampooing, cutting, coloring, and styling of hair. They may advise clients on how to care for their hair at home. In addition, cosmetologists may be trained to give manicures, pedicures, and scalp and facial treatments; provide makeup analysis; and clean and style wigs and hairpieces.

A number of workers offer specialized services. Manicurists and pedicurists, called *nail technicians* in some States, work exclusively on nails and provide manicures, pedicures, polishing, and nail extensions to clients. Another group of specialists is skin care specialists, or *estheticians*, who cleanse and beautify the skin by giving facials, full-body treatments, and head and neck massages, as well as apply makeup. They also may remove hair through waxing or, if properly trained, with laser treatments. Finally, in larger salons, shampooers specialize in shampooing and conditioning hair.

In addition to working with clients, personal appearance workers may keep records of hair color or skin care regimens used by their regular clients. A growing number actively sell hair, skin, and nail care products. Barbers, cosmetologists, and other personal appearance workers who operate their own salons have managerial duties that may include hiring, supervising, and firing workers, as well as keeping business and inventory records, ordering supplies, and arranging for advertising.

Work environment. Many full-time barbers, cosmetologists, and other personal appearance workers put in a 40-hour week, but longer hours are common, especially among self-employed workers. Work schedules may include evenings and weekends, the times when beauty salons and barbershops are busiest. Many workers, especially those who are self-employed, determine their own schedules. In 2008, about 29 percent of barbers, hairstylists and cosmetologists worked part time, and 14 percent had variable schedules.

Barbers, cosmetologists, and other personal appearance workers usually work in clean, pleasant surroundings with good lighting and ventilation. Most work in a salon or barbershop, although some may work in a spa, hotel, or resort. Good health and stamina are important, because these workers are on their feet for most of their shift. Prolonged exposure to some hair and nail chemicals may cause irritation, so protective clothing, such as plastic gloves or aprons, may be worn.

Training, Other Qualifications, and Advancement

All States require barbers, cosmetologists, and other personal appearance workers to be licensed, with the exceptions of shampooers. To qualify for a license, most job seekers are required to graduate from a State-licensed barber or cosmetology school.

Education and training. A high school diploma or GED is required for some personal appearance workers in some States. In addition, most States require that barbers and cosmetologists complete a program in a State-licensed barber or cosmetology school. Programs in hairstyling, skin care, and other personal appearance services can be found in both high schools and in public or private postsecondary vocational schools.

Full-time programs in barbering and cosmetology usually last 9 months or more and may lead to an associate degree, but

training for manicurists and pedicurists and skin care specialists requires significantly less time. Shampooers generally do not need formal training. Most professionals take advanced courses in hairstyling or other personal appearance services to keep up with the latest trends. They also may take courses in sales and marketing.

Licensure. All States require barbers, cosmetologists, and other personal appearance workers to be licensed, with the exception of shampooers. Qualifications for a license vary by State, but generally a person must have a high school diploma or GED, be at least 16 years old, and have graduated from a State-licensed barber or cosmetology school. After graduating from a State approved training program, students take a State licensing examination. The exam consists of a written test and, in some cases, a practical test of styling skills or an oral examination. In many States, cosmetology training may be credited toward a barbering license, and vice versa, and a few States combine the two licenses. Most States require separate licensing examinations for manicurists, pedicurists, and skin care specialists. A fee is usually required upon application for a license, and periodic license renewals may be necessary.

Some States have reciprocity agreements that allow licensed barbers and cosmetologists to obtain a license in another State without additional formal training, but such agreements are uncommon. Consequently, persons who wish to work in a particular State should review the laws of that State before entering a training program.

Other qualifications. Successful personal appearance workers should have an understanding of fashion, art, and technical design. They also must keep a neat personal appearance and a clean work area. Interpersonal skills, image, and attitude play an important role in career success. As client retention and retail sales become an increasingly important part of salons' revenue, the ability to be an effective salesperson becomes ever more vital for salon workers. Some cosmetology schools consider "people skills" to be such an integral part of the job that they require coursework in that area. Business skills are important for those who plan to operate their own salons.

Advancement. Advancement usually takes the form of higher earnings, as barbers and cosmetologists gain experience and build a steady clientele. Some barbers and cosmetologists manage salons, lease booth space in salons, or open their own salons after several years of experience. Others teach in barber or cosmetology schools or provide training through vocational schools. Still others advance to other related occupations, such as sales representatives for companies that sell salon-related products, image or fashion consultants, or examiners for State licensing boards.

Employment

Barbers, cosmetologists, and other personal appearance workers held about 821,900 jobs in 2008. Of these, barbers and cosmetologists held 684,200 jobs, manicurists and pedicurists 76,000, skin care specialists 38,800, and shampooers 22,900.

Most of these workers are employed in personal care services establishments, such as beauty salons, barber shops, nail salons, day and resort spas. Others were employed in nursing and other residential care homes. Nearly every town has a barbershop or

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Barbers, cosmetologists, and other personal appearance workers	—	821,900	987,400	165,500	20

Manicurists and pedicurists.....	39-5092	76,000	90,200	14,300	19
Shampooers.....	39-5093	22,900	26,300	3,400	15
Skin care specialists	39-5094	38,800	53,500	14,700	38

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

beauty salon, but employment in this occupation is concentrated in the most populous cities and States.

About 44 percent of all barbers, cosmetologists, and other personal appearance workers are self-employed. Many of these workers own their own salon, but a growing number of the self-employed lease booth space or a chair from the salon's owner. In this case, workers provide their own supplies, and are responsible for paying their own taxes and benefits. They may pay a monthly or weekly fee to the salon owner, who is responsible for utilities and maintenance of the building.

Job Outlook

Overall employment of barbers, cosmetologists, and other personal appearance workers is projected to grow much faster than the average for all occupations. Opportunities for entry-level workers should be favorable, while job candidates at high-end establishments will face keen competition.

Employment change. Personal appearance workers will grow by 20 percent from 2008 to 2018, which is much faster than the average for all occupations.

Employment trends are expected to vary among the different occupational specialties. Employment of hairdressers, hairstylists, and cosmetologists will increase by about 20 percent, while the number of barbers will increase by 12 percent. This growth will primarily come from an increasing population, which will lead to greater demand for basic hair services. Additionally, the demand for hair coloring and other advanced hair treatments has increased in recent years, particularly among baby boomers and young people. This trend is expected to continue, leading to a favorable outlook for hairdressers, hairstylists, and cosmetologists. Employment of shampooers will grow by 15 percent, as many cosmetologists and barbers are able to perform shampooing services, as well.

Continued growth in the number full-service spas and nail salons will also generate numerous job openings for manicurists, pedicurists, and skin care specialists. Estheticians and other skin care specialists will see large gains in employment, and are expected to grow almost 38 percent, primarily due to the popularity of skin treatments for relaxation and medical well-being. Manicurists and pedicurists meanwhile will grow by 19 percent.

Job prospects. Job opportunities generally should be good, particularly for licensed personal appearance workers seeking entry-level positions. A large number of job openings will come about from the need to replace workers who transfer to other occupations, retire, or leave the labor force for other reasons. However, workers can expect keen competition for jobs

and clients at higher paying salons, as these positions are relatively few and require applicants to compete with a large pool of licensed and experienced cosmetologists. Opportunities will generally be best for those with previous experience and for those licensed to provide a broad range of services.

Earnings

Median hourly wages in May 2008 for hairdressers, hairstylists, and cosmetologists, including tips and commission, were \$11.13. The middle 50 percent earned between \$8.57 and \$15.03. The lowest 10 percent earned less than \$7.47, and the highest 10 percent earned more than \$20.41.

Median hourly wages in May 2008 for barbers, including tips, were \$11.56. The middle 50 percent earned between \$8.93 and \$14.69. The lowest 10 percent earned less than \$7.56, and the highest 10 percent earned more than \$19.51.

Among skin care specialists, median hourly wages, including tips, were \$13.81, for manicurists and pedicurists \$9.46, and for shampooers \$8.32.

While earnings for entry-level workers usually are low, earnings can be considerably higher for those with experience. A number of factors, such as the size and location of the salon, determine the total income of personal appearance workers. They may receive commissions based on the price of the service, or a salary based on the number of hours worked, and many receive commissions on the products they sell. In addition, some salons pay bonuses to employees who bring in new business. For many personal appearance workers, the ability to attract and hold regular clients is a key factor in determining earnings.

Although some salons offer paid vacations and medical benefits, many self-employed and part-time workers in this occupation do not enjoy such benefits. Some personal appearance workers receive free trial products from manufacturers in the hope that they will recommend the products to clients.

Child Care Workers

Significant Points

- About 33 percent of child care workers are self-employed, most of whom provided child care in their homes.
- Training requirements range from a high school diploma to a college degree, although some jobs require less than a high school diploma.
- Many workers leave these jobs every year, creating good job opportunities.

Nature of the Work

Child care workers nurture, teach, and care for children who have not yet entered kindergarten. They also supervise older children before and after school. These workers play an important role in children's development by caring for them when their parents are at work or are away for other reasons or when the parents place their children in care to help them socialize with children their age. In addition to attending to children's health, safety, and nutrition, child care workers organize activities and implement curricula that stimulate children's physical, emotional, intellectual, and social growth. They help children explore individual interests, develop talents and independence, build self-esteem, learn how to get along with others, and prepare for more formal schooling.

Child care workers generally are classified into three different groups based on where they work: private household workers, who care for children at the children's homes; family child care providers, who care for children in the providers' homes; and child care workers who work at child care centers, which include Head Start, Early Head Start, full-day and part-day preschool, and other early childhood programs.

Private household workers who are employed on an hourly basis usually are called babysitters. These child care workers bathe, dress, and feed children; supervise their play; wash their clothes; and clean their rooms. Babysitters also may put

children to bed and wake them, read to them, involve them in educational games, take them for doctors' visits, and discipline them. Those who are in charge of infants prepare bottles and change diapers. Babysitters may work for many different families. Workers who are employed by one family are often called nannies. They generally take care of children from birth to age 12, tending to the child's early education, nutrition, health, and other needs. They also may perform the duties of a housekeeper, including cleaning and doing the laundry.

Family child care providers often work alone with a small group of children, although some work in larger settings they work in groups or teams. Child care centers generally have more than one adult per group of children; in groups of children aged 3 to 5 years, a child care worker may assist a more experienced preschool teacher.

Most child care workers perform a combination of basic care and teaching duties, but the majority of their time is spent on caregiving activities. However, there is an increasing focus on preparing children aged 3 to 5 years for school. Workers whose primary responsibility is teaching are classified as preschool teachers. (Preschool teachers are covered elsewhere in the *Handbook*.) However, many basic care activities also are opportunities for children to learn. For example, a worker who shows a child how to tie a shoelace teaches the child while providing for that child's basic needs.

Child care workers spend most of their day working with children. However, they do maintain contact with parents or guardians through informal meetings or scheduled conferences to discuss each child's progress and needs. Many child care workers keep records of each child's progress and suggest ways in which parents can stimulate their child's learning and development at home. Some child care centers and before- and afterschool programs actively recruit parent volunteers to work with the children and participate in administrative decisions and program planning.

Young children learn mainly through playing, solving problems, questioning, and experimenting. Child care workers recognize that fact and capitalize on children's play and other experiences to further their language development (through storytelling and acting games), improve their social skills (by having them work together to build a neighborhood in a sandbox), and introduce scientific and mathematical concepts (by balancing and counting blocks when building a bridge or mixing colors when painting). Often, a less structured approach, including small-group lessons; one-on-one instruction; and creative activities such as art, dance, and music, is used to teach young children. Child care workers play a vital role in preparing children to build the skills they will need in school.

Child care workers in child care centers, schools, or family child care homes greet young children as they arrive, help them with their jackets, and select an activity of interest. When caring for infants, they feed and change them. To ensure a well-balanced program, child care workers prepare daily and long-term schedules of activities. Each day's activities balance individual and group play, as well as quiet time and time for physical activity. Children are given some freedom to participate in activities they are interested in. As children age, child care workers may provide

Child care workers nurture, teach, and care for children who have not yet entered kindergarten and older children before and after school.

more guided learning opportunities, particularly in the areas of math and reading.

Concern over school-aged children being home alone before and after school has spurred many parents to seek alternative ways for their children to spend their time constructively. The purpose of before- and after-school programs is to watch over school-aged children during the gap between school hours and the end of their parents' daily work hours. These programs also may operate during the summer and on weekends. Workers in before- and after-school programs may help students with their homework or engage them in extracurricular activities, including field trips, sports, learning about computers, painting, photography, and other subjects. Some child care workers are responsible for taking children to school in the morning and picking them up from school in the afternoon. Before- and after-school programs may be operated by public school systems, local community centers, or other private organizations.

Helping to keep children healthy is another important part of the job. Child care workers serve nutritious meals and snacks and teach good eating habits and personal hygiene. They ensure that children have proper rest periods. They identify children who may not feel well, and they may help parents locate programs that will provide basic health services. Child care workers also watch for children who show signs of emotional or developmental problems. Upon identifying such a child, they discuss the child's situation with their supervisor and the child's parents. Early identification of children with special needs—such as those with behavioral, emotional, physical, or learning disabilities—is important in improving their future learning ability. Special education teachers often work with preschool children to provide the individual attention they need. (Special education teachers are discussed elsewhere in the *Handbook*.)

Work environment. Helping children grow, learn, and gain new skills can be very rewarding. The work is sometimes routine, but new activities and challenges mark each day. Child care can be physically and emotionally taxing as workers con-

stantly stand, walk, bend, stoop, and lift to attend to each child's interests and problems. These workers experienced a larger than average number of work-related injuries or illnesses.

States regulate child care facilities, the number of children per child care worker, the qualifications of the staff, and the health and safety of the children. To ensure that children in child care centers receive proper supervision, State or local regulations may require a certain ratio of workers to children. The ratio varies with the age of the children. For infants (children under 1 year old), child care workers may be responsible for 3 or 4 children. For toddler's (children 1 to 2 years old), workers may be responsible for 4 to 10 children, and for preschool-aged children (those between 3 and 5 years old), workers may be responsible for 8 to 25 children. However, these regulations vary greatly from State to State. In before- and after-school programs, workers may be responsible for many school-aged children at a time.

Family child care providers work out of their own homes, an arrangement that provides convenience, but also requires that their homes be accommodating to young children. Private household workers usually work in the homes or apartments of their employers. Most live in their own homes and travel to work, although some live in the home of their employer and generally are provided with their own room and bath. They often come to feel like part of their employer's family.

The work hours of child care workers vary widely. Child care centers usually are open year round, with long hours so that parents can drop off and pick up their children before and after work. Some centers employ full-time and part-time staff with staggered shifts to cover the entire day. Some workers are unable to take regular breaks during the day due to limited staffing. Public and many private preschool programs operate during the typical 9- or 10-month school year, employing both full-time and part-time workers. Family child care providers have flexible hours and daily routines, but they may work long or unusual hours to fit parents' work schedules. Live-in nannies usually work longer hours than do child care workers who live in their own homes. However, although nannies may work evenings or weekends, they usually get other time off. About 36 percent worked part time.

Training, Other Qualifications, and Advancement

Licensure and training requirements vary greatly by State, but some jobs require less than a high school diploma.

Education and training. The training and qualifications required of child care workers vary widely. Each State has its own licensing requirements that regulate caregiver training. These requirements range from less than a high school diploma, to a national Child Development Associate (CDA) credential, to community college courses or a college degree in child development or early childhood education. State requirements are generally higher for workers at child care centers than for family child care providers.

Child care workers in private settings who care for only a few children often are not regulated by States at all. Child care workers generally can obtain some form of employment with less than a high school diploma and little or no experience, but certain private firms and publicly funded programs have more

demanding training and education requirements. Different public funding streams may set other education and professional development requirements. For example, many States have separate funding for prekindergarten programs for 4-year-old children. In accordance with the regulations that accompany the funding, these States typically set higher education degree requirements for those workers than do ordinary State child care licensing requirements.

Some employers prefer workers who have taken secondary or postsecondary courses in child development and early childhood education or who have work experience in a child care setting. Other employers require their own specialized training. An increasing number of employers are requiring an associate's degree in early childhood education.

Licensure. Many States require child care centers, including those in private homes, to be licensed if they care for more than a few children. In order to obtain their license, child care centers may require child care workers to pass a background check, get immunizations, and meet a minimum training requirement.

Other qualifications. Child care workers must anticipate and prevent problems, deal with disruptive children, provide fair but firm discipline, and be enthusiastic and constantly alert. They must communicate effectively with the children and their parents, as well as with teachers and other child care workers. Workers should be mature, patient, understanding, and articulate and have energy and physical stamina. Skills in music, art, drama, and storytelling also are important. Self-employed child care workers must have business sense and management abilities.

Certification and advancement. Some employers prefer to hire child care workers who have earned a nationally recognized Child Development Associate (CDA) credential or the Child Care Professional (CCP) designation from the Council for Professional Recognition and the National Child Care Association, respectively. Requirements include child care experience and coursework, such as college courses or employer-provided seminars.

Opportunities for advancement are limited. However, as child care workers gain experience, some may advance to supervisory or administrative positions in large child care centers or preschools. Often, these positions require additional training, such as a bachelor's or master's degree. Other workers move on to work in resource and referral agencies, consulting with parents on available child care services. A few workers become involved in policy or advocacy work related to child care and early childhood education. With a bachelor's degree, workers may become preschool teachers or become certified to teach in public or private schools. Some workers set up their own child care businesses.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018		Change, 2008-2018	
			Number	Percent	Number	Percent
Child care workers	39-9011	1,301,900	1,443,900	142,100	11	

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Employment

Child care workers held about 1.3 million jobs in 2008. About 33 percent of child care workers were self-employed; most of these were family child care providers.

Child day care services employed about 19 percent of all child care workers, and about 19 percent worked for private households. The remainder worked primarily in educational services; nursing and residential care facilities; amusement and recreation industries; civic and social organizations; and individual and family services. Some child care programs are for-profit centers, which may be affiliated with a local or national company. A very small percentage of private-industry establishments operate onsite child care centers for the children of their employees.

Job Outlook

Child care workers are expected to experience job growth that is about as fast as the average for all occupations. Job prospects will be good because of the many workers who leave the occupation and need to be replaced.

Employment change. Employment of child care workers is projected to increase by 11 percent between 2008 and 2018, which is about as fast as the average for all occupations. An increasing emphasis on early childhood education programs will increase demand for these workers. Child care workers often work alongside preschool teachers as assistants. Therefore, increased demand for formal preschool programs will create growth for child care workers. Although only a few States currently provide targeted or universal preschool programs, many more are considering or starting such programs. A rise in enrollment in private preschools is likely as the value of formal education before kindergarten becomes more widely accepted. More States moving toward universal preschool education could increase employment growth for child care workers. However, growth will be moderated by relatively slow growth in the population of children under the age of five, who are generally cared for by these workers.

Job prospects. High replacement needs should create good job opportunities for child care workers. Qualified persons who are interested in this work should have little trouble finding and keeping a job. Many child care workers must be replaced each year as they leave the occupation to fulfill family responsibilities, to study, or for other reasons. Others leave because they are interested in pursuing other occupations or because of low wages.

Earnings

Pay depends on the educational attainment of the worker and the type of establishment. Although the pay generally is very low, more education usually means higher earnings. Median hourly wages of child care workers were \$9.12 in May 2008. The mid-

dle 50 percent earned between \$7.75 and \$11.30. The lowest 10 percent earned less than \$7.04, and the highest 10 percent earned more than \$13.98. Median hourly wages in the industries employing the largest numbers of child care workers in May 2008 were:

Other residential care facilities.....	\$10.56
Elementary and secondary schools	10.53
Civic and social organizations.....	8.53
Other amusement and recreation industries	8.41
Child day care services.....	8.39

Earnings of self-employed child care workers vary with the number of hours worked, the number and ages of the children, and the geographic location.

Benefits vary, but are minimal for most child care workers. Many employers offer free or discounted child care to employees. Some offer a full benefits package, including health insurance and paid vacations, but others offer no benefits at all. Some employers offer seminars and workshops to help workers learn new skills. A few are willing to cover the cost of courses taken at community colleges or technical schools. Live-in nannies receive free room and board.

Related Occupations

Child care work requires patience; creativity; an ability to nurture, motivate, teach, and influence children; and leadership, organizational, and administrative skills. Others who work with children and need these qualities and skills include:

	Page
Teacher assistants	276
Teachers—kindergarten, elementary, middle, and secondary	288
Teachers—preschool, except special education	286
Teachers—special education.....	294

Fitness Workers

Significant Points

- Many fitness and personal training jobs are part time, but many workers increase their hours by working at several different facilities or at clients' homes.
- Most fitness workers need to be certified.
- Employment is expected to grow much faster than the average.
- Job prospects are expected to be good.

Nature of the Work

Fitness workers lead, instruct, and motivate individuals or groups in exercise activities, including cardiovascular exercise, strength training, and stretching. They work in health clubs, country clubs, hospitals, universities, yoga and Pilates studios, resorts, and clients' homes. Fitness workers also are found in workplaces, where they organize and direct health and fitness programs for employees. Although gyms and health clubs offer a variety of exercise activities, such as weight lifting, yoga, cardiovascular training, and karate, fitness workers typically specialize in only a few areas.

Personal trainers work one-on-one or with two or three clients, either in a gym or in the clients' homes. They help clients assess their level of physical fitness and set and reach fitness

Personal trainers work one-on-one or with two or three clients, either in a gym or in the client's home.

goals. *Trainers* also demonstrate various exercises and help clients improve their exercise techniques. They may keep records of their clients' exercise sessions to monitor the clients' progress toward physical fitness. They also may advise their clients on how to modify their lifestyles outside of the gym to improve their fitness.

Group exercise instructors conduct group exercise sessions that usually include aerobic exercise, stretching, and muscle conditioning. Cardiovascular conditioning classes often are set to music. *Instructors* select the music and choreograph a corresponding exercise sequence. Two increasingly popular conditioning methods taught in exercise classes are Pilates and yoga. In these classes, instructors demonstrate the different moves and positions of the particular method; they also observe students and correct those who are doing the exercises improperly. Group exercise instructors are responsible for ensuring that their classes are motivating, safe, and challenging, yet not too difficult for the participants.

Fitness directors oversee the fitness-related aspects of a health club or fitness center. They create and oversee programs that meet the needs of the club's members, including new-member orientations, fitness assessments, and workout incentive programs. They also select fitness equipment; coordinate personal training and group exercise programs; hire, train, and supervise fitness staff; and carry out administrative duties.

Fitness workers in smaller facilities with few employees may perform a variety of functions in addition to their fitness duties, such as tending the front desk, signing up new members, giving tours of the fitness center, writing newsletter articles, creating posters and flyers, and supervising the weight-training and cardiovascular equipment areas. In larger commercial facilities, personal trainers often are required to sell their services to members and to make a specified number of sales. Some fitness workers may combine the duties of group exercise instructors and personal trainers; in smaller facilities, the fitness director may teach classes and do personal training.

Work environment. Most fitness workers spend their time indoors at fitness or recreation centers and health clubs. Fitness directors and supervisors, however, typically spend most of their time in an office. In some fitness centers, workers may split their time among doing office work, engaging in personal training, and teaching classes. Nevertheless, fitness workers at all levels risk suffering injuries during physical activities.

Since most fitness centers are open long hours, fitness workers often work nights and weekends and even occasional holidays. In 2008, about 40 percent of fitness workers were part-time employees. Some may travel from place to place throughout the day, to different gyms or to clients' homes, to maintain a full work schedule.

Fitness workers generally enjoy a lot of autonomy. Group exercise instructors choreograph or plan their own classes, and personal trainers have the freedom to design and implement their clients' workout routines.

Training, Other Qualifications, and Advancement

For most fitness workers, certification is critical. Personal trainers usually must be certified to begin working with clients or

with members of a fitness facility. Group fitness instructors may begin without a certification, but they are often encouraged or required by their employers to become certified.

Education and training. The education and training required depends on the specific type of fitness work: personal training, group fitness, and a specialization such as Pilates or yoga each need different preparation. Personal trainers often start out by taking classes to become certified. Then they may begin by working alongside an experienced trainer before being allowed to train clients alone. Group fitness instructors often get started by participating in exercise classes until they are ready to audition as instructors and, if the audition is successful, begin teaching classes. They also may improve their skills by taking training courses or attending fitness conventions. Most employers require instructors to work toward becoming certified.

Fitness workers usually do not receive much on-the-job training; they are expected to know how to do their jobs when they are hired. Workers may receive some organizational training to learn about the operations of their new employer. Occasionally, they receive specialized training if they are expected to teach or lead a specific method of exercise or focus on a particular age or ability group. Because requirements vary from employer to employer, before pursuing training it may be helpful to contact local fitness centers or other potential employers to find out what background they prefer.

An increasing number of employers are requiring fitness workers to have a bachelor's degree in a field related to health or fitness, such as exercise science or physical education. Some employers allow workers to substitute a college degree for certification, but most employers who require a bachelor's degree also require certification.

Training for *Pilates* and *yoga instructors* has changed. When interest in these forms of exercise exploded, the demand for teachers grew faster than the ability to train them properly. Inexperienced teachers contributed to student injuries, leading to a push toward more standardized, rigorous requirements for teacher training.

Pilates and *yoga teachers* now need specialized training in their particular method of exercise. For Pilates, training options range from weekend-long workshops to yearlong programs, but the trend is toward requiring even more training. The Pilates Method Alliance has established training standards that recommend at least 200 hours of training; the group also has standards for training schools and maintains a list of training schools that meet the requirements. However, some Pilates teachers are certified group exercise instructors who attend short Pilates workshops; currently, many fitness centers hire people with minimal Pilates training if the applicants have a fitness certification and group fitness experience.

Training requirements for yoga teachers are similar to those for Pilates teachers. Training programs range from a few days to more than 2 years. Many people get their start by taking yoga; eventually, their teachers may consider them ready to assist or to substitute teach. Some students may begin teaching their own classes when their yoga teachers think that they are ready; the teachers may even provide letters of recommenda-

tion. Those who wish to pursue teaching more seriously usually seek formal teacher training.

Currently, there are many training programs throughout the yoga community, as well as programs throughout the fitness industry. The Yoga Alliance has established training standards requiring at least 200 training hours, with a specified number of hours in techniques, teaching methodology, anatomy, physiology, philosophy, and other areas. The Yoga Alliance also registers schools that train students to its standards. Because some schools may meet the standards but not be registered, prospective students should check the requirements and decide whether particular schools meet them.

Certification and other qualifications. The most important characteristic that an employer looks for in a new fitness instructor is the ability to plan and lead a class that is motivating and safe. Group fitness instructors do not necessarily require certification to begin working. However, most organizations encourage their group instructors to become certified over time, and many require it.

In the fitness field, there are many organizations that offer certification. Getting certified by one of the top certification organizations is becoming increasingly important, especially for personal trainers. One way to ensure that a certifying organization is reputable is to make sure that it is accredited by the National Commission for Certifying Agencies.

Most certifying organizations require candidates to have a high school diploma, be certified in cardiopulmonary resuscitation (CPR), and pass an exam. All certification exams have a written component, and some also have a practical component. The exams measure knowledge of human physiology, understanding of proper exercise techniques, assessment of client fitness levels, and development of appropriate exercise programs. There is no particular training program required for certification; candidates may prepare however they prefer. Certifying organizations do offer study materials, including books, CD-ROMs, other audio and visual materials, and exam preparation workshops and seminars, but candidates are not required to purchase materials to take exams.

Certification generally is good for 2 years, after which workers must become recertified by attending continuing education classes or conferences, writing articles, or giving presentations. Some organizations offer more advanced certification that requires an associate's or bachelor's degree in an exercise-related subject for individuals who are interested in training athletes, working with people who are injured or ill, or advising clients on general health.

Pilates and yoga instructors usually do not need group exercise certification to maintain their employment. It is more important that they have specialized training in their particular method of exercise. However, the Pilates Method Alliance does offer certification. Pilates certification requires 450 hours of

documented training or 720 hours of full-time work the previous 12 months.

People planning fitness careers should be outgoing, excellent communicators, good at motivating people, and sensitive to the needs of others. Excellent health and physical fitness are important because of the physical nature of the job. Those who wish to be personal trainers in a large commercial fitness center should have strong sales skills. All personal trainers should have the personality and motivation to attract and retain clients.

Advancement. A bachelor's degree in exercise science, physical education, kinesiology (the study of the mechanics of human motion, including the role of the muscles), or a related area, along with experience, usually is required to advance to management positions in a health club or fitness center. Some organizations require a master's degree. As in other occupations, managerial skills also are needed to advance to supervisory or managerial positions. College courses in management, business administration, accounting, and personnel management may be helpful, but many fitness companies have corporate universities in which they train employees for management positions.

Personal trainers may advance to head trainer, with responsibility for hiring and overseeing the personal training staff and for bringing in new personal-training clients. Group fitness instructors may be promoted to group exercise director, a position responsible for hiring instructors and coordinating exercise classes. Later, a worker might become the fitness director of an organization, managing the fitness budget and staff. A worker also might become the general manager, whose main focus is the financial aspects of the organization, particularly setting and achieving sales goals; in a small fitness center, however, the general manager usually is involved with all aspects of running the facility. Some workers go into business for themselves and open their own fitness centers.

Employment

Fitness workers held about 261,100 jobs in 2008. About 61 percent of all personal trainers and group exercise instructors worked in fitness and recreational sports centers, including health clubs. Another 13 percent worked in civic and social organizations. About 9 percent of fitness workers were self-employed; many of these were personal trainers, while others were group fitness instructors working on a contract basis with fitness centers. Many fitness jobs are part time, and many workers hold multiple jobs, teaching or doing personal training at several different fitness centers and at clients' homes.

Job Outlook

Jobs for fitness workers are expected to increase much faster than the average for all occupations. Fitness workers should

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Fitness trainers and aerobics instructors	39-9031	261,100	337,900	76,800	29

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

have good opportunities because of continued job growth in health clubs, fitness facilities, and other settings in which fitness workers are concentrated.

Employment change. Employment of fitness workers is expected to increase 29 percent over the 2008–18 decade, which is much faster than the average for all occupations. These workers are expected to gain jobs because an increasing number of people are spending time and money on fitness and more businesses are recognizing the benefits of health and fitness programs for their employees.

Aging baby boomers, one group that increasingly is becoming concerned with staying healthy and physically fit, will be the main driver of employment growth in fitness workers. An additional factor is the combination of a reduction in the number of physical education programs in schools with parents' growing concern about childhood obesity. This factor will increase the need for fitness workers to work with children in nonschool settings, such as health clubs. Increasingly, parents also are hiring personal trainers for their children, and the number of weight-training gyms for children is expected to continue to grow. Health club membership among young adults has grown steadily as well, driven by concern with physical fitness and by rising incomes.

As health clubs strive to provide more personalized service to keep their members motivated, they will continue to offer personal training and a wide variety of group exercise classes. Participation in yoga and Pilates is expected to continue to increase, driven partly by the aging population, which demands low-impact forms of exercise and seeks relief from arthritis and other ailments.

Job prospects. Opportunities are expected to be good for fitness workers because demand for these workers is expected to remain strong in health clubs, fitness facilities, and other settings in which fitness workers are concentrated. In addition, many job openings will stem from the need to replace the large numbers of workers who leave these occupations each year. Part-time jobs will be easier to find than full-time jobs. People with degrees in fitness-related subjects will have better opportunities because clients prefer to work with people they perceive as higher quality trainers. Trainers who incorporate new technology and wellness issues as part of their services may be in more demand.

Earnings

Median annual wages of fitness trainers and aerobics instructors in May 2008 were \$29,210. The middle 50 percent earned between \$19,610 and \$44,420. The bottom 10 percent earned less than \$16,120, while the top 10 percent earned \$60,760 or more. These figures do not include the earnings of the self-employed. Earnings of successful self-employed personal trainers can be much higher. Median annual wages in the industries employing the largest numbers of fitness workers in May 2008 were as follows:

General medical and surgical hospitals.....	\$32,140
Fitness and recreational sports centers.....	30,610
Local government.....	30,200
Civic and social organizations.....	25,110
Other schools and instruction.....	24,230

Because many fitness workers work part time, they often do not receive benefits such as health insurance or retirement plans from their employers. They are able to use fitness facilities at no cost, however.

Related Occupations

Other occupations that focus on health and physical fitness include the following:

	Page
Athletes, coaches, umpires, and related workers	321
Dietitians and nutritionists	366
Physical therapists.....	377
Recreation workers.....	522

Flight Attendants

Significant Points

- Competition for positions is expected to remain keen because the opportunity for travel attracts more applicants than there are jobs.
- Job duties are learned through formal on-the-job training at a flight training center.
- A high school diploma is the minimum educational requirement, but airlines prefer applicants with a college degree and with experience in dealing with the public.

Nature of the Work

Major airlines are required by law to provide *flight attendants* for the safety and security of the traveling public. Although the primary job of the flight attendants is to ensure that security and safety regulations are followed, attendants also try to make flights comfortable and enjoyable for passengers.

At least 1 hour before takeoff, attendants are briefed by the captain—the pilot in command—on such things as emergency evacuation procedures, coordination of the crew, the length of the flight, expected weather conditions, and any special issues having to do with passengers. Flight attendants make sure that first-aid kits and other emergency equipment are aboard and in working order and that the passenger cabin is in order, with adequate supplies of food, beverages, and any other amenities. As passengers board the plane, flight attendants greet them, check their tickets, and tell them where to store carry-on items.

Before the plane takes off, flight attendants instruct all passengers in the use of emergency equipment and check to see that seatbelts are fastened, seat backs are in upright positions, and all carry-on items are properly stowed. In the air, helping passengers in the event of an emergency is the most important responsibility of a flight attendant. Safety-related actions range from reassuring passengers during rough weather to directing passengers who must evacuate a plane following an emergency landing. Flight attendants also answer questions about the flight, and help small children, elderly or disabled persons, and any others needing assistance. Flight attendants may administer first aid to passengers who become ill. Flight attendants generally serve beverages and on many flights sell precooked meals or snacks. Prior to landing, flight attendants take inventory of headsets, alcoholic beverages, and moneys collected. They also report any medical problems passengers may have had, the condition of cabin equipment, and any lost-and-found articles.

Lead, or first, flight attendants, sometimes known as *pursers*, oversee the work of the other attendants aboard the aircraft, while performing most of the same duties.

Work environment. Because airlines operate around the clock and year round, flight attendants can work nights, holidays, and weekends. In most cases, agreements between the airline and the employees' union determine the total daily and monthly working time. Scheduled on-duty time usually is limited to 12 hours per day, however flight attendants can be scheduled up to 14 hours per day, with somewhat greater maximums

Flight attendants spend a great deal of time away from home.

for international flying. The Federal Aviation Administration (FAA) requires that flight attendants receive 9 consecutive hours of rest following any duty period.

Attendants usually fly 65 to 90 hours a month and generally spend another 50 hours a month on the ground preparing planes for flights, writing reports following completed flights, and waiting for planes to arrive. Most airlines guarantee a minimum of 65 to 85 flight hours per month, with the option to work additional hours. Flight attendants receive extra compensation for additional hours.

Flight attendants may be away from their home base at least one-third of the time. During this period, the airlines provide hotel accommodations and an allowance for meal expenses.

Flight attendants must be flexible and willing to relocate. However, many flight attendants elect to live in one place and commute to their assigned home base. Home bases and routes worked are bid for and awarded on a seniority basis, so the longer the flight attendant has been employed, the more likely he or she is to work on their preferred flights. Almost all flight attendants start out working on reserve status, or on call. Flight attendants on reserve status usually live near their home base, because they are required to be able to report to their home base on short notice. On small corporate airlines, flight attendants often work on an as-needed basis and must adapt to varying environments and passengers.

The combination of free time and free or discounted airfares provides flight attendants the opportunity to travel. However, the work can be strenuous and trying. Flight attendants stand during much of the flight and must remain pleasant and efficient, regardless of how tired they are or how demanding passengers may be. Occasionally, flight attendants must deal with turbulent flights which can cause difficulties regarding service and cause anxiety among passengers that flight attendants must address.

Working in a moving aircraft leaves flight attendants susceptible to injuries. According to BLS data, full-time flight attendants experienced a much higher than average work-related injury and illness rate. Various physical injuries can occur when opening overhead compartments or while pushing heavy service carts. In addition, medical problems can arise from irregular sleeping and eating patterns, dealing with stressful passengers, working in a pressurized environment, and breathing recycled air.

Training, Other Qualifications, and Advancement

Flight attendants must be certified by the FAA. A high school diploma or its equivalent is the minimum educational requirement, but airlines increasingly prefer applicants who have a college degree. Experience in dealing with the public is important, because flight attendants must be able to interact comfortably with strangers and remain calm under duress.

Education and training. A high school diploma or its equivalent is the minimum educational requirement. However, airlines increasingly prefer applicants with a college degree. Applicants who attend schools or colleges that offer flight attendant training may have an advantage over other applicants. Highly desirable areas of concentration include people-oriented disciplines, such as communications, psychology, nursing, travel and tourism, hospitality, and education. Flight attendants for international airlines generally must speak a foreign language fluently. For their international flights, some of the major airlines prefer candidates who can speak two major foreign languages.

Once hired, all candidates must undergo a period of formal training. The length of training, ranging from 3 to 6 weeks, depends on the size and type of carrier and takes place at the airline's flight training center. Airlines that do not operate training centers generally send new employees to the center of another airline. Some airlines may provide transportation to the training centers and an allowance for room, board, and school supplies, while other airlines charge individuals for training. New trainees are not considered employees of the airline until they successfully complete the training program. Trainees learn emergency procedures, such as evacuating an airplane, operating emergency systems and equipment, administering first aid, and surviving in the water. In addition, trainees are taught how to deal with disruptive passengers and with hijacking and terrorist situations. New hires learn flight regulations and duties, gain knowledge of company operations and policies, and receive instruction on personal grooming and weight control. Trainees for international routes get additional instruction in passport and customs regulations. Trainees must perform many drills and duties unaided, in front of the training staff. Throughout training, they also take tests designed to eliminate unsuccessful trainees. Toward the end of their training, students go on practice flights. Upon successful completion of training, flight attendants receive the FAA Certificate of Demonstrated Proficiency. Flight attendants also are required to go through periodic retraining and pass an FAA safety examination to continue flying.

Licensure and certification. All flight attendants must be certified by the FAA. To be certified, flight attendants are required to successfully complete training requirements, such as

evacuation, fire fighting, medical emergency, and security procedures established by the FAA and the Transportation Security Administration. They also must perform the assigned duties of a cabin crew member and complete an approved proficiency check. Flight attendants are certified for specific types of aircraft, regardless of the carrier. Therefore, only 1-day or 2-day recurrent training, with the new carrier, is needed for those flight attendants who change airlines, as long as the type of aircraft remains the same.

Other qualifications. Airlines prefer to hire poised, tactful, and resourceful people who can speak clearly and interact comfortably with strangers and remain calm under duress. Applicants with previous experience in dealing with the public are preferred by airlines. Additionally, airlines usually have age, physical, and appearance requirements. Applicants usually must be at least 18 to 21 years old, although some carriers may have higher minimum-age requirements. Applicants must meet height requirements for reaching overhead bins, which often contain emergency equipment, and most airlines want candidates with weight proportionate to height. Flight attendants must be in excellent health, and a medical evaluation is required. Vision is required to be correctable to 20/30 or better with glasses or contact lenses (uncorrected no worse than 20/200). Men must have their hair cut above the collar and be clean shaven. Airlines prefer applicants with no visible tattoos, body piercing, or unusual hairstyles or makeup.

In addition to education and training, airlines conduct a thorough background check, which goes back as many as 10 years, as required by the FAA. Everything about an applicant is investigated, including date of birth, employment history, criminal record, school records, and any gaps in employment. Employment is contingent on a successful background check. An applicant will not be offered a job or will be immediately dismissed if his or her background check shows any discrepancies. All U.S. airlines require that applicants be citizens of the United States or registered aliens with legal rights to obtain employment in the United States.

Advancement. After completing initial training, flight attendants are assigned to one of their airline's bases. New flight attendants are placed on reserve status and are called either to staff extra flights or to fill in for crewmembers that are sick, on vacation, or rerouted. When they are not on duty, reserve flight attendants must be available to report for flights on short notice. They usually remain on reserve for at least 1 year but, in some cities, it may take 5 to 10 years—or longer—to advance from reserve status. Flight attendants who no longer are on reserve bid monthly for regular assignments. Because assignments are based on seniority, usually only the most experienced attendants get their choice of assignments. Advancement takes longer today than in the past, because experienced flight attendants are remaining in this career longer than in the past.

Some flight attendants become supervisors, moving from senior or lead flight attendant, to check flight attendant, to flight attendant supervisor, then on to base manager, and finally to manager or vice president of in-flight operations. They may take on additional duties, such as recruiting, instructing, or developing in-flight products. Their experience also may qualify

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Flight attendants.....	39-6031	98,700	106,700	8,000	8

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

them for numerous airline-related jobs involving contact with the public, such as reservation ticket agent or public relations specialist. Flight attendants who do not want to travel often for various reasons may move to a position as an administrative assistant. With additional education, some flight attendants may decide to transfer to other areas of the airline for which they work, such as risk management or human resources.

Employment

Flight attendants held about 98,700 jobs in 2008. Commercial airlines employed the vast majority of flight attendants, and most attendants lived near major metropolitan airports or airports operating as hubs for the major airlines. A small number of flight attendants worked for companies that offered chartered flights.

Job Outlook

Employment of flight attendants is projected to grow about as fast as average. Competition for jobs is expected to remain keen because the opportunity for travel attracts more applicants than there are jobs.

Employment change. Employment of flight attendants is expected to grow by 8 percent, which is about as fast as the average for all occupations over the 2008–18 period. Population growth and an improving economy are expected to boost the number of airline passengers. As airlines expand their capacity to meet rising demand by increasing the number and size of planes in operation and the number of flights offered, more flight attendants will be needed.

Job prospects. Despite growing demand for flight attendants, competition is expected to be keen because this job usually attracts more applicants than there are jobs, with only the most qualified eventually being hired. College graduates who have experience dealing with the public should have the best chance of being hired. Job opportunities may be better with the faster growing regional and commuter, low-cost, and charter airlines. There also are job opportunities for professionally trained flight attendants to work for companies operating private aircraft for their executives.

The majority of job opportunities through the year 2018 will arise from the need to replace flight attendants who leave the labor force or transfer to other occupations, often for higher earnings or a more stable lifestyle. With the job now viewed increasingly as a profession, however, fewer flight attendants leave their jobs, and job turnover is not as high as in the past. According to the Association of Flight Attendants, the average job tenure of attendants is currently 16 years and is increasing.

In the long run, opportunities for persons seeking flight attendant jobs should improve as the airline industry expands. Over the next decade, however, demand for flight attendants

will fluctuate with the demand for air travel, which is highly sensitive to swings in the economy. During downturns, as air traffic declines, the hiring of flight attendants declines, and some experienced attendants may be laid off until traffic recovers.

Earnings

Median annual wages of flight attendants were \$35,930 in May 2008. The middle 50 percent earned between \$28,420 and \$49,910. The lowest 10 percent earned less than \$20,580, and the highest 10 percent earned more than \$65,350.

According to data from the Association of Flight Attendants, beginning attendants had median earnings of \$16,191 a year in 2009. Beginning pay scales for flight attendants vary by carrier, however. New hires usually begin at the same pay scale, regardless of experience; all flight attendants receive the same future pay increases based on an established pay scale.

Some airlines offer incentive pay for working holidays, night and international flights, or taking positions that require additional responsibility or paperwork.

Flight attendants and their immediate families are entitled to free or discounted fares on their own airline and reduced fares on most other airlines. Some airlines require that the flight attendant be with an airline for 3 to 6 months before taking advantage of this benefit. Other benefits may include medical, dental, and life insurance; 401K or other retirement plan; sick leave; paid holidays; stock options; paid vacations; and tuition reimbursement. Flight attendants also receive a “per diem” allowance for meal expenses while on duty away from home. Flight attendants are required to purchase uniforms and wear them while on duty. The airlines usually pay for uniform replacement items, and may provide a small allowance to cover cleaning and upkeep of the uniforms.

The majority of flight attendants hold union membership, primarily with the Association of Flight Attendants. Other unions that represent flight attendants include the Transport Workers Union of America and the International Brotherhood of Teamsters.

Related Occupations

Other jobs that involve helping people as a safety professional, while requiring the ability to be calm even under trying circumstances, include:

	Page
Emergency medical technicians and paramedics	419
Fire fighters	470
Other workers who provide customer service include:	
Food and beverage serving and related workers	491
Reservation and transportation ticket agents and travel clerks.....	598

Sources of Additional Information

Information about job opportunities and qualifications required for work at a particular airline may be obtained by writing to the airline's human resources office.

Gaming Services Occupations

Significant Points

- Workers need a license issued by a regulatory agency, such as a State casino control board or commission.
- Competition for jobs is expected to be keen.
- Job prospects will be best for those with previous casino gaming experience, a degree or technical or vocational training in gaming or a hospitality-related field, and strong customer service skills.

Nature of the Work

Legalized gambling in the United States today includes casino gaming, State lotteries, pari-mutuel wagering on contests such as horse or dog racing, and charitable gaming. There are a number of service occupations that are unique to the multibillion-dollar world of gaming, the playing of games of chance.

The majority of *gaming services workers* are employed in casinos. Duties and titles may vary within occupations from one establishment to another. Some positions are associated with oversight and direction—supervision, surveillance, and investigation—while others involve working with the games or patrons themselves by tending slot machines, dealing cards or running games, handling money, writing and running tickets,

Gaming service employees must have excellent customer service skills.

and other activities. In most gaming jobs, workers interact directly with patrons, and part of their responsibility is to make those interactions enjoyable.

Like nearly every business establishment, casinos have workers who direct and oversee day-to-day operations. *Gaming supervisors* and *gaming managers* oversee the gaming operations and personnel in an assigned area. They circulate among the tables and observe the operations to ensure that all of the stations and games are covered for each shift and that workers and gamblers adhere to the rules of the games. Gaming supervisors and gaming managers often interpret or explain the operating rules of the house to patrons who may have difficulty understanding the rules. Periodically, they address complaints about service.

Gaming managers also have additional responsibilities beyond those of supervisors. For example, gaming managers prepare work schedules and station assignments for their subordinates. They are responsible for interviewing, hiring, training, and evaluating new workers.

Slot key persons coordinate and supervise the slot machine department and its workers. Their duties include verifying and paying off jackpots to patrons, resetting slot machines after completing the payoff, and refilling machines with tickets or money. Slot key persons must be familiar with a variety of slot machines and be able to make minor repairs and adjustments to the machines as needed. If major repairs are required, slot key persons determine whether the slot machine should be removed from the floor. They also enforce safety rules and report hazards within their assigned areas.

Gaming and sports book writers and runners assist in the operations of games such as bingo and keno, in addition to taking bets on sporting events. They scan tickets presented by patrons and calculate and distribute winnings. Some writers and runners operate the equipment that randomly selects the numbers. Others may announce numbers selected, pick up tickets from patrons, collect bets, or receive, verify, and record patrons' cash wagers.

Gaming dealers operate table games such as craps, blackjack, and roulette. Standing or sitting behind the table, dealers provide dice, dispense cards to players, or run the equipment. Dealers also monitor the patrons for infractions of casino rules. Gaming dealers must be skilled in customer service and in executing their game. Dealers determine winners, calculate and pay winning bets, and collect losing bets. Most gaming dealers are competent in at least two games, one usually being blackjack or craps.

Work environment. Most casinos are open 24 hours a day, 7 days a week. Employees can be expected to work nights, weekends, and holidays. Casino work can be physically demanding. Most occupations require that workers stand for long periods; some require the lifting of heavy items. The atmosphere in casinos exposes workers to certain hazards, such as cigarette, cigar, and pipe smoke. Noise from slot machines, gaming tables, and talking workers and patrons may be distracting to some, although workers wear protective headgear in areas where loud machinery is used to count money.

Training, Other Qualifications, and Advancement

Each casino establishes its own education, training, and experience requirements, but all gaming service workers must obtain a license from a regulatory agency, such as a State casino control board or commission.

Education and training. There usually are no minimum educational requirements for entry-level gaming jobs, although most employers prefer workers with at least a high school diploma or GED.

Each casino establishes its own requirements for education, training, and experience. Some of the major casinos and slot machine manufacturers run their own training schools, and almost all provide some form of in-house training in addition to requiring certification. The type and quantity of classes needed may vary. Many institutions of higher learning offer training or classes toward certificates in gaming, as well as offering associate's, bachelor's, or master's degrees in a variety of hospitality-related fields, such as hospitality management, hospitality administration, or hotel management. Some schools offer training in games, gaming supervision, slot attendant and slot repair technician work, slot department management, and surveillance and security.

Slot key persons do not need to meet formal educational requirements to enter the occupation, but completion of slot attendant or slot technician training is helpful. As with most other gaming workers, slot key persons receive on-the-job training during the first several weeks of employment.

Gaming and sports book writers and runners usually have at least a high school diploma or GED. Most of these workers receive on-the-job training.

Most gaming dealers acquire their skills by attending a dealer school or a vocational and technical school. Such schools teach the rules and procedures of the games, as well as State and local laws and regulations. Although beneficial, graduation from one of these schools does not guarantee a job at a casino, because most casinos also require prospective dealers to audition for open positions. During the audition, personal qualities are assessed along with knowledge of the games.

For most gaming supervisor and gaming manager positions, an associate's or bachelor's degree is beneficial, but not required. Most employees in these occupations have experience in other gaming occupations, typically as dealers, and have a broad knowledge of casino rules, regulations, procedures, and games.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Gaming services occupations.....	—	178,700	204,400	25,700	14
Gaming managers	11-9071	6,200	6,900	700	12
First-line supervisors/managers of gaming workers	39-1010	65,300	70,800	5,500	8
Gaming supervisors	39-1011	40,900	45,700	4,800	12
Slot key persons	39-1012	24,400	25,100	700	3
Gaming dealers	39-3011	91,100	108,400	17,300	19
Gaming and sports book writers and runners	39-3012	16,200	18,300	2,100	13

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Licensure. Gaming services workers are required to be licensed by a regulatory agency, such as a State casino control board or commission. Applicants for a license must provide photo identification and pay a fee. Some States may require gaming service workers to be residents of that State. Age requirements vary by State. The licensing application process also includes a background investigation and drug test.

Other qualifications. In addition to possessing a license, gaming services workers need superior customer service skills. Casino gaming workers provide entertainment and hospitality to patrons, and the quality of their service contributes to an establishment's success or failure. Therefore, gaming workers need good communication skills, an outgoing personality, and the ability to maintain their composure even when dealing with angry or demanding patrons. Personal integrity also is important because workers handle large amounts of money.

Gaming services workers who manage money should have some experience handling cash or using calculators or computers. For such positions, most casinos administer a math test to assess an applicant's level of competency.

Gaming supervisors and gaming managers must have strong leadership, organizational, and communication skills. Excellent customer service and employee relations skills also are necessary.

Advancement. Advancement opportunities in casino gaming depend less on workers' previous casino duties and titles than on their ability and eagerness to learn new jobs. For example, an entry-level gaming worker eventually might advance to become a dealer or card room manager or to assume some other supervisory position.

Employment

Gaming services occupations provided 178,700 jobs in 2008. Employment among occupational specialties was distributed as follows:

Gaming dealers.....	91,100
Gaming supervisors.....	40,900
Slot key persons	24,400
Gaming and sports book writers and runners.....	16,200
Gaming managers.....	6,200

Gaming services workers are found mainly in the traveler accommodation and gambling industries. Most are employed in commercial casinos, including riverboat casinos, casino hotels,

and pari-mutuel racetracks with casinos—known as “racinos,” which are legal in 20 states. In addition, there are 29 States with Indian casinos. The largest number of gaming services workers work in casinos in Nevada. Legal lotteries are held in 43 States and the District of Columbia, and pari-mutuel wagering is legal in 40 States. Forty-seven States and the District of Columbia also allow charitable gaming.

Job Outlook

Employment of gaming service workers is expected to grow faster than the average for all occupations. Opportunities will be best for those with previous casino gaming experience, a degree or technical or vocational training in gaming or a hospitality-related field, and strong customer service skills.

Employment change. Employment in gaming services occupations is projected to grow by 14 percent between 2008 and 2018, which is faster than the average for all occupations. The increasing popularity and prevalence of Indian casinos and racinos will provide new job openings. States that have recently legalized gaming in the form of electronic gaming devices or table games will provide growth as more gaming facilities are opened. With many States benefiting from casino gambling in the form of tax revenue or agreements with Indian tribes, additional States are reconsidering their opposition to legalized gambling and will likely approve the construction of more casinos and other gaming establishments during the next decade. Additional job growth will occur as popular tourist destinations, such as Las Vegas, continue to expand their gaming operations.

The increase in gaming reflects growth in the population and in its disposable income, both of which are expected to continue. Higher expectations for customer service among gaming patrons also should result in more jobs for gaming services workers. Because of increasing demand in gaming establishments for additional table games, particularly poker, the largest growth is expected among gaming dealers. However, new automated electronic table games, which eliminate the need for dealers, will moderate growth.

Advancements in slot machine technology, such as coinless slot machines—known as “ticket-in, ticket-out machines”—will cause employment of slot key persons to grow by 3 percent from 2008 to 2018, which is slower than the average for all occupations. Ticket-in, ticket-out technology reduces the need for slot key persons to pay out jackpots, fill hoppers, and reset machines. Additionally, slot machines linked to a network allow adjustments to be made from a central computer server rather than from the floor by a slot key person.

Job prospects. In addition to job openings arising from employment growth, opportunities will result from the need to replace workers transferring to other occupations or leaving the labor force.

Keen competition for gaming services jobs is expected, because there generally are more applicants than jobs. Job prospects in gaming services occupations will be best for those with previous casino gaming experience, a degree or technical or vocational training in gaming or a hospitality-related field, and strong interpersonal and customer service skills.

Earnings

Wages for gaming services workers vary according to occupation, level of experience, training, location, and the size of the gaming establishment. The following were median annual wages for various gaming services occupations in May 2008:

Gaming managers.....	\$68,290
Gaming supervisors.....	45,500
Slot key persons	25,460
Gaming and sports book writers and runners.....	19,690
Gaming dealers.....	16,310

Gaming dealers generally receive a large portion of their earnings from tips in the form of tokens received from players. Earnings from tips vary with the table games the dealer operates, the personal traits of the dealer, and the pooling policies of the casino.

Related Occupations

Other occupations that provide hospitality and customer service include:

	Page
Cashiers.....	530
Gaming cage workers.....	565
Retail salespersons	543
Sales worker supervisors.....	551
Security guards and gaming surveillance officers.....	481
Tellers.....	599

Recreation Workers

Significant Points

- The recreation field offers an unusually large number of part-time and seasonal job opportunities.
- Opportunities for part-time, seasonal, and temporary recreation jobs will be good, but competition will remain keen for full-time career positions.
- Many recreation workers spend most of their time outdoors and may work in a variety of weather conditions.

Many recreation workers spend most of their time outdoors in various weather conditions.

Nature of the Work

As participation in organized recreational activities grows, *recreation workers* will be needed to plan, organize, and direct these activities in local playgrounds and recreation areas, parks, community and senior centers, nursing homes and other senior housing, camps, and tourist attractions. These workers lead groups in activities such as arts and crafts, sports, performing arts, camping, and other special interests. They make sure that participants abide by the rules of the camps and recreational facilities and that safety practices are adhered to so that no one gets injured. Recreation workers also are found in some businesses or business groups, where they direct leisure activities for employees, such as softball or bowling, and organize sports leagues.

Recreation workers hold a variety of positions at different levels of responsibility. Those who work directly with children in residential or day camps are called *camp counselors*. These workers lead and instruct children and teenagers in a variety of outdoor recreation activities, such as swimming, hiking, horseback riding, and camping. In addition, counselors who specialize may teach campers special subjects, such as archery, boating, music, drama, gymnastics, tennis, and computers. In residential camps, counselors also provide guidance and supervise daily living and socialization. *Camp directors* typically supervise camp counselors, plan camp activities or programs, and perform the various administrative functions of a camp.

Workers who provide instruction and coaching primarily in one activity, such as art, music, drama, swimming, or tennis, are called *activity specialists*. These workers can work in camps or anywhere else where there is interest in a single activity.

Recreation leaders are responsible for a recreation program's daily operation. They primarily organize and direct participants, schedule the use of facilities, keep records of equipment use, and ensure that recreation facilities and equipment are used properly. In addition, they may lead classes and provide instruction in a recreational activity.

Recreation supervisors oversee recreation leaders and plan, organize, and manage recreational activities to meet the needs of a variety of populations. These workers often serve as liaisons between the director of the park or recreation center and the recreation leaders. Recreation supervisors with more specialized responsibilities also may direct special activities or events or oversee a major activity, such as aquatics, gymnastics, or one or more performing arts.

Directors of recreation and parks develop and manage comprehensive recreation programs in parks, playgrounds, and other settings. Directors usually serve as technical advisors to State and local recreation and park commissions and may be responsible for recreation and park budgets.

Work environment. Recreation workers work in a variety of settings—for example, a cruise ship, a nature park, a summer camp, or a playground in the center of an urban community. Many recreation workers spend most of their time outdoors and may work in a variety of weather conditions. Recreation directors and supervisors, however, typically spend most of their time in an office, planning programs and special events. Directors and supervisors generally engage in less physical activity than do lower level recreation workers. Nevertheless, recreation workers at all levels risk suffering injuries during physical activities.

Some recreation workers work about 40 hours a week. However, many people entering this field, such as camp counselors, may have some night and weekend work, irregular hours, and seasonal employment. In 2008, about 40 percent of these workers worked part time.

Training, Other Qualifications, and Advancement

The educational and training requirements for recreation workers vary widely with on the type of job. Full-time career positions usually require a college degree. Many jobs, however, require demonstrated knowledge of the activity or can be learned with only a short period of on-the-job training.

Education and training. The educational needs for people entering into this occupational field vary widely depending on the job and level of responsibility. For activity specialists, it is more important to have experience and demonstrated competence in a particular activity, such as art or kayaking, than to have a degree. Camp counselors often are older teenagers or young adults who have experienced camping as a child and enjoy the camping experience. A degree is less important than the counselor's maturity level, ability to work well with children and teens, and ability to make sure that they stay safe.

Those working in administrative positions for large organizations or public recreation systems may need a bachelor's degree or higher. Full-time career professional positions usually require a college degree with a major in parks and recreation or leisure studies, but a bachelor's degree in any liberal arts field may be sufficient for some jobs in the private sector. In industrial recreation, or "employee services" as it is more commonly called, companies that offer recreational activities for their employees prefer to hire those with a bachelor's degree in recreation or leisure studies and a background in business administration.

Employers seeking candidates for some administrative positions favor those with at least a master's degree in parks and recreation, business administration, or public administration. Most require at least an associate's degree in recreation studies or a related field.

An associate's or bachelor's degree in a recreation-related discipline, along with experience, is preferred for most recreation supervisor jobs and is required for most higher level administrative jobs. Graduates of associate's degree programs in parks and recreation, social work, and other human services disciplines also can enter some career recreation positions. High school graduates occasionally enter career positions, but doing so is not common.

Programs leading to an associate's or bachelor's degree in parks and recreation, leisure studies, or related fields are offered at several hundred colleges and universities. Many also offer master's or doctoral degrees in the field. In 2009, 89 bachelor's degree programs in parks and recreation were accredited by the National Recreation and Park Association (NRPA). Accredited programs provide broad exposure to the history, theory, and practice of park and recreation management. Courses offered include community organization; supervision and administration; recreational needs of special populations, such as the elderly or disabled; and supervised fieldwork. Students may specialize in areas such as therapeutic recreation, park management, outdoor recreation, industrial or commercial recreation, and camp management.

Specialized training or experience in a particular field, such as art, music, drama, or athletics, is an asset for many jobs. Some jobs also require certification. For example, a lifesaving certificate is a prerequisite for teaching or coaching water-related activities.

The large number of seasonal and part-time workers learn through on-the-job training.

Licensure and certification. The NRPA certifies individuals for professional and technical jobs. Certified park and recreation professionals must pass an exam. In order to qualify to take the exam, individuals need to (1) have earned a bachelor's degree in a major such as recreation, park resources, or leisure services from a program accredited by the NRPA or

have at least 1 year of experience if the program is not accredited; (2) have earned any other bachelor's degree and have at least 3 years of relevant full-time work experience; or (3) have at least 5 years of full-time experience in the field. Continuing education is necessary to remain certified.

Many cities and localities require lifeguards to be certified. Training and certification details vary from State to State and county to county. Information on lifeguards is available from local parks and recreation departments.

Other qualifications. People planning careers in recreation should be outgoing, good at motivating people, and sensitive to the needs of others. Excellent health and physical fitness often are required, due to the physical nature of some jobs. Time management and the ability to manage others also is important.

Advancement. Recreation workers start their careers working with people. As they gain experience, they may get promoted to positions with greater responsibilities. Recreation workers with experience and managerial skills may advance to supervisory or managerial positions. Eventually, they may become the director of a recreation department.

Employment

Recreation workers held about 327,500 jobs in 2008, and many additional workers held summer jobs in the occupation. About 31 percent of recreation workers worked for local governments, primarily in park and recreation departments. About 16 percent of recreation workers were employed by nursing and residential care facilities, and another 10 percent were employed in civic and social organizations, such as the Boy Scouts or Girl Scouts or the YMCA and YWCA.

Job Outlook

Faster than average growth is expected. Jobs opportunities for part-time, seasonal, and temporary recreation workers will be good, but competition will remain keen for career positions as recreation workers.

Employment change. Overall employment of recreation workers is projected to increase by 15 percent between 2008 and 2018, which is faster than the average for all occupations. Although people will spend more time and money on recreation, budget restrictions in State and local government will limit the number of jobs added. Many of the new jobs will be in social assistance organizations and in nursing and residential care facilities. Civic and social organizations and fitness and sports centers will also contribute to growth.

Growth will be driven by the growing numbers of young and older Americans. The large numbers of births in recent years likely will increase the demand for recreation services for children, and retiring baby boomers are expected to have more leisure time, higher disposable incomes, and more concern for health and fitness than previous generations had. The latter fac-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018		Change, 2008-2018	
			2018	Number	Percent	
Recreation workers	39-9032	327,500	375,700	48,200	15	

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

tors should lead to an increasing demand for recreation services for baby boomers.

Job prospects. Applicants for part-time, seasonal, and temporary recreation jobs should have good opportunities, but competition will remain keen for career positions because the recreation field attracts many applicants and because the number of career positions is limited compared with the number of lower level seasonal jobs. Opportunities for staff positions should be best for people with formal training and experience in part-time or seasonal recreation jobs. Volunteer experience, part-time work during school, and a summer job are viewed favorably. Those with graduate degrees should have the best opportunities for supervisory or administrative positions. Job openings will stem from growth and the need to replace the large numbers of workers who leave the occupation each year.

Earnings

In May 2008, median annual wages of recreation workers who worked full time were \$21,960. The middle 50 percent earned between \$17,680 and \$28,810. The lowest paid 10 percent earned less than \$15,630, while the highest paid 10 percent earned \$37,730 or more. However, earnings of recreation directors and others in supervisory or managerial positions can be substantially higher. Most public and private recreation agencies provide full-time recreation workers with typical benefits; part-time workers receive few, if any, benefits. In May 2008, median annual wages in the industries employing the largest numbers of recreation workers were as follows:

Nursing care facilities	\$23,100
Individual and family services	22,260
Local government.....	21,890
Civic and social organizations.....	19,800
Other amusement and recreation industries	19,670

The large numbers of temporary, seasonal jobs in the recreation field typically are filled by high school or college students, generally do not have formal education requirements, and are open to anyone with the desired personal qualities. Employers compete for a share of the vacationing student labor force, and although salaries in recreation often are lower than those in other fields, the nature of the work and the opportunity to work outdoors are attractive to many.

Part-time, seasonal, and volunteer jobs in recreation include summer camp counselors, craft specialists, and afterschool and weekend recreation program leaders. In addition, many teachers and college students accept jobs as recreation workers when school is not in session. The vast majority of volunteers serve as activity leaders at local day camp programs or in youth organizations, camps, nursing homes, hospitals, senior centers, and other settings.

Other Service Occupations

Fire Inspectors and Investigators

Nature of the Work

Fire inspectors visit and inspect businesses and other places of assembly each year to ensure that these places meet State and local fire codes. These inspectors may also work with developers and planners to check and approve plans for new buildings and to inspect buildings under construction. *Fire investigators* determine the causes of fires. They collect evidence, interview

witnesses, and prepare reports on fires in cases in which the cause may be arson or criminal negligence. In national forests and parks, *forest fire inspectors* and *prevention specialists* spot fires from watchtowers and report the fires to headquarters by telephone or radio. They also patrol to ensure that travelers and campers comply with fire regulations.

Education and Training

Most fire inspectors and investigators have experience in fire suppression in addition to a high school diploma. They get on-

the-job training in inspection or investigation or attend training academies.

Job Outlook

Current and projected employment:

2008 Employment	16,600
2018 Employment	18,100
Employment change.....	1,500
Growth rate.....	9%

Employment change. Fire inspectors and investigators are expected to grow as fast as the average for all occupations. As cities and other areas grow, there are more buildings to inspect and fires to investigate. Employment of fire inspectors and investigators should grow along with the population.

Job prospects. Jobseekers should expect keen competition. Those who have completed some fire suppression education at a community college, have experience in fire suppression, or have experience and training related to criminal investigation should have an advantage.

Earnings

Median annual wages in May 2008 were as follows:

Fire inspectors and investigators	\$53,030
Forest fire inspectors and prevention specialists	31,380

Related Occupations

	Page
Firefighters	470
Police and detectives	473
Private detectives and investigators.....	477

Makeup Artists, Theatrical and Performance

Nature of the Work

Theatrical and performance makeup artists apply makeup to enhance performing artists' appearances for movie, television,

or stage performances. They may be self-employed or work directly for a theater, television station, or production company.

Education and Training

Most theatrical and performance makeup artists undergo post-secondary training at a school of cosmetology or other specialized institute. Such programs may last several months to a year, and may require a high school diploma for admission. Depending on the State and specific work being performed, makeup artists who also style hair usually require a State license. A background or courses in art and design may be helpful.

Job Outlook

Current and projected employment:

2008 Employment	2,800
2018 Employment	3,300
Employment change.....	500
Growth rate.....	17%

Employment change. Employment is expected to grow faster than the average for all occupations. Continued increases in the demand for television programs, movies, and other entertainment will lead to new openings for theatrical and performance makeup artists. At the same time, the increasing use of computer-generated effects in films and the popularity of reality television have limited growth for this occupation. As this is a small occupation, the number of new jobs will be few, despite the faster than average growth.

Job prospects. Theatrical and performance makeup artists will face keen competition. Entry-level workers should expect few opportunities, while those with experience will have more work. Job openings will be greatest in areas with many media production companies, particularly Los Angeles and New York City.

Earnings

Median hourly wages for makeup artists, theatrical and performance, were \$12.63 in May 2008.

Sales and Related Occupations

Advertising Sales Agents

Significant Points

- Applicants who have sales experience and a college degree should have the best opportunities, but keen competition for jobs is expected during downturns in spending on advertising.
- Educational requirements vary; the ability to communicate effectively and persuasively is important for entry-level candidates.
- Performance-based pay, including bonuses and commissions, can make up a large portion of an advertising sales agent's earnings.
- Pressure to meet monthly sales quotas can be stressful.

Nature of the Work

Advertising sales agents—often referred to as *account executives* or *advertising sales representatives*—sell or solicit advertising primarily for newspapers and periodicals, television and radio, websites, telephone directories, and direct mail and outdoor advertisers. Because such a large share of revenue for many of these media outlets is generated from advertising, advertising sales agents play an important role in their success.

More than half of all advertising sales agents work in the information sector, mostly for media firms including television and radio broadcasters, print and Internet publishers, and cable program distributors. Firms that are regionally based often need the help of two types of advertising sales agents, one to handle local clients and one to solicit advertising from national advertisers. Print publications and radio and television stations employ local sales agents, who are responsible for sales in an immediate territory, while separate companies known as media representative firms sell advertising space or time for media owners at the national level. Sales agents employed in media representation work exclusively through executives at advertising agencies, called media buyers, who purchase advertising space for their clients who want to initiate national advertising campaigns. When a local television broadcaster, radio station, newspaper, or online publisher is working with a media representative firm, the media company normally employs a national sales manager to coordinate efforts with the media representative.

Most advertising sales agents work outside the office occasionally, calling on clients and prospective clients at their places of business. These agents may have an appointment, or they may practice cold calling—arriving without an appointment. Obtaining new accounts is an important part of the job, and they may spend much of their time traveling to and visiting prospective advertisers and current clients. Sales agents also may work on their employer's premises and handle sales for customers who walk in or telephone the firm to inquire about advertising.

Some may make telephone sales calls as well—calling prospects, attempting to sell the media firm's advertising space or time, and arranging followup appointments between interested prospects and sales agents.

A critical part of building relationships with clients is learning about their needs. Before the first meeting with a client, a sales agent gathers background information on the client's products, current customers, prospective customers, and the geographic area of the target market. The sales agent then meets with the clients to explain how specific types of advertising will help promote the client's products or services most effectively. If a client wishes to proceed, the advertising sales agent prepares an advertising proposal to present to the client. Preparation of the proposal entails determining the advertising medium to be used, preparing sample advertisements, and providing the client with cost estimates for the project. Because consolidation among media industries has brought the sales of different types of advertising under one roof, advertising sales increasingly are in the form of integrated packages. This means that advertising sales agents may sell packages that include print and online ad space and time slots with a broadcast subsidiary. Technological innovations also have created more products to sell, meaning that a local television sales agent might sell ad space on a station's Web site and mobile service, in addition to selling commercials.

After a contract has been established, advertising sales agents serve as the main contact between the advertiser or ad agency and the media firm. They handle communication between the parties and assist in developing sample artwork or radio and television spots if needed. For radio and television advertisements, they also may arrange for commercial taping sessions and accompany clients to the sessions.

In addition to maintaining sales and overseeing clients' accounts, advertising sales agents' other duties include analyzing sales statistics and audience demographics, preparing reports on clients' accounts, and scheduling and keeping appointments and work hours. They read about new and existing products and monitor the sales, prices, and products of their competitors. In many firms, the advertising sales agent handles the drafting of contracts specifying the advertising work to be performed and its cost, and may undertake customer service responsibilities such as answering questions or addressing any problems the client may have with the proposal. Sales agents also are responsible for developing sales tools, promotional plans, and media kits, which they use to help make a sale.

Work environment. Selling can be stressful because income and job security depend directly on the agent's ability to maintain and expand his or her clientele. Companies generally set monthly sales quotas and place considerable pressure on advertising sales agents to meet those quotas. The added stress of rejection places more pressure on the agent.

Although most agents work long and often irregular hours, some have the freedom to determine their own schedules. The Internet and other electronic tools allow agents to do more work from home or while on the road, enabling them to send messages

and documents to clients and coworkers, keep up with industry news, and access databases that help them target potential customers. Advertising sales agents use e-mail to conduct much of the business with their clients.

Many advertising sales agents work more than 40 hours per week, frequently involving irregular hours and work on weekends and holidays. However, many advertising sales agents are able to set their own schedules. Ten percent of advertising sales agents were employed part time in 2008.

Training, Other Qualifications, and Advancement

For sales positions that require meeting clients, large employers prefer applicants with a college degree. Smaller companies generally are more willing to hire individuals with a high school degree. Successful sales experience and the ability to communicate effectively become more important than educational attainment once the candidate is hired. Most training for advertising sales agents takes place informally on the job.

Education and training. Although a high school diploma may be sufficient for an entry-level advertising sales position, some employers prefer applicants with a college degree, particularly for sales positions that require meeting clients. Courses in marketing, leadership, communication, business, and advertising are helpful. For those who have a proven record of successfully selling other products, educational requirements are not likely to be strict.

Most training, however, takes place on the job, and can be formal or informal in nature. In most cases, an experienced sales manager instructs a newly hired advertising sales agent who lacks sales experience. In this one-on-one environment, supervisors typically coach new hires and observe them as they make sales calls and contact clients. Supervisors then advise the new hires on ways to improve their interaction with clients. Employers may bring in consultants to lead formal training sessions when agents sell to a specialized market segment, such as automotive dealers or real estate professionals.

Other qualifications. Employers look for applicants who are honest and who possess a pleasant personality and neat professional appearance. After gaining entry into the occupation, the advertising sales agent will find that successful sales experience and the ability to communicate effectively become more important than educational attainment. In fact, when the agent is selling or soliciting ad space, personality traits are equally, if not more, important than one's academic background. In general, smaller companies are more willing to hire unproven individuals.

Because they represent their employers to the executives of client organizations, advertising sales agents must have excellent interpersonal and written communication skills. Being multilingual, particularly in English and Spanish, is another skill that will benefit prospective advertising agents as media increasingly seek to market to Hispanics and foreign-born persons. Self-motivation, organization, persistence, independence, and the ability to multitask are required because advertising sales agents set their own schedules and perform their duties without much supervision. Creativity also is an invaluable trait for advertising sales agents, who must come up with new ways to attract clients and to serve existing ones.

Bringing in new clients is an important part of an advertising sales agent's job.

Advancement. Advancement in the occupation means taking on bigger, more lucrative clients. Agents with proven leadership ability and a strong sales record may advance to supervisory and managerial positions, such as sales supervisor, sales manager, or vice president of sales. Frequent contact with managers of other departments and people in other firms provides sales agents with leads about job openings, enhancing their advancement opportunities. Successful advertising sales agents also may advance to positions in other industries, such as corporate sales. In small firms, where the number of supervisory and management positions is limited, advancement may come slowly. Promotion may occur more quickly in larger media firms and in media representative firms.

Employment

Advertising sales agents held about 166,800 jobs in 2008. Workers were concentrated in three industries: 33 percent were in advertising, public relations, and related services; about 32 percent were employed in newspaper, periodical, book, and directory publishers; and 17 percent were in radio and television broadcasting. Media representative firms are in the advertising and related services industry. A relatively small number of jobs were found in cable and other program distribution.

Employment is spread around the country, but jobs in radio and television stations and large, well-known publications are concentrated in metropolitan areas. Media representative firms also are concentrated in large cities with many advertising agencies, such as New York City.

Job Outlook

Employment is projected to increase about as fast as average. Growth in new media outlets, such as the Internet, will be partially offset by a decline in print media. Applicants who have sales experience and a college degree should have the best opportunities, but keen competition for jobs is expected during downturns in advertising spending.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Advertising sales agents.....	41-3011	166,800	178,900	12,100	7

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Employment change. Employment of advertising sales agents is expected to increase by 7 percent from 2008 to 2018, about as fast as the average for all occupations. Fast growth in the number of cable channels, online advertisers, and other advertising media will create many new opportunities for advertisers. This growth will be partially offset by the decline in print media, which will decrease the demand for advertising sales agents in these industries.

Advertising as an industry is expected to grow over the 2008–18 period. Changes in technology will create new and more efficient ways for advertisers to reach customers, which will increase the need for advertising sales agents. Growth should be particularly high in online advertising sales, in cable television, and for consolidated media firms.

At the same time, the industries employing large shares of advertising sales agents, particularly the newspaper, periodical, and directory publishing industries, have suffered significant declines in recent years. As a result, there are likely to be fewer opportunities for advertising sales agents within these areas compared to other industries over the next decade.

Although advances in technology have made advertising sales agents more productive, allowing agents to take on additional duties and improve the quality of the services they provide, technological advances have not substantially decreased overall demand for these workers. Productivity gains have had the largest effect on the miscellaneous services that these workers provide, such as accounting, the formulation of proposals, and customer service duties, allowing them to provide faster, improved services to their clients. For example, the use of e-mail has considerably shortened the time it takes to negotiate a sale and place an ad. Sales agents may accomplish more in less time, but many work more hours than in the past, spending additional time on followup and service calls. Thus, although productivity gains will temper the growth of advertising sales agents, who can now manage more accounts, the increasing growth in advertising across all industries will ensure that new advertising sales agents will continue to be needed in the future.

Job prospects. Applicants who have sales experience and a college degree should have the best opportunities. For those with a proven sales record in advertising sales, opportunities should be excellent. In addition to the job openings generated by employment growth, openings will occur each year because of the need to replace sales representatives who transfer to other occupations or leave the labor force. Each year, many advertising sales agents discover that they are unable to earn enough money; as a result, they leave the occupation. Advertising revenues are sensitive to economic downturns, which cause the industries and companies that advertise to reduce both the frequency of campaigns and the overall level of spending on advertising. Advertising sales agents must work hard to get the most out of every dollar spent on advertising under these conditions. Therefore, the number of opportunities for advertising sales agents fluctuates with the business

cycle. Applicants can expect keen competition for job openings during downturns in advertising spending.

Earnings

Including commissions, median annual wages for all advertising sales agents were \$43,480 per year in May 2008. The middle 50 percent earned between \$30,750 and \$64,320 a year. The lowest 10 percent earned less than \$22,620, and the highest 10 percent earned more than \$93,600 a year. Median annual wages for sales agents in the industries in which they were concentrated were as follows:

Motion picture and video industries.....	\$62,600
Cable and other subscription programming	50,740
Advertising, public relations, and related services.....	48,550
Radio and television broadcasting	41,750
Newspaper, periodical, book, and directory publishers	38,100

Performance-based pay, including bonuses and commissions, can make up a large portion of an advertising sales agent's earnings. Most employers pay some combination of salaries, commissions, and bonuses. Commissions are usually based on individual sales numbers, whereas bonuses may depend on individual performance, on the performance of all sales workers in a group or district, or on the performance of the entire company. For agents covering multiple areas or regions, commissions also may be based on the difficulty in making a sale in that particular area. Sales revenue is affected by the economic conditions and business expectations facing the industries that tend to advertise. Earnings from commissions are likely to be high when these industries are doing well and low when companies decide not to advertise as frequently.

In addition to their earnings, advertising sales agents are usually reimbursed for entertaining clients and for other business expenses, such as the costs of transportation, meals, and hotel stays. They often receive benefits such as health and life insurance, pension plans, vacation and sick leave, personal use of a company car, and frequent-flier mileage. Some companies offer incentives such as free vacation trips or gifts for outstanding sales workers.

Related Occupations

Cashiers

Significant Points

- Cashiers need little or no work experience; they are trained on the job.
- Opportunities for full-time and part-time jobs are expected to be good because of the need to replace the large number of workers who leave cashier jobs.
- Many cashiers start at the minimum wage.

Nature of the Work

Supermarkets, department stores, gasoline service stations, movie theaters, restaurants, and many other businesses employ cashiers to register the sale of their goods and services. Although specific job duties vary by employer, cashiers usually are assigned to a register at the beginning of their shifts and are given a drawer containing a specific amount of money with which to start—their “till.” They must count their till to ensure that it contains the correct amount of money and adequate supplies of change. Some cashiers also handle returns and exchanges. When they do, they must ensure that returned merchandise is in good condition, and determine where and when it was purchased and what type of payment was used.

After entering charges for all items and subtracting the value of any coupons or special discounts, cashiers total the customer’s bill and take payment. Forms of payment include cash, personal checks, and gift, credit, and debit cards. Cashiers must know the store’s policies and procedures for each type of payment the store accepts. For checks and credit and debit card charges, they may request additional identification from the customer or call in for an authorization. They must verify the age of customers purchasing alcohol or tobacco. When the sale is complete, cashiers issue a receipt to the customer and return the appropriate change. They may also wrap or bag the purchase.

At the end of their shifts, cashiers once again count the drawers’ contents and compare the totals with sales data. An occasional shortage of small amounts may be overlooked but, in many establishments, repeated shortages are grounds for

Cashiers must be friendly and courteous when interacting with customers.

dismissal. In addition to counting the contents of their drawers at the end of their shifts, cashiers usually separate and total charge forms, return slips, coupons, and any other non-cash items.

Most cashiers use scanners and computers, but some establishments still require price and product information to be entered manually. In a store with scanners, a cashier passes a product’s Universal Product Code over the scanning device, which transmits the code number to a computer. The computer identifies the item and its price. In other establishments, cashiers manually enter codes into computers and then descriptions of the items and their prices appear on the screen.

Depending on the type of establishment, cashiers may have other duties as well. In many supermarkets, for example, cashiers weigh produce and bulk food, as well as return unwanted items to the shelves. In convenience stores, cashiers may be required to know how to use a variety of machines other than cash registers, and how to furnish money orders and sell lottery tickets. Operating ticket-dispensing machines and answering customers’ questions are common duties for cashiers who work at movie theaters and ticket agencies.

Work environment. Most cashiers work indoors, usually standing in booths or behind counters. Often, they are not allowed to leave their workstations without supervisory approval because they are responsible for large sums of money. The work of cashiers can be very repetitious, but improvements in workstation design in many stores are alleviating problems caused by repetitive motion. In addition, the work can sometimes be dangerous; the risk from robberies and homicides is much higher for cashiers than for other workers, although more safety precautions are being taken to help deter robbers.

About 47 percent of all cashiers worked part time in 2008. Hours of work often vary depending on the needs of the employer. Generally, cashiers are expected to work weekends, evenings, and holidays to accommodate customers’ needs. However, many employers offer flexible schedules. Because the holiday season is the busiest time for most retailers, many employers restrict the use of vacation time from Thanksgiving through the beginning of January.

Training, Other Qualifications, and Advancement

Cashier jobs usually are entry-level positions requiring little or no previous work experience. They require good customer service skills.

Education and training. Although there are no specific educational requirements, employers filling full-time jobs often prefer applicants with high school diplomas.

Nearly all cashiers are trained on the job. In small businesses, an experienced worker often trains beginners. The trainee spends the first day observing the operation and becoming familiar with the store's equipment, policies, and procedures. After this, trainees are assigned to a register—frequently under the supervision of an experienced worker. In larger businesses, trainees spend several days in classes before being placed at cash registers. Topics typically covered in class include a description of the industry and the company, store policies and procedures, equipment operation, and security.

Training for experienced workers is not common, except when new equipment is introduced or when procedures change. In these cases, the employer or a representative of the equipment manufacturer trains workers on the job.

Other qualifications. People who want to become cashiers should be able to do repetitious work accurately. They also need basic mathematics skills and good manual dexterity. Because cashiers deal constantly with the public, they should be neat in appearance and able to deal tactfully and pleasantly with customers. In addition, some businesses prefer to hire workers who can operate specialized equipment or who have business experience, such as typing, selling, or handling money.

Advancement. Advancement opportunities for cashiers vary. For those working part time, promotion may be to a full-time position. Others advance to head cashier or cash-office clerk. In addition, this job offers a good opportunity to learn about an employer's business and can serve as a steppingstone to a more responsible position.

Employment

Cashiers held about 3.55 million jobs in 2008. Although cashiers are employed in almost every industry, 24 percent of all jobs were in grocery stores. Gasoline stations, department stores, and other retail establishments also employed large numbers of these workers. Outside of retail establishments, many cashiers worked in food services and drinking places.

Job Outlook

Cashiers are expected to grow more slowly than the average for all occupations. Opportunities for full-time and part-time jobs are expected to be good because of the need to replace the large number of workers who leave this occupation.

Employment change. Employment of cashiers is expected to grow by 4 percent between 2008 and 2018 which is slower

than the average for all occupations. Continued growth in retail sales is expected, but the rising popularity of purchasing goods online will limit the employment growth of cashiers, although many customers still prefer the traditional method of purchasing goods at stores. Also, the growing use of self-service checkout systems in retail trade, especially at grocery stores, should have an adverse effect on employment of cashiers. These self-checkout systems may outnumber checkouts with cashiers in the future in many establishments. The impact on job growth for cashiers will largely depend on the public's acceptance of this self-service technology.

Job prospects. Opportunities for full-time and part-time cashier jobs should continue to be good because of the need to replace the large number of workers who transfer to other occupations or leave the labor force. There is substantial movement into and out of the occupation because education and training requirements are minimal and the predominance of part-time jobs is attractive to people seeking a short-term source of income rather than a full-time career. Historically, workers under the age of 25 have filled many of the openings in this occupation. In 2008, about 47 percent of all cashiers were 24 years of age or younger.

Because cashiers are needed in businesses and organizations of all types and sizes, job opportunities are found throughout the country. However, job opportunities may vary from year to year because the strength of the economy affects demand for cashiers. Companies tend to hire more cashiers when the economy is strong. Seasonal demand for cashiers also causes fluctuations in employment.

Earnings

Many cashiers start at the Federal minimum wage, which was \$7.25 an hour as of July 2009. Some State laws set the minimum wage higher, and establishments must pay at least that amount. Wages tend to be higher in areas where there is intense competition for workers.

Median hourly wages of cashiers, except gaming in May 2008 were \$8.49. The middle 50 percent earned between \$7.50 and \$9.72 an hour. The lowest 10 percent earned less than \$6.88, and the highest 10 percent earned more than \$12.02 an hour. Median hourly wages in the industries employing the largest numbers of cashiers in May 2008 were:

Health and personal care stores.....	\$8.71
Other general merchandise stores	8.60
Grocery stores	8.59
Department stores.....	8.38
Gasoline stations	8.16

Similar to other occupations, benefits for full-time cashiers tend to be better than those for cashiers working part time. In addition to typical benefits, those working in retail establishments

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Cashiers, except gaming	41-2011	3,550,000	3,675,500	125,500	4

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

often receive discounts on purchases, and cashiers in restaurants may receive free or low-cost meals. Some employers also offer employee stock option plans and education reimbursement plans.

Related Occupations

Demonstrators and Product Promoters

Significant Points

- Job openings should be plentiful.
- Most jobs are part time or short term or have variable work schedules, and many jobs require frequent travel.
- On-the-job training is provided and education beyond high school is not required.

Nature of the Work

Demonstrators and *product promoters* create public interest in buying products such as cosmetics, food, and housewares. The information they provide helps consumers make choices among the wide variety of products and services they can buy.

Demonstrators and product promoters encourage people and stores to buy a product by demonstrating it to prospective customers and answering their questions. They may sell the demonstrated merchandise or gather names of prospects to contact later or pass on to sales staff. Demonstrators promote sales

of a product to consumers, while product promoters encourage sales to retail stores and help them market products effectively.

Demonstrators and product promoters generate sales of both sophisticated and simple products, ranging from computer software to mops. They attract an audience by offering samples, administering contests, distributing prizes and coupons, and using direct-mail advertising. They must greet and catch the attention of possible customers and quickly identify those who are interested and able to buy. They inform and educate customers about the features of products and demonstrate their use with apparent ease in order to inspire confidence in the product and its manufacturer. They also distribute information, such as brochures and order forms. Some demonstrations are intended to generate immediate sales through impulse buying, whereas others increase the likelihood of future sales by increasing brand awareness.

Demonstrations and product promotions are conducted in retail and grocery stores, shopping malls, trade shows, and outdoor fairs. Locations are selected on the basis of the nature of the product and the type of audience. Demonstrations at large events may require teams of demonstrators to handle large crowds efficiently. Some demonstrators promote products on videotape or on television programs, such as “infomercials” or home shopping programs.

Demonstrators and product promoters may prepare the content of a presentation and alter it to target a specific audience or to keep it current. They may participate in the design of an exhibit or customize the exhibit for particular audiences. Results obtained by demonstrators and product promoters are analyzed, and presentations are adjusted to make them more effective. Demonstrators and product promoters also may be involved in transporting, assembling, and disassembling materials used in demonstrations.

A demonstrator’s presentation may include visuals, models, case studies, testimonials, test results, and surveys. The equipment used for a demonstration varies with the product being demonstrated. A food product demonstration might require the use of cooking utensils, while a software demonstration could require the use of a multimedia computer. Demonstrators must be familiar with the product to be able to relate detailed

Demonstrators and product promoters encourage people and stores to buy a product by showing it to prospective customers and answering their questions.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Demonstrators and product promoters.....	41-9011	102,800	110,100	7,300	7

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

information to customers and to answer any questions that arise before, during, or after a demonstration. In order to do so, they may research the product presented, the products of competitors, and the interests and concerns of the target audience before conducting a demonstration. Demonstrations of complex products often need practice.

Work environment. About 54 percent of all demonstrators and product promoters work part time and about 22 percent have variable work schedules. Many positions may last 6 months or less.

Demonstrators and product promoters may work long hours while standing or walking, with little opportunity to rest. Some of them travel frequently, and night and weekend work often is required. The atmosphere of a crowded trade show or State fair frequently is hectic, and demonstrators and product promoters may feel pressure to influence the greatest number of consumers possible in a very limited amount of time. However, many enjoy the opportunity to interact with a variety of people.

Training, Other Qualifications, and Advancement

On-the-job training is provided and education beyond high school is not required.

Education and training. Demonstrators and product promoters usually receive on-the-job training, and formal postsecondary education is not required. Training is primarily product oriented, because a demonstrator must be familiar with the product to demonstrate it properly. The length of training varies with the complexity of the product. Experience with the product or familiarity with similar products may be required for the demonstration of complex products, such as computers. During the training process, demonstrators may be introduced to the manufacturer's corporate philosophy and preferred methods for dealing with customers.

Other qualifications. Employers look for demonstrators and product promoters with good communication skills and a pleasant appearance and personality. Demonstrators and product promoters must be comfortable with public speaking. They should be able to entertain an audience and use humor, spontaneity, and personal interest in the product as promotional tools. Foreign language skills are helpful.

Advancement. Demonstrators and product promoters who perform well and show leadership abilities may advance to other marketing and sales occupations or open their own business.

Employment

Demonstrators and product promoters held about 102,800 jobs in 2008. About 23 percent of all salaried jobs for demonstrators and product promoters were in retail trade, especially general merchandise stores, and 18 percent were in advertising, public relations, and related services. Other jobs were

found in administrative and support services, including employment services.

Job Outlook

Employment of demonstrators and product promoters is expected to grow as fast as average for all occupations through 2018. Job openings should be plentiful over the next decade.

Employment change. Demonstrators and product promoters are expected to experience 7 percent growth between 2008 and 2018, as fast as the average for all occupations. Job growth should be driven by increases in the number and size of trade shows and greater use of these workers in department stores and various retail shops for in-store promotions. Product demonstration is considered a highly effective marketing tool. New jobs should arise as firms devote a greater percentage of marketing budgets to product demonstration. However, it is also an expensive method of marketing, which will somewhat limit growth.

Job prospects. Job openings should be plentiful for demonstrators and product promoters. Employers may have difficulty finding qualified demonstrators who are willing to fill part-time, short-term positions.

Employment of demonstrators and product promoters is affected by downturns in the business cycle. Many firms tend to reduce advertising budgets during recessions.

Earnings

Demonstrators and product promoters had median hourly wages of \$11.18 in May 2008. The middle 50 percent earned between \$9.06 and \$14.88. The lowest 10 percent earned less than \$8.14, and the highest 10 percent earned more than \$19.94. Employers of demonstrators and product promoters generally pay for job-related travel expenses.

Insurance Sales Agents

Significant Points

- In addition to offering insurance policies, agents increasingly sell mutual funds, annuities, and securities and offer comprehensive financial planning services, including retirement and estate planning services, some designed specifically for the elderly.
- Agents must obtain a license in the States where they sell.
- Job opportunities should be best for college graduates who have sales ability, excellent interpersonal skills, and expertise in a wide range of insurance and financial services.

Nature of the Work

Most people have their first contact with an insurance company through an insurance sales agent. These workers help individuals, families, and businesses select insurance policies that provide the best protection for their lives, health, and property.

Insurance sales agents, commonly referred to as “producers” in the insurance industry, sell one or more types of insurance, such as property and casualty, life, health, disability, and long-term care. Property and casualty insurance agents sell policies that protect individuals and businesses from financial loss resulting from automobile accidents, fire, theft, storms, and other events that can damage property. For businesses, property and casualty insurance can also cover injured workers’ compensation, product liability claims, or medical malpractice claims.

Life insurance agents specialize in selling policies that pay beneficiaries when a policyholder dies. Depending on the policyholder’s circumstances, a cash-value policy can be designed to provide retirement income, funds for the education of children, and other benefits, as well. Life insurance agents also sell annuities that promise a retirement income. Health insurance agents sell health insurance policies that cover the costs of medical care and loss of income due to illness or injury. They also may sell dental insurance and short-term and long-term-disability insurance policies. Agents may specialize in any one of these products, or function as generalists, providing multiple products to a single customer.

An increasing number of insurance sales agents offer their clients advice on how to minimize risk as well as comprehensive financial planning services, especially to those approaching retirement. These services include retirement planning, estate planning, and assistance in setting up pension plans for businesses. As a result, many insurance agents are involved in

“cross-selling” or “total account development.” Besides offering insurance, these agents may become licensed to sell mutual funds, variable annuities, and other securities. This practice is most common with life insurance agents who already sell annuities, but many property and casualty agents also sell financial products. (See the statement on securities, commodities, and financial services sales agents elsewhere in the *Handbook*.)

Insurance sales agents also prepare reports, maintain records, and seek out new clients. In the event that policy holders experience a loss, agents help them settle their insurance claims. Insurance sales agents working exclusively for one insurance company are referred to as *captive agents*. These agents typically have a contractual agreement with the carrier, and are usually an employee of the carrier. Independent insurance agents, or *brokers*, are mostly facilitators who represent several companies. They match insurance policies for their clients with the company that offers the best rate and coverage.

Technology—specifically, the Internet—has greatly affected the insurance business, making the tasks of obtaining price quotes and processing applications and service requests faster and easier. The Internet has made it easier for agents to take on more clients and to be better informed about new products. It has also altered the relationship between agent and client. Agents formerly used to devote much of their time to marketing and selling products to new clients. Now, clients are increasingly obtaining insurance quotes from a company’s Web site and then contacting the company directly to purchase policies. This interaction gives the client a more active role in selecting their policy, while reducing the amount of time agents spend seeking new clients. Insurance sales agents also obtain many new accounts through referrals, so it is important that they maintain regular contact with their clients to ensure that the client’s financial needs are being met. Developing a satisfied clientele that will recommend an agent’s services to other potential customers is a key to success for agents.

Increasing competition in the insurance industry has spurred carriers to find new ways to keep their clients satisfied. One solution is hiring customer service representatives who are accessible 24 hours a day, 7 days a week to handle routine tasks such as answering questions, making changes in policies, processing claims, and selling more products to clients. The opportunity to cross-sell new products to clients will help an agent’s business grow. The use of customer service representatives also allows agents to concentrate their efforts on seeking out new clients and maintaining relationships with old ones. (See the statements on customer service representatives; and claims adjusters, appraisers, examiners, and investigators elsewhere in the *Handbook*.)

Work environment. Most insurance sales agents work in offices. Since some agencies are small, agents may work alone or with only a few others. Some independent agents, or brokers, however, may spend much of their time traveling to meet with clients, close sales, or investigate claims. Agents usually determine their own hours of work and often schedule evening and weekend appointments for the convenience of clients. Some sales agents meet with clients during business hours and then spend evenings doing paperwork and preparing presentations

An increasing number of insurance sales agents offer comprehensive financial planning services to their clients.

for prospective clients. Although most agents work a 40-hour week, some may work much longer.

Training, Other Qualifications, and Advancement

Every sales agent involved in the solicitation, selling, or negotiation of insurance must have a State-issued license. Licensure requirements vary by State but typically require some insurance-related coursework and the passing of several exams. Although some agents are hired right out of college, many are hired by insurance companies as customer service representatives and are later promoted to sales agent.

Education and training. For insurance sales agent jobs, many companies and independent agencies prefer to hire college graduates—especially those who have majored in business, finance, or economics. High school graduates may be hired if they have proven sales ability or have been successful in other types of work.

College training can help agents grasp the technical aspects of insurance policies as well as the fundamentals of the insurance industry. Many colleges and universities offer courses in insurance, and a few schools offer a bachelor's degree in the field. College courses in finance, mathematics, accounting, economics, business law, marketing, and business administration enable insurance sales agents to understand how social and economic conditions relate to the insurance industry. Courses in psychology, sociology, and public speaking can prove useful in improving sales techniques. In addition, familiarity with

popular software packages has become very important because computers provide instantaneous information on a wide variety of financial products and greatly improve an agent's efficiency.

Agents learn many of their job duties on the job from other agents. Many employers have their new agents shadow an experienced agent for a period of time. This allows the agent to learn how to conduct their business, how the agency interacts with clients, and how to write policies.

Employers also are placing greater emphasis on continuing professional education as the diversity of financial products sold by insurance agents increases. It is important for insurance agents to keep up to date on issues concerning clients. Changes in tax laws, government benefits programs, and other State and Federal regulations can affect the insurance needs of clients and the way in which agents conduct business. Agents can enhance their selling skills and broaden their knowledge of insurance and other financial services by taking courses at colleges and universities and by attending institutes, conferences, and seminars sponsored by insurance organizations.

Licensure. Insurance sales agents must obtain a license in the States where they plan to work. Separate licenses are required for agents to sell life and health insurance and property and casualty insurance. In most States, licenses are issued only to applicants who complete specified prelicensing courses and who pass State examinations covering insurance fundamentals and State insurance laws. Most State licensing authorities also have mandatory continuing education requirements every 2 years, focusing on insurance laws, consumer protection, ethics, and the technical details of various insurance policies.

As the demand for financial products and financial planning increases, many insurance agents choose to gain the proper licensing and certification to sell securities and other financial products. Doing so, however, requires substantial study and passing an additional examination—either the Series 6 or Series 7 licensing exam, both of which are administered by the National Association of Securities Dealers (NASD). The Series 6 exam is for individuals who wish to sell only mutual funds and variable annuities, whereas the Series 7 exam is the main NASD series license that qualifies agents as general securities sales representatives.

Other qualifications. Previous experience in sales or insurance jobs can be very useful in becoming an insurance sales agent. In selling commercial insurance, technical experience in a particular field can help sell policies to those in the same profession. As a result, these agents tend to be older than entrants in many other occupations.

Insurance sales agents should be flexible, enthusiastic, confident, disciplined, hard working, and willing to solve problems. They should communicate effectively and inspire customer confidence. Because they usually work without supervision, sales agents must have good time-management skills and the initiative to locate new clients.

Certification and advancement. A number of organizations offer professional designation programs that certify an agent's expertise in specialties such as life, health, and property and casualty insurance, as well as financial consulting. For example, The National Alliance for Insurance Education and Research offers a wide variety of courses in health, life and property, and

casualty insurance for independent insurance agents. Although voluntary, such programs assure clients and employers that an agent has a thorough understanding of the relevant specialty. Agents who complete certification are usually required to fulfill a specified number of hours of continuing education to retain their designation, as determined by the Alliance.

In the area of financial planning, many agents find it worthwhile to demonstrate competency by earning the certified financial planner or chartered financial consultant designation. The Certified Financial Planner credential, issued by the Certified Financial Planner Board of Standards, requires relevant experience, completion of education requirements, passing a comprehensive examination, and adherence to an enforceable code of ethics. The exam tests the candidate's knowledge of the financial planning process, insurance and risk management, employee benefits planning, taxes and retirement planning, and investment and estate planning.

The Chartered Financial Consultant (ChFC) and the Chartered Life Underwriter (CLU) designations, issued by the American College in Bryn Mawr, Pennsylvania, typically require professional experience and the completion of an eight-course program of study. For those new to the industry, however, the American College offers the Life Underwriter Training Council Fellow (FUTCF), an introductory course that teaches basic insurance concepts. Many property and casualty insurance agents obtain the Chartered Property Casualty Underwriter (CPCU) designation, offered by the American Institute for Chartered Property Casualty Underwriter. The majority of professional designations in insurance have continuing education requirements.

An insurance sales agent who shows ability and leadership may become a sales manager in a local office. A few advance to managerial or executive positions. However, many who have established a client base prefer to remain in sales work. Some—particularly in the property and casualty field—launch their own independent agencies or brokerage firms.

Employment

Insurance sales agents held about 434,800 jobs in 2008. About 51 percent of insurance sales agents work for insurance agencies and brokerages. About 21 percent work directly for insurance carriers. Although most insurance agents specialize in life and health insurance or property and casualty insurance, a growing number of “multiline” agents sell all lines of insurance. A small number of agents work for banks and securities brokerages as a result of the increasing integration of the finance and insurance industries. Approximately 22 percent of insurance sales agents are self employed.

The majority of insurance sales agents are employed in local offices or independent agencies, but some work in the headquarters of insurance companies.

Job Outlook

Employment is expected to grow about as fast as average for all occupations. Opportunities will be best for college graduates who have sales ability, excellent interpersonal skills, and expertise in a wide range of insurance and financial services.

Employment change. Employment of insurance sales agents is expected to increase by 12 percent over the 2008–18 period, which is about as fast as average for all occupations. Future demand for insurance sales agents depends largely on the variety of financial products and volume of sales. Sales of health insurance, long-term-care insurance, and other comprehensive financial planning services designed specifically for the elderly are expected to rise sharply as the population ages. In addition, a growing population will increase demand for insurance for automobiles, homes, and high-priced valuables and equipment. As new businesses emerge and existing firms expand their insurance coverage, sales of commercial insurance also should increase, including coverage such as product liability, workers' compensation, employee benefits, and pollution liability insurance.

Employment of agents will not keep up with the rising level of insurance sales, however. Many insurance carriers are trying to contain costs and are shedding their captive agents—those agents working directly for insurance carriers. Instead carriers are relying more on independent agents or brokers.

It is unlikely that the Internet will threaten the jobs of these agents. The automation of policy and claims processing allows insurance agents to take on more clients. Most clients value their relationship with their agent and prefer personal service, discussing their policies directly with their agents, rather than through a computer. Insurance law and investments are becoming more complex, and many people and businesses lack the time and expertise to buy insurance without the advice of an agent.

Job prospects. College graduates who have sales ability, excellent interpersonal skills, and expertise in a wide range of insurance and financial services should enjoy the best prospects. Multilingual agents should have an advantage, because they can serve a wider range of customers. Additionally, insurance language tends to be quite technical, so agents who have a firm understanding of relevant technical and legal terms will also be desirable to employers. Many beginning agents fail to earn enough from commissions to meet their income goals and eventually transfer to other careers. Many job openings are likely to result from the need to replace agents who leave the occupation or retire.

Agents may face some competition from traditional securities brokers and bankers, as they also sell insurance policies. Insurance sales agents will need to expand the products and services they offer as consolidation increases among insurance companies, banks, and brokerage firms and as demands increase from clients for more comprehensive financial planning.

Independent agents who incorporate new technology into their existing businesses will remain competitive. Agents who

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018		Change, 2008-2018	
			2018	Number	Percent	
Insurance sales agents.....	41-3021	434,800	486,400	51,600	12	

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

use the Internet to market their products will reach a broader client base and expand their business. Agents who offer better customer service also will remain competitive.

Earnings

The median annual wages of wage and salary insurance sales agents were \$45,430 in May 2008. The middle 50 percent earned between \$33,070 and \$68,730. The lowest 10 percent had earnings of \$26,120 or less, while the highest 10 percent earned more than \$113,930. Median annual wages in May 2008 in the two industries employing the largest number of insurance sales agents were \$48,150 for insurance carriers, and \$44,450 for agencies, brokerages, and other insurance related activities.

Many independent agents are paid by commission only, whereas sales workers who are employees of an agency or an insurance carrier may be paid in one of three ways: salary only, salary plus commission, or salary plus bonus. In general, commissions are the most common form of compensation, especially for experienced agents. The amount of the commission depends on the type and amount of insurance sold and on whether the transaction is a new policy or a renewal. Bonuses usually are awarded when agents meet their sales goals or when an agency meets its profit goals. Some agents involved with financial planning receive a fee for their services, rather than a commission.

Company-paid benefits to insurance sales agents usually include continuing education, training to qualify for licensing, group insurance plans, office space, and clerical support services. Some companies also may pay for automobile and transportation expenses, attendance at conventions and meetings, promotion and marketing expenses, and retirement plans. Independent agents working for insurance agencies receive fewer benefits, but their commissions may be higher to help them pay for marketing and other expenses.

Models

Significant Points

- Despite faster than average growth, keen competition is expected for modeling jobs.
- Most jobs are part time or have variable work schedules, and many jobs require frequent travel.
- Formal training is limited and education beyond high school usually is not required.

Nature of the Work

Models create public interest in buying products such as clothing, cosmetics, food, and housewares. The information they provide helps consumers make choices among the wide variety of products and services they can buy.

Models pose for photos, paintings, or sculptures. They display clothing such as dresses, coats, underclothing, swimwear, and suits, for a variety of audiences and in various types of media. They model accessories, such as handbags, shoes, and jewelry, and promote beauty products, including fragrances and cosmetics. The most successful models, called supermodels, hold celebrity status and often use their image to sell books, cal-

endars, fitness videos, and other products. In addition to modeling, they may appear in movies and television shows.

Models appear in printed publications, at live modeling events, and on television to advertise and promote products and services. Most modeling jobs are for printed publications, and models usually do a combination of editorial, commercial, and catalog work. Editorial print modeling uses still photographs of models for fashion magazine covers and to accompany feature articles. Commercial print modeling includes work for advertisements in magazines, newspapers, and billboards. Models advertise merchandise and appear in department-store catalogs, mail-order catalogs, and on the Internet.

During a photo shoot, a model poses to demonstrate the features of clothing and other products. Models make small changes in posture and facial expression to capture the look desired by the client. Photographers instruct models to pose in certain positions and to interact with their physical surroundings. Models work closely with photographers, hair and clothing stylists, makeup artists, and clients to produce the desired look and to finish the photo shoot on schedule. Stylists and makeup artists prepare the model for the photo shoot, provide touchups, and change the look of models throughout the day. If stylists are not provided, models must apply their own makeup and bring their own clothing.

Live modeling is done in a variety of locations. Live models stand, turn, and walk to demonstrate clothing to a variety of audiences. At fashion shows and in showrooms, garment buyers are the primary audience. Runway models display clothes that are intended for direct sale to consumers or are the artistic expressions of the designer. High fashion, or haute couture, runway models walk a runway before an audience of photographers, journalists, designers, and garment buyers. Live modeling also is done in apparel marts, department stores, and fitting rooms of clothing designers. In retail establishments, models display clothing directly for shoppers and may be required to describe the features and prices of the clothing. Other models pose for sketch artists, painters, and sculptors.

Because advertisers often need to target specific segments of the population, models may specialize in a certain area. For example, petite and plus-size fashions are modeled by women whose size is smaller or larger than that worn by the typical model. Models who are disabled may be used to model fashions or products for disabled consumers. "Parts" models have a body part, such as a hand or foot, which is particularly well suited to model products such as fingernail polish or shoes.

Almost all models work through agents who provide a link between models and clients. Agents scout for new faces, advise and train new models, and promote them to clients. Clients pay models, and the agency receives a portion of the model's earnings for its services. A typical modeling job lasts only 1 day, so modeling agencies differ from other employment agencies in that they maintain an ongoing relationship with the model.

With the help of agents, models spend a considerable amount of time promoting and developing themselves. Models assemble and maintain portfolios, print composite cards, and travel to check out potential clients, or "go-sees." A portfolio is a collection of a model's previous work that is carried to all go-sees and bookings. A composite card contains the

Models appear in printed publications, at live modeling events, and on television to advertise and promote products and services.

best photographs from a model's portfolio, along with his or her measurements. Increasingly, composite cards are being sent electronically to clients and printed portfolios are being replaced with digital portfolios.

Models must gather information before a job. From an agent, they learn the pay, date, time, and length of the shoot. Also, models need to ask if hair, makeup, and clothing stylists will be provided. It is helpful for models to know what product is being promoted and what image they should project. Some models research the client and the product being modeled to prepare for a shoot. Once a job is completed, models must check in with their agency and plan for the next appointment.

Work environment. Many models work part time, often with variable work schedules.

Models work under a variety of conditions varying from difficult to glamorous. Models can work in a comfortable, climate-controlled studio or outdoors in adverse weather conditions. Schedules can be demanding and sometimes stressful. Yet, successful models interact with a variety of people and enjoy frequent travel. They may meet potential clients at several go-sees in one day and often travel to work in distant cities, foreign countries, and exotic locations.

Training, Other Qualifications, and Advancement

Formal training is limited and education beyond high school usually is not required.

Education and training. Some aspiring models opt to attend modeling schools. Modeling schools provide training in posing, walking, makeup application, and other basic tasks, but attending such schools does not necessarily lead to job opportunities. Agents continually scout for fresh faces at modeling schools, and many models are discovered in this way. Most agencies review snapshots or have "open calls," during which models are seen in person; this service usually is provided free of charge. Some agencies sponsor modeling contests and searches. Very few people who send in snapshots or attend open calls are offered contracts.

Agencies advise models on how to dress, wear makeup, and conduct themselves properly during go-sees and bookings. Because models' advancement depends on their previous work, development of a good portfolio is key to getting assignments. The higher the quality of the photos in the portfolio and the more current they are, the more likely it is that the model will find work.

Other qualifications. Models should be photogenic and have a basic knowledge of hair styling, makeup, and clothing. A model should have flawless skin, healthy hair, and attractive facial features. Specific requirements depend on the client, but most models must be within certain ranges for height, weight, and clothing size in order to meet the practical needs of fashion designers, photographers, and advertisers. Requirements may change slightly from time to time along with common perceptions of physical beauty. However, most fashion designers believe that their clothing looks best on tall, thin models. Although physical requirements may be relaxed for some types of modeling jobs, opportunities are limited for those who do not meet these basic requirements.

A model's career depends on preservation of his or her physical characteristics, so models must control their diet, exercise regularly, and get enough sleep in order to stay healthy. Haircuts, pedicures, and manicures are necessary work-related expenses for models.

The ability to relate to the camera in order to capture the desired look on film is essential; agents test prospective models using snapshots or professional photographs. For photographic and runway work, models must be able to move gracefully and confidently. Training in acting, voice, and dance is useful and allows a model to be considered for television work. Foreign language skills are useful because successful models travel frequently to foreign countries.

Models must interact with a large number of people, so personality plays an important role in success. Models must be professional, polite, and prompt because every contact could lead to future employment. Organizational skills are necessary to manage personal lives, financial matters, and work and travel schedules. Competition for jobs is keen and clients' needs are very specific, so patience and persistence are essential. State and local governments require models under the age of 18 to hold a work permit.

Advancement. Models advance by working more regularly and being selected for assignments that have higher pay. They may begin to appear in magazines, print campaigns, commercials, or runway shows with higher profiles. They may begin to work with clients who will provide them with more widespread exposure. A model's selection of an agency is an important factor for advancement in the occupation. The better the reputation and skill of the agency, the more assignments a model is likely to get. Prospective clients prefer to work with agents, which

makes it very difficult for a model to pursue a freelance career. Modeling careers are relatively short.

Employment

Models held about 2,200 jobs in 2008. About 18 percent were self-employed.

Job Outlook

Employment of models is expected to grow faster than average for all occupations through 2018. Nonetheless, models should face keen competition for a small number of openings.

Employment change. Employment of models is expected to grow by 16 percent between 2008 and 2018, which is faster than the average for all occupations. Growth in the employment of models will be driven by their continued use in advertising products. Advertisers will continue to use models in fashion shows, catalogs, and print campaigns as a method to increase awareness of their product.

Job prospects. Modeling is considered a glamorous occupation, and it has few formal entry requirements. Consequently, those who wish to pursue a modeling career can expect keen competition for jobs. The modeling profession typically attracts many more jobseekers than there are job openings. The increasing diversity of the general population should boost demand for models more representative of diverse racial and ethnic groups. Work for male models also should increase as society becomes more receptive to the marketing of men's fashions. Because fashions change frequently, demand for a model's look may fluctuate. Most models experience periods of unemployment.

Employment of models, which is often irregular to begin with, is also affected by downturns in the business cycle. Many firms tend to reduce advertising budgets during recessions.

Earnings

Median hourly wages of models were \$13.18 in May 2008. The middle 50 percent earned between \$10.09 and \$17.23. The lowest 10 percent earned less than \$8.32, and the highest 10 percent earned more than \$21.10. Wages vary for different types of modeling, and they depend on the experience and reputation of the model. Female models typically earn more than male models for similar work. Hourly wages can be relatively high, particularly for supermodels and others in high demand, but models may not work every day and jobs may last only a few hours. Models occasionally receive free or discounted clothing instead of, or in addition to, regular wages. Almost all models work with an agent and pay a percentage of their earnings in return for the agent's services. Models who do not find immediate work may receive payments, called advances, from agents to cover promotional and living expenses. Models usually provide their own health and retirement benefits.

Real Estate Brokers and Sales Agents

Significant Points

- A license is required in every State and the District of Columbia.
- Residential real estate brokers and sales agents often work evenings and weekends.
- Although gaining a job may be relatively easy, beginning workers face competition from well-established, more experienced agents and brokers.
- Employment is sensitive to swings in the economy, as well as interest rates; during periods of declining economic activity or rising interest rates, the volume of sales and the resulting demand for sales workers fall.

Nature of the Work

One of the most complex and significant financial events in peoples' lives is the purchase or sale of a home or investment property. Because of the complexity and importance of this transaction, people typically seek the help of *real estate brokers* and *sales agents* when buying or selling real estate.

Real estate brokers and sales agents have a thorough knowledge of the real estate market in their communities. They know which neighborhoods will best fit clients' needs and budgets. They are familiar with local zoning and tax laws and know where to obtain financing for the purchase of property.

Brokers and agents do the same type of work, but brokers are licensed to manage their own real estate businesses. Agents must work with a broker. They usually provide their services to a licensed real estate broker on a contract basis. In return, the broker pays the agent a portion of the commission earned from the agent's sale of the property. Brokers, as independent businesspeople, often sell real estate owned by others; they also may rent or manage properties for a fee.

When selling property, brokers and agents arrange for title searches to verify ownership and for meetings between buyers and sellers during which they agree to the details of the transactions. In a final meeting, the new owners take possession of the property. Agents and brokers also act as intermediaries in price negotiations between buyers and sellers. They may help to arrange financing from a lender for the prospective buyer, which may make the difference between success and failure in closing a sale. In some cases, brokers and agents assume primary responsibility for finalizing, or closing, sales, but typically this function is done by lenders or lawyers.

Agents and brokers spend a significant amount of time looking for properties to buy or sell. They obtain listings—agreements by owners to place properties for sale with the firm. When listing a property for sale, agents and brokers compare the listed property with similar properties that recently sold, to determine a competitive market price for the property. Following the sale of the property, both the agent who sold it and the agent who obtained the listing receive a portion of the commission. Thus, agents who sell a property that they themselves have listed can increase their commission.

Before showing residential properties to potential buyers, agents meet with them to get an idea of the type of home the buyers would like, and how much the buyers can afford to spend. They may also ask buyers to sign a loyalty contract, which states that the agent will be the only one to show houses to the buyer. An agent or broker then generates lists of properties for sale, their location and description, and available sources of financing. In some cases, agents and brokers use computers to give buyers a virtual tour of properties that interest them.

Agents may meet numerous times with prospective buyers to discuss and visit available properties. Agents identify and emphasize the most pertinent selling details. To a young family looking for a house, for example, they may emphasize the convenient floor plan, the area's low crime rate, and the proximity to schools and shopping. To a potential investor, they may point out the tax advantages of owning a rental property and finding a renter. If negotiation over price becomes necessary, agents must follow their client's instructions thoroughly and may present counteroffers to reach the final sales price.

Once the buyer and seller have signed a contract, the real estate broker or agent must ensure that all terms of the contract are met before the closing date. If the seller agrees to any repairs, the broker or agent ensures they are made. Increasingly, brokers and agents must deal with environmental issues as well, such as advising buyers about lead paint on the walls. In addition, the agent must make sure that any legally mandated or agreed-upon inspections, such as termite and radon inspections, take place. Loan officers, attorneys, and other people handle many details, but the agent must ensure that they are carried out.

Most real estate brokers and sales agents sell residential property. A small number—usually employed in large or specialized firms—sell commercial, industrial, agricultural, or other types of real estate. Every specialty requires knowledge of that particular type of property and clientele. Selling, buying, or leasing business property requires an understanding of leasing practices, business trends, and the location of the property. Agents who sell, buy, or lease industrial properties must know about the

Most real estate brokers and sales agents sell residential property.

region's transportation, utilities, and labor supply. Whatever the type of property, the agent or broker must know how to meet the client's particular requirements.

Work environment. Real estate agents and brokers often work more than a standard 40-hour week, often working evenings and weekends for the convenience of clients. Although the hours are long and frequently irregular, most agents and brokers have the freedom to determine their own schedule.

Advances in telecommunications and the ability to retrieve data about properties over the Internet allow many real estate brokers and sales agents to work out of their homes instead of real estate offices. Even with this convenience, workers spend much of their time away from their desks—showing properties to customers, analyzing properties for sale, meeting with prospective clients, or researching the real estate market.

Training, Other Qualifications, and Advancement

In every State and the District of Columbia, real estate brokers and sales agents must be licensed. Prospective agents must be high school graduates, be at least 18 years old, and pass a written test administered by the State.

Education and training. Agents and brokers must be high school graduates. In fact, as real estate transactions have become more legally complex, many firms have turned to college graduates to fill positions. A large number of agents and brokers have some college training.

Most universities, colleges, and community colleges offer various courses in real estate. Some offer associate and bachelor's degrees in real estate, but mostly they offer certificate programs. Additionally, college courses in finance, business administration, statistics, economics, law, and English are also helpful. For those who intend to start their own company, business courses such as marketing and accounting are as important as courses in real estate or finance.

Many local real estate associations that are members of the National Association of Realtors sponsor courses covering the fundamentals and legal aspects of the field. Advanced courses in mortgage financing, property development and management, and other subjects also are available. Also, some brokerage firms offer formal training programs for both beginners and experienced agents. In addition, much of the training needed to learn the practical aspects of the trade happens on the job, under

the direction of an experienced agent, who may demonstrate how to use a computer to locate or list available properties and identify sources of financing.

Licensure. In every State and the District of Columbia, real estate brokers and sales agents must be licensed. Prospective brokers and agents must pass a written examination. The examination—more comprehensive for brokers than for agents—includes questions on basic real estate transactions and the laws affecting the sale of property. Most States require candidates for the general sales license to complete between 30 and 90 hours of classroom instruction. To get a broker's license an individual needs between 60 and 90 hours of formal training and a specific amount of experience selling real estate, usually 1 to 3 years. Some States waive the experience requirements for the broker's license for applicants who have a bachelor's degree in real estate.

State licenses typically must be renewed every 1 or 2 years; usually, no examination is needed. However, many States require continuing education for license renewals. Prospective agents and brokers should contact the real estate licensing commission of the State in which they wish to work to verify the exact licensing requirements.

Other qualifications. Personality traits are as important as academic background. Brokers look for agents who have a pleasant personality and a neat appearance. They must be at least 18 years old. Maturity, good judgment, trustworthiness, honesty, and enthusiasm for the job are required to attract prospective customers in this highly competitive field. Agents should be well organized, be detail oriented, and have a good memory for names, faces, and business particulars. A good knowledge of the local area and its neighborhoods is a clear advantage.

Advancement. As agents gain knowledge and expertise, they become more efficient in closing a greater number of transactions and increase their income. In many large firms, experienced agents can advance to sales manager or general manager. People who earn their broker's license may open their own offices. Others with experience and training in estimating property values may become real estate appraisers, and people familiar with operating and maintaining rental properties may become property managers. (See the *Handbook* statements on property, real estate, and community association managers; and appraisers and assessors of real estate.) Experienced agents and brokers with a thorough knowledge of business conditions and property values in their localities may enter mortgage financing or real estate investment counseling.

Employment

In 2008, real estate brokers and sales agents held about 517,800 jobs; real estate sales agents held approximately 76 percent of these jobs.

Many real estate brokers and sales agents worked part time, combining their real estate activities with other careers. About 59 percent of real estate brokers and sales agents were self-employed. Real estate is sold in all areas, but employment is concentrated in large urban areas and in rapidly growing communities.

Most real estate firms are relatively small; indeed, some are one-person businesses. By contrast, some large real estate firms have several hundred agents operating out of numerous branch offices. Many brokers have franchise agreements with

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Real estate brokers and sales agents	41-9020	517,800	592,100	74,300	14
Real estate brokers	41-9021	123,400	134,000	10,600	9
Real estate sales agents	41-9022	394,400	458,200	63,700	16

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

national or regional real estate organizations. Under this type of arrangement, the broker pays a fee in exchange for the privilege of using the more widely known name of the parent organization. Although franchised brokers often receive help in training sales staff and running their offices, they bear the ultimate responsibility for the success or failure of their firms.

Job Outlook

Employment of real estate brokers and agents is expected to grow faster than average. Beginning agents and brokers, however, will face competition from their well-established, more experienced counterparts.

Employment change. Employment of real estate brokers and sales agents is expected to grow 14 percent during the 2008-18 decade, faster than average for all occupations. A growing population, particularly young adults who will be forming households in greater numbers, will require the services of real estate agents and brokers to buy their homes. Home sales will be sparked by the continuing desire for people to own their own homes and their perception that real estate will be a good investment over the long run. However, job growth will be somewhat limited by the increasing use of the Internet, which is improving the productivity of agents and brokers, and transforming the way they do business. For example, prospective customers often can perform their own searches for properties that meet their criteria by accessing real estate information on the Internet.

Job prospects. In addition to job growth, a large number of job openings will arise from the need to replace workers who transfer to other occupations or leave the labor force. Real estate brokers and sales agents are older, on average, than most other workers, and many are expected to leave the occupation over the next decade.

Employment of real estate brokers and sales agents is sensitive to swings in the economy, such as a recession. During periods of declining economic activity or rising interest rates, the volume of sales and the resulting demand for sales workers fall. As a result, the income of agents and brokers declines, and many work fewer hours or leave the occupation altogether. Over the coming decade, the opportunity for part-time work is expected to decline. Although the occupation is relatively easy to enter, increasingly complex legal and technological requirements are raising startup costs associated with becoming an agent and making it more difficult for part-time workers to enter the occupation.

Well-trained, ambitious people who enjoy selling—particularly those with extensive social and business connections in their communities—should have the best chance for success. However, beginning agents and brokers often face competition from their well-established, more experienced counterparts in obtaining listings and in closing an adequate number of sales.

Earnings

The median annual wages, including commissions, of salaried real estate sales agents were \$40,150 in May 2008. The middle 50 percent earned between \$27,390 and \$64,820 a year. The lowest 10 percent earned less than \$21,120, and the highest 10 percent earned more than \$101,860. Median annual wages in the industries employing the largest number of real estate sales agents in May 2008 were:

Residential building construction.....	\$49,620
Land subdivision	44,410
Offices of real estate agents and brokers.....	41,320
Activities related to real estate	36,410
Lessors of real estate	32,150

Median annual wages, including commissions, of salaried real estate brokers were \$57,500 in May 2008. The middle 50 percent earned between \$36,420 and \$93,970 a year. Median annual wages in the industries employing the largest number of real estate brokers in May 2008 were:

Residential building construction.....	\$63,280
Offices of real estate agents and brokers.....	59,710
Activities related to credit Intermediation.....	57,740
Activities related to real estate	56,140
Lessors of real estate	47,230

Commissions on sales are the main source of earnings of real estate agents and brokers. The rate of commission varies according to whatever the agent and broker agree on, the type of property, and its value. The percentage paid on the sale of farm and commercial properties or unimproved land is typically higher than the percentage paid for selling a home.

Commissions may be divided among several agents and brokers. The broker or agent who obtains a listing usually shares the commission with the broker or agent who sells the property and with the firms that employ each of them. Although an agent's share varies greatly from one firm to another, often it is about half of the total amount received by the firm. Agents who both list and sell a property maximize their commission.

Income usually increases as an agent gains experience, but individual motivation, economic conditions, and the type and location of the property also can affect income. Sales workers who are active in community organizations and in local real estate associations can broaden their contacts and increase their income. A beginner's earnings often are irregular because a few weeks or even months may go by without a sale. Although some brokers allow an agent to draw against future income from a special account, the practice is not common with new

employees. The beginner, therefore, should have enough money to live for about 6 months or until commissions increase.

Related Occupations

Other occupations requiring knowledge of real estate include:

	Page
Appraisers and assessors of real estate	90
Property, real estate, and community association managers.....	76
Other sales workers who need these character traits include:	
Insurance sales agents	534
Sales representatives, wholesale and manufacturing	547
Securities, commodities, and financial services sales agents.....	553

Sources of Additional Information

Information on licensing requirements for real estate brokers and sales agents is available from most local real estate organizations or from the State real estate commission or board.

Retail Salespersons

Significant Points

- Good employment opportunities are expected because of the need to replace the large number of workers who leave the occupation each year.
- Many salespersons work evenings and weekends, particularly during peak retail periods.
- Employers look for people who enjoy working with others and who have good communication skills, an interest in sales work, a neat appearance, and a courteous demeanor.
- Although advancement opportunities are limited, having a college degree or a great deal of experience may help retail salespersons move into management positions.

Nature of the Work

Whether selling shoes, computer equipment, or automobiles, retail salespersons assist customers in finding what they are looking for. They also try to increase sales by describing a product's features, demonstrating its uses, and promoting its value.

In addition to selling, many retail salespersons—especially those who work in department and apparel stores—conduct financial transactions with their customers. This usually involves receiving payments by cash, check, debit card, or credit card; operating cash registers; and bagging or packaging purchases. Depending on the hours they work, retail salespersons may have to open or close cash registers. This work may in-

Retail salespersons work in various settings, including clothing stores, automobile dealers, and electronics and appliance stores.

clude counting the money in the register and separating charge slips, coupons, and exchange vouchers. Retail salespersons also may have to make deposits at a cash office. (Cashiers, who have similar duties, are discussed elsewhere in the *Handbook*.) In addition, retail salespersons may help stock shelves or racks, arrange for mailing or delivery of purchases, mark price tags, take inventory, and prepare displays.

For some sales jobs, particularly those involving expensive and complex items, retail salespersons need special knowledge or skills. For example, salespersons who sell automobiles must be able to explain the features of various models, the manufacturers' specifications, the types of options and financing available, and the details of associated warranties. In addition, all retail salespersons must recognize security risks and thefts and understand their organization's procedure for handling such situations—procedures that may include notifying security guards or calling police.

Work environment. Most retail salespersons work in clean, comfortable, well-lit stores. However, they often stand for long periods and may need supervisory approval to leave the sales floor. They also may work outdoors if they sell items such as cars, plants, or lumber yard materials.

The Monday-through-Friday, 9-to-5 workweek is the exception rather than the rule for retail salespersons. Many salespersons work evenings and weekends, particularly during holidays and other peak sales periods. The end-of-year holiday season often is the busiest time, and as a result, many employers limit the use of vacation time between Thanksgiving and the beginning of January.

This occupation offers opportunities for both full-time and part-time work. About 34 percent of retail salespersons worked part time in 2008. Part-time opportunities may vary by setting, however, as many who sell big-ticket items are required to work full time.

Training, Other Qualifications, and Advancement

Retail salespersons typically learn their skills through on-the-job training. Although advancement opportunities are limited, having a college degree or a great deal of experience may help retail salespersons move into management positions.

Education and training. There usually are no formal education requirements for retail sales positions, but employers often prefer applicants with a high school diploma or its equivalent. This may be especially important for those who sell technical products or “big-ticket” items, such as electronics or automobiles. A college degree may be required for management trainee positions, especially in larger retail establishments.

Most retail salespersons receive on-the-job training, which usually lasts anywhere from a few days to a few months. In small stores, newly hired workers usually are trained by an experienced employee. In large stores, training programs are more formal and generally are conducted over several days. Topics often include customer service, security, the store’s policies and procedures, and cash register operation. Depending on the type of product they are selling, employees may be given additional specialized training. For example, those working in cosmetics receive instruction on the types of products the store offers and for whom the cosmetics would be most beneficial. Likewise, those who sell computers may be instructed in the technical differences between computer products. Because providing the best possible service to customers is a high priority for many employers, employees often are given periodic training to update and refine their skills.

Other qualifications. Employers look for people who enjoy working with others and who possess good communication skills. Employers also value workers who have the tact and patience to deal with difficult customers. Among other desirable characteristics are an interest in sales work, a neat appearance, and a courteous demeanor. The ability to speak more than one language may be helpful for employment in communities where people from various cultures live and shop. Before hiring a salesperson, some employers conduct a background check, especially for a job selling high-priced items.

Advancement. Opportunities for advancement vary. In some small establishments, advancement is limited because one person—often the owner—does most of the managerial work. In others, some salespersons can be promoted to assistant manager. Large retail businesses usually prefer to hire college graduates as management trainees, making a college education increasingly important. However, motivated and capable employees without college degrees still may advance to administrative or supervisory positions in large establishments.

As salespersons gain experience and seniority, they often move into positions with greater responsibility and may be given their choice of departments in which to work. This opportunity often means moving to areas with higher potential earnings and commissions. The highest earnings potential usually lies in selling “big-ticket” items—such as cars, jewelry, furniture, and electronic equipment—although doing so often requires extensive knowledge of the product and an excellent talent for persuasion.

Previous sales experience may be an asset when one is applying for positions with larger retailers or in nonretail industries, such as financial services, wholesale trade, or manufacturing.

Employment

Retail salespersons held about 4.5 million jobs in 2008. The largest employers were clothing and clothing accessories stores, department stores, building material and supplies dealers, motor vehicle and parts dealers, and general merchandise stores such as warehouse clubs and supercenters. In addition, about 156,500 retail salespersons were self-employed.

Because retail stores are found in every city and town, employment is distributed geographically in much the same way as the population.

Job Outlook

Employment is expected to grow about as fast as average. Due to the frequency with which people leave this occupation, job opportunities are expected to be good.

Employment change. Employment is expected to grow by 8 percent over the 2008–18 decade, about as fast as the average for all occupations. In addition, given the size of this occupation, about 374,700 new retail salesperson jobs will arise over the projections decade—more jobs than will be generated in almost any other occupation.

Employment growth among retail salespersons reflects rising retail sales stemming from a growing population. Many retail establishments will continue to expand in size and number, leading to new retail sales positions. Growth will be fastest in general merchandise stores, many of which sell a wide assortment of goods at low prices. As consumers continue to prefer these stores other establishments with higher prices, growth in this industry will be rapid. Employment of retail sales persons is expected to decline in department stores and automobile dealers as these industries see a reduction in store locations.

Despite the growing popularity of electronic commerce, the impact of online shopping on the employment of retail salespersons is expected to be minimal. Internet sales have not decreased the need for retail salespersons. Retail stores commonly use an online presence to complement their in-store sales, and many consumers prefer to buy merchandise in person. Retail salespersons will remain important in assisting customers, providing specialized service, and increasing customer satisfaction.

Job prospects. Employment opportunities for retail salespersons are expected to be good because of the need to replace the large number of workers who transfer to other occupations or leave the labor force each year. In addition, many new jobs will be created for retail salespersons as businesses seek to expand operations and enhance customer service. A substantial number of these openings should occur in warehouse clubs and supercenters as a result of strong growth among these establishments.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018		Change, 2008-2018	
			2018	Number	Percent	
Retail salespersons	41-2031	4,489,200	4,863,900	374,700	8	

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Opportunities for part-time work should be abundant, and demand is expected to be strong for temporary workers during peak selling periods, such as the end-of-year holiday season between Thanksgiving and the beginning of January.

During economic downturns, sales volumes and the resulting demand for sales workers usually decline. Consequently, retail sales jobs generally are more susceptible to fluctuations in the economy than are many other occupations.

Earnings

Median hourly wages of wage-and-salary retail salespersons, including commissions, were \$9.86 in May 2008. The middle 50 percent earned between \$8.26 and \$13.35 an hour. The lowest 10 percent earned less than \$7.37, and the highest 10 percent earned more than \$19.14 an hour. Median hourly wages in the industries employing the largest numbers of retail salespersons in May 2008 were as follows:

Automobile dealers	\$18.91
Building material and supplies dealers	11.95
Other general merchandise stores	9.22
Department stores.....	9.14
Clothing stores	8.94

Many beginning or inexperienced workers earn the Federal minimum wage of \$7.25 an hour, but many States set minimum wages higher than the Federal minimum. In areas where employers have difficulty attracting and retaining workers, wages tend to be higher than the legislated minimum.

Compensation systems can vary by type of establishment and merchandise sold. Salespersons receive hourly wages, commissions, or a combination of the two. Under a commission system, salespersons receive a percentage of the sales they make. This system offers sales workers the opportunity to increase their earnings considerably, but they may find that their earnings depend strongly on their ability to sell their product and on the ups and downs of the economy.

Benefits may be limited in smaller stores, but benefits in large establishments usually are considerable. In addition, nearly all salespersons are able to buy their store's merchandise at a discount, with the savings depending on the type of merchandise. Also, to bolster revenue, employers may use incentive programs such as awards, bonuses, and profit-sharing plans to the sales staff.

Sales Engineers

Significant Points

- A bachelor's degree in engineering usually is required; many sales engineers have previous work experience in an engineering specialty.
- Competition for jobs is expected.
- Earnings typically are based on a combination of salary and commission.

Nature of the Work

Many products and services, especially those purchased by large companies and institutions, are highly complex. Sales engineers—also called *technical sales support workers*—determine how products and services could be designed or modified to suit customers' needs. They also may advise customers on how best to use the products or services provided.

Sales engineers specialize in technologically and scientifically advanced products. They possess extensive knowledge of these products, including knowledge about their components, functions, and the scientific processes that make them work. They use their technical skills to explain the benefits of their products to potential customers and to demonstrate how their products are better than the products of their competitors. Often, they modify and adjust products to meet customers' specific needs. Some sales engineers work for the companies that design and build technical products, while others work for independent sales firms.

Many of the duties of sales engineers are similar to those of other salespersons. They must interest the client in purchasing their products, negotiate a price, and complete the sale. Some sales engineers, however, are teamed with other salespersons who concentrate on marketing and selling the product, enabling the sales engineer to concentrate on the technical aspects of the job. By working on a sales team, each member is able to focus on his or her strengths and expertise. (Information on other sales occupations, including sales representatives, wholesale and manufacturing, appears elsewhere in the *Handbook*.)

Sales engineers use scientific knowledge to help their customers choose the right technical products.

Sales engineers tend to employ selling techniques that are different from those used by most other sales workers. They generally use a “consultative” style; that is, they focus on the client’s problem and show how it can be solved or mitigated with their product or service. This selling style differs from the “benefits and features” method, whereby the salesperson describes the product and leaves the customer to decide how it would be useful.

In addition to retaining current clients and attracting new ones, sales engineers help clients solve any problems that arise when the product is installed. Afterward, they may continue to serve as a liaison between the client and their company. Increasingly, sales engineers are asked to undertake additional tasks related to sales, such as market research, because of their familiarity with clients’ purchasing needs. Drawing on this same familiarity, sales engineers may help identify and develop new products.

Work environment. Workers in this occupation can encounter pressure and stress because their income and job security often depend directly on their success in sales and customer service. Many work more than 40 hours per week to meet sales goals and client needs. Although the hours may be long and often irregular, many sales engineers have the freedom to determine their own schedules. Consequently, they often can arrange their appointments so that they can have time off when they want it.

Some sales engineers have large territories and travel extensively. Because sales regions may cover several States, sales engineers may be away from home for several days or even weeks at a time, often traveling by airplane. Others cover a smaller region and travel mostly by car, spending few nights away from home. International travel to secure contracts with foreign clients is becoming more common.

Training, Other Qualifications, and Advancement

Sales engineers generally are required to possess a bachelor’s degree in engineering, and many have previous work experience in an engineering specialty. New sales engineers may need some on-the-job training in sales or may work closely with a sales mentor before they can work on their own.

Education and training. A bachelor’s degree in engineering usually is required for a person to become a sales engineer. However, workers without a degree, but with previous

experience in sales and technical experience or training, sometimes hold the title of sales engineer. Also, workers who have a degree in a science, such as chemistry, or even a degree in business with little or no previous sales experience, may be called sales engineers.

University engineering programs generally require 4 years of study. They vary in content, but all contain courses in math and the physical sciences, as well as general education courses such as English and communications. In addition, most require the development of computer skills. Some programs offer a general engineering curriculum; students then specialize on the job or in graduate school. Most programs, however, require students to choose an area of specialization. The most common majors are electrical, mechanical, and civil engineering, but some programs offer additional majors, such as chemical, biomedical, and computer hardware engineering.

New graduates with engineering degrees may need sales experience and training before they can work independently as sales engineers. Training may involve teaming with a sales mentor who is familiar with the employer’s business practices, customers, procedures, and company culture. After the training period has been completed, sales engineers may continue to partner with someone who lacks technical skills, yet excels in the art of sales.

It is important for sales engineers to continue their engineering and sales education throughout their careers. Much of their value to their employers depends on their knowledge of, and ability to sell, the latest technologies. Sales engineers in high-technology fields, such as information technology and advanced electronics, may find that their technical knowledge rapidly becomes obsolete, requiring frequent retraining.

Other qualifications. Many sales engineers first work as engineers. For some, engineering experience is necessary to obtain the technical background that is needed to sell their employers’ products or services effectively.

These workers must possess excellent communication skills, because interacting with customers is one of their main job functions. They also must be strong in math and have an aptitude for science as they work with complex, technical products.

Advancement. Promotion may include a higher commission rate, a larger sales territory, or elevation to the position of supervisor or marketing manager. Alternatively, sales engineers may move into different occupations, such as consulting.

Employment

Sales engineers held about 78,000 jobs in 2008. About 34 percent were employed in wholesale trade establishments, and another 24 percent were employed in manufacturing establishments. Smaller numbers of sales engineers worked in computer systems design and related services organizations, as well as telecommunications firms. Unlike workers in many other sales occupations, very few sales engineers are self-employed.

Job Outlook

Job growth for sales engineers is projected to be about as fast as average, and competition for jobs is expected.

Employment change. Employment of sales engineers is expected to grow by 9 percent between 2008 and 2018, about

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Sales engineers.....	41-9031	78,000	84,900	6,900	9

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

as fast as the average for all occupations. Job growth will stem from the increasing variety and technical nature of the goods and services to be sold. Competitive pressures and advancing technology will force companies to improve and update product designs more frequently and to optimize their manufacturing, sales processes, and general business processes, thus requiring the services of sales engineers.

Growth will be fastest in technology companies, such as software publishers and computer systems design firms. Increasing demand for the latest, most sophisticated technological products will spur demand for sales engineers with expertise in the field. Conversely, as manufacturing organizations continue to outsource their sales functions to independent companies, employment in the manufacturing industry will fall.

Job prospects. Competition for jobs is expected because the relatively high earnings potential of this occupation creates significant interest in sales engineer positions. Prospects will be best for those with the personal traits necessary for successful sales work. In addition to new positions created as companies expand their sales forces, some openings will arise each year from the need to replace sales engineers who transfer to other occupations or leave the labor force.

Earnings

Median annual wages, including commissions, of sales engineers were \$83,100 in May 2008. The middle 50 percent earned between \$63,340 and \$108,470 a year. The lowest 10 percent earned less than \$49,640, and the highest 10 percent earned more than \$136,770 a year. Median annual wages of sales engineers employed by the computer systems design and related services industry were \$95,580.

Compensation varies significantly by the type of firm and the product sold. Most employers offer a combination of salary and commission payments or a salary plus a bonus. Those working in independent sales companies may just earn commissions. Commissions usually are based on the value of sales, whereas bonuses may depend on individual performance, on the performance of all workers in the group or district, or on the company's performance. Earnings from commissions and bonuses may vary greatly from year to year, depending on sales ability, the demand for the company's products or services, and the overall economy.

In addition to receiving their earnings, sales engineers who work for manufacturers usually are reimbursed for expenses such as transportation, meals, hotels, and customer entertainment. Besides receiving typical benefits, sales engineers may get personal use of a company car and frequent-flyer mileage. Some companies offer incentives such as free vacation trips or gifts for outstanding performance. Sales engineers who work in independent firms may have higher, but less stable, earnings and, often, relatively few benefits. For example, most inde-

pendent sales engineers do not get paid vacations, a common benefit for many other workers.

Sales Representatives, Wholesale and Manufacturing

Significant Points

- Job prospects will be best for those with a college degree, the appropriate technical expertise, and the personal traits necessary for successful selling.
- Earnings usually are based on a combination of salary and commission.
- Employment opportunities and earnings may fluctuate from year to year because sales are affected by changing economic conditions.

Nature of the Work

Sales representatives are an important part of manufacturers' and wholesalers' success. Regardless of the type of products they sell, sales representatives' primary duties are to make customers interested in their merchandise and to arrange the sale of that merchandise.

The process of promoting and selling a product can be extensive, at times taking up to several months. Whether in person or over the phone, sales representatives describe their products, conduct demonstrations, explain the benefits that their products convey, and answer any questions that their customers may have.

Sales representatives—sometimes called *manufacturers' representatives* or *manufacturers' agents*—generally work for manufacturers, wholesalers, or technical companies. Some work for a single organization, while others represent several companies and sell a range of products. Rather than selling goods directly to consumers, sales representatives deal with businesses, government agencies, and other organizations. (Retail salespersons, who sell directly to consumers, and sales engineers, who specialize in sales of technical products and services, are discussed elsewhere in the *Handbook*.)

Some sales representatives specialize in technical and scientific products ranging from agricultural and mechanical equipment to computer and pharmaceutical goods. Other representatives deal with all other types of goods, including food, office supplies, and apparel.

Sales representatives stay abreast of new products and the changing needs of their customers in a variety of ways. They attend trade shows at which new products and technologies are showcased. They also attend conferences and conventions to meet other sales representatives and clients and discuss new product developments. In addition, the entire sales force may participate in company-sponsored meetings to review the firm's sales performance, product development, sales goals, and profitability.

Frequently, sales representatives who lack the necessary expertise about a given product may team with a technical expert. In this arrangement, the technical expert—sometimes a sales engineer—attends the sales presentation to explain the product and answer questions or concerns. The sales representative makes the preliminary contact with customers, introduces the company's product, and closes the sale. Under such an arrangement, the representative is able to spend more time maintaining and soliciting accounts and less time acquiring technical knowledge. After the sale, representatives may make follow up visits to ensure that the equipment is functioning properly and may even help train customers' employees to operate and maintain new equipment. Those selling technical goods also may arrange for the product to be installed. Those selling consumer goods often suggest how and where merchandise should be displayed. When working with retailers, they may help arrange promotional programs, store displays, and advertising.

Sales representatives have several duties beyond selling products. They analyze sales statistics, prepare reports, and handle administrative duties such as filing expense accounts, scheduling appointments, and making travel plans. They also read about new and existing products and monitor the sales, prices, and products of their competitors.

Sales representatives generally work in either inside sales, interacting with customers over the phone from an office location, or outside "field" sales, traveling to meet clients in person.

Inside sales representatives may spend a lot of their time on the phone, selling goods, taking orders, and resolving problems or complaints about the merchandise. These sales representatives typically do not leave the office. Frequently, they are responsible for acquiring new clients by "cold calling" various organizations—calling potential customers to establish an initial contact. They also may be responsible for arranging meetings for outside sales representatives.

Outside sales representatives spend much of their time traveling to, and visiting with, current clients and prospective buyers. During a sales call, they discuss the client's needs and suggest how their merchandise or services can meet those needs. They may show samples or catalogs that describe items their company provides, and they may inform customers about prices, availability, and ways in which their products can save money and boost productivity. Because many sales representatives sell several complementary products made by different manufacturers, they may take a broad approach to their customers' business. For example, sales representatives may help install new equipment and train employees in its use.

Work environment. Some sales representatives have large territories and travel considerably. Because a sales region may cover several States, representatives may be away from home for several days or weeks at a time, often traveling by airplane. Others cover a smaller region and travel mostly by car, spending few nights away from home. Sales representatives frequently are on their feet for long periods and may carry heavy sample products, requiring some physical stamina.

In 2008, about 48 percent of sales representatives worked around 40 hours per week, but about 24 percent worked more than 50 hours per week. Since sales calls take place during regular working hours, much of the planning and paperwork involved with sales must be completed during the evening and on weekends. Although the hours are often irregular, many sales representatives have the freedom to determine their own schedules.

Workers in this occupation can encounter pressure and stress because their income and job security often depend directly on the amount of merchandise they sell and their companies usually set goals or quotas that they are expected to meet. Sales

Sales representatives may travel extensively to meet with clients.

representatives also deal with many different types of people, which can be stimulating but demanding.

Training, Other Qualifications, and Advancement

There generally is no formal educational requirement for sales representative positions, but many jobs require some postsecondary education. Regardless of educational background, factors such as communication skills, the ability to sell, and familiarity with brands are essential to being a successful sales representative.

Education and training. There usually is no formal educational requirement for sales representatives. Some positions, especially those which deal with scientific and technical products, require a bachelor's degree. For other jobs, however, applicants can be fully qualified with a high school diploma or its equivalent. For these positions, previous sales experience may be desirable.

Many sales representatives attend seminars in sales techniques or take courses in marketing, economics, communication, or even a foreign language to provide the extra edge needed to make sales. Often, companies have formal training programs for beginning sales representatives that last up to 2 years. However, most businesses accelerate these programs to much shorter timeframes in order to reduce costs and expedite the returns from training. In some programs, trainees rotate among jobs in plants and offices to learn all phases of production, installation, and distribution of the product. In others, trainees take formal classroom instruction at the plant, followed by on-the-job training under the supervision of a field sales manager.

Regardless of where they work, new employees may be trained by accompanying experienced workers on their sales calls. As they gain familiarity with the firm's products and clients, the new workers are given increasing responsibility, until they are eventually assigned their own territory. As businesses experience greater competition, representatives face more pressure to produce sales.

Other qualifications. For sales representative jobs, companies seek individuals who have excellent communication skills and the desire to sell. Those who want to become sales representatives should be goal oriented, persuasive, and able to work well both independently and as part of a team. A pleasant personality and appearance and problem-solving skills are highly valued. Patience and perseverance also are keys to completing a sale, which can take up to several months.

Manufacturers' representatives who operate a sales agency also must manage their business. Doing so requires organizational and general business skills, as well as knowledge of accounting, marketing, and administration.

Certification and advancement. Certifications are available that provide formal recognition of the skills of sales representatives. Many in this profession have either the Certified Professional Manufacturers' Representative (CPMR) certification or the Certified Sales Professional (CSP) certification, offered by the Manufacturers' Representatives Education Research Foundation. Certification typically involves completing formal training and passing an examination.

Frequently, promotion takes the form of an assignment to a larger account or territory, where commissions are likely to be greater. Those who have good sales records and leadership ability may advance to higher level positions such as sales supervisor, district manager, or vice president of sales. Others find opportunities in purchasing, advertising, or marketing research.

Advancement opportunities typically depend on whether the sales representatives are working directly for a manufacturer or wholesaler or whether they are working with an independent sales agency. Experienced sales representatives working directly for a manufacturer or wholesaler may move into jobs as sales trainers and instruct new employees on selling techniques and company policies and procedures. Some leave their organization and start their own independent sales company.

Employment

Manufacturing and wholesale sales representatives held about 2 million jobs in 2008. About 432,900 of these worked with technical and scientific products. Around 61 percent of all representatives worked for wholesale companies. Others were employed in manufacturing establishments, retail organizations, and professional, technical, and scientific firms. Because of the diversity of products and services sold, employment opportunities are available throughout the country. About 73,800 sales representatives were self-employed.

Job Outlook

Job growth is expected to be about as fast as average. Job prospects will be best for those with a college degree, the appropriate technical expertise, and the personal traits necessary for successful selling.

Employment change. Employment of sales representatives, wholesale and manufacturing, is expected to grow by 7 percent between 2008 and 2018, about as fast as the average for all occupations. Given the size of this occupation, a large number of new jobs, about 143,200, will arise over the projection period. Job growth will result from the continued expansion in the variety and number of goods sold throughout the economy. Because they play an important role in the transfer of goods between organizations, sales representatives will be needed to accommodate this expansion. In addition, as technology continues to

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Sales representatives, wholesale and manufacturing	41-4000	1,973,200	2,116,400	143,200	7
Sales representatives, wholesale and manufacturing, technical and scientific products	41-4011	432,900	475,000	42,000	10
Sales representatives, wholesale and manufacturing, except technical and scientific products.....	41-4012	1,540,300	1,641,400	101,100	7

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

progress, sales representatives can help ensure that retailers offer the latest products to their customers and that businesses acquire the tools they need to increase their efficiency in operations.

Employment growth will be greatest in independent sales companies as manufacturers continue to outsource sales activities to independent agents rather than using in-house sales workers. Independent sales agents generally are more efficient, reducing the overhead cost to their clients. Also, by using agents who contract their services to more than one company, companies can share costs of the agents with each other.

Job prospects. Job prospects will be best for those with a college degree, the appropriate technical expertise, and the personal traits necessary for successful selling. Opportunities will be better in independent sales companies than with manufacturers, who are expected to continue contracting out field sales duties.

Employment opportunities and earnings may fluctuate from year to year because sales are affected by changing economic conditions and businesses' preferences. In addition, many job openings will result from the need to replace workers who transfer to other occupations or leave the labor force.

Earnings

Median annual wages of sales representatives, wholesale and manufacturing, technical and scientific products, were \$70,200, including commissions, in May 2008. The middle 50 percent earned between \$48,540 and \$99,570 a year. The lowest 10 percent earned less than \$34,980, and the highest 10 percent earned more than \$133,040 a year. Median annual wages in the industries employing the largest numbers of sales representatives, wholesale and manufacturing, technical and scientific products, were as follows:

Computer systems design and related services	\$80,060
Wholesale electronic markets and agents and brokers	77,190
Drugs and druggists' sundries merchant wholesalers	74,840
Professional and commercial equipment and supplies merchant wholesalers	70,140
Electrical and electronic goods merchant wholesalers	63,050

Median annual wages of sales representatives, wholesale and manufacturing, except technical and scientific products, were \$51,330, including commission, in May 2008. The middle 50 percent earned between \$36,460 and \$75,120 a year. The lowest 10 percent earned less than \$26,950, and the highest 10 percent earned more than \$106,040 a year. Median annual wages in the industries employing the largest numbers of sales representatives, wholesale and manufacturing, except technical and scientific products, were as follows:

Wholesale electronic markets and agents and brokers	\$57,100
Machinery equipment and supplies merchant wholesalers	50,310
Professional and commercial equipment and supplies merchant wholesalers	49,750
Grocery and related product merchant wholesalers	47,980
Miscellaneous nondurable goods merchant wholesalers	44,680

Compensation methods for representatives vary significantly by the type of firm and the product sold. Most employers use a combination of salary and commissions or salary plus bonus. Commissions usually are based on the value of sales, whereas bonuses may depend on individual performance, on the performance of all sales workers in the group or district, or on the company's performance. Unlike those working directly for a manufacturer or wholesaler, sales representatives working for an independent sales company usually are not reimbursed for expenses. Depending on the type of product or products they are selling, their experience in the field, and the number of clients they have, they can earn significantly more or less than those working in direct sales for a manufacturer or wholesaler.

In addition to receiving their earnings, sales representatives working directly for a manufacturer or wholesaler usually are reimbursed for expenses such as the costs of transportation, meals, hotels, and entertaining customers. They often receive benefits, including personal use of a company car and frequent flyer mileage. Some companies offer incentives such as free vacation trips or gifts for achieving an outstanding sales performance.

Sales Worker Supervisors

Significant Points

- Employment is projected to increase more slowly than the average for all occupations.
- Competition is expected for jobs; applicants with a college degree or sales experience should have the best opportunities.
- Long, irregular hours, including evenings and weekends, are common.

Nature of the Work

Sales worker supervisors oversee the work of sales and related workers, such as retail salespersons, cashiers, customer service representatives, stock clerks and order fillers, sales engineers, and wholesale sales representatives. Sales worker supervisors are responsible for interviewing, hiring, and training employees. They also may prepare work schedules and assign workers to specific duties. Many of these supervisors hold job titles such as *sales manager, department manager, or shift supervisor*.

In retail establishments, sales worker supervisors ensure that customers receive satisfactory service and quality goods. They also answer customers' inquiries, deal with complaints, and sometimes handle purchasing, budgeting, and accounting.

Responsibilities vary with the size and type of establishment. As the size of retail stores grows and the variety of goods and services increases, supervisors tend to specialize in one department or one aspect of merchandising. Sales worker supervisors in large retail establishments are often referred to as department supervisors or managers. They provide day-to-day oversight of individual departments, such as shoes, cosmetics, or housewares in department stores; produce or meat in grocery stores; and car sales in automotive dealerships. Department supervisors establish and implement policies, goals, and procedures for their specific departments; coordinate activities with other department heads; and strive for smooth operations within their departments. They supervise employees whose responsibilities may include pricing and ticketing goods and placing them on display; cleaning and organizing shelves, displays, and inventories in stockrooms; and inspecting merchandise to ensure that nothing is outdated. Sales worker supervisors review inventory and sales records, develop merchandising techniques, and coordinate sales promotions. In addition, they may greet and assist customers and promote sales and good public relations.

Sales worker supervisors in non-retail establishments oversee and coordinate the activities of sales workers who sell industrial products, insurance policies, or services such as advertising, financial, or Internet services. Sales worker supervisors may prepare budgets, make personnel decisions, devise sales-incentive programs, and approve sales contracts.

In small or independent companies and retail stores, sales worker supervisors not only directly supervise sales associates, but they also are responsible for the operation of the entire company or store. Some are self-employed business or store owners.

Work environment. Most sales worker supervisors have offices. In retail trade, their offices are within the stores, usually

close to the areas they oversee. Although they spend some time in the office completing merchandise orders or arranging work schedules, a large portion of their workday is spent on the sales floor, supervising employees or selling merchandise.

Work hours of supervisors vary greatly among establishments because work schedules usually depend on the needs of the customer. Supervisors generally work at least 40 hours a week. Long, irregular hours are common, particularly during sales, holidays, busy shopping seasons, and at times when inventory is recorded. Supervisors are expected to work some evenings and weekends but usually are given a day off during the week. Hours can change weekly, and supervisors sometimes must report to work on short notice, especially when employees are absent. Independent owners often can set their own schedules, but hours must be convenient to customers.

Training, Other Qualifications, and Advancement

Sales worker supervisors usually gain knowledge of management principles and practices through work experience. Many supervisors begin their careers as salespersons, cashiers, or customer service representatives. These workers should be patient, decisive, and sales-oriented.

Education and training. There is no standard educational requirement for sales worker supervisors, and the educational backgrounds of these workers vary widely. For some jobs, a college degree is required. Supervisors who have college degrees often hold associate or bachelor's degrees in liberal arts, social sciences, business, or management. College graduates usually can enter directly into management training programs sponsored by their company, without much experience. Many supervisors, however, are hired without postsecondary education. For these workers, previous experience in a sales occupation is essential. Most sales worker supervisors have retail sales experience or experience as a customer service representative. In these positions, they learn merchandising, customer service, and the basic policies and procedures of the company.

Regardless of education level or major area of study, recommended high school or college courses include those related to business, such as accounting, marketing, management, and sales, as well as those related to social science, such as psychology, sociology, and communication. To gain experience, many

Sales worker supervisors often have extensive experience in a related sales occupation.

college students participate in internship programs that usually are developed jointly by schools and businesses.

The type and amount of training available to supervisors varies by company. Many national retail chains and companies have formal training programs for management trainees that include both classroom and on-site training. Training time may be as brief as 1 week or may last more than 1 year, giving trainees experience during all sales seasons.

Ordinarily, classroom training includes topics such as interviewing, customer service skills, inventory management, employee relations, and scheduling. Training programs for retail franchises are generally extensive, covering all functions of the company's operation, including budgeting, marketing, management, finance, purchasing, product preparation, human resource management, and compensation.

Other qualifications. Sales worker supervisors must possess good communication skills and get along with all types of people. They need initiative, self-discipline, good judgment, and decisiveness. Patience and a conciliatory temperament are necessary when dealing with demanding customers. Supervisors also must be able to motivate, organize, and direct the work of their employees. Supervisors who own their own establishment need good business skills and strong customer service and public relations skills.

Advancement. Supervisors who display leadership and team-building skills, motivation, and decisiveness may become candidates for promotion to assistant manager or manager. A postsecondary degree may speed their advancement into management. In many retail establishments, managers are promoted from within the company. In small retail establishments, where the number of positions is limited, advancement to a higher management position also may be limited. Large establishments often have extensive career ladder programs and may offer supervisors the opportunity to transfer to another store in the chain or to the central office. Although promotions may occur more rapidly in large establishments, some managers may need to relocate every several years to be able to advance.

Supervisors also can become advertising, marketing, promotions, public relations, and sales managers—workers who coordinate marketing plans, monitor sales, and propose advertisements and promotions. They may also become purchasing managers, buyers, or purchasing agents—workers who purchase goods and supplies for their organization or for resale. (These occupations are covered elsewhere in the *Handbook*.)

Some supervisors who have worked in their industry for a long time open their own stores or sales firms. However, retail trade and sales occupations are highly competitive, and although many independent owners succeed, some fail to cover expenses and eventually go out of business.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Supervisors, sales workers	41-1000	2,192,300	2,305,100	112,800	5
First-line supervisors/managers of retail sales workers	41-1011	1,685,500	1,773,900	88,400	5
First-line supervisors/managers of non-retail sales workers	41-1012	506,800	531,200	24,400	5

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Employment

Sales worker supervisors held about 2.2 million jobs in 2008. Approximately 34 percent were self-employed, many of whom were store owners. About 48 percent of sales worker supervisors were wage and salary workers employed in the retail sector. Some of the largest employers were grocery stores, department stores, clothing and clothing accessory stores, and general merchandise stores such as warehouse clubs and supercenters. The remaining sales worker supervisors worked in nonretail establishments.

Job Outlook

Employment is projected to grow more slowly than average. Competition for jobs is expected; applicants with a college degree or sales experience should have the best opportunities.

Employment change. Employment of sales worker supervisors is expected to grow by 5 percent between 2008 and 2018, more slowly than the average for all occupations. Job growth will be limited as retail companies increase the responsibilities of retail salespersons and existing sales worker supervisors, and as the retail industry, overall, grows at a slow rate.

Projected employment growth of sales worker supervisors will mirror, in part, the patterns of employment growth in the industries in which they work. For example, faster growth is expected in the professional, scientific, and technical services industry, as a result of strong demand for the services that this industry provides. Conversely, growth of sales worker supervisors will increase more slowly in the retail sector, in-line with overall industry growth.

Job prospects. Similar to other supervisor positions, competition is expected for sales worker supervisor jobs over the 2008-18 period. Candidates who have a college degree, and those with experience—as a sales representative, cashier, or customer service representative, for example—will have the best opportunities.

Some job openings over the next decade will occur as experienced supervisors move into higher levels of management, transfer to other occupations, or leave the labor force. However, these job openings will not be great in number since movement into upper management is also competitive.

Earnings

Wages of sales worker supervisors vary substantially, depending on a worker's level of responsibility, length of service, and the type, size, and location of the firm.

Median annual wages of supervisors of retail sales workers were \$35,310, including commissions, in May 2008. The middle 50 percent earned between \$27,520 and \$46,450. The

lowest 10 percent earned less than \$22,210, and the highest 10 percent earned more than \$61,970. Median annual wages in the industries employing the largest numbers of wage and salary supervisors of retail sales workers were as follows:

Building material and supplies dealers	\$37,710
Grocery stores	35,140
Clothing stores	34,180
Other general merchandise stores	30,590
Department stores.....	30,480

Median annual wages of supervisors of non-retail sales workers were \$68,100, including commissions, in May 2008. The middle 50 percent earned between \$51,380 and \$98,080. The lowest 10 percent earned less than \$36,830, and the highest 10 percent earned more than \$136,180. Median annual wages in the industries employing the largest numbers of wage and salary supervisors of non-retail sales workers were as follows:

Professional and commercial equipment and supplies merchant wholesalers	\$82,880
Wholesale electronic markets and agents and brokers	81,100
Machinery equipment and supplies merchant wholesalers	68,260
Grocery and related product merchant wholesalers	66,470
Postal Service.....	60,730

Compensation systems vary by type of establishment and by merchandise sold. Many supervisors receive a commission or a combination of salary and commission. Under a commission system, supervisors receive a percentage of department or store sales. Thus, these supervisors' earnings depend on their ability to sell their product and the condition of the economy. Those who sell large amounts of merchandise or exceed sales goals often receive bonuses or other awards.

Related Occupations

Sales worker supervisors serve customers, supervise workers, and direct and coordinate the operations of an establishment. Workers with similar responsibilities include:

	Page
Administrative services managers.....	29
Advertising, marketing, promotions, public relations, and sales managers.....	32
Food service managers.....	55
Lodging managers.....	70
Office and administrative support worker supervisors and managers.....	594

Securities, Commodities, and Financial Services Sales Agents

Significant Points

- Most positions require a bachelor's degree in business, finance, accounting, or economics; a master's degree in business or professional certification is helpful for advancement.
- Applicants face keen competition for jobs, especially in investment banks.
- Turnover is high for newcomers, but those who are successful have a very strong attachment to their occupation because of high earnings and considerable investment in training.

Nature of the Work

Each day, hundreds of billions of dollars change hands on the major United States securities exchanges. This money is used to invest in securities, such as stocks, bonds, or mutual funds, which are bought and sold by large institutional investors, mutual funds, pension plans, and the general public. Most securities trades are arranged through *securities, commodities, and financial services sales agents*, whether they are between individuals with a few hundred dollars or large institutions with hundreds of millions of dollars. The duties of sales agents vary greatly depending on their specialty.

The most common type of securities sales agent is called a *broker* or *stock broker*. Stock brokers advise everyday people, or retail investors, on appropriate investments based on their needs and financial ability. Once the client and broker agree on the best investment, the broker electronically sends the order to the floor of the securities exchange to complete the transaction. After the transaction is finalized, the broker charges a commission for the service.

The most important part of a broker's job is finding clients and building a customer base. Thus, beginning securities and commodities sales agents spend much of their time searching for clients, often relying heavily on telephone solicitation, or "cold calling," from a list of potential clients. Some agents network by joining civic organizations or social groups, while others may rely on referrals from satisfied customers.

Investment bankers are sales agents who connect businesses that need money to finance their operations or expansion plans

People increasingly seek the advice and services of securities, commodities, and financial services sales agents to realize their financial goals.

with investors who are interested in providing that funding in exchange for debt (in the form of bonds) or equity (in the form of stock). This process is called underwriting, and it is the main function of the investment bank. Investment bankers have to sell twice: first, they sell their advisory services to help companies issue new stock or bonds, and second, they sell the securities issued to investors.

Perhaps the most important advisory service provided by investment banks is to help companies new to the public investment arena issue stock for the first time. This process, known as an initial public offering, or IPO, can take a great deal of effort because private companies must meet stringent financial requirements to become publicly owned companies. Corporate finance departments also help private companies sell stock to institutional investors or wealthy individuals. They also advise companies that are interested in funding their operations by taking on debt—often issued in the form of bonds. Unlike a stock, which entitles its holder to partial ownership of a company, a bond entitles its holder to be repaid with a predetermined rate of interest.

Another important advisory service is provided by the mergers and acquisitions department. Investment bankers in this area advise companies that are interested in being acquired, or interested in merging with or purchasing other companies. Once a potential seller or buyer is found, bankers advise their client on how to execute the agreement. Generally both buyers and sellers have investment banks working for them to make sure that the transaction goes smoothly.

Investment banking sales agents and traders sell stocks and bonds to investors. Instead of selling their services to companies for fees, salespeople and traders sell securities to customers for commissions. These sales agents generally contact customers and their agents to discuss new stock and bond issues. When

an investor decides to make a purchase, the order goes to the trading floor. Traders execute buy and sell orders from clients and make trades on behalf of the bank itself. Because markets fluctuate so much, trading is a split-second decision-making process. If a trader cannot secure the promised price on an exchange, millions of dollars could potentially be lost. On the other hand, if a trader finds a better deal, the bank could make millions more.

A small but powerful group of sales agents work directly on the floor of a stock or commodities exchange. When a firm or investor wishes to buy or sell a security or commodity, sales agents relay the order through their firm's computers to the floor of the exchange. There, *floor brokers* negotiate the price with other floor brokers, make the sale, and forward the purchase price to the sales agents. In addition to floor brokers, who work for individual securities dealers, there are also *independent brokers*. These are similar to floor brokers, except that they are not buyers for specific firms. Instead, they can buy and sell stocks for their own accounts, or corporate accounts that they manage, or they can sell their services to floor brokers who are too busy to execute all of the trades they are responsible for making. *Specialists* or *market makers* also work directly on the exchange floor, and there is generally one for each security or commodity being traded. They facilitate the trading process by quoting prices and by buying or selling shares when there are too many or too few available.

Financial services sales agents consult on a wide variety of banking, securities, insurance, and other related services to individuals and businesses, often catering the services to meet the client's financial needs. They contact potential customers to explain their services which may include checking accounts, loans, certificate of deposits, individual retirement accounts, credit cards, and estate and retirement planning.

Work environment. Most securities and commodities sales agents work in offices under somewhat stressful conditions. The pace of work is fast, and managers tend to be very demanding of their workers since both commissions and advancement are tied to sales.

Stock brokers and investment advisors usually work more than 40 hours a week, including evenings and weekends, as many of their clients work during the day. A growing number of securities sales agents, employed mostly by discount or online brokerage firms, work in call-center environments. In these centers, hundreds of agents spend much of the day on the telephone taking orders from clients or offering assistance and information on their accounts. Often, such call centers operate 24 hours a day, requiring agents to work in shifts.

Investment bankers in corporate finance or mergers and acquisitions typically work long hours and endure extreme stress, especially at the junior levels. Because banks work with companies all over the world, extensive travel is often part of the job, as is evening and weekend work. With some experience, the workload becomes more manageable, but since higher-level workers generally have more contact with clients, they also tend to travel more.

Sales and trading departments typically work more than 40 hours a week, but not nearly as much as their counterparts in investment banking. They also travel less, usually

for conferences or training. On the other hand, their jobs are incredibly stressful. For sales agents, every minute of the day that is wasted means they might have made another sale. Since both commissions and advancement are tied to sales, this can be very stressful. Traders have perhaps the most stressful jobs of all, as split second decisions can lead to millions of dollars being won or lost. Trading floors are very busy and often very loud. Exchange workers, much like traders, have highly stressful jobs because the bulk of their work takes place on the floor of the exchanges. However, exchange traders and workers typically work shorter hours than many other agents since most of their work is done while the market is open.

Financial services sales agents normally work 40 hours a week in a comfortable office environment. They may spend considerable time outside the office, meeting with current and prospective clients, and attending civic functions. Some financial services sales agents work exclusively inside banks, providing service to walk-in customers.

Training, Other Qualifications, and Advancement

Most positions require a bachelor's degree in business, finance, accounting, or economics. An MBA or professional certification is helpful for advancement.

Education and training. A bachelor's degree in business, finance, accounting, or economics is important for securities and commodities sales agents, especially in larger firms. Many firms hire summer interns before their last year of college and those who are most successful are offered full-time jobs after they graduate.

Numerous agents eventually get a master's degree in business administration (MBA), which is often a requirement for high-level positions in the securities industry. Because the MBA is a professional degree designed to expose students to real-world business practices, it is considered to be a major asset for job-seekers. Employers often reward MBA holders with higher-level positions, better compensation, and even large signing bonuses.

Most employers provide intensive on-the-job training, teaching employees the specifics of the firm, such as the products and services offered. Trainees in large firms may receive classroom instruction in securities analysis, effective speaking, and the finer points of selling. Firms often rotate their trainees among various departments, to give them a broad perspective of the securities business. In small firms, sales agents often receive training at outside institutions and on the job.

Securities and commodities sales agents must keep up with new products and services and other developments. Because of this, brokers regularly attend conferences and training seminars.

Licensure. Brokers and investment advisors must register as representatives of their firm with the Financial Industry Regulatory Authority (FINRA). Before beginners can qualify as registered representatives, they must be an employee of a registered firm for at least 4 months and pass the General Securities Registered Representative Examination—known as the Series 7 Exam—administered by FINRA. The exam takes 6 hours and contains 250 multiple-choice questions; a passing score is above 70 percent.

Most States require a second examination—the Uniform Securities Agents State Law Examination (Series 63 or 66). This test measures a candidate's knowledge of the securities business in general, customer protection requirements, and recordkeeping procedures. Most firms offer training to help their employees pass these exams.

There are many other licenses available, each of which gives the holder the right to sell different investment products and services. Traders and some other sales representatives also need licenses, although these vary greatly by firm and specialization. Financial services sales agents may also need to be licensed, especially if they sell securities or insurance.

Registered representatives must attend continuing education classes to maintain their licenses. Courses consist of computer-based training in regulatory matters and company training on new products and services.

Other qualifications. Many employers consider personal qualities and skills more important than academic training. Employers seek applicants who have excellent interpersonal and communication skills, a strong work ethic, the ability to work in a team environment, and a desire to succeed. The ability to understand and analyze numbers is also important. Because securities, commodities, and financial services sales agents are entrusted with large sums of money and personal information, employers also make sure that applicants have a good credit history and a clean record. Self-confidence and the ability to handle frequent rejection are important ingredients for success.

Most firms prefer candidates with sales experience, particularly those who have worked on commission in areas such as real estate or insurance. Other firms prefer to hire workers right out of college, with the intention of molding them to their corporate image.

Certification and advancement. Although not always required, certifications enhance professional standing and are recommended by employers. Brokers, investment advisors, and financial services sales agents can earn the Chartered Financial Analyst (CFA) designation, sponsored by the CFA Institute. To qualify for this designation, applicants need a bachelor's degree, four years of related work experience, and must pass three exams which requires several hundred hours of self-study. Exams cover subjects in accounting, economics, securities analysis, financial markets and instruments, corporate finance, asset valuation, and portfolio management, and applicants can take the exams while they are obtaining the required work experience.

Brokers, investment advisors, and financial services sales agents usually advance by accumulating a greater number of accounts. Although beginners often service the accounts of individual investors, they may eventually handle very large institutional accounts, such as those of banks and pension funds. After taking a series of tests, some brokers become portfolio managers and have greater authority to make investment decisions regarding an account. Some experienced sales agents become branch office managers and supervise other sales agents while continuing to provide services for their own customers. A few agents advance to top management positions or become partners in their firms.

Investment bankers who enter the occupation directly after college generally start as analysts. At this level, employees receive intensive training and have little contact with clients as they spend most of their time producing “pitchbooks”—information booklets used to sell products. After 2 to 3 years, top analysts may be promoted to an associate position or asked to leave. Recent graduates from MBA programs can start as associates, which is similar to the analyst position, but with more responsibilities, such as leading a group of analysts and having contact with clients. After 2 to 3 years, associates are promoted or terminated. Successful associates can become vice presidents, and vice presidents may advance to become directors, sometimes called executive directors.

Employment

Securities, commodities, and financial services sales agents held about 317,200 jobs in 2008. About 49 percent of jobs were in the securities, commodity contracts, and other financial investments and related activities industry. About 15 percent of all workers were self-employed.

Because of their close relationship to stock exchanges and large banking operations, most of the major investment banks in the United States are based in New York metropolitan area. Smaller investment banks can be found in many major American cities and some major investment banks have operations in other cities, although most of their business remains in New York.

Job Outlook

Employment is projected to grow as fast as the average. Keen competition is expected as the number of applicants will continue to far exceed the number of job openings in this high-paying occupation.

Employment change. Employment of securities, commodities, and financial services sales agents is expected to grow 9 percent during the 2008–18 decade, about as fast as the average for all occupations. Consolidation of the financial industry, mainly stemming from recent global financial problems, will be the largest inhibitor of employment growth. Increased levels of industry consolidation often result in duplicated tasks among workers, a scenario that is expected to result in layoffs of many broker, sales, and investment banking positions. Additionally, the deregulation of financial markets in past decades has broken down the barriers between investment activities and banking, resulting in competition between traditional banks and securities companies on all levels. However, many of the major investment banks are now owned by large banks and most major banks also have brokerages, which allow their customers to quickly and easily transfer money between their personal banking and investment accounts. The ability of customers

to access accounts online, as well as manage their personal investments through the Internet, will result in fewer brokers as well.

Job prospects. Competition for jobs will continue to be keen with more applicants than available openings. Additionally, the recent financial crisis has resulted in mass consolidation in the financial industry, a scenario that will likely result in fewer positions as companies attempt to streamline operations by eliminating duplicate tasks.

Entry-level sales agents, particularly those with previous sales experience, should face better prospects in smaller firms, as opposed to larger firms, where many positions have recently been eliminated. Investment banking is especially known for its competitive hiring process and candidates will face particularly keen competition for the relatively few openings. Having a degree from a prestigious undergraduate institution is very helpful, as are excellent grades in finance, economics, accounting, and business courses. Certifications and graduate degrees, such as a CFA certification or a master’s degree in business or finance, can also significantly improve an applicant’s prospects. Competition is even greater for positions working in exchanges.

Employment in the securities industry is closely connected with market conditions and the state of the overall economy and is highly volatile during recessionary periods. Turnover is high for newcomers, who face difficult prospects no matter when they join the industry. Once established, however, securities and commodities sales agents have a very strong attachment to their profession because of their high earnings and considerable investment in training.

Earnings

The median annual wage-and-salary wages of securities, commodities, and financial services sales agents were \$68,680 in May 2008. The middle half earned between \$40,480 and \$122,270.

Median annual wages in the industries employing the largest numbers of securities, commodities, and financial services sales agents were:

Other financial investment activities	\$94,960
Security and commodity contracts intermediation and brokerage	85,580
Management of companies and enterprises	81,940
Activities related to credit intermediation.....	52,890
Nondepository credit intermediation.....	47,760

Because this is a sales occupation, many workers are paid a commission based on the amount of stocks, bonds, mutual funds, insurance, and other products they sell. Most firms provide sales agents with a steady income by paying a “draw against commission”—a minimum salary based on commissions they

Projections data from the National Employment Matrix

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

can be expected to earn. Trainee brokers usually are paid a salary until they develop a client base. The salary gradually decreases in favor of commissions as the broker gains clients.

Investment bankers in corporate finance and mergers and acquisitions are generally paid a base salary with the opportunity to earn a substantial bonus. At the higher levels, bonuses far exceed base salary. This arrangement works similarly to commissions but gives banks greater flexibility to reward members of the team who were more effective. Since investment bankers in sales and trading departments work alone, they generally work on commissions.

Brokers who work for discount brokerage firms that promote the use of telephone and online trading services usually are paid a salary, sometimes boosted by bonuses that reflect the profitability of the office. Financial services sales agents are also paid a salary, although bonuses or commissions from sales are starting to account for a larger share of their income.

Benefits in the securities industry are generally very good. They commonly include healthcare, retirement, and life insurance. Securities firms may also give discounts to employees on financial services that they sell to customers. Other benefits may include paid lunches with clients, paid dinners for employees who work late, and often extensive travel opportunities.

Travel Agents

Significant Points

- Many people are attracted to this occupation because of the travel benefits, such as reduced rates for transportation and lodging.
- Applicants with formal training should have the best opportunities to get a job as a travel agent.
- Travel agents who specialize in specific destinations or in certain types of travel or travelers should have the best chance for success.
- Job opportunities and earnings may decline during economic downturns and international crises, when travel plans are likely to be deferred.

Nature of the Work

Travel agents assist travelers by sorting through vast amounts of information to help their clients make the best possible travel arrangements. Travel agents offer advice on destinations and make arrangements for transportation, hotel accommodations, car rentals, and tours for their clients. In addition, resorts and specialty travel groups use travel agents to promote travel packages to their clients.

Travel agents are expected to be able to advise travelers about their destinations, such as the weather conditions, local ordinances and customs, attractions, and exhibitions. For those traveling internationally, agents also provide information on customs regulations, required documents (passports, visas, and certificates of vaccination), travel advisories, and currency exchange rates. In the event of changes in itinerary in the middle of a trip, travel agents intercede on the traveler's behalf to make alternate booking arrangements.

Travel agents use a variety of published and computer-based sources for information on departure and arrival times, fares, quality of hotel accommodations, and group discounts. They may also visit hotels, resorts, and restaurants themselves to evaluate the comfort, cleanliness, and the quality of specific hotels and restaurants so that they can base recommendations on their own experiences or those of colleagues or clients. Many travel agents specialize in specific destinations or regions; others specialize in travel targeted to particular demographic groups, such as senior citizens.

Travel agents who primarily work for tour operators and other travel arrangers may help develop, arrange, and sell the company's own package tours and travel services. They may promote these services, using telemarketing, direct mail, and the Internet. They make presentations to social and special-interest groups, arrange advertising displays, and suggest company-sponsored trips to business managers.

Work environment. Travel agents spend most of their time behind a desk conferring with clients, completing paperwork, contacting airlines and hotels to make travel arrangements, and promoting tours. They also spend a considerable amount of time either on the telephone or on the computer researching travel itineraries or updating reservations and travel documents.

Travel agents help clients plan personal and business trips.

Agents sometimes have to face a great deal of pressure during travel emergencies or when they need to reschedule missed reservations. They are especially busy during peak vacation times, such as summer and holiday travel periods. Many agents, especially those who are self-employed, frequently work more than 40 hours per week, although technology now allows a growing number of agents to work from home.

Training, Other Qualifications, and Advancement

Employers prefer to hire travel agents who have formal training in this field. Superb communication and computer skills are essential for talking with clients and making travel reservations.

Education and training. Most travel agencies prefer applicants who have received training specific to becoming a travel agent. Many vocational schools offer full-time travel agent programs. Travel agent courses also are offered in public adult education programs, online, and in community colleges. These programs teach students about geography, sales, mar-

keting, and travel industry forms and procedures for ticketing and reservations.

A few colleges offer a bachelor's or master's degree in travel and tourism that can benefit prospective agents. Backgrounds in geography, foreign languages, or world history can also be useful for job applicants because they suggest an existing interest in travel and culture, which could help agents develop a rapport with clients.

Continuing education is critical for travel agents because the abundance of travel information readily available through the Internet and other sources has resulted in more informed consumers who expect travel agents to be experts in their field.

Other qualifications. Travel agents must be well-organized, accurate, and detail oriented in order to compile information from various sources and to plan and organize travel itineraries. Agents must have excellent communication skills and must be professional and courteous when dealing with travel representatives and clients.

Personal travel experience is an asset because knowledge about a city or foreign country often helps influence a client's travel plans. Business experience or training is important for self-employed agents who run their own business. In addition, computer skills are necessary and essential, because most travel arrangements are now made using the Internet or electronic reservation systems.

Certification and advancement. Some employees start as reservation clerks or receptionists in travel agencies. With experience and some formal training, they can take on greater responsibilities and eventually assume travel agent duties. In agencies with many offices, travel agents may advance to busier offices or to office manager or other managerial positions.

Those who start their own agencies generally have experience in an established agency. These agents must gain formal approval from suppliers or corporations, such as airlines, ship lines, or rail lines, to extend credit on reservations and to ensure payment. The Airlines Reporting Corporation and the International Airlines Travel Agency Network, for example, are the approving bodies for airlines. To gain approval, an agency must be financially sound and employ at least one experienced manager or travel agent.

Employment

Travel agents held about 105,300 jobs in May 2008 and are found in every part of the country. About 76 percent worked for travel arrangement and reservation services with 60 percent in travel agencies. Another 17 percent were self-employed.

Job Outlook

Little or no change in employment is expected over the 2008–18 period. Applicants with formal training should have the best opportunities to get a job as a travel agent. Travel agents who

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Travel agents	41-3041	105,300	104,100	-1,200	-1

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

specialize in specific destinations or in certain types of travel or travelers should have the best chance for success.

Employment change. Employment of travel agents is expected to decline by 1 percent over the 2008–18 period. The ease of Internet use and the ready availability of travel and airline Web sites that allow people to research and plan their own trips, make their own reservations, and purchase their own tickets will result in less demand for travel agents for routine travel arrangements. However, as more travelers take exotic and customized trips, the demand for some of the specialized services offered by travel agents will grow. Additionally, the increasing number of international visitors to the United States represents a growing market for travel agents who organize and sell tours to these international visitors.

Job prospects. Applicants with formal training should have the best opportunities to get a job as a travel agent. Agents who specialize in specific destinations, luxury travel, or particular types of travelers, such as ethnic groups or groups with a special interest or hobby, should have the best chance for success.

The demand for travel agents may decline during economic downturns and international crises, when travel plans are likely to be deferred. Thus, job opportunities for travel agents will fluctuate with changing economic and global conditions. Many openings, though, are expected to occur as agents leave for other occupations or retire.

Earnings

Experience, sales ability, and the size and location of the agency determine the salary of a travel agent. Median annual wages of travel agents were \$30,570 in May 2008. The middle 50 percent earned between \$23,940 and \$38,390. The lowest 10 percent earned less than \$18,770, while the top 10 percent earned more than \$47,860. Median wages in May 2008 for travel agents employed in the travel arrangement and reservation services industry were \$30,470.

Salaried agents usually enjoy standard employer-paid benefits that self-employed agents must provide for themselves. When traveling for personal reasons, agents usually get reduced rates for transportation and accommodations. In addition, agents sometimes take “familiarization” trips, at lower cost or no cost to themselves, to learn about various vacation sites. These benefits often attract people to this occupation.

Earnings of travel agents who own their agencies depend mainly on commissions and service fees they charge clients for trip planning. Often it takes time to acquire clients, so it is not unusual for new self-employed agents to have low earnings. Established agents may have lower earnings during economic downturns.

Related Occupations

Travel agents organize and schedule business, educational, or recreational travel or activities. Other workers with similar responsibilities are found in the following occupations:

	Page
Hotel, motel, and resort desk clerks	592
Reservation and transportation ticket agents and travel clerks	598
Tour guides and escorts	826
Travel guides	826

Other Sales and Related Occupations

Counter and Rental Clerks

Nature of the Work

Counter and rental clerks receive orders for repairs, rentals, and services. They discuss available options with the customer, write-up details of the purchase, compute the cost, and accept payment.

Education and Training

Most counter and rental clerk jobs are entry-level positions that require little or no experience and minimal formal education. In most companies, counter and rental clerks are trained on the job by more experienced workers and sometimes through the use of videos and other instruction manuals.

Job Outlook

Current and projected employment:

2008 Employment	448,200
2018 Employment	461,900
Employment change.....	13,700
Growth rate.....	3%

Employment change. Employment is projected to grow at 3 percent, slower than the average for all occupations. As this occupation usually requires personal contact with the customer, it is difficult to completely automate. Growth in the occupation will reflect growth in the rental business, including apartment rentals, and growth in the purchasing of services, such as dry

cleaning and auto repairs, and the desire by companies to provide greater customer service. Trends, such as videos provided by mail and online, may reduce the need for some of these clerks at video rental stores.

Job prospects. Job opportunities are expected to be favorable. Entry-level jobs typically experience high turnover and generate numerous job openings, leading to favorable job opportunities as workers who leave this occupation will need to be replaced.

Earnings

Median annual wages for counter and rental clerks were \$20,900 in May 2008.

Office and Administrative Support Occupations

Financial Clerks

Bill and Account Collectors

Significant Points

- Employment of bill and account collectors is projected to grow by about 19 percent over the 2008-18 decade, which is faster than average for all occupations.
- Most jobs in this occupation require only a high school diploma, though many employers prefer workers with some customer service experience.
- Job prospects should be favorable, especially for those with related work experience.

Nature of the Work

Bill and account collectors, often called *collectors*, attempt to collect payment on overdue bills. Some are employed by third-party collection agencies, while others—known as *in-house collectors*—work directly for the original creditors, such as mortgage and credit card companies, health care providers, and utilities.

The duties of bill and account collectors are similar across the many different organizations in which they work. First, collectors are called upon to locate and notify consumers or businesses with delinquent accounts, usually over the telephone, but sometimes by letter. When debtors move without leaving a forwarding address, collectors may check with the post office, telephone companies, credit bureaus, or former neighbors to obtain the new address. This is called “skip tracing.” Computer systems assist in tracing by automatically tracking when individuals or companies change their addresses or contact information on any of their open accounts.

Once collectors find debtors, they inform them of the overdue accounts and solicit payment. If necessary, they review terms of sale, or credit contracts. Good collectors use their listening skills to attempt to learn the cause of delinquencies. They generally have the authority to offer repayment plans or other assistance to make it easier for debtors to pay their bills. In many cases, they are able to find payment solutions that will allow the debtor to pay off their accounts. They may also offer simple advice or refer customers to debt counselors.

If a consumer agrees to pay, the collector records this commitment and checks later to verify that the payment was made. If a consumer fails to pay, the collector prepares a statement indicating the consumer’s delinquency for the credit department of the establishment. In more extreme cases, collectors may initiate repossession proceedings, disconnect service, or hand the account over to an attorney for legal action. Most collectors

handle other administrative functions for the accounts assigned to them, including recording changes of address and purging the records of the deceased.

Because people are very sensitive about their financial problems, collectors must be careful to follow applicable Federal and State laws that govern their work. The Federal Trade Commission requires that a collector positively identify the delinquent account holder before announcing that the purpose of the call is to collect a debt. The collector must then issue a statement—often called a “mini-Miranda”—that lets the customer know that he or she is a collector. Collectors also face many State laws that govern how they must proceed in doing their work. Most companies use electronic systems to help collectors remember all laws and regulations governing each call.

Collectors use computers and a variety of automated systems in their jobs. Companies keep records of their accounts using computers, and collectors can keep track of previous collection attempts and other information in computerized notes. Using this information puts them at an advantage when trying to negotiate with consumers. As with most call-center workers, they use headsets instead of regular telephones. Many also use automatic dialing, which allows collectors to make calls quickly and efficiently, without the chance of dialing incorrectly.

Work environment. In-house bill and account collectors typically are employed in an office environment, and those who work for third-party collection agencies may work in a call-center environment. Workers spend most of their time on the phone tracking down and contacting people with debts. The work can be stressful, as many consumers are confrontational when pressed about their debts. Successful collectors must face regular rejection and still be ready to make the next call in a polite and positive voice. Fortunately, some consumers appreciate assistance in resolving their outstanding debts, and can be quite grateful.

As in most jobs where workers spend most of their time on the phone, collectors usually have goals they are expected to meet. Typically these include calls per hour and success rate goals. Additionally, because most workers are offered incentives for collecting, they may rely on a certain level of success to meet their own budgetary needs.

Bill and account collectors sometimes must work evenings and weekends. While some collectors work part-time, the majority work 40 hours per week. Flexible work schedules are common.

Training, Other Qualifications, and Advancement

Most employers require collectors to have at least a high school diploma and prefer applicants with postsecondary education or customer service experience. Employers provide on-the-job training to new employees.

Bill and account collectors must have good communication and people skills as their work requires daily interactions with customers.

Education and training. Most bill and account collectors are required to have at least a high school diploma. However, employers prefer workers who have completed some college or who have experience in other occupations that involve contact with the public. Previous experience working in a call center is especially helpful.

Once hired, workers receive on-the-job training. New employees learn company procedures under the guidance of a supervisor or other senior worker. Some formal classroom training may also be necessary, such as training in specific computer software. Additional training topics usually include telephone techniques and negotiation skills. Workers also learn the laws governing the collection of debt as mandated by the Fair Debt Collection Practices Act and various State laws.

Other qualifications. Workers should have good communication and people skills because they need to speak to consumers daily, some of whom may be in stressful financial situations. They should be comfortable talking on the telephone with people they have never met. They must be mature and able to handle rejection. Computer literacy and experience with advanced telecommunications equipment is also useful.

Advancement. As collectors gain experience, their success rates generally go up, leading them to earn more money in commissions. Successful collectors are usually given larger accounts with higher earning opportunities. Some become team leaders or supervisors. Workers who acquire additional skills, experience, and training improve their advancement opportunities.

Employment

Bill and account collectors held about 411,000 jobs in 2008. About one quarter of collectors worked in business support services. Another 19 percent worked in finance and insurance, and 18 percent worked for health care and social assistance providers.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Bill and account collectors.....	43-3011	411,000	490,500	79,500	19

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Job Outlook

Employment of bill and account collectors is expected to grow faster than the average for all occupations. Job prospects are expected to be favorable, especially for those with related work experience.

Employment change. Employment of bill and account collectors is projected to grow by about 19 percent over the 2008-18 decade, which is faster than average for all occupations. New jobs should be created in key industries such as health care and financial services, which often have delinquent accounts. In-house bill collectors will take on some of these collections, while others will be sold to third-party collection agencies. In both cases, bill and account collectors will be responsible for recovering these debts, causing the occupation to grow.

Job growth will be tempered somewhat by continued outsourcing of collections work to offshore call centers. In recent years, many companies have chosen to use these call centers for some of their debt recovery efforts. Nevertheless, creditors will continue to hire collectors in the United States, as domestic workers tend to have greater success in negotiating with clients.

The occupation should see large growth in the health care industry. The rapid growth projected in this industry, in combination with increasing prices, should result in many collections opportunities. This will affect both collectors who work in the health care industry itself and those who work for collections agencies that accept accounts from health care providers.

Job prospects. Opportunities for job seekers who are looking for bill and account collector jobs should be favorable due to continued job growth and the need to replace workers who leave the occupation. Those who have experience in a related occupation should have the best prospects. Companies prefer to hire workers who have worked in a call center before, or in another job that requires regular phone-based negotiations.

Unlike most occupations, the number of collections jobs tends to remain stable and even grow during economic downturns. When the economy suffers, individuals and businesses struggle to meet their financial obligations. While this increases the number of debts that must be collected, it also means that fewer people are able to pay their outstanding debt. Companies decide how many collectors to hire based on expected success rates. As a result, the number of collectors does not necessarily increase proportionally to the number of delinquent accounts. Nevertheless, the number of collections jobs tends to remain stable during downturns, although prospective employees may face increased competition for these jobs.

Earnings

Median hourly wages of bill and account collectors were \$14.73 in May 2008. The middle 50 percent earned between \$12.14 and \$18.12. The lowest 10 percent earned less than \$10.17, and the highest 10 percent earned more than \$22.07. Most bill and

account collectors earn commissions based on the amount of debt they recover.

Related Occupations

Bill and account collectors review and collect information on accounts. Other occupations with similar responsibilities include:

	Page
Credit authorizers, checkers, and clerks.....	589
Interviewers, except eligibility and loan	593
Loan officers	109

Collectors spend most of their time on the telephone, speaking with customers. Other jobs that require regular telephone interaction include:

Customer service representatives	567
Sales representatives, wholesale and manufacturing	547

Sources of Additional Information

Career information on bill and account collectors is available from:

➤ ACA International, The Association of Credit and Collection Professionals, P.O. Box 390106, Minneapolis, MN 55439. Internet: <http://www.acainternational.org>

Bookkeeping, Accounting, and Auditing Clerks

Significant Points

- Bookkeeping, accounting, and auditing clerks held about 2.1 million jobs in 2008 and are employed in nearly every industry.
- A high school degree is the minimum requirement; however, postsecondary education is increasingly important, and an associate degree in business or accounting is required for some positions.
- The large size of this occupation ensures plentiful job openings, including many opportunities for temporary and part-time work.

Nature of the Work

Bookkeeping, accounting, and auditing clerks are financial recordkeepers. They update and maintain accounting records, including those which calculate expenditures, receipts, accounts payable and receivable, and profit and loss. These workers have a wide range of skills from full-charge bookkeepers, who can maintain an entire company's books, to accounting clerks who handle specific tasks. All these clerks make numerous computations each day and must be comfortable using computers to calculate and record data.

In small businesses, *bookkeepers and bookkeeping clerks* often have responsibility for some or all the accounts, known as the general ledger. They record all transactions and post debits (costs) and credits (income). They also produce financial statements and prepare reports and summaries for supervisors and managers. Bookkeepers prepare bank deposits by compiling data from cashiers, verifying and balancing receipts, and sending cash, checks, or other forms of payment to the bank. Additionally, they may handle payroll, make purchases, prepare invoices, and keep track of overdue accounts.

In large companies, *accounting clerks* have more specialized tasks. Their titles, such as *accounts payable clerk* or *accounts receivable clerk*, often reflect the type of accounting they do. In addition, their responsibilities vary by level of experience. Entry-level accounting clerks post details of transactions, total accounts, and compute interest charges. They also may monitor loans and accounts to ensure that payments are up to date. More advanced accounting clerks may total, balance, and reconcile billing vouchers; ensure the completeness and accuracy of data on accounts; and code documents according to company procedures.

Auditing clerks verify records of transactions posted by other workers. They check figures, postings, and documents to ensure that they are mathematically accurate, and properly coded. They also correct or note errors for accountants or other workers to fix.

As organizations continue to computerize their financial records, many bookkeeping, accounting, and auditing clerks use specialized accounting software, spreadsheets, and databases. Most clerks now enter information from receipts or bills into computers, and the information is then stored electronically. The widespread use of computers also has enabled bookkeeping, accounting, and auditing clerks to take on additional responsibilities, such as payroll, procurement, and billing. Many of these functions require these clerks to write letters and make phone calls to customers or clients.

Work environment. Bookkeeping, accounting, and auditing clerks work in an office environment. They may experience eye and muscle strain, backaches, headaches, and repetitive motion

Bookkeeping, accounting, and auditing clerks handle financial records for many small businesses.

injuries from using computers on a daily basis. Clerks may have to sit for extended periods while reviewing detailed data.

Many bookkeeping, accounting, and auditing clerks work regular business hours and a standard 40-hour week, although some may work occasional evenings and weekends. About 1 out of 4 clerks worked part time in 2008.

Bookkeeping, accounting, and auditing clerks may work longer hours to meet deadlines at the end of the fiscal year, during tax time, or when monthly or yearly accounting audits are performed. Additionally, those who work in hotels, restaurants, and stores may put in overtime during peak holiday and vacation seasons.

Training, Other Qualifications, and Advancement

Employers usually require bookkeeping, accounting, and auditing clerks to have at least a high school diploma and some accounting coursework or relevant work experience. Clerks should also have good communication skills, be detail oriented, and trustworthy.

Education and training. Most bookkeeping, accounting, and auditing clerks are required to have a high school degree at a minimum. However, having some postsecondary education is increasingly important and an associate degree in business or accounting is required for some positions. Although a bachelor's degree is rarely required, graduates may accept bookkeeping, accounting, and auditing clerk positions to get into a particular company or to enter the accounting or finance field with the hope of eventually being promoted.

Once hired, bookkeeping, accounting, and auditing clerks usually receive on-the-job training. Under the guidance of a supervisor or another experienced employee, new clerks learn company procedures. Some formal classroom training also may be necessary, such as training in specialized computer software.

Other qualifications. Bookkeeping, accounting, and auditing clerks must be careful, orderly, and detail-oriented to avoid making errors and to recognize errors made by others. These workers also should be discreet and trustworthy, because they frequently come in contact with confidential material. They should also have good communication skills, because they increasingly work with customers. In addition, all bookkeeping, accounting, and auditing clerks should have a strong aptitude for numbers.

Experience in a related job and working in an office environment is recommended. Workers must be able to use computers, and knowledge of specialized bookkeeping or accounting software is especially valuable.

Certification and advancement. Bookkeeping, accounting, and auditing clerks, particularly those who handle all the recordkeeping for a company, may find it beneficial to become certified. The Certified Bookkeeper (CB) designation, awarded by the American Institute of Professional Bookkeepers, demonstrates that individuals have the skills and knowledge needed to carry out all bookkeeping functions, including overseeing payroll and balancing accounts, according to accepted accounting procedures. For cer-

tification, candidates must have at least 2 years of bookkeeping experience, pass a four-part examination, and adhere to a code of ethics. Several colleges and universities offer a preparatory course for certification; some offer courses online. Additionally, certified bookkeepers are required to meet a continuing education requirement every 3 years to maintain certification.

Bookkeeping, accounting, and auditing clerks usually advance by taking on more duties for higher pay or by transferring to a closely related occupation. Most companies fill office and administrative support supervisory and managerial positions by promoting individuals from within their organizations, so clerks who acquire additional skills, experience, and training improve their advancement opportunities. With appropriate experience and education, some bookkeeping, accounting, and auditing clerks may become accountants or auditors.

Employment

Bookkeeping, accounting, and auditing clerks held about 2.1 million jobs in 2008. They work in nearly all industries and at all levels of government. State and local government, educational services, health care, and the accounting, tax preparation, bookkeeping, and payroll services industries are among the individual industries employing the largest numbers of these clerks.

Job Outlook

Job growth is projected to be about as fast as the average. The large size of this occupation ensures plentiful job opportunities, as many bookkeeping, accounting, and auditing clerks are expected to retire or transfer to other occupations.

Employment change. Employment of bookkeeping, accounting, and auditing clerks is projected to grow by 10 percent during the 2008–18 decade, which is about as fast as the average for all occupations. This occupation is one of the largest growth occupations in the economy, with about 212,400 new jobs expected over the projections decade.

A growing economy will result in more financial transactions and other activities that require recordkeeping by these workers. Additionally, an increased emphasis on accuracy, accountability, and transparency in the reporting of financial data for public companies will increase the demand for these workers. Also, new regulations and reporting methods, including the use of International Financial Reporting Standards, should result in additional demand for clerks involved in accounting and auditing. However, growth will be limited by improvements in accounting software and document-scanning technology that make it easier to record, track, audit, and file financial information, including transactions and reports. Moreover, companies will continue to outsource their bookkeeping, accounting, and, in some cases, auditing functions to third party contractors located both domestically and abroad.

Job prospects. While many job openings are expected to result from job growth, even more openings will stem from

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018		Change, 2008-2018	
			2018	Number	Percent	
Bookkeeping, accounting, and auditing clerks	43-3031	2,063,800	2,276,200	212,400	10	

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

the need to replace existing workers who leave. Each year, numerous jobs will become available, as clerks transfer to other occupations or leave the labor force. The large size of this occupation ensures plentiful job openings, including many opportunities for temporary and part-time work.

Clerks who can carry out a wider range of bookkeeping and accounting activities will be in greater demand than specialized clerks. For example, demand for full-charge bookkeepers is expected to increase, because they can perform a wider variety of financial transactions, including payroll and billing. Certified Bookkeepers (CBs) and those with several years of accounting or bookkeeping experience who have demonstrated that they can handle a range of tasks will have the best job prospects.

Earnings

In May 2008, the median annual wages of bookkeeping, accounting, and auditing clerks were \$32,510. The middle half of the occupation earned between \$26,350 and \$40,130. The top 10 percent of bookkeeping, accounting, and auditing clerks earned more than \$49,260, and the bottom 10 percent earned less than \$20,950.

Gaming Cage Workers

Significant Points

- Most employers prefer applicants who have at least a high school diploma and experience in handling money or previous casino employment.
- Workers need a license, which requires a background investigation.
- Employment is projected to decline rapidly.
- Jobseekers are expected to face competition.

Nature of the Work

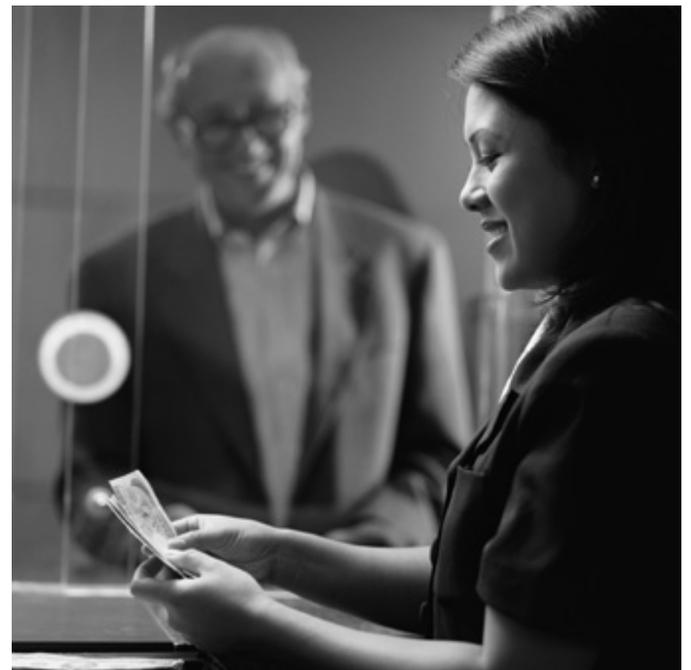

Gaming cage workers and *gaming change persons* and *booth cashiers* work in casinos and other gaming establishments. The

“cage” where these workers can be found is the central depository for money, gaming chips, and paperwork necessary to support casino play.

Gaming cage workers and gaming change persons and booth cashiers carry out a wide range of financial transactions and handle any paperwork that may be required. Gaming cage workers, known as *cage cashiers*, exchange patrons’ chips, tickets, and tokens for cash. Gaming change persons and booth cashiers work in booths and process credit card cash advances and wire transfers and cash checks for patrons. Both cage workers and booth cashiers may sell gambling chips, tokens, or tickets to patrons or to other workers for resale to patrons. Additionally, some cage workers may perform credit checks and verify credit references for people who want to open a house credit account. They may use cash registers, adding machines, or computers to calculate and record transactions. At the end of their shift, cage workers and booth cashiers must balance the books.

Because gaming establishments are closely scrutinized, cage workers and booth cashiers must follow a number of rules and regulations related to their handling of money. For example, they monitor large cash transactions and report these transactions to the Internal Revenue Service to help enforce tax regulations and prevent money laundering. Also, in determining when to extend credit or cash a check, cage workers must follow detailed procedures.

Work environment. The atmosphere in casinos is often considered glamorous. However, casino work also can be physically demanding. The occupation requires workers to stand for long periods, with constant reaching and grabbing for money, chips, and tickets. Sometimes cage workers and booth cashiers may be expected to lift and carry relatively heavy items. The casino atmosphere exposes workers to certain hazards, such as cigarette, cigar, and pipe smoke. Noise from slot machines, gaming tables, and talking workers and patrons may be distracting to some, although workers wear protective headgear in areas where loud machinery is used to count money.

Gaming cage workers exchange tickets and chips for money.

Most casinos are open 24 hours a day, 7 days a week, and offer three staggered shifts. Casinos typically require cage workers to work nights, weekends, and holidays.

Training, Other Qualifications, and Advancement

Although there are no mandatory education requirements, gaming cage workers and gaming change persons and booth cashiers typically receive on-the-job training and are licensed by a regulatory agency, such as a State casino control board or commission.

Education and training. There usually are no minimum educational requirements, although most employers prefer at least a high school diploma or the equivalent.

Once hired gaming cage workers and gaming change persons and booth cashiers usually receive on-the-job training. Under the guidance of a supervisor or other senior worker, new employees learn company procedures. Some formal classroom training also may be necessary, such as training in specific gaming regulations and procedures.

Licensure. All gaming workers are required to have a license issued by a regulatory agency, such as a State casino control board or commission. Applicants for a license must provide photo identification and pay a fee. Some States may require gaming cage workers to be residents of that State. Age requirements vary by State. The licensing application process also includes a background investigation and drug test.

Other qualifications. Experience in handling money or previous casino employment is preferred. Prospective workers are sometimes required to pass a basic math test, and they must be careful, orderly, and detail oriented in order to avoid making errors and to recognize errors made by others. These workers also should be discreet and trustworthy because they frequently come in contact with confidential material such as a patron's credit information. Good customer service skills and computer proficiency also are necessary for this occupation. Each casino establishes its own requirements for education, training, and experience.

Advancement. Advancement opportunities in casino gaming depend less on workers' previous casino duties and titles than on their ability and eagerness to learn new jobs. For example, in addition to advancement opportunities available in the cage, such as promotion to head cage cashier or supervisor, cage workers and booth cashiers may advance onto the floor and become dealers or supervisors.

Employment

Gaming cage workers held about 16,900 jobs, and gaming change persons and booth cashiers held about 22,300 jobs, in 2008. All of these individuals work in establishments that offer gaming; employment is concentrated in Nevada, California, Washington, and Mississippi. However, numerous States have

legalized gambling, and gaming establishments can now be found in many parts of the country.

Job Outlook

Employment of gaming cage workers and gaming change persons and booth cashiers is projected to decline rapidly through 2018. Jobseekers are expected to face competition because the number of applicants is likely to exceed the number of openings.

Employment change. Employment of gaming cage workers and gaming change persons and booth cashiers is expected to decrease rapidly by about 10 percent between 2008 and 2018. Gaming cage workers and gaming change persons and booth cashiers will experience employment declines as casinos increasingly automate transactions, reducing the amount of cash handled by employees. For example, self-serve cash-out and change machines are common, along with automated teller machines. In addition, most slot machines are now able to make payouts in tickets instead of coins. Tickets can be read by other slot machines and the amount on the ticket transferred to the new machine, or tickets can be read by self-serve machines that allow players to cash out without ever going to the cage. Known as ticket-in, ticket-out game play, these technologies reduce the number of cash transactions needed to play and speed up the exchange process, which means that fewer workers are needed to handle the cage than in the past. In addition, such machines have eliminated the need to have booths and change persons on the slots floor at many casinos. However, many gaming cage workers and gaming change persons and booth cashiers likely will be given opportunities by their employers to transfer to other occupations related to customer service.

Job prospects. Some openings will result from high turnover in these occupations caused by the high level of scrutiny workers receive and the need to be accurate. However, jobseekers are expected to face competition because the number of applicants is likely to exceed the number of openings. People with good mathematics abilities, previous casino experience, some background in accounting or bookkeeping, and good customer service skills should have the best opportunities.

Earnings

Wages for gaming cage workers and gaming change persons and booth cashiers vary according to level of experience, training, location, and size of the gaming establishment. Median hourly wages of gaming cage workers were \$11.97 in May 2008. The middle 50 percent earned between \$10.09 and \$14.66 an hour. The lowest 10 percent earned less than \$8.66, and the highest 10 percent earned more than \$17.35 an hour.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Gaming cage workers.....	—	39,200	35,100	-4,100	-10
Gaming change persons and booth cashiers	41-2012	22,300	20,000	-2,300	-10
Gaming cage workers.....	43-3041	16,900	15,100	-1,800	-10

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Median hourly wages of gaming change persons and booth cashiers were \$10.57 in May 2008. The middle 50 percent earned between \$8.60 and \$13.11 an hour. The lowest 10 percent earned less than \$7.48, and the highest 10 percent earned more than \$15.41 an hour.

Information and Record Clerks

Customer Service Representatives

Significant Points

- Customer service representatives held about 2.3 million jobs in 2008, ranking among the largest occupations.
- Most companies require a high school diploma and will provide job training.
- Employment is projected to grow faster than average, and job prospects should be good.

Nature of the Work

Customer service representatives provide a valuable link between customers and the companies who produce the products they buy and the services they use. They are responsible for responding to customer inquiries and making sure that any problems they are experiencing are resolved. Although most customer service representatives do their work by telephone in call centers, some interact with customers by e-mail, fax, post, or face-to-face.

Many customer service inquiries involve simple questions or requests. For instance, a customer may want to know the status of an order or wish to change his or her address in the company's file. However, some questions may be somewhat more difficult, and may require additional research or help from an expert. In some cases, a representative's main function may be to determine who in the organization is best suited to answer a customer's questions.

Some customer inquiries are complaints, which generally must be handled in accordance with strict company policies. In some cases, representatives may try to fix problems or suggest solutions. They may have the authority to reverse erroneous fees or send replacement products. Other representatives act as gatekeepers who make sure that complaints are valid before accepting customer returns.

Although selling products and services is not the primary function of a customer service representative, some customer services representatives may provide information that helps customers to make purchasing decisions. For instance, a representative may

point out a product or service that would fulfill a customer's needs. (For information on workers whose primary function is sales, see the statement on retail salespersons elsewhere in the *Handbook*.)

Customer service representatives use computers, telephones, and other technology extensively in their work. When the customer has an account with the company, a representative will usually open his or her file in the company's computer system. Representatives use this information to solve problems and may be able to make specific changes as necessary. They also have access to responses for the most commonly asked questions and specific guidelines for dealing with requests or complaints. In the event that the representative does not know the answer or is unable to solve a specific problem, a supervisor or other experienced worker may provide assistance.

Many customer service workers are located in call centers, where they spend the entire day speaking on the telephone. Companies usually keep statistics on their workers to make sure they are working efficiently. This helps them to keep up with their call volume and ensures that customers do not have to wait on hold for extended periods of time. Supervisors may listen in on or tape calls to ensure customers are getting quality service.

Almost every industry employs customer service representatives, and their duties may vary greatly depending on the nature of the organization. For instance, representatives who work in banks may have similar duties to tellers, whereas those in insurance companies may be required to handle paperwork, such as changes to policies or renewals. Those who work for utility and communication companies may assist customers with service problems, such as outages. Representatives who work in retail stores often handle returns and help customers to find items in their stores.

Work environment. Although customer service representatives work in a variety of settings, most work in areas that are clean and well lit. Those who work in call centers generally have their own workstations or cubicle spaces equipped with telephones, headsets, and computers. Because many call centers are open extended hours or are staffed around the clock, these positions may require workers to take on early morning, evening, or late night

shifts. Weekend or holiday work is also common. Because peak times may not last for a full shift, many workers are part-time or work a split shift. As a result, the occupation is well suited to flexible work schedules. Many companies hire additional employees at certain times of year when higher call volumes are expected.

Call centers may be crowded and noisy, and work may be repetitious and stressful, with little time between calls. Also, long periods spent sitting, typing, or looking at a computer screen may cause eye and muscle strain, backaches, headaches, and repetitive motion injuries. A growing number of employers are hiring telecommuters, who provide customer service from their own homes. Although this remains somewhat rare, it can be a major advantage for workers who need to remain in their homes during the day.

Customer service representatives working in retail stores may have customers approach them in person or contact them by telephone. They may be required to work later in the evenings or on weekends, as stores are generally open during those times. Evenings and weekends tend to be peak hours for customer traffic.

Customer service representatives may have to deal with difficult or irate customers, which can be challenging. However, the ability to resolve customers' problems has the potential to be very rewarding.

Training, Other Qualifications, and Advancement

Most jobs require at least a high school diploma. Employers provide training to workers before they begin serving customers.

Education and training. Most customer service representative jobs require a high school diploma. However, because employers are demanding a more skilled workforce, some customer service jobs now require associate or bachelor's degrees. High school and college level courses in computers, English, or business are helpful in preparing for a job in customer service.

Training requirements vary by industry. Almost all customer service representatives are provided with some training prior to beginning work. This training generally focuses on the company and its products, the most commonly asked questions, the computer and telephone systems they will be using, and basic people skills. Length of training varies, but often lasts several weeks. Some customer service representatives are expected to update their training regularly. This is particularly true of workers in industries such as banking, in which regulations and products are continually changing.

Other qualifications. Because customer service representatives constantly interact with the public, good communication and problem-solving skills are essential. Verbal communication and listening skills are especially important. Companies prefer to hire individuals who have a pleasant speaking voice and are easy to understand. For workers who communicate through e-mail, good typing, spelling, and grammar skills are necessary. Basic to intermediate computer knowledge and good interpersonal skills are also important.

Customer service representatives play a critical role in providing an interface between customers and companies. As a result, employers seek out people who are friendly and possess a professional manner. The ability to deal patiently with problems and complaints and to remain courteous when faced with difficult or angry people is critical. Also, a customer service representative often must be able to work independently within specified time constraints.

Good communication and problem-solving skills are essential for customer service representatives.

Advancement. Customer service jobs are often good introductory positions into a company or an industry. In some cases, experienced workers can move into supervisory or managerial positions or they may move into areas such as product development, in which they can use their knowledge to improve products and services. Some people work in call centers with the hope of transferring to a position in another department.

Employment

Customer service representatives held about 2.3 million jobs in 2008, ranking among the largest occupations. They can be found in almost every industry, although about 23 percent worked in the finance and insurance industry. Another 15 percent worked in the administrative and support services industry, which includes third party telephone call centers.

Job Outlook

Customer service representatives are expected to experience faster than average growth. Furthermore, job prospects should be good as many workers who leave this very large occupation will need to be replaced.

Employment change. Employment of customer service representatives is expected to grow by about 18 percent over the 2008-18 period, faster than the average for all occupations.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Customer service representatives.....	43-4051	2,252,400	2,651,900	399,500	18

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Providing quality customer service is important to nearly every company in the economy; in addition, companies are expected to place increasing emphasis on customer relationships, resulting in increased demand for customer service representatives. This very large occupation is projected to provide about 400,000 new jobs over the next decade.

Customer service representatives are especially prevalent in the finance and insurance industry, as many customer interactions do not require physical contact. Employment of customer service representatives in this industry is expected to increase 9 percent over the 2008-18 period.

Although technology has tempered growth of this occupation to some degree, it has also created many opportunities for growth. For instance, online banking has reduced the need for telephone banking services. At the same time, however, it has increased the need for customer service representatives who assist users with banking Web sites. Additionally, online services create many new opportunities for customer support representatives as companies that operate on the Internet provide customer service by telephone.

In the past, many companies chose to relocate their customer service call centers in foreign countries, which led to layoffs in some industries. Although many companies continue to offshore some of their customer service jobs, this is becoming less prevalent than in the past. While it continues to be less expensive to hire workers overseas, many companies have found that foreign workers do not have the same cultural sensitivity as those located within the United States.

Job prospects. Prospects for obtaining a job in this field are expected to be good, with more job openings than jobseekers. In particular, bilingual jobseekers should enjoy excellent opportunities. Rapid job growth, coupled with a large number of workers who leave the occupation each year, should make finding a job as a customer service representative relatively easy.

While jobs in some industries may be affected by economic downturns, customer service representatives are not as vulnerable to layoffs as some other workers. This is, in part, because many customer service representatives work in industries where customers have accounts. While customers may have less money to spend, and as a result may choose to purchase fewer goods or services, they continue to have customer service needs. For instance, during an economic downturn, individuals may have less money in their bank accounts, but they continue to need banking services and customer service from their banks. Nevertheless, companies do attempt to cut costs during such times, so downsizing is still a possibility.

Earnings

In May 2008, median hourly wages of customer service representatives were \$14.36. The middle 50 percent earned between

\$11.34 and \$18.27. The lowest 10 percent earned less than \$9.15, and the highest 10 percent earned more than \$23.24.

Earnings for customer service representatives vary according to level of skill required, experience, training, location, and size of firm. Median hourly wages in the industries employing the largest numbers of these workers in May 2008 were:

Insurance carriers	\$15.74
Agencies, brokerages, and other insurance related activities.....	15.28
Depository credit intermediation.....	14.56
Employment services	12.73
Business support services.....	11.56

In addition to receiving an hourly wage, full-time customer service representatives who work evenings, nights, weekends, or holidays may receive shift differential pay. Also, because call centers are often open during extended hours, or even 24 hours a day, some customer service representatives have the benefit of being able to work a schedule that does not conform to the traditional workweek. Other benefits can include life and health insurance, pensions, bonuses, employer-provided training, and discounts on the products and services the company offers.

Related Occupations

Customer service representatives interact with customers to provide information in response to inquiries about products and services and to handle and resolve complaints. Other occupations in which workers have similar dealings with customers and the public include:

	Page
Bill and account collectors.....	561
Computer support specialists	138
Insurance sales agents	534
Retail salespersons	543
Securities, commodities, and financial services sales agents.....	553
Tellers.....	599

Receptionists and Information Clerks

Significant Points

- Good interpersonal skills are critical.
- A high school diploma or its equivalent is the most common educational requirement.
- A large number of job openings are expected.
- Opportunities should be best for persons with a wide range of clerical and technical skills, particularly those with related work experience.

Nature of the Work

Receptionists and information clerks are charged with a responsibility that may affect the success of an organization: making a good first impression. Receptionists and information clerks answer telephones, route and screen calls, greet visitors, respond to inquiries from the public, and provide information about the organization. Some are responsible for the coordination of all mail into and out of the office. In addition, they contribute to the security of an organization by helping to monitor the access of visitors—a function that has become increasingly important.

Whereas some tasks are common to most receptionists and information clerks, their specific responsibilities vary with the type of establishment in which they work. For example, receptionists and information clerks in hospitals and in doctors' offices may gather patients' personal and insurance information and direct them to the proper waiting rooms. In corporate headquarters, they may greet visitors and manage the scheduling of the board room or common conference area. In beauty or hair salons, they arrange appointments, direct customers to the hairstylist, and may serve as cashiers. In factories, large corporations, and government offices, receptionists and information clerks may provide identification cards and arrange for escorts to take visitors to the proper office. Those working for bus and train companies respond to inquiries about departures, arrivals, stops, and other related matters.

Receptionists and information clerks use the telephone, personal computers, and other electronic devices to send e-mail and fax documents, for example. Despite the widespread use of automated answering systems or voice mail, many receptionists and clerks still take messages and inform other employees of visitors' arrivals or cancellation of an appointment. When they are not busy with callers, most workers are expected to assist other administrative employees by performing a variety of office duties, including opening and sorting mail, collecting and distributing parcels, transmitting and delivering facsimiles, and performing Internet search tasks. Other duties include updating appointment calendars, preparing travel vouchers, and performing basic bookkeeping, word processing, and filing.

Companies sometimes hire off-site receptionists and information clerks called, virtual receptionists, to perform, or supplement, many of the duties done by the traditional receptionist. Virtual receptionists use software integrated into their phone system to instantly track their employer's location, in-

form them of every call, and relay vital information to their callers. Using fax mailbox services, employers can retrieve faxes from any location at any time. The service receives them for the employer in special mailboxes and then transfers them when the line is free.

Work environment. Receptionists and information clerks who greet customers and visitors usually work in areas that are highly visible and designed and furnished to make a good impression. Most work stations are clean, well lighted, and relatively quiet. Virtual receptionists work from home or at an off-site office building. The work performed by some receptionists and information clerks may be tiring, repetitious, and stressful as they may spend all day answering continuously ringing telephones and sometimes encounter difficult or irate callers. The work environment, however, may be very friendly and motivating for individuals who enjoy greeting customers face to face and making them feel comfortable. About 30 percent of receptionists and information clerks worked part time.

Training, Other Qualifications, and Advancement

A high school diploma or its equivalent is the most common educational requirement, although hiring requirements for receptionists and information clerks vary by industry and employer. Good interpersonal skills and being technologically proficient also are important to employers.

Education and training. Receptionists and information clerks generally need a high school diploma or equivalent as most of their training is received on the job. However, employers often look for applicants who already possess certain skills, such as knowledge of spreadsheet and word processing software or answering telephones. Some employers also may prefer some formal office education or training. On the job, they learn how to operate the telephone system and computers. They also learn the proper procedures for greeting visitors and for distributing mail, fax messages, and parcels. While many of these skills can be learned quickly, those who are charged with relaying information to visitors or customers may need several months to learn details about the organization.

Receptionists and information clerks answer telephones, route and screen calls, greet visitors, respond to inquiries from the public, and provide information about the organization.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Receptionists and information clerks.....	43-4171	1,139,200	1,312,100	172,900	15

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Other qualifications. Good interpersonal and customer service skills—being courteous, professional, and helpful—are critical for this job. Being an active listener often is a key quality needed by receptionists and information clerks that requires the ability to listen patiently to the points being made, to wait to speak until others have finished, and to ask appropriate questions when necessary. In addition, the ability to relay information accurately to others is important.

The ability to operate a wide range of office technology also is helpful, as receptionists and information clerks are often asked to work on other assignments during the day.

Advancement. Advancement for receptionists generally comes about either by transferring to an occupation with more responsibility or by being promoted to a supervisory position. Receptionists with especially strong computer skills, a bachelor's degree, and several years of experience may advance to a better paying job as a secretary or an administrative assistant.

Employment

Receptionists and information clerks held about 1.1 million jobs in 2008. The healthcare and social assistance industries—including offices of physicians, hospitals, nursing homes, and outpatient care facilities—employed about 36 percent of all receptionists and information clerks. Wholesale and retail trade, personal services, educational services, finance and insurance, employment services, religious organizations, and real estate industries also employed large numbers of receptionists and information clerks.

Job Outlook

Employment is projected to grow faster than the average for all occupations. Job growth, coupled with the need to replace workers who transfer to other occupations or leave the labor force, will generate a large number of job openings for receptionists and information clerks.

Employment change. Employment of receptionists and information clerks is expected to increase by 15 percent from 2008 to 2018, which is faster than the average for all occupations. Employment growth will result from growth in industries such as offices of physicians and in other health practitioners, legal services, personal care services, construction, and management and technical consulting.

Technology will have conflicting effects on employment growth for receptionists and information clerks. The increasing use of voice mail and other telephone automation reduces the need for receptionists by allowing one receptionist to perform work that formerly required several. At the same time, however, the increasing use of other technology has caused a consolidation of clerical responsibilities and growing demand for workers with diverse clerical and technical

skills, such as virtual receptionists. Because receptionists and information clerks may perform a wide variety of clerical tasks, they should continue to be in demand. Further, they perform many tasks that are interpersonal in nature and are not easily automated, ensuring continued demand for their services in a variety of establishments.

Job prospects. In addition to job growth, numerous job opportunities will be created as receptionists and information clerks transfer to other occupations or leave the labor force altogether. Opportunities should be best for persons with a wide range of clerical and technical skills, particularly those with related work experience.

Earnings

Median hourly wages of receptionists and information clerks in May 2008 were \$11.80. The middle 50 percent earned between \$9.69 and \$14.44. The lowest 10 percent earned less than \$8.09, and the highest 10 percent earned more than \$17.07. Median hourly wages in the industries employing the largest number of receptionists and information clerks in May 2008 were:

Offices of dentists.....	\$13.78
Offices of physicians	12.20
Employment services	11.63
Offices of other health practitioners.....	11.45
Personal care services	9.35

Related Occupations

Receptionists deal with the public and often direct people to others who can assist them. Other workers who perform similar duties include:

	Page
Customer service representatives.....	567
Dispatchers, except police, fire, and ambulance	590
Secretaries and administrative assistants	583

Material Recording, Scheduling, Dispatching, and Distributing Occupations

Cargo and Freight Agents

Significant Points

- Cargo and freight agents need no more than a high school diploma and learn their duties informally on the job.
- Much faster than average employment growth is expected.
- Job prospects are expected to be good.

Nature of the Work

Cargo and freight agents help transportation companies manage incoming and outgoing shipments in airline, train, or trucking terminals or on shipping docks. Agents expedite shipments by determining a route, preparing all necessary documents, and arranging for the pickup of freight or cargo and its delivery to loading platforms. They may also keep records of the cargo, including its amount, type, weight, dimensions, destination, and time of shipment. They also keep a tally of missing items and record the condition of damaged items.

Cargo and freight agents arrange cargo according to destination. They also determine any shipping rates and other applicable charges. For imported or exported freight, they verify that the proper customs paperwork is in order. Cargo and freight agents often track shipments electronically, using bar codes, and answer customers' questions about the status of their shipments.

Employment of cargo and freight agents is expected to grow much faster than average.

Work environment. Cargo and freight agents work in a wide variety of environments. Some work in warehouses, stockrooms, or shipping and receiving rooms that may not be temperature controlled. Others may spend time in cold storage rooms or outside on loading platforms, where they are exposed to the weather.

Most jobs for cargo and freight agents involve frequent standing, bending, walking, and stretching. Some lifting and carrying of small items may be involved. Although automated devices have lessened the physical demands of this occupation, not every employer has these devices. The work still can be strenuous, even though mechanical material-handling equipment is used to move heavy items.

The typical workweek is Monday through Friday. However, evening and weekend hours are common in jobs involving large shipments.

Training, Other Qualifications, and Advancement

Cargo and freight agents need no more than a high school diploma and learn their duties informally on the job.

Education and training. Many jobs are entry level and most require a high school diploma. Cargo and freight agents undergo informal on-the-job training. For example, they may start out by checking items to be shipped and making sure that addresses are correct.

Other qualifications. Employers prefer to hire people who are comfortable using computers. Typing, filing, recordkeeping, and other clerical skills also are important.

Advancement. Advancement opportunities for cargo and freight agents are usually limited, but some agents may become team leaders or use their experience to switch to other clerical occupations in the businesses where they work. Some may move to higher paying transportation industry jobs, such as freight brokering.

Employment

Cargo and freight agents held about 85,900 jobs in 2008. Most agents were employed in transportation. Approximately 52 percent worked for firms engaged in support activities for the transportation industry, 19 percent were in the air transportation industry, 8 percent worked for courier businesses, and 7 percent were in the truck transportation industry.

Job Outlook

Employment is expected to grow much faster than average; job prospects are expected to be good.

Employment change. Employment of cargo and freight agents is expected to increase by 24 percent during the 2008-18 decade, which is much faster than the average for all occupations. As the overall economy continues to grow, more agents will be needed to handle the growing number of shipments resulting from increases in cargo traffic. Additionally, as shipments require multiple modes of transportation to reach their final destinations, such as freight trucking and air, a greater number

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Cargo and freight agents	43-5011	85,900	106,500	20,600	24

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

of agents will be needed to manage the process. The growing popularity of online shopping and same day delivery may also spur employment growth.

Job prospects. A combination of job growth and turnover are expected to result in good job prospects for cargo and freight agents. However, employment of cargo and freight agents is sensitive to the fluctuations of the economy, and workers may experience high levels of unemployment when the overall level of economic activity falls.

Earnings

Median hourly wages of cargo and freight agents in May 2008 were \$17.92. The middle 50 percent earned between \$13.67 and \$22.92. The lowest 10 percent earned less than \$10.65, and the highest 10 percent earned more than \$27.70. Median hourly wages in the industries employing the largest numbers of cargo and freight agents in May 2008 were:

Scheduled air transportation.....	\$18.39
Freight transportation arrangement	18.34
Couriers and express delivery services	18.08
General freight trucking	17.99
Support activities for air transportation.....	11.48

These workers usually receive the same benefits as most other workers. If uniforms are required, employers generally provide them or offer an allowance to purchase them.

Related Occupations

Cargo and freight agents coordinate shipments of cargo by airlines, trains, and trucks. Others who do similar work are:

	Page
Postal Service clerks	596
Postal Service mail sorters, processors, and processing machine operators	596
Shipping, receiving, and traffic clerks.....	577
Weighers, measurers, checkers, and samplers, recordkeeping	599

Sources of Additional Information

Information about the freight and cargo industry, including training opportunities, is available from:

► Transportation Intermediaries Association (TIA). 1625 Prince Street, Suite 200, Alexandria, VA 22314. Internet: <http://www.tianet.org>

Couriers and Messengers

Significant Points

- A high school diploma is sufficient for most positions; those operating a vehicle require a valid State driver's license.
- Little or no change in employment is expected over the 2008-2018 period.

Nature of the Work

Couriers and *messengers* move and distribute documents and packages for individuals, businesses, institutions, and government agencies. They pick up documents and packages from customers and deliver them to their final destinations, usually within a local area. Because they only travel to nearby locations, couriers and messengers often specialize in same-day delivery. Some offer faster service, such as delivery within one hour. Couriers and messengers also deliver items that senders are unwilling to entrust to other means of delivery, such as important legal or financial documents, passports, airline tickets, medical specimens, and occasionally donated organs.

Couriers and messengers receive their instructions either in person or by mobile telephone, two-way radio, or wireless data service. They then use that information to pick up items and deliver them to their destinations. They may take payment upon pickup, and are often responsible for obtaining signatures upon delivery.

Some couriers and messengers carry items only for their employers, often law firms, banks, medical laboratories, or financial institutions. Others act as part of organizations' internal mail system and carry items mainly within an organization's buildings or entirely within one building. Many couriers and messengers work for messenger or courier services. Those with experience may open their own courier and messenger business and work as independent contractors.

Couriers and messengers reach their destination by several methods. Most drive vans or trucks, but some drive cars or ride motorcycles. In congested urban areas, messengers sometimes use bicycles to make deliveries. Some may travel by foot.

Work environment. Couriers and messengers spend most of their time making deliveries alone and are not closely supervised. Those who deliver by bicycle must be physically fit and be able to cope with all weather conditions and the hazards of heavy traffic. Car, van, and truck couriers must sometimes carry heavy loads, either manually or with the aid of a hand truck. They also have to deal with difficult parking situations, traffic jams, and road construction.

Couriers and messengers are responsible for the items they deliver until they are in the hands of the customer. Often, deliveries contain valuable or sensitive information and with it, expectations of safe and timely delivery making the job stressful at times. The pressure of making as many deliveries as possible to increase one’s earnings can also be stressful and may lead to unsafe driving or cycling practices.

The typical workweek is Monday through Friday; however, evening and weekend hours are common.

Training, Other Qualifications, and Advancement

Most couriers and messengers train on the job and are not required to hold more than a high school diploma. Communication skills, a good driving record, and good sense of direction are helpful.

Education and training. Most courier and messenger jobs do not have formal education requirements; however, a high school diploma may be helpful in getting a job. Couriers and messengers usually learn as they work, sometimes training with an experienced worker for a short time.

Those who deal with hazardous or sensitive packages such as medical samples or donated organs may need to take a course in safely and effectively handling these items.

Licensure. Almost all couriers and messengers are required to have valid State driver’s license. Having a clean driving record is usually helpful.

Other qualifications. Couriers and messengers need good knowledge of the area in which they travel and a good sense of direction. In addition, good oral and written communication skills are important because communicating with customers and dispatchers is an integral part of some courier and messenger jobs.

Many couriers and messengers are required to provide and maintain their own vehicles, especially those who work as independent contractors. Almost all two-wheeled couriers own their own bicycle, moped, or motorcycle.

Those who own their own courier and messenger business must be able to keep basic accounting records and pay their own taxes.

Advancement. Couriers and messengers have limited advancement opportunities. However, some companies may offer experienced workers preference when assigning jobs, which means they receive higher-paying contracts and more work when business is slow.

Some independent contractors become master contractors. Master contractors organize routes for multiple independent contractors for courier agencies.

Employment

Couriers and messengers held about 122,400 jobs in 2008. About 17 percent worked in healthcare; 12 percent worked in

A good sense of direction is essential for couriers and messengers, who often work under tight time constraints.

the local messengers and local delivery industry; 12 percent were employed by couriers and express delivery services; and 9 percent worked in legal services. About 19 percent were self-employed independent contractors; they provide their own vehicles and, to a certain extent, set their own schedules. However, they are like employees in some respects, because they often contract with one company.

Job Outlook

Little or no employment change is expected through 2018. The need to replace workers who leave the occupation will create the majority of job openings.

Employment change. Little or no change is expected over the 2008-18 decade. Although individuals and businesses continue to value package delivery services, the need for document delivery services has been greatly reduced due to the widespread use of computers and the Internet. Many documents, forms, and other materials that were once hand-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Couriers and messengers.....	43-5021	122,400	122,000	-400	0

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

delivered are now transferred in digital format. Wider acceptance of digital signatures has reduced the number of legal and financial documents that need to be moved from place to place.

Nonetheless, some demand for courier and messenger services will continue to arise, especially for items that cannot be sent electronically, such as blueprints and other oversized materials, securities, and passports. Couriers will also be required by medical and dental laboratories to pick up and deliver medical specimens and other materials.

Job prospects. Job opportunities will arise out of the need to replace couriers and messengers who leave the occupation. Additionally, a continued need for parcel delivery, both within urban areas and between cities, will result in some jobs for couriers and messengers. The vast majority of openings are expected to be in large urban areas.

Earnings

Median hourly wages of couriers and messengers in May 2008 were \$11.22 per hour. The middle 50 percent earned between \$9.08 and \$14.10. The lowest 10 percent earned less than \$7.88, and the highest 10 percent earned more than \$17.77. Median hourly wages in the industries employing the largest numbers of couriers and messengers in May 2008 were:

Medical and diagnostic laboratories.....	\$12.05
General medical and surgical hospitals.....	11.85
Legal services.....	10.83
Couriers and express delivery services	10.75
Local messengers and local delivery.....	10.00

Couriers and messengers who are full-time employees usually receive the same benefits as most other workers. About 21 percent are union members, which may lead to higher earnings, better benefits and more job stability. Most independent contractors do not receive benefits, but may have higher earnings. If uniforms are required, employers generally provide them or offer an allowance to purchase them.

Related Occupations

Messengers and couriers deliver letters, parcels, and other items. Others who do similar work include:

	Page
Cargo and freight agents	572
Postal Service mail carriers.....	575
Shipping, receiving, and traffic clerks.....	577
Truck drivers and driver/sales workers	797

Sources of Additional Information

Local employers and local offices of the State employment service can provide additional information about job opportunities. People interested in courier and messenger jobs also may contact local courier and messenger services.

Information on careers as couriers and messengers is available from:

► Messenger Courier Association of the Americas, 750 National Press Building, 529 14th St., NW, Washington, DC 20045. Internet: <http://www.mcaa.com/>

The Occupational Information Network (O*NET) provides information on a wide range of occupational characteristics. Links to O*NET appear at the end of the Internet version of this occupational statement, accessible at <http://www.bls.gov/ooh/ocos136.htm>

Postal Service Mail Carriers

Significant Points

- Little or no change in employment is projected over the 2008-18 period.
- Keen competition for jobs is expected.
- Qualification is based on an examination.
- Applicants customarily wait 1 to 2 years or more after passing the examination before being hired.

Nature of the Work

Postal Service mail carriers deliver mail to residences and businesses in cities, towns, and rural areas. Although carriers are classified by their type of route—either city or rural—duties of *city and rural carriers* are similar. Most travel established routes, delivering and collecting mail. Mail carriers start work at the post office early in the morning, when they arrange the mail in delivery sequence. Automated equipment has reduced the time that carriers need to sort the mail, allowing them to spend more of their time delivering it.

Mail carriers cover their routes on foot, by vehicle, or by a combination of both. On foot, they carry a heavy load of mail in a satchel or push it on a cart. In most urban and rural areas, they use a car or small truck. The Postal Service provides vehicles to city carriers; most rural carriers use their own vehicles and are reimbursed for that use. Deliveries are made to houses, to roadside mailboxes, and to large buildings such as offices or apartments, which generally have all of their tenants' mailboxes in one location.

Besides delivering and collecting mail, carriers collect money for postage-due and COD (cash-on-delivery) fees and obtain signed receipts for registered, certified, and insured mail. If a customer is not home, the carrier leaves a notice that tells where special mail is being held. After completing their routes, carriers return to the post office with mail gathered from homes, businesses, and sometimes street collection boxes, and turn in the mail, receipts, and money collected during the day.

Some city carriers may have specialized duties such as delivering only parcels or picking up mail only from mail collection boxes. In comparison with city carriers, rural carriers perform a wider range of postal services, in addition to delivering and picking up mail. For example, rural carriers may sell stamps and money orders and register, certify, and insure parcels and letters. All carriers, however, must be able to answer customers' questions about postal regulations and services and provide change-of-address cards and other postal forms when requested.

Work environment. Most carriers begin work early in the morning—those with routes in a business district can start as

early as 4 a.m. Overtime hours are frequently required for urban carriers. Carriers spend most of their time outdoors, delivering mail in all kinds of weather. Though carriers face many natural hazards, such as extreme temperatures and wet and icy roads and sidewalks, serious injuries are often due to the nature of the work, which requires repetitive arm and hand movements, as well as constant lifting and bending. These activities can lead to repetitive stress injuries in various joints and muscles.

Training, Other Qualifications, and Advancement

All applicants for Postal Service mail carrier jobs are required to take an examination. After passing the exam, it may take 1 to 2 years or longer before being hired because the number of applicants generally exceeds the number of job openings.

Education and training. There are no specific education requirements to become a Postal Service mail carrier; however, all applicants must have a good command of the English language. Upon being hired, new carriers are trained on the job by experienced workers. Many post offices offer classroom instruction on safety and defensive driving. Workers receive additional instruction when new equipment or procedures are introduced. In these cases, usually another postal employee or a training specialist trains the workers.

Other qualifications. Postal Service mail carriers must be at least 18 years old. They must be U.S. citizens or have been granted permanent resident-alien status in the United States, and males must have registered with the Selective Service upon reaching age 18.

All applicants must pass a written examination that measures speed and accuracy at checking names and numbers and the ability to memorize mail distribution procedures. Jobseekers should contact the post office or mail processing center where they wish to work to determine when an exam will be given. Applicants' names are listed in order of their examination scores. Five points are added to the score of an honorably discharged veteran and 10 points are added to the score of a veteran who was wounded in combat or is disabled. When a vacancy occurs, the appointing officer chooses one of the top three applicants; the rest of the names remain on the list to be considered for future openings until their eligibility expires—usually 2 years after the examination date.

When accepted, applicants must undergo a criminal-history check and pass a physical examination and a drug test. Applicants also may be asked to show that they can lift and handle mail sacks weighing 70 pounds. A safe driving record is required for mail carriers who drive at work, and applicants must receive a passing grade on a road test.

Good interpersonal skills are important because mail carriers must be courteous and tactful when dealing with the public, especially when answering questions or receiving complaints. A good memory and the ability to read rapidly and accurately are also important.

Advancement. Postal Service mail carriers may begin on a casual, transitional, part-time, or flexible basis and become regular or full-time employees in order of seniority, as vacancies occur. Carriers can look forward to obtaining preferred routes

Postal Service mail carriers receive good benefits.

as their seniority increases. Postal Service mail carriers can advance to supervisory positions on a competitive basis.

Employment

The U.S. Postal Service employed 343,300 mail carriers in 2008. The majority of mail carriers work in cities and suburbs, while the rest work in rural areas.

Postal Service mail carriers are classified as casual, transitional, part-time flexible, part-time regular, or full time. Casuals are hired for 90 days at a time to help process and deliver mail during peak mailing or vacation periods in rural areas. Transitional carriers are hired on a temporary basis in cities for a period of one year. Part-time, flexible workers do not have a regular work schedule or weekly guarantee of hours but are called as the need arises. Part-time regulars have a set work schedule of fewer than 40 hours per week, often replacing regular full-time workers on their scheduled day off. Few carriers are classified as part-time employees, especially among rural carriers. Full-time postal employees work a 40-hour week over a 5-day period and made up 85 percent of mail carriers in 2008.

Job Outlook

Employment of Postal Service mail carriers is expected to experience little or no change through 2018. Keen competition is

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Postal service mail carriers	43-5052	343,300	339,400	-3,900	-1

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

expected for mail carrier jobs because of the attractive wages and benefits and relatively low entry requirements.

Employment change. Employment of mail carriers is expected to decline by about 1 percent through 2018. Employment will be adversely affected by several factors. The use of automated “delivery point sequencing” systems to sort letter mail and flat mail directly, according to the order of delivery, reduces the amount of time that carriers spend sorting their mail, allowing them to spend more time on the streets delivering mail. The amount of time carriers save on sorting letter mail and flat mail will allow them to increase the size of their routes, which will reduce the need to hire more carriers. Additionally, the Postal Service is moving toward more centralized mail delivery, such as the use of cluster mailboxes, to cut down on the number of door-to-door deliveries. However, as the population continues to rise and the number of addresses to which mail must be delivered increases the demand for mail carriers in some areas of the country will grow.

Employment and schedules in the Postal Service fluctuate with the demand for its services. When mail volume is high, such as during holidays, full-time employees work overtime, part-time workers get additional hours, and casual workers may be hired.

Job prospects. Those seeking jobs as Postal Service mail carriers can expect to encounter keen competition. The number of applicants usually exceeds the number of job openings because of the occupation’s low entry requirements and attractive wages and benefits. The best employment opportunities for mail carriers are expected to be in areas of the country with significant population growth as the number of addresses to which mail must be delivered continues to grow.

Earnings

Median annual wages of Postal Service mail carriers were \$49,800 in May 2008. The middle 50 percent earned between \$41,270 and 51,250. The lowest 10 earned less than \$37,400, while the top 10 percent earned more than \$52,400. Rural mail carriers are reimbursed for mileage put on their own vehicles while delivering mail.

Postal Service mail carriers enjoy a variety of employer-provided benefits similar to those enjoyed by other Federal Government workers. The National Association of Letter Carriers and the National Rural Letter Carriers Association together represent most of these workers.

Related Occupations

Other occupations with duties similar to those of Postal Service mail carriers include:

	Page
Couriers and messengers.....	573
Truck drivers and driver/sales workers	797

Sources of Additional Information

Information on job requirements, entrance examinations, and specific employment opportunities for Postal Service mail carriers is available from local post offices and State employment service offices. This information also is available from the United States Post Office online at <http://www.usps.com>.

The Occupational Information Network (O*NET) provides information on a wide range of occupational characteristics. Links to O*NET appear at the end of the Internet version of this occupational statement, accessible at <http://www.bls.gov/ooh/ocos345.htm>

Shipping, Receiving, and Traffic Clerks**Significant Points**

- Shipping, receiving, and traffic clerks generally are entry-level workers who need no more than a high school diploma.
- Employers prefer to hire those familiar with computers and other electronic office and business equipment.
- Employment is expected to decline moderately as a result of increasing automation; however, job openings will result from the need to replace workers who leave the occupation.

Nature of the Work

Shipping, receiving, and traffic clerks keep records of all goods shipped and received. Their duties depend on the size of the establishment they work for and the level of automation used. Larger companies typically are more able to finance the purchase of computers, scanners, and other equipment to handle some or all of a clerk’s responsibilities. In smaller companies, a clerk maintains records, prepares shipments, sorts packages, and accepts deliveries.

Shipping clerks keep records of all outgoing shipments. They prepare shipping documents and mailing labels and make sure that orders have been filled correctly. Also, they record items taken from inventory and note when orders were filled. Sometimes they fill the order themselves, taking merchandise from the stockroom, noting when inventories run low, and wrapping or packing the goods in shipping containers. They also address and label packages, look up and compute freight or postal rates, and record the weight and cost of each shipment. In addition, shipping clerks may prepare invoices and furnish information about shipments to other parts of the company, such as the accounting department. In modern warehouses, the recording of

Shipping clerks weigh orders for shipment.

this shipping information and the printing of mailing labels can be automated with the use of a computer and barcode scanner. Once a shipment is checked and ready to go, shipping clerks may sort and move the goods from the warehouse to the shipping dock or truck terminal and direct their loading.

Receiving clerks perform tasks similar to those of shipping clerks. They determine whether orders have been filled correctly by verifying incoming shipments against the original order and the accompanying bill of lading or invoice. They make a record of the shipment and the condition of its contents. In many firms, receiving clerks either use hand-held scanners to record barcodes on incoming products or manually enter the information into a computer. These data then can be transferred to the appropriate departments. An increasing number of clerks at larger, more modern companies are using radio-frequency identification (RFID) scanners, which store and remotely retrieve data by using tags or transponders. Clerks then check the shipment for any discrepancies in quantity, price, and discounts. Receiving clerks may route or move shipments to the proper department, warehouse section, or stockroom. They also may arrange for adjustments with shippers if merchandise is lost or damaged. Receiving clerks in small businesses may perform some duties similar to those of stock clerks. In larger establishments, receiving clerks may control all receiving platform operations, such as the scheduling of trucks, recording of shipments, and handling of damaged goods.

Traffic clerks maintain records on the destination, weight, and charges for all incoming and outgoing freight. They verify rate charges by comparing the classification of materials with rate charts. In many companies, this work may be automated. Information either is scanned or is entered by hand into a computer for use by the accounting department or other departments within the company. Traffic clerks also keep a file of claims for overcharges and for damage to goods in transit.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected	Change, 2008-2018	
			Employment, 2018	Number	Percent
Shipping, receiving, and traffic clerks	43-5071	750,500	701,200	-49,300	-7

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

It is common, especially in smaller companies, for workers to perform the functions of all three positions. These workers are responsible for incoming and outgoing packages, as well as the logistical details of shipping them. Some shipping, receiving, and traffic clerks share responsibilities with material moving workers (see statement found elsewhere in the *Handbook*) and must sort, load, unload or store items. Clerks with these additional responsibilities may use machinery, such as forklifts, to transport items in a warehouse.

Work environment. Shipping, receiving, and traffic clerks often work in offices inside manufacturing plants or warehouses. Most jobs involve frequent standing, bending, walking, and stretching. Lifting and carrying smaller items also may be involved, especially at small companies with less automation. Although automated devices have lessened the physical demands of this occupation, their use remains somewhat limited. The work still can be strenuous, even though mechanical material handling equipment, such as computerized conveyor systems, may be used to move heavy items.

The typical workweek is Monday through Friday; however, evening and weekend hours are common in some jobs and may be required when large shipments are involved or during major holiday periods.

Training, Other Qualifications, and Advancement

Shipping, receiving, and traffic clerks generally are entry-level workers who need no more than a high school diploma. Because of increasing automation, however, employers prefer to hire those familiar with computers and other electronic office and business equipment.

Education and training. Shipping, receiving, and traffic clerks typically learn the job by doing routine tasks under close supervision. They first learn how to count and mark stock, and then start keeping records and taking inventory.

Training in the use of automated equipment usually is done informally on the job. As these occupations become more automated, however, workers may need longer periods of training to master the use of the equipment and technology. Many employers prefer to hire workers experienced with computers and other electronic equipment.

Other qualifications. Strength, stamina, communication skills, attention to detail, and an ability to work at repetitive tasks, sometimes under pressure, are important characteristics.

Advancement. Shipping, receiving, and traffic clerks may be promoted to supervisory roles, and those with an understanding of other tasks in their firm can move into other positions, such as purchasing managers or logisticians.

Employment

Shipping, receiving, and traffic clerks held about 750,500 jobs in 2008. About 71 percent were employed in manufacturing or by wholesale and retail establishments. Although jobs for shipping,

receiving, and traffic clerks are found throughout the country, many clerks work in urban areas, where shipping depots in factories and wholesale establishments usually are located.

Job Outlook

Employment is expected to decline moderately as a result of increasing automation. However, job openings will result from the need to replace shipping, receiving, and traffic clerks who leave the occupation.

Employment change. Employment of shipping, receiving, and traffic clerks is expected to decline moderately by 7 percent between 2008 and 2018. As companies increasingly use computers and high-technology scanners to store and retrieve shipping and receiving records, fewer clerks will be needed to oversee these activities.

Methods of handling materials have changed significantly in recent years. Large warehouses increasingly are becoming automated, with equipment such as automatic sorting systems, robots, computer-directed trucks, and automated identification and data collection (AIDC) systems. This automation, coupled with the growing use of hand-held barcode and RFID scanners in shipping and receiving departments, should increase the productivity of shipping, receiving, and traffic clerks.

Job prospects. Despite the projected employment decline, many job openings will occur because of the need to replace shipping, receiving, and traffic clerks who leave the occupation. This is a large entry-level occupation, and many vacancies are created as workers leave as part of their normal career progression. Because smaller warehouses, distribution centers, and trucking terminals will continue to rely on sorting and moving goods by hand, job opportunities at those facilities may be better than at larger, more automated centers.

Earnings

Median annual wages of shipping, receiving, and traffic clerks in May 2008 were \$27,660. The middle 50 percent earned between \$21,900 and \$34,640. The lowest 10 percent earned less than \$18,000, and the highest 10 percent earned more than \$42,990.

These workers usually receive the same benefits as most other workers. If uniforms are required, employers generally provide them or offer an allowance to purchase them.

Related Occupations

Shipping, receiving, and traffic clerks record, check, and often store materials that a company receives. They also process and pack goods for shipment. Other workers who perform similar duties are:

	Page
Cargo and freight agents	572

Miscellaneous Office and Administrative Support Occupations

Desktop Publishers

Significant Points

- About 38 percent work for newspaper, periodical, book, and directory publishers; another 21 percent work in the printing industry.
- Employment is expected to decline rapidly.
- Most employers prefer to hire experienced desktop publishers; among persons without experience, opportunities should be best for those with certificates or degrees in desktop publishing or graphic design.

Nature of the Work

Desktop publishers use computer software to format and combine text, data, photographs, charts, and other graphic art or illustrations into prototypes of pages and other documents that are to be printed. They then may print the document on a

high-resolution printer or send the materials to a commercial printer. Examples of materials produced by desktop publishers include books, brochures, calendars, magazines, newsletters, newspapers, and forms.

Desktop publishers typically design and create the graphics that accompany text, find and edit photographs and other digital images, and manipulate the text and images to display information in an attractive and readable format. They design page layouts, develop presentations and advertising campaigns, and do color separation of pictures and graphics material. Some desktop publishers may write some of the text or headlines used in newsletters or brochures.

Desktop publishers use the appropriate software to enter and select formatting properties, such as the size and style of type, column width, and spacing. Print formats are stored in the computer and displayed on its monitor. New information, such as charts, pictures, or more text, can be added. An entire newspaper, catalog, or book page, complete with artwork and graphics, can be created on the screen exactly as it will appear in print. Then, digital files are used to produce printing plates.

Desktop publishers format text, data, photographs, and other graphics into documents that are to be printed.

Like photographers and multimedia artists and animators, desktop publishers can create special effects or other visual images with the use of film, video, computers, or other electronic media. (Separate statements on photographers and on artists and related workers appear elsewhere in the *Handbook*.)

Computer software and printing technology continue to advance, making desktop publishing more economical and efficient than before. Other innovations in the occupation include digital color page-makeup systems, electronic page-layout systems, and off-press color proofing systems. In addition, most materials are reproduced on the Internet as well as printed; therefore, desktop publishers may need to know electronic publishing software, such as Hypertext Markup Language (HTML), and may be responsible for converting text and graphics to an Internet-ready format.

Some desktop publishers may write and edit, as well as layout and design pages. For example, in addition to laying out articles for a newsletter, desktop publishers may be responsible for copyediting content or for writing original content themselves. Desktop publisher's writing and editing responsibilities may vary widely from project to project and employer to employer. Smaller firms typically use desktop publishers to perform a wide range of tasks, while desktop publishers at larger firms may specialize in a certain part of the publishing process. (Writers and editors are discussed elsewhere in the *Handbook*.)

Desktop publishers also may be called publications specialists, electronic publishers, DTP operators, desktop publishing editors, electronic prepress technicians, electronic publishing specialists, image designers, typographers, compositors, layout artists, and Web publications designers. The exact name may vary with the specific tasks performed or simply by personal preference.

Work environment. Desktop publishers usually work in clean, air-conditioned office areas with little noise. They generally work a standard workweek; however, some may work night shifts, weekends, or holidays, depending upon the production schedule for the project or to meet deadlines.

These workers often are subject to stress and the pressures of short deadlines and tight work schedules. Like other workers who spend long hours working in front of a computer monitor,

desktop publishers may be susceptible to eyestrain, back discomfort, and hand and wrist problems.

Training, Other Qualifications, and Advancement

Most desktop publishers learn their skills on the job. Experience is the best training, and many desktop publishers get started just by experimenting with the software and developing a knack for designing and laying out material for publication.

Education and training. There is generally no educational requirement for the job of desktop publisher. Most people learn on the job or by taking classes online or through local learning centers that teach the latest software. For those who are interested in pursuing a career in desktop publishing, an associate's degree or a bachelor's degree in graphic arts, graphic communications, or graphic design is preferred. Graphic arts programs are a good way to learn about the desktop publishing software used to format pages, assign type characteristics, and import text and graphics into electronic page layouts. Courses in other aspects of printing also are available at vocational institutes and private trade and technical schools.

Other qualifications. Although formal training is not always required, those with certificates or degrees will have the best job opportunities. Most employers prefer to hire people who have at least a high school diploma and who possess good communication abilities, basic computer skills, and a strong work ethic. Desktop publishers should be able to deal courteously with people, because they have to interact with customers and clients and be able to express design concepts and layout options with them. In addition, they may have to do simple math calculations and compute ratios to scale graphics and artwork and estimate job costs. A basic understanding of, and facility with, computers, printers, scanners, and other office equipment and technologies also is needed to work as a desktop publisher.

Desktop publishers need good manual dexterity, and they must be able to pay attention to detail and work independently. In addition, good eyesight, including visual acuity, depth perception, a wide field of view, color vision, and the ability to focus quickly, are assets. Artistic ability often is a plus. Employers also seek persons who are even tempered and adaptable—important qualities for workers who frequently must meet deadlines and learn how to operate new equipment.

Advancement. Workers with limited training and experience assist more experienced staff on projects while they learn the software and gain practical experience. They advance on the basis of their demonstrated mastery of skills. Some may move into supervisory or management positions. Other desktop publishers may start their own companies or work as independent consultants, while those with more artistic talent and further education may find job opportunities in graphic design or commercial art.

Employment

Desktop publishers held about 26,400 jobs in 2008. Approximately 38 percent worked for newspaper, periodical, book, and directory publishers, while 21 percent worked in the printing and related support activities industry. Other desktop publishers work for professional, scientific, and technical services firms and in many other industries that produce printed or published materials.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Desktop publishers.....	43-9031	26,400	20,400	-5,900	-23

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

The printing and publishing industries are two of the most geographically dispersed industries in the United States, and desktop publishing jobs are found throughout the country. Although most jobs are in large metropolitan cities, electronic communication networks and the Internet allow some desktop publishers to work from other locations.

Job Outlook

Employment is expected to decline rapidly because more people are learning basic desktop publishing skills as a part of their regular job functions in other occupations and because more organizations are formatting materials for display on the Internet rather than designing pages for print publication.

Employment change. Employment of desktop publishers is expected to decline 23 percent between 2008 and 2018. Desktop publishing has become a frequently used and common tool for designing and laying out printed matter, such as advertisements, brochures, newsletters, and forms. However, increased computer-processing capacity and the widespread availability of more elaborate desktop publishing software will make it easier and more affordable for nonprinting professionals to use. As a result, there will be less need for people to specialize in desktop publishing.

In addition, organizations are increasingly moving their published material to the Internet to save the cost of printing and distributing materials. This change will slow the growth of desktop publishers, especially in smaller membership and trade organizations, which publish newsletters and brief reports. Companies that produce more extensive reports and rely on high-quality, high-resolution color and graphics within their publications, however, will continue to use desktop publishers to lay out publications for offset printing.

Job prospects. There will be some job opportunities for desktop publishers because of the need to replace workers who move into managerial positions, transfer to other occupations, or leave the labor force. However, job prospects will be better for those with experience; many employers prefer to hire experienced desktop publishers because of the long time it takes to become good at this type of work. Among individuals with little or no experience, opportunities should be best for those with computer backgrounds, those with certification in desktop publishing, or those who have completed a postsecondary program in desktop publishing, graphic design, or Web design.

Earnings

Wages for desktop publishers vary according to level of experience, training, geographic location, and company size. Median annual wages of desktop publishers were \$36,600 in May 2008. The middle 50 percent earned between \$28,140 and \$47,870. The lowest 10 percent earned less than \$21,860, and the highest 10 percent earned more than \$59,210 a year. Median annual

wages of desktop publishers in May 2008 were \$39,870 in printing and related support services and \$33,130 in newspaper, periodical, book, and directory publishers.

Related Occupations

Desktop publishers use artistic and editorial skills in their work. These skills also are essential for the following workers:

	Page
Artists and related workers.....	301
Commercial and industrial designers.....	304
Graphic designers.....	312
Prepress technicians and workers.....	748

Sources of Additional Information

Office Clerks, General

Significant Points

- Employment growth and high replacement needs in this large occupation will result in numerous job openings.
- Prospects should be best for those with knowledge of basic computer applications and office machinery.
- Part-time and temporary positions are common.

Nature of the Work

Rather than performing a single specialized task, *general office clerks* have responsibilities that often change daily with the needs of the specific job and the employer. Some clerks spend their days filing or keyboarding. Others enter data at a computer terminal. They also operate photocopiers, fax machines, and

General office clerks operate photocopiers, fax machines, and other office equipment.

other office equipment; prepare mailings; proofread documents; and answer telephones and deliver messages.

The specific duties assigned to clerks vary significantly, depending on the type of office in which they work. An office clerk in a doctor's office, for example, would not perform the same tasks that a clerk in a large financial institution or in the office of an auto parts wholesaler would. Although all clerks may sort checks, keep payroll records, take inventory, and access information, they also perform duties unique to their employer. For example, a clerk in a doctor's office may organize medications, a corporate office clerk may help prepare materials for presentations, and a clerk employed by a wholesaler may fill merchandise orders.

Clerks' duties also vary by level of experience. Inexperienced employees may make photocopies, stuff envelopes, or record inquiries. Experienced clerks are usually given additional responsibilities. For example, they may maintain financial or other records, set up spreadsheets, verify statistical reports for accuracy and completeness, handle and adjust customer complaints, work with vendors, make travel arrangements, take inventory of equipment and supplies, answer questions on departmental services and functions, or help prepare invoices or budgetary requests. Senior office clerks may also be expected to monitor and direct the work of lower-level clerks.

Work environment. For the most part, general office clerks work in comfortable office settings. Those on full-time sched-

ules usually work a standard 40-hour week; however, some work shifts or overtime during busy periods. About 24 percent of clerks worked part time in 2008. Many clerks also work in temporary positions.

Training, Other Qualifications, and Advancement

General office clerks often need to know how to use computers, word processing, and other business software and office equipment. Experience working in an office is helpful, but office clerks also learn skills on the job.

Education and training. Employers usually require a high school diploma or equivalent, and some require basic computer skills, including familiarity with word processing software, as well as other general office skills. Although most general office clerk jobs are entry-level positions, employers may prefer or require previous office or business experience.

Training for this occupation is available through business education programs offered in high schools, community and junior colleges, and postsecondary vocational schools. Courses in office practices, word processing, and other computer applications are particularly helpful.

Other qualifications. Because general office clerks usually work with other office staff, they should be cooperative and able to work as part of a team. Employers prefer individuals who can perform a variety of tasks and satisfy the needs of the many departments within a company. In addition, applicants should have good writing and other communication skills, be detail oriented, and be adaptable.

Advancement. General office clerks who exhibit strong communication, interpersonal, and analytical skills may be promoted to supervisory positions. Others may move into different, more senior administrative jobs, such as receptionist, secretary, or administrative assistant. After gaining some work experience or specialized skills, many workers transfer to jobs with higher pay or greater advancement potential. Advancement to professional occupations within an organization normally requires additional formal education, such as a college degree.

Employment

General office clerks held about 3.0 million jobs in 2008. Most are employed in relatively small businesses. Although they work in every sector of the economy, about one quarter worked in educational services and in health care and social assistance.

Job Outlook

Employment growth and high replacement needs in this large occupation are expected to result in numerous job openings for general office clerks. Prospects should be best for those with knowledge of basic computer applications and office machinery.

Employment change. Employment of general office clerks is expected to grow by 12 percent between 2008 and 2018, which is about as fast as the average for all occupations. The employment outlook for these workers will continue to be affected by the increasing use of technology, expanding office automation, and the consolidation of administrative support tasks. These factors will lead to a consolidation of administrative support staffs and a diversification of job responsibilities. However, this consolidation will increase the demand for general office clerks because they perform a variety of administrative support tasks,

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Office clerks, general	43-9061	3,024,400	3,383,100	358,700	12

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

as opposed to clerks with very specific functions. It will become increasingly common within businesses, especially those smaller in size, to find only general office clerks in charge of all administrative support work.

Job prospects. In addition to many full-time job openings for general office clerks, part-time and temporary positions are common. Prospects should be best for those who have knowledge of basic computer applications and office machinery—such as computers, fax machines, telephone systems, and scanners—and good writing and other communication skills. Office clerks with previous business or office experience should also have good job prospects. As general administrative support duties continue to be consolidated, employers will increasingly seek well-rounded individuals with highly developed communication skills and the ability to perform multiple tasks.

Job opportunities may vary from year to year because the strength of the economy affects demand for general office clerks. Companies tend to employ more workers when the economy is strong. Industries least likely to be affected by economic fluctuations tend to be the most stable places for employment.

Earnings

Median annual wages of general office clerks were \$25,320 in May 2008; the middle 50 percent earned between \$19,620 and \$31,980 annually. The lowest 10 percent earned less than \$16,030, and the highest 10 percent earned more than \$39,880. Median annual wages in the industries employing the largest numbers of general office clerks in May 2008 were:

Local government.....	\$28,750
General medical and surgical hospitals.....	27,700
Elementary and secondary schools	25,690
Colleges, universities, and professional schools	25,400
Employment services	23,840

Related Occupations

The duties of general office clerks can include a combination of bookkeeping, keyboarding, office machine operation, and filing. Other office and administrative support workers who perform similar duties include:

	Page
Bookkeeping, accounting, and auditing clerks	563
Communications equipment operators.....	588
Customer service representatives.....	567
Data entry and information processing workers	590
Order clerks.....	595
Receptionists and information clerks.....	570
Secretaries and administrative assistants	583
Stock clerks and order fillers.....	598
Tellers.....	599

Non-clerical entry-level workers who perform these duties include:

Cashiers.....	530
Counter and rental clerks	560
Food and beverage serving and related workers	491

Sources of Additional Information

State employment service offices and agencies can provide information about job openings for general office clerks.

Secretaries and Administrative Assistants

Significant Points

- This occupation ranks among those with the largest number of job openings.
- Opportunities should be best for applicants with extensive knowledge of computer software applications.
- Secretaries and administrative assistants are increasingly assuming responsibilities once reserved for managerial and professional staff.

Nature of the Work

As the reliance on technology continues to expand in offices, the role of the office professional has greatly evolved. Office automation and organizational restructuring have led *secretaries and administrative assistants* to increasingly assume responsibilities once reserved for managerial and professional staff. In spite of these changes, however, the core responsibilities for secretaries and administrative assistants have remained much the same: performing and coordinating an office's administrative

Secretaries and administrative assistants often use computers to create spreadsheets, compose correspondence, manage databases, and create presentations and reports.

activities and storing, retrieving, and integrating information for dissemination to staff and clients.

Secretaries and administrative assistants perform a variety of administrative and clerical duties necessary to run an organization efficiently. They serve as information and communication managers for an office; plan and schedule meetings and appointments; organize and maintain paper and electronic files; manage projects; conduct research; and disseminate information by using the telephone, mail services, Web sites, and e-mail. They may also handle travel and guest arrangements.

Secretaries and administrative assistants use a variety of office equipment, such as fax machines, photocopiers, scanners, and videoconferencing and telephone systems. In addition, secretaries and administrative assistants often use computers to do tasks previously handled by managers and professionals; they create spreadsheets, compose correspondence, manage databases, and create presentations, reports, and documents using desktop publishing software and digital graphics. They may also negotiate with vendors, maintain and examine leased equipment, purchase supplies, manage areas such as stockrooms or corporate libraries, and retrieve data from various sources. At the same time, managers and professionals have assumed many tasks traditionally assigned to secretaries and administrative assistants, such as keyboarding and answering the telephone. Because secretaries and administrative assistants do less dictation and word processing, they now have time to support more members of the executive staff. In a number of organizations, secretaries and administrative assistants work in teams to work flexibly and share their expertise.

Many secretaries and administrative assistants provide training and orientation for new staff, conduct research on the Internet, and operate and troubleshoot new office technologies.

Specific job duties vary with experience and titles. *Executive secretaries and administrative assistants* provide high-level administrative support for an office and for top executives of an organization. Generally, they perform fewer clerical tasks than do secretaries and more information management. In addition to arranging conference calls and supervising other clerical staff, they may handle more complex responsibilities such as reviewing incoming memos, submissions, and reports in order

to determine their significance and to plan for their distribution. They also prepare agendas and make arrangements for meetings of committees and executive boards. They may also conduct research and prepare statistical reports.

Some secretaries and administrative assistants, such as *legal* and *medical secretaries*, perform highly specialized work requiring knowledge of technical terminology and procedures. For instance, legal secretaries prepare correspondence and legal papers such as summonses, complaints, motions, responses, and subpoenas under the supervision of an attorney or a paralegal. They may also review legal journals and assist with legal research—for example, by verifying quotes and citations in legal briefs. Additionally, legal secretaries often teach newly minted lawyers how to prepare documents for submission to the courts. Medical secretaries transcribe dictation, prepare correspondence, and assist physicians or medical scientists with reports, speeches, articles, and conference proceedings. They also record simple medical histories, arrange for patients to be hospitalized, and order supplies. Most medical secretaries need to be familiar with insurance rules, billing practices, and hospital or laboratory procedures. Other technical secretaries who assist engineers or scientists may prepare correspondence, maintain their organization's technical library, and gather and edit materials for scientific papers.

Secretaries employed in elementary schools and high schools perform important administrative functions for the school. They are responsible for handling most of the communications between parents, the community, and teachers and administrators who work at the school. As such, they are required to know details about registering students, immunizations, and bus schedules, for example. They schedule appointments, keep track of students' academic records, and make room assignments for classes. Those who work directly for principals screen inquiries from parents and handle those matters not needing a principal's attention. They may also set a principal's calendar to help set her or his priorities for the day.

Some secretaries and administrative assistants, also known as *virtual assistants*, are freelancers who work at a home office. They use the Internet, e-mail, fax, and the phone to communicate with clients. Other duties include medical or legal transcription, writing and editing reports and business correspondence, answering e-mail, data entry, setting appointments, making travel arrangements, bookkeeping, and desktop publishing.

Work environment. Secretaries and administrative assistants usually work in schools, hospitals, corporate settings, government agencies, or legal and medical offices. Virtual assistants work from a home office. Their jobs often involve sitting for long periods. If they spend a lot of time keyboarding, particularly at a computer monitor, they may encounter problems of eyestrain, stress, and repetitive motion ailments such as carpal tunnel syndrome.

The majority of secretaries and administrative assistants are full-time employees who work a standard 40-hour week. About 18 percent of secretaries work part time and many others work in temporary positions. A few are self-employed, freelance (such as virtual assistants), or participate in job-sharing arrangements, in which two people divide responsibility for a single job.

Training, Other Qualifications, and Advancement

Word processing, writing, and communication skills are essential for all secretaries and administrative assistants. Employers increasingly require extensive knowledge of computer software applications, such as desktop publishing, project management, spreadsheets, and database management.

Education and training. High school graduates who have basic office skills may qualify for entry-level secretarial positions. They can acquire these skills in various ways. Training ranges from high school vocational education programs that teach office skills and typing to 1-year and 2-year programs in office administration offered by business and vocational-technical schools, and community colleges. Many temporary placement agencies also provide formal training in computer and office skills. Most medical and legal secretaries must go through specialized training programs that teach them the language of the industry. Virtual assistant training programs are available at many community colleges in transcription, bookkeeping, website design, project management, and computer technology. There are also online training and coaching programs.

Employers of executive secretaries increasingly are seeking candidates with a college degree, as these secretaries work closely with top executives. A degree related to the business or industry in which a person is seeking employment may provide the jobseeker with an advantage in the application process.

Most secretaries and administrative assistants, once hired, tend to acquire more advanced skills through on-the-job instruction by other employees or by equipment and software vendors. Others may attend classes or participate in online education to learn how to operate new office technologies, such as information storage systems, scanners, or new updated software packages. As office automation continues to evolve, retraining and continuing education will remain integral parts of secretarial jobs.

Other qualifications. Secretaries and administrative assistants should be proficient in typing and good at spelling, punctuation, grammar, and oral communication. Employers also look for good customer service and interpersonal skills because secretaries and administrative assistants must be tactful in their dealings with people. Discretion, good judgment, organizational or management ability, initiative, and the ability to work independently are especially important for higher-level administrative positions. Changes in the office environment have increased the demand for secretaries and administrative assistants who are adaptable and versatile.

Certification and advancement. Testing and certification for proficiency in office skills are available through organizations such as the International Association of Administrative Professionals; National Association of Legal Secretaries (NALS), Inc.; Legal Secretaries International, Inc; and International Virtual Assistants Association (IVAA). As secretaries and administrative assistants gain experience, they can earn several different designations. Prominent designations include the Certified Professional Secretary (CPS) and the Certified Administrative Professional (CAP), which can be earned by meeting certain experience or educational requirements and passing an examination. Similarly, those with 1 year of experience in the legal field, or who have concluded

an approved training course and who want to be certified as a legal support professional, can acquire the Accredited Legal Secretary (ALS) designation through a testing process administered by NALS. NALS offers two additional designations: Professional Legal Secretary (PLS), considered an advanced certification for legal support professionals, and a designation for proficiency as a paralegal. Legal Secretaries International confers the Certified Legal Secretary Specialist (CLSS) designation in areas such as intellectual property, criminal law, civil litigation, probate, and business law to those who have 5 years of legal experience and pass an examination. In some instances, certain requirements may be waived. There is currently no set standard of certification for virtual assistants. A number of certifications exist which involve passing a written test covering areas of core competencies and business ethics. The IVAA has three certifications available: Certified Virtual Assistant, Ethics Checked Virtual Assistant; and the Real Estate Virtual Assistant.

Secretaries and administrative assistants generally advance by being promoted to other administrative positions with more responsibilities. Qualified administrative assistants who broaden their knowledge of a company's operations and enhance their skills may be promoted to senior or executive secretary or administrative assistant, clerical supervisor, or office manager. Secretaries with word processing or data entry experience can advance to jobs as word processing or data entry trainers, supervisors, or managers within their own firms or in a secretarial, word processing, or data entry service bureau. Secretarial and administrative support experience also can lead to jobs such as instructor or sales representative with manufacturers of software or computer equipment. With additional training, many legal secretaries become paralegals.

Employment

Secretaries and administrative assistants held about 4.3 million jobs in 2008, ranking it among the largest occupations in the U.S. economy. The following tabulation shows the distribution of employment by secretarial specialty:

Secretaries, except legal, medical, and executive....	2,020,000
Executive secretaries and administrative assistants	1,594,400
Medical secretaries.....	471,100
Legal secretaries	262,600

Secretaries and administrative assistants are employed in organizations of every type. Around 90 percent are employed in service-providing industries, ranging from education and healthcare to government and retail trade. Most of the rest work for firms engaged in manufacturing or construction.

Job Outlook

Employment is projected to grow about as fast as the average. Secretaries and administrative assistants will have among the largest number of job openings due to growth and the need to replace workers who transfer to other occupations or leave this occupation. Opportunities should be best for applicants with extensive knowledge of computer software applications.

Employment change. Employment of secretaries and administrative assistants is expected to increase by 11 percent, which is

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Secretaries and administrative assistants	43-6000	4,348,100	4,819,700	471,600	11
Executive secretaries and administrative assistants	43-6011	1,594,400	1,798,800	204,400	13
Legal secretaries.....	43-6012	262,600	311,000	48,400	18
Medical secretaries.....	43-6013	471,100	596,600	125,500	27
Secretaries, except legal, medical, and executive	43-6014	2,020,000	2,113,300	93,300	5

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

about as fast as the average for all occupations, between 2008 and 2018. Projected employment varies by occupational specialty. Above average employment growth in the health care and social assistance industry should lead to much faster than the average growth for medical secretaries, while moderate growth in legal services is projected to lead to faster than average growth in employment of legal secretaries. Employment of executive secretaries and administrative assistants is projected to grow as fast as the average for all occupations. Growing industries—such as construction; educational services; health care and social assistance; and professional, scientific, and technical services—will continue to generate the most new jobs. Slower than average growth is expected for secretaries, except legal, medical, or executive, who account for about 46 percent of all secretaries and administrative assistants.

Increasing office automation and organizational restructuring will continue to make secretaries and administrative assistants more productive in coming years. Computers, e-mail, scanners, and voice message systems will allow secretaries and administrative assistants to accomplish more in the same amount of time. The use of automated equipment is also changing the distribution of work in many offices. In some cases, traditional secretarial duties as typing, filing, photocopying, and bookkeeping are being done by clerks in other departments or by the professionals themselves. For example, professionals and managers increasingly do their own word processing and data entry, and handle much of their own correspondence. In some law and medical offices, paralegals and medical assistants are assuming some tasks formerly done by secretaries. Also, many small and medium-sized organizations are outsourcing key administrative functions, such as data entry, bookkeeping, and Internet research, to virtual assistants.

Developments in office technology are certain to continue. However, many secretarial and administrative duties are of a personal, interactive nature and, therefore, are not easily automated. Responsibilities such as planning conferences, working with clients, and instructing staff require tact and communication skills. Because technology cannot substitute for these personal skills, secretaries and administrative assistants will continue to play a key role in most organizations.

As paralegals and medical assistants assume more of the duties traditionally assigned to secretaries, offices will continue to replace the traditional arrangement of one secretary per manager with secretaries and administrative assistants who support the work of systems, departments, or units. This approach means that secretaries and administrative assistants will assume added responsibilities and will be seen as valuable members of a team.

Job prospects. In addition to jobs created from growth, numerous job opportunities will arise from the need to replace secretaries and administrative assistants who transfer to other occupations, including exceptionally skilled executive secretaries and administrative assistants who often move into professional occupations. Job opportunities should be best for applicants with extensive knowledge of computer software applications, with experience as a secretary or administrative assistant, or with advanced communication and computer skills. Applicants with a bachelor's degree will be in great demand to act more as managerial assistants and to perform more complex tasks.

Earnings

Median annual wages of secretaries, except legal, medical, and executive, were \$29,050 in May 2008. The middle 50 percent earned between \$23,160 and \$36,020. The lowest 10 percent earned less than \$18,440, and the highest 10 percent earned more than \$43,240. Median annual wages in the industries employing the largest numbers of secretaries, except legal, medical, and executive in May 2008 were:

Local government.....	\$32,610
Colleges, universities, and professional schools	31,530
General medical and surgical hospitals.....	30,960
Elementary and secondary schools	29,850
Employment services	28,340

Median annual wages of executive secretaries and administrative assistants were \$40,030 in May 2008. The middle 50 percent earned between \$32,410 and \$50,280. The lowest 10 percent earned less than \$27,030, and the highest 10 percent earned more than \$62,070. Median annual wages in the industries employing the largest numbers of executive secretaries and administrative assistants in May 2008 were:

Management of companies and enterprises	\$45,190
Local government.....	41,880
Colleges, universities, and professional schools	39,220
State government.....	35,540
Employment services	33,820

Median annual wages of legal secretaries were \$39,860 in May 2008. The middle 50 percent earned between \$30,870 and \$50,930. The lowest 10 percent earned less than \$25,580, and the highest 10 percent earned more than \$62,290. Medical secretaries earned median annual wages of \$29,680 in May 2008. The middle 50 percent earned between \$24,530 and \$36,090. The lowest 10 percent earned less than \$20,870, and the highest 10 percent earned more than \$42,660.

Virtual assistants set their own rate structure and billing terms based on the type of work, skill level, cost of living in their area, experience, and personal financial needs. Those who bill using an hourly rate can range anywhere from \$25 to \$100 per hour. Some also bill on a per page or project rate.

Related Occupations

Workers in a number of other occupations also type, record information, and process paperwork. Among them are:

Other Office and Administrative Support Occupations

Billing and Posting Clerks and Machine Operators

Nature of the Work

Billing and posting clerks and *machine operators*—commonly called *billing clerks*—calculate charges, develop bills, and prepare them to be mailed to customers.

Education and Training

Many billing clerks are hired at entry level. They generally need at least a high school diploma and basic software skills.

Job Outlook

Current and Projected Employment:

2008 Employment	528,800
2018 Employment	609,600
Employment change.....	80,800
Growth rate.....	15%

Employment change. Employment is expected to grow faster than average. Automated and electronic billing processes

have streamlined billing departments, but job growth is expected due to an increasing number of transactions, especially in the rapidly growing health care industry.

Job prospects. Prospects should be good. Many job openings will occur as workers transfer to other occupations or leave the labor force.

Earnings

Median annual wages for billing and posting clerks and machine operators were \$30,950 in May 2008.

Related Occupations

	Page
Bookkeeping, accounting, and auditing clerks	563
Order clerks.....	595
Payroll and timekeeping clerks	595

Sources of Additional Information

Information on employment opportunities for billing clerks is available from State job banks.

The Occupational Information Network (O*NET) provides information on a wide range of occupational char-

acteristics. Links to O*NET appear at the end of the Internet version of this occupational statement, accessible at <http://www.bls.gov/ooh/ocos277.htm>

Brokerage Clerks

Nature of the Work

Brokerage clerks perform a number of clerical duties pertaining to transactions involving securities, such as stocks, bonds, commodities, and other kinds of investments. Duties include writing orders for stock purchases and sales, computing transfer taxes, verifying stock transactions, accepting and delivering securities, distributing dividends, and keeping records of daily transactions and holdings.

Education and Training

Brokerage clerk positions usually require only a high school diploma, but graduates from 2- and 4-year college degree programs are increasingly preferred. Short term on-the-job training is common.

Job Outlook

Current and projected employment:

2008 Employment	67,600
2018 Employment	65,800
Employment change.....	-1,800
Growth rate.....	-3%

Employment change. Employment of brokerage clerks is expected to decline slowly. Industry consolidation and increased automation of securities transactions through electronic networks will reduce the need for brokerage clerks. Additionally, clerks are often seen as reducing profits as they don't bring in customers, thus making them particularly susceptible to layoffs and downsizing.

Job prospects. Keen competition is expected for most jobs as the financial services industry undergoes further consolidation and the number of applicants is expected to exceed the number of job openings. Those with job related experience or a 2-year or 4-year degree should have the best opportunities.

Earnings

Median annual wages for brokerage clerks were \$38,710 in May 2008.

acteristics. Links to O*NET appear at the end of the Internet version of this occupational statement, accessible at <http://www.bls.gov/ooh/ocos145.htm>

Communications Equipment Operators

Nature of the Work

Most communications equipment operators work as *switchboard operators* or *telephone operators* for a wide variety of businesses. They may relay incoming, outgoing, and interoffice calls, or assist customers with clerical duties, such as offer directory information, take messages, greet and announce visitors or, in some cases, handle billing requests or emergency calls.

Education and Training

Communications equipment operators generally receive informal on the job training, so a high school diploma is sufficient for most positions.

Job Outlook

Current and projected employment:

2008 Employment	181,600
2018 Employment	163,400
Employment change.....	-18,200
Growth rate.....	-10%

Employment change. Employment of communications equipment operators is expected to decline rapidly due to new labor-saving communications technologies, such as voice recognition technology and internet directory assistance services. The movement of jobs to foreign countries, proliferation of cell phones, and consolidation of telephone operator jobs into fewer locations also will continue to negatively impact employment growth.

Job prospects. Despite declining employment, job prospects should be favorable as occupational turnover is expected to remain high.

Earnings

Switchboard operators, including answering service.....	\$24,220
Telephone operators	31,670
Communications equipment operators, all other	35,050

Related Occupations

	Page
Customer service representatives.....	567
Dispatchers, except police, fire, and ambulance	590
Hotel, motel, and resort desk clerks.....	592
Police, fire, and ambulance dispatchers	595
Receptionists and information clerks.....	570

Sources of Additional Information

For information on employment opportunities, contact companies in the industries that employ communications equipment operators.

Computer Operators

Nature of the Work

Computer operators oversee the operation of computer hardware systems, ensuring that these machines are used as efficiently and securely as possible. They control the console of either a mainframe digital computer or a group of minicomputers and set controls on the computers and peripheral devices required to run computer tasks or “jobs.” Operators maintain logbooks or operating records for each job run and list any events, such as malfunctions, that occur during their shift. Other computer operators perform and monitor routine tasks, such as tape backup, virus checking, software upgrading, and basic maintenance or help programmers and systems analysts test and debug new programs. Computer processing operations regularly run around-the-clock, allowing opportunities for evening, night, or weekend work. However, increased automation and telecommunication systems lessen the need for full-time coverage of operations and permits many operators to monitor systems remotely.

Education and Training

Computer operators generally require a high school degree and are trained by employers on the job. Most computer operators expect to advance to other positions in the information technology field within a few years.

Job Outlook

Current and projected employment:

2008 Employment	110,000
2018 Employment	89,500
Employment change.....	-20,500
Growth rate.....	-19%

Employment change. Employment of computer operators is projected to decline rapidly because advances in technology are making many of the duties performed by these workers obsolete. The expanding use of software that automates computer operations gives companies the option of making systems more efficient, but greatly reduces the need for operators.

Job prospects. Experienced operators are expected to face competition for the few job openings that will arise each year to replace workers who transfer to other occupations or leave the labor force. Opportunities will be best for operators who have formal computer education, familiarity with a variety of operating systems, and knowledge of the latest technology.

Earnings

Median annual wages for computer operators were \$35,600 in May 2008.

Related Occupations

Credit Authorizers, Checkers, and Clerks

Nature of the Work

Credit authorizers, checkers, and clerks review credit history and obtain the information needed to determine the creditworthiness of individuals or businesses applying for credit.

Education and Training

Employers may hire clerks with only a high school diploma, but some prefer workers with an accounting education from a trade school or community college. Most employers provide on-the-job training.

Job Outlook

Current and projected employment:

2008 Employment	63,800
2018 Employment	65,600
Employment change.....	1,800
Growth rate.....	3%

Employment change. Slower than average growth is expected. While technology continues to improve the efficiency of credit application processing, jobs will continue to arise as a result of increased risk aversion and closer attention to credit policies by lenders.

Job prospects. Prospects should be good. Openings will arise from the need to replace workers who leave the occupation for various reasons, such as advancement to another position.

Earnings

Median annual wages for credit authorizers, checkers, and clerks were \$30,390 in May 2008.

Related Occupations

	Page
Bill and account collectors.....	561
Loan interviewers and clerks	593
Loan officers	109

Sources of Additional Information

State employment offices can provide information about job openings for credit authorizers, checkers, and clerks.

Data Entry and Information Processing Workers

Nature of the Work

Data entry and information processing workers enter data into a computer, operate a variety of office machines, and perform other clerical or administrative duties. Data entry and information processing workers also are known as word processors, typists, and data entry keyers, or, less commonly, electronic data processors, keypunch technicians, and transcribers. *Word processors and typists* set up and prepare reports, letters, mailing labels, and other text material. Some may work with highly technical material, plan and key complicated statistical tables, combine and rearrange materials from different sources, or prepare master copies. *Data entry keyers* input lists of items, numbers, or other data, e.g., customers' personal information, medical records, or membership lists, into computers or complete forms that appear on a computer screen. They also may reformat existing data, edit current information, or proofread new entries for accuracy. Data entry keyers may use scanners, electronically transmitted files, or other forms of character recognition systems. Generally, these employees work standard workdays, but technology allows many to work from remote locations, including home, or during off hours when processing demands are less.

Education and Training

Many data entry and information processing workers are hired right out of high school and trained on the job. Spelling, punctuation, and grammar skills are important, as is familiarity with standard office equipment and procedures. Students may acquire skills in keyboarding and in the use of word processing, spreadsheet, and database management software in high schools, community colleges, business schools, temporary help agencies, or using self-teaching aids such as books, tapes, and Internet tutorials.

Job Outlook

Current and projected employment:

2008 Employment	426,200
2018 Employment	400,700
Employment change.....	-25,500
Growth rate.....	-6%

Employment change. Employment of data entry and information processing workers is expected to decline moderately. Improved technologies and greater social acceptance of workers performing their own data entry and information processing work will lessen the need for these workers, except for highly detailed or sophisticated work.

Job prospects. The need to replace workers who transfer to other occupations or leave this large occupation for other

reasons will produce numerous job openings each year. Job prospects will be most favorable for those with the best technical skills and be willing to upgrade their skills continuously in order to remain marketable.

Earnings

Median annual wages in May 2008 were as follows:

Word processors and typists	\$31,390
Data entry keyers.....	26,120

Related Occupations

	Page
Computer operators.....	589
Dispatchers, except police, fire, and ambulance	590

Dispatchers, Except Police, Fire, and Ambulance

Nature of the Work

Dispatchers schedule and dispatch workers, equipment, or service vehicles to carry materials or passengers. They keep records, logs, and schedules of the calls that they receive and of the transportation vehicles that they monitor and control. Many dispatchers employ computer-aided dispatch systems to accomplish these tasks.

Education and Training

Workers usually have a high school degree and learn the skills needed to do their jobs through a few months of on-the-job training.

Job Outlook

Current and projected employment:

2008 Employment	195,700
2018 Employment	190,700
Employment change.....	-5,000
Growth rate.....	-3%

Employment change. Employment is expected to decline slowly. Increasing worker productivity may cause an employment decline; however population growth and economic expansion may limit the decline.

Job prospects. Favorable opportunities are expected, largely due to job openings arising from the need to replace workers

who transfer to other occupations or leave the labor force. As the equipment becomes more complex, individuals with computer skills and experience should have the best prospects for employment.

Earnings

Median annual wages for dispatchers, except police, fire, and ambulance, were \$33,850 in May 2008.

Related Occupations

Eligibility Interviewers, Government Programs

Nature of the Work

Eligibility interviewers, government programs interview applicants for government services and determine if they qualify for government assistance, such as welfare, unemployment benefits, Social Security benefits, and public housing. They prepare case files, determine the appropriate amount of payment, and follow up with recipients to determine their eligibility for services after a certain period.

Education and Training

Most employees are trained on the job and learn from more-experienced workers. Good interpersonal and communication skills and organizational ability are needed for this job.

Job Outlook

Current and projected employment:

2008 Employment	119,500
2018 Employment	130,500
Employment change.....	11,000
Growth rate.....	9%

Employment change. Employment is projected to grow about as fast as the average for all occupations. The increase in the number of retiring baby boomers becoming eligible for Social Security and other government entitlement programs will be the main cause of growth in this occupation. However, automation should reduce employment growth for some eligibility interviewers, as more government programs allow people to apply for assistance online.

Job prospects. Job opportunities are expected to be favorable. Prospects will be best for those with a broad range of job skills, such as good customer service, math, and telephone skills.

Earnings

Median annual wages for eligibility interviewers, government programs were \$39,310 in May 2008.

File Clerks

Nature of the Work

File clerks classify, store, retrieve, track, and update records and information.

Education and Training

Most employers prefer applicants with a high school diploma or its equivalent. Most training occurs on the job, and can be learned in a short period of time.

Job Outlook

Current and projected employment:

2008 Employment	212,200
2018 Employment	162,600
Employment change.....	-49,600
Growth rate.....	-23%

Employment change. Employment is expected to decline rapidly. Employment is expected to decline due to productivity gains from office automation and the consolidation of clerical jobs. Additionally, most files are stored digitally and can be retrieved electronically, reducing the demand for file clerks.

Job prospects. Favorable opportunities are expected. Despite employment declines, job opportunities should arise from the need to replace workers who leave the labor force or transfer to other occupations. Job prospects will be best for those who have typing and other secretarial skills and who are familiar with a wide range of office machines, especially personal computers.

Earnings

Median annual wages for file clerks were \$23,800 in May 2008.

Related Occupations

	Page
Receptionists and information clerks.....	570
Shipping, receiving, and traffic clerks.....	577

Sources of Additional Information

The Occupational Information Network (O*NET) provides information on a wide range of occupational characteristics. Links to O*NET appear at the end of the Internet version of this occupational statement, accessible at <http://www.bls.gov/ooh/ocos146.htm>

Hotel, Motel, and Resort Desk Clerks

Nature of the Work

Hotel, motel, and resort desk clerks are the first line of customer service for a lodging property. They register arriving guests, assign rooms, and answer guests' questions on hotel services and other matters. At other times, they check out guests and report problems with guest rooms or public areas to the housekeeping or maintenance staff. Night and weekend work is common and approximately 1 in 4 desk clerks works part time.

Education and Training

Most hotel, motel, and resort desk clerks learn their job through short-term on-the-job training, which describes their job duties, familiarizes them with the hotel's facilities, and provides instruction on how to use the computerized reservation, room assignment, and billing systems. Postsecondary education is not required for this job, but some background or coursework in hospitality is helpful. Most importantly, employers look for people who are friendly and customer-service oriented, well groomed, and display maturity and good judgment.

Job Outlook

Current and projected employment:

2008 Employment	230,200
2018 Employment	261,700
Employment change.....	31,500
Growth rate.....	14%

Employment change. Employment of hotel, motel, and resort desk clerks is expected to grow faster than the average. As developers open new hotels, jobs for hotel, motel, and resort desk clerks should become available. The recent trend toward smaller limited-service hotels, which are more efficient to operate and require less staff, however, will mean fewer desk clerks for each hotel. In addition, jobs will be created as consumers begin traveling again after the hiatus brought on by the recent economic downturn.

Job prospects. During recessions, vacation and business travel declines, and hotels and motels need fewer desk clerks; however, newly opened hotels and the need to replace the many desk clerks who leave this occupation each year will offer some new opportunities.

Earnings

Median annual wages for hotel, motel, and resort desk clerks were \$19,480 in May 2008.

Human Resources Assistants, Except Payroll and Timekeeping

Nature of the Work

Human resources assistants maintain the human resource records of an organization's employees. These records include such information as name, address, job title, and earnings; benefits such as health and life insurance; and tax withholdings.

Education and Training

Employers prefer to hire people who have a high school diploma or its equivalent. Computer, communication, and interpersonal skills are also important.

Job Outlook

Current and projected employment:

2008 Employment	169,700
2018 Employment	160,000
Employment change.....	-9,700
Growth rate.....	-6%

Employment change. Employment is expected to decline slowly. Productivity gains from office automation and increases in the use of electronic files will lead to declines in the demand for human resources assistants to do data entry and recordkeeping.

Job prospects. Applicants may face competition. Job opportunities should be best for those with excellent communication and computer skills and a broad based knowledge of general office functions.

Earnings

Median annual wages for human resource assistants, except payroll and timekeeping, were \$35,750 in May 2008.

Interviewers, Except Eligibility and Loan

Nature of the Work

Interviewers obtain and verify information from individuals and businesses by mail, telephone, or in person for the purpose of completing forms, applications, and questionnaires, such as market research surveys, Census forms, college admission applications, and medical histories. They review the answers for completeness and accuracy and record the information.

Education and Training

Most employers prefer applicants with a high school diploma or its equivalent or a mix of education and related experience. New employees generally are trained on the job.

Job Outlook

Current and projected employment:

2008 Employment	233,400
2018 Employment	269,900
Employment change.....	36,400
Growth rate.....	16%

Employment change. Employment is projected to grow faster than the average for all occupations. Rapid growth in the healthcare and market research industries that employ the majority of these workers will generate jobs for interviewers. However, the expanding use of online surveys and questionnaires to conduct market research and the increasing use of digital health records will impede growth.

Job prospects. Job prospects are expected to be good. Turn-over is generally high for this occupation where over a quarter of the jobs are part time. Applicants with good customer service and communications skills and those that are detail oriented should have the best prospects.

Earnings

Median annual wages for interviewers, except eligibility and loan, were \$28,140 in May 2008.

Loan Interviewers and Clerks

Nature of the Work

Loan interviewers, also called *loan processors* or *loan clerks*, interview applicants and others to obtain and verify personal and financial information for the purposes of completing loan applications. They also prepare the documents that go to the appraiser and are issued at closing.

Education and Training

A high school diploma or equivalent is generally the minimum needed to get into the occupation; some college coursework is usually preferred. Once hired, new interviewers receive short-term on-the-job-training to learn about pricing loans and about the rules and regulations regarding the issuing of loans. Excellent written and verbal communication skills are essential.

Job Outlook

Current and projected employment:

2008 Employment	210,400
2018 Employment	219,400
Employment change.....	9,100
Growth rate.....	4%

Employment change. Employment is projected to grow slower than the average for all occupations. A growing population will, over time, spur demand for home loans and, thus, for loan interviewers to verify and process financial data on the application and to assemble documents and prepare them for settlement. However, the increasing use of online applications will limit demand for loan interviewers.

Job prospects. Prospects will be best for applicants with a broad range of job skills, including good customer service, math, and telephone skills. The job outlook for loan interviewers and clerks is sensitive to overall economic activity.

Earnings

Median annual wages for loan interviewers and clerks were \$32,470 in May 2008.

Meter Readers, Utilities

Nature of the Work

Meter readers read electric, gas, water, or steam consumption meters and record the volume used. They also inspect the meters and their connections for any defects or damage and supply repair and maintenance workers with the information necessary to fix damaged meters.

Education and Training

Most meter reader jobs require a high school diploma and a valid driver's license. Many people start utility careers in this occupation with the goal of advancing to positions with more responsibility.

Job Outlook

Current and projected employment:

2008 Employment	45,300
2018 Employment	36,300
Employment change.....	-9,100
Growth rate.....	-20%

Employment change. Employment is expected to decline rapidly. New Automatic Meter Reader (AMR) systems allow meters to be monitored and billed from a central point, reducing the need for meter readers.

Job prospects. Jobseekers can expect competition. Although this is a declining occupation, job opportunities are expected to be good because of the need to replace workers leaving the occupation.

Earnings

Median annual wages for meter readers, utilities were \$32,950 in May 2008.

Office and Administrative Support Worker Supervisors and Managers

Nature of the Work

Office and administrative support supervisors and managers plan or supervise support staff to ensure that they can work efficiently. After allocating work assignments and issuing deadlines, office and administrative support supervisors and managers oversee the work to ensure that it is proceeding on schedule and meeting established quality standards.

Education and Training

Many employers require office and administrative support supervisors and managers to have postsecondary training—and in some cases, an associate or even a bachelor's degree. Most firms fill office and administrative support supervisory and managerial positions by promoting office or administrative support workers from within their organizations.

Job Outlook

Current and projected employment:

2008 Employment	1,457,200
2018 Employment	1,617,500
Employment change.....	160,300
Growth rate.....	11%

Employment change. Employment of office and administrative support supervisors and managers is expected to grow about as fast as the average for all occupations through the year 2018. Continuing advances in technology should increase office and administrative support workers' productivity and allow a wider variety of tasks to be performed by people in professional positions.

Job prospects. Keen competition is expected for jobs as the number of applicants greatly exceeds the number of job openings. Opportunities will continue to be best for those office and administrative support worker supervisors and managers who show leadership and team building skills, and who are able to multitask, communicate well, and keep abreast of technological advances.

Earnings

Median annual wages for office and administrative support worker supervisors and managers were \$45,790 in May 2008.

Order Clerks

Nature of the Work

Order clerks receive and process orders for a variety of goods or services and inform customers of receipt, prices, shipping dates, and delays. Order clerks also prepare simple contracts and handle customer complaints.

Education and Training

Most order clerks are trained on the job. Employers prefer workers with a high school diploma or its equivalent, and who are computer literate and proficient in word-processing and spreadsheet software.

Job Outlook

Current and projected employment:

2008 Employment	245,700
2018 Employment	181,500
Employment change.....	-64,200
Growth rate.....	-26%

Employment change. Employment is expected to decline rapidly. Improvements in technology and office automation continue to increase worker productivity and decrease the need for order clerks.

Job prospects. Favorable opportunities are expected. Despite employment declines, numerous openings will occur each year to replace order clerks who transfer to other occupations or leave the labor force. Many of these openings will be for seasonal work, especially in catalog companies or online retailers catering to holiday gift buyers.

Earnings

Median annual wages for order clerks were \$27,990 in May 2008.

Payroll and Timekeeping Clerks

Nature of the Work

Payroll and timekeeping clerks compile and post employee time and payroll data. They ensure that employees are paid on time and that their paychecks are accurate.

Education and Training

Payroll and timekeeping clerks typically learn the skills they need on the job. Employers prefer high school graduates who have computer skills.

Job Outlook

Current and projected employment:

2008 Employment	208,700
2018 Employment	197,700
Employment change.....	-10,900
Growth rate.....	-5%

Employment change. Employment is projected to decline slowly. Increased automation of the payroll and timekeeping process, and the use of computer software that allows employees to update and record their own payroll and timekeeping information, will decrease the need for payroll and timekeeping clerks.

Job prospects. Favorable opportunities are expected. Despite the projected employment decline, job openings will arise each year as payroll and timekeeping clerks leave the labor force or transfer to other occupations. Those who have completed a certification program, indicating that they can handle more complex payroll issues, will have an advantage in the job market.

Earnings

Median annual wages for payroll and timekeeping clerks were \$34,810 in May 2008.

Police, Fire, and Ambulance Dispatchers

Nature of the Work

Police, fire, and ambulance dispatchers, also called 911 operators, monitor the location of emergency services personnel from their jurisdiction's emergency services departments. These workers dispatch the appropriate type and number of units in response to calls for assistance.

Education and Training

Workers usually have a high school degree and develop the necessary skills in about 3 to 6 months of on-the-job training. Many States require specific types of training or certification from a professional association.

Job Outlook

Current and projected employment:

2008 Employment	99,900
2018 Employment	117,700
Employment change.....	17,800
Growth rate.....	18%

Employment change. Employment is expected to grow faster than average. The growing and aging population will increase demand for emergency services and create new jobs for police, fire, and ambulance dispatchers. Growth may be slowed in some places, as some municipalities consolidate their call centers.

Job prospects. Favorable opportunities are expected, largely due to job openings arising from the need to replace workers who transfer to other occupations or leave the labor force. As the equipment dispatchers use becomes more complex, individuals with computer skills should have the best opportunities.

Earnings

Median annual wages for police, fire, and ambulance dispatchers were \$33,670 in May 2008.

Postal Service Clerks

Nature of the Work

Postal Service clerks sell stamps, money orders, postal stationery, and mailing envelopes and boxes in post offices throughout the country. These workers register, certify, and insure mail, calculate and collect postage, and answer questions about other postal matters.

Education and Training

All applicants for Postal Service jobs are required to take an examination. Additionally, they must be at least 18 years of age and a U.S. citizen or have been granted permanent resident-alien status in the United States. Males must have registered with the Selective Service upon reaching age 18. A good command of the English language is also required.

Job Outlook

Current and projected employment:

2008 Employment	75,800
2018 Employment	62,100
Employment change.....	-13,700
Growth rate.....	-18%

Employment change. Employment is projected to decline rapidly. Postal Service clerks will be adversely affected by the decline in first-class mail volume because of the increasing use of electronic mail and automated bill pay.

Job prospects. Keen competition for jobs is expected. The number of applicants usually exceeds the number of job openings because of the occupation's low entry requirements and attractive wages and benefits.

Earnings

Median annual wages of postal service clerks were \$51,040 in May 2008.

**Postal Service Mail Sorters,
Processors, and Processing
Machine Operators**

Nature of the Work

Postal Service mail sorters, processors, and processing machine operators prepare incoming and outgoing mail for distribution at post offices and at mail processing centers. They load and unload postal trucks and move mail around mail processing

centers. They also load and operate mail processing, sorting, and canceling machinery.

Education and Training

All applicants for Postal Service jobs are required to take a Postal Service examination. Additionally, they must be at least 18 years of age, and be a U.S. citizen or have been granted permanent resident-alien status in the United States. Males must have registered with the Selective Service upon reaching age 18. A good command of the English language also is required.

Job Outlook

Current and projected employment:

2008 Employment	179,900
2018 Employment	125,300
Employment change.....	-54,500
Growth rate.....	-30%

Employment change. Employment is projected to decline rapidly. Increased use of automated equipment for sorting and processing mail reduces the need for employees in this occupation. Employment also will be negatively affected by companies increasingly presorting their own mail before it arrives at the Post Office to qualify for postage rate reductions.

Job prospects. Keen competition for jobs is expected. The number of applicants usually exceeds the number of job openings because of the occupation's low entry requirements and attractive wages and benefits.

Earnings

Median annual wages for Postal Service mail sorters, processors, and processing machine operators were \$50,020 in May 2008.

Procurement Clerks

Nature of the Work

Procurement clerks compile requests for materials, prepare purchase orders, keep track of purchases and supplies, and handle inquiries about orders. They make sure that what was purchased arrives on schedule and meets the purchaser's specifications.

Education and Training

Most employers prefer applicants who have a high school diploma or its equivalent. Most procurement clerks are trained on the job under close supervision of more experienced employees.

Job Outlook

Current and projected employment:

2008 Employment	81,500
2018 Employment	86,200
Employment change.....	4,800
Growth rate.....	6%

Employment change. Employment is expected to grow more slowly than the average. The need for procurement clerks will be reduced, as the use of computers to place orders directly with suppliers and as ordering over the Internet becomes more prevalent.

Job prospects. Job prospects are expected to be favorable. Job openings will arise out of the need to replace workers who transfer to other occupations or leave the labor force.

Earnings

Median hourly wages for procurement clerks were \$16.72 in May 2008.

Production, Planning, and Expediting Clerks

Nature of the Work

Production and planning clerks compile records and reports on various aspects of production, such as materials and parts used, products produced, machine and instrument readings, and frequency of defects. *Expediting clerks* contact vendors and shippers to ensure that merchandise, supplies, and equipment are forwarded on the specified shipping dates.

Education and Training

Many production, planning, and expediting jobs are at the entry level and do not require more than a high school diploma. These clerks usually learn the job by doing routine tasks under close supervision. Computer skills are very important.

Job Outlook

Current and projected employment:

2008 Employment	283,500
2018 Employment	287,800
Employment change.....	4,300
Growth rate.....	2%

Employment change. Employment of production, planning, and expediting clerks is projected to show little or no growth over the 2008–2018 projection period. As greater emphasis is placed on the timely delivery of goods and services throughout the economy, there will be increasing need for production, planning, and expediting clerks at all levels of the supply chain. However, the expected employment declines in manufacturing will limit the growth of this occupation.

Job prospects. In addition to new jobs, job openings will arise from the need to replace production, planning, and expediting clerks who leave the labor force or transfer to other occupations. Opportunities will be better in industries that are experiencing faster growth, such as wholesale trade and warehousing.

Earnings

Median annual wages for production, planning, and expediting clerks were \$40,480 in May 2008.

Reservation and Transportation Ticket Agents and Travel Clerks

Nature of the Work

Reservation and transportation ticket agents and travel clerks make and confirm travel reservations and sell tickets to passengers. They may check baggage and direct passengers to designated departure areas, or provide tourists with travel information, such as points of interest, restaurants, rates, and emergency services. Some work at transportation center ticket counters and travel offices, while others answer telephones and e-mail at reservation call centers or at individual properties. Most work a standard 40-hour week in locations that typically operate around the clock.

Education and Training

Most workers in this occupation need only a high school diploma or its equivalent. Much of the training comes from company-sponsored programs where they learn about the company’s reservation system and ticketing procedures and travel-related information.

Job Outlook

Current and projected employment:

2008 Employment	168,300
2018 Employment	181,900
Employment change.....	13,600
Growth rate.....	8%

Employment change. Employment of reservation and transportation ticket agents and travel clerks is expected to grow as fast as average. Increased use of online reservations systems and self-service ticketing machines will reduce the number of people necessary to provide these services.

Job prospects. Applicants for these jobs are likely to encounter competition in part because of the low entry requirements and good travel benefits offered by many companies in the travel industry. Employment opportunities may fluctuate with the economy which often has a strong impact on travel industry employment.

Earnings

Median annual wages for reservation and transportation ticket agents and travel clerks were \$31,070 in May 2008.

Stock Clerks and Order Fillers

Nature of the Work

Stock clerks receive merchandise in stores, warehouses, stockrooms, and other storage facilities; unpack it; mark items with identifying codes, such as price, stock, or inventory control codes; stock shelves; and help customers with their packages. Order fillers complete customers mail, Web, and phone orders by retrieving the ordered merchandise, computing the prices and recording the sale, and preparing it for shipment. Most jobs are physically demanding and may result in minor muscle ailments, scrapes, or other injuries. In retail establishments, evening and weekend hours are common.

Education and Training

A high school diploma or GED is usually sufficient for this occupation. Most stock clerks and order fillers learn their jobs through short-term on-the-job training.

Job Outlook

Current and projected employment:

2008 Employment	1,858,800
2018 Employment	1,993,300
Employment change.....	134,400
Growth rate.....	7%

Employment change. Average growth in the employment of stock clerks and order fillers is expected. Most stock clerks and order fillers work in retail trade, most notably in grocery and department stores, stocking shelves and retrieving items for customers. These tasks, which usually require handling small quantities of items, are difficult to automate.

Job prospects. Numerous job openings will occur due to the need to replace workers who leave the occupation, a characteristic of very large occupations with minimal training requirements. Job openings in grocery, general merchandise, clothing, and department stores will be greater than in other industries, because much of the work is done manually and is difficult to automate.

Earnings

Median annual wages for stock clerks and order fillers were \$20,800 in May 2008.

Tellers

Nature of the Work

Bank tellers are responsible for quickly and accurately processing routine transactions that customers conduct at banks. Routine transactions include cashing checks and making deposits, loan payments, and withdrawals.

Education and Training

Most teller jobs require a high school diploma and a background check. Tellers are usually trained on the job.

Job Outlook

Current and projected employment:

2008 Employment	600,500
2018 Employment	638,000
Employment change.....	37,500
Growth rate.....	6%

Employment change. Employment of tellers is expected to grow more slowly than average. To attract customers, banks are opening new branch offices in a variety of locations, such as grocery stores, and keeping their branches open longer during the day and on weekends. Both of these trends are expected to result in some job growth for tellers, particularly those who work part time.

Job prospects. Job prospects for tellers are expected to be favorable. Most job openings will arise from growth and from the need to replace the many tellers who transfer to other occupations.

Earnings

Median annual wages for tellers were \$23,610 in May 2008.

Weighers, Measurers, Checkers, and Samplers, Recordkeeping

Nature of the Work

Weighers, measurers, checkers, and samplers weigh, measure, and check materials, supplies, and equipment to keep accurate records. Most of their duties are clerical. They verify the quantity, quality, and overall value of the items they are responsible for and check the condition of items purchased, sold, or produced against records, bills, invoices, or receipts.

Education and Training

Most jobs do not require more than a high school diploma or its equivalent. However, preference is given to applicants familiar with computers. Typing, filing, recordkeeping, and other clerical skills are important.

Job Outlook

Current and projected employment:

2008 Employment	71,900
2018 Employment	62,400
Employment change.....	-9,400
Growth rate.....	-13%

Employment change. Employment is projected to decline rapidly. Increased use of automated equipment that performs the functions of these workers will lessen the need for weighers, checkers, measurers, and samplers.

Job prospects. Favorable opportunities are expected. Despite employment declines, job opportunities should arise from the need to replace workers who leave the labor force or transfer to other occupations.

Earnings

Median annual wages for weighers, measurers, checkers, and samplers, recordkeeping were \$26,940 in May 2008.

Farming, Fishing, and Forestry Occupations

Fishers and Fishing Vessel Operators

Significant Points

- This occupation is characterized by strenuous work, long hours, seasonal employment, and some of the most hazardous conditions in the workforce.
- About 56 percent of all workers are self-employed, among the highest proportions in the workforce.
- Fishers usually begin as deckhands and acquire their occupational skills on the job.
- Employment is projected to decline moderately.

Nature of the Work

Fishers and fishing vessel operators catch and trap various types of marine life for human consumption, animal feed, bait, and other uses. (Aquaculture—the raising and harvesting, under controlled conditions, of fish and other aquatic life in ponds or confined bodies of water—is covered in the *Handbook* statement on farmers, ranchers, and agricultural managers.)

Fishing hundreds of miles from shore with commercial fishing vessels—large boats capable of hauling a catch of tens of thousands of pounds of fish—requires a crew that includes a captain, or skipper, a first mate and sometimes a second mate, a boatswain (called a deckboss on some smaller boats), and deckhands with specialized skills.

The *fishing boat captain* plans and oversees the fishing operation, the fish to be sought, the location of the best fishing grounds, the method of capture, the duration of the trip, and the sale of the catch.

The captain ensures that the fishing vessel is seaworthy; oversees the purchase of supplies, gear, and equipment, such as fuel, netting, and cables; obtains the required fishing permits and licenses; and hires qualified crew members and assigns their duties. The captain plots the vessel's course using compasses, charts, and electronic navigational equipment, such as loran systems or GPS navigation systems. Captains also use radar and sonar to avoid obstacles above and below the water and to detect fish. Sophisticated tracking technology allows captains to better locate schools of fish. The captain directs the fishing operation through subordinate officers' and records daily activities in the ship's log. In port, the captain sells the catch to wholesalers, food processors, or through a fish auction and ensures that each crew member receives the prearranged portion of the proceeds. Captains increasingly use the Internet to bypass processors and sell fish directly to consumers, grocery stores, and restaurants often even before they return to port.

The *first mate* is the captain's assistant and assumes control of the vessel when the captain is off duty. Duty shifts, called

watches, usually last 6 hours. In this role, the first mate must be familiar with navigation requirements and the operation of all electronic equipment. The mate's regular duty though, with the help of the boatswain and under the captain's oversight, is to direct the fishing operations and sailing responsibilities of the deckhands, including the operation, maintenance, and repair of the vessel and the gathering, preservation, stowing, and unloading of the catch.

The *boatswain*, a highly experienced deckhand with supervisory responsibilities, directs the *deckhands* as they carry out the sailing and fishing operations. Before departure, the deckhands load equipment and supplies. When necessary, boatswains repair fishing gear, equipment, nets, and accessories. They operate the fishing gear, letting out and pulling in nets and lines, and extract the catch, such as cod, flounder, and tuna, from the nets or the lines' hooks. Deckhands use dip nets to prevent the escape of small fish and gaffs to facilitate the landing of large fish. They then wash, salt, ice, and stow away the catch. Deckhands also must ensure that decks are clear and clean at all times and that the vessel's engines and equipment are kept in good working order. Unless "lumpers" (laborers or longshore workers) are hired, the deckhands unload the catch.

Large fishing vessels that operate in deep water generally have technologically advanced equipment, and some may have facilities on board where the fish are processed and prepared for sale. Such vessels are equipped for long stays at sea and can perform the work of several smaller boats.

Some fishers work on small boats in relatively shallow waters, often in sight of land. Navigation and communication needs are vital and constant for almost all types of boats. On these small boats, crews often consist of one or two members who are involved in all aspects of the fishing operation. Their work might include placing gill nets across the mouths of rivers or inlets, entrapment nets in bays and lakes, or pots and traps for fish or shellfish such as lobsters and crabs. Dredges and scrapes are sometimes used to gather shellfish such as oysters and scallops. A very small proportion of commercial fishing is conducted as diving operations. Depending upon the water's depth, divers wearing regulation diving suits with an umbilical (air line) or a scuba outfit and equipment use spears to catch fish and use nets and other equipment to gather shellfish, coral, sea urchins, abalone, and sponges. In very shallow waters, fish are caught from small boats with an outboard motor, from rowboats, or by wading from shore. Fishers use a wide variety of hand-operated equipment, including nets, tongs, rakes, hoes, hooks, and shovels, to gather fish and shellfish; to catch amphibians and reptiles such as frogs and turtles; and to harvest marine vegetation such as Irish moss and kelp.

Although most fishers are involved in commercial fishing, some captains and deckhands use their expertise in fishing for sport or recreational purposes. For this type of fishing, a group of people charter a fishing vessel with a captain, and possibly several

A fisher tends to his equipment on his fishing boat.

deckhands, for periods ranging from several hours to a number of days and embark upon sportfishing, socializing, and relaxation.

Work environment. Fishing operations are conducted under various environmental conditions, depending on the region, body of water, and the kind of species sought. Storms, fog, and wind may hamper fishing vessels or cause them to suspend fishing operations and return to port. In relatively busy fisheries, boats have to take care to avoid collisions.

Fishers and fishing vessel operators work under some of the most hazardous conditions of any occupation, and transportation to a hospital or doctor often is not readily available when injuries occur. The crew must be on guard against the danger of injury from malfunctioning fishing gear, entanglement in fishing nets and gear, slippery decks, ice formation in the winter, or being swept overboard by a large wave. Malfunctioning navigation or communication equipment may lead to collisions or shipwrecks.

Fishers and fishing vessel operators endure strenuous outdoor work and long hours. Commercial fishing trips may require a stay of several weeks, or even months, hundreds of miles away from one's home port. The pace of work may vary, but even during travel between the home port and the fishing grounds deckhands on smaller boats usually try to finish their cleaning and maintenance duties so that there are no chores remaining to be done at port. However, lookout watches are a regular responsibility, and crew members must be prepared to stand watch at prearranged times of the day or night. Although fishing gear has improved, and operations have become more mechanized, netting and processing fish are strenuous activities. Newer vessels have improved living quarters and amenities such as television and shower stalls, but crews still experience the aggravations of confined quarters, continuous close personal contact, and the absence of family.

Training, Other Qualifications, and Advancement

Fishers usually acquire their occupational skills on the job. There are no formal academic training requirements.

Education and training. Most fishers begin as deckhands and learn their trade on the job. Deckhands normally start by finding work through family, friends, or simply walking around the docks and asking for employment. Some larger trawlers

and processing ships are run by larger companies, where new workers can apply through the companies' human resources department. Operators of large commercial fishing vessels are required to complete a Coast Guard-approved training course. Students can expedite their entrance into these occupations by enrolling in 2-year vocational-technical programs offered by secondary schools. In addition, some community colleges and universities offer fishery technology and related programs that include courses in seamanship, vessel operations, marine safety, navigation, vessel repair and maintenance, health emergencies, and fishing gear technology. Secondary and postsecondary programs are normally offered in or near coastal areas, and usually include hands-on experience.

Experienced fishers may find short-term workshops especially useful. These generally are offered through various postsecondary institutions and provide a good working knowledge of electronic equipment used in navigation and communication and offer information on the latest improvements in fishing gear.

Licensure. Captains and mates on large fishing vessels of at least 200 gross tons must be licensed. Captains of sportfishing boats used for charter, regardless of the boats' size, must also be licensed. Crew members on certain fish-processing vessels may need a merchant mariner's document. The U.S. Coast Guard issues these documents and licenses to individuals who meet the stipulated health, physical, and academic requirements. (For information about merchant marine occupations, see the section on water transportation occupations elsewhere in the *Handbook*.) States set licensing requirements for boats operating in State waters, defined as inland waters and waters within 3 miles of the coast.

Fishers need a permit to fish in almost any water. Permits are distributed by States for State waters and by regional fishing councils for Federal waters. The permits specify the season when fishing is allowed, the type of fish that may be caught, and sometimes the type of fishing gear that is permissible.

Other qualifications. Fishers must be in good health and possess physical strength. Good coordination, mechanical aptitude, and the ability to work under difficult or dangerous conditions are necessary to operate, maintain, and repair equipment and fishing gear. Fishers need stamina to work long hours at sea, often under difficult conditions. On large vessels, they must be able to work as members of a team. Fishers must be patient, yet always alert, to overcome the boredom of long watches when they are not engaged in fishing operations. The ability to assume any deckhand's functions on short notice is important. As supervisors, mates must be able to assume all duties, including the captain's, when necessary. The captain must be highly experienced, mature, and decisive and also must possess the skills needed to run business operations.

Advancement. On fishing vessels, most fishers begin as deckhands. Experienced, reliable deckhands who display supervisory qualities may become boatswains, who, in turn, may become second mates, first mates, and, finally, captains. Deckhands who acquire experience and whose interests are in ship engineering—the maintenance and repair of ship engines and equipment—can eventually become licensed chief engineers on large commercial vessels after meeting the Coast Guard's experience, physical, and academic requirements. Almost all captains

become self-employed, and the overwhelming majority eventually own, or have an interest in, one or more fishing ships. Some may choose to run a sport or recreational fishing operation.

Employment

Fishers and fishing vessel operators held an estimated 35,600 jobs in 2008. Over half were self-employed. Most fishing takes place off the coasts, particularly off Alaska, the Gulf Coast, Virginia, California, and New England. Alaska ranks the highest in total volume of fish caught, according to the National Marine Fisheries Service. Many fishers are seasonal workers and positions are usually filled by people who work primarily in other occupations, such as teachers, or by students. For example, salmon season causes employment of fishers in Alaska to more than double during the summer. Because fishing is mostly seasonal and workers are often self-employed, measuring total employment is difficult.

Job Outlook

Employment of fishers and fishing vessel operators is projected to decline moderately as regulations relating to the replenishment of fish stocks reduce allowable fishing.

Employment change. Employment of fishers and fishing vessel operators is expected to decline moderately by 8 percent through the year 2018. Fishers and fishing vessel operators depend on the natural ability of fish stocks to replenish themselves through growth and reproduction, as well as on governmental regulation to promote replenishment of fisheries. As the use of sophisticated electronic equipment for navigation, communication, and locating fish has raised the efficiency of finding fish stocks, the need for setting limits to catches also has risen. Additionally, improvements in fishing gear and the use of highly automated floating processors, where the catch is processed aboard the vessel, have greatly increased fish hauls.

Fisheries councils issue various types of restrictions to prevent over-harvesting and to allow stocks of fish and shellfish to naturally replenish. Fishing councils are shifting to an individual quota system that tends to reduce employment. Nonetheless, such a system is beneficial for those who remain in the industry because it allows for longer fishing seasons, better investment returns, and steadier employment.

In addition, rising seafood imports and increasing competition from farm-raised fish are adversely affecting fishing income and is also causing some fishers to leave the industry. However, competition from farm-raised and imported seafood tends to be concentrated in specific species and thus should have more of an impact in some regions than others.

Governmental efforts to replenish stocks are having some positive results, which should increase the stock of fish in the future. Furthermore, efforts by private fishers' associations

on the West Coast to increase government monitoring of the fisheries may help to prevent the type of decline in fish stocks found in waters off the East Coast. Nevertheless, pollution is now being recognized as a new factor affecting the reproduction of fish, a scenario that may take years to mitigate. Consequently, fewer fishers and fishing vessel operators are expected to make their living from the Nation's waters in the years ahead.

Job prospects. The vast majority of job openings will result from the need to replace fishers and fishing vessel operators who leave the occupation because of the strenuous and hazardous nature of the job and the lack of steady, year-round income. The best prospects should be with large fishing operations, while opportunities with small independent fishers are expected to be limited. Sportfishing boats may provide some job opportunities.

Earnings

In May 2008, median annual wages of wage-and-salary fishers were \$27,950. The middle 50 percent earned between \$19,510 and \$33,580. The bottom 10 percent earned less than \$16,080, while the top 10 percent earned more than \$45,930. Earnings of fishers and fishing vessel operators normally are highest in the summer and fall when demand for their catch and environmental conditions are favorable and lowest during the winter. Many full-time and most part-time workers supplement their income by working in other activities during the off-season.

Earnings of fishers vary widely, depending upon their position, their ownership percentage of the vessel, the size of their ship, and the amount and value of the catch. The costs of the fishing operation such as fuel, repair and maintenance of gear and equipment, and the crew's supplies are deducted from the sale of the catch. Net proceeds are distributed among the crew members in accordance with a prearranged percentage. Generally, the ship's owner, usually its captain, receives half of the net proceeds. From this amount, the owner pays for depreciation, maintenance and repair, and replacement and insurance costs of the ship and its equipment; the money that remains is the owner's profit.

Related Occupations

Other occupations that involve outdoor work with fish and watercraft include:

	Page
Fish and game wardens	473
Water transportation occupations.....	805

Many ships not only catch the fish but also cut, trim, and preserve it. Seafood processing work done on land is performed by meat, poultry, and fish cutters and trimmers.

Forest and Conservation Workers

Significant Points

- Most forest and conservation workers develop skills through on-the-job training.
- Seasonal demand for forest and conservation workers can vary by region and time of year.
- The best employment opportunities should continue to be in Maine, the Southeast, and the Pacific Northwest.

Nature of the Work

The Nation's forests are a rich natural resource, providing beauty, tranquility, and varied recreational benefits, as well as wood for commercial use. Managing and harvesting the forests and woodlands require many different kinds of workers. Forest and conservation workers help develop, maintain, and protect the forests by growing and planting new seedlings, fighting insects and diseases that attack trees, and helping to control soil erosion.

Forest and conservation workers perform a variety of tasks to reforest and conserve timberlands and to maintain forest facilities, such as roads and campsites. Some forest workers, called tree planters, use digging and planting tools called "dibbles" and "hoedads" to plant seedlings to reforest timberland areas. Forest workers also remove diseased or undesirable trees with power saws or handsaws, spray trees with insecticides and fungicides to kill insects and to protect against disease, and apply herbicides on undesirable brush to reduce competing vegetation. Those who work for State and local governments or who are under contract with them also clear away brush and debris from camp trails, roadsides, and camping areas. Some forest workers clean kitchens and rest rooms at recreational facilities and campgrounds. In private industry, forest workers usually working under the direction of professional foresters, may paint boundary lines, assist with controlled burning, aid

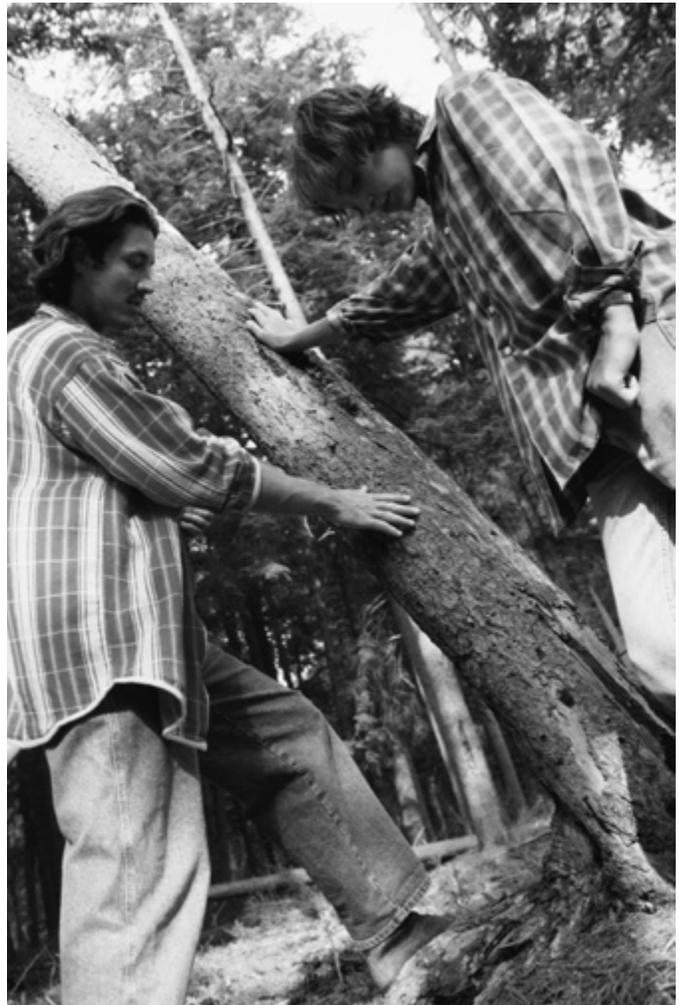

in marking and measuring trees, and keep tallies of examined and counted trees.

Other forest and conservation workers work in forest nurseries, sorting out tree seedlings and discarding those not meeting standards of root formation, stem development, and condition of foliage.

Some forest workers are employed on tree farms, where they plant, cultivate, and harvest many different kinds of trees. Their duties vary with the type of farm. Those who work on specialty farms, such as farms growing Christmas or ornamental trees for nurseries, are responsible for shearing treetops and limbs to control the growth of the trees under their care, to increase the density of limbs, and to improve the shapes of the trees. In addition, these workers' duties include planting the seedlings, spraying to control surrounding weed growth and insects, and harvesting the trees.

Other forest workers gather, by hand or with the use of hand-tools, products from the woodlands, such as decorative greens, tree cones and barks, moss, and other wild plant life. Some may tap trees for sap to make syrup or chemicals.

Work environment. Most of these jobs are physically demanding. Workers spend all their time outdoors, sometimes in poor weather and often in isolated areas. It may be necessary for some forestry aides or forest workers to walk long distances

Forest and conservation workers strive to promote growth of individual trees and entire forests.

through densely wooded areas to accomplish their work tasks. The increased use of enclosed machines has decreased some of the discomforts caused by inclement weather and has generally made tasks much safer.

Still, workers must be careful and use proper safety measures and equipment such as hardhats, eye protection, safety clothing, and boots to reduce the risk of injury. Data from the U.S. Bureau of Labor Statistics show that full-time forest and conservation workers experienced a work-related injury and illness rate that was higher than the national average. But the jobs of forest and conservation workers generally are much less hazardous than those of logging workers, who work in a similar environment.

Training, Other Qualifications, and Advancement

Most forest and conservation workers develop skills through on-the-job training, learning from experienced workers.

Education and training. Generally, a high school diploma is sufficient for most forest and conservation occupations. Many forest worker jobs offer only seasonal employment during warm-weather months, so students are often hired to perform short-term, labor-intensive tasks, such as planting tree seedlings or conducting pre-commercial tree thinning.

Training programs for forest and conservation workers are common in many States. These training programs typically take place in the field, encouraging the health and productivity of the Nation’s forests through programs such as the Sustainable Forest Initiative.

Some vocational and technical schools and community colleges offer courses leading to a 2-year technical degree in forest management technology, wildlife management, conservation, and forest harvesting, all of which are helpful in obtaining a job. A curriculum that includes field trips to observe or participate in forestry or logging activities provides a particularly good background. Additionally, a few community colleges offer training for equipment operators.

Other qualifications. Forest and conservation workers must be in good health and able to work outdoors every day. They also must be able to work as part of a team. Maturity and good judgment are important in making quick, intelligent decisions when hazards arise. Mechanical aptitude and coordination are necessary for operators of machinery and equipment, who often are responsible for repair and maintenance.

Advancement. Advancement generally takes place by obtaining a bachelor’s degree in forestry or related field. A bachelor’s degree may also qualify candidates to become a forester. (See the section on conservation scientists and foresters elsewhere in the *Handbook*.)

Employment

Forest and conservation workers held about 12,900 jobs in 2008 in the following industries:

State government.....	5,900
Forestry	2,000
Local government.....	1,600

About 58 percent of all forest and conservation workers work for government, primarily at the State and local level. Those employed in forest management services may work on a contract basis for the U.S. Department of Agriculture’s Forest Service. Self-employed forest and conservation workers make up around 1 percent of the occupation.

Although forest and conservation workers are located in every State, employment is concentrated in the West and Southeast, where many national and private forests and parks are located. Seasonal demand for forest and conservation workers can vary by region and time of year. For northern States, in particular, winter weather can interrupt forestry operations.

Job Outlook

Employment is expected to experience average growth. Most job openings will result from the large number of workers who leave these jobs on a seasonal basis and from an increase in retirements.

Employment change. Employment of forest and conservation workers is expected to grow 9 percent over the 2008-18 decade, as fast as the average for all occupations. Demand for forest and conservation workers will increase as more land is set aside to protect natural resources or wildlife habitats. In addition, more jobs may be created by recent Federal legislation designed to prevent destructive wildfires by thinning the forests and by setting controlled burns in dry regions susceptible to forest fires.

Recent developments in Western forests may result in the conversion of unused roads into forestland, thus creating some new jobs. Additionally, increasing pressure from a growing number of stakeholders for the United States Forest Service to undertake major road repair may also result in higher levels of employment. Employment growth will, nonetheless, be largely determined by each of these programs’ ability to obtain necessary funding.

Job prospects. Some opportunities will stem from employment growth, but most openings will arise from the large number of workers who leave these jobs on a seasonal basis and from an increase in retirements expected over the next decade. The best employment opportunities should continue to be in Maine, the Southeast, and the Pacific Northwest.

Employment of forest and conservation workers can sometimes be unsteady. During the muddy spring season and the cold winter months, weather often can curtail the work, depending on the geographic region.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Forest and conservation workers.....	45-4011	12,900	14,000	1,100	9

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Earnings

In May 2008, median hourly wages of wage and salary forest and conservation workers were \$10.98. The middle 50 percent earned between \$8.98 and \$14.75. The lowest 10 percent earned less than \$8.02, and the highest 10 percent earned more than \$20.04.

Many beginning or inexperienced workers earn the Federal minimum wage of \$7.25 per hour as of July 24, 2009, but many States may set minimum wages higher than the Federal minimum.

Forest and conservation workers who work for State and local governments or for large, private firms generally enjoy more generous benefits than do workers in smaller firms.

Related Occupations

Other occupations concerned with the care of trees and their environment include:

	Page
Conservation scientists and foresters	185
Forest and conservation technicians.....	230
Grounds maintenance workers.....	498

Logging Workers

Significant Points

- Workers spend all their time outdoors, sometimes in poor weather and often in isolated areas.
- Most jobs are physically demanding and can be hazardous.
- Employment is projected to grow 6 percent, which is slower than the average.
- Despite slower than average employment growth, job opportunities should be good because of the need to replace workers who leave the occupation for other jobs that are less physically demanding, dangerous, and prone to layoffs.

Nature of the Work

Logging workers harvest thousands of acres of forests each year for the timber that provides the raw material for countless consumer and industrial products. The timber-cutting and logging process is carried out by a logging crew. A typical crew might consist of one or two tree fallers or one tree harvesting machine operator to cut down trees, one buckler to cut logs, two logging skidder operators to drag cut trees to the loading deck, and one equipment operator to load the logs onto trucks.

Fallers, commonly known as *tree fallers*, cut down trees with hand-held power chain saws or mobile felling machines. Using gas-powered chain saws, *bucklers* trim off the tops and branches and buck (cut) the resulting logs into specified lengths. *Choke setters* fasten chokers (steel cables or chains) around logs to be skidded (dragged) by tractors or forwarded by the cable-yarding system to the landing or deck area, where the logs are separated by species and type of product, such as pulpwood, saw logs, or veneer logs, and loaded onto trucks. *Rigging slingers* and *chasers* set up and dismantle the cables and guy wires of the yarding system. *Log sorters, markers, movers, and chippers* sort, mark, and move logs, based on species, size, and ownership, and tend machines that chip up logs.

Logging equipment operators use tree harvesters to fell the trees, shear the limbs off, and then cut the logs into desired lengths. They drive tractors mounted on crawler tracks and operate self-propelled machines called skidders or forwarders, which drag or transport logs from the felling site in the woods to the log landing area for loading. They also operate grapple loaders, which lift and load logs into trucks. Some logging equipment operators, usually at a sawmill or a pulp-mill woodyard, use a tracked or wheeled machine similar to a fork-lift to unload logs and pulpwood off of trucks or gondola railroad cars. Some newer, more efficient logging equipment has state-of-the-art computer technology, requiring skilled operators with more training.

Log graders and scalers inspect logs for defects, measure logs to determine their volume, and estimate the marketable content or value of logs or pulpwood. These workers often use hand-held data collection devices to enter data about individual trees; later, the data can be downloaded to a central computer.

A logging worker cuts a log into smaller lengths.

Other timber-cutting and logging workers have a variety of responsibilities. Some hike through forests to assess logging conditions. Some clear areas of brush and other growth to prepare for logging activities or to promote the growth of desirable species of trees.

Most crews work for self-employed logging contractors who have substantial logging experience, the capital to purchase equipment, and the skills needed to run a small business successfully. Many contractors work alongside their crews as supervisors and often operate one of the logging machines, such as the grapple loader or the tree harvester. Some manage more than one crew and function as owner-supervisors.

Although timber-cutting and logging equipment has greatly improved and operations are becoming increasingly mechanized, many logging jobs still are dangerous and very labor intensive. These jobs require various levels of skill, ranging from the unskilled task of manually moving logs, branches, and equipment to skillfully using chain saws to fell trees, and heavy equipment to skid and load logs onto trucks. To keep costs down, many timber-cutting and logging workers maintain and repair the equipment they use. A skillful, experienced logging worker is expected to handle a variety of logging operations.

Work environment. Logging jobs are physically demanding and can be hazardous. Workers spend all their time outdoors, sometimes in poor weather and often in isolated areas. The increased use of enclosed machines has decreased some of the discomforts caused by inclement weather and has generally made logging much safer. Workers in some sparsely populated western States and northern Maine commute long distances between their homes and logging sites. A few logging camps in Alaska and Maine house workers in bunkhouses. In the more densely populated eastern and southern States, commuting distances are shorter.

Most logging occupations involve lifting, climbing, and other strenuous activities, although machinery has eliminated some heavy labor. Loggers work under unusually hazardous conditions. Falling branches, vines, and rough terrain are constant hazards, as are the dangers associated with tree-felling and log-handling operations. Special care must be taken during strong winds, which can even halt logging operations. Slippery or muddy ground, hidden roots, or vines not only reduce efficiency, but also present a constant danger, especially in the presence of moving vehicles and machinery. Poisonous plants, brambles, insects, snakes, heat, humidity, and extreme cold are common conditions where loggers work. The use of hearing protection devices is required on logging operations because the high noise level of felling and skidding operations over long periods may impair one's hearing. Workers must be careful and use proper safety measures and equipment such as hardhats, eye and ear protection, safety clothing, and boots to reduce the risk of injury.

Training, Other Qualifications, and Advancement

Most logging workers develop skills through on-the-job training, learning from experienced workers.

Education and training. Generally, a high school diploma is sufficient for most logging occupations. Through on-the-job training, logging workers become familiar with the character

and dangers of the forest environment and the operation of logging machinery and equipment.

Safety training is a vital and required part of the instruction of all logging workers. Many State forestry or logging associations provide training sessions for tree fallers, whose job duties require more skill and experience than do other positions on the logging team. Sessions may take place in the field, where trainees, under the supervision of an experienced logger, have the opportunity to practice various felling techniques. Fallers learn how to manually cut down extremely large or expensive trees safely and with minimal damage to the felled or surrounding trees.

Training programs for loggers are common in many States. Although specific coursework may vary by State, most programs usually include classroom or field training in a number of areas, including best management practices, environmental compliance, wetlands, safety, endangered species, reforestation, and business management. Some programs lead to logger certification.

Logging companies and trade associations, such as the North-eastern Loggers Association, the American Loggers Council, and the Forest Resources Association, Inc., also offer training programs for workers who operate large, expensive machinery and equipment. Often, a representative of the equipment manufacturer spends several days in the field explaining and overseeing the operation of newly purchased machinery.

Some vocational and technical schools and community colleges offer courses leading to a 2-year technical degree in forest harvesting, which may be helpful in obtaining a job. A curriculum that includes field trips to observe or participate in logging activities provides a particularly good background. Additionally, a few community colleges offer training for equipment operators.

Other qualifications. Logging workers must be in good health and able to work outdoors every day. They also must be able to work as part of a team. Many logging occupations require physical strength and stamina. Maturity and good judgment are important in making quick, intelligent decisions when hazards arise. Mechanical aptitude and coordination are necessary for machinery and equipment operators, who often are responsible for repair and maintenance. Self-employed loggers need initiative and managerial and business skills to be successful as logging contractors.

Advancement. Logging workers generally advance from tasks requiring a lot of manual labor to those involving the operation of expensive, sometimes complicated logging equipment. Inexperienced entrants usually begin as laborers, carrying tools and equipment, clearing brush, performing equipment maintenance, and loading and unloading logs and brush. For some, familiarization with logging operations may lead to jobs such as log-handling equipment operator. Further experience may lead to jobs involving the operation of more complicated machinery and yarding towers to transport, load, and unload logs. Those who have the skills required for the efficient use of power saws and other equipment may become fallers and buckers.

Some experienced logging workers start their own logging contractor businesses, but to do so they also need some basic business skills, which are essential in logging's difficult business climate.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Logging workers	45-4020	66,100	70,000	3,900	6
Fallers.....	45-4021	11,000	10,700	-300	-3
Logging equipment operators	45-4022	41,700	44,900	3,200	8
Log graders and scalers.....	45-4023	5,500	5,400	-100	-2
Logging workers, all other.....	45-4029	8,000	9,100	1,100	14

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Employment

Logging workers held about 66,100 jobs in 2008 in the following occupations:

Logging equipment operators	41,700
Fallers.....	11,000
Log graders and scalers.....	5,500
Logging workers, all others.....	8,000

About half of all logging workers work for the logging industry. Another 31 percent are self-employed, who mostly work under contract to landowners and the logging industry. About 10 percent work in the wood product manufacturing industry, mainly in sawmills.

Seasonal demand for logging workers can vary by region and time of year. For northern States in particular, winter weather can interrupt logging operations, although some logging can be done in winter.

Job Outlook

Employment of logging workers is projected to grow more slowly than the average over the 2008–18 decade. Despite slower than average employment growth, job opportunities should be good because of the need to replace workers who leave the occupation for jobs that are less hazardous.

Employment change. Employment of logging workers is expected to grow 6 percent from 2008 to 2018, which is slower than the average for all occupations. New policies allowing some access to Federal timberland may result in some logging jobs, and Federal legislation designed to prevent destructive wildfires by proactively thinning forests in susceptible regions also may result in additional jobs. Foreign and domestic demand for new wood products, such as wood pellets, is expected to result in some employment growth as well. Nonetheless, domestic timber producers continue to face increasing competition from foreign producers, who can harvest the same amount of timber at lower cost. The logging industry is expected to continue to consolidate in order to reduce costs, which may offset the creation of most new jobs.

Increased mechanization of logging operations and improvements in logging equipment will continue to depress demand for many manual timber-cutting and logging workers. Employment of fallers, buckers, choke setters, and other workers whose jobs are labor intensive should decline as more laborsaving equipment is used. Employment of machinery and equipment operators, such as tree harvesting, skidding, and log-handling equipment operators, will be less adversely

affected and should rise as logging companies switch away from manual tree felling.

Job prospects. Despite slower than average employment growth, job opportunities should be good because of the need to replace workers who leave the occupation for other jobs that are less physically demanding, dangerous, and prone to layoffs. Employment of logging workers can sometimes be unsteady as changes in the level of construction, particularly residential construction, can cause slowdowns in logging activities in the short term. In addition, logging operations must be relocated when timber in a particular area has been harvested. During prolonged periods of inactivity, some workers may stay on the job to maintain or repair logging machinery and equipment, but others are laid off or forced to find jobs in other occupations.

Earnings

Earnings of logging workers vary by size of establishment and by geographic area. Workers in the largest establishments earn more than those in the smallest ones. Workers in Alaska and the Northwest earn more than those in the South, where the cost of living is generally lower. Median hourly wages in May 2008 for logging occupations were as follows:

Log graders and scalers.....	\$15.64
Logging equipment operators	15.18
Fallers.....	14.66
Logging workers, all others.....	15.96

Small logging contractor firms generally offer timber-cutting and logging workers few benefits beyond vacation days. However, some employers offer full-time workers basic benefits, such as medical coverage, and provide safety apparel and equipment.

Agricultural Workers, Other

Significant Points

- Duties vary widely—from raising plants and livestock to operating large farm equipment.
- The majority of agricultural workers learn their skills on the job in less than a month; animal breeders require more work experience or a college degree.
- Job openings are expected to be numerous; opportunities for agricultural equipment operators, and crop, greenhouse, and nursery farmworkers should be particularly plentiful.

Nature of the Work

Agricultural workers play a large role in getting food, plants, and other agricultural products to market. Working mostly on farms or ranches, but also in nurseries and slaughterhouses, these workers have numerous and diverse duties. Among their activities are planting and harvesting crops, installing irrigation, and delivering animals. While most agricultural workers have relatively few technical skills, some have college degrees that train them to breed animals with specific traits.

Crop, nursery, and greenhouse farmworkers and laborers—the largest specialty by far—perform numerous activities related to growing and harvesting grains, fruits, vegetables, nuts, fiber, trees, shrubs, and other crops. They plant and seed, prune, irrigate, harvest, and pack and load crops for shipment. Farmworkers also apply pesticides, herbicides, and fertilizers to crops and repair fences and some farm equipment. Nursery and greenhouse workers prepare land or greenhouse beds for growing

horticultural products, such as trees, plants, flowers, and sod. Their duties include planting, watering, pruning, weeding, and spraying the plants. They may cut, roll, and stack sod; stake trees; tie, wrap, and pack plants to fill orders; and dig up or move field-grown and containerized shrubs and trees.

Farm and ranch animal farmworkers—the second largest specialty—care for live farm, ranch, or water animals that may include cattle, sheep, swine, goats, horses, poultry, finfish, shellfish, and bees. The animals are usually raised to supply meat, fur, skins, feathers, eggs, milk, or honey. Duties may include feeding, watering, herding, grazing, castrating, branding, debeaking, weighing, catching, and loading animals; they also maintain records on animals, examine animals to detect diseases and injuries, assist in delivering animals at their birth, and administer medications, vaccinations, or insecticides. Many workers clean and maintain animal housing areas every day. On dairy farms, farmworkers operate milking machines.

Other agricultural workers known as *agricultural equipment operators* use a variety of farm equipment to plow, sow seeds, and maintain and harvest crops. Equipment may include tractors, fertilizer spreaders, haybines, raking equipment, balers, combines, threshers, and trucks. These workers also operate machines, such as conveyor belts, loading machines, separators, cleaners, and dryers, used in moving and treating crops after their harvest. As part of the job, workers may make adjustments and minor repairs to equipment.

Animal breeders select and breed animals using their knowledge of genetics and animal science to produce offspring with desired traits and characteristics, such as chickens that lay more eggs, pigs that produce leaner meat, and sheep with more desirable wool. Other animal breeders breed and raise cats, dogs, and other household pets. Larger and more expensive animals, such as horses and cattle, are usually bred through artificial insemination, a specialized technique which requires taking semen from the male and then inseminating the female. This process ensures better results than conventional mating and also enables one prized male to sire many more offspring. To know which animals to breed and when, animal breeders keep detailed records, including the health of the animals, their size and weight, and the amount and quality of the product produced by them. They also keep track of the traits of the offspring. Some animal breeders work as consultants for a number of farmers, but others breed and raise their own animals for sale or future breeding. For those who raise animals, tasks might include fixing and cleaning animal shelters, feeding and watering the animals, and overseeing animals' health. Some breeders supervise others who perform these tasks. Animal breeders also read journals and newsletters to learn the latest information on breeding and veterinary practices.

Work environment. Working conditions for agricultural workers vary widely. Much of the work of farmworkers and laborers on farms and ranches is physically strenuous and takes place outdoors in all kinds of weather. Harvesting fruits and vegetables, for example, may require much bending, stooping, and lifting. Workers may have limited access to sanitation facilities while working in the field and drinking water may also be limited. Nevertheless, many agricultural workers enjoy the variety of their work, the rural setting, the satisfaction of working the land, and raising animals.

Farm work does not lend itself to a regular 40-hour work-week. In fact, about 16 percent of all agricultural workers have a variable schedule. Work cannot be delayed when crops must be planted or harvested or when animals must be sheltered and fed. Long hours and weekend work is common in these jobs. For example, farmworkers and agricultural equipment operators may work 6 or 7 days a week during planting and harvesting seasons.

Many agricultural worker jobs are seasonal in nature, so some workers also do other jobs during slow seasons. Migrant farmworkers, who move from location to location as crops ripen, live an unsettled lifestyle, which can be stressful. Work also is seasonal for farmworkers in nurseries; spring and summer are the busiest times of the year. Greenhouse workers enjoy relatively comfortable working conditions while tending plants indoors. However, during the busy seasons, when landscape contractors need plants, work schedules may be more demanding, often requiring weekend work. Moreover, the transition from warm weather to cold weather means that nursery workers might have to work overtime with little notice in order to move plants indoors to protect them from frost. Farmworkers who work with animals usually have a more regular schedule; their work is steadier and year round, but they sometimes must come to work on short notice to help handle emergencies.

Farmworkers risk exposure to pesticides and other hazardous chemicals sprayed on crops or plants. However, exposure

can be minimal if safety procedures are followed. Those who work on mechanized farms must take precautions to avoid injury when working with tools and heavy equipment. Those who work directly with animals risk being bitten or kicked.

Animal breeders spend most of their time outdoors around animals but can also work in offices or laboratories. Breeders who consult may travel from farm to farm. If they need to sell offspring, breeders may travel to attend shows and meet potential buyers. While tending to the animals, breeders may be bitten or kicked.

Training, Other Qualifications, and Advancement

The majority of agricultural workers learn their skills on the job in less than a month; animal breeders require more work experience or a college degree.

Education and training. Most farmworkers learn their jobs quickly as they work; many do not have a high school diploma. People without a high school diploma are particularly common in the crop production sector, which is more labor-intensive and employs numerous migrant farmworkers. Other agricultural workers may require a month to a year of training on the job, depending on their responsibilities.

Other qualifications. Experience working on a farm or around animals is helpful but not necessary to qualify for many jobs. For those who operate equipment on the road or drive a truck as part their job, a driver's license or commercial driver's license is required.

Nursery workers who deal directly with customers must be friendly and tactful. Employers also look for responsible, self-motivated individuals because nursery workers sometimes work with little supervision.

Advancement. Farmworkers who work hard, have good communication skills, and take an interest in the business may advance to crew leader or other supervisory positions. The ability to speak both English and Spanish is quite helpful in supervisory work as well.

Some agricultural workers aspire to become farm, ranch, or other agricultural managers, or own farms or ranches themselves. (Farmers, ranchers, and agricultural managers are discussed elsewhere in the *Handbook*.) In addition, their knowledge of raising and harvesting produce may provide an excellent background for becoming purchasing agents and buyers of farm products. Knowledge of working a farm as a business can also help agricultural workers become farm and home management advisors. Those who earn a college degree in agricultural science could become agricultural and food scientists. (Agricultural and food scientists are discussed elsewhere in the *Handbook*.)

Employment

Agricultural workers held about 821,700 jobs in 2008. About one third was employed in animal production; some found employment in support activities for agriculture and forestry.

Arizona, California, Colorado, Texas, and New Mexico employ approximately one quarter of all crop workers; California, Florida, and Oregon employ the most nursery workers.

Job Outlook

Job opportunities for agricultural workers occupations should be abundant because large numbers of workers leave these jobs due to their low wages and physical demands. Little or no

A nursery worker waters flowers in a greenhouse.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Agricultural workers, all other	—	821,700	804,400	17,400	-2
Animal breeders	45-2021	14,700	15,500	800	6
Miscellaneous agricultural workers	45-2090	807,000	788,800	-18,200	-2

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

change in employment is expected over the 2008–18 decade, reflecting in large part the outlook for farmworkers in crops, nurseries, and greenhouses, who make up the largest majority of all agricultural workers.

Employment change. Overall employment is expected to show little or no change in employment. Fewer agricultural workers will be needed overall because of continued consolidation of farms and technological advancements in farm equipment that is raising output per farm worker. The agriculture industry also is expected to face increased competition from foreign countries and rising imports, particularly from Central America and China because of trade agreements with those regions. Nursery and greenhouse workers might experience some job growth in this period, if the demand for landscaping plants resumes its growth pattern.

Job prospects. Job openings should be plentiful because of relatively large numbers of workers who leave these jobs for other occupations. This is especially true for jobs as agricultural equipment operators, and crop, greenhouse, and nursery farmworkers. Those who work with animals tend to have a more settled lifestyle, as the work does not require them to follow crops for harvest.

Earnings

Agricultural workers had the following median hourly wages in May 2008:

Animal breeders	\$13.02
Agricultural equipment operators	10.92
Farmworkers, farm and ranch animals	10.13
Farmworkers and laborers, crop, nursery, and greenhouse	8.64
Agricultural workers, all others	12.00

Farmworkers in crop production often are paid piece rates, with earnings based on how much they do instead of how many hours they work. Farmworkers tend to receive fewer benefits

than those in many other occupations. Some employers supply seasonal workers with room and board.

Related Occupations

The duties of farmworkers who perform outdoor labor are similar to the duties of:

	Page
Fishers and fishing vessel operators	601
Forest and conservation workers	604
Grounds maintenance workers	498
Farmworkers who work with farm and ranch animals perform tasks similar to those of:	
Animal care and service workers	504
Animal breeders may perform some work similar to those of:	
Veterinarians	402
Veterinary technologists and technicians	443

Other Farming, Fishing, and Forestry Occupations

Agricultural Inspectors

Nature of the Work

Agricultural inspectors are employed by Federal and State governments to ensure compliance with laws and regulations governing the health, safety, and quality of agricultural commodities, processing equipment and facilities, and fish and logging operations.

Education and Training

Most jobs require work experience in a related field, such as food processing, or some college coursework in biology, agricultural science, or a related subject.

Job Outlook

Current and projected employment:

2008 Employment	16,600
2018 Employment	18,700
Employment change.....	2,100
Growth rate.....	13%

Employment change. Average employment growth is expected as Federal and State governments, the largest employers of these workers, are not expected to hire a significant number of new inspectors. However, demand for agricultural inspectors may increase significantly if pending legislation requiring greater scrutiny of the food industry by the Food and Drug Administration is passed.

Job prospects. Prospects should be good as a large number of government inspectors are expected to retire in the coming decade.

Earnings

Median annual wages of agricultural inspectors were \$41,170 in May 2008.

Related Occupations

	Page
Food scientists and technologists.....	177
Purchasing agents and buyers, farm products	79

Sources of Additional Information

Information on obtaining positions as an agricultural inspector with the Federal Government is available from the Office of Personnel Management through USAJOBS, the Federal Government's official employment information system. This resource for locating and applying for job opportunities can be accessed through the Internet at <http://www.usajobs.opm.gov> or through an interactive voice response telephone system at (703) 724-1850 or TDD (978) 461-8404. These numbers are not toll free, and charges may result.

Graders and Sorters, Agricultural Products

Nature of the Work

Graders and sorters grade, sort, or classify unprocessed food and other agricultural products by size, weight, color, or condition and discard inferior or defective products.

Education and Training

While some jobs require a high school diploma, simple jobs that need mostly visual inspection might be filled by those with work-related experience.

Job Outlook

Current and projected employment:

2008 Employment	33,400
2018 Employment	33,500
Employment change.....	100
Growth rate.....	0%

Employment change. Little or no change in employment is expected. Increased use of electronic sorters, higher levels of imported agricultural products, and growth of produce with less waste will result in decreased demand for these workers.

Job prospects. Most job openings will arise from the need to replace workers who leave the occupation each year. There may be competition for positions.

Earnings

Median hourly wages for graders and sorters of agricultural products were \$9.06 per hour in May 2008.

Related Occupations

Construction Trades and Related Workers

Boilermakers

Significant Points

- Most boilermakers learn their job through a formal apprenticeship; people with a welding certification or other welding training get priority in selection to boilermaker apprenticeship programs.
- Boilermakers use potentially dangerous equipment and the work is physically demanding.
- Job opportunities are expected to be favorable.

Nature of the Work

Boilermakers and *boilermaker mechanics* make, install, and repair boilers, closed vats, and other large vessels or containers that hold liquids and gases. Boilers heat water or other fluids under extreme pressure for use in generating electric power and to provide heat and power in buildings, factories, and ships. Tanks and vats are used to store and process chemicals, oil, beer, and hundreds of other products.

In addition to installing and maintaining boilers and other vessels, boilermakers also help erect and repair air pollution equipment, blast furnaces, water treatment plants, storage and process tanks, and smoke stacks. Boilermakers also install refractory brick and other heat-resistant materials in fireboxes or pressure vessels. Some install and maintain the huge pipes used in dams to send water to and from hydroelectric power generation turbines.

Boilers and other high-pressure vessels used to hold liquids and gases usually are made in sections by casting each piece out of steel, iron, copper, or stainless steel. Manufacturers increasingly are automating this process to improve the quality of these vessels. Boilermakers weld sections of the boiler together, often using robotic welding systems or automated welding machines. Small boilers may be assembled in the manufacturing plant; larger boilers usually are prefabricated in numerous pieces and assembled on site, although they may be temporarily assembled in a fabrication shop to ensure a proper fit before final assembly at the permanent site.

Because boilers last a long time—sometimes 50 years or more—boilermakers need to regularly maintain them and upgrade components, such as boiler tubes, heating elements, and ductwork, to increase efficiency. They frequently inspect fittings, feed pumps, safety and check valves, water and pressure gauges, boiler controls, and auxiliary machinery. For closed vats and other large vessels, boilermakers clean or supervise cleaning of the vats using scrapers, wire brushes, and cleaning solvents. They repair or replace defective parts using hand and power tools, gas torches, and welding equipment, and may operate metalworking machinery to repair or make parts. They also dismantle leaky boilers, patch weak spots with metal stock, replace defective sections, and strengthen joints.

Before making or repairing a fabricated metal product, a boilermaker studies design drawings and creates full size patterns or templates, using straightedges, squares, transits, and tape measures. After the various sized shapes and pieces are marked out on metal, boilermakers use hand and power tools or flame cutting torches to make the cuts. The sections of metal are then bent into shape and accurately lined up before they are welded together. If the plate sections are very large, heavy cranes are used to lift the parts into place. Boilermakers align sections using plumb bobs, levels, wedges, and turnbuckles. They use metalworking machinery and other tools to remove irregular edges so that metal pieces fit together properly. They then join them by bolting, welding, or riveting. Boilermakers also align and attach water tubes, stacks and liners, safety and check valves, water and pressure gauges, and other parts, and test complete vessels for leaks or other defects.

Boilermakers weld sections of the boiler together.

Work environment. Boilermakers often use potentially dangerous equipment, such as acetylene torches and power grinders, handle heavy parts and tools, and work on ladders or on top of large vessels. Dams, boilers, storage tanks, and pressure vessels are usually of substantial size, thus a major portion of boilermaker work is performed at great heights, sometimes hundreds of feet above the ground in the case of dams. The work is physically demanding and may be done in cramped quarters inside boilers, vats, or tanks that are often dark, damp, and poorly ventilated. Field construction work is performed outside so exposure to all types of weather conditions, including extreme heat and cold, is common. To reduce the chance of injuries, boilermakers often wear hardhats, harnesses, protective clothing, ear plugs, safety glasses and shoes, and respirators.

Boilermakers may experience extended periods of overtime when equipment is shut down for maintenance. Overtime work also may be necessary to meet construction or production deadlines. However, since most field construction and repair work is contract work, there may be periods of unemployment when a contract is complete. Many boilermakers must travel to a project and live away from home for long periods of time.

Training, Other Qualifications, and Advancement

Most boilermakers learn this trade through a formal apprenticeship. People with a welding certification or other welding training get priority in selection to boilermaker apprenticeship programs.

Education and training. Boilermakers learn their trade through formal apprenticeships offered through unions or employers or from a combination of trade and technical school training and employer-provided training. Training usually includes both boilermaking and structural fabrication. Apprenticeship programs usually consist of 6,000 hours or 4 years of paid on-the-job training, supplemented by a minimum of 144 hours of classroom instruction each year in subjects such as set-up and assembly rigging, plate and pressure welding, blueprint reading, and layout. Those who finish registered apprenticeships are certified as fully qualified journey-level workers.

Most apprentices must be at least 18 years old, a high school graduate or holder of a GED, and be legally authorized to work in the United States. Those with welding training or a welding certification will have an advantage in applying for apprenticeship programs. When an apprenticeship becomes available, the local union usually publicizes the opportunity by notifying local vocational schools and high school vocational programs. Education often continues throughout a boilermaker's career as they often attend classes or seminars to learn about new equipment, procedures, and technology.

Other qualifications. The work of boilermakers requires a high degree of technical skill, knowledge, and dedication. Because the tools and equipment used by boilermakers are typically heavier and more cumbersome than those in other

construction trades, having physical strength and stamina is important. Good manual dexterity is also important.

Advancement. Some boilermakers advance to supervisory positions. Because of their extensive training, those qualified through apprenticeships usually have an advantage in getting promoted over those who have not gone through the complete program.

Employment

Boilermakers held about 20,200 jobs in 2008. About 21 percent worked in the nonresidential building construction industry, assembling and erecting boilers and other vessels. Another 21 percent worked in manufacturing.

Job Outlook

Employment is projected to grow faster than average. Favorable job opportunities are expected.

Employment change. Employment of boilermakers is expected to grow by 19 percent between 2008 and 2018. Growth will be driven by the need to maintain and upgrade, rather than replace, the many existing boilers that are getting older, and by the need to meet the growing population's demand for electric power. While boilers historically have lasted over 50 years, the need to replace components, such as boiler tubes, heating elements, and ductwork, is an ongoing process that will continue to spur demand for boilermakers. To meet the requirements of the Clean Air Act, utility companies also will need to continue upgrading their boiler systems.

Federal policies are also encouraging the construction of more environmentally sound and higher efficiency clean-burning coal, wind, and solar power plants, which will spur demand for boilermakers.

Installation of new boilers and pressure vessels, air pollution equipment, water treatment plants, storage and process tanks, electric static precipitators, and stacks and liners, will further drive growth of boilermakers, although to a lesser extent than repairs will.

Job prospects. Job prospects should be favorable because the work of a boilermaker remains hazardous and physically demanding, leading some qualified applicants to seek other types of work. Job growth will generate some new openings, but an even greater number of openings will arise from the numerous boilermakers expected to retire.

People who have welding training or a welding certificate should have the best opportunities for being selected for boilermaker apprenticeship programs.

Many industries that purchase boilers are sensitive to economic conditions. Therefore, during economic downturns, boilermakers in the construction industry may be temporarily laid off. However, maintenance and repairs of boilers must continue even during economic downturns so boilermaker mechanics in

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected	Change, 2008-2018	
			Employment, 2018	Number	Percent
Boilermakers.....	47-2011	20,200	24,000	3,800	19

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

manufacturing and other industries generally have more stable employment.

Earnings

In May 2008, the median annual wage and salary of boiler-makers was about \$52,260. The middle 50 percent earned between \$41,210 and \$64,300. The lowest 10 percent earned less than \$32,480, and the highest 10 percent earned more than \$76,160. Apprentices generally start at about half of journey-level wages, with wages gradually increasing to the journey wage as workers gain skills.

Many boilermakers belong to labor unions, most to the International Brotherhood of Boilermakers. Other boilermakers are members of the International Association of Machinists, the United Automobile Workers, or the United Steelworkers of America.

Brickmasons, Blockmasons, and Stonemasons

Significant Points

- Job opportunities are expected to be good, especially for those with restoration skills.
- Some entrants learn informally on the job, but apprenticeship programs provide the most thorough training.
- The work is usually outdoors and involves lifting heavy materials and working on scaffolds.
- About 27 percent of brickmasons, blockmasons, and stonemasons were self-employed.

Nature of the Work

Brickmasons, *blockmasons*, and *stonemasons* create attractive, durable surfaces and structures. For thousands of years, these workers have built buildings, fences, roads, walkways, and walls using bricks, concrete blocks, and natural stone. The structures that they build will continue to be in demand for years to come.

The work varies in complexity, from laying a simple masonry walkway to installing an ornate exterior on a highrise building. Workers cut or break the materials used to create walls, floors, and other structures. Once their building materials are properly sized, they are laid with or without a binding material. Workers use their own perceptions and a variety of tools to ensure that the structure meets the desired standards. After they finish laying the bricks, blocks, or stone, the workers clean the finished product with a variety of cleaning agents.

Brickmasons and blockmasons—who often are called simply *bricklayers*—build and repair walls, floors, partitions, fireplaces, chimneys, and other structures with brick, precast masonry panels, concrete block, and other masonry materials. Some brickmasons specialize in installing firebrick linings in industrial furnaces.

When building a structure, brickmasons usually start in the corners. Because of the precision needed, corners are time-consuming to erect and require the skills of experienced bricklayers. To lay the brick, brickmasons spread a bed of mortar (a mixture of cement, lime, sand, and water) with a trowel (a flat, bladed metal tool with a handle), place the brick on the mortar bed, and press and tap the brick into place. Depending on blueprint specifications, brickmasons either cut bricks with a hammer and chisel or saw them to fit around windows, doors, and other openings. Mortar joints are then finished with jointing tools for a sealed, neat, uniform appearance. Although brickmasons typically use steel supports, or lintels, at window and door openings, they sometimes build brick arches, which support and enhance the beauty of the brickwork.

Refractory masons are brickmasons who specialize in installing firebrick and refractory tile in high-temperature boilers, furnaces, cupolas, ladles, and soaking pits in industrial establishments. Most of these workers are employed in steel mills, where molten materials flow on refractory beds from furnaces to rolling machines. They also are employed at oil refineries,

glass furnaces, incinerators, and other locations requiring high temperatures during the manufacturing process.

After a structure is completed there is often work that still needs to be done. *Pointing, cleaning, and caulking workers* can be the final workers on a job or the primary workers on a restoration project. These workers usually replace bricks or make repairs to brickwork on older structures where mortar has come loose. Special care is taken not to damage the main structural integrity or the bricks, blocks, or stone. Depending on how much mortar is being replaced, it may take several applications to allow the new mortar to cure properly. After laying the new bricks, the workers use chemicals to clean the brick and stone to give the structure a finished appearance.

Stonemasons build stone walls, as well as set stone exteriors and floors. They work with two types of stone—natural-cut stone, such as marble, granite, and limestone; and artificial stone, made from concrete, marble chips, or other masonry materials. Masons use a special hammer and chisel to cut stone. They cut stone along the grain to make various shapes and sizes, and valuable pieces are often cut with a saw that has a diamond blade. Stonemasons often work from a set of drawings in which each stone has been numbered for identification. Helpers may locate and carry these prenumbered stones to the masons. A derrick operator using a hoist may be needed to lift large stone pieces into place.

A blockmason sets concrete blocks.

When building a stone wall, masons set the first course of stones into a shallow bed of mortar. They then align the stones with wedges, plumb lines, and levels, and work them into position with various tools. Masons continue to build the wall by alternating layers of mortar and courses of stone. As the work progresses, masons remove the wedges, fill the joints between stones, and use a pointed metal tool, called a tuck pointer, to smooth the mortar to an attractive finish. To hold large stones in place, stonemasons attach brackets to the stones and weld or bolt these brackets to anchors in the wall. Finally, masons wash the stones with a cleansing solution to remove stains and dry the mortar.

When setting stone floors, which often consist of large and heavy pieces of stone, masons first use a trowel to spread a layer of damp mortar over the surface to be covered. They then use crowbars and hard rubber mallets for aligning and leveling to set the stone in the mortar bed. To finish, workers fill the joints and clean the stone slabs.

Some masons specialize in setting marble, which, in many respects, is similar to setting large pieces of stone. Brickmasons and stonemasons also repair imperfections and cracks and replace broken or missing masonry units in walls and floors.

Most nonresidential buildings are now built with walls made of some combination of any of the following: concrete block, brick veneer, stone, granite, marble, tile, and glass. In the past, masons doing nonresidential interior work mainly built block partition walls and elevator shafts, but because many types of masonry and stone are used in the interiors of today's nonresidential structures, these workers now must be more versatile. For example, some brickmasons and blockmasons now install structural insulated concrete units and wall panels. They also install a variety of masonry anchors and other masonry-associated accessories used in many highrise buildings.

Work environment. Brickmasons, blockmasons, and stonemasons usually work outdoors; in contrast to the past when work slowed down in the winter months, new processes and materials are allowing these masons to work in a greater variety of weather conditions. Masons stand, kneel, and bend for long periods and often have to lift heavy materials. Common hazards include injuries from tools and falls from scaffolds, but these can often be avoided when proper safety equipment, such as a hardhat, is used and when proper safety practices are followed.

Many workers work a standard 40-hour week. Some, however, do work more. Earnings for workers in the construction trades can be reduced on occasion when poor weather and slowdowns in construction activity decrease the amount of time the laborers can work.

Training, Other Qualifications, and Advancement

Some brickmasons, blockmasons, and stonemasons pick up their skills informally, observing and learning from experienced workers. Many others receive initial training in vocational education schools or from industry-based programs common throughout the country. Others complete an apprenticeship, which provides the most thorough training.

Education and training. Individuals who learn the trade on the job usually start as helpers, laborers, or mason tenders. These workers carry materials, move or assemble scaffolds, and mix mortar. When the opportunity arises, they learn from

experienced craftworkers how to mix and spread mortar, lay brick and block, or set stone. They also may learn restoration skills such as cleaning, pointing, and repointing. As they gain experience, they learn more difficult tasks and make the transition to full-fledged craftworkers. The learning period usually lasts longer for workers who learn the trade on the job than for those who have already been trained in an apprenticeship program. Registered apprenticeship programs usually last between 3 and 4 years.

Some workers learn the trade at technical schools that offer masonry courses. Entrance requirements and fees vary depending on the school and who is funding the program. Some people take courses before being hired, and some take them later as part of on-the-job training.

Apprenticeships for brickmasons, blockmasons, and stonemasons usually are sponsored by local union-management joint apprenticeship and training committees, local contractors, or trade associations. Apprenticeship programs usually require 3 to 4 years of on-the-job training, in addition to a minimum of 144 hours of classroom instruction each year in blueprint reading, mathematics, layout work, sketching, and other subjects. In the coming years, the focus of apprenticeships is likely to change from time served to demonstrated competence. This may result in apprenticeships of shorter average duration. Applicants for apprenticeships must be at least 17 years old and in good physical condition. A high school diploma is preferable, especially with courses in mathematics, mechanical drawing, and general shop.

Apprentices often start by working with laborers: carrying materials, mixing mortar, and building scaffolds for about a month. Next, apprentices learn to lay, align, and join brick and block. They may also learn to work with stone and concrete, which is important when using other masonry materials.

Bricklayers who work in nonresidential construction usually work for large contractors and receive well-rounded training—normally through an apprenticeship in all phases of brick or stone work. Those who work in residential construction usually work for small contractors and specialize in only one or two aspects of the job.

Other qualifications. The most desired qualities in workers are dependability and a strong work ethic. Knowledge of basic math, including measurement, volume, mixing proportions, algebra, plane geometry, and mechanical drawing are important in this trade.

Advancement. With additional training and experience, brickmasons, blockmasons, and stonemasons may become supervisors for masonry contractors. Some eventually become owners of businesses and may spend most of their time as managers. Others move into closely related areas such as

construction management or building inspection. Many unionized Joint Apprenticeship and Training Committees offer “life-long learning” through continuing education courses that help those members who want to advance their technical knowledge and their careers.

Employment

Brickmasons, blockmasons, and stonemasons held 160,200 jobs in 2008. The vast majority were brickmasons and blockmasons. Workers in these crafts are employed in building construction or by specialty trade contractors.

About 27 percent of brickmasons, blockmasons, and stonemasons were self-employed. Many of the self-employed are contractors who work on small jobs, such as patios, walkways, and fireplaces.

Job Outlook

Brickmasons, blockmasons, and stonemasons should see as fast as average growth as the construction industry responds to the needs of a growing population. Job prospects should be better for workers with more thorough training who can work on complex structures.

Employment change. Jobs for brickmasons, blockmasons, and stonemasons are expected to increase by 12 percent over the 2008–18 decade, as fast as the average for all occupations, as the rising population will create a need for schools, hospitals, apartment buildings, and other structures. Also stimulating demand for workers will be the need to build more energy-efficient industrial facilities and office buildings (some of which may be made from brick) and to restore a growing number of old brick buildings. Moreover, the Federal Government has indicated a willingness to spend more on repairing schools and on making government buildings more energy efficient, which should have a positive impact on the construction industry in general.

Because of demographic forces, the residential housing market is expected to eventually pick up again. Brick exteriors and, particularly, stone should remain popular, reflecting a growing preference for durable exterior materials requiring little maintenance. There is also an increased demand for durable homes that incorporate brick or stone in hurricane-prone areas.

Job prospects. Job opportunities for brickmasons, blockmasons, and stonemasons are expected to be in rough balance over the 2008–18 period as laid-off workers and a reduced level of construction help balance out a need for skilled brickmasons, blockmasons, and stonemasons. The masonry workforce is growing older, and a large number of masons are expected to retire over the next decade, which will create many job openings. Applicants who take masonry-related courses at technical schools will improve their job prospects.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Brickmasons, blockmasons, and stonemasons.....	47-2020	160,200	178,600	18,500	12
Brickmasons and blockmasons	47-2021	135,800	151,500	15,600	12
Stonemasons	47-2022	24,300	27,100	2,800	12

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Employment of brickmasons, blockmasons, and stonemasons, like that of many other construction workers, is sensitive to changes in the economy. When the level of construction activity falls, workers in these trades can experience periods of unemployment. On the other hand, shortages of workers may occur in some areas during peak periods of building activity. Ongoing, however, is the need to repair and restore a large number of aging masonry buildings. This work will increase opportunities for workers with these types of skills.

New concerns over the costs of heating and cooling buildings of all types has led to a need to train construction workers of all types, including brickmasons, blockmasons, and stonemasons, in the emerging field of green construction. Contractors familiar with this burgeoning area will have better job opportunities in the future.

Earnings

Median hourly wages of brickmasons and blockmasons in May 2008 were \$21.94. The middle 50 percent earned between \$16.77 and \$28.46. The lowest 10 percent earned less than \$13.26, and the highest 10 percent earned more than \$35.63. In the two industries employing the largest numbers of brickmasons and blockmasons in May 2008—the foundation, structure, and building exterior contractors industry and the nonresidential building industry—median hourly wages were \$21.71 and \$23.84, respectively.

Median hourly wages of wage and salary stonemasons in May 2008 were \$18.17. The middle 50 percent earned between \$14.31 and \$23.72. The lowest 10 percent earned less than \$11.63, and the highest 10 percent earned more than \$31.87.

Apprentices or helpers usually start at about 50 percent of the wage rate paid to experienced workers. Pay increases as apprentices gain experience and learn new skills. Employers usually increase apprentices' wages about every 6 months on the basis of specific advancement criteria.

About 18 percent of brickmasons, blockmasons, and stonemasons were members of unions, mainly the International Union of Bricklayers and Allied Craftworkers.

Related Occupations

Brickmasons, blockmasons, and stonemasons combine a thorough knowledge of brick, concrete block, stone, and marble with manual skill to erect attractive, yet highly durable, structures. Workers in other occupations with similar skills include:

	Page
Carpenters	618
Carpet, floor, and tile installers and finishers	621
Cement masons, concrete finishers, segmental pavers, and terrazzo workers	625
Drywall and ceiling tile installers, tapers, plasterers, and stucco masons	638

Sources of Additional Information

For details about apprenticeships or other work opportunities in these trades, contact local bricklaying, stonemasonry, or marble-setting contractors; the Associated Builders and Contractors; a local office of the International Union of Bricklayers and Allied Craftworkers; a local joint union-management

apprenticeship committee; or the nearest office of a State employment service or apprenticeship agency. Apprenticeship information is also available from the U.S. Department of Labor's toll-free helpline: (877) 872-5627 and online at: http://www.doleta.gov/OA/eta_default.cfm

For general information on apprenticeships and how to get them, see the *Occupational Outlook Quarterly* article "Apprenticeships: Career training, credentials—and a paycheck in your pocket," online at <http://www.bls.gov/opub/ooq/2002/summer/art01.pdf> and in print in many libraries and career centers.

Carpenters

Significant Points

- About 32 percent of all carpenters are self-employed.
- Job opportunities should be best for those with the most training and skills.
- Carpenters can learn their craft through on-the-job training, vocational schools or technical colleges, or formal apprenticeship programs, which often takes 3 to 4 years.

Nature of the Work

Carpenters construct, erect, install, and repair structures and fixtures made from wood and other materials. Carpenters are involved in many different kinds of construction, from the building of highways and bridges to the installation of kitchen cabinets.

Each carpentry task is somewhat different, but most involve the same basic steps. Working from blueprints or instructions from supervisors, carpenters first do the layout—measuring, marking, and arranging materials—in accordance with local building codes. They cut and shape wood, plastic, fiberglass, or drywall using hand and power tools, such as chisels, planes, saws, drills, and sanders. They then join the materials with nails, screws, staples, or adhesives. In the last step, carpenters do a final check of the accuracy of their work with levels, rules, plumb bobs, framing squares, and surveying equipment, and make any necessary adjustments. Some materials come prefabricated, allowing for easier and faster installation.

Carpenters may do many different carpentry tasks, or they may specialize in one or two. Carpenters who remodel homes and other structures, for example, need a broad range of carpentry skills. As part of a single job, they might frame walls and partitions, put in doors and windows, build stairs, install cabinets and molding, and complete many other tasks. Well-trained carpenters are able to switch from residential building to commercial construction or remodeling work, depending on which offers the best work opportunities.

Carpenters who work for large construction contractors or specialty contractors may perform only a few regular tasks, such as constructing wooden forms for pouring concrete, or erecting scaffolding. Some carpenters build tunnel bracing, or brattices, in underground passageways and mines to control the circulation of air through the passageways and to worksites. Others build concrete forms for tunnel, bridge, or sewer construction projects.

Carpenters employed outside the construction industry perform a variety of installation and maintenance work. They may replace panes of glass, ceiling tiles, and doors, as well as repair desks, cabinets, and other furniture. Depending on the employer, carpenters install partitions, doors, and windows; change locks; and repair broken furniture. In manufacturing firms, carpenters may assist in moving or installing machinery.

A carpenter uses a pneumatic gun for hammering nails.

(For more information on workers who install machinery, see the discussion of industrial machinery mechanics and millwrights, as well as maintenance and repair workers, general, elsewhere in the *Handbook*.)

Work environment. As is true of other building trades, carpentry work is sometimes strenuous. Prolonged standing, climbing, bending, and kneeling often are necessary. Carpenters risk injury working with sharp or rough materials, using sharp tools and power equipment, and working in situations where they might slip or fall. Consequently, workers in this occupation experience a very high incidence of nonfatal injuries and illnesses. Additionally, carpenters who work outdoors are subject to variable weather conditions.

Many carpenters work a standard 40 hour week; however, some work more. About 7 percent worked part time.

Training, Other Qualifications, and Advancement

Carpenters can learn their craft through on-the-job training, vocational schools or technical colleges, or formal apprenticeship programs, which often takes 3 to 4 years.

Education and training. Learning to be a carpenter can start in high school. Classes in English, algebra, geometry, physics, mechanical drawing, blueprint reading, and general shop will prepare students for the further training they will need.

After high school, there are a number of different ways to obtain the necessary training. Some people get a job as a carpenter's helper, assisting more experienced workers. At the same time, the helper might attend a trade or vocational school, or community college to receive further trade-related training and eventually become a carpenter.

Some employers offer employees formal apprenticeships. These programs combine on-the-job training with related classroom instruction. Apprentices usually must be at least 18 years old and meet local requirements. Apprenticeship programs usually last 3 to 4 years, but new rules may allow apprentices to complete programs sooner as competencies are demonstrated.

On the job, apprentices learn elementary structural design and become familiar with common carpentry jobs, such as layout, form building, rough framing, and outside and inside finishing. They also learn to use the tools, machines, equipment, and materials of the trade. In the classroom, apprentices learn safety, first aid, blueprint reading, freehand sketching, basic mathematics, and various carpentry techniques. Both in the classroom and on the job, they learn the relationship between carpentry and the other building trades.

The number of apprenticeship programs is limited, however, so only a small proportion of carpenters learn their trade through these programs. Most apprenticeships are offered by commercial and industrial building contractors, along with construction unions.

Some people who are interested in carpentry careers choose to receive classroom training before seeking a job. There are a number of public and private vocational-technical schools and training academies affiliated with unions and contractors that offer training to become a carpenter. Employers often look favorably upon these students and usually start them at a higher level than those without this training.

Other qualifications. Carpenters need manual dexterity, good eye-hand coordination, physical fitness, and a good sense

of balance. The ability to solve mathematical problems quickly and accurately also is required. In addition, military service or a good work history is viewed favorably by employers.

Certification and advancement. Carpenters who complete formal apprenticeship programs receive certification as journeypersons. Some carpenters earn other certifications in scaffold building, high torque bolting, or pump work. These certifications prove that carpenters are able to perform these tasks, which can lead to additional responsibilities.

Carpenters usually have more opportunities than most other construction workers to become general construction supervisors, because carpenters are exposed to the entire construction process. For those who would like to advance, it is increasingly important to be able to communicate in both English and Spanish in order to relay instructions and safety precautions to workers; Spanish-speaking workers make up a large part of the construction workforce in many areas. Carpenters may advance to carpentry supervisor or general construction supervisor positions. Others may become independent contractors. Supervisors and contractors need good communication skills to deal with clients and subcontractors. They also should be able to identify and estimate the quantity of materials needed to complete a job and accurately estimate how long a job will take to complete and what it will cost.

Employment

Carpenters are employed throughout the country in almost every community and make up the second largest building trades occupation. They held about 1.3 million jobs in 2008.

About 32 percent worked in the construction of buildings industry, and about 22 percent worked for specialty trade contractors. Most of the rest of wage and salary carpenters worked for manufacturing firms, government agencies, retail establishments, and a wide variety of other industries. About 32 percent of all carpenters were self-employed. Some carpenters change employers each time they finish a construction job. Others alternate between working for a contractor and working as contractors themselves on small jobs, depending on where the work is available.

Job Outlook

As fast as average job growth, coupled with replacement needs, will create a large number of openings each year. Job opportunities should be best for those with the most training and skills.

Employment change. Employment of carpenters is expected to increase by 13 percent during the 2008–18 decade, as fast as the average for all occupations. Population growth over the next decade will stimulate some growth in the construction industry over the long run to meet people’s housing and other basic needs. Energy conservation will also stimulate demand for buildings that are more energy efficient, particularly in the industrial sector. The home remodeling market also will create demand for carpenters. Moreover, construction of roads and bridges should

increase the demand for carpenters in the coming decade. Much will depend on spending by the Federal and State governments, as they attempt to upgrade and repair existing infrastructure, such as highways, bridges, and public buildings.

Some of the demand for carpenters, however, will be offset by expected productivity gains resulting from the increasing use of prefabricated components and improved fasteners and tools. Prefabricated wall panels, roof assemblies, and stairs, as well as prehung doors and windows can be installed very quickly. Instead of having to be built on the worksite, prefabricated walls, partitions, and stairs can be lifted into place in one operation; beams and, in some cases, entire roof assemblies, are lifted into place using a crane. As prefabricated components become more standardized, builders will use them more often. New and improved tools, equipment, techniques, and materials also are making carpenters more versatile, allowing them to perform more carpentry tasks.

Job prospects. Job opportunities will be good for those with the most training and skills. The need to replace carpenters who retire or leave the occupation for other reasons should result in a large number of openings. Carpenters with specialized or all-around skills will have better opportunities for steady work than carpenters who can perform only a few relatively simple, routine tasks.

Employment of carpenters, like that of many other construction workers, is sensitive to the fluctuations of the economy. Workers in these trades may experience periods of unemployment when the overall level of construction falls. On the other hand, shortages of these workers may occur in some areas during peak periods of building activity.

Job opportunities for carpenters also vary by geographic area. Construction activity parallels the movement of people and businesses and reflects differences in local economic conditions. The areas with the largest population increases will also provide the best opportunities for jobs as carpenters and for apprenticeships for people seeking to become carpenters.

Earnings

In May 2008, median hourly wages of wage and salary carpenters were \$18.72. The middle 50 percent earned between \$14.42 and \$25.37. The lowest 10 percent earned less than \$11.66, and the highest 10 percent earned more than \$33.34. Median hourly wages in the industries employing the largest numbers of carpenters were as follows:

Nonresidential building construction	\$21.08
Building finishing contractors	19.37
Residential building construction.....	18.24
Foundation, structure, and building exterior contractors.....	17.67
Employment services	15.81

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Carpenters	47-2031	1,284,900	1,450,300	165,400	13

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Earnings can be reduced on occasion, because carpenters lose worktime in bad weather and during recessions when jobs are unavailable. Earnings may be increased by overtime during busy periods.

Some carpenters are members of the United Brotherhood of Carpenters and Joiners of America. About 19 percent of all carpenters were members of unions or covered by union contracts, higher than the average for all occupations.

Related Occupations

Carpenters are skilled construction workers. Other skilled construction occupations include:

	Page
Brickmasons, blockmasons, and stonemasons.....	615
Cement masons, concrete finishers, segmental pavers, and terrazzo workers	625
Construction equipment operators	632
Drywall and ceiling tile installers, tapers, plasterers, and stucco masons.....	638
Electricians.....	641
Plumbers, pipelayers, pipefitters, and steamfitters.....	659

Sources of Additional Information

Carpet, Floor, and Tile Installers and Finishers

Significant Points

- Most workers learn on the job.
- About 35 percent of carpet, floor, and tile installers and finishers are self-employed.
- Projected job growth varies by specialty; for example, tile and marble setters are expected to grow by 14 percent, while carpet installers is projected to decline by 1 percent.
- Employment of carpet, floor, and tile installers and finishers is less sensitive to fluctuations in construction activity than is employment of workers in other construction trades.

Nature of the Work

Carpet, floor, and tile installers and finishers lay floor coverings in homes, offices, hospitals, stores, restaurants, and many other types of buildings. Tile also may be installed on walls and ceilings. Carpet, tile, and other types of floor coverings not only serve an important basic function in buildings, but their decorative qualities also contribute to the appeal of the buildings.

Before installing carpet, carpet installers first inspect the surface to be covered to determine its condition and, when necessary, correct any imperfections that could show through the carpet or cause the carpet to wear unevenly. They measure the area to be carpeted and plan the layout, keeping in mind likely traffic patterns and placement of seams for best appearance and maximum wear.

When installing wall-to-wall carpet without tacks, installers first fasten a tackless strip to the floor, next to the wall. They then install the padded cushion, or underlay. Next, they roll out, measure, mark, and cut the carpet, allowing for 2 to 3 inches of extra carpet for the final fitting. Using a device called a “knee kicker,” they position the carpet, stretching it to fit evenly on the floor and snugly against each wall and door threshold. They then cut off the excess carpet. Finally, using a power stretcher, they stretch the carpet, hooking it to the tackless strip to hold it in place. The installers then finish the edges using a wall trimmer.

Because most carpet comes in 12-foot widths, wall-to-wall installations require installers to join carpet sections together for large rooms. The installers join the sections using heat-taped seams—seams held together by a special plastic tape that is activated by heat.

In commercial installations, carpet often is glued directly to the floor or to padding that has been glued to the floor. For

special upholstery work, such as installing carpet on stairs, carpet may be held in place with staples.

Carpet installers use hand tools such as hammers, drills, staple guns, carpet knives, and rubber mallets. They also may use carpet-laying tools, such as carpet shears, knee kickers, wall trimmers, loop pile cutters, heat irons, and power stretchers.

Floor installers and *floor layers* lay floor coverings such as laminate, linoleum, vinyl, cork, and rubber for decorative purposes or to reduce noise, absorb shocks, or create air-tight environments. Although these workers also may install carpet, wood, or tile, that is not their main job. Before installing the floor, floor layers inspect the surface to be covered and, if necessary, correct any defects, such as a sub-floor that is unlevelled or contains rotted wood, in order to start with a strong, smooth, clean foundation. Then they measure and cut flooring materials. When installing linoleum or vinyl, they may use an adhesive to glue the material directly to the floor. For laminate floor installation, workers may unroll and install a polyethylene film that acts as a moisture barrier, along with a thicker, padded underlayer that helps reduce noise. Cork and rubber floors can often be installed directly on top of the sub-floor without an underlayer. Finally, floor layers install the floor covering to form a tight fit.

After a carpenter installs a new hardwood floor or when a customer wants to refinish an old wood floor, floor sanders and finishers are called in to smooth any imperfections in the wood and apply coats of varnish or polyurethane. To remove imperfections and smooth the surface, they scrape and sand wood floors using floor-sanding machines. After sanding, they then examine the floor and remove excess glue from joints using a knife or wood chisel and may further sand the wood surfaces by hand, using sandpaper. Finally, they apply sealant using brushes or rollers, often applying multiple coats.

Tile installers, *tilesetters*, and *marble setters* apply hard tile and marble to floors, walls, ceilings, countertops, patios, and

roof decks. Tile and marble are durable, impervious to water, and easy to clean, making them a popular building material in bathrooms, kitchens, hospitals, and commercial buildings.

Prior to installation, tilesetters use measuring devices, spacers, and levels to ensure that the tile is placed in a consistent manner. Tiles vary in color, shape, and size, with their sides ranging from 1 inch to 24 or more inches in length, so tilesetters sometimes prearrange tiles on a dry floor according to the planned design. This allows them to examine the pattern, check that they have enough of each type of tile, and determine where they will have to cut tiles to fit the design in the available space. Tilesetters cut tiles with a machine saw or a special cutting tool to cover all exposed areas, including corners and around pipes, tubs, and wash basins. To set tile on a flat, solid surface, such as drywall, concrete, plaster, or wood, tilesetters first use a tooth-edged trowel to spread a “thin set”—a thin layer of either cement adhesive or “mastic,” which is a very sticky paste. They then properly position the tile and gently tap the surface with the trowel handle, a rubber mallet, or a small block of wood to set the tile evenly and firmly. Spacers are used to maintain exact distance between tiles, and any excess thin set is wiped off the tile immediately after placement.

To apply tile to an area that lacks a solid surface, tilesetters nail a support of metal mesh or tile backer board to the wall or ceiling to be tiled. They use a trowel to apply a cement mortar—called a “scratch coat”—onto the metal screen, and scratch the surface of the soft mortar with a small tool similar to a rake. After the scratch coat has dried, tilesetters apply a brown coat of mortar to level the surface, and then apply mortar to the brown coat and begin to place tile onto the surface. Hard backer board also is used in areas where there is excess moisture, such as a shower stall.

When the cement or mastic has set, tilesetters fill the joints with “grout,” which is very fine cement. Grout that is used for joints 1/8th of an inch and larger typically has sand in it. Tilesetters then apply the grout to the surface with a rubber-edged device called a “float” or a grouting trowel to fill the joints and remove excess grout. Before the grout sets, they wipe the tiles and smooth the joints with a wet sponge for a uniform appearance.

Marble setters cut and set marble slabs on floors and walls of buildings. They trim and cut marble to specified sizes using a power wet saw, other electric cutting equipment, or handtools. After setting the marble in place, the workers polish the marble to a high luster using power tools or by hand.

Work environment. Carpet, floor, and tile installers and finishers usually work indoors and have regular daytime hours. However, when floor covering installers need to work in occupied stores or offices, they may work evenings and weekends to avoid disturbing customers or employees. By the time workers install carpets, flooring, or tile in a new structure, the majority of construction has been completed and the work area is relatively clean and uncluttered. Installing these materials is labor intensive; workers spend much of their time bending, kneeling, and reaching—activities that require endurance. The work can be very hard on workers’ knees; therefore, safety regulations often require that they wear kneepads. Carpet installers frequently lift heavy rolls of carpet and may move heavy furniture, which requires strength and can be physically exhausting and hard on workers’ backs. Carpet and floor layers may be exposed to

Carpet, floor, and tile installers and finishers lay floor coverings in homes and other types of buildings.

fumes from various kinds of glue and to fibers of certain types of carpet. Tile and floor installers are usually required to wear safety goggles when using certain equipment.

Workers are subject to cuts from tools or materials, falls from ladders, and strained muscles. Data from the U.S. Bureau of Labor Statistics show that full-time carpet, floor, and tile installers and finishers experienced a work-related injury and illness rate that was higher than the national average.

Training, Other Qualifications, and Advancement

The vast majority of carpet, floor, and tile installers and finishers learn their trade informally on the job. Some workers, mostly tile setters, learn through formal apprenticeship programs, which include classroom instruction and paid on-the-job training.

Education and training. Most carpet installers receive short-term on-the-job training, often sponsored by individual contractors; therefore, a high school diploma usually is not required. Workers start as helpers and begin with simple assignments, such as installing stripping and padding, or helping to stretch newly installed carpet. With experience, helpers take on more difficult assignments, such as cutting and fitting.

Tile and marble setters learn their craft mostly through long-term on-the-job training. They start by helping carry materials and learning about the tools of the trade, and later they take on more difficult tasks, such as preparing the subsurface for tile or marble. As tile and marble setters progress, they learn to cut the tile and marble to fit the job. They also learn to apply grout and sealants to give the product its final appearance. Apprenticeship programs and some contractor-sponsored programs provide comprehensive training in all phases of the tiling and floor layer trades.

Other floor layers also learn on the job and begin by learning how to use the tools of the trade. As they progress, they learn how to cut and install the various floor coverings.

Other qualifications. Good manual dexterity, eye-hand coordination, physical fitness, and sense of balance and color are some of the skills needed to become carpet, floor, and tile installers and finishers. The ability to solve basic arithmetic problems quickly and accurately also is required. In addition, reliability and a good work history are viewed favorably by contractors.

Advancement. Carpet, floor, and tile installers and finishers sometimes advance to become supervisors, salespersons, or estimators. In these positions, they must be able to estimate the time, money, and quantity of materials needed to complete a job.

Some carpet installers may become managers for large installation firms. For those interested in advancement, it is increasingly important to be able to communicate in both English and Spanish because Spanish-speaking workers make up a large part of the

construction workforce in many areas. Workers who want to advance to supervisor jobs or become independent contractors also need good English skills to deal with clients and subcontractors.

Many carpet, floor, and tile installers and finishers who begin working for someone else eventually go into business for themselves as independent contractors.

Employment

Carpet, floor, and tile installers and finishers held about 160,500 jobs in 2008. About 35 percent of all carpet, floor, and tile installers and finishers were self-employed. The following tabulation shows 2008 total employment by specialty:

Tile and marble setters	76,000
Carpet installers.....	51,100
Floor layers, except carpet, wood, and hard tiles	21,200
Floor sanders and finishers.....	12,200

Many carpet installers work for flooring contractors or floor covering retailers. Most salaried tilers are employed by tile-setting contractors who work mainly on nonresidential construction projects, such as schools, hospitals, and office buildings. Most self-employed tilers work on residential projects.

Although carpet, floor, and tile installers and finishers are employed throughout the Nation, they tend to be concentrated in populated areas where there are high levels of construction activity.

Job Outlook

Employment of carpet, floor, and tile installers and finishers is expected to grow as fast as the average for all occupations. Job growth and opportunities, however, will differ among the individual occupations in this category.

Employment change. Overall employment is expected to grow by 7 percent between 2008 and 2018, about as fast as the average. Tile and marble setting, the largest specialty, will experience faster than average employment growth because population and business growth will result in more construction of shopping malls, hospitals, schools, restaurants, and other structures in which tile is used extensively. Tiles, including those made of glass, slate, and mosaic, and other less traditional materials, are also becoming more popular, particularly in the growing number of more expensive homes.

Employment of carpet installers, the second-largest specialty, will decline by 1 percent as residential investors and homeowners increasingly choose hardwood and tile floors because of their durability, neutral colors, and low maintenance, and because owners feel these floors will add to the value of their

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Carpet, floor, and tile installers and finishers.....	47-2040	160,500	171,900	11,400	7
Carpet installers	47-2041	51,100	50,500	-600	-1
Floor layers, except carpet, wood, and hard tiles.....	47-2042	21,200	21,000	-200	-1
Floor sanders and finishers.....	47-2043	12,200	13,600	1,400	11
Tile and marble setters	47-2044	76,000	86,800	10,800	14

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

homes. Carpets, on the other hand, stain and wear out faster than wood or tile, which contributes to the decreased demand for carpet installation. Nevertheless, carpet will continue to be used in nonresidential structures such as schools, offices, and hospitals. Also, many multifamily structures will require or recommend carpet because it provides sound dampening.

Workers who install other types of flooring, including laminate, cork, bamboo, rubber, and vinyl, should have little or no job growth because these materials are used less frequently and are often laid by other types of construction workers. Employment of floor sanders and finishers—a small specialty—is projected to grow by 11 percent because of the increasing use of prefinished hardwood flooring and because their work is heavily concentrated in the relatively small niche market of residential remodeling. There should also be some employment growth resulting from restoration of damaged hardwood floors, a procedure that is typically more cost effective than installing new floors.

Job prospects. In addition to employment growth, numerous job openings are expected for carpet, floor, and tile installers and finishers because of the need to replace workers who leave the occupation. The strenuous nature of the work leads to high replacement needs; many of these workers do not stay in the occupation long.

Few openings will arise for vinyl and linoleum floor installers because the number of these jobs is comparatively small and because homeowners can increasingly take advantage of easy application products, such as self-adhesive vinyl tiles.

Employment of carpet, floor, and tile installers and finishers is less sensitive to changes in construction activity than most other construction occupations because much of the work involves replacing worn carpet and other flooring in existing buildings. However, workers in these trades may still experience periods of unemployment when the overall level of construction falls. On the other hand, shortages of these workers may occur in some areas during peak periods of building activity.

Earnings

In May 2008, median hourly wages of carpet installers were \$17.80. The middle 50 percent earned between \$12.82 and \$25.35. The lowest 10 percent earned less than \$10.23, and the top 10 percent earned more than \$34.10. Median hourly wages of carpet installers working for building finishing contractors were \$18.25, and \$16.92 for those working in home furnishings stores. Carpet installers are paid either on an hourly basis or by the number of yards of carpet installed.

Median hourly wages of wage and salary floor layers except carpet, wood, and hard tiles were \$17.50 in May 2008. The middle 50 percent earned between \$13.34 and \$23.33. The lowest 10 percent earned less than \$10.55, and the top 10 percent earned more than \$30.84.

Median hourly wages of floor sanders and finishers were \$15.41 in May 2008. The middle 50 percent earned between \$12.79 and \$20.16. The lowest 10 percent earned less than \$10.54, and the top 10 percent earned more than \$25.96.

Median hourly wages of tile and marble setters were \$18.85 in May 2008. The middle 50 percent earned between \$13.71 and \$25.19. The lowest 10 percent earned less than \$10.65, and the top 10 percent earned more than \$32.40.

Earnings of carpet, floor, and tile installers and finishers vary greatly by geographic location and by union membership status. Some carpet, floor, and tile installers and finishers belong to the United Brotherhood of Carpenters and Joiners of America. Some tilesetters belong to the International Union of Bricklayers and Allied Craftsmen, and some carpet installers belong to the International Brotherhood of Painters and Allied Trades.

Apprentices and other trainees usually start out earning about half of what an experienced worker earns; their wage rates increase as they advance through the training program.

Related Occupations

Carpet, floor, and tile installers and finishers measure, cut, and fit materials to cover a space. Workers in other occupations involving similar skills, but using different materials, include:

Cement Masons, Concrete Finishers, Segmental Pavers, and Terrazzo Workers

Significant Points

- Job opportunities are expected to be good, especially for those with the most experience and skills.
- Most workers learn on the job or through a combination of classroom and on-the-job training that can take 3 to 4 years.
- Cement masons often have variable schedules and work overtime, with premium pay, because once concrete has been placed, the job must be completed quickly.

Nature of the Work

Cement masons, concrete finishers, and terrazzo workers all work with concrete, one of the most common and durable materials used in construction. Once set, concrete—a mixture of Portland cement, sand, gravel, and water—becomes the foundation for everything from decorative patios and floors to huge dams or miles of roadways.

Cement masons and *concrete finishers* place and finish concrete. They also may color concrete surfaces, expose aggregate (small stones) in walls and sidewalks, or fabricate concrete beams, columns, and panels. In preparing a site to place concrete, cement masons first set the forms for holding the concrete and properly align them. They then direct the casting of the concrete and supervise laborers who use shovels or special tools to spread it. Masons then guide a straightedge back and forth across the top of the forms to “screed,” or level, the freshly placed concrete. Immediately after leveling the concrete, masons carefully float it—which means to smooth the concrete surface with a “bull float,” a long-handled tool of about 8 by 48 inches that covers the coarser materials in the concrete and brings a rich mixture of fine cement paste to the surface.

After the concrete has been leveled and floated, concrete finishers press an edger between the forms and the concrete and guide it along the edge and the surface. This produces slightly rounded edges and helps prevent chipping or cracking. Concrete finishers use a special tool called a “groover” to make joints or grooves at specific intervals that help control cracking. Next, they smooth the surface using either a powered or hand trowel, which is a small, smooth, rectangular metal tool.

Sometimes, cement masons perform all the steps of laying concrete, including the finishing. As the final step, they re-trowel the concrete surface back and forth with powered or hand trowels to create a smooth finish. For a coarse, nonskid finish, masons brush the surface with a broom or stiff-bristled brush. For a pebble finish, they embed small gravel chips into the surface. They then wash any excess cement from the exposed chips with a mild acid solution. For color, they use colored premixed concrete.

Throughout the entire process, cement masons must monitor how the wind, heat, or cold affects the curing of the concrete.

They must have a thorough knowledge of concrete characteristics so that, by using sight and touch, they can determine what is happening to the concrete and take measures to prevent defects.

Segmental pavers lay out, cut, and install pavers—flat pieces of masonry made from compacted concrete or brick. This masonry is typically installed in patios, sidewalks, plazas, streets, crosswalks, parking lots, and driveways. Installers usually begin their work by preparing a base that has been graded to the proper depth and filled and leveled with a layer of sand. Installers then place the pavers in a pattern, normally by hand but sometimes by machine. Sand is then added to fill the joints between the pavers.

Terrazzo workers and *finishers* create attractive walkways, floors, patios, and panels by exposing marble chips and other fine aggregates on the surface of finished concrete. Much of the preliminary work of terrazzo workers is similar to that of cement masons. Depending on the type of terrazzo, they usually first build a solid, level concrete foundation that is 3 to 4 inches deep. Second, after the forms are removed from the foundation, workers add a 1-inch layer of sandy concrete. Terrazzo workers partially embed, or attach with adhesive, metal divider strips in the concrete wherever there is to be a joint or change of color in the terrazzo. For the third and final layer, terrazzo workers blend and place into each of the panels a fine marble chip mixture that may be color-pigmented. While the mixture is still wet, workers add additional marble chips of various colors into each panel and roll a lightweight roller over the entire surface.

When the terrazzo is thoroughly set, helpers grind it with a terrazzo grinder, which is somewhat like a floor polisher, only much heavier. Any depressions left by the grinding are filled with a matching grout material and hand-troweled for a smooth, uniform surface. Terrazzo workers then clean, polish, and seal the dry surface for a lustrous finish.

Work environment. Concrete, segmental paving, and terrazzo work is fast paced and strenuous, and requires continuous physical effort. A work week of 40 hours is the most common, although the number of hours can be increased or decreased by outside factors, such as the need to coordinate work with other jobs being done on the construction site. As a result, about 17 percent of workers have a variable schedule.

Because most finishing is done at floor level, workers must bend and kneel often. Many jobs are outdoors, and work is

Concrete workers direct the concrete to a desired location.

generally halted during inclement weather. The work, either indoors or outdoors, may be in areas that are muddy, dusty, or dirty. To avoid chemical burns from uncured concrete and sore knees from frequent kneeling, many workers wear kneepads. Workers usually also wear water-repellent boots while working with wet concrete.

Training, Other Qualifications, and Advancement

Most cement masons, concrete finishers, segmental pavers, and terrazzo workers learn their trades through on-the-job training, either as helpers or in apprenticeship programs. Some workers also learn their jobs by attending trade or vocational-technical schools.

Education and training. Many masons and finishers first gain experience as construction laborers. (See the section on construction laborers elsewhere in the *Handbook*.) Most on-the-job training programs consist of informal instruction, in which experienced workers teach helpers to use the tools, equipment, machines, and materials of the trade. Trainees begin with tasks such as edging, jointing, and using a straightedge on freshly placed concrete. As training progresses, assignments become more complex, and trainees can usually do finishing work within a short time.

Some workers train in formal apprenticeship programs usually sponsored by local contractors, trade associations, or local union-management committees. These programs combine on-the-job training with a recommended minimum of 144 hours of classroom instruction each year. In the classroom, apprentices learn applied mathematics, blueprint reading, and safety. Apprentices generally receive special instruction in layout work and cost estimation. Apprenticeships may take 3 to 4 years to complete, although completion times are increasingly variable as apprenticeship progression based on demonstrated competence instead of time is gaining popularity. Applying for an apprenticeship may require a written test and a physical exam.

Many States have technical schools that offer courses in masonry which improve employment and advancement opportunities. Entrance requirements and fees vary depending on the school and who is funding the program. These schools may offer courses before hiring or after hiring as part of the on-the-job training.

Other qualifications. The most important qualities employers look for are dependability and a strong work ethic. When hiring helpers and apprentices, employers prefer high school graduates who are at least 18 years old, possess a driver's license, and are in good physical condition. The ability to get

along with others is also important because cement masons frequently work in teams. High school courses in general science, mathematics, and vocational-technical subjects—such as blueprint reading and mechanical drawing—provide a helpful background. Cement masons, concrete finishers, segmental pavers, and terrazzo workers should enjoy doing demanding work. They should take pride in craftsmanship and be able to work without close supervision.

Advancement. With additional training, cement masons, concrete finishers, segmental pavers, or terrazzo workers may become supervisors for masonry contractors or move into construction management, building inspection, or contract estimation. Certification programs offered through the National Concrete Masonry Association may allow workers to advance more quickly as they document higher levels of skill in working with concrete. Some workers eventually become owners of businesses, where they may spend most of their time managing rather than practicing their original trade. For those who want to own their own business, taking business classes will help to prepare.

Employment

Cement masons, concrete finishers, segmental pavers, and terrazzo workers held about 207,800 jobs in 2008; segmental pavers and terrazzo workers accounted for only a small portion of the total. Most cement masons and concrete finishers worked for specialty trade contractors, primarily foundation, structure, and building exterior contractors. They also worked for contractors in nonresidential and residential building construction and in heavy and civil engineering construction on projects such as highways, bridges, shopping malls, or large buildings such as factories, schools, and hospitals. A small number were employed by firms that manufacture concrete products. Most segmental pavers and terrazzo workers worked for specialty trade contractors who install decorative floors and wall panels.

Only about 5 percent of cement masons, concrete finishers, segmental pavers, and terrazzo workers were self-employed, a smaller proportion than in other building trades. Most self-employed masons specialize in small jobs, such as driveways, sidewalks, and patios.

Job Outlook

Average employment growth is expected, and job prospects are expected to be good, especially for those with the most experience and skills.

Employment change. Employment of cement masons, concrete finishers, segmental pavers, and terrazzo workers is

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Cement masons, concrete finishers, segmental pavers, and terrazzo workers	—	207,800	234,500	26,700	13
Cement masons, concrete finishers, and terrazzo workers.....	47-2050	206,600	233,200	26,600	13
Cement masons and concrete finishers	47-2051	201,000	226,800	25,900	13
Terrazzo workers and finishers	47-2053	5,600	6,300	700	13
Segmental pavers	47-4091	1,200	1,300	100	7

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

expected to grow approximately 13 percent over the 2008–18 decade, about as fast as the average for all occupations. Over the long run, more workers will likely be needed to build new highways, bridges, factories, and other residential and nonresidential structures to meet the demands of a growing population. Additionally, cement masons will be needed to repair and renovate existing highways and bridges and other aging structures. Additional funds for these projects are expected to come from the Federal Government, which plans to spend money on construction to stimulate the national economy by addressing necessary infrastructure repairs and renovating schools and other government buildings.

The use of concrete for buildings is increasing because its strength is an important asset in areas prone to severe weather. For example, residential construction in Florida is using more concrete as building requirements are changed in reaction to the increased frequency and intensity of hurricanes. Concrete use is likely to expand into other hurricane-prone areas as the durability of the Florida homes is demonstrated.

Job prospects. Opportunities for cement masons, concrete finishers, segmental pavers, and terrazzo workers are expected to be good, particularly for those with the most experience and skills. Employers report difficulty in finding workers with the right skills, as many qualified jobseekers often prefer work that is less strenuous and has more comfortable working conditions. There are also expected to be a significant number of retirements over the next decade, which will create more job openings. Applicants who take masonry-related courses at technical schools will have better opportunities than those without these courses.

Employment of cement masons, concrete finishers, segmental pavers, and terrazzo workers, like that of many other construction workers, is sensitive to the fluctuations of the economy. Workers in these trades may experience periods of unemployment when the overall level of construction falls. On the other hand, shortages of these workers may occur in some areas during peak periods of building activity.

Earnings

In May 2008, the median hourly wage of cement masons and concrete finishers was \$16.87. The middle 50 percent earned between \$13.46 and \$22.71. The bottom 10 percent earned less than \$11.02, and the top 10 percent earned more than \$30.30. Median hourly wages in the industries employing the largest numbers of cement masons and concrete finishers were as follows:

Nonresidential building construction	\$17.82
Other specialty trade contractors.....	17.26
Highway, street, and bridge construction	17.12
Residential building construction.....	16.68
Foundation, structure, and building exterior contractors.....	16.67

In May 2008, the median hourly wage of terrazzo workers and finishers was \$17.25. The middle 50 percent earned between \$13.65 and \$23.12. The bottom 10 percent earned less than \$10.82, and the top 10 percent earned more than \$30.12.

In May 2008, the median hourly wage of segmental pavers was \$13.17. The middle 50 percent earned between \$10.77 and

\$16.41. The bottom 10 percent earned less than \$9.14, and the top 10 percent earned more than \$19.33.

Like other construction trades workers who are paid by the hour, earnings of cement masons, concrete finishers, segmental pavers, and terrazzo workers may be reduced on occasion because poor weather and slowdowns in construction activity limit the amount of time they can work. Nonunion workers generally have lower wage rates than union workers. Apprentices usually start at 50 to 60 percent of the rate paid to experienced workers, and increases are generally achieved by meeting specified advancement requirements every 6 months. Cement masons often work overtime, with premium pay, because once concrete has been placed, the job must be completed.

About 14 percent of cement masons, concrete finishers, segmental pavers, and terrazzo workers belong to unions, the largest of which are the Operative Plasterers’ and Cement Masons’ International Association of the United States and Canada, and the International Union of Bricklayers and Allied Craftworkers. A few terrazzo workers belong to the United Brotherhood of Carpenters and Joiners of the United States.

Related Occupations

Other construction-related occupations requiring similar skills and knowledge include:

Construction and Building Inspectors

Significant Points

- About 44 percent of inspectors worked for local governments, primarily municipal or county building departments.
- Many home inspectors are self-employed.
- Training requirements vary widely; some States require a license or certificate.
- Opportunities should be best for those with construction-related work experience; training in engineering, architecture, construction technology, or related fields; or certification as a construction inspector.

Nature of the Work

Construction and building inspectors examine buildings, highways and streets, sewer and water systems, dams, bridges, and other structures. They ensure that their construction, alteration, or repair complies with building codes and ordinances, zoning regulations, and contract specifications. Building codes and standards are the primary means by which building construction

is regulated in the United States for the health and safety of the general public. National model building and construction codes are published by the International Code Council (ICC), although many localities have additional ordinances and codes that modify or add to the National model codes. To monitor compliance with regulations, inspectors make an initial inspection during the first phase of construction and follow up with further inspections throughout the construction project. However, no inspection is ever exactly the same. In areas where certain types of severe weather or natural disasters—such as earthquakes or hurricanes—are more common, inspectors monitor compliance with additional safety regulations designed to protect structures and occupants during those events.

There are many types of inspectors. *Building inspectors* inspect the structural quality and general safety of buildings. Some specialize in for example, structural steel or reinforced-concrete structures. Before construction begins, *plan examiners* determine whether the plans for the building or other structure comply with building codes and whether they are suited to the engineering and environmental demands of the building site. To inspect the condition of the soil and the positioning and depth of the footings, inspectors visit the worksite before the foundation is poured. Later, they return to the site to inspect the foundation after it has been completed. The size and type of structure, as well as the rate at which it proceeds toward completion, determine the number of other site visits they must make. Upon completion of the project, they make a final, comprehensive inspection.

In addition to structural characteristics, a primary concern of building inspectors is fire safety. They inspect structures' fire sprinklers, alarms, smoke control systems, and fire exits. Inspectors assess the type of construction, the building's contents, adequacy of fire protection equipment, and any risks posed by adjoining buildings. (For additional information on *fire inspectors*, see the statement on fire inspectors and investigators elsewhere in the *Handbook*.)

Electrical inspectors examine the installation of electrical systems and equipment to ensure that they function properly and comply with electrical codes and standards. They visit worksites to inspect new and existing sound and security systems, wiring, lighting, motors, and generating equipment. They also inspect the installation of the electrical wiring for heating and air-conditioning systems, appliances, and other components.

Elevator inspectors examine lifting and conveying devices such as elevators, escalators, moving sidewalks, lifts and hoists, inclined railways, ski lifts, and amusement rides.

Home inspectors conduct inspections of newly built or previously owned homes, condominiums, town homes, manufactured homes, apartments, and commercial buildings. Home inspection has become a standard practice in the home-purchasing process. Home inspectors are most often hired by prospective home buyers to inspect and report on the condition of a home's systems, components, and structure. Although they look for and report violations of building codes, they do not have the power to enforce compliance with the codes. Typically, they are hired either immediately prior to a purchase offer on a home or as a contingency to a sales contract. In addition to examining structural quality, home inspectors inspect all home

systems and features, including roofing as well as the exterior, attached garage or carport, foundation, interior, plumbing, and electrical, heating, and cooling systems. Some home inspections are done for homeowners who want an evaluation of their home's condition, for example, prior to putting the home on the market or as a way to diagnose problems.

Mechanical inspectors examine the installation of heating, ventilation, air conditioning, and refrigeration systems and equipment to insure they are installed and function properly. This may include the inspection of commercial kitchen equipment, gas-fired appliances, and boilers.

Plumbing inspectors examine the installation of piping systems to insure the safety and health of the drinking water system, chemical process piping for industrial uses, and the sanitary disposal of waste. On most construction sites this will involve at least three inspections, including the piping layout, venting, backflow protection, and setting of fixtures.

Public works inspectors ensure that Federal, State, and local government water and sewer system, highway, street, bridge, and dam construction conforms to detailed contract specifications. They inspect excavation and fill operations, the placement of forms for concrete, concrete mixing and pouring, asphalt paving, and grading operations. They record the work and materials used so that contract payments can be calculated. Public

Although inspections are primarily visual, inspectors may use tape measures, survey instruments, and metering devices.

works inspectors may specialize in highways, structural steel, reinforced concrete, or ditches. Others specialize in dredging operations required for bridges and dams or for harbors.

The owner of a building or structure under construction employs *specification inspectors* to ensure that work is done according to design specifications. Specification inspectors represent the owner's interests, not those of the general public. Insurance companies and financial institutions also may use their services.

Details concerning construction projects, building and occupancy permits, and other documentation generally are stored on computers so that they can easily be retrieved and updated. For example, inspectors may use laptop computers to record their findings while inspecting a site. Most inspectors use computers to help them monitor the status of construction inspection activities and keep track of permits issued, and some can access all construction and building codes from their computers on the job site, decreasing the need for paper binders. However, many inspectors continue to use a paper checklist to detail their findings.

Although inspections are primarily visual, inspectors may use tape measures, survey instruments, metering devices, and equipment such as concrete strength measurers. They keep a log of their work, take photographs, and file reports. Many inspectors also use laptops or other portable electronic devices on-site to facilitate the accuracy of their written reports, as well as e-mail and fax machines to send out the results. If necessary, they act on their findings. For example, government and construction inspectors notify the construction contractor, superintendent, or supervisor when they discover a violation of a code or ordinance or something that does not comply with the contract specifications or approved plans. If the problem is not corrected within a reasonable or otherwise specified period, government inspectors have authority to issue a "stop-work" order.

Many inspectors also investigate construction or alterations being done without proper permits. Inspectors who are employees of municipalities enforce laws pertaining to the proper design, construction, and use of buildings. They direct violators of permit laws to obtain permits and to submit to inspection.

Work environment. Construction and building inspectors usually work alone. However, several may be assigned to large, complex projects, particularly because inspectors tend to specialize in different areas of construction. Although they spend considerable time inspecting construction worksites, inspectors also spend time in a field office reviewing blueprints, answering letters or telephone calls, writing reports, and scheduling inspections.

Many construction sites are dirty and may be cluttered with tools, materials, or debris. Inspectors may have to climb ladders or many flights of stairs or crawl around in tight spaces. Although their work generally is not considered hazardous, inspectors, like other construction workers, wear hardhats and adhere to other safety requirements while at a construction site.

Inspectors normally work regular hours. However, they may work additional hours during periods when a lot of construction is taking place. Also, if an accident occurs at a construction site, inspectors must respond immediately and may work additional hours to complete their report. Non-government inspectors—especially those who are self-employed—may have a varied work schedule, at times working evenings and weekends.

Training, Other Qualifications, and Advancement

Although requirements vary considerably, construction and building inspectors should have a thorough knowledge of construction materials and practices. In some States, construction and building inspectors are required to obtain a special license or certification, so it is important to check with the appropriate State agency.

Education and training. Most employers require at least a high school diploma or the equivalent, even for workers with considerable experience. More often, employers look for persons who have studied engineering or architecture or who have a degree from a community or junior college with courses in building inspection, home inspection, construction technology, drafting, and mathematics. Many community colleges offer certificate or associate degree programs in building inspection technology. Courses in blueprint reading, algebra, geometry, and English also are useful. A growing number of construction and building inspectors are entering the occupation with a college degree, which often can substitute for previous experience.

The level of training requirements varies by type of inspector and State. In general, construction and building inspectors receive much of their training on the job, although they must learn building codes and standards on their own. Working with an experienced inspector, they learn about inspection techniques; codes, ordinances, and regulations; contract specifications; and recordkeeping and reporting duties. Supervised onsite inspections also may be a part of the training. Other requirements can include various courses and assigned reading. Some courses and instructional material are available online as well as through formal venues.

Licensure and certification. Many States and local jurisdictions require some type of license or certification for employment as a construction and building inspector. Requirements may vary by State or local municipality. Typical requirements for licensure or certification include previous experience, a minimum educational attainment level, such as a high school diploma, and passing a State-approved examination. Some States have individual licensing programs for inspectors, while others may require certification by such associations as the International Code Council, International Association of Plumbing and Mechanical Officials, and National Fire Protection Association.

Similarly, some States require home inspectors to obtain a State-issued license or certification. Currently, 34 States have regulations affecting home inspectors. Requirements for a license or certification vary by State, but may include obtaining a minimum level of education, having a set amount of experience with inspections, purchasing liability insurance of a certain amount, and the passing of an examination. Renewal is usually every few years and annual continuing education is almost always required.

Other qualifications. Because inspectors must possess the right mix of technical knowledge, experience, and education, employers prefer applicants who have both formal training and experience. For example, many inspectors previously worked as carpenters, electricians, or plumbers. Home inspectors combine knowledge of multiple specialties, so many of them come

into the occupation having a combination of certifications and previous experience in various construction trades.

Construction and building inspectors must be in good physical condition in order to walk and climb about construction and building sites. They also must have a driver's license so that they can get to scheduled appointments.

Advancement. Being a member of a nationally recognized inspection association enhances employment opportunities and may be required by some employers. Even if it is not required, certification can enhance an inspector's opportunities for employment and advancement to more responsible positions. To become certified, inspectors with substantial experience and education must pass examinations on topics including code requirements, construction techniques and materials, standards of practice, and codes of ethics. The International Code Council offers multiple voluntary certifications, as do many other professional associations. Many categories of certification are awarded for inspectors and plan examiners in a variety of specialties, including the Certified Building Official (CBO) certification, for code compliance, and the Residential Building Inspector (RBI) certification, for home inspectors. In a few cases, there are no education or experience prerequisites, and certification consists of passing an examination in a designated field either at a regional location or online. In addition, Federal, State, and many local governments may require inspectors to pass a civil service exam.

Because they advise builders and the general public on building codes, construction practices, and technical developments, construction and building inspectors must keep abreast of changes in these areas. Continuing education is required by many States and certifying organizations. Numerous employers provide formal training to broaden inspectors' knowledge of construction materials, practices, and techniques. Inspectors who work for agencies or firms that do not conduct their own training programs can expand their knowledge and upgrade their skills by attending State-sponsored training programs, by taking college or correspondence courses, or by attending seminars and conferences sponsored by various related organizations, including professional organizations. An engineering or architectural degree often is required for advancement to supervisory positions.

Employment

Construction and building inspectors held about 106,400 jobs in 2008. Local governments—primarily municipal or county building departments—employed 44 percent. Employment of local government inspectors is concentrated in cities and in suburban areas undergoing rapid growth. Local governments in larger jurisdictions may employ large inspection staffs, including many plan examiners or inspectors who specialize in structural steel, reinforced concrete, and boiler, electrical, and elevator inspection. In smaller jurisdictions, only one or a few inspectors with generalist skills in multiple areas may be on staff.

Another 27 percent of construction and building inspectors worked for architectural and engineering services firms, conducting inspections for a fee or on a contract basis. Many of these were home inspectors working on behalf of potential real estate purchasers. Most of the remaining inspectors were employed in other service-providing industries or by State governments.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Construction and building inspectors.....	47-4011	106,400	124,200	17,900	17

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

About 8 percent of construction and building inspectors were self-employed; many of these were home inspectors.

Job Outlook

Inspectors should experience faster than average employment growth. Opportunities should be best for those with construction-related work experience; training in engineering, architecture, construction technology, or related fields; or certification as a construction inspector.

Employment change. Employment of construction and building inspectors is expected to grow 17 percent over the 2008-2018 decade, faster than the average for all occupations. Concern for public safety and a desire for improvement in the quality of construction should continue to stimulate demand for construction and building inspectors in government as well as in firms specializing in architectural, engineering, and related services. As the result of new technology such as building information modeling (BIM), the availability of a richer set of buildings data in a more timely and transparent manner will make it easier to conduct plan reviews. This will lead to more time and resources spent on inspections. In addition, the growing focus on natural and manmade disasters is increasing the level of interest in and need for qualified inspectors. Issues such as green and sustainable design are new areas of focus that will also drive the demand for construction and building inspectors.

The routine practice of obtaining home inspections is a relatively recent development, causing employment of home inspectors to increase rapidly. Although employment of home inspectors is expected to continue to increase, the attention given to this specialty, combined with the desire of some construction workers to move into less strenuous and potentially higher paying work, may result in reduced growth of home inspectors in some areas. In addition, increasing State regulations are starting to limit entry into the specialty only to those who have a given level of previous experience and who are certified.

Job prospects. Those with construction-related work experience; training in engineering, architecture, construction technology, or related fields; or certification as a construction inspector will have the best prospects. Inspectors are involved in all phases of construction, including maintenance and repair work, and are therefore less likely than many construction workers to lose their jobs when new construction slows during recessions. Those who are self-employed, such as home inspectors, are more likely to be affected by economic downturns or fluctuations in the real estate market. However, those with a thorough knowledge of construction practices and skills in areas such as reading and evaluating blueprints and plans will be better off. In addition to openings stemming from the expected employment growth, some job openings will arise from the need to replace inspectors who transfer to other occupations or leave the labor force.

Earnings

Median annual wages of wage and salary construction and building inspectors were \$50,180 in May 2008. The middle 50 percent earned between \$39,070 and \$63,360. The lowest 10 percent earned less than \$31,270, and the highest 10 percent earned more than \$78,070. Median annual wages in the industries employing the largest numbers of construction and building inspectors were:

Federal Executive Branch	\$62,120
Management, scientific, and technical consulting services	58,520
Local government.....	50,330
Architectural, engineering, and related services	49,320
State government.....	45,700

Building inspectors, including plan examiners, generally earn the highest salaries. Salaries in large metropolitan areas are substantially higher than those in small jurisdictions.

Benefits vary by place of employment. Those working for the government and private companies typically receive standard benefits, including health and medical insurance, a retirement plan, and paid annual leave. Those who are self-employed may have to provide their own benefits.

About 25 percent of all construction and building inspectors belonged to a union or were covered by a union contract in 2008.

Related Occupations

Because construction and building inspectors are familiar with construction principles, the most closely related occupations are construction occupations, especially:

	Page
Carpenters	618
Electricians.....	641
Plumbers, pipelayers, pipefitters, and steamfitters.....	659

Construction and building inspectors also combine knowledge of construction principles and law with an ability to coordinate data, diagnose problems, and communicate with people. Workers in other occupations using a similar combination of skills include:

Architects, except landscape and naval	151
Appraisers and assessors of real estate	90
Construction managers.....	38
Cost estimators.....	100
technicians.....	173
Engineers.....	161
Surveyors, cartographers, photogrammetrists, and surveying and mapping technicians.....	157

Construction Equipment Operators

Significant Points

- Construction equipment operators are trained either through a formal apprenticeship program, through on-the-job training, through a paid training program, or a combination of these programs.
- Job opportunities are expected to be good.
- Hourly pay is relatively high, but operators of some types of equipment cannot work in inclement weather, so total annual earnings may be reduced.

Nature of the Work

Construction equipment operators use machinery to move construction materials, earth, and other heavy materials at construction sites and mines. They operate equipment that clears and grades land to prepare it for construction of roads, buildings, and bridges, as well as airport runways, power generation facilities, dams, levees, and other structures. They use machines to dig trenches to lay or repair sewer and other utilities, and hoist heavy construction materials. They even may work offshore constructing oil rigs. Construction equipment operators also operate machinery that spreads asphalt and concrete on roads and other structures.

These workers also help set up and inspect the equipment, make adjustments, and perform some maintenance and minor repairs. Construction equipment is more technologically advanced than it was in the past. For example, global positioning system (GPS) technology is now being used to help with grading and leveling activities.

Included in the construction equipment operator occupation are operating engineers and other construction equipment operators; paving and surfacing equipment operators; and piledriver operators. *Operating engineers* and *other construction equipment operators* work with one or several types of power construction equipment. They may operate excavation and loading machines equipped with scoops, shovels, or buckets that dig sand, gravel, earth, or similar materials and load it into trucks or onto conveyors. In addition operating to the familiar bulldozers, they operate trench excavators, road graders, and similar equipment. Sometimes, they may drive and control industrial trucks or tractors equipped with forklifts or booms for lifting materials or with hitches for pulling trailers. They also may operate and maintain air compressors, pumps, and other power equipment at construction sites.

Paving and surfacing equipment operators operate machines that spread and level asphalt or spread and smooth concrete for roadways or other structures. *Asphalt spreader operators* turn valves to regulate the temperature and flow of asphalt onto the roadbed. They must take care that the machine distributes the paving material evenly and without voids, and they must make sure that there is a constant flow of asphalt going into the hopper. Concrete paving machine operators control levers and turn handwheels to move attachments that spread, vibrate, and level wet concrete in forms. They must observe the surface of the concrete to identify low spots into which workers must add concrete. They use other attachments to smooth the surface of the concrete, spray on a curing compound, and cut expansion joints. Tamping equipment operators operate tamping machines that compact earth and other fill materials for roadbeds or other construction sites. They also may operate machines with interchangeable hammers to cut or break up old pavement and drive guardrail posts into the earth.

Piledriver operators use large machines mounted on skids, barges, or cranes to hammer piles into the ground. Piles are long, heavy beams of wood or steel driven into the ground to support retaining walls, bulkheads, bridges, piers, or building foundations. Some piledriver operators work on offshore oil rigs. Piledriver operators move hand and foot levers and turn valves to activate, position, and control the pile-driving equipment.

Work environment. Construction equipment operators work outdoors in nearly every type of climate and weather condition, although in many areas of the country some types of

Construction equipment operators level the surface of a construction site.

construction operations must be suspended in winter. Bulldozers, scrapers, and especially piledrivers are noisy and shake or jolt the operator. Operating heavy construction equipment can be dangerous, and this occupation incurs injuries and illnesses at a higher-than-average rate. As with most machinery, accidents generally can be avoided by observing proper operating procedures and safety practices. Construction equipment operators often get dirty, greasy, muddy, or dusty. Some operators work in remote locations on large construction projects, such as highways and dams, or in factory or mining operations.

Operators may have irregular hours because work on some construction projects continues around the clock or must be performed late at night or early in the morning.

Training, Other Qualifications, and Advancement

Construction equipment operators are trained either through a formal apprenticeship program, through on-the-job training, through a paid training program, or a combination of these programs.

Education and training. Employers of construction equipment operators generally prefer to hire high school graduates, although some employers may train nongraduates to operate some types of equipment. High school courses in automobile mechanics are helpful because workers may perform maintenance on their machines. Also useful are courses in science and mechanical drawing. With the development of GPS, construction equipment operators need more experience with computers than in the past.

On the job, workers may start by operating light equipment under the guidance of an experienced operator. Later, they may operate heavier equipment, such as bulldozers. Technologically advanced construction equipment with computerized controls and improved hydraulics and electronics requires more skill to operate. Operators of such equipment may need more training and some understanding of electronics.

It is generally accepted that formal training provides more comprehensive skills. Some construction equipment operators train in formal operating engineer apprenticeship programs administered by union-management committees of the International Union of Operating Engineers (IUOE). Because

apprentices learn to operate a wider variety of machines than do other beginners, they usually have better job opportunities. Apprenticeship programs consist of at least 3 years, or 6,000 hours, of paid on-the-job training together with 144 hours of related classroom instruction each year.

Private vocational schools offer instruction in the operation of certain types of construction equipment. Completion of such programs may help a person get a job. However, people considering this kind of training should check the school’s reputation among employers in the area and find out if the school offers the opportunity to work on actual machines in realistic situations. A large amount of information can be learned in classrooms, but to become a skilled construction equipment operator, a worker needs to actually perform the various tasks. Many training facilities, including IUOE apprenticeship programs, incorporate sophisticated simulators into their training, allowing beginners to familiarize themselves with the equipment in a controlled environment.

Certification and other qualifications. Mechanical aptitude and experience operating related mobile equipment, such as farm tractors or heavy equipment, in the Armed Forces or elsewhere is an asset. Construction equipment operators often need a commercial driver’s license to haul their equipment to the various jobsites. Commercial driver’s licenses are issued by States according to each State’s rules and regulations. Operators also need to be in good physical condition and have a good sense of balance, the ability to judge distance, and eye-hand-foot coordination. Some operator positions require the ability to work at heights.

Certification or training from the right school can improve opportunities for jobseekers; some employers may require operators to be certified. While attending some vocational schools, or by fulfilling the requirements of related professional associations, operators can qualify for various certifications. These certifications prove to potential employers that an operator is able to handle specific types of equipment.

Advancement. Construction equipment operators can advance to become supervisors. Some operators choose to pass on their knowledge and teach in training facilities. Other operators start their own contracting businesses, although doing so may be difficult because of high startup costs.

Employment

Construction equipment operators held about 469,300 jobs in 2008. Jobs were found in every section of the country and were distributed among various types of operators as follows:

Operating engineers and other construction equipment operators	404,500
Paving, surfacing, and tamping equipment operators.....	60,200
Pile-driver operators	4,600

About 63 percent of construction equipment operators worked in the construction industry. Many equipment operators worked in heavy and civil engineering construction, building highways, bridges, or railroads. About 16 percent of construction equipment operators worked in local government. Others—mostly grader, bulldozer, and scraper operators—worked in mining. Some also worked for manufacturing or utility companies. About 3 percent of construction equipment operators were self-employed.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Construction equipment operators	47-2070	469,300	525,500	56,200	12
Paving, surfacing, and tamping equipment operators	47-2071	60,200	67,200	6,900	12
Pile-driver operators.....	47-2072	4,600	5,200	600	13
Operating engineers and other construction equipment operators.....	47-2073	404,500	453,200	48,700	12

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Job Outlook

Average job growth is projected. The need to fill jobs and replace workers who leave the occupation should result in good job opportunities for construction equipment operators.

Employment change. Employment of construction equipment operators is expected to increase 12 percent between 2008 and 2018, about as fast as the average for all occupations. The likelihood of increased spending by the Federal Government on infrastructure to improve roads and bridges, railroads, the electric transmission system, and water and sewer systems, which are in great need of repair across the country, will generate numerous jobs for construction equipment operators who work primarily in these areas. In addition, population increases and the need for construction projects, such as new roads and sewer lines to service the increased population, will generate more jobs. However, without the extra spending on infrastructure by the Federal Government, employment may be flat as States and localities struggle with reduced taxes and budget shortfalls to pay for road and other improvements.

An expected rise in energy production is expected to increase work on oil rigs, smart grids, windmill farms, pipeline construction, and other types of power-generating facilities. Also, increased output of mines and rock and gravel quarries will generate jobs in the mining industry.

Job prospects. Job opportunities for construction equipment operators are expected to be good because the occupation often does not attract enough qualified candidates to fill jobs. Some workers' reluctance to work in construction makes it easier for willing workers to get operator jobs.

In addition, many job openings will arise from job growth and from the need to replace experienced construction equipment operators who transfer to other occupations, retire, or leave the job for other reasons. Construction equipment operators who can use a wide variety of equipment will have the best prospects. Operators with pipeline experience will have especially good opportunities if, as expected, natural-gas companies expand work on their infrastructure.

Employment of construction equipment operators, like that of many other construction workers, is sensitive to fluctuations in the economy. Workers in these trades may experience periods of unemployment when the overall level of construction falls. However, shortages of these workers may occur in some areas during peak periods of building activity.

Earnings

Wages for construction equipment operators vary. In May 2008, median hourly wages of wage and salary operating engineers and other construction equipment operators were \$18.88. The middle

50 percent earned between \$14.78 and \$25.49. The lowest 10 percent earned less than \$12.47, and the highest 10 percent earned more than \$33.34. Median hourly wages in the industries employing the largest numbers of operating engineers were as follows:

Nonresidential building construction	\$21.45
Highway, street, and bridge construction	21.20
Utility system construction	19.79
Other specialty trade contractors.....	18.61
Local government.....	17.19

Median hourly wages of wage and salary paving, surfacing, and tamping equipment operators were \$16.00 in May 2008. The middle 50 percent earned between \$12.94 and \$20.75. The lowest 10 percent earned less than \$10.77, and the highest 10 percent earned more than \$26.70. Median hourly wages in the industries employing the largest numbers of paving, surfacing, and tamping equipment operators were as follows:

Other specialty trade contractors.....	\$16.16
Highway, street, and bridge construction	16.13
Local government.....	15.94

In May 2008, median hourly wages of wage and salary pile-driver operators were \$23.01. The middle 50 percent earned between \$17.52 and \$32.94. The lowest 10 percent earned less than \$14.25, and the highest 10 percent earned more than \$38.01. Median hourly wages in the industries employing the largest numbers of piledriver operators were as follows:

Other specialty trade contractors.....	\$26.07
Other heavy and civil engineering construction.....	23.24
Nonresidential building construction	20.46
Utility system construction	19.54

Hourly pay is relatively high, particularly in large metropolitan areas. However, annual earnings of some workers may be lower than hourly rates would indicate because worktime may be limited by bad weather. About 27 percent of construction equipment operators belong to a union.

Related Occupations

Other workers who operate mechanical equipment include the following:

	Page
Agricultural equipment operators	609
Crane and tower operators	809
Logging equipment operators	606
Material moving occupations.....	809
Truck drivers, heavy and tractor-trailer.....	797

Sources of Additional Information

For further information about apprenticeships or work opportunities for construction equipment operators, contact a local of the International Union of Operating Engineers, a local apprenticeship committee, or the nearest office of the State apprenticeship agency or employment service. You also can find information on the registered apprenticeship system, with links to State apprenticeship programs, on the U.S. Department of Labor's Web site: http://www.doleta.gov/OA/eta_default.cfm. In addition, apprenticeship information is available from the U.S. Department of Labor's toll free help line: (877) 872-5627.

The Occupational Information Network (O*NET) provides information on a wide range of occupational characteristics. Links to O*NET appear at the end of the Internet version of this occupational statement, accessible at <http://www.bls.gov/ooh/ocos255.htm>

Construction Laborers

Significant Points

- Many construction laborer jobs require a variety of basic skills, but others require specialized training and experience.
- Most construction laborers learn on the job, but formal apprenticeship programs provide the most thorough preparation.
- Job opportunities vary by locality, but in many areas there will be competition, especially for jobs requiring limited skills.
- Laborers who have specialized skills or who can relocate near new construction projects should have the best opportunities.

Nature of the Work

Construction laborers can be found on almost all construction sites, performing a wide range of tasks from the very easy to the hazardous. They can be found at building, highway, and heavy construction sites; residential and commercial sites; tunnel and shaft excavations; and demolition sites. Many of the jobs they perform require physical strength, training, and experience. Other jobs require little skill and can be learned quickly. Although most construction laborers specialize in a type of construction, such as highway or tunnel construction, some are generalists who perform many different tasks during all stages of construction. Construction laborers who work in underground construction, such as in tunnels, or in demolition are more likely to specialize in only those areas.

Construction laborers clean and prepare construction sites. They remove trees and debris; tend pumps, compressors, and generators; and erect and disassemble scaffolding and other temporary structures. They load, unload, identify, and distribute building materials to the appropriate location according to project plans and specifications. Laborers also tend machines; for example, they may use a portable mixer to mix concrete or tend a machine that pumps concrete, grout, cement, sand, plaster, or stucco through a spray gun for application to ceilings and walls. They often help other craftworkers, including carpenters, plasterers, operating engineers, and masons.

Construction laborers are responsible for the installation and maintenance of traffic control devices and patterns. At highway construction sites, this work may include clearing and preparing highway work zones and rights-of-way; installing traffic barricades, cones, and markers; and controlling traffic passing near, in, and around work zones. Construction laborers also dig trenches; install sewer, water, and storm drainpipes; and place concrete and asphalt on roads. Other highly specialized tasks include operating laser guidance equipment to place pipes; operating air, electric, and pneumatic drills; and transporting and setting explosives for the construction of tunnels, shafts, and roads.

Some construction laborers help with the removal of hazardous materials, such as asbestos, lead, or chemicals. (Workers who specialize in, and are certified for, the removal of hazardous materials are discussed in the *Handbook* statement on hazardous materials removal workers.)

Construction laborers operate a variety of equipment, including pavement breakers; jackhammers; earth tampers; concrete, mortar, and plaster mixers; electric and hydraulic boring machines; torches; small mechanical hoists; laser beam equipment; and surveying and measuring equipment. They may use computers and other high-tech input devices to control robotic pipe cutters and cleaners. To perform their jobs effectively, construction laborers must be familiar with the duties of other craftworkers and with the materials, tools, and machinery they use, as all of these workers work as part of a team, jointly carrying out assigned construction tasks.

Work environment. Most construction laborers do physically demanding work. Some work at great heights or outdoors in all weather conditions. Some jobs expose workers to harmful materials or chemicals, fumes, odors, loud noises, or dangerous machinery. Some laborers may be exposed to

A construction laborer performs work on a scale too small for a large piece of equipment.

lead-based paint, asbestos, or other hazardous substances during their work, especially when they work in confined spaces. Workers in this occupation experience one of the highest rates of nonfatal injuries and illnesses; consequently, the work requires constant attention to safety on the job. To avoid injury, workers in these jobs wear safety clothing, such as gloves, hardhats, protective chemical suits, and devices to protect their eyes, respiratory system, or hearing. While working underground, construction laborers must be especially alert in order to follow procedures safely and must deal with a variety of hazards.

A standard 40 hour work week is the most common work week for construction laborers. About 1 in 7 has a variable schedule, as overnight work may be required in highway work. In some parts of the country, construction laborers may work only during certain seasons. They also may experience weather-related work stoppages at any time of the year.

Training, Other Qualifications, and Advancement

Many construction laborer jobs require a variety of basic skills, but others require specialized training and experience. Most construction laborers learn on the job, but formal apprenticeship programs provide the most thorough preparation.

Education and training. Although some construction laborer jobs have no specific educational qualifications or entry-level training, apprenticeships for laborers usually require a high school diploma or the equivalent. High school classes in English, mathematics, physics, mechanical drawing, blueprint reading, welding, and general shop can be helpful.

Most workers start by getting a job with a contractor who provides on-the-job training. Increasingly, construction laborers are finding work through temporary-help agencies that send laborers to construction sites for short-term work. Entry-level workers generally help more experienced workers, by performing routine tasks such as cleaning and preparing the worksite and unloading materials. When the opportunity arises, they learn from experienced construction trades workers how to do more difficult tasks, such as operating tools and equipment. Construction laborers also may choose or be required to attend a trade or vocational school, association

training class, or community college to receive further trade-related training.

Some laborers receive more formal training in the form of an apprenticeship. These programs include between 2 and 4 years of classroom and on-the-job training. In the first 200 hours, workers learn basic construction skills, such as blueprint reading, the correct use of tools and equipment, and safety and health procedures. The remainder of the curriculum consists of specialized skills training in three of the largest segments of the construction industry: building construction, heavy and high-way construction, and environmental remediation, such as lead or asbestos abatement and mold or hazardous waste remediation. Training in “green,” energy-efficient construction, an area of growth in the construction industry, is now available and can help workers find employment.

Workers who use dangerous equipment or handle toxic chemicals usually receive specialized safety training. Laborers who remove hazardous materials are required to take union- or employer-sponsored Occupational Safety and Health Administration safety training.

Apprenticeship applicants usually must be at least 18 years old and meet local requirements. Because the number of apprenticeship programs is limited, however, only a small proportion of laborers learn their trade in this way.

Other qualifications. Laborers need manual dexterity, eye-hand coordination, good physical fitness, a good sense of balance, and an ability to work as a member of a team. The ability to solve arithmetic problems quickly and accurately may be required. In addition, military service or a good work history is viewed favorably by contractors.

Certification and advancement. Laborers may earn certifications in welding, scaffold erecting, and concrete finishing. These certifications help workers prove that they have the knowledge to perform more complex tasks.

Through training and experience, laborers can move into other construction occupations. Laborers may also advance to become construction supervisors or general contractors. For those who would like to advance, it is increasingly important to be able to communicate in both English and Spanish in order to relay instructions and safety precautions to workers with limited understanding of English; Spanish-speaking workers make up a large part of the construction workforce in many areas. Supervisors and contractors need good communication skills to deal with clients and subcontractors.

In addition, supervisors and contractors should be able to identify and estimate the quantity of materials needed to complete a job and accurately estimate how long a job will take to complete and what it will cost. Computer skills also are important for advancement as construction becomes increasingly mechanized and computerized.

Employment

Construction laborers held about 1.2 million jobs in 2008. They worked throughout the country, but like the general population, were concentrated in metropolitan areas. About 62 percent of construction laborers worked in the construction industry, including 27 percent who worked for specialty trade contractors. About 21 percent were self-employed in 2008.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Construction laborers	47-2061	1,248,700	1,504,600	255,900	20

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Job Outlook

Employment is expected to grow much faster than the average. In many areas, there will be competition for jobs, especially those requiring limited skills. Laborers who have specialized skills or who can relocate near new construction projects should have the best opportunities.

Employment change. Employment of construction laborers is expected to grow by 20 percent between 2008 and 2018, much faster than the average for all occupations. Because of the large variety of tasks that laborers perform, demand for laborers will mirror the level of overall construction activity. However, some jobs may be adversely affected by automation as they are replaced by new machinery and equipment that improves productivity and quality.

Increasing job prospects for construction laborers, however, is the expected additional government funding for the repair and reconstruction of the Nation's infrastructure, such as roads, bridges, public buildings, and water lines. The occupation should experience an increase in demand because laborers make up a significant portion of workers on these types of projects.

New emphasis on green construction also should help lead to better employment prospects as many green practices require more labor on construction sites. Additional duties resulting from practicing green construction include having to segregate materials that can be used again from those which cannot, and the actual reuse of such materials. In addition, these workers will be needed for the construction of any new projects to harness wind or solar power.

Job prospects. In many geographic areas, construction laborers—especially for those with limited skills—will experience competition because of a plentiful supply of workers who are willing to work as day laborers. Overall opportunities will be best for those with experience and specialized skills and for those who can relocate to areas with new construction projects. Opportunities also will be better for laborers specializing in road construction.

Employment of construction laborers, like that of many other construction workers, is sensitive to the fluctuations of the economy. On the one hand, workers in these trades may experience periods of unemployment when the overall level of construction falls. On the other hand, shortages of these workers may occur in some areas during peak periods of building activity.

Earnings

Median hourly wages of wage and salary construction laborers in May 2008 were \$13.71. The middle 50 percent earned between \$10.74 and \$18.57. The lowest 10 percent earned less than \$8.67, and the highest 10 percent earned more than \$25.98. Median hourly wages in the industries

employing the largest number of construction laborers were as follows:

Nonresidential building construction	\$14.95
Other specialty trade contractors.....	13.81
Residential building construction.....	13.79
Foundation, structure, and building exterior contractors.....	13.35
Employment services	10.80

Earnings for construction laborers can be reduced by poor weather or by downturns in construction activity, which sometimes result in layoffs. Apprentices or helpers usually start out earning about 60 percent of the wage paid to experienced workers. Pay increases as apprentices gain experience and learn new skills.

Some laborers—about 14 percent—belong to a union, mainly the Laborers' International Union of North America.

Related Occupations

The work of construction laborers is closely related to that of other construction occupations, as well as that of others who perform similar physical work, such as the following:

	Page
Assemblers and fabricators	723
Brickmasons, blockmasons, and stonemasons.....	615
Forest and conservation workers.....	604
Grounds maintenance workers.....	498
Highway maintenance workers.....	829
Logging workers	606
Material moving occupations.....	809
Refractory materials repairers, except brickmasons	830
Roustabouts, oil and gas.....	829
Structural metal fabricators and fitters	723

Sources of Additional Information

For information about jobs as a construction laborer, contact local building or construction contractors, local joint labor-management apprenticeship committees, apprenticeship agencies, or the local office of your State Employment Service. You also can find information on the registered apprenticeships, together with links to State apprenticeship programs, on the U.S. Department of Labor's Web site: http://www.doleta.gov/OA/eta_default.cfm. Apprenticeship information also is available from the U.S. Department of Labor's toll-free help line: (877) 872-5627.

For general information on apprenticeships and how to get them, see the *Occupational Outlook Quarterly* article "Apprenticeships: Career training, credentials—and a paycheck in your pocket," online at <http://www.bls.gov/opub/ooq/2002/summer/art01.pdf> and in print at many libraries and career centers.

Drywall and Ceiling Tile Installers, Tapers, Plasterers, and Stucco Masons

Significant Points

- Most workers learn their trade through informal training programs or through an apprenticeship.
- Work is physically demanding.
- Job prospects are expected to be good.
- Workers may be idled when downturns in the economy slow construction activity.

Nature of the Work

Drywall and ceiling tile installers, tapers, plasterers, and stucco masons are specialty construction workers who build, apply, or fasten interior and exterior wallboards or wall coverings in residential, commercial, and other structures. Specifically, drywall and ceiling tile installers and tapers work indoors, installing wallboards to ceilings or to interior walls of buildings; plasterers and stucco masons, on the other hand, work both indoors and outdoors—applying plaster to interior walls and cement or stucco to exterior walls. While most work is performed for functionality, such as fireproofing and sound dampening, some applications are intended purely for decorative purposes.

Drywall consists of a thin layer of gypsum between two layers of heavy paper. It is used to make walls and ceilings in most buildings today because it is faster and cheaper to install than plaster.

There are two kinds of drywall workers—installers and tapers—although many workers do both types of work. Installers, also called *framers* or *hangers*, fasten drywall panels to the inside framework of houses and other buildings. Tapers or *finishers*, prepare these panels for painting by taping and finishing joints and imperfections. In addition to drywall workers, ceiling tile installers also help to build walls and ceilings.

Because drywall panels are manufactured in standard sizes—usually 4 feet by 8 feet—drywall installers must measure, cut, fit, and fasten them to the inside framework of buildings. Installers saw, drill, or cut holes in panels for electrical outlets, air-conditioning units, and plumbing. After making these alterations, installers typically screw the wallboard panels to the wood or metal framework, called studs. Because drywall is

heavy and cumbersome, another worker usually helps the installer to position and secure the panel. Installers often use a lift when placing ceiling panels.

After the drywall is installed, tapers fill joints between panels with a joint compound, also called spackle or “mud.” Using the wide, flat tip of a special trowel, they spread the compound into and along each side of the joint. They immediately use the trowel to press a paper tape—used to reinforce the drywall and to hide imperfections—into the wet compound and to smooth away excess material. Nail and screw depressions also are covered with this compound, as are imperfections caused by the installation of air-conditioning vents and other fixtures. Using increasingly wider trowels, tapers apply second and third coats of the compound, sanding the treated areas after each coat to make them smooth and devoid of seams.

Ceiling tile installers, or *acoustical carpenters*, apply or mount acoustical tiles or blocks, strips, or sheets of shock-absorbing materials to ceilings and walls of buildings to reduce deflection of sound or to decorate rooms. First, they measure and mark the surface according to blueprints and drawings. Then, they nail or screw moldings to the wall to support and seal the joint between the ceiling tile and the wall. Finally, they mount the tile, either by applying a cement adhesive to the back of the tile and then pressing the tile into place, or by nailing, screwing, or wire-tying the lath directly to the structural framework.

Plasterers apply plaster to interior walls and ceilings to form fire-resistant and relatively soundproof surfaces. They also apply plaster veneer over drywall to create smooth or textured abrasion-resistant finishes. In addition, plasterers install pre-fabricated exterior insulation systems over existing walls—for good insulation and interesting architectural effects—and cast ornamental designs in plaster. Stucco masons apply durable plasters, such as polymer-based acrylic finishes and stucco, to exterior surfaces.

Plasterers can plaster either solid surfaces, such as concrete block, or supportive wire mesh called lath. When plasterers work with hard interior surfaces, such as concrete block and concrete, they first apply a brown coat of gypsum plaster that provides a base, which is followed by a second, or finish coat, also called “white coat.” When plastering metal-mesh lath foundations, they apply a preparatory, or “scratch coat” with a trowel. They spread this rich plaster mixture into and over the metal lath. Before the plaster sets, plasterers scratch its surface with a rake-like tool to produce ridges, so that the subsequent brown coat will bond tightly. They then apply the brown coat and the white finish coat.

When plastering on non-solid surfaces, *lathers* are needed to help build supportive walls out of wire. This support base is put on walls, ceilings, ornamental frameworks, and partitions of buildings before plaster and other coatings are added.

Applying different types of plaster coating requires different techniques. When applying the brown coat, plasterers spray or trowel the mixture onto the surface, then smooth it to an even, level surface. For the finish, or white coat, plasterers usually prepare a mixture of plaster and water. They quickly apply this using a “hawk,” that is a light, metal plate with a handle, along with a trowel, brush, and water. This mixture, which sets very quickly, produces a very smooth, durable finish.

Drywall and ceiling tile installers, tapers, plasterers, and stucco masons learn their trade through informal training programs or through apprenticeships.

Plasterers create decorative interior surfaces as well. One way that they do this is by pressing a brush or trowel firmly against a wet plaster surface and using a circular hand motion to create decorative swirls. Plasterers sometimes do more complex decorative and ornamental work that requires special skill and creativity. For example, they may mold intricate wall and ceiling designs, such as cornice pieces and chair rails. Following an architect's blueprint, plasterers pour or spray a special plaster into a mold and allow it to set. Workers then remove the molded plaster and put it in place, according to the plan.

Stucco masons usually apply stucco—a mixture of Portland cement, lime, and sand—over cement, concrete, masonry or wire lath. Stucco also may be applied directly to a wire lath with a scratch coat, followed by a brown coat, and then a finish coat. Stucco masons may also embed marble or gravel chips into the finish coat to achieve a pebble-like, decorative finish.

When required, stucco masons apply insulation to the exteriors of new and old buildings. They cover the outer wall with rigid foam insulation board and reinforcing mesh, and then trowel on a base coat. They may apply an additional coat of this material with a decorative finish.

Work environment. As in many other construction trades, this work is physically demanding. Drywall and ceiling tile installers, tapers, plasterers, and stucco masons spend most of the day on their feet, either standing, bending, stretching, or kneel-

ing. Some workers need to use stilts; others may have to lift and maneuver heavy, cumbersome materials, such as oversized wallboards. The work also can be dusty and dirty, irritating the skin, eyes, and lungs, unless protective masks, goggles, and gloves are used. Hazards include falls from ladders and scaffolds, and injuries from power tools and from working with sharp tools, such as utility knives.

Most work indoors, except for the relatively few stucco masons who apply exterior finishes.

Training, Other Qualifications, and Advancement

Most workers learn their trade through informal training programs or through an apprenticeship. It can take 3 to 4 years of paid on-the-job training to become a fully skilled worker, but many skills can be learned within the first year. In general, the more formal the training process, the more skilled the individual becomes, and the more in demand by employers.

Education and training. A high school education, or its equivalent, is helpful, as are courses basic math, mechanical drawing, and blueprint reading. The most common way to get a first job is to find an employer who will provide on-the-job training. Entry-level workers generally start as helpers, assisting more experienced workers. Employers may also send new employees to a trade or vocational school or community college to receive classroom training.

Some employers, particularly large nonresidential construction contractors with unionized workforces, offer employees formal apprenticeships. These programs combine on-the-job training with related classroom instruction—at least 144 hours of instruction each year for drywall and ceiling tile installers and tapers, and 166 hours for plasterers and stucco masons. The length of the apprenticeship program, usually 3 to 4 years, varies with the apprentice's skill. Because the number of apprenticeship programs is limited, however, only a small proportion of these workers learn their trade this way.

Helpers and apprentices start by carrying materials, lifting and cleaning up debris. They also learn to use the tools, machines, equipment, and materials of the trade. Within a few weeks, they learn to measure, cut, apply, and install materials. Eventually, they become fully experienced workers. At the end of their training, workers learn to estimate the cost of completing a job.

Other jobseekers may choose to obtain their training before seeking a job. There are a number of vocational-technical schools and training academies affiliated with the industry's unions and contractors that offer training in these occupations. Employers often look favorably upon graduates of these training programs and usually start them at a higher level than those without the training.

Other qualifications. Workers need to be in good physical condition and have good eye-hand coordination, a sense of balance and manual dexterity. For drywall and ceiling tile installers and tapers, the ability to solve basic arithmetic problems quickly and accurately is required. They also should be able to identify and estimate the quantity of materials needed to complete a job, and accurately estimate how long a job will take to complete and at what cost.

Artistic creativity is helpful for plasterers and stucco masons who apply decorative finishes. In addition, a good work history is viewed favorably by contractors.

Apprentices usually must be at least 18 years old and have a high school diploma or GED. Those who complete apprenticeships registered with the Federal or State Government receive a journey worker certificate that is recognized Nationwide.

Certification and advancement. Some organizations related to masonry trades offer training and certification intended to enhance the skills of their members. For example, the International Union of Bricklayers and Allied Craftworkers International Masonry Institute confers designations in several areas of specialization, including one for plastering. Candidates who complete a 12-week certification program can earn a designation as a “journey level plasterer” by passing a competency-based exam. Experienced candidates can become trainers and earn a designation as “Certified Instructor or Journeyworkers and Apprentices in the Trowel Trades.”

Drywall and ceiling tile installers, tapers, plasterers, and stucco masons may advance to supervisor or general construction supervisor positions. However, it is increasingly important to be able to communicate in both English and Spanish in order to relay instructions and safety precautions to workers with limited understanding of English because Spanish-speaking workers make up a large part of the construction workforce in many areas. Knowing English well also makes it easier to advance. Many workers become independent contractors. Others become building inspectors.

Employment

Drywall and ceiling tile installers, tapers, plasterers, and stucco masons held about 237,700 jobs in 2008. About 19 percent were self-employed independent contractors. The following tabulation shows 2008 wage-and-salary employment by specialty:

Drywall and ceiling tile installers	151,300
Plasterers and stucco masons	49,000
Tapers	37,400

Most workers are employed in populous areas. In other areas, where there may not be enough work to keep them employed full time, carpenters and painters usually do the work.

Job Outlook

Employment of drywall and ceiling tile installers, tapers, plasterers, and stucco masons is expected to grow about as fast as

average for all occupations. Job growth, however, will differ among the individual occupations in this category. Good job prospects are expected overall.

Employment change. Overall employment is expected to grow by 12 percent between 2008 and 2018. Employment of drywall and ceiling tile installers—the largest specialty—is expected to grow 14 percent, reflecting growth of new construction and remodeling projects. New residential construction projects are expected to provide the majority of jobs during the projection decade, but home improvement and renovation projects are also expected to create jobs because existing residential and nonresidential buildings are getting old and need repair.

Employment of tapers is expected to grow 13 percent, which is as fast as the average. Demand for tapers, which often mirrors demand for drywall installers, also will be driven by the overall growth of construction activity.

Employment of plasterers and stucco masons, on the other hand, is expected to grow 7 percent. Despite an increased appreciation for the attractiveness and durability that plaster provides, growing use of cheaper and easier to install alternatives, such as drywall, will impede employment growth for these workers. Nonetheless, stucco masons will experience some employment growth due to demand for new polymer-based exterior insulating finishes that are gaining popularity, particularly in the South and Southwest regions of the country.

Job prospects. Job opportunities for drywall and ceiling tile installers, tapers, plasterers, and stucco masons are expected to be good overall. Many potential workers are not attracted to this occupation because they prefer work that is less strenuous and has more comfortable working conditions. Experienced workers will have especially favorable opportunities.

Besides opportunities resulting from job growth, many drywall and ceiling tile installer and taper jobs will open up each year because of the need to replace workers who transfer to other occupations or leave the labor force. Skilled, experienced plasterers with artistic ability should have excellent opportunities, especially with restoration projects. Decorative custom finishes, expensive homes, and large-scale restoration projects will further result in opportunities for plasterers in the Northeast, particularly in urban areas. For stucco masons, the best employment opportunities should continue to be in Florida, California, and the Southwest, where the use of stucco is expected to remain popular.

Like many other construction workers, employment in these occupations is sensitive to the fluctuations of the economy. Workers in these trades may experience periods of

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Drywall and ceiling tile installers, tapers, plasterers, and stucco masons.....	—	237,700	266,200	28,500	12

Drywall and ceiling tile installers	47-2081	151,300	171,700	20,500	14
Tapers	47-2082	37,400	42,300	4,900	13
Plasterers and stucco masons	47-2161	49,000	52,200	3,200	7

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

unemployment when the overall level of construction falls. On the other hand, shortages of these workers may occur in some areas during peak periods of building activity.

Earnings

The median hourly wages of wage and salary drywall and ceiling tile installers were \$18.12 in May 2008. The middle 50 percent earned between \$14.23 and \$23.80. The lowest 10 percent earned less than \$11.64, and the highest 10 percent earned more than \$31.72.

Median hourly wages of wage and salary tapers were \$21.03 in May 2008. The middle 50 percent earned between \$15.45 and \$28.27. The lowest 10 percent earned less than \$12.62, and the highest 10 percent earned more than \$34.91.

Median hourly wages of wage and salary plasterers and stucco masons were \$18.01 in May 2008. The middle 50 percent earned between \$14.36 and \$22.94. The lowest 10 percent earned less than \$12.01, and the top 10 percent earned more than \$29.59.

Related Occupations

Drywall and ceiling tile installers, tapers, plasterers, and stucco masons combine strength and dexterity with precision and accuracy to make materials fit according to a plan. Other occupations that require similar abilities include:

	Page
Brickmasons, blockmasons, and stonemasons.....	615
Carpenters	618
Carpet, floor, and tile installers and finishers.....	621
Cement masons, concrete finishers, segmental pavers, and terrazzo workers	625
Insulation workers.....	653

Electricians

Significant Points

- Job opportunities should be good, especially for those with the broadest range of skills.
- Most electricians acquire their skills by completing an apprenticeship program usually lasting 4 years.
- About 79 percent of electricians work in the construction industry or are self-employed, but there also will be opportunities for electricians in other industries.

Nature of the Work

Electricians install and maintain all of the electrical and power systems for our homes, businesses, and factories. They install and maintain the wiring and control equipment through which electricity flows. They also install and maintain electrical equipment and machines in factories and a wide range of other businesses.

Electricians generally focus on either construction or maintenance, although many do both. Electricians specializing in construction primarily install wiring systems into factories, businesses, and new homes. Electricians specializing in maintenance fix and upgrade existing electrical systems and repair electrical equipment. All electricians must follow State and local building codes and the National Electrical Code when performing their work.

Electricians usually start their work by reading blueprints—technical diagrams that show the locations of circuits, outlets, load centers, panel boards, and other equipment. After determining where all the wires and components will go, electricians install and connect the wires to circuit breakers, transformers, outlets, or other components and systems.

When installing wiring, electricians use handtools such as conduit benders, screwdrivers, pliers, knives, hacksaws, and wire strippers, as well as power tools such as drills and saws. Later, they use ammeters, ohmmeters, voltmeters, harmonics testers, and other equipment to test connections and ensure the compatibility and safety of components.

Maintenance electricians repair or replace electric and electronic equipment when it breaks. They make needed repairs as quickly as possible in order to minimize inconvenience. They may replace items such as circuit breakers, fuses, switches, electrical and electronic components, or wire.

Electricians also periodically inspect all equipment to ensure that it is operating properly and to correct problems before breakdowns occur.

Maintenance work varies greatly, depending on where an electrician works. Electricians who focus on residential work perform a wide variety of electrical work for homeowners. They may rewire a home and replace an old fuse box with a new circuit breaker box to accommodate additional appliances, or they may install new lighting and other electric household items, such as ceiling fans. These electricians also might do some construction and installation work.

Electricians in large factories usually do maintenance work that is more complex. These kinds of electricians may repair motors, transformers, generators, and electronic controllers on machine tools and industrial robots. They also advise management as to whether the continued operation of certain equipment could be hazardous. When working with complex electronic devices, they may consult with engineers, engineering technicians, line installers and repairers, or industrial machinery mechanics and maintenance workers. (Statements on these occupations appear elsewhere in the *Handbook*.)

Work environment. Electricians work indoors and out, at construction sites, in homes, and in businesses or factories. The work may be strenuous at times and may include bending conduit, lifting heavy objects, and standing, stooping, and kneeling for long periods. Electricians risk injury from electrical shock, falls, and cuts, and must follow strict safety procedures to avoid injuries. Data from the U.S. Bureau of Labor Statistics show that full-time electricians experienced a work-related injury and illness rate that was higher than the national average. When working outdoors, they may be subject to inclement weather. Some electricians may have to travel long distances to jobsites.

Most electricians work a standard 40-hour week, although overtime may be required. Those who do maintenance work may work nights or weekends and be on call to go to the work-site when needed. Electricians in industrial settings may have periodic extended overtime during scheduled maintenance or retooling periods. Companies that operate 24 hours a day may employ three shifts of electricians.

Training, Other Qualifications, and Advancement

Most electricians learn their trade through apprenticeship programs that combine on-the-job training with related classroom instruction.

Education and training. Apprenticeship programs combine paid on-the-job training with related classroom instruction. Joint training committees made up of local unions of the International Brotherhood of Electrical Workers and local chapters of the

National Electrical Contractors Association; individual electrical contracting companies; or local chapters of the Associated Builders and Contractors and the Independent Electrical Contractors Association usually sponsor apprenticeship programs.

Because of the comprehensive training received, those who complete apprenticeship programs qualify to do both maintenance and construction work. Apprenticeship programs usually last 4 years. Each year includes at least 144 hours of classroom instruction and 2,000 hours of on-the-job training. In the classroom, apprentices learn electrical theory, blueprint reading, mathematics, electrical code requirements, and safety and first aid practices. They also may receive specialized training in soldering, communications, fire alarm systems, and cranes and elevators.

On the job, apprentices work under the supervision of experienced electricians. At first, they drill holes, set anchors and attach conduit. Later, they measure, fabricate, and install conduit and install, connect, and test wiring, outlets, and switches. They also learn to set up and draw diagrams for entire electrical systems. Eventually, they practice and master all of an electrician's main tasks.

Some people start their classroom training before seeking an apprenticeship. A number of public and private vocational-technical schools and training academies offer training to become an electrician. Employers often hire students who complete these programs and usually start them at a more advanced level than

An electrician prepares the wiring for an interior room.

those without this training. A few people become electricians by first working as helpers—assisting electricians by setting up job sites, gathering materials, and doing other nonelectrical work—before entering an apprenticeship program. All apprentices need a high school diploma or a General Equivalency Diploma (G.E.D.). Electricians also may need additional classes in mathematics because they solve mathematical problems on the job.

Education continues throughout an electrician's career. Electricians may need to take classes to learn about changes to the National Electrical Code, and they often complete regular safety programs, manufacturer-specific training, and management training courses. Classes on such topics as low-voltage voice and data systems, telephone systems, video systems, and alternative energy systems such as solar energy and wind energy increasingly are being given as these systems become more prevalent. Other courses teach electricians how to become contractors.

Licensure. Most States and localities require electricians to be licensed. Although licensing requirements vary from State to State, electricians usually must pass an examination that tests their knowledge of electrical theory, the National Electrical Code, and local and State electric and building codes.

Electrical contractors who do electrical work for the public, as opposed to electricians who work for electrical contractors, often need a special license. In some States, electrical contractors need certification as master electricians. Most States require master electricians to have at least 7 years of experience as an electrician or a bachelor's degree in electrical engineering or a related field.

Other qualifications. Applicants for apprenticeships usually must be at least 18 years old and have a high school diploma or a G.E.D. They also may have to pass a test and meet other requirements.

Other skills needed to become an electrician include manual dexterity, eye-hand coordination, physical fitness, and a good sense of balance. Electricians also need good color vision because workers frequently must identify electrical wires by color. In addition, apprenticeship committees and employers view a good work history or military service favorably.

Advancement. Experienced electricians can advance to jobs as supervisors. In construction, they also may become project managers or construction superintendents. Those with sufficient capital and management skills can start their own contracting business, although doing so often requires a special electrical contractor's license. Supervisors and contractors should be able to identify and estimate costs and prices and the time and materials needed to complete a job. Many electricians also become electrical inspectors.

For those who seek to advance, it is increasingly important to be able to communicate in both English and Spanish in order to relay instructions and safety precautions to workers with limited understanding of English; Spanish-speaking workers

make up a large part of the construction workforce in many areas. Spanish-speaking workers who want to advance in this occupation need very good English skills to understand electrician classes and installation instructions, which are usually written in English and are highly technical.

Employment

Electricians held about 694,900 jobs in 2008. About 65 percent of wage and salary workers were employed by electrical contracting firms, and the remainder worked as electricians in a variety of other industries. In addition, about 9 percent of electricians were self-employed.

Job Outlook

Average employment growth is expected. Job prospects should be good, particularly for workers with the widest range of skills, including voice, data, and video wiring.

Employment change. Employment of electricians should increase 12 percent between 2008 and 2018, about as fast as the average for all occupations. As the population grows, electricians will be needed to wire new homes, restaurants, schools, and other structures that will be built to accommodate the growing population. In addition, older buildings will require improvements to their electrical systems to meet modern codes and accommodate higher electricity consumption due to the greater use of electronic equipment in houses and workplaces.

New technologies also are expected to continue to spur demand for these workers. Robots and other automated manufacturing systems in factories will require the installation and maintenance of more complex wiring systems. In addition, efforts to boost conservation of energy in public buildings and in new construction will boost demand for electricians because electricians are key to installing some of the latest energy savers, such as solar panels and motion sensors for turning on lights.

Job prospects. In addition to jobs created by the increased demand for electrical work, openings are expected over the next decade as electricians retire. This will create good job opportunities, especially for those with the widest range of skills, including voice, data, and video wiring. Job openings for electricians will vary by location and specialty, however, and will be best in the fastest growing regions of the country.

Employment of electricians, like that of many other construction workers, is sensitive to the fluctuations of the economy. On the one hand, workers in these trades may experience periods of unemployment when the overall level of construction falls. On the other hand, shortages of these workers may occur in some areas during peak periods of building activity.

Although employment of maintenance electricians is steadier than that of construction electricians, those working in the automotive and other manufacturing industries that are sensitive to cyclical swings in the economy may experience layoffs during

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Electricians.....	47-2111	694,900	777,900	83,000	12

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

recessions. In addition, in many industries opportunities for maintenance electricians may be limited by increased contracting out for electrical services in an effort to reduce operating costs. However, increased job opportunities for electricians in electrical contracting firms should partially offset job losses in other industries.

Earnings

In May 2008, median hourly wages of wage and salary electricians were \$22.32. The middle 50 percent earned between \$17.00 and \$29.88. The lowest 10 percent earned less than \$13.54, and the highest 10 percent earned more than \$38.18. Median hourly wages in the industries employing the largest numbers of electricians were as follows:

Electric power generation, transmission and distribution.....	\$28.15
Local government.....	25.66
Nonresidential building construction	22.21
Building equipment contractors	21.72
Employment services	18.32

Apprentices usually start at between 30 and 50 percent of the rate paid to fully trained electricians, depending on experience. As apprentices become more skilled, they receive periodic pay increases throughout their training.

About 32 percent of all electricians are members of a union, especially the International Brotherhood of Electrical Workers. Among unions representing maintenance electricians are the International Brotherhood of Electrical Workers; the International Union of Electronic, Electrical, Salaried, Machine, and Furniture Workers; the International Association of Machinists and Aerospace Workers; the International Union, United Automobile, Aircraft and Agricultural Implement Workers of America; and the United Steelworkers of America.

Elevator Installers and Repairers

Significant Points

- Most workers belong to a union and enter the occupation through a 4-year apprenticeship program.
- Excellent employment opportunities are expected.
- Elevator installers and repairers are less affected by seasonality and downturns in the economy than most other construction trades workers because much of the work involves maintenance and repair.

Nature of the Work

Elevator installers and repairers—also called *elevator constructors* or *elevator mechanics*—assemble, install, and replace elevators, escalators, chairlifts, dumbwaiters, moving walkways, and similar equipment in new and old buildings. Once the equipment is in service, they maintain and repair it as well. They also are responsible for modernizing older equipment.

To install, repair, and maintain modern elevators, which are almost all electronically controlled, elevator installers and repairers must have a thorough knowledge of electronics, hydraulics, and electricity. Many elevators are controlled with microprocessors, which are programmed to dispatch elevators in the most efficient manner. With these controls, it is possible to get the greatest amount of service with the smallest number of cars.

Elevator installers and repairers usually specialize in installation, maintenance, or repair work. Maintenance and repair workers generally need greater knowledge of electronics and electricity than do installers because a large part of maintenance and repair work is troubleshooting.

When installing a new elevator, installers and repairers begin by studying blueprints to determine the equipment needed to install rails, machinery, car enclosures, motors, pumps, cylinders, and plunger foundations. Then, they begin equipment installation. Working on scaffolding or platforms, installers bolt or weld steel rails to the walls of the shaft to guide the elevator.

Elevator installers put in electrical wires and controls by running tubing, called conduit, along a shaft's walls from floor to floor. Once the conduit is in place, mechanics pull plastic-covered electrical wires through it. They then install electrical components and related devices required at each floor and at the main control panel in the machine room.

Installers bolt or weld together the steel frame of an elevator car at the bottom of the shaft; install the car's platform, walls, and doors; and attach guide shoes and rollers to minimize the lateral motion of the car as it travels through the shaft. They also install the outer doors and door frames at the elevator entrances on each floor.

For cabled elevators, workers install geared or gearless machines with a traction drive wheel that guides and moves heavy steel cables connected to the elevator car and counterweight. (The counterweight moves in the opposite direction from the car and balances most of the weight of the car to reduce the weight that the elevator's motor must lift.) Elevator installers also install elevators in which a car sits on a hydraulic plunger that is driven by a pump. The plunger pushes the elevator car up from underneath, similar to a hydraulic lift in an auto service station.

Installers and repairers also install escalators. They place the steel framework, the electrically powered stairs, and the tracks and install associated motors and electrical wiring. In addition to elevators and escalators, installers and repairers also may install devices such as dumbwaiters and material lifts—which are similar to elevators in design—as well as moving walkways, stair lifts, and wheelchair lifts.

Once an elevator is operating correctly, it must be maintained and serviced regularly to keep it in safe working condition. Elevator installers and repairers generally do preventive

maintenance—such as oiling and greasing moving parts, replacing worn parts, testing equipment with meters and gauges, and adjusting equipment for optimal performance. They ensure that the equipment and rooms are clean. They also troubleshoot and may be called to do emergency repairs. Unlike most elevator installers, people who specialize in elevator maintenance work independently most of the day and typically service many of the same elevators on multiple occasions over time.

A service crew usually handles major repairs—for example, replacing cables, elevator doors, or machine bearings. These tasks may require the use of cutting torches or rigging equipment—tools that an elevator repairer would not normally carry. Service crews also do major modernization and alteration work, such as moving and replacing electrical motors, hydraulic pumps, and control panels.

The most highly skilled elevator installers and repairers, called “adjusters,” specialize in fine-tuning all the equipment after installation. Adjusters make sure that an elevator works according to specifications and stops correctly at each floor within a specified time. Adjusters need a thorough knowledge of electronics, electricity, and computers to ensure that newly installed elevators operate properly.

Work environment. Elevator installers lift and carry heavy equipment and parts, and they may work in cramped spaces or awkward positions. Potential hazards include falls, electrical shock, muscle strains, and other injuries related to handling heavy equipment. To prevent injury, workers often are required to wear hardhats, harnesses, ear plugs, safety glasses, protective clothing and shoes, and occasionally, respirators. Data from the U.S. Bureau of Labor Statistics show that full-time elevator installers and repairers experienced a work-related injury and illness rate that was much higher than the national average.

Most elevator installers and repairers work a 40-hour week. However, overtime is required when essential equipment must be repaired, and some workers are on 24-hour call. Because most of their work is performed indoors in buildings, elevator installers and repairers lose less work time because of inclement weather than do most other workers in the construction trades.

Employment of elevator installers and repairers is less affected by economic downturns and seasonality than employment in other construction trades.

Training, Other Qualifications, and Advancement

Most elevator installers receive their education through an apprenticeship program. High school classes in mathematics, science, and shop may help applicants compete for apprenticeship openings.

Education and training. Most elevators installers and repairers learn their trade in an apprenticeship program administered by local joint educational committees representing the employers and the union—the International Union of Elevator Constructors. In nonunion shops, workers may complete training programs sponsored by independent contractors.

Apprenticeship programs teach a range of skills and usually last 4 years. Programs combine paid on-the-job training with classroom instruction in blueprint reading, electrical and electronic theory, mathematics, applications of physics, and safety.

Most apprentices assist experienced elevator installers and repairers. Beginners carry materials and tools, bolt rails to walls, and assemble elevator cars. Eventually, apprentices learn more difficult tasks, such as wiring.

Applicants for apprenticeship positions must have a high school diploma or the equivalent. High school courses in electricity, mathematics, and physics provide a useful background. As elevators become increasingly sophisticated, workers may need to get more advanced education—for example, a certificate or associate degree in electronics. Workers with education beyond high school usually advance more quickly than their counterparts without a degree.

Many elevator installers and repairers receive additional training on their particular company's equipment.

Licensure. Many cities and States require elevator installers and repairers to pass a licensing examination. However, other requirements for licensure may vary.

Certification and other qualifications. Workers who also complete an apprenticeship registered by the U.S. Department of Labor or their State board earn a journeyworker certificate recognized nationwide. Applicants for apprenticeship positions must be at least 18 years old, have a high school diploma or equivalent, and pass an aptitude test and a drug test. Good physical condition and mechanical skills also are important.

Jobs with many employers require membership in the union. To be considered fully qualified by the union, workers must complete an apprenticeship and pass a standard exam administered by the National Elevator Industry Educational Program.

The National Association of Elevator Contractors also offers certification as a Certified Elevator Technician (CET) or Certified Accessibility and Private Residence Lift Technician (CAT).

Advancement. Ongoing training is very important for a worker to keep up with technological developments in elevator repair. In fact, union elevator installers and repairers typically receive training throughout their careers, through

correspondence courses, seminars, or formal classes. This training greatly improves one's chances for promotion and retention.

Some installers may receive additional training in specialized areas and advance to the position of mechanic-in-charge, adjuster, supervisor, or elevator inspector. Adjusters, for example, may be picked for their position because they possess particular skills or are electronically inclined. Other workers may move into management, sales, or product-design jobs.

Employment

Elevator installers and repairers held about 24,900 jobs in 2008. Most were employed by specialty trades contractors, particularly other building equipment contractors.

Job Outlook

Even with average job growth, excellent job opportunities are expected in this occupation.

Employment change. Employment of elevator installers and repairers is expected to increase 9 percent during the 2008–18 decade. Demand for additional elevator installers depends greatly on growth in nonresidential construction, such as commercial office buildings and stores that have elevators and escalators. This sector of the construction industry is expected to grow during the decade as the economy expands. In addition, the need to continually maintain, update and repair old equipment, provide access to the disabled, and install increasingly sophisticated equipment and controls should add to the demand for elevator installers and repairers. Another factor causing the demand for elevator installers and repairers to increase is a growing number of elderly people who require easier access to their homes through stair lifts and residential elevators.

Job prospects. Workers who seek to enter this occupation should have excellent opportunities. Elevator installer and repairer jobs have relatively high earnings and good benefits. However, it is the dangerous and physically challenging nature of this occupation and the significant training it requires that reduce the number of applicants and create better opportunities for those who apply. Job prospects should be best for those with postsecondary education in electronics or experience in the military.

Elevators, escalators, lifts, moving walkways, and related equipment need to be kept in good working condition year round every year, so employment of elevator repairers is less affected by economic downturns and seasonality than employment in other construction trades. Although elevator installers and repairers are employed throughout the Nation, the majority of positions tend to be concentrated in the Northeast because of its high concentration of tall office and residential structures.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018		Change, 2008-2018	
			2018	Number	Percent	
Elevator installers and repairers.....	47-4021	24,900	27,100	2,300	9	

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Earnings

Wages of elevator installers and repairers are among the highest of all construction trades. Median hourly wages of elevator installers and repairers were \$33.35 in May 2008. The middle 50 percent earned between \$25.79 and \$39.41. The lowest 10 percent earned less than \$19.38, and the top 10 percent earned more than \$46.78. Median hourly wages in the building equipment contractors industry were \$33.46.

Wages for members of the International Union of Elevator Constructors vary on the basis of locale and specialty. Check with a local chapter in your area for average wages.

Over half of all elevator installers and repairers were members of unions or covered by a union contract, one of the highest proportions of all occupations. Of those in a union, the largest number were members of the International Union of Elevator Constructors. In addition to free continuing education, elevator installers and repairers receive the basic benefits enjoyed by most other workers.

Related Occupations

Elevator installers and repairers combine electrical and mechanical skills with construction skills, such as welding, rigging, measuring, and blueprint reading. Other occupations that require many of these skills are:

	Page
Boilermakers	613
Electrical and electronics installers and repairers	675
Electricians	641
Industrial machinery mechanics and millwrights	709
Sheet metal workers	665
Structural and reinforcing iron and metal workers	668

Sources of Additional Information

For information about apprenticeships or job opportunities as an elevator mechanic, contact local contractors, a local chapter of the International Union of Elevator Constructors, a local joint union-management apprenticeship committee, or the nearest office of your State employment service or apprenticeship agency. You can also find information on the registered apprenticeship system with links to State apprenticeship programs on the U.S. Department of Labor's Web site: http://www.doleta.gov/atels_bat. Apprenticeship information is also available from the U.S. Department of Labor's toll-free helpline: (877) 872-5627.

Glaziers

Significant Points

- Glaziers generally learn the trade by helping experienced workers, sometimes with supplemental classroom training.
- Job opportunities are expected to be good.
- Employment is expected to grow 8 percent, about as fast as the average for all occupations.

Nature of the Work

Glass serves many uses in modern life. Insulated and specially treated glass keeps in warmed or cooled air and provides good condensation and sound control. Tempered and laminated glass makes doors and windows more secure. In large commercial buildings, glass panels give office buildings a distinctive look, while reducing the need for artificial lighting. The creative use of large windows, glass doors, skylights, and sunroom additions makes homes bright, airy, and inviting.

Glaziers are responsible for selecting, cutting, installing, replacing, and removing all types of glass. They generally work on one of several types of projects.

Residential glazing involves work, such as replacing glass in home windows; installing glass mirrors, shower doors, and bathtub enclosures; and fitting glass for tabletops and display cases. On commercial interior projects, glaziers install items such as heavy, often etched, decorative room dividers or security windows. Glazing projects also may involve replacement of storefront windows for establishments such as supermarkets, auto dealerships, or banks. In the construction of large commercial buildings, glaziers, after reading and interpreting blueprints and specifications, build metal framework extrusions and install glass panels or curtain walls. (Workers who replace and repair glass in motor vehicles are not covered in this statement. See the statement on automotive body and related repairers elsewhere in the *Handbook*.)

Besides working with glass, glaziers also may work with plastics, granite, marble, and other similar materials used as glass substitutes and with films or laminates that improve the durability or safety of the glass. They may mount steel and aluminum sashes or frames and attach locks and hinges to glass doors.

For most jobs, the glass is precut and mounted in frames at a factory or a contractor's shop. It arrives at the jobsite ready for glaziers to position and secure it in place. They may use a crane or hoist with suction cups to lift large, heavy pieces of glass. They then gently guide the glass into position by hand.

Once glaziers have the glass in place, they secure it with mastic, putty, or other paste-like cement, or with bolts, rubber gaskets, glazing compound, metal clips, or metal or wood moldings. When they secure glass using a rubber gasket—a thick, molded rubber half-tube with a split running its length—they first secure the gasket around the perimeter within the opening, then set the glass into the split side of the gasket, causing it to clamp to the edges and hold the glass firmly in place.

When they use metal clips and wood moldings, glaziers first secure the molding to the opening, place the glass in the molding, and then force springlike metal clips between the glass and the molding. The clips exert pressure and keep the glass firmly in place.

When a glazing compound is used, glaziers first spread it neatly against and around the edges of the molding on the inside of the opening. Next, they install the glass. Pressing it against the compound on the inside molding, workers screw or nail outside molding that loosely holds the glass in place. To hold it firmly, they pack the space between the molding and the glass with glazing compound and then trim any excess material with a glazing knife.

For some jobs, the glazier must cut the glass manually at the jobsite. To prepare the glass for cutting, glaziers rest it either on edge on a rack, or “A-frame,” or flat against a cutting table. They then measure and mark the glass for the cut.

Glaziers cut glass with a special tool that has a small, very hard metal wheel. Using a straightedge as a guide, the glazier presses the cutter’s wheel firmly on the glass, guiding and rolling it carefully to make a score just below the surface. To help the cutting tool move smoothly across the glass, workers brush a thin layer of oil along the line of the intended cut or dip the cutting tool in oil. Immediately after cutting, the glazier presses on the shorter end of the glass to break it cleanly along the cut.

In addition to handtools such as glasscutters, suction cups, and glazing knives, glaziers use power tools such as saws, drills, cutters, and grinders. An increasing number of glaziers use computers in the shop or at the jobsite to improve their layout work and reduce the amount of wasted glass.

Work environment. Glaziers often work outdoors, sometimes in inclement weather. They typically work with sharp tools and are often around broken glass. As a result, the rate of nonfatal injuries and illnesses for glaziers is among the highest of any occupation. For these reasons, constant attention to safety is crucial in this occupation.

Glaziers’ work is quite physical, and so they must be prepared to lift heavy glass panels and work on scaffolding, sometimes at great heights. In addition, glaziers do a considerable amount of bending, kneeling, lifting, and standing during the installation process.

Most glaziers work a standard 40 hour workweek. During construction boom times, however, they may be required to work 50 or even 60 hours per week.

Training, Other Qualifications, and Advancement

Glaziers generally learn their trade by helping experienced workers, sometimes with supplemental classroom training. A few formal apprenticeship programs are available.

Education and training. Glaziers learn their trade through formal and informal training programs. Usually 3 years of classroom and on-the-job training are required to become a

skilled glazier. There are a number of different avenues that one can take to obtain the necessary training. Most glaziers start by obtaining a job with a contractor who then provides on-the-job training. Entry-level workers generally start as helpers, assisting more experienced workers. During this time, employers may send the employee to a trade or vocational school or community college to receive further classroom training.

Some employers offer formal apprenticeships. These programs combine paid on-the-job training with related classroom instruction. Apprenticeship applicants usually must be at least 18 years old and meet local requirements. The length of the program is usually 3 years but varies with the apprentice’s skill. Because the number of apprenticeship programs is limited, however, only a small proportion of glaziers learn their trade through these programs.

On the job, apprentices or helpers often start by carrying glass and cleaning up debris in glass shops. They often practice cutting on discarded glass. Later, they are given an opportunity to cut glass for a job and assist experienced workers on simple installation jobs. By working with experienced glaziers, they eventually acquire the skills of a fully qualified glazier. On the job, they learn to use the tools and equipment of the trade; handle, measure, cut, and install glass and metal framing; cut and fit moldings; and install and balance glass doors. In the classroom, they are taught about glass and installation techniques as well as basic mathematics, blueprint reading and sketching, general construction techniques, safety practices, and first aid.

Manufacturers have often worked with unions to ensure that workers know everything they need to know in order to install manufacturers’ products safely and properly. In line with the architectural push for green construction, trade associations, unions, and partnerships between the two are now offering training to construction workers on the latest energy efficient products and green building techniques.

Licensure. Only the State of Connecticut currently requires glaziers to have a license. In addition to passing a test, workers need education, experience, and an apprenticeship to be licensed. There is a voluntary license in Florida. Other States may require licenses in the future.

Other qualifications. Skills needed to become a glazier include manual dexterity, good eye-hand coordination, physical

Glaziers cut glass to lengths specified by the customer.

fitness, and a good sense of balance. The ability to solve arithmetic problems quickly and accurately also is required. In addition, a good work history or military service is viewed favorably by employers.

Certification and advancement. Glaziers who learn the trade through a formal registered apprenticeship program become certified journeyworkers. Some associations offer other certifications. The National Glass Association, for example, offers a series of written examinations that certify an individual's competency to perform glazier work at three progressively difficult levels of proficiency: Level I Glazier; Level II Commercial Interior or Residential Glazier, or Storefront or Curtainwall Glazier; and Level III Master Glazier.

Advancement for glaziers generally consists of increases in pay; some advance to glazier supervisors, general construction supervisors, independent contractors, or cost estimators. For those who would like to advance, it is increasingly important to be able to communicate in both English and Spanish to relay instructions and safety precautions to workers with limited understanding of English, because Spanish-speaking workers make up a large part of the construction workforce in many areas. Supervisors and contractors need good communication skills to deal with clients and subcontractors and should be able to identify and estimate the quantity of materials needed to complete a job and accurately estimate how long a job will take to complete and at what cost.

Employment

Glaziers held 54,100 jobs in 2008. About 61 percent of glaziers worked for foundation, structure, and building exterior contractors. About 14 percent of glaziers worked in building material and supplies dealers that install or replace glass. A small amount—about 7 percent—were self-employed.

Job Outlook

Average employment growth is projected. Good job opportunities are expected, especially for those with a range of skills.

Employment change. Employment is expected to grow 8 percent from 2008-2018, about as fast as average for all occupations. Job growth will stem from increasing demand for new commercial construction emphasizing glass exteriors. As manufacturers of glass products continue to improve the energy efficiency of glass windows, architects are designing more buildings with glass exteriors, especially in the South. In addition, the continuing need to modernize and repair existing structures, including residences, often involves installing new windows. Demand for specialized safety glass and glass coated with protective laminates is also growing, in response to a higher need for security and the need to withstand hurricanes, particularly in many commercial and government buildings.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Glaziers	47-2121	54,100	58,300	4,200	8

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Counteracting these factors, however, is the ability of other workers, such as carpenters to install windows of simple design and low cost, which reduces employment growth for glaziers.

Job prospects. In addition to growth, job openings will arise from the need to replace glaziers who leave the occupation, resulting in good job opportunities. Since employers prefer workers who can do a variety of tasks, glaziers with a range of skills will have the best opportunities.

Like other construction trades workers, glaziers employed in the construction industry should expect to experience periods of unemployment, because of the limited duration of construction projects and the cyclical nature of the construction industry. During downturns in the economy, job openings for glaziers are reduced, as the level of construction declines. However, construction activity varies from area to area, so job openings fluctuate with local economic conditions. Employment opportunities should be greatest in metropolitan areas, where most glazing contractors and glass shops are located.

Earnings

In May 2008, median hourly wages of wage and salary glaziers were \$17.11. The middle 50 percent earned between \$13.37 and \$22.66. The lowest 10 percent earned less than \$10.65, and the highest 10 percent earned more than \$30.47. Median hourly wages in the foundation, structure, and building exterior contractors industry were \$17.79. Median hourly wages for glaziers employed by building materials and supply dealers, where most glass shops are found, were \$14.90.

Glaziers covered by union contracts generally earn more than their nonunion counterparts. Apprentice wage rates usually start at 40 to 50 percent of the rate paid to experienced glaziers and increase as workers gain experience. Because glaziers can lose work time because of weather conditions and fluctuations in construction activity, their overall earnings may be lower than their hourly wages suggest.

Related Occupations

Glaziers use their knowledge of construction materials and techniques to install glass. Other construction workers whose jobs also involve skilled, custom work include:

	Page
Brickmasons, blockmasons, and stonemasons.....	615
Carpenters	618
Carpet, floor, and tile installers and finishers	621
Cement masons, concrete finishers, segmental pavers, and terrazzo workers	625
Painters and paperhangers.....	656
Sheet metal workers	665

Other workers who repair and install automobile glass are:
Automotive body and related repairers 687

Sources of Additional Information

For more information about glazier apprenticeships or work opportunities, contact local glazing or general contractors, a local of the International Union of Painters and Allied Trades, a local joint union-management apprenticeship agency, or the nearest office of the State employment service or State apprenticeship agency. You can also find information on the registered apprenticeships together with links to State apprenticeship programs on the U.S. Department of Labor Web site: http://www.doleta.gov/atels_bat. Apprenticeship information is also available from the U.S. Department of Labor toll-free helpline: 1 (877) 872-5627.

For general information on apprenticeships and how to get them, see the *Occupational Outlook Quarterly* article “Apprenticeships: Career training, credentials—and a paycheck in your pocket,” online at <http://www.bls.gov/opus/ooq/2002/summer/art01.pdf> and in print at many libraries and career centers.

The Occupational Information Network (O*NET) provides information on a wide range of occupational characteristics. Links to O*NET appear at the end of the Internet version of this occupational statement, accessible at <http://www.bls.gov/ooh/ocos207.htm>

Hazardous Materials Removal Workers

Significant Points

- Formal education beyond high school is not required, but government standards require specific types of on-the-job training.
- Good job opportunities are expected, mainly due to the need to replace workers who leave the occupation.
- Working conditions can be hazardous.

Nature of the Work

Hazardous materials removal workers identify, remove, package, transport, and dispose of asbestos, radioactive and nuclear waste, arsenic, lead, and mercury—or any materials that typically possess at least one of four characteristics—ignitability,

corrosivity, reactivity, or toxicity. These workers often respond to emergencies where harmful substances are present, and are sometimes called abatement, remediation, or decontamination specialists. Increased public awareness and Federal and State regulations are resulting in the removal of hazardous materials from buildings, facilities, and the environment to prevent contamination of natural resources and to promote public health and safety.

Hazardous materials removal workers use a variety of tools and equipment, depending on the work at hand. Equipment ranges from brooms to personal protective suits that completely isolate workers from the hazardous material. Because of the threat of contamination, workers often wear disposable or reusable coveralls, gloves, hardhats, shoe covers, safety glasses or goggles, chemical-resistant clothing, face shields, and devices to protect one’s hearing. Most workers are also required to wear respirators while working, to protect them from airborne particles or noxious gases. The respirators range from simple versions that cover only the mouth and nose to self-contained suits with their own air supply. Recent improvements to respiratory equipment allows for greater comfort, enabling workers to wear the equipment for a longer period of time.

Asbestos and lead are two of the most common contaminants that hazardous materials removal workers encounter. Through the 1970s, asbestos was used to fireproof roofing and flooring, for heat insulation, and for a variety of other purposes. It was durable, fire retardant, corrosion resistant, and insulated well, making it ideal for such applications. Embedded in materials, asbestos is fairly harmless; airborne as a particulate, however, can cause several deadly lung diseases, including lung cancer and asbestosis. Today, asbestos is rarely used in buildings, but there are still structures that contain this material that must be remediated. Similarly, lead was a common building element found in paint and plumbing fixtures and pipes until the late 1970s. Because lead is easily absorbed into the bloodstream, often from breathing lead dust or from eating chips of paint containing lead, it can cause serious health risks, especially in children. Due to these risks, it has become necessary to remove lead-based products from buildings and structures.

Asbestos abatement workers and *lead abatement workers* remove asbestos, lead, and other materials from buildings scheduled to be renovated or demolished. Using a variety of hand and power tools, such as vacuums and scrapers, these workers remove the asbestos and lead from surfaces. A typical residential lead abatement project involves the use of a chemical to strip the lead-based paint from the walls of the home. Lead abatement workers apply the compound with a putty knife and allow it to dry. Then they scrape the hazardous material into an impregnable container for transport and storage. They also use sandblasters and high-pressure water sprayers to remove lead from larger structures. The vacuums utilized by asbestos abatement workers have special, highly efficient filters designed to trap the asbestos, which later is disposed of or stored. During the abatement, special monitors measure the amount of asbestos and lead in the air, to protect the workers; in addition, lead abatement workers wear a personal air monitor that indicates the amount of lead to which a worker has been exposed. Workers also use monitoring devices to identify the

asbestos, lead, and other materials that need to be removed from the surfaces of walls and structures.

Transportation of hazardous materials is safer today than it was in the past, but accidents still occur. *Emergency and disaster response workers* clean up hazardous materials after train derailments and trucking accidents. These workers also are needed when an immediate cleanup is required, as would be the case after an attack by biological or chemical weapons.

Some hazardous materials removal workers specialize in radioactive substances. These substances range from low-level-contaminated protective clothing, tools, filters, and medical equipment, to highly radioactive nuclear reactor fuels. *Decontamination technicians* perform duties similar to those of janitors and cleaners, but the items and areas they clean are radioactive. They use brooms, mops, and other tools to clean exposed areas and remove exposed items for decontamination or disposal. Some of these jobs are now being done by robots controlled by people away from the contamination site. Increasingly, many of these remote devices are being used to automatically monitor and survey surfaces, such as floors and walls, for contamination.

With experience, decontamination technicians can advance to *radiation-protection technician* jobs and use radiation survey meters and other remote devices to locate and assess radiated materials, operate high-pressure cleaning equipment for decontamination, and package radioactive materials for transportation or disposal.

Some hazardous materials removal workers specialize in radioactive substances.

Decommissioning and decontamination workers remove and treat radioactive materials generated by nuclear facilities and power plants. With a variety of handtools, they break down contaminated items such as “gloveboxes,” which are used to process radioactive materials. At decommissioning sites, the workers clean and decontaminate the facility, as well as remove any radioactive or contaminated materials.

Treatment, storage, and disposal workers transport and prepare materials for treatment or disposal. To ensure proper treatment of materials, laws enforced by the U.S. Environmental Protection Agency (EPA) or Occupational Safety and Health Administration (OSHA) require these workers to be able to verify shipping manifests. At incinerator facilities, treatment, storage, and disposal workers transport materials from the customer or service center to the incinerator. At landfills, they follow a strict procedure for the processing and storage of hazardous materials. They organize and track the location of items in the landfill and may help change the state of a material from liquid to solid in preparation for its storage. These workers typically operate heavy machinery, such as forklifts, earthmoving machinery, and large trucks and rigs.

To help clean up the Nation’s hazardous waste sites, a Federal program, called Superfund, was created in 1980. Under the Superfund program, abandoned, accidentally spilled, or illegally dumped hazardous waste that poses a current or future threat to human health or the environment is cleaned up. In doing so, the EPA along with potentially responsible parties, communities, local, State, and Federal authorities, identify hazardous waste sites, test site conditions, devise cleanup plans, and clean up the sites.

Mold remediation is a new aspect of some hazardous materials removal work. Some types of mold can cause harsh allergic reactions, especially in people who are susceptible to them. Although mold is present in almost all structures and is not usually defined as a hazardous material, some mold—especially the types that cause allergic reactions—can infest a building to such a degree that extensive efforts must be taken to remove it safely. Molds are fungi that typically grow in warm, damp conditions both indoors and outdoors year round. They can be found in heating and air-conditioning ducts, within walls, and in showers, attics, and basements. Although mold remediation is often undertaken by other construction workers, large scale mold removal is usually handled by hazardous materials removal workers, who take special precautions to protect themselves and surrounding areas from being contaminated.

Hazardous materials removal workers may also be required to construct scaffolding or erect containment areas prior to abatement or decontamination. In most cases, government regulation dictates that hazardous materials removal workers be closely supervised on the worksite. The standard usually is 1 supervisor to every 10 workers. The work is highly structured, sometimes planned years in advance, and usually team oriented. There is a great deal of cooperation among supervisors and workers. Because of the hazard presented by the materials being removed, work areas are restricted to licensed hazardous materials removal workers, thus minimizing exposure to the public.

Work environment. Hazardous materials removal workers function in a highly structured environment to minimize the danger they face. Each phase of an operation is planned in advance,

and workers are trained to deal with hazardous situations. Crews and supervisors take every safety measure to ensure that the worksite is safe. Whether they work with asbestos, mold, lead abatement, or in radioactive decontamination, hazardous materials removal workers must stand, stoop, and kneel for long periods. Some must wear fully enclosed personal protective suits for several hours at a time; these suits may be hot and uncomfortable and may cause some individuals to experience claustrophobia.

Hazardous materials removal workers face different working conditions, depending on their area of expertise. Although many work a standard 40-hour week, overtime and shift work are common, especially for emergency and disaster response workers. Asbestos and lead abatement workers usually work in structures such as office buildings, schools, or historic buildings under renovation. Because they are under pressure to complete their work within certain deadlines, workers may experience fatigue. Completing projects frequently requires night and weekend work, because hazardous materials removal workers often work around the schedules of others. Treatment, storage, and disposal workers are employed primarily at facilities such as landfills, incinerators, boilers, and industrial furnaces. These facilities often are located in remote areas, due to the kinds of work being done, so workers may have to commute long distances to their jobs.

Decommissioning and decontamination workers, decontamination technicians, and radiation protection technicians work at nuclear facilities and electric power plants. Like treatment, storage, and disposal facilities, these sites are often far from urban areas. Workers who perform jobs in cramped conditions may need to use sharp tools to dismantle contaminated objects. A hazardous materials removal worker must have great self-control and a level head to cope with the daily stress associated with handling hazardous materials.

Hazardous materials removal workers may be required to travel outside their normal working areas in order to respond to emergency cleanups, which sometimes take several days or weeks to complete. During the cleanup, workers may be away from home for the entire time.

Training, Other Qualifications, and Advancement

No formal education beyond a high school diploma is required for a person to become a hazardous materials removal worker. However, Federal, State, and local government standards require specific types of on-the-job training. Regulations vary by specialty and sometimes by State or locality. Employers are responsible for employee training.

Education and training. Hazardous materials removal workers usually need at least 40 hours of formal on-the-job training. For most specialties, this training must meet specific requirements set by the Federal Government or individual States.

Licensure. Workers who treat asbestos and lead, the most common contaminants, must complete a training program through their employer that meets Occupational Safety and Health Administration (OSHA) standards. Employer-sponsored training is usually performed in-house, and the employer is responsible for covering all technical and safety subjects outlined by OSHA.

To become an emergency and disaster response worker and treatment, storage, and disposal worker, candidates must obtain

a Federal license as mandated by OSHA. Employers are responsible for ensuring that employees complete a formal 40-hour training program, given either in house or in OSHA-approved training centers. The program covers health hazards, personal protective equipment and clothing, site safety, recognition and identification of hazards, and decontamination.

In some cases, workers may discover one hazardous material while abating another. If workers are not licensed to handle the newly discovered material, they cannot continue to work with it. Many experienced workers opt to take courses in additional types of hazardous material removal to avoid this situation.

Mold removal is not regulated by OSHA, but is regulated by each State. For decommissioning and decontamination workers employed at nuclear facilities, training is most extensive. In addition to obtaining licensure through the standard 40-hour training course in hazardous waste removal, workers must take courses dealing with regulations governing nuclear materials and radiation safety as mandated by the Nuclear Regulatory Commission. These courses add up to approximately 3 months of training, although most are not taken consecutively. Many agencies, organizations, and companies throughout the country provide training programs that are approved by the U.S. Environmental Protection Agency, the U.S. Department of Energy, and other regulatory bodies. To maintain their license, workers in all fields are required to take continuing education courses as a refresher, every year.

Other qualifications. Workers must be able to perform basic mathematical conversions and calculations when mixing solutions that neutralize contaminants and should have good physical strength and manual dexterity. Because of the nature of the work and the time constraints sometimes involved, employers prefer people who are dependable, prompt, and detail-oriented. Since much of the work is done in buildings, a background in construction is helpful.

Employment

Hazardous materials removal workers held about 42,500 jobs in 2008. About 79 percent were employed in waste management and remediation services. Another 5 percent were employed in construction.

Job Outlook

Employment is expected to grow faster than average. Good job opportunities are expected because of the need to replace the large number of workers who leave the occupation each year.

Employment change. Employment of hazardous materials removal workers is expected to grow 15 percent between 2008 and 2018, faster than the average for all occupations. The need for decontamination technicians, radiation safety technicians, and decommissioning workers, in response to increased pressure for cleaner electric generation facilities, is expected to drive employment growth. Furthermore, renewed interest in nuclear power production could lead to the reactivation of additional facilities, resulting in the need for many new remediation workers.

Numerous Superfund projects will require cleanup of hazardous materials waste sites, also spurring demand for hazardous materials removal workers. However, employment growth will largely be determined by Federal funding.

Since the 1970s, asbestos and lead-based paints and plumbing fixtures and pipes have not been used and much of the re-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Hazardous materials removal workers.....	47-4041	42,500	48,800	6,300	15

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

mediation stemming from those products has taken place. With the continuing decline in the number of structures that contain asbestos and lead, demand for asbestos and lead abatement workers will be somewhat limited. Some demand, however, will result from the need to abate lead and asbestos from Federal and historic buildings.

Job prospects. In addition to job openings from employment growth, many openings are expected for hazardous materials removal workers because of the need to replace workers who leave the occupation, leading to good opportunities. Job opportunities for radiation safety technicians and decontamination workers should be plentiful as a number of new workers will be needed to replace those who retire or leave the occupation for other reasons. Additional openings may result for remediation workers if nuclear power is more widely adopted in the next decade.

Lead and asbestos workers will have some opportunities at specialty remediation companies as restoration of Federal buildings and historic structures continues, although at a slower pace than in the past. The best employment opportunities for mold remediation workers will be in Southeast, and parts of the Northeast and Northwest, where mold tends to thrive.

Many of these workers are not greatly affected by economic fluctuations because the facilities in which they work must operate, regardless of the state of the economy.

Earnings

Median hourly wages of hazardous materials removal workers were \$17.94 in May 2008. The middle 50 percent earned between \$14.09 and \$24.09 per hour. The lowest 10 percent earned less than \$11.41 per hour, and the highest 10 percent earned more than \$30.42 per hour. Median hourly wages in remediation and other waste management services, the largest industry employing hazardous materials removal workers, were \$18.10.

Related Occupations

Workers who perform similar tasks to those of hazardous materials removal workers include:

	Page
Insulation workers.....	653
Painters and paperhangers.....	656
Power plant operators, distributors, and dispatchers.....	760
Sheet metal workers.....	665
Water and liquid waste treatment plant and system operators.....	765
Other workers who commonly respond to emergencies involving hazardous materials include:	
Fire fighters.....	470
Police and detectives.....	473

Insulation Workers

Significant Points

- Workers must follow strict safety guidelines to protect themselves from insulating irritants.
- Most insulation workers learn their work informally on the job; mechanical insulators usually complete formal apprenticeship programs.
- Job opportunities are expected to be excellent.

Nature of the Work

Properly insulated buildings reduce energy consumption by keeping heat in during the winter and out in the summer. Vats, tanks, vessels, boilers, steam and hot-water pipes, and refrigerated storage rooms also are insulated to prevent the wasteful loss of heat or cold and to prevent burns. Insulation also helps to reduce the noise that passes through walls and ceilings. Insulation workers install the materials used to insulate buildings and mechanical equipment.

Insulation workers, mechanical, apply insulating materials to pipes and ductwork, or other mechanical systems, in order to help control and maintain temperature. When covering a steam pipe, for example, these insulation workers measure and cut sections of insulation to the proper length, stretch it open along a cut that runs the length of the material, and slip it over the pipe. They then fasten the insulation with adhesive, staples, tape, or wire bands. Sometimes, they wrap a cover of aluminum, plastic, or canvas over the insulation and cement or band the cover in place. Finally, mechanical insulation workers may screw on metal around insulated pipes to protect the insulation from the weather or physical abuse.

Insulation workers, floor, ceiling, and wall, apply or blow in insulation in attics and exterior walls. When blowing-in loose-fill insulation, a helper feeds a machine with fiberglass, cellulose, or rock-wool insulation, while another worker blows the insulation with a compressor hose into the space being filled.

When covering a wall or other flat surface, these insulation workers may use a hose to spray foam insulation onto a wire mesh that provides a rough surface to which the foam can cling and that adds strength to the finished surface. Workers may then install drywall or apply a final coat of plaster for a finished appearance. In new construction or on major renovations, insulation workers staple fiberglass or rock-wool batts to exterior walls and ceilings before drywall, paneling, or plaster walls are put in place.

In making major renovations to old buildings or when putting new insulation around pipes and industrial machinery, insulation workers often must first remove the old insulation. In the past, asbestos—now known to cause cancer in humans—was used extensively in walls and ceilings and to cover pipes, boilers, and various industrial equipment. Because of this danger, U.S. Environmental Protection Agency regulations require that asbestos be removed before a building undergoes major renovations or is demolished. When asbestos is present, specially trained workers must remove it before insulation workers can install the new insulating materials. (See the statement on hazardous materials removal workers elsewhere in the *Handbook*.)

Insulation workers use common handtools, including trowels, brushes, knives, scissors, saws, pliers, and stapling guns. They may use power saws to cut insulating materials, welding

machines to join metal or secure clamps, and compressors to blow or spray insulation.

Work environment. Insulation workers generally work indoors in residential and industrial settings. They spend most of the workday on their feet, either standing, bending, or kneeling. They also work from ladders or in confined spaces. Their work usually requires more coordination than strength. In industrial settings, these workers often insulate pipes and vessels at temperatures that may cause burns. Minute particles from insulation materials, especially when blown, can irritate the eyes, skin, and respiratory system.

Insulation workers who install insulation on floors, ceilings, and walls experience a high rate of injuries and illnesses. Consequently, workers must follow strict safety guidelines to protect themselves from insulating irritants. They must keep work areas well ventilated; wear protective suits, masks, and respirators; and take decontamination showers when necessary. Most insulation is applied after buildings are enclosed, so weather conditions have less effect on the employment of insulation workers than some other construction workers.

Training, Other Qualifications, and Advancement

Most insulation workers learn their trade informally on the job, although most mechanical insulators complete formal apprenticeship programs.

Education and training. Employers prefer to hire high school graduates. High school courses in blueprint reading, shop mathematics, science, pattern layout, woodworking, and general construction provide a helpful background.

Most new workers receive instruction and supervision from experienced insulation workers. Trainees begin with simple tasks, such as carrying insulation or holding material while it is fastened in place. On-the-job training can take up to 4 years. Learning to install insulation in homes generally requires less training than does learning to apply insulation in commercial and industrial settings. As they gain experience, trainees receive less supervision, more responsibility, and higher pay.

Trainees in formal apprenticeship programs receive in-depth instruction in all phases of insulation. Apprenticeships are generally offered by contractors that install and maintain mechanical industrial insulation. Apprenticeship programs may be provided by a joint committee of local insulation contractors and the local union of the International Association of Heat and Frost Insulators and Allied Workers, to which some insulation workers belong. Programs normally consist of 4 or 5 years of on-the-job training coupled with classroom instruction, and apprentices must pass practical and written tests to demonstrate their knowledge of the trade.

Licensure. The Environmental Protection Agency offers mandatory certification for insulation workers who remove and handle asbestos.

Other qualifications. For entry-level jobs, insulation contractors prefer to hire workers who are in good physical condition and licensed to drive. Applicants seeking apprenticeship positions are advised to have a high school diploma or its equivalent and be at least 18 years old. Supervisors and contractors, especially, need good communication skills to deal with clients and subcontractors.

Insulation workers should have excellent job opportunities.

Certification and advancement. Voluntary certification programs have been developed by insulation contractor organizations to help workers prove their skills and knowledge of residential and industrial insulation. The National Insulation Association also offers a certification in performing an energy appraisal to determine if and how insulation can benefit industrial customers.

Skilled insulation workers may advance to supervisor, shop superintendent, or insulation contract estimator, or they may set up their own insulation business.

For those who would like to advance, it is increasingly important to be able to relay instructions and safety precautions to workers in both English and Spanish because Spanish-speaking workers make up a large part of the construction workforce in many areas.

Employment

Insulation workers held about 57,300 jobs in 2008. About 92 percent were employed in the construction industry, with 50 percent working for drywall and insulation contractors. In less populated areas, plumbers and pipefitters, carpenters, heating and air-conditioning installers, or drywall installers may do insulation work.

Job Outlook

Insulation workers should have excellent opportunities due to faster than average job growth, coupled with the need to replace many workers who leave this occupation.

Employment change. Employment of insulation workers is expected to increase 17 percent during the 2008-18 decade, faster than the average for all occupations. Demand for insulation workers will be spurred by the need to make existing buildings more energy efficient, as well as to the anticipated construction of new power plants—a big user of piping and equipment. Modest increases in the housing stock over the decade will also generate jobs for insulation workers.

Job prospects. Job opportunities for insulation workers are expected to be excellent. In addition to opportunities created by growth, job openings will arise from the need to replace workers who retire or leave the labor force for other reasons. The irritating nature of many insulation materials, combined with the often difficult working conditions, causes many insulation workers to leave the occupation each year.

Insulation workers in the construction industry may experience periods of unemployment because of the short duration of many construction projects and the cyclical nature of construction activity. However, as the occupation focuses more and more on weatherization, energy efficiency, and green house gas reduction, the occupation should become more protected

against such cyclical ups and downs in construction overall. Workers employed to perform industrial plant maintenance generally have more stable employment because maintenance and repair must be done continually.

Earnings

In May 2008, median hourly wages of wage and salary insulation workers, floor, ceiling, and wall, were \$15.34. The middle 50 percent earned between \$12.04 and \$19.64. The lowest 10 percent earned less than \$9.61, and the highest 10 percent earned more than \$26.53. Median hourly wages of insulation workers, mechanical, were \$17.95. The middle 50 percent earned between \$14.01 and \$24.58. The lowest 10 percent earned less than \$11.46, and the highest 10 percent earned more than \$32.82. Median hourly wages in the industries employing the largest numbers of insulation workers were:

Insulation workers, mechanical	
Building equipment contractors	\$17.87
Building finishing contractors	17.53
Insulation workers, floor, ceiling, and wall	
Building finishing contractors	15.11

Union workers tend to earn more than nonunion workers. Apprentices start at about one-half of the journey worker’s wage. Insulation workers doing commercial and industrial work earn substantially more than those working in residential construction, which does not require as much skill.

Related Occupations

Insulation workers combine their knowledge of insulation materials with the skills of cutting, fitting, and installing materials. Workers in occupations involving similar skills include:

	Page
Carpenters	618
Carpet, floor, and tile installers and finishers	621
Drywall and ceiling tile installers, tapers, plasterers, and stucco masons	638
Roofers	662
Sheet metal workers	665

Painters and Paperhangers

Significant Points

- Most workers learn informally on the job as helpers, but some experts recommend completion of an apprenticeship program.
- Employment prospects for painters should be excellent due to the large numbers of workers who leave the occupation for other jobs; paperhangers will face very limited opportunities.
- About 45 percent of painters and paperhangers are self-employed.

Nature of the Work

Paint and indoor wall coverings make surfaces clean, attractive, and vibrant. In addition, paints and other sealers protect exterior surfaces from erosion caused by exposure to the weather.

Painters apply paint, stain, varnish, and other finishes to buildings and other structures. They select the right paint or finish for the surface to be covered, taking into account durability, ease of handling, method of application, and customers' wishes. Painters first prepare the surfaces to be coated, so that the paint will adhere properly. This may require removing the old coat of paint by sanding, wire brushing, burning, or water and abrasive blasting. Painters also fill nail holes and cracks, sandpaper rough spots, and wash walls and trim to remove dirt, grease, and dust. On new surfaces, they apply a primer or sealer to prepare the surface for the top coat. Painters also mix paints and match colors, relying on knowledge of paint composition and color harmony. In most paint shops or hardware stores, mixing and matching are automated.

There are several ways to apply paint and similar coverings. Therefore, painters must be able to choose the appropriate paint applicator for each job, depending on the surface to be covered, the characteristics of the finish, and other factors. Some jobs need only a good bristle brush with a soft, tapered edge; others require a dip or fountain pressure roller; still, others are best done using a paint sprayer. Many jobs need several types of applicators. In fact, painters may use an assortment of brushes, edgers, and rollers for a single job. The right tools speed the painter's work and produce the most attractive finish.

Some painting artisans specialize in creating distinctive finishes by using one of many decorative techniques. These techniques frequently involve "broken color," a process created by applying one or more colors in broken layers over a different base coat to produce a speckled or textured effect. Often these techniques employ glazes or washes applied over a solid colored background. Glazes are made of oil-based paints and give a sleek glow to walls. Washes are made of latex-based paints that have been thinned with water which adds a greater sense of depth and texture. Other decorative painting techniques include sponging, rag-rolling, stippling, sheen striping, dragging, distressing, color blocking, marbling, and faux finishes.

Some painters specialize in painting industrial structures to prevent deterioration. One example is applying a protective coating to oil rigs or steel bridges to fight corrosion. The coating most commonly used is a waterborne acrylic solvent that is easy to apply and environmentally friendly, but other specialized and sometimes difficult-to-apply coatings may be used. Painters may also coat interior and exterior manufacturing facilities and equipment such as storage tanks, plant buildings, lockers, piping, structural steel, and ships.

When painting any industrial structure, workers must take necessary safety precautions depending on their project. Those who specialize in interior applications such as painting the inside of storage tanks, for example, must wear a full-body protective suit. When working on bridges, painters are often suspended by cables and may work at extreme heights. When working on tall buildings, painters erect scaffolding, including "swing stages," scaffolds suspended by ropes, or cables attached to roof hooks. When painting steeples and other pointed structures, they use a bosun's chair, a swing-like device.

Paperhangers cover walls with decorative coverings made of paper, vinyl, or fabric. They first prepare the surface to be covered by applying a compound, which seals the surface and makes the covering adhere better. When redecorating, they may first remove the old covering by soaking, steaming, or applying solvents. When necessary, they patch holes and take care of other imperfections before hanging the new wall covering.

After preparing the surface, paperhangers mix the adhesive unless they are using pretreated paper. They then measure the area to be covered, check the covering for flaws, cut the covering into strips of the proper size, and closely examine the pattern in order to match it when the strips are hung. A great deal of this process can now be handled by specialized equipment.

The next step is to brush or roll the adhesive onto the back of the covering, if needed, and to then place the strips on the

wall, making sure the pattern is matched, the strips are straight, and the edges are butted together to make tight, closed seams. Finally, paperhangers smooth the strips to remove bubbles and wrinkles, trim the top and bottom with a utility knife, and wipe off any excess adhesive.

Work environment. Most painters and paperhangers work 40 hours a week or less; about 25 percent have variable schedules or work part time. Painters and paperhangers must stand for long periods, often working from scaffolding and ladders. Their jobs also require a considerable amount of climbing, bending, kneeling, and stretching. These workers must have good stamina because much of the work is done with their arms raised overhead. Painters, especially industrial painters, often work outdoors, almost always in dry, warm weather. Those who paint bridges or building infrastructure may be exposed to extreme heights and uncomfortable positions; some painters work suspended with ropes or cables.

Some painting jobs can leave a worker covered with paint. Drywall dust created by electric sanders prior to painting requires workers to wear protective safety glasses and a dust mask. Painters and paperhangers occasionally work with materials that are hazardous or toxic, such as when they are required to remove lead-based paints. In the most dangerous

Painters and paperhangers must stand for long periods, often working from scaffolding and ladders.

situations, painters work in a sealed self-contained suit to prevent inhalation of or contact with hazardous materials. Data from the U.S. Bureau of Labor Statistics show that full-time painters and paperhangers experienced a work-related injury and illness rate that was higher than the national average.

Training, Other Qualifications, and Advancement

Painting and paperhanging is learned mostly on the job, but some experts recommend completion of an apprenticeship program.

Education and training. Most painters and paperhangers learn through on-the-job training and by working as a helper for an experienced painter. However, there are a number of formal and informal training programs that provide more thorough instruction and a better career foundation. In general, the more formal the training received, the more likely the individual will enter the profession at a higher level and earn a higher salary. There are limited informal training opportunities for paperhangers because there are fewer paperhangers and helpers are usually not required.

A high school education or its equivalent usually is required to enter an apprenticeship program. Apprenticeships for painters and paperhangers consist of 2 to 4 years of paid on-the-job training, supplemented by a minimum of 144 hours of related classroom instruction each year. Apprentices receive instruction in color harmony, use and care of tools and equipment, surface preparation, application techniques, paint mixing and matching, characteristics of different finishes, blueprint reading, wood finishing, and safety.

Besides apprenticeships, some workers gain skills by attending technical or vocational schools that offer training prior to employment. These schools can take about a year to complete.

Whether a painter learns the trade through a formal apprenticeship or informally as a helper, on-the-job instruction covers similar skill areas. Under the direction of experienced workers, trainees carry supplies, erect scaffolds, and do simple painting and surface preparation tasks while they learn about paint and painting equipment. As they gain experience, trainees learn to prepare surfaces for painting and paperhanging, to mix paints, and to apply paint and wall coverings efficiently and neatly. Near the end of their training, they may learn decorating concepts, color coordination, and cost-estimating techniques. In addition to learning craft skills, painters must become familiar with safety and health regulations so that their work complies with the law.

Other qualifications. Painters and paperhangers should have good manual dexterity, vision, and color sense. They also need physical stamina and balance to work on ladders and platforms. Apprentices or helpers generally must be at least 18 years old, in addition to the high school diploma or GED that most apprentices need.

Certification and advancement. Some organizations offer training and certification to enhance the skills of their members. People interested in industrial painting, for example, can earn several designations from the National Association of Corrosion Engineers in several areas of specialization, including one for coating applicators, called

Protective Coating Specialist. Courses range from 1 day to several weeks depending on the certification program and specialty, and applicants must usually satisfy work experience requirements.

Painters and paperhangers may advance to supervisory or estimating jobs with painting and decorating contractors. Many establish their own painting and decorating businesses. For those who would like to advance, it is increasingly important to be able to communicate in both English and Spanish in order to relay instructions and safety precautions to workers with limited English skills; Spanish-speaking workers make up a large segment of the construction workforce in many areas. Painting contractors need good English skills to deal with clients and subcontractors.

Employment

Painters and paperhangers held about 450,100 jobs in 2008 of which 98 percent were painters. Around 36 percent of painters and paperhangers work for painting and wall covering contractors engaged in new construction, repair, restoration, or remodeling work. In addition, organizations that own or manage large buildings—such as apartment complexes—may employ painters, as do some schools, hospitals, factories, and government agencies.

Job Outlook

Overall employment is expected to grow 7 percent, reflecting as fast as average growth among painters but a rapid decline in the number of paperhangers. Excellent employment opportunities are expected for painters due to the need to replace the large number of workers who leave the occupation; paperhangers will have very limited opportunities.

Employment change. Overall employment is expected to grow by 7 percent between 2008 and 2018, about as fast as the average for all occupations. Employment of painters will grow 7 percent, as retiring baby boomers either purchase second homes or otherwise leave their existing homes that then require interior painting. Investors who sell properties or rent them out will also require the services of painters prior to completing a transaction. The relatively short life of exterior paints in residential homes as well as changing color and application trends will continue to support demand for painters. Painting is labor-intensive and not susceptible to technological changes that might make workers more productive and slow employment growth.

Growth of industrial painting will be driven by the need to prevent corrosion and deterioration of the many industrial structures by painting or coating them. Applying a protective

coating to steel bridges, for example, is cost-effective and can add years to the life expectancy of a bridge.

Employment of paperhangers, on the other hand, should decline rapidly as many homeowners take advantage of easy application materials and resort to cheaper alternatives, such as painting.

Job prospects. Job prospects for painters should be excellent because of the need to replace workers who leave the occupation for other jobs. There are no strict training requirements for entry into these jobs, so many people with limited skills work as painters or helpers for a relatively short time and then move on to other types of work with higher pay or better working conditions.

Opportunities for industrial painters should be excellent as the positions available should be greater than the pool of qualified individuals to fill them. While industrial structures that require painting are located throughout the Nation, the best employment opportunities should be in the Gulf Coast region, where strong demand and the largest concentration of workers exists.

Very few openings will arise for paperhangers because the number of these jobs is comparatively small and cheaper, more modern decorative finishes such as faux effects and sponge painting have gained in popularity at the expense of paper, vinyl, or fabric wall coverings.

Jobseekers considering these occupations should expect some periods of unemployment, especially until they gain experience. Many construction projects are of short duration, and construction activity is cyclical in nature. Remodeling, restoration, and maintenance projects, however, should continue as homeowners undertake renovation projects and hire painters even in economic downturns. Nonetheless, workers in these trades may experience periods of unemployment when the overall level of construction falls. On the other hand, a shortage of these workers may occur in some areas during peak periods of building activity.

Earnings

In May 2008, median hourly wages of wage and salary painters, construction and maintenance, were \$15.85, not including the earnings of the self-employed. The middle 50 percent earned between \$13.13 and \$20.55. The lowest 10 percent earned less than \$10.75, and the highest 10 percent earned more than \$27.16. Median hourly wages in the industries employing the largest numbers of painters were as follows:

Nonresidential building construction	\$16.72
Building finishing contractors	15.48
Residential building construction	14.87

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Painters and paperhangers.....	47-2140	450,100	479,900	29,800	7
Painters, construction and maintenance.....	47-2141	442,800	473,600	30,900	7
Paperhangers	47-2142	7,400	6,300	-1,100	-14

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

In May 2008, median hourly wages for wage and salary paperhangers were \$16.76. The middle 50 percent earned between \$13.64 and \$23.08. The lowest 10 percent earned less than \$10.82, and the highest 10 percent earned more than \$33.48.

Earnings for painters may be reduced on occasion because of bad weather and the short-term nature of many construction jobs. Hourly wage rates for apprentices usually start at 40 to 50 percent of the rate for experienced workers and increase periodically.

Some painters and paperhangers are members of the International Brotherhood of Painters and Allied Trades. Some painters are members of other unions.

Related Occupations

Painters and paperhangers apply various coverings to decorate and protect wood, drywall, metal, and other surfaces. Other construction workers who do finishing work include:

	Page
Carpenters	618
Carpet, floor, and tile installers and finishers	621
Drywall and ceiling tile installers, tapers, plasterers, and stucco masons	638
Painting and coating workers, except construction and maintenance	778

Sources of Additional Information

For details about painting and paperhanging apprenticeships or work opportunities, contact local painting and decorating contractors, local trade organizations, a local of the International Union of Painters and Allied Trades, a local joint union-management apprenticeship committee, or an office of the State apprenticeship agency or employment service.

Plumbers, Pipelayers, Pipefitters, and Steamfitters

Significant Points

- Job opportunities should be very good.
- These workers constitute one of the largest and highest paid construction occupations.
- Most States and localities require plumbers to be licensed.
- Most workers train in apprenticeship programs and in career or technical schools or community colleges.

Nature of the Work

Most people are familiar with plumbers who come to their home to unclog a drain or fix a leaking toilet. Plumbers, pipelayers, pipefitters, and steamfitters install, maintain, and repair many different types of pipe systems. Some of these systems move water from reservoirs to municipal water treatment plants and then to residential, commercial, and public buildings. Other systems dispose of waste, supply gas to stoves and furnaces, or provide for heating and cooling needs. Pipe systems in powerplants carry the steam that powers huge turbines. Pipes also are used in manufacturing plants to move material through the production process. Specialized piping systems are very important in both pharmaceutical and computer-chip manufacturing.

Although plumbing, pipelaying, pipefitting, and steamfitting are sometimes considered a single trade, workers generally specialize in one of five areas. *Plumbers* install and repair the water, waste disposal, drainage, and gas systems in homes and commercial and industrial buildings. Plumbers also install plumbing fixtures—bathtubs, showers, sinks, and toilets—and appliances such as dishwashers, waste disposers, and water heaters. *Pipelayers* lay clay, concrete, plastic, or cast-iron pipe for drains, sewers, water mains, and oil or gas lines. Before laying the pipe, pipelayers prepare and grade the trenches either manually or with machines. After laying the pipe, they weld,

Pipelayers install pipe to be buried underground on huge construction projects.

glue, cement, or otherwise join the pieces together. *Pipefitters* install and repair both high-pressure and low-pressure pipe systems used in manufacturing, in the generation of electricity, and in the heating and cooling of buildings. They also install automatic controls that are increasingly being used to regulate these systems. *Steamfitters* install pipe systems that move liquids or gases under high pressure. *Sprinklerfitters* install automatic fire sprinkler systems in buildings. Plumbers, pipelayers, pipefitters, and steamfitters use many different materials and construction techniques, depending on the type of project. Residential water systems, for example, incorporate copper, steel, and plastic pipe that can be handled and installed by one or two plumbers. Municipal sewerage systems, by contrast, are made of large cast-iron pipes; installation normally requires crews of pipefitters. Despite these differences, all plumbers, pipelayers, pipefitters, and steamfitters must be able to follow building plans or blueprints and instructions from supervisors, lay out the job, and work efficiently with the materials and tools of their trade. When plumbers working construction install piping in a new house, they work from blueprints or drawings that show the planned location of pipes, plumbing fixtures, and appliances. Recently, plumbers have become more involved in the design process. Their knowledge of codes and the operation of plumbing systems can cut costs. First they lay out the job to fit the piping into the structure of the house with the least waste of material. Then they measure and mark areas in which pipes will be installed and connected. Construction plumbers also check for obstructions such as electrical wiring and, if necessary, plan the pipe installation around the problem.

Sometimes, plumbers have to cut holes in walls, ceilings, and floors of a house. With some systems, they may hang steel supports from ceiling joists to hold the pipe in place. To assemble a system, plumbers—using saws, pipe cutters, and pipe-bending machines—cut and bend lengths of pipe. They connect the lengths of pipe with fittings, using methods that depend on the type of pipe used. For plastic pipe, plumbers connect the sections and fittings with adhesives. For copper pipe, they slide a fitting over the end of the pipe and solder it in place with a torch.

After the piping is in place in the house, plumbers install the fixtures and appliances and connect the system to the outside water or sewer lines. Finally, using pressure gauges, they check the system to ensure that the plumbing works properly.

Work environment. Plumbers work in commercial and residential settings where water and septic systems need to be installed and maintained. Pipefitters and steamfitters most often work in industrial and power plants. Pipelayers work outdoors, sometimes in remote areas, laying pipes that connect sources of oil, gas, and chemicals with the users of these resources. Sprinklerfitters work in all buildings that require the use of fire sprinkler systems.

Because plumbers, pipelayers, pipefitters, and steamfitters frequently must lift heavy pipes, stand for long periods, and sometimes work in uncomfortable or cramped positions, they need physical strength and stamina. They also may have to work outdoors in inclement weather. In addition, they are subject to possible falls from ladders, cuts from sharp tools, and burns from hot pipes or soldering equipment. Consequently, this occupation experiences rates of nonfatal injuries and illnesses that are much higher than average.

Plumbers, pipelayers, pipefitters, and steamfitters often work more than 40 hours per week and can be on call for emergencies nights and weekends. Some pipelayers may need to travel to and from worksites.

Training, Other Qualifications, and Advancement

Most plumbers, pipelayers, pipefitters, and steamfitters train on the job through jointly administered apprenticeships and in career or technical schools or community colleges.

Education and training. Plumbers, pipelayers, pipefitters, and steamfitters enter into the occupation in a variety of ways. Most plumbers, pipefitters, and steamfitters get their training in jointly administered apprenticeships or in technical schools and community colleges. Pipelayers typically receive their training on the job.

Apprenticeship programs generally provide the most comprehensive training available for these jobs. Such programs are, for the most part, administered jointly by union locals and their affiliated companies or by nonunion contractor organizations. Organizations that sponsor apprenticeships include the United Association of Journeymen and Apprentices of the Plumbing and Pipefitting Industry of the United States and Canada; local employers of either the Mechanical Contractors Association of America or the National Association of Plumbing-Heating-Cooling Contractors; a union associated with a member of the National Fire Sprinkler Association; the Associated Builders and Contractors; the National Association of Plumbing-Heating-Cooling Contractors; the American Fire Sprinkler Association; and the Home Builders Institute of the National Association of Home Builders.

Apprenticeships—both union and nonunion—consist of 4 or 5 years of paid on-the-job training and at least 144 hours of related classroom instruction per year. Classroom subjects include drafting and blueprint reading, mathematics, applied physics and chemistry, safety, and local plumbing codes and regulations. On the job, apprentices first learn basic skills, such as identifying grades and types of pipe, using the tools of the trade, and unloading materials safely. As apprentices gain experience, they learn how to work with various types of pipe and how to install different piping systems and plumbing fixtures. Apprenticeship gives trainees a thorough knowledge of all aspects of the trade. Although most plumbers, pipefitters, and steamfitters are trained through apprenticeships, some still learn their skills informally on the job or by taking classes on their own.

Licensure. Although there are no uniform national licensing requirements, most States and communities require plumbers to be licensed. Licensing requirements vary, but most localities require workers to have 2 to 5 years of experience and to pass an examination that tests their knowledge of the trade and of local plumbing codes before they are permitted to work independently. Several States require a special license to work on gas lines. A few States require pipefitters to be licensed. Licenses usually require a test, experience, or both.

Other qualifications. Applicants for union or nonunion apprentice jobs must be at least 18 years old and in good physical condition. A drug test may be required. Apprenticeship committees may require applicants to have a high school diploma or its equivalent. For jointly administered apprenticeships approved

by the U.S. Department of Labor, a high school diploma is mandatory, because these programs can earn credit from community colleges and, in some cases, from 4-year colleges. Armed Forces training in plumbing, pipefitting, and steamfitting is considered very good preparation. In fact, people with this background may be given credit for previous experience when they enroll in a civilian apprenticeship program. High school or postsecondary courses in shop, plumbing, general mathematics, drafting, blueprint reading, computers, and physics also are good preparation.

Certification and advancement. With additional training, some plumbers, pipefitters, and steamfitters become supervisors for mechanical and plumbing contractors. Others, especially plumbers, go into business for themselves, often starting as a self-employed plumber working from home. Some eventually become owners of businesses employing many workers and may spend most of their time as managers rather than as plumbers. Others move into closely related areas such as construction management or building inspection.

For those who would like to advance, it is becoming increasingly important to be able to communicate in both English and Spanish in order to relay instructions and safety precautions to workers with limited understanding of English; Spanish-speaking workers make up a large part of the construction workforce in many areas. Supervisors and contractors need good communication skills to deal with clients and subcontractors.

In line with new opportunities arising from the growing need to conserve water, the Plumbing-Heating-Cooling Contractors—National Association has formed a partnership with GreenPlumbers USA to train and certify plumbers across the Nation on water-saving technologies and energy efficiency. Attainment of this certification may help people trained in this area to get more jobs and advance more quickly.

Employment

Plumbers, pipelayers, pipefitters, and steamfitters constitute one of the largest construction occupations, holding about 555,900 jobs in 2008. About 56 percent worked for plumbing, heating, and air-conditioning contractors engaged in new construction, repair, modernization, or maintenance work. Others were employed by a variety of industrial, commercial, and government employers. Pipefitters, for example, were employed in the petroleum and chemical industries to maintain the pipes that carry industrial liquids and gases. About 12 percent of plumbers, pipelayers, pipefitters, and steamfitters were self-employed.

Job Outlook

Faster than average employment growth is projected. Job opportunities are expected to be very good.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Pipelayers, plumbers, pipefitters, and steamfitters.....	47-2150	555,900	642,100	86,300	16
Pipelayers.....	47-2151	61,200	71,700	10,500	17
Plumbers, pipefitters, and steamfitters.....	47-2152	494,700	570,500	75,800	15

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Employment change. Employment of plumbers, pipelayers, pipefitters, and steamfitters is expected to grow 16 percent between 2008 and 2018, faster than the average for all occupations. Demand for plumbers will stem from new construction and from renovation of buildings. In addition, repair and maintenance of existing residential systems will keep plumbers employed. A growing emphasis on water conservation, particularly in dryer parts of the country, that will require retrofitting in order to conserve water in new ways will increase demand for plumbers. Demand for pipefitters and steamfitters will be driven by maintenance and construction of places such as powerplants, water and wastewater treatment plants, office buildings, and factories, all of which have extensive pipe systems. The stimulus package aimed at repairing the Nation's infrastructure should help the employment picture immediately; long-term growth of pipelayer jobs will stem from the building of new water and sewer lines and of pipelines to new oil and gas fields. Demand for sprinklerfitters also should increase, because of proposed changes to construction codes, set to take effect in 2011, that will require the installation of fire sprinkler systems in residential buildings where these systems had previously never been required.

Job prospects. Job opportunities are expected to be very good, with demand for skilled plumbers, pipelayers, pipefitters, and steamfitters expected to outpace the supply of well-trained workers in this craft. Some employers report difficulty finding workers with the right qualifications. In addition, many people currently working in these trades are expected to retire over the next 10 years, which will create additional job openings. Workers with welding experience should have especially good opportunities.

Traditionally, many organizations with extensive pipe systems have employed their own plumbers or pipefitters to maintain equipment and keep systems running smoothly. But, to reduce labor costs, a large number of these firms no longer employ full-time, in-house plumbers or pipefitters. Instead, when they need a plumber, they increasingly are relying on workers provided under service contracts by plumbing and pipefitting contractors.

Construction projects generally provide only temporary employment. When a project ends, some plumbers, pipelayers, pipefitters, and steamfitters may be unemployed until they can begin work on a new project, although most companies are trying to limit these periods of unemployment in order to retain workers. In addition, the jobs of plumbers, pipelayers, pipefitters, and steamfitters are generally less sensitive to changes in economic conditions than are jobs in other construction trades. Moreover, the coming emphasis on conservation of energy and water is opening up opportunities for those

plumbers, pipefitters, and steamfitters who become proficient in new green technologies.

Earnings

Plumbers, pipelayers, pipefitters, and steamfitters are among the highest paid workers in construction occupations. Median hourly wages of wage and salary plumbers, pipefitters, and steamfitters were \$21.94 in May 2008. The middle 50 percent earned between \$16.63 and \$29.66. The lowest 10 percent earned less than \$13.22, and the highest 10 percent earned more than \$37.93. Median hourly wages in the industries employing the largest numbers of plumbers, pipefitters, and steamfitters were as follows:

Natural gas distribution	\$26.27
Nonresidential building construction	23.14
Building equipment contractors	21.86
Utility system construction	21.15
Local government.....	20.65

In May 2008, median hourly wages of wage and salary pipelayers were \$15.72. The middle 50 percent earned between \$12.84 and \$20.85. The lowest 10 percent earned less than \$10.74, and the highest 10 percent earned more than \$27.43.

Apprentices usually begin at about 50 percent of the wage rate paid to experienced workers. Wages increase periodically as skills improve. After an initial waiting period, apprentices receive the same benefits as experienced plumbers, pipelayers, pipefitters, and steamfitters.

About 31 percent of plumbers, pipelayers, pipefitters, and steamfitters belonged to a union. Many of these workers are members of the United Association of Journeymen and Apprentices of the Plumbing and Pipefitting Industry of the United States and Canada.

Related Occupations

Other workers who install and repair mechanical systems in buildings include the following:

	Page
Boilermakers	613
Electricians.....	641
Elevator installers and repairers	644
Heating, air-conditioning, and refrigeration mechanics and installers.....	703
Industrial machinery mechanics and millwrights	709
Sheet metal workers	665
Stationary engineers and boiler operators.....	763

Other construction-related workers who need to know plumbing requirements include the following:

Construction and building inspectors.....	628
Construction managers.....	38

The Occupational Information Network (O*NET) provides information on a wide range of occupational characteristics. Links to O*NET appear at the end of the Internet version of this occupational statement, accessible at <http://www.bls.gov/ooh/ocos211.htm>

Roofers

Significant Points

- Most roofers learn their skills on the job; some train through 3-year apprenticeships.
- Demand for roofers is less vulnerable to downturns in the economy than demand for other construction trades because most roofing work consists of repair and reroofing.
- Most job openings will occur from the need to replace those who leave the occupation because the work can be hot, strenuous, and dirty, causing many people to switch to jobs in other construction trades.

Nature of the Work

Roofers repair and install roofs made from a combination of some of the following: tar, asphalt, gravel, rubber, thermoplastic, metal, and shingles—all of which protect buildings and their contents from water damage. A leaky roof can damage ceilings, walls, and furnishings. Repair and reroofing—replacing old roofs on existing buildings—make up the majority of work for roofers.

There are two types of roofs—low-slope and steep-slope. Low-slope roofs rise 4 inches or less per horizontal foot and are installed in layers. Steep-slope roofs rise more than 4 inches per horizontal foot and are usually covered in shingles. Most commercial, industrial, and apartment buildings contain low-slope roofs, while the majority of residential houses have steep-slope roofs. Some roofers work on both types; others specialize.

Most low-slope roofs are covered with several layers of materials. Roofers begin by installing a layer of insulation on the roof deck, followed by applying a tarlike substance called molten bitumen on top of it. Next, they install overlapping layers of roofing felt—a fabric soaked in bitumen—over the surface. Roofers use a mop to spread hot bitumen over the felt before adding another layer of felt. This seals the seams and makes the surface waterproof. Roofers repeat these steps to build up the desired number of layers, called “plies.” The top layer is then glazed to make a smooth finish or has gravel embedded in the hot bitumen to create a rough surface.

An increasing number of low-slope roofs are covered with single-ply membranes of waterproof rubber or thermoplastic compounds. Roofers roll these sheets over the roof’s insulation and seal the seams. Adhesive, mechanical fasteners, or stone ballast hold the sheets in place. Roofers must make sure the building is strong enough to hold the stone ballast.

A small but increasing number of buildings now have “green” roofs that incorporate landscape roofing systems. A landscape roofing system begins with a single or multiply waterproof layer. After it is proven to be leak free, roofers put a root barrier over it, and then layers of soil, in which trees and grass are planted. Roofers are responsible for making sure the roof is watertight and can endure the weight and water needs of the plants.

Most residential steep-slope roofs are covered with shingles. To apply shingles, roofers first lay, cut, and tack 3-foot strips of roofing felt over the entire roof. Starting from the bottom edge, roofers then nail overlapping rows of shingles to the roof. Roofers measure and cut the felt and shingles to fit intersecting roof surfaces and to fit around vent pipes and chimneys. Wherever two sections of the roof meet each other at an angle or where shingles reach a vent pipe or chimney, roofers cement or nail flashing-strips of metal or shingle over the joints to make them watertight. Finally, roofers cover exposed nail-heads with roofing cement or caulking to prevent water leakage. A similar process is used when installing tile, metal shingles, or shakes (rough wooden shingles).

Some roofers specialize in waterproofing or dampproofing masonry and concrete walls, floors, and foundations. To prepare surfaces for waterproofing, they hammer and chisel away rough spots or remove them with a rubbing brick before applying a coat of liquid waterproofing compound. They also may

paint or spray surfaces with a waterproofing material or attach waterproofing membrane to surfaces. Roofers usually spray a bitumen-based coating on interior or exterior surfaces when dampproofing.

Work environment. Roofing work is strenuous. It involves heavy lifting, as well as climbing, bending, and kneeling. Roofers work outdoors in all types of weather, particularly when making repairs. However, they rarely work when it rains or in very cold weather because ice can be dangerous. In northern States, roofing work is generally not performed during winter months. During the summer, roofers may work overtime to complete jobs quickly, especially before forecasted rainfall.

Workers risk slips or falls from scaffolds, ladders, or roofs, and burns from hot bitumen, but safety precautions can prevent most accidents. In addition, roofs can become extremely hot during the summer, causing heat-related illnesses. Data from the U.S. Bureau of Labor Statistics show that full-time roofers experienced a work-related injury and illness rate that was much higher than the national average.

Training, Other Qualifications, and Advancement

Most roofers learn their skills on the job by working as helpers for experienced roofers and by taking classes, including safety training offered by their employers; some complete 3-year apprenticeships.

Education and training. A high school education, or its equivalent, is helpful and so are courses in mechanical drawing and basic mathematics. Although most workers learn roofing as helpers for experienced workers, some roofers train through 3-year apprenticeship programs administered by local union-management committees representing roofing contractors and locals of the United Union of Roofers, Waterproofers, and Allied Workers. Apprenticeship programs usually include at least 2,000 hours of paid long-term on-the-job training each year, plus a minimum of 144 hours of classroom instruction a year in tools and their use, arithmetic, safety, and other topics. On-the-job training for apprentices is similar to the training given to helpers, but an apprenticeship program is more structured and comprehensive. Apprentices, for example, also learn to damp-proof and waterproof walls.

Trainees start by carrying equipment and material and erecting scaffolds and hoists. Within 2 or 3 months, they are taught to measure, cut, and fit roofing materials and, later, to lay asphalt or fiberglass shingles. Because some roofing materials are used infrequently, such as solar tiles, it can take several years to get experience working on all types of roofing.

Other qualifications. Physical condition and strength, along with good balance, are essential for roofers. They cannot be afraid of heights. Experience with metal-working is helpful for workers who install metal roofing. Usually, apprentices must be at least 18 years old.

Advancement. Roofers may advance to become supervisors or estimators for a roofing contractor or become independent contractors themselves.

Employment

Roofers held about 148,900 jobs in 2008. About 70 percent of all salaried roofers worked for roofing contractors, while only

Roofers need good physical condition, strength, and balance.

21 percent were self-employed. Many self-employed roofers specialized in residential work.

Job Outlook

Most job openings will occur from turnover because the work is hot, strenuous, and dirty, causing many people to switch to jobs in other construction trades. Employment is projected to grow slower than the average.

Employment change. Employment of roofers is expected to grow 4 percent between 2008 and 2018, slower than the average for all occupations. Roofs deteriorate faster than most other parts of buildings and, as a result, they need to be repaired or replaced more often. In addition to repair work, the need to install roofs on new buildings may result in some job growth. So as building construction increases, some demand for roofers can be expected.

Employment growth, nonetheless, may be impeded because a greater proportion of roofing work may be completed by

other construction workers as opposed to traditional roofing contractors.

Job prospects. Job opportunities for roofers will occur primarily because of the need to replace workers who leave the occupation. The proportion of roofers who leave the occupation each year is higher than in most construction trades—roofing work is hot, strenuous, and dirty, and a considerable number of workers treat roofing as a temporary job until they find other work. Some roofers leave the occupation to go into other construction trades. Jobs should be easier to find during spring and summer.

Employment of roofers who install new roofs, like that of many other construction workers, is sensitive to fluctuations of the economy. Workers may experience periods of unemployment when the overall level of construction falls. On the other hand, shortages of these workers may occur in some areas during peak periods of building activity. Nevertheless, roofing work is more heavily concentrated in repair and replacement rather than new installation, making demand for roofing less vulnerable to downturns than demand for some other construction trades.

Earnings

In May 2008, median hourly wages of roofers were \$16.17. The middle 50 percent earned between \$12.97 and \$21.98. The lowest 10 percent earned less than \$10.63, and the highest 10 percent earned more than \$28.46. Median hourly wages of roofers in the foundation, structure, and building exterior contractors industry were \$16.26. Earnings may be less on occasions when poor weather limits the time roofers can work.

Apprentices usually begin earning about 40 percent to 50 percent of the rate paid to experienced roofers. They receive periodic raises as they master the skills of the trade.

Some roofers are members of United Union of Roofers, Waterproofers, and Allied Workers. Hourly wages and fringe benefits are generally higher for union workers.

Related Occupations

Roofers use shingles, tile, bitumen and gravel, single-ply plastic or rubber sheets, or other materials to protect and waterproof building surfaces. Workers in other occupations who cover surfaces with special materials for protection and decoration include:

	Page
Carpenters	618
Carpet, floor, and tile installers and finishers	621
Cement masons, concrete finishers, segmental pavers, and terrazzo workers	625
Drywall and ceiling tile installers, tapers, plasterers, and stucco masons	638
Sheet metal workers	665

Sheet Metal Workers

Significant Points

- Sheet metal workers are primarily employed in construction and manufacturing industries.
- Workers learn through informal on-the-job training or formal apprenticeship programs.
- Job opportunities in construction should be good, particularly for individuals who have apprenticeship training or who are certified welders; applicants for jobs in manufacturing will experience competition.

Nature of the Work

Sheet metal workers make, install, and maintain heating, ventilation, and air-conditioning duct systems; roofs; siding; rain gutters; downspouts; skylights; restaurant equipment; outdoor signs; railroad cars; tailgates; customized precision equipment; and many other products made from metal sheets. They also may work with fiberglass and plastic materials. Although some workers specialize in fabrication, installation, or maintenance, most do all three jobs. Sheet metal workers do both construction-related work and mass production of sheet metal products in manufacturing.

Sheet metal workers first study plans and specifications to determine the kind and quantity of materials they will need. They

A sheet metal worker is using a torch to heat a sheet of metal.

measure, cut, bend, shape, and fasten pieces of sheet metal to make ductwork, countertops, and other custom products. Sheet metal workers program and operate computerized metalworking equipment. They cut, drill, and form parts with computer-controlled saws, lasers, shears, and presses.

In shops without computerized equipment, and for products that cannot be made with such equipment, sheet metal workers make the required calculations and use tapes, rulers, and other measuring devices for layout work. They then cut or stamp the parts with machine tools.

Before assembling pieces, sheet metal workers use measuring instruments such as tape measures, calipers, and micrometers to check each part for accuracy. If necessary, they use hand, rotary, or squaring shears and hacksaws to finish pieces. After inspecting the pieces, workers fasten seams and joints together with welds, bolts, cement, rivets, solder, or other connecting devices. They then take the parts constructed in the shop and assemble the pieces further as they install them. These workers install ducts, pipes, and tubes by joining them end to end and hanging them with metal hangers secured to a ceiling or a wall. They also use shears, hammers, punches, and drills to make parts at the worksite or to alter parts made in the shop.

Some jobs are done completely at the jobsite. When installing a metal roof, for example, sheet metal workers usually measure and cut the roofing panels onsite. They secure the first panel

in place and interlock and fasten the grooved edge of the next panel into the grooved edge of the first. Then they nail or weld the free edge of the panel to the structure. This two-step process is repeated for each additional panel. Finally, the workers fasten machine-made molding at joints, along corners, and around windows and doors, for a neat, finished effect.

In addition to installation, some sheet metal workers specialize in testing, balancing, adjusting, and servicing existing air-conditioning and ventilation systems to make sure they are functioning properly and to improve their energy efficiency. Properly installed duct systems are a key component of heating, ventilation, and air-conditioning (HVAC) systems; sometimes duct installers are called HVAC technicians. A growing activity for sheet metal workers is the commissioning of a building—a complete mechanical inspection of the building’s HVAC, water, and lighting systems.

Sheet metal workers in manufacturing plants make sheet metal parts for products such as aircraft or industrial equipment. Although some of the fabrication techniques used in large-scale manufacturing are similar to those used in smaller shops, the work may be highly automated and repetitive. Sheet metal workers doing such work may be responsible for reprogramming the computer control systems of the equipment they operate.

Work environment. Sheet metal workers usually work a 40-hour week. Those who fabricate sheet metal products work in small shops and manufacturing plants that are usually well lighted and well ventilated. However, they stand for long periods and lift heavy materials and finished pieces. Those performing installation at construction sites or inside buildings do considerable bending, lifting, standing, climbing, and squatting, sometimes in close quarters or awkward positions. Working outdoors exposes sheet metal workers to various kinds of weather.

Sheet metal workers must follow safety practices, because this occupation has a relatively high rate of nonfatal injuries. Some sheet metal workers work around high-speed machines, which can be dangerous. Others are subject to cuts from sharp metal, burns from soldering or welding, and falls from ladders or scaffolds. They often are required to wear safety glasses and must not wear jewelry or loose-fitting clothing that could easily be caught in a machine. To avoid repetitive-type injuries, they may work at a variety of different production stations.

Training, Other Qualifications, and Advancement

Sheet metal workers learn their trade through both formal apprenticeships and informal on-the-job training programs. Formal apprenticeships are more likely to be found in construction.

Education and training. To become a skilled sheet metal construction worker usually takes between 4 and 5 years of both classroom and on-the-job training. Although there are a number of different ways to obtain this training, generally the more formalized the training received by an individual, the more thoroughly skilled the person becomes and the more likely he or she is to be in demand by employers. For some, this training begins in a high school, where classes in English, algebra, geometry, physics, mechanical drawing and blueprint reading, and general shop are recommended.

After high school, there are a number of different ways to train. One way is to get a job with a contractor who will provide

training on the job. Entry-level workers generally start as helpers, assisting more experienced workers. Most begin by carrying metal and cleaning up debris in a metal shop, learning about materials, tools, and their uses as they go about their tasks. Later, they learn to operate machines that bend or cut metal. In time, helpers go to the jobsite to learn installation. Employers may send their employees to a trade or vocational school to take courses or to a community college to receive further formal training. Helpers may be promoted to the journeyman level if they show the requisite knowledge and skills. Most sheet metal workers in large-scale manufacturing receive on-the-job training, with additional classwork or in-house training as necessary. The training needed to become proficient in manufacturing takes less time than the training for proficiency in construction.

Apprenticeship programs combine paid on-the-job training with related classroom instruction. Usually, apprenticeship applicants must be at least 18 years old and meet local requirements. The length of the program, typically 4 to 5 years, varies with the apprentice’s skill. Apprenticeship programs provide comprehensive instruction in both sheet metal fabrication and sheet metal installation. They may be administered by local joint committees composed of the Sheet Metal Workers’ International Association and local chapters of the Sheet Metal and Air-Conditioning Contractors National Association.

Sheet metal workers can choose one of many specialties. Workers can specialize in commercial and residential HVAC installation and maintenance, industrial welding and fabrication, exterior or architectural sheet metal installation, sign fabrication, service and refrigeration, and testing and balancing of building systems.

On the job, apprentices receive first safety training and then training in tasks that allow them to begin work immediately. They use materials such as fiberglass, plastics, and other non-metallic materials. Workers focus on a particular sheet metal career path. In the classroom, apprentices learn computer aided drafting; reading of plans and specifications; trigonometry and geometry applicable to layout work; welding; the use of computerized equipment; the principles of heating, air-conditioning, and ventilation systems. In addition, apprentices learn the relationship between sheet metal work and other construction work.

Other qualifications. Sheet metal workers need to be in good physical condition and have mechanical and mathematical aptitude and good reading skills. Good eye-hand coordination, accurate perception of spaces and forms, and manual dexterity also are important. Courses in algebra, trigonometry, geometry, mechanical drawing, and shop provide a helpful background for learning the trade, as does related work experience obtained in the U.S. Armed Services.

Certification and advancement. It is important for experienced sheet metal workers to keep abreast of new technological developments, such as the use of computerized layout and laser-cutting machines. In addition, new software, called B.I.M., which stands for “building information modeling,” allows contractors, architects, and engineers to coordinate their efforts and increase efficiency at worksites.

Certifications in one of the specialties also can be beneficial to workers. Certifications related to sheet metal specialties are

offered by a wide variety of associations, several of which are listed in the sources of additional information at the end of this statement.

Sheet metal workers in construction may advance to supervisory jobs. Some of these workers take additional training in welding and do more specialized work. Workers who perform building and system testing are able to move into construction and building inspection. Others go into the contracting business for themselves. Because a sheet metal contractor must have a shop with equipment to fabricate products, this type of contracting business is more expensive to start than other types of construction contracting.

Sheet metal workers in manufacturing may advance to positions as supervisors or quality inspectors. Some of these workers may move into other management positions.

Employment

Sheet metal workers held about 170,700 jobs in 2008. About 63 percent of all sheet metal workers were in the construction industry, including 46 percent who worked for plumbing, heating, and air-conditioning contractors; most of the rest in construction worked for roofing contractors and for building finishing contractors. Some worked for general contractors engaged in residential and commercial building and for other special trade contractors.

About 23 percent of all sheet metal workers were in manufacturing industries, such as the fabricated metal products, machinery, and aerospace products and parts industries. Some sheet metal workers work for the Federal Government.

Compared with workers in most construction craft occupations, relatively few sheet metal workers are self-employed.

Job Outlook

Slower than average employment growth is projected. Job opportunities should be best for individuals who have apprenticeship training or who are certified welders. Applicants for jobs in manufacturing will experience competition.

Employment change. Employment of sheet metal workers is expected to increase by 6 percent between 2008 and 2018, slower than the average for all occupations. This change reflects anticipated growth in the number of industrial, commercial, and residential structures to be built over the decade. In addition, it reflects the need to install energy-efficient air-conditioning, heating, and ventilation systems in older buildings and to perform other types of renovation and maintenance work on these systems. Also, the popularity of decorative sheet metal products and increased architectural restoration are expected to add to the demand for sheet metal workers.

Sheet metal workers in manufacturing, however, are expected to experience a moderate decline in employment as the industry becomes more automated and some of the work is done in other countries.

Job prospects. Job opportunities are expected to be good for sheet metal workers in the construction industry, reflecting both employment growth and openings arising each year as experienced sheet metal workers leave the occupation. Opportunities should be particularly good for individuals who have apprenticeship training or who are certified welders. Applicants for jobs in manufacturing will experience competition.

Sheet metal workers in construction may experience periods of unemployment, particularly when construction projects end and economic conditions dampen construction activity. However, because maintenance of existing equipment makes up a large part of the work done by sheet metal workers, they are less affected by construction downturns than are some other construction occupations. Installation of new air-conditioning and heating systems in existing buildings is expected to continue as individuals and businesses adopt more energy-efficient equipment to cut utility bills. In addition, a large proportion of sheet metal installation and maintenance is done indoors, so sheet metal workers usually lose less worktime because of bad weather than do other construction workers.

Earnings

In May 2008, median hourly wages of sheet metal workers were \$19.37. The middle 50 percent earned between \$14.39 and \$27.03. The lowest 10 percent of all sheet metal workers earned less than \$11.43, and the highest 10 percent earned more than \$35.36. The median hourly wages of the largest industries employing sheet metal workers were as follows:

Federal Government.....	\$23.37
Building finishing contractors.....	21.35
Building equipment contractors.....	19.98
Foundation, structure, and building exterior contractors.....	17.67
Architectural and structural metals manufacturing	17.32

Apprentices normally start at about 40 to 50 percent of the rate paid to experienced workers. As apprentices acquire more skills, they receive periodic pay increases, until their pay approaches that of experienced workers.

About 32 percent of all sheet metal workers belong to a union. Union workers in some areas receive supplemental wages from the union when they are laid off or experience shortened workweeks.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Sheet metal workers.....	47-2211	170,700	181,800	11,100	6

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Related Occupations

To fabricate and install sheet metal products, sheet metal workers combine metalworking skills and knowledge of construction materials and techniques. Other occupations in which workers lay out and fabricate metal products include the following:

	Page
Assemblers and fabricators	723
Machine setters, operators, and tenders— metal and plastic	734
Machinists	737
Tool and die makers	740

Construction occupations requiring similar skills and knowledge include the following:

Glaziers	647
Heating, air-conditioning, and refrigeration mechanics and installers.....	703

Structural and Reinforcing Iron and Metal Workers

Significant Points

- Workers must be in good physical condition and have no fear of heights.
- Most employers recommend completion of a formal 3-year or 4-year paid apprenticeship, but some workers learn on the job.
- In most areas of the country, job opportunities should be favorable.

Nature of the Work

Structural and reinforcing iron and metal workers place and install iron or steel girders, columns, and other construction materials to form buildings, bridges, and other structures. They also position and secure steel bars or mesh in concrete forms in order to reinforce the concrete used in highways, buildings, bridges, tunnels, and other structures. In addition, they repair and renovate older buildings and structures. Even though the primary metal involved in this work is steel, these workers often are known as *ironworkers* or *erectors*. Some ironworkers make structural metal in fabricating shops, which are usually located away from the construction site. (These workers are covered in the statement on assemblers and fabricators found elsewhere in the *Handbook*.)

Before construction can begin, ironworkers must erect steel frames and assemble the cranes and derricks that move structural steel, reinforcing bars, buckets of concrete, lumber, and other materials and equipment around the construction site. Once this job has been completed, workers begin to connect

Workers hammer large structural steel into the ground at a construction site.

steel columns, beams, and girders according to blueprints and instructions from supervisors and superintendents. Structural steel, reinforcing rods, and ornamental iron generally come to the construction site ready for erection—cut to the proper size, with holes drilled for bolts and numbered for assembly.

Ironworkers at the construction site unload and stack the pre-fabricated steel so that it can be hoisted easily when needed. To hoist the steel, ironworkers attach cables (slings) to the steel and to the crane or derrick. One worker directs the hoist operator with hand signals while another worker holds a rope (tag line) attached to the steel to prevent it from swinging. The crane or derrick hoists steel into place in the framework, whereupon two ironworkers, called connectors, position the steel with connecting bars and spud wrenches—a long wrench with a pointed handle. Workers using driftpins or the handle of a spud wrench align the holes in the steel with the holes in the framework. Ironworkers check vertical and horizontal alignment with plumb bobs, laser equipment, transits, or levels; then they bolt or weld the piece permanently in place.

Reinforcing iron and rebar workers, sometimes called *rod busters*, set reinforcing bars (often called rebar) in the forms that hold concrete, following blueprints showing the location, size, and number of bars. They then fasten the bars together by tying wire around them with pliers. When reinforcing floors, ironworkers place spacers under the rebar to hold the bars off the deck. Although these materials usually arrive ready to use, ironworkers occasionally must cut bars with metal shears or acetylene torches, bend them by hand or machine, or weld them with arc-welding equipment. Some concrete is reinforced with welded wire fabric that ironworkers put into position using hooked rods. Post-tensioning is another technique used to reinforce concrete. In this technique, workers substitute cables for rebar. When the concrete is poured, the ends of the cables are left exposed. After the concrete cures, ironworkers tighten the cables with jacking equipment specially designed for the purpose. Post-tensioning allows designers to create larger open areas in a building, because supports can be placed further apart. This technique is commonly employed in parking garages and arenas.

Ornamental ironworkers install stairs, handrails, curtain walls (the nonstructural walls and window frames of many large buildings), and other miscellaneous metal after the structure of the building has been completed. As they hoist pieces into position, ornamental ironworkers make sure that the pieces are properly fitted and aligned before bolting or welding them for a secure fit.

Work environment. Structural and reinforcing iron and metal workers usually work outside in all kinds of weather. However, those who work at great heights do not work during wet, icy, or extremely windy conditions. Because the danger of injuries from falls is great, ironworkers use safety devices such as safety harnesses, scaffolding, and nets to reduce risk. Nevertheless, this occupation does experience an above average rate of nonfatal injuries.

Training, Other Qualifications, and Advancement

Many workers learn to be ironworkers through formal apprenticeships, but others learn on the job. Certifications in welding and rigging can increase a worker's usefulness on the job site.

Education and training. Most employers recommend a 3-year to 4-year apprenticeship consisting of a combination of paid on-the-job training and classroom instruction as the best way to learn this trade. Apprenticeship programs are administered by committees made up of representatives of local unions of the International Association of Bridge, Structural, Ornamental and Reinforcing Iron Workers or the local chapters of contractors' associations. To be accepted into an apprenticeship program, most employers and local apprenticeship committees prefer that applicants have a high school diploma. In addition, high school courses in general mathematics, mechanical drawing, English, and welding are considered helpful.

Classroom study for apprentices consists of blueprint reading; mathematics, the basics of structural erecting, rigging, reinforcing, welding, assembling, and safety training. Apprentices also study the care and safe use of tools and materials. On the job, apprentices work in all aspects of the trade, such as unloading and storing materials at the job site, rigging materials for movement by crane, connecting structural steel, and welding.

Some ironworkers learn the trade informally on the job, without completing an apprenticeship. On-the-job trainees usually begin by assisting experienced ironworkers on simple jobs, such as carrying various materials. With experience, trainees perform more difficult tasks, such as cutting and fitting different parts.

Other qualifications. Ironworkers must be at least 18 years old. Because materials used in iron working are heavy and bulky, ironworkers must be in good physical condition. They also need good agility, balance, eyesight, and depth perception to work safely at great heights on narrow beams and girders. Ironworkers should not be afraid of heights or suffer from dizziness.

Certification and advancement. Ironworkers who complete apprenticeships are certified at the journey level, which often make them more competitive candidates for jobs and promotions. Those who meet education and experience requirements can become welders certified by the American Welding Society. Apprenticeship programs often provide trainees the opportunity to become welder-certified as part of their coursework because welding skills are useful for many ironworker tasks.

Some experienced workers are promoted to supervisor. Others may go into the contracting business for themselves. The ability to communicate in both English and Spanish will improve opportunities for advancement.

Employment

Ironworkers held about 97,800 jobs in 2008; structural iron and steel workers held about 70,200 jobs, and reinforcing iron and rebar workers held about 27,700 jobs. About 88 percent worked in construction, with 51 percent working for foundation, structure, and building exterior contractors. Most of the remaining ironworkers worked for contractors specializing in the construction of various structures, such as bridges, buildings, and factories.

Structural and reinforcing iron and metal workers are employed in all parts of the country, but most work in metropolitan areas, where the bulk of commercial and industrial construction takes place.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Structural and reinforcing iron and metal workers	–	97,800	110,000	12,200	12
Reinforcing iron and rebar workers	47-2171	27,700	31,100	3,500	13
Structural iron and steel workers	47-2221	70,200	78,900	8,700	12

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Job Outlook

Average job growth is projected. In most areas of the country, job opportunities should be favorable.

Employment change. Employment of structural and reinforcing iron and metal workers is expected to grow 12 percent between 2008 and 2018, about as fast as the average for all occupations. The rehabilitation, maintenance, and replacement of a growing number of older buildings, powerplants, highways, and bridges also are expected to create employment opportunities. State and Federal legislatures will likely continue to call for road construction and related infrastructure projects, which will secure jobs for the near future. However, a lack of qualified applicants challenges the education and retraining needs of the industry to meet the demands of employment growth.

Job prospects. In addition to new jobs from employment growth, many job openings will result from the need to replace experienced ironworkers who leave the occupation or retire. In most areas, job opportunities should be favorable, although the number of job openings can fluctuate from year to year with economic conditions and the level of construction activity.

Employment of structural and reinforcing iron and metal workers, like that of many other construction workers, is sensitive to the fluctuations of the economy. Workers in these trades may experience periods of unemployment when the overall level of construction falls. On the other hand, shortages of these workers may occur in some areas during peak periods of building activity. Similarly, job opportunities for ironworkers may vary widely by geographic area. Population growth in the South and West should create more job opportunities than elsewhere as bridges, buildings, and roads are constructed. Job openings for ironworkers usually are more abundant during the spring and summer months, when the level of construction activity increases. Workers who are willing to relocate are often able to find work in another area.

Earnings

In May 2008, median hourly wages of structural iron and steel workers were \$20.68. The middle 50 percent earned between \$15.18 and \$29.15. The lowest 10 percent earned less than \$12.25, and the highest 10 percent earned more than \$37.04.

In May 2008, median hourly wages of reinforcing iron and rebar workers were \$19.18. The middle 50 percent earned between \$14.35 and \$27.29. The lowest 10 percent earned less than \$11.78, and the highest 10 percent earned more than \$35.26.

In May 2008, median hourly wages of structural iron and steel workers in foundation, structure, and building exterior contractors were \$21.51 and in nonresidential building con-

struction, \$18.53. Reinforcing iron and rebar workers earned median hourly wages of \$19.37 in foundation, structure, and building exterior contractors.

About 40 percent of the workers in this trade are union members. According to International Association of Bridge, Structural, Ornamental, and Reinforcing Iron Workers, average hourly compensation, including benefits, for structural and reinforcing metal workers who belonged to a union and worked full time were higher than the hourly earnings of nonunion workers. Structural and reinforcing iron and metal workers in New York, Boston, San Francisco, Chicago, Los Angeles, Philadelphia, and other large cities received the highest wages.

Apprentices generally start at about 60 percent of the rate paid to experienced journey level workers. Throughout the course of the apprenticeship program, as they acquire skills they receive periodic increases until their pay approaches that of experienced workers.

Earnings for ironworkers may be reduced on occasion because work can be limited by bad weather and economic downturns.

Related Occupations

Structural and reinforcing iron and metal workers play an essential role in erecting buildings, bridges, highways, power lines, and other structures. Others who work on these construction jobs include:

Installation, Maintenance, and Repair Occupations

Electrical and Electronic Equipment Mechanics, Installers, and Repairers

Computer, Automated Teller, and Office Machine Repairers

Significant Points

- Employment is expected to decline slowly.
- Job prospects will be best for applicants with knowledge of electronics, certification, formal training, and repair experience.
- Workers qualify for these jobs by receiving training in electronics from associate degree programs, the military, vocational schools, equipment manufacturers, or employers.

Nature of the Work

Computer, automated teller, and office machine repairers install, fix, and maintain many of the machines that are used by businesses, households, and consumers. For large or stationary machines, repairers frequently perform the work on site. These workers—known as *field technicians*—often have assigned areas where they perform preventive maintenance on a regular basis. *Bench technicians* commonly repair smaller equipment and often work in repair shops located in stores, factories, or service centers. In small companies, repairers may work both in repair shops and at customer locations.

Computer repairers, also known as *computer service technicians* or *data processing equipment repairers*, service mainframe, server, and personal computers; printers; and auxiliary computer equipment. These workers primarily perform hands-on repair, maintenance, and installation of computers and related equipment. Workers who provide technical assistance, in person or by telephone, to computer system users are known as computer support specialists or computer support technicians. (See the section on computer support specialists and systems administrators elsewhere in the *Handbook*.)

Computer repairers typically replace subsystems instead of repairing them. Commonly replaced subsystems include video cards, which transmit signals from the computer to the monitor; hard drives, which store data; and network cards, which allow communication over the network. Replacement is common because subsystems are usually inexpensive and businesses are reluctant to shut down their computers for time-consuming repairs. Defective modules may be given to bench technicians, who use software programs to diagnose the problem and who may repair the modules, if possible.

Office machine and cash register servicers work on photocopiers, cash registers, and fax machines. Newer models of office machinery include computerized components that allow them to function more reliably than earlier models and, therefore, require less maintenance.

Office machine repairers usually work on machinery at the customer's workplace. However, if the machines are small enough, customers may bring them to a repair shop for repair. Common malfunctions include paper jams caused by worn or dirty parts, and poor-quality copy resulting from problems with lamps, lenses, or mirrors. These malfunctions often can be resolved simply by cleaning the relevant components. Breakdowns also may result from the general wear and tear of commonly used parts. For example, heavy use of a photocopier may wear down the printhead, which applies ink to the final copy. In such cases, the repairer usually replaces the part instead of repairing it.

Automated teller machine servicers install and repair automated teller machines (ATMs) and, increasingly, electronic kiosks. In addition to performing bank transactions without the assistance of a teller, electric kiosks are being used for a variety of non-traditional services, including stamp, phone card, and ticket sales. A growing number of electronic kiosks also allow consumers to redeem movie tickets or airline and train boarding passes.

When ATMs malfunction, computer networks often recognize the problem and alert repairers. Common problems include worn magnetic heads on card readers, which prevent the equipment from recognizing customers' bankcards, and "pick failures," which prevent the equipment from dispensing the correct amount of cash. In such cases, field technicians travel to the locations of ATMs and repair equipment by removing and replacing defective components. Broken components may be taken to a repair shop, where bench technicians make the necessary repairs. Field technicians perform routine maintenance on a regular basis, replacing worn parts and running diagnostic tests to ensure that the equipment operates properly.

To install large equipment, such as mainframe computers and ATMs, repairers connect the equipment to power sources and communication lines that allow the transmission of information over computer networks. For example, when an ATM dispenses cash, it transmits the withdrawal information to the customer's bank. Workers may also install operating software and peripheral equipment, checking that all components are configured to operate together correctly.

Computer, automated teller, and office machine repairers use a variety of tools for diagnostic tests and repair. To

Computer, automated teller, and office machine repairers use a variety of tools for diagnostic tests and repair.

diagnose malfunctions, they use multimeters to measure voltage, current, resistance, and other electrical properties; signal generators to provide test signals; and oscilloscopes to monitor equipment signals. To diagnose computerized equipment, repairers use software programs. To repair or adjust equipment, workers use handtools, such as pliers, screwdrivers, and soldering irons.

Work environment. Repairers usually work in clean, well-lit surroundings. Because computers and office machines are sensitive to extreme temperatures and humidity, repair shops usually are air-conditioned and well ventilated. Field repairers must travel frequently to various locations to install, maintain, or repair customers' equipment. ATM repairers may have to perform their jobs in small, confined spaces that house the equipment.

Because computers and ATMs are critical for many organizations to function efficiently, data processing equipment repairers and ATM field technicians often work around the clock. Their schedules may include evening, weekend, and holiday shifts, sometimes assigned on the basis of seniority. Office machine and cash register servicers usually work regular business hours because the equipment they repair is not

as critical. Most repairers work about 40 hours per week, but about 9 percent work more than 50 hours per week. Although their jobs are not strenuous, repairers often must lift equipment and work in a variety of postures. Repairers of computer monitors need to discharge voltage from the equipment to avoid electrocution.

Training, Other Qualifications, and Advancement

Knowledge of electronics is required, and employers prefer workers with formal training. Office machine and ATM repairers usually have an associate degree. Certification is available for entry-level workers and experienced workers seeking advancement.

Education and training. Knowledge of electronics is necessary for employment as a computer, automated teller, or office machine repairer. Employers prefer workers who are certified or who have training in electronics from an associate degree program, the military, a vocational school, or an equipment manufacturer. Employers generally provide some training to new repairers on specific equipment; however, workers are expected to arrive on the job with a basic understanding of equipment repair. Employers may send experienced workers to training sessions to keep up with changes in technology and service procedures.

Most office machine and ATM repairer positions require an associate degree in electronics. A basic understanding of mechanical equipment is also important because many of the parts that fail in office machines and ATMs, such as paper loaders, are mechanical. Entry-level employees at large companies normally receive on-the-job training lasting several months. Such training may include a week of classroom instruction, followed by a period of 2 weeks to several months assisting an experienced repairer.

Other qualifications. Field technicians work closely with customers and must have good communications skills and a neat appearance. Employers may require that field technicians have a driver's license.

Certification and advancement. Various organizations offer certification. For instance, the Electronics Technicians Association (ETA) offers more than 50 certification programs in numerous electronics specialties for varying levels of competence. The International Society of Certified Electronics Technicians also offers certification for several levels of competence, focusing on a broad range of topics, including basic electronics, multimedia systems, electronic systems, and appliance service. To become certified, applicants must meet several prerequisites and pass a comprehensive written or online examination. Certification demonstrates a level of competency. It can make an applicant more attractive to employers or increase an employee's opportunities for advancement.

Newly hired computer repairers may possibly work on personal computers or peripheral equipment. With experience, they can advance to positions maintaining more sophisticated systems, such as networking equipment and servers. Field repairers of ATMs may advance to bench technician positions responsible for more complex repairs. Experienced workers may become specialists who assist other repairers diagnose difficult problems or who work with engineers in designing equipment

and developing maintenance procedures. Experienced workers may also move into management positions responsible for supervising other repairers.

Because of their familiarity with equipment, experienced repairers may also move into customer service or sales positions. Some experienced workers open their own repair shops or become wholesalers or retailers of electronic equipment.

Employment

Computer, automated teller, and office machine repairers held about 152,900 jobs in 2008. Wholesale trade establishments employed about 29 percent of the workers in this occupation; most of these establishments were wholesalers of professional and commercial equipment and supplies. Many workers also were employed in electronics and appliance stores and office supply stores. Others worked in electronic and precision equipment repair shops and computer systems design firms. About 20 percent of computer, automated teller, and office machine repairers were self-employed.

Job Outlook

Employment is expected to decline slowly. Opportunities will be best for applicants with knowledge of electronics, formal training, and repair experience. Employers increasingly prefer applicants who are certified.

Employment change. Employment of computer, automated teller, and office machine repairers is expected to decline by 4 percent from 2008 to 2018. Less expensive and more reliable computer equipment is expected to result in fewer computer repairers. Nonetheless, some computer repairers will be needed as malfunctions still occur and can cause severe problems for users, most of whom lack the knowledge to make repairs. Additionally, computers are critical to most businesses today and will become even more so as companies increasingly engage in electronic commerce, and as individuals continue to bank, shop, and pay bills online.

Employment growth of ATM repairers will be impeded as a result of newer technology which allows for the testing and re-setting of machines remotely. The relatively slow rate at which new ATMs are installed will also limit demand for ATM repairers, despite a greater reliance on these machines by consumers.

Fewer office machine repairers will be needed as office equipment is often inexpensive and increasingly replaced instead of repaired. However, digital copiers and some newer office machines are more costly and complex. This equipment is often computerized, designed to work on a network, and capable of performing multiple functions. But because this equipment is becoming more reliable, the need for repairers will continue to decline.

Job prospects. Job prospects are expected to be limited as newer equipment continues to require less maintenance and

repair. As a result, the vast majority of job openings will stem from the need to replace workers who retire or leave the occupation for other reasons. Those with knowledge of electronics, certification, formal training, and repair experience will have the best prospects.

A growing number of new ATMs called electronic kiosks offer non-traditional retail services, such as employee information processing and ticket redemption, in addition to banking transactions. Candidates who have expertise in the installation, maintenance, and repair of such equipment will also have better job prospects.

Earnings

Median hourly wages of computer, automated teller, and office machine repairers were \$18.18 in May 2008. The middle 50 percent earned between \$14.17 and \$23.20. The lowest 10 percent earned less than \$11.14, and the highest 10 percent earned more than \$28.41. Median hourly wages in the industries employing the largest numbers of computer, automated teller, and office machine repairers in May 2008 were:

Computer systems design and related services	\$19.87
Professional and commercial equipment and supplies merchant wholesalers	19.12
Office supplies, stationery, and gift stores	17.40
Electronic and precision equipment repair and maintenance	17.03
Electronics and appliance stores	15.67

Electrical and Electronics Installers and Repairers

Significant Points

- Knowledge of electrical equipment and electronics is necessary for employment; employers often prefer applicants with an associate degree in electronics, and professional certification often is required.
- Job opportunities will be best for applicants with an associate degree, certification, or related experience.
- Overall employment is projected to grow more slowly than the average for all occupations.

Nature of the Work

Businesses and other organizations depend on complex electronic equipment for a variety of functions. Industrial controls automatically monitor and direct production processes on the factory floor. Transmitters and antennae provide communication links for many organizations. Electric power companies use electronic equipment to operate and control generating plants, substations, and monitoring equipment. The Federal Government uses radar and missile control systems to provide for the national defense and to direct commercial air traffic. Such complex pieces of electronic equipment are installed, maintained, and repaired by *electrical and electronics installers and repairers*.

Installers and repairers, known as *field technicians*, often travel to factories or other locations to repair equipment. These workers usually have assigned areas in which they perform preventive maintenance on a regular basis. When equipment breaks down, field technicians go to a customer's site to repair the equipment. *Bench technicians* work in repair shops located in factories and service centers, fixing components that cannot be repaired on the factory floor.

Electrical and electronic equipment are two distinct types of industrial equipment, although a great deal of equipment contains both electrical and electronic components. In general, electrical parts provide the power for the equipment, whereas electronic components control the device.

Some industrial electronic equipment is self-monitoring and alerts repairers to malfunctions. When equipment breaks down, repairers will first check for common causes of trouble, such as loose connections or obviously defective components. If routine checks do not locate the trouble, repairers may refer to schematics and manufacturers' specifications that show connections and provide instructions on how to trace problems. Automated

electronic control systems are becoming increasingly complex, making diagnosis more challenging. With these systems, repairers use software programs and testing equipment to diagnose malfunctions. Among their diagnostic tools are multimeters, which measure voltage, current, and resistance, and advanced multimeters, which measure capacitance, inductance, and current gain of transistors. Repairers also use signal generators, which provide test signals, and oscilloscopes, which display signals graphically. Finally, repairers use handtools such as pliers, screwdrivers, soldering irons, and wrenches to replace faulty parts and adjust equipment.

Because repairing components is a complex activity and factories cannot allow production equipment to stand idle, repairers on the factory floor usually remove and replace defective units, such as circuit boards, instead of fixing them. Defective units are discarded or returned to the manufacturer or a specialized shop for repair. Bench technicians at these locations have the training, tools, and parts needed to thoroughly diagnose and repair circuit boards or other complex components. These workers also locate and repair circuit defects, such as poorly soldered joints, blown fuses, or malfunctioning transistors.

Electrical and electronics installers often retrofit older manufacturing equipment with new automated control devices. Older manufacturing machines are frequently in good working order, but are limited by inefficient control systems for which replacement parts are no longer available. As a result, installers sometimes replace old electronic control units with new programming logic controls (PLCs). Setting up and installing a new PLC involves connecting it to different sensors and electrically powered devices (electric motors, switches, and pumps) and writing a computer program to operate the PLC. Electronics installers often coordinate their efforts with those of other workers who are installing and maintaining equipment. (See the section on industrial machinery mechanics and millwrights elsewhere in the *Handbook*.)

Electrical and electronics installers and repairers, transportation equipment install, adjust, or maintain mobile electronic communication equipment, including sound, sonar, security, navigation, and surveillance systems on trains, watercraft, or other vehicles. *Electrical and electronics repairers, power-house, substation, and relay* inspect, test, maintain, or repair electrical equipment used in generating stations, substations, and in-service relays. These workers may be known as power-house electricians, relay technicians, or power transformer repairers. *Electric motor, power tool, and related repairers*—such as armature winders, generator mechanics, and electric golf cart repairers—specialize in installing, maintaining, and repairing electric motors, wiring, or switches.

Electronic equipment installers and repairers, motor vehicles have a significantly different job. They install, diagnose, and repair communication, sound, security, and navigation equipment in motor vehicles. Most installation work involves either new alarm or sound systems. New sound systems vary significantly in cost and complexity of installation. For instance, replacing a head unit (radio) with a new CD player is simple, requiring the removal of a few screws and the connection of a few wires. Installing a new sound system with a subwoofer, amplifier, and fuses is far more complicated. The

Motor vehicle electronic equipment installers and repairers normally work indoors in well-ventilated and well-lighted repair shops.

installer builds a custom fiberglass or wood box designed to hold the subwoofer and to fit inside the unique dimensions of the automobile. Installing sound-deadening material, which often is necessary with more powerful speakers, requires an installer to remove many parts of a car (for example, seats, carpeting, or interiors of doors), add sound-absorbing material in empty spaces, and reinstall the interior parts. The installer also runs new speaker and electrical cables. The new system may require additional fuses, a new electrical line to be run from the battery through a newly drilled hole in the firewall into the interior of the vehicle, or a more powerful alternator or battery. Motor vehicle installers and repairers work with an increasingly complex range of electronic equipment, including DVD players, satellite navigation equipment, passive security systems, and active security systems.

Work environment. Many electrical and electronics installers and repairers work on factory floors, where they are subject to noise, dirt, vibration, and heat. Bench technicians primarily work in repair shops, where the surroundings are reasonably quiet, comfortable, and well lighted.

Installers and repairers may have to do heavy lifting and work in a variety of positions. They must follow safety guidelines and often wear protective goggles and hardhats. When working on ladders or on elevated equipment, repairers must wear harnesses to avoid falls. Before repairing a piece of machinery, these workers must follow procedures to ensure that others cannot start the equipment during the repair process. They also must take precautions against electric shock by locking off power to the unit under repair.

Motor vehicle electronic equipment installers and repairers normally work indoors in well-ventilated and well-lighted repair shops. Minor cuts and bruises are common, but serious accidents usually are avoided when safety practices are observed.

Training, Other Qualifications, and Advancement

Applicants with an associate degree in electronics are preferred, and professional certification often is required.

Education and training. Knowledge of electrical equipment and electronics is necessary for employment. Employers

often prefer applicants with an associate degree from a community college or technical school, although a high school diploma may be sufficient for some jobs. Entry-level repairers may begin by working with experienced technicians who provide technical guidance, and work independently only after developing the necessary skills.

Other qualifications. Installers and repairers should have good eyesight and color perception to work with the intricate components used in electronic equipment. Field technicians work closely with customers and should have good communication skills and a neat appearance. Employers also may require that field technicians have a driver's license.

Certification and advancement. Various organizations offer certification. For instance, the Electronics Technicians Association (ETA) offers over 50 certification programs in numerous electronics specialties for varying levels of competence. The International Society of Certified Electronics Technicians also offers certification for several levels of competence, focusing on a broad range of topics, including basic electronics, electronic systems, and appliance service. To become certified, applicants must meet several prerequisites and pass a comprehensive written or online examination. Certification demonstrates a level of competency and can make an applicant more attractive to employers, as well as increase one's opportunities for advancement.

Experienced repairers with advanced training may become specialists or troubleshooters who assist other repairers diagnose difficult problems. Workers with leadership skills may become supervisors of other repairers. Some experienced workers open their own repair shops.

Employment

Electrical and electronics installers and repairers held about 160,900 jobs in 2008. The following tabulation breaks down their employment by occupational specialty:

Electrical and electronics installers and repairers, commercial and industrial equipment	78,000
Electric motor, power tool, and related repairers	23,700
Electrical and electronics repairers, powerhouse, substation, and relay	23,400
Electrical equipment installers and repairers, motor vehicles	19,700
Electrical and electronics installers and repairers, transportation equipment.....	16,100

Many repairers worked for repair and maintenance establishments.

Job Outlook

Overall employment is expected to grow more slowly than the average through the year 2018. Job prospects should be best for applicants with an associate degree, certification, and related experience.

Employment change. Overall employment of electrical and electronics installers and repairers is expected to grow by 5 percent through the year 2018, which is slower than the average for all occupations. Growth rates, however, will vary by occupational specialty.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Electrical and electronics installers and repairers	-	160,900	168,400	7,500	5
Electric motor, power tool, and related repairers	49-2092	23,700	24,900	1,200	5
Electrical and electronics installers and repairers, transportation equipment	49-2093	16,100	16,700	700	4
Electrical and electronics repairers, commercial and industrial equipment.....	49-2094	78,000	81,000	2,900	4
Electrical and electronics repairers, powerhouse, substation, and relay.....	49-2095	23,400	26,100	2,700	12
Electronic equipment installers and repairers, motor vehicles	49-2096	19,700	19,700	0	0

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Employment of electrical and electronics installers and repairers of commercial and industrial equipment is expected to grow 4 percent, which is slower than the average for all occupations. As equipment becomes more sophisticated, businesses will strive to lower costs by increasing and improving automation. Companies will install electronic controls, robots, sensors, and other equipment to automate processes such as assembly and testing. Improved reliability of equipment, however, may constrain employment growth of installers; on the other hand, companies will increasingly rely on repairers because malfunctions that idle commercial and industrial equipment will continue to be costly.

Little or no employment change is expected for motor vehicle electronic equipment installers and repairers. As motor vehicle manufacturers install more and better sound, security, entertainment, and navigation systems in new vehicles, and as newer electronic systems require progressively less maintenance, employment growth for aftermarket electronic equipment installers will be limited.

Employment of electric motor, power tool, and related repairers is expected to grow 5 percent, which is slower than the average for all occupations. Retrofitting electrical generators in public buildings to reduce emissions and energy consumption will spur some employment growth. However, improvements in electrical and electronic equipment design, as well as the increased use of disposable tool parts should suppress job growth.

Employment of electrical and electronic installers and repairers of transportation equipment is expected to grow 4 percent, which is slower than the average for all occupations. Declining employment in the rail transportation industry will dampen growth in this occupational specialty.

Employment of electrical and electronics installers and repairers, powerhouse, substation, and relay is also expected to grow 12 percent, about as fast as the average for all occupations. While privatization in utilities industries should improve productivity and hinder employment growth, installation of newer, energy efficient green technologies will spur demand for employment.

Job prospects. Job opportunities should be best for applicants with an associate degree in electronics, certification, and related experience. In addition to employment growth, the need to replace workers who transfer to other occupations or leave the labor force will result in some job openings.

Earnings

Median hourly wages of electrical and electronics repairers, commercial and industrial equipment were \$23.29 in May 2008. The middle 50 percent earned between \$18.40 and \$28.73. The lowest 10 percent earned less than \$14.39, and the highest 10 percent earned more than \$33.81. In May 2008, median hourly wages were \$25.31 in the Federal Government and \$22.46 in building equipment contractors, the industries employing the largest numbers of electrical and electronics repairers, commercial and industrial equipment.

Median hourly wages of electric motor, power tool, and related repairers were \$16.96 in May 2008. The middle 50 percent earned between \$13.48 and \$21.57. The lowest 10 percent earned less than \$10.47, and the highest 10 percent earned more than \$26.40. In May 2008, median hourly wages were \$16.57 in commercial and industrial machinery and equipment (except automotive and electronic) repair, the industry employing the largest number of electronic motor, power tool, and related repairers.

Median hourly wages of electrical and electronics repairers, powerhouse, substation, and relay were \$29.34 in May 2008. The middle 50 percent earned between \$25.68 and \$33.72. The lowest 10 percent earned less than \$20.91, and the highest 10 percent earned more than \$38.43. In May 2008, median hourly wages were \$29.66 in electric power generation, transmission, and distribution, the industry employing the largest number of these repairers.

Median hourly wages of electronics installers and repairers, motor vehicles were \$13.29 in May 2008. The middle 50 percent earned between \$10.79 and \$16.89. The lowest 10 percent earned less than \$8.85, and the highest 10 percent earned more than \$21.07.

Median hourly wages of electrical and electronics repairers, transportation equipment were \$21.37 in May 2008. The middle 50 percent earned between \$16.86 and \$25.73. The lowest 10 percent earned less than \$13.42, and the highest 10 percent earned more than \$30.32.

Electronic Home Entertainment Equipment Installers and Repairers

Significant Points

- Employers increasingly prefer applicants who are certified.
- Job opportunities will be best for applicants with knowledge of electronics, related hands-on experience, and good customer service skills.
- Employment is expected to grow as fast as average, due in large part to the rising sales of home entertainment equipment.

Nature of the Work

Electronic home entertainment equipment installers and repairers—also called *service technicians*—repair a variety of audio and video equipment. They may specialize in one type of product, or may be trained in many different ones. The most common products include televisions and radios, stereo components, digital video disc players, and video cameras. They also install and repair satellite television dishes and home theater systems, which consist of large-screen televisions and sophisticated surround-sound audio components.

Customers usually bring small, portable equipment to repair shops for servicing. Repairers at these locations, known as *bench technicians*, are equipped with a full array of electronic tools and parts. When larger, less mobile equipment breaks down, customers may pay repairers to come to their homes.

These repairers, known as *field technicians*, travel with a limited set of tools and parts, and attempt to complete the repair at the customer's location. If the job is complex, technicians may bring defective components back to the shop for diagnosis and repair.

When equipment breaks down, repairers check for defective components. If routine checks fail to locate the trouble, repairers may refer to schematics and manufacturers' specifications that provide instructions on how to locate problems. Repairers may also use a variety of test equipment to diagnose and identify malfunctions. For example, multimeters detect short circuits, failed capacitors, and blown fuses by measuring voltage, current, and resistance. Color-bar and dot generators provide onscreen test patterns, and oscilloscopes and digital storage scopes measure complex waveforms produced by electronic equipment. Repairs may involve removing and replacing a failed transistor or fuse, often with hand tools, such as pliers, screwdrivers, soldering irons, and wrenches. Repairers also make adjustments to equipment, such as fine tuning the picture quality of a television set or the sound on a surround-sound system.

Improvements in technology have miniaturized and digitized many audio and video recording devices. Miniaturization has made repair work significantly more difficult because both the components and the acceptable tolerances are smaller. Also, components now are mounted on the surface of circuit boards, instead of plugged into slots, requiring more precise soldering when a new part is installed. Improved technologies have lowered the price of electronic home entertainment equipment to the point where customers often replace broken equipment instead of repairing it.

Work environment. Most repairers work in well-lit electrical repair shops. Field technicians, however, spend much time traveling in service vehicles and working in customers' residences.

Repairers may have to work in a variety of positions and carry heavy equipment. Although the work of repairers is comparatively safe, they must take precautions against minor burns and electric shock. Because television monitors carry high voltage even when they are turned off, repairers need to discharge the voltage before servicing such equipment.

When equipment breaks down, electronic home entertainment equipment installers and repairers check for defective components.

Training, Other Qualifications, and Advancement

Employers prefer applicants who have knowledge of electronics, good problem-solving skills, and previous repair experience. Good customer service skills are essential for field technicians, as they spend a majority of their time working in customers’ homes. Certification is available for entry-level workers and experienced workers seeking advancement.

Education and training. Employers prefer applicants who have knowledge and skills in electronics as well as previous repair experience. Many applicants gain these skills at vocational training programs and community colleges. Training programs should include both hands-on experience and theoretical education in digital consumer electronics. Entry-level repairers may work closely with more experienced technicians, who provide technical guidance.

Other qualifications. Field technicians work closely with customers and must have good communication skills and a neat appearance. Repairers also must have good problem solving skills, as their main duty is to diagnose and solve problems. For home entertainment system installers, excellent vision and a keen sense of sound are important for fine-tuning the installed product. Employers usually require that field technicians have a driver’s license.

Certification and advancement. A growing number of employers require applicants to be certified. Various organizations offer certification for electronic home entertainment equipment installers and repairers. For instance, the Electronics Technicians Association (ETA) offers certification programs in numerous electronics specialties, including Residential Electronics Systems Integrator. The International Society of Certified Electronics Technicians also offers certification in multimedia systems and electronic systems. To become certified, applicants must meet several prerequisites and pass a comprehensive written or online examination. Certification demonstrates a level of competency. It can make an applicant more attractive to employers or increase an employee’s opportunities for advancement. Experienced repairers with advanced training may become specialists or troubleshooters, helping other repairers to diagnose difficult problems. Workers with leadership ability may become supervisors of other repairers. Some experienced workers open their own repair shops.

Employment

Electronic home entertainment equipment installers and repairers held about 51,200 jobs in 2008. Many repairers—about 33 percent—worked in the retail trade industry. About 26 percent of electronic home entertainment equipment installers and repairers were self-employed.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Electronic home entertainment equipment installers and repairers	49-2097	51,200	56,800	5,500	11

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Job Outlook

Employment is expected to increase about as fast as average for all occupations. Job prospects will be best for applicants with certification, knowledge of electronics, related work experience, and good customer service skills.

Employment change. Employment of electronic home entertainment equipment installers and repairers is expected to grow by 11 percent from 2008 to 2018, which is as fast as the average for all occupations. Demand will be driven by the rising sales of home entertainment equipment.

Employment growth of home entertainment installers will be driven by consumer demand for sophisticated digital equipment, such as high definition televisions, video recorders, cameras, and camcorders. Home entertainment systems continue to grow in popularity and consumers’ desire for state-of-the-art sound and picture quality will further spur the need for installers.

The need for repairers, however, is expected to grow slowly because home entertainment equipment is less expensive than in the past. As technological developments have lowered the price and improved the reliability of equipment, the demand for repair services has decreased. When a malfunction does occur, it is often cheaper for consumers to replace equipment than to pay for repairs.

Job prospects. Job openings will arise from employment growth and from the need to replace workers who retire or who leave the occupation. Opportunities will be best for applicants with certification, knowledge of electronics, related hands-on experience, and good customer-service skills.

Earnings

Median hourly wages of wage-and-salary electronic home entertainment equipment installers and repairers were \$15.42 in May 2008. The middle 50 percent earned between \$12.09 and \$19.64. The lowest 10 percent earned less than \$9.90, and the highest 10 percent earned more than \$24.13. In May 2008, median hourly wages of electronic home entertainment equipment installers and repairers in electrical and electronic goods merchant wholesalers were \$17.19, and \$16.17 in building equipment contractors.

Radio and Telecommunications Equipment Installers and Repairers

Significant Points

- Little or no change in employment is projected.
- Job opportunities vary by specialty; good opportunities are expected for central office installers and repairers, but station installers and repairers can expect keen competition.
- Applicants with computer skills and postsecondary electronics training should have the best opportunities.
- Repairers may be on-call around the clock in case of emergencies; therefore, night, weekend, and holiday hours are common.

Nature of the Work

Telephones, computers, and radios depend on a variety of equipment to transmit communications signals and connect to the Internet. From electronic and optical switches that route telephone calls and packets of data to their destinations to radio transmitters and receivers that relay signals from radios in airplanes, boats, and emergency vehicles, complex equipment is needed to keep the country communicating. The workers who set up and maintain this sophisticated equipment are called radio and telecommunications equipment installers and repairers.

Telecommunications equipment installers and repairers have a range of skills and abilities, which vary by the type of work they do and where it is performed. Most work indoors. (Equipment installers who work mainly outdoors are classified as telecommunications line installers and repairers—a separate occupation discussed elsewhere in the *Handbook*.)

Central office installers and repairers—telecommunications equipment installers and repairers who work at switching hubs called central offices—do some of the most complex work. Switching hubs contain the switches and routers that direct packets of information to their destinations. Installers and repairers set up those switches and routers, as well as cables and other equipment.

Although most telephone lines connecting houses to central offices and switching stations are still copper, the lines connecting central hubs to each other are fiber optic. Fiber optic lines,

along with newer packet switching equipment, have greatly increased the transmission capacity of each line, allowing an ever increasing amount of information to pass through the lines. Switches and routers are used to transmit, process, amplify, and direct a massive amount of information. Installing and maintaining this equipment requires a high level of technical knowledge.

Nonetheless, the increasing reliability of switches and routers has simplified maintenance as new self-monitoring telecommunications switches can now alert central office repairers to malfunctions. Some switches allow repairers to diagnose and correct problems from remote locations. When faced with a malfunction, the repairer may refer to manufacturers' manuals that provide maintenance instructions.

As cable television and telecommunications technology converge, the equipment used in both technologies is becoming more similar. The distribution centers for cable television companies, which are similar to central offices in the telecommunications sector, are called headends. *Headend technicians* perform essentially the same work as central office technicians, but they work in the cable television industry.

When problems with telecommunications equipment arise, telecommunications equipment repairers diagnose the source of the problem by testing each part of the equipment—a process that requires understanding how the software and hardware interact. To locate the problem, repairers often use spectrum analyzers, network analyzers, or both, to detect any distortion in the signal. To fix the equipment, repairers may use small hand tools, including pliers and screwdrivers, to remove and replace defective components such as circuit boards or wiring. Newer equipment is easier to repair because whole boards and parts are designed to be quickly removed and replaced. Repairers also may install updated software or programs that maintain existing software.

Another type of telecommunications installer and repairer, *PBX installers and repairers*, set up private branch exchange (PBX) switchboards, which relay incoming, outgoing, and interoffice telephone calls within a single location or organization. To install switches and switchboards, installers first connect the equipment to power lines and communications cables and install frames and supports. They test the connections to ensure that adequate power is available and that the communication links work properly. They also install equipment such as power systems, alarms, and telephone sets. New switches and switchboards are computerized and workers often need to install software or program the equipment to provide specific features. Finally, the installer performs tests to verify that the newly installed equipment functions properly. If a problem arises, PBX repairers determine whether it is located within the PBX system or whether it stems from the telephone lines maintained by the local telephone company. Newer installations may use voice-over Internet protocol (VoIP) systems—systems that operate like PBX, but they use a company's computer wiring to run Internet access, network applications, and telephone communications.

Station installers and repairers, telephone—commonly known as *home installers and repairers* or *telecommunications service technicians*—install and repair telecommunications wiring and equipment in customers' home or business premises. They install telephone, VoIP, Internet, and other communications services by installing wiring inside the home or connecting existing wiring to outside service lines. Depending on the service required, they

may set up television capability or connect modems and install software on a customer's computer. To complete the connection to an outside service line, the installer may need to climb telephone poles or ladders and test the line. Later on, if a maintenance problem occurs, station repairers test the customer's lines to determine if the problem is located in the customer's premises or in the outside service lines and attempt to fix the problem if it is inside. If the problem is with the outside service lines, telecommunications line repairers usually are called to fix it.

Radio mechanics install and maintain radio transmitting and receiving equipment, excluding cellular communications systems. This includes stationary equipment mounted on transmission towers or tall buildings and mobile equipment, such as two-way radio communications systems in taxis, airplanes, ships, and emergency vehicles. Aviation and marine radio mechanics also may work on other electronic equipment, in addition to radios. Newer radio equipment is self-monitoring and may alert mechanics to potential malfunctions. When malfunctions occur, these mechanics examine equipment for damaged components and either fix them, replace the part, or make a software modification. They may use electrical measuring instruments to monitor signal strength, transmission capacity, interference, and signal delay, as well as hand tools to replace defective components and adjust equipment so that it performs within required specifications.

Work environment. Radio and telecommunications equipment installers and repairers generally work in clean, well-lighted, air-conditioned surroundings, such as a telecommunications company's central office, a customer's location, or an electronic service center. Traveling to the site of the installation or repair is common among station installers and repairers, PBX and VoIP installers and repairers, and radio mechanics. Installation may require access to rooftops, attics, ladders, and telephone poles to complete the repair. Radio mechanics may need to work on transmission towers, which may be located on top of tall buildings or mountains, as well as aboard airplanes and ships.

The work of most repairers involves lifting, reaching, stooping, crouching, and crawling. Adherence to safety precautions is important in order to guard against work hazards. These hazards include falls, minor burns, and electrical shock. Data from the U.S. Bureau of Labor Statistics show that telecommunications equipment installers and repairers, except line installers, experienced a work-related injury and illness rate that was higher than the national average.

Nearly all radio and telecommunications equipment installers and repairers work full time during regular business hours to meet the demand for repair services during the workday. Schedules are more irregular at employers that provide repair services 24 hours a day, such as for police radio communications operations or where installation and maintenance must take place after normal business hours. At these locations, mechanics work a variety of shifts, including weekend and holiday hours. Repairers may be on call around the clock, in case of emergencies, and may have to work overtime.

Training, Other Qualifications, and Advancement

Postsecondary education in electronics and computer technology is increasingly required for radio and telecommunications equipment installers and repairer jobs, and a few employers even prefer people with a bachelor's degree for some of the most complex types of work.

Education and training. As telecommunications technology becomes more complex, the education required for radio and telecommunications equipment installers and repairer jobs has increased. Most employers prefer applicants with postsecondary training in electronics and familiarity with computers. The education needed for these jobs may vary from certification to a 2- or 4-year degree in electronics or a related subject. Sources of training include 2- and 4-year college programs in electronics or communications technology, military experience in radios and electronics, trade schools, and programs offered by equipment and software manufacturers. Educational requirements are higher for central office installers and repairers and for those working in nonresidential settings.

Many in the telecommunications industry work their way up into this occupation by gaining experience at less difficult jobs. Experience as a telecommunications line installer or station installer is helpful before moving up to the job of central office installer and other more complex jobs, for example. Military experience with communications equipment is also valued by many employers in both telecommunications and radio repair.

Newly hired repairers usually receive some training from their employers. This may include formal classroom training in electronics, communications systems, or software and informal hands-on training assisting an experienced repairer. Large companies may send repairers to outside training sessions to learn about new equipment and service procedures. As networks have become more sophisticated—often including equipment from a variety of companies—the knowledge needed for installation and maintenance also has increased.

Licensure. Aviation and marine radio mechanics are required to have a license from the Federal Communications

Radio and telecommunications equipment installers often use computers to diagnose problems with telecommunications switching equipment.

Commission before they can work on these types of radios. This requires passing several exams on radio law, electronics fundamentals, and maintenance practices.

Other qualifications. Familiarity with computers, being mechanically inclined, and being able to solve problems are traits that are highly regarded by employers. Repairers must also be able to distinguish colors, because wires are typically color-coded. For positions that require climbing poles and towers, workers must be in good physical shape and not afraid of heights. Repairers who handle assignments alone at a customer's site must be able to work without close supervision. For workers who frequently contact customers, a pleasant personality, neat appearance, and good communications skills also are important.

Certification and advancement. This is an occupation where the technology is changing rapidly. Workers must keep abreast of the latest equipment available and know how to repair it. Telecommunications equipment installers and repairers often need to be certified to perform certain tasks or to work on specific equipment. Certification usually requires taking classes. Some certifications are needed to enter the occupation; others are meant to improve one's current abilities or to advance in the occupation.

The Society of Cable and Telecommunications Engineers and the Telecommunications Industry Association offer certifications to workers in this field. Telecommunications equipment manufacturers also provide training on specific equipment.

Experienced repairers with advanced training may become specialists or troubleshooters who help other repairers diagnose difficult problems, or may work with engineers in designing equipment and developing maintenance procedures. Home installers may advance to wiring computer networks or working as a central office installer and repairer. Because of their familiarity with equipment, repairers are particularly well qualified to become manufacturers' sales workers. Workers with leadership ability also may become maintenance supervisors or service managers. Some experienced workers open their own repair service shops, or become wholesalers or retailers of electronic equipment.

Employment

Radio and telecommunications equipment installers and repairers held about 208,800 jobs in 2008. About 203,100 were telecommunications equipment installers and repairers, except line installers. The remaining 5,700 were radio mechanics.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Radio and telecommunications equipment installers and repairers	49-2020	208,800	208,100	-700	0
Radio mechanics	49-2021	5,700	5,500	-200	-4
Telecommunications equipment installers and repairers, except line installers	49-2022	203,100	202,600	-500	0

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Telecommunications equipment installers and repairers work mostly in the telecommunications industry. Increasingly, however, they can be found in the construction industry working as contractors to the telecommunications industry.

Radio mechanics work in the electronic and precision equipment repair and maintenance industry, the telecommunications industry, electronics and appliance stores, government, and other industries.

Job Outlook

Little or no change in employment of radio and telecommunications equipment installers and repairers is projected. Job opportunities vary by specialty; good opportunities are expected for central office installers and repairers, but station installers and repairers can expect keen competition. Job prospects are best for those with computer skills and postsecondary training in electronics.

Employment change. Little or no change in employment of radio and telecommunications equipment installers and repairers is expected during the 2008-18 period. Over the next decade, telecommunications companies will provide faster Internet connections, provide video-on-demand, add hundreds of television stations, and many services that haven't even been invented yet. Although building the new networks required to provide these services will create jobs, these gains will be offset by a decline in maintenance work. The new equipment requires much less maintenance work because it is newer, more reliable, easier to repair, and more resistant to damage from the elements.

The increased reliability of radio equipment and the use of self-monitoring systems also will continue to lessen the need for radio mechanics. However, technological changes are also creating new wireless applications that create jobs for radio mechanics.

Job prospects. Applicants with computer skills and postsecondary training in electronics should have the best opportunities for radio and telecommunications equipment installer and repairer jobs, but opportunities will vary by specialty. Good opportunities should be available for central office and PBX installers and repairers experienced in current technology, as the growing popularity of VoIP, expanded multimedia offerings such as video on demand, and other telecommunications services continue to place additional demand on telecommunications networks. These new services require high data transfer rates, which can be achieved only by installing new optical switching and routing equipment. Extending high-speed communications from central offices to customers also will require telecommunications equipment installers to put in place more advanced switching and routing equipment,

but opportunities for repairers will be limited by the increased reliability and automation of the new switching equipment.

Station installers and repairers can expect keen competition. Prewired buildings and the increasing reliability of telephone equipment will reduce the need for installation and maintenance of customers' telephones, as will the declining number of pay telephones in operation as use of cellular telephones grows. However, some of these losses should be offset by the need to upgrade internal lines in businesses and the wiring of new homes and businesses with fiber optic lines.

Radio mechanics should find good opportunities if they have a strong background in electronics and an ability to work independently. Increasing competition from cellular services is limiting the growth of radio services, but employers report difficulty finding adequate numbers of qualified radio mechanics to perform repair work.

Earnings

In May 2008, median annual wages of telecommunications equipment installers and repairers, except line installers, were \$55,600. The middle 50 percent earned between \$42,930 and \$63,030. The bottom 10 percent earned less than \$31,330, whereas the top 10 percent earned more than \$69,470. Median annual wages of these workers in the wired telecommunications carriers industry were \$57,160 in May 2008.

Median annual wages of radio mechanics in May 2008 were \$40,260. The middle 50 percent earned between \$30,680 and \$51,560. The bottom 10 percent earned less than \$24,610, whereas the top 10 percent earned more than \$63,600.

About 32 percent of radio and telecommunication equipment installers and repairers are members of unions, such as the Communications Workers of America (CWA) and the International Brotherhood of Electrical Workers (IBEW.)

Telecommunications equipment installers and repairers employed by large telecommunications companies who also belong to unions often have very good benefits, including health, dental, vision, and life insurance. They also usually have good retirement and leave policies. Those working for small independent companies and contractors may get fewer benefits.

Radio mechanics tend to work for small electronics firms or government. Benefits vary widely depending upon the type of work and size of firm. Government jobs usually have good benefits.

Related Occupations

Vehicle and Mobile Equipment Mechanics, Installers, and Repairers

Aircraft and Avionics Equipment Mechanics and Service Technicians

Significant Points

- Most workers learn their jobs in 1 of about 170 schools certified by the Federal Aviation Administration (FAA).
- Job opportunities should be favorable for persons who have completed an aircraft mechanic training program, but keen competition is likely for jobs at major airlines, which offer the best pay and benefits.
- Job opportunities are likely to continue to be best at small commuter and regional airlines, at FAA repair stations, and in general aviation.

Nature of the Work

Today's airplanes are highly complex machines with parts that must function within extreme tolerances for them to operate safely. To keep aircraft in peak operating condition, *aircraft and avionics equipment mechanics and service technicians* perform scheduled maintenance, make repairs, and complete inspections required by the FAA.

Many aircraft mechanics specialize in preventive maintenance. They inspect aircraft engines, landing gear, instruments, pressurized sections, accessories—brakes, valves, pumps, and air-conditioning systems, for example—and other parts of the aircraft, and do the necessary maintenance and replacement of parts. They also keep records related to the maintenance performed on the aircraft. Mechanics and technicians conduct inspections following a schedule based on the number of hours the aircraft has flown, calendar days since the last inspection, cycles of operation, or a combination of these factors. In large, sophisticated planes equipped with aircraft monitoring systems, mechanics can gather valuable diagnostic information from electronic boxes and consoles that monitor the aircraft's basic operations. In planes of all sorts, aircraft mechanics examine engines by working through specially designed openings while standing on ladders or scaffolds or by using hoists or lifts to remove the entire engine from the craft. After taking an engine apart, mechanics use precision instruments to measure parts for wear and use x-ray and magnetic inspection equipment to check for invisible cracks. They repair or replace worn or defective parts. Mechanics also may repair sheet metal or composite surfaces; measure the tension of control cables; and check for corrosion, distortion, and cracks in the fuselage, wings, and tail. After completing all repairs, they must test the equipment to ensure that it works properly.

Other mechanics specialize in repair work rather than inspection. They find and fix problems that pilots describe. For example, during a preflight check, a pilot may discover that the aircraft's

fuel gauge does not work. To solve the problem, mechanics may troubleshoot the electrical system, using electrical test equipment to make sure that no wires are broken or shorted out, and replace any defective electrical or electronic components. Mechanics work as fast as safety permits so that the aircraft can be put back into service quickly.

Some mechanics work on one or many different types of aircraft, such as jets, propeller-driven airplanes, and helicopters. Others specialize in one section of a particular type of aircraft, such as the engine, hydraulics, or electrical system. In small, independent repair shops, mechanics usually inspect and repair many different types of aircraft.

Airframe mechanics are authorized to work on any part of the aircraft except the instruments, power plants, and propellers. *Powerplant mechanics* are authorized to work on engines and do limited work on propellers. Combination airframe-and-powerplant mechanics—called *A&P mechanics*—work on all parts of the plane except the instruments. Most mechanics working on civilian aircraft today are A&P mechanics.

Avionics systems—components used for aircraft navigation and radio communications, weather radar systems, and other instruments and computers that control flight, engine, and other primary functions—are now an integral part of aircraft design and have vastly increased aircraft capability. *Avionics technicians* repair and maintain these systems. Because of the increasing use of technology, more time is spent repairing electronic systems, such as computerized controls. Technicians also may be required to analyze and develop solutions to complex electronic problems.

Work environment. Mechanics work in hangars, repair stations, or out on the airfield on the “flight lines” where aircraft park. Mechanics often work under time pressure to maintain flight schedules or, in general aviation, to keep from inconveniencing customers. At the same time, mechanics have a tre-

Avionics technicians are responsible for repairing an aircraft's electronics systems.

mendous responsibility to maintain safety standards, and this can cause the job to be stressful.

Frequently, mechanics must lift or pull objects weighing more than 70 pounds. They often stand, lie, or kneel in awkward positions and occasionally must work in precarious positions, such as on scaffolds or ladders. Noise and vibration are common when engines are being tested, so ear protection is necessary. According to BLS data, full-time aircraft mechanics and service technicians experienced a higher than average work-related injury and illness rate. Aircraft mechanics usually work 40 hours a week on 8-hour shifts around the clock. Overtime and weekend work is frequent.

Training, Other Qualifications, and Advancement

Most mechanics who work on civilian aircraft are certified by the FAA, which requires mechanics to be at least 18 years of age, fluent in English, and have a high school diploma or its equivalent in addition to having the needed technical skills. Most mechanics learn their skills in an FAA-certified Aviation Maintenance Technician School

Education and training. Although a few people become mechanics through on-the-job training, most learn the skills needed to do their jobs in 1 of about 170 Aviation Maintenance Technician schools certified by the FAA. By law, FAA standards require that certified mechanic schools offer students a minimum of 1,900 class-hours. Coursework in schools normally lasts from 12 to 24 months and provides training with the tools and equipment used on the job. About one-third of these schools award 2-year and 4-year degrees in avionics, aviation technology, or aviation maintenance management.

Aircraft trade schools are placing more emphasis on technologies such as turbine engines, composite materials, and aviation electronics, which are increasingly being used in the construction of new aircraft. Technological advances have also affected aircraft maintenance, meaning mechanics must have an especially strong background in computers and electronics to get or keep jobs in this field.

Courses in mathematics, physics, chemistry, electronics, computer science, and mechanical drawing are helpful because they demonstrate many of the principles involved in the operation of aircraft, and knowledge of these principles is often necessary to make repairs. Courses that develop writing skills also are important because mechanics are often required to submit reports. Mechanics must be able to read, write, and understand English.

A few mechanics are trained on the job by experienced mechanics. Their work must be supervised and documented by certified mechanics until they have FAA certificates.

Licensure. The FAA requires that all maintenance work on aircraft be performed by certified mechanics or under the supervision of a certified mechanic. As a result, most airlines hire mechanics that have FAA certification. The FAA offers certification for airframe mechanics and powerplant mechanics, although most airlines prefer to hire mechanics with a combined A&P certificate.

Mechanics need at least 18 months of work experience before applying for an airframe or powerplant certificate, and 30 months of experience working with both engines and air-

frames for a combined A&P certificate, although completion of a program at an FAA-certified school can be substituted for these work experience requirements.

In addition to having experience or formal training, applicants for all certificates must pass written, oral, and practical tests that demonstrate that they can do the work authorized by the certificate. Written tests are administered at one of the many designated computer testing facilities worldwide, while the oral and practical tests are administered by a Designated Mechanic Examiner of the FAA. All tests must be passed within a 24-month period to receive certification.

FAA regulations require current work experience to keep certificates valid. Applicants must have at least 1,000 hours of work experience in the previous 24 months or take a refresher course. Mechanics also must take at least 16 hours of training every 24 months to keep their certificates current. Many mechanics take training courses offered by manufacturers or employers, usually through outside contractors.

The FAA allows certified airframe mechanics who are trained and qualified and who have the proper tools to work on avionics equipment. However, avionics technicians are not required to have FAA certification if they have avionics repair experience from the military or from working for avionics manufacturers. Avionics technicians who work on communications equipment must obtain a restricted radio-telephone operator license from the Federal Communications Commission.

Other qualifications. Aircraft mechanics must do careful and thorough work that requires a high degree of mechanical aptitude. Employers seek applicants who are self-motivated, hard-working, enthusiastic, and able to diagnose and solve complex mechanical problems. Additionally, employers prefer mechanics who can perform a variety of tasks. Agility is important for the reaching and climbing necessary to do the job. Because they may work on the tops of wings and fuselages on large jet planes, aircraft mechanics must not be afraid of heights.

Advances in computer technology, aircraft systems, and the materials used to manufacture airplanes have made mechanics' jobs more highly technical. Aircraft mechanics must possess the skills necessary to troubleshoot and diagnose complex aircraft systems. They also must continually update their skills with and knowledge of new technology and advances in aircraft technology.

Some aircraft mechanics in the Armed Forces acquire enough general experience to satisfy the work experience requirements for the FAA certificate. With additional study, they may pass the certifying exam. In general, however, jobs in the military services are too specialized to provide the broad experience required by the FAA. Most Armed Forces mechanics have to complete the entire FAA training program, although a few receive some credit for the material they learned in the service. In any case, military experience is a great advantage when seeking employment; employers consider applicants with formal training to be the most desirable applicants.

Advancement. As aircraft mechanics gain experience, they may advance to lead mechanic (or crew chief), inspector, lead inspector, or shop supervisor positions. Opportunities are best for those who have an aircraft inspector's authorization. To obtain an

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Aircraft and avionics equipment mechanics and service technicians	—	140,300	150,100	9,800	7
Avionics technicians	49-2091	18,800	20,800	2,000	11
Aircraft mechanics and service technicians	49-3011	121,500	129,300	7,800	6

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

inspector's authorization, a mechanic must have held an A&P certificate for at least 3 years, with 24 months of hands-on experience.

In the airlines, where promotion often is determined by examination, supervisors sometimes advance to executive positions. Those with broad experience in maintenance and overhaul might become inspectors with the FAA. With additional business and management training, some open their own aircraft maintenance facilities. Mechanics with the necessary pilot licenses and flying experience may take the FAA examination for the position of flight engineer, with opportunities to become pilots.

Mechanics and technicians learn many different skills in their training that can be applied to other jobs, and some transfer to other skilled repairer occupations or electronics technician jobs. For example, some avionics technicians continue their education and become aviation engineers, electrical engineers (specializing in circuit design and testing), or communication engineers. Others become repair consultants, in-house electronics designers, or join research groups that test and develop products.

Employment

Aircraft and avionics equipment mechanics and service technicians held about 140,300 jobs in 2008; about 87 percent of these workers were aircraft mechanics and service technicians; the rest were avionics technicians.

Employment of aircraft and avionics equipment mechanics and service technicians primarily is concentrated in a small number of industries. Almost half of aircraft and avionics equipment mechanics and service technicians worked in air transportation and support activities for air transportation. About 21 percent worked in aerospace product and parts manufacturing and about 15 percent worked for the Federal Government. Most of the rest worked for companies that operate their own planes to transport executives and cargo.

Most airline mechanics and service technicians work at major airports near large cities. Civilian mechanics employed by the U.S. Armed Forces work at military installations.

Job Outlook

Job growth for aircraft and avionics equipment mechanics and service technicians is expected to be about as fast as the average for all occupations. Job opportunities should be favorable for people who have completed an aircraft mechanic training program, but keen competition is likely for jobs at major airlines.

Employment change. Employment is expected to increase by 7 percent during the 2008-18 period, which is about as fast as the average for all occupations. Passenger air traffic is expected to increase as the result of an expanding economy and

a growing population, and the need for aircraft mechanics and service technicians will grow accordingly. Although there is an increasing trend for some large airlines to outsource aircraft and avionics equipment mechanic jobs overseas, most airline companies still prefer that aircraft maintenance be performed in the U.S. because overseas contractors may not comply with more stringent U.S. safety regulations.

Job prospects. Most job openings for aircraft mechanics through the year 2018 will stem from the need to replace the many mechanics expected to retire over the next decade. In addition, some mechanics will leave to work in related fields, such as automobile repair, as their skills are largely transferable to other maintenance and repair occupations.

Also contributing to favorable future job opportunities for mechanics is the long-term trend toward fewer students entering technical schools to learn skilled maintenance and repair trades. Many of the students who have the ability and aptitude to work on planes are choosing to go to college, work in computer-related fields, or go into other repair and maintenance occupations with better working conditions. If this trend continues, the supply of trained aviation mechanics may not keep up with the needs of the air transportation industry.

Job opportunities will continue to be the best at small commuter and regional airlines, at FAA repair stations, and in general aviation. Commuter and regional airlines is the fastest growing segment of the air transportation industry, but wages in these airlines tend to be lower than those in the major airlines, so they attract fewer job applicants. Also, some jobs will become available as experienced mechanics leave for higher paying jobs with the major airlines or transfer to other occupations. Mechanics will face more competition for jobs with large airlines because the high wages and travel benefits that these jobs offer generally attract more qualified applicants than there are openings.

Nonetheless, job opportunities with the airlines are expected to be better than they have been in the past. In general, prospects will be best for applicants with experience and an A&P certification. Mechanics who keep abreast of technological advances in electronics, composite materials, and other areas will be in greatest demand. Also, mechanics who are willing to relocate to smaller rural areas will have better job opportunities.

Avionics technicians who are trained to work with complex aircraft systems, performing some duties normally performed by certified A&P mechanics, should have the best job prospects. Additionally, technicians with licensing that enables them to work on the airplane, either removing or reinstalling equipment, are expected to be in especially high demand.

Earnings

Median hourly wages of aircraft mechanics and service technicians were about \$24.71 in May 2008. The middle 50 percent earned between \$20.25 and \$29.25. The lowest 10 percent earned less than \$15.85, and the highest 10 percent earned more than \$33.19. Median hourly wages in the industries employing the largest numbers of aircraft mechanics and service technicians in May 2008 were:

Scheduled air transportation.....	\$27.96
Federal Executive Branch	24.98
Aerospace product and parts manufacturing.....	24.47
Nonscheduled air transportation	24.27
Support activities for air transportation.....	20.95

Median hourly wages of avionics technicians were about \$23.71 in May 2008. The middle 50 percent earned between \$20.10 and \$28.02. The lowest 10 percent earned less than \$16.45, and the highest 10 percent earned more than \$30.87.

Mechanics who work on jets for the major airlines generally earn more than those working on other aircraft. Those who graduate from an aviation maintenance technician school often earn higher starting salaries than individuals who receive training in the Armed Forces or on the job. Airline mechanics and their immediate families receive reduced-fare transportation on their own and most other airlines.

Almost 3 in 10 aircraft and avionics equipment mechanics and service technicians are members of unions or covered by union agreements. The principal unions are the International Association of Machinists and Aerospace Workers and the Transport Workers Union of America. Some mechanics are represented by the International Brotherhood of Teamsters.

Automotive Body and Related Repairers

Significant Points

- Little or no change in the overall number of jobs is expected.
- Repairers need good reading ability and basic mathematics and computer skills to use print and digital technical manuals.
- Many repairers, particularly in urban areas, need a national certification to advance past entry-level work.

Nature of the Work

Most of the damage resulting from everyday vehicle collisions can be repaired, and vehicles can be refinished to look and drive like new. This damage may be relatively minor, such as scraped paint or a dented panel, or major, requiring the complex replacement of parts. Such repair services are performed by trained workers.

Automotive body and related repairers, often called *collision repair technicians*, straighten bent bodies, remove dents, and replace crumpled parts that cannot be fixed. They repair all types of vehicles, and although some work on large trucks, buses, or tractor-trailers, most work on cars and small trucks. They can work alone, with only general direction from supervisors, or as specialists on a repair team. In some shops, helpers or apprentices assist experienced repairers.

Each damaged vehicle presents different challenges for repairers. Using their broad knowledge of automotive construction and repair techniques, automotive body repairers must decide how to handle each job based on what the vehicle is made of and what needs to be fixed. They must first determine the extent of the damage and decide which parts can be repaired or need to be replaced.

If the car is heavily damaged, an automotive body repairer might start by measuring the frame to determine if there has been structural damage. Repairers would then attach or clamp frames and sections to structural machines that use hydraulic pressure to align damaged components. “Unibody” vehicles—designs built without frames—must be restored to precise factory specifications for the vehicle to operate correctly. For these vehicles, repairers use bench systems to accurately measure how much each section is out of alignment, and hydraulic machinery to return the vehicle to its original shape.

Automotive body repairers must carefully restore cars to given specifications following an accident.

Only once the frame is aligned properly can repairers begin to fix or replace other damaged body parts. If the vehicle or part is made of metal, body repairers will use a pneumatic metal-cutting gun or a plasma cutter to remove badly damaged sections of body panels and then weld or otherwise attach replacement sections. Less serious dents are pulled out with a hydraulic jack or hand prying bar or knocked out with hand tools or pneumatic hammers. Small dents and creases in the metal are smoothed by holding a small anvil against one side of the damaged area while hammering the opposite side. Repairers may also remove very small pits and dimples with pick hammers and punches in a process called metal finishing. Body repairers then use plastic or solder to fill small dents that cannot be worked out of plastic or metal panels. On metal panels, they sculpt the hardened filler to the original shape by filing, grinding and sanding the repair back to the shape that is desired.

Body repairers may also repair or replace the plastic body parts that are increasingly used on new vehicles. They remove damaged panels and identify the type and properties of the plastic used. Some types of plastic allow repairers to apply heat from a hot-air welding gun or immerse the panel in hot water and press the softened section back into shape by hand. In most cases, it is more cost effective for the plastic parts to be replaced rather than to be repaired. A few body repairers specialize in fixing fiberglass car bodies.

Some body repairers specialize in installing and repairing glass in automobiles and other vehicles. *Automotive glass installers and repairers* remove broken, cracked, or pitted windshields and window glass. Glass installers apply a moisture-proofing compound along the edges of the glass, place the glass in the vehicle, and install rubber strips around the sides of the windshield or window to make it secure and weatherproof.

Many large shops make repairs using an assembly-line approach where vehicles are fixed by a team of repairers who each specialize in several types of repair. One worker might straighten frames while another repairs doors and fenders, for example. In most shops, automotive painters do the priming and refinishing, but in small shops, workers often do both body repairing and painting. (Automotive painters are discussed in the section on painting and coating workers, except construction and maintenance elsewhere in the *Handbook*.)

Work environment. Repairers work indoors in body shops where noise from the clatter of hammers against metal and the whine of power tools is prevalent. Most shops are well ventilated to disperse dust and paint fumes. Body repairers may also be required to work in awkward or cramped positions, and much of their work can be physically challenging. Hazards include cuts from sharp metal edges, burns from torches and heated metal, and injuries from power tools. However, serious accidents usually are avoided when the shop is kept clean and orderly and safety practices are observed.

Most automotive body repairers work a standard 40-hour week. More than 40 hours a week may be required when there is a backlog of repair work to be completed. This may include working on weekends.

Training, Other Qualifications, and Advancement

As automotive technology rapidly becomes more sophisticated, most employers prefer applicants who have completed a formal training program in automotive body repair or refinishing. Most new repairers complete at least part of this training on the job, while continuing to receive training from industry vendors or suppliers throughout their careers. Many repairers, particularly in urban areas, need a national certification to advance past entry-level work.

Education and training. A high school diploma or GED is often all that is required to enter this occupation, but more specific education and training is needed to learn how to repair newer automobiles. Collision repair programs may be offered in high school or in postsecondary vocational schools and community colleges. Courses in electronics, physics, chemistry, English, computers, and mathematics provide a good background for a career as an automotive body repairer. Training programs combine classroom instruction and hands-on practice.

Trade and technical school programs typically award certificates to graduates after 6 months to a year of collision repair study. Some community colleges offer 2-year programs in collision repair. Many of these schools also offer certificates for individual courses, so that students are able to take classes incrementally or as needed.

New repairers begin by assisting experienced body repairers in tasks such as removing damaged parts and sanding body panels. Novices learn to remove small dents and make other minor repairs. They then progress to more difficult tasks, such as straightening body parts and installing either repaired or replaced bolt-on parts. Generally, it takes 3 to 4 years of hands-on training to become skilled in all aspects of body repair, some of which may be completed as part of a formal education program. Basic automotive glass installation and repair can be learned in as little as 6 months, but becoming fully qualified can take several years.

Continuing education and training are needed throughout a career in automotive body repair. Automotive parts composition, body materials, electronics, and airbags and other new safety components continue to change and to become more complex. To keep up with these technological advances, repairers must continue to gain new skills by reading technical manuals and furthering their education with classes and seminars. Many companies within the automotive body repair industry

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Automotive body and related repairers	–	185,900	187,000	1,100	1
Automotive body and related repairers	49-3021	166,400	167,200	800	0
Automotive glass installers and repairers	49-3022	19,500	19,900	400	2

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

send employees to advanced training programs to brush up on old skills or to learn new techniques.

Other qualifications. Fully skilled automotive body repairers must have good reading ability and basic mathematics, including geometry, physics, and computer skills. Restoring unibody automobiles to their original specification requires repairers to follow instructions and diagrams in print and digital technical manuals and to make precise three-dimensional measurements of the position of one body section relative to another. In addition, repairers should enjoy working with their hands and be able to pay attention to detail while they work.

Certification and advancement. Certification by the National Institute for Automotive Service Excellence (ASE), although voluntary, is the pervasive industry credential for experienced automotive body repairers. Many repairers, particularly in urban areas, need a national certification to advance past entry-level work. Repairers may take up to four ASE Master Collision Repair and Refinish Exams. Repairers who pass at least one exam and have 2 years of hands-on work experience earn ASE certification. The completion of a postsecondary program in automotive body repair may be substituted for 1 year of work experience. Those who pass all four exams become ASE Master Collision Repair and Refinish Technicians. Automotive body repairers must retake the examination at least every 5 years to retain their certification. Ongoing training through the Inter-Industry Conference on Auto Collision Repair (I-CAR) can lead to additional recognition as a Platinum technician. Finally, many vehicle manufacturers and paint manufacturers also have product certification programs that can advance a repairer's career.

As beginners increase their skills, learn new techniques, earn certifications, and complete work more rapidly, their pay increases. An experienced automotive body repairer with managerial ability may advance to shop supervisor, and some workers open their own body repair shops. Other repairers become automobile damage appraisers for insurance companies.

Employment

Automotive body and related repairers held about 185,900 jobs in 2008; about 10 percent specialized in automotive glass installation and repair. Around 62 percent of repairers worked for automotive repair and maintenance shops, while 17 percent worked for automobile dealers. A small number worked for wholesalers of motor vehicles, parts, and supplies. About 12 percent of automotive body repairers were self-employed.

Job Outlook

Employment is projected to see little or no change. Job opportunities will be excellent for people with formal training in automotive body repair and refinishing as older workers retire and

need to be replaced; those without any training or experience will face competition.

Employment change. Employment of automotive body repairers is expected to grow by 1 percent over the 2008-18 decade. The number of vehicles on the road is expected to continue increasing over the next decade. This will lead to overall growth in the demand for collision repair services. The increasing role of technology in vehicles also will mean new opportunities for workers with expertise or training in repairing particular makes and models of cars or working with specific materials.

However, several factors will limit the number of new jobs for automotive body repairers. The increasingly advanced technology used in vehicles has led to significant increases in the prices of new and replacement parts. Collision repair shop owners, in an effort to stay profitable, have adopted productivity enhancing techniques. The result of this has also been consolidation within the industry, or a decreasing number of collision repair shops and limited total employment growth. In some cases, the use of new technology like airbags has led to more cars that are involved in accidents to be declared a total loss – where repairing a car costs more than the value of the vehicle. High insurance deductibles have meant that an increasing number of cars suffering minor collision damage are going unrepaired.

Job prospects. Although few jobs are expected to arise due to growth, the need to replace experienced repairers who transfer to other occupations or who retire or stop working for other reasons will provide many job openings over the next 10 years. Opportunities will be excellent for people with formal training in automotive body repair and refinishing. Those without any training or experience in automotive body refinishing or collision repair will face competition for these jobs.

Earnings

Median hourly wages of automotive body and related repairers, including incentive pay, were \$17.81 in May 2008. The middle 50 percent earned between \$13.74 and \$23.57 an hour. The lowest 10 percent earned less than \$10.75, and the highest 10 percent earned more than \$30.17 an hour. Median hourly wages of automotive body and related repairers were \$18.95 in automobile dealers and \$17.40 in automotive repair and maintenance.

Median hourly wages of automotive glass installers and repairers, including incentive pay, were \$15.44 in May 2008. The middle 50 percent earned between \$12.40 and \$18.88 an hour. The lowest 10 percent earned less than \$9.71 and the highest 10 percent earned more than \$23.39 an hour. Median hourly wages in automotive repair and maintenance shops, the industry employing most automotive glass installers and repairers, were \$15.34.

The majority of body repairers employed by independent repair shops and automotive dealers are paid on an incentive basis. Under this system, body repairers are paid a set amount for various tasks, and earnings depend on both the amount of work assigned and how fast it is completed. Employers frequently guarantee workers a minimum weekly salary. Body repairers who work for trucking companies, buslines, and other organizations that maintain their own vehicles usually receive an hourly wage.

Helpers and trainees typically earn between 30 percent and 60 percent of the earnings of skilled workers. They are paid by the hour until they are skilled enough to be paid on an incentive basis.

Employee benefits vary widely from business to business. However, industry sources report that benefits such as paid leave, health insurance, and retirement assistance are increasingly common in the collision repair industry. Automotive dealerships are the most likely to offer such incentives.

Automotive Service Technicians and Mechanics

Significant Points

- Automotive service technicians and mechanics must continually adapt to changing technology and repair techniques.
- Formal automotive technician training is the best preparation.
- Opportunities should be very good for those who complete postsecondary automotive training programs; those without formal automotive training are likely to face competition for entry-level jobs.

Nature of the Work

Automotive service technicians inspect, maintain, and repair automobiles and light trucks that run on gasoline, electricity, or alternative fuels, such as ethanol. They perform basic care maintenance, such as oil changes and tire rotations, diagnose more complex problems, and plan and execute vehicle repairs. (Service technicians who work on diesel-powered trucks, buses, and equipment are discussed in the *Handbook* section on diesel service technicians and mechanics. Motorcycle technicians—who repair and service motorcycles, motor scooters, mopeds, and small all-terrain vehicles—are discussed in the *Handbook* section on small engine mechanics.)

Automotive service technicians' and mechanics' responsibilities have evolved from simple mechanical repairs to high-level technology-related work. Today, integrated electronic systems and complex computers regulate vehicles and their performance while on the road. This increasing sophistication of automobiles requires workers who can use computerized shop equipment and work with electronic components while maintaining their skills with traditional hand tools. Technicians must have an increasingly broad knowledge of how vehicles' complex components work and interact. They also must be able to work with electronic diagnostic equipment and digital manuals and reference materials.

When mechanical or electrical troubles occur, technicians first get a description of the problem from the owner or, in a large shop, from the repair service estimator or service advisor who wrote the repair order. To locate the problem, technicians use a diagnostic approach. First, they test to see whether components and systems are secure and working properly. Then, they isolate the components or systems that might be the cause of the problem. For example, if an air-conditioner malfunctions, the technician might check for a simple problem, such as a low coolant level, or a more complex issue, such as a bad drive-train connection that has shorted out the air conditioner. As part of their investigation, technicians may test drive the vehicle or use a variety of testing equipment, including onboard and hand-held diagnostic computers or compression gauges. These tests may indicate whether a component is salvageable or whether a new one is required. Accuracy and efficiency are critical in diagnosing and repairing vehicles, as parts are increasingly expensive, and timely repairs allow shops to take on more business.

During routine service inspections, technicians test and lubricate engines and other major components. Sometimes, technicians repair or replace worn parts before they cause breakdowns or damage the vehicle. Technicians usually follow a checklist to ensure that they examine every critical part. Belts, hoses, plugs,

Automotive service technicians and mechanics perform routine vehicle maintenance as well as major repairs.

brakes, fuel systems, and other potentially troublesome items are watched closely.

Service technicians use a variety of tools in their work. They use power tools, such as pneumatic wrenches, to remove bolts quickly; machine tools like lathes and grinding machines to rebuild brakes; welding and flame-cutting equipment to remove and repair exhaust systems; and jacks and hoists to lift cars and engines. They also use common hand tools, such as screwdrivers, pliers, and wrenches, to work on small parts and in hard-to-reach places. Technicians usually provide their own hand tools, and many experienced workers have thousands of dollars invested in them. Employers furnish expensive power tools, engine analyzers, and other diagnostic equipment.

Computers are also commonplace in modern repair shops. Service technicians compare the readouts from computerized diagnostic testing devices with benchmarked standards given by the manufacturer. Deviations outside of acceptable levels tell the technician to investigate that part of the vehicle more closely. Through the Internet or from software packages, most shops receive automatic updates to technical manuals and access to manufacturers' service information, technical service bulletins, and other databases that allow technicians to keep up with common problems and to learn new procedures.

High technology tools are needed to fix the computer equipment that operates everything from the engine to the radio in many cars. In fact, today, most automotive systems, such as braking, transmission, and steering systems, are controlled primarily by computers and electronic components. Additionally, luxury vehicles often have integrated global positioning systems, accident-avoidance systems, and other new features with which technicians will need to become familiar. Also, as more alternate-fuel vehicles are purchased, more automotive service technicians will need to learn the science behind these automobiles and how to repair them.

Automotive service technicians in large shops often specialize in certain types of repairs. For example, *transmission technicians and rebuilders* work on gear trains, couplings, hydraulic pumps, and other parts of transmissions. Extensive knowledge of computer controls, the ability to diagnose electrical and hydraulic problems, and other specialized skills are needed to work on these complex components, which employ some of the most sophisticated technology used in vehicles. *Tune-up technicians* adjust ignition timing and valves and adjust or replace spark plugs and other parts to ensure efficient engine performance. They often use electronic testing equipment to isolate and adjust malfunctions in fuel, ignition, and emissions control systems.

Automotive air-conditioning repairers install and repair air-conditioners and service their components, such as compressors, condensers, and controls. These workers require special training in Federal and State regulations governing the handling and disposal of refrigerants. *Front-end mechanics* align and balance wheels and repair steering mechanisms and suspension systems. They frequently use special alignment equipment and wheel-balancing machines. *Brake repairers* adjust brakes, replace brake linings and pads, and make other repairs on brake systems. Some technicians specialize in both brake and front-end work.

Work environment. While in 2008, most automotive service technicians worked a standard 40 hour week, 24 percent

worked longer hours. Some may work evenings and weekends to satisfy customer service needs. Generally, service technicians work indoors in well-ventilated and well-lighted repair shops. However, some shops are drafty and noisy. Although many problems can be fixed with simple computerized adjustments, technicians frequently work with dirty and greasy parts and in awkward positions. They often lift heavy parts and tools. As a result, minor workplace injuries are not uncommon, but technicians usually can avoid serious accidents if safe practices are observed.

Training, Other Qualifications, and Advancement

Automotive technology is rapidly growing in sophistication, and employers are increasingly looking for workers who have completed a formal training program in high school or in a postsecondary vocational school or community college. Acquiring National Institute for Automotive Service Excellence (ASE) certification is important for those seeking work in large, urban areas.

Education and training. Most employers regard the successful completion of a vocational training program in automotive service technology as the best preparation for trainee positions. High school programs, while an asset, vary greatly in scope. Graduates of these programs may need further training to become qualified. Some of the more extensive high school programs participate in Automotive Youth Education Service (AYES), a partnership between high school automotive repair programs, automotive manufacturers, and franchised automotive dealers. All AYES high school programs are certified by the National Institute for Automotive Service Excellence. Students who complete these programs are well prepared to enter entry-level technician positions or to advance their technical education. Courses in automotive repair, electronics, physics, chemistry, English, computers, and mathematics provide a good educational background for a career as a service technician.

Postsecondary automotive technician training programs usually provide intensive career preparation through a combination of classroom instruction and hands-on practice. Schools update their curriculums frequently to reflect changing technology and equipment. Some trade and technical school programs provide concentrated training for 6 months to a year, depending on how many hours the student attends each week, and upon completion, award a certificate. Community college programs usually award a certificate or an associate degree. Some students earn repair certificates in a particular skill and leave to begin their careers. Associate degree programs, however, usually take 2 years to complete and include classes in English, basic mathematics, computers, and other subjects, as well as automotive repair. Recently, some programs have added classes on customer service, stress management, and other employability skills. Some formal training programs have alliances with tool manufacturers that help entry-level technicians accumulate tools during their training period.

Various automobile manufacturers and participating franchised dealers also sponsor 2-year associate degree programs at postsecondary schools across the Nation. Students in these programs typically spend alternate 6-week to 12-week periods attending classes full time and working full time in the service departments of sponsoring dealers. At these dealerships, stu-

dents work with an experienced worker who provides hands-on instruction and timesaving tips.

Those new to automotive service usually start as trainee technicians, technicians' helpers, or lubrication workers, and gradually acquire and practice their skills by working with experienced mechanics and technicians. In many cases, on-the-job training may be a part of a formal education program. With a few months' experience, beginners perform many routine service tasks and make simple repairs. While some graduates of postsecondary automotive training programs often are able to earn promotion to the journey level after only a few months on the job, it typically takes 2 to 5 years of experience to become a fully qualified service technician, who is expected to quickly perform the more difficult types of routine service and repairs. An additional 1 to 2 years of experience familiarizes technicians with all types of repairs. Complex specialties, such as transmission repair, require another year or two of training and experience. In contrast, brake specialists may learn their jobs in considerably less time because they do not need complete knowledge of automotive repair.

Employers increasingly send experienced automotive service technicians to manufacturer training centers to learn to repair new models or to receive special training in the repair of components, such as electronic fuel injection or air-conditioners. Motor vehicle dealers and other automotive service providers may send promising beginners or experienced technicians to manufacturer-sponsored technician training programs to upgrade or maintain employees' skills. Factory representatives also visit many shops to conduct short training sessions.

Other qualifications. The ability to diagnose the source of a problem quickly and accurately requires good reasoning ability and a thorough knowledge of automobiles. Many technicians consider diagnosing hard-to-find troubles one of their most challenging and satisfying duties. For trainee automotive service technician jobs, employers look for people with strong communication and analytical skills. Technicians need good reading, mathematics, and computer skills to study technical manuals. They must also read to keep up with new technology and learn new service and repair procedures and specifications.

Training in electronics is vital because electrical components, or a series of related components, account for nearly all malfunctions in modern vehicles. Trainees must possess mechanical aptitude and knowledge of how automobiles work. Experience working on motor vehicles in the Armed Forces or as a hobby can be very valuable.

Certification and advancement. ASE certification has become a standard credential for automotive service technicians. While not mandatory for work in automotive service, certification is common for all experienced technicians in large, urban areas. Certification is available in eight different areas of automotive service, such as electrical systems, engine repair, brake systems, suspension and steering, and heating and air-conditioning. For certification in each area, technicians must have at least 2 years of experience and pass the examination. Completion of an automotive training program in high school, vocational or trade school, or community or junior college may be substituted for 1 year of experience. For ASE certification as a Master Automobile Technician, technicians must pass all eight examinations.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Automotive service technicians and mechanics.....	49-3023	763,700	799,600	35,900	5

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

By becoming skilled in multiple auto repair services, technicians can increase their value to their employer and their pay. Experienced technicians who have administrative ability sometimes advance to shop supervisor or service manager. Those with sufficient funds many times open independent automotive repair shops. Technicians who work well with customers may become automotive repair service estimators. They may also find work as educators.

Employment

Automotive service technicians and mechanics held about 763,700 jobs in 2008. Automotive repair and maintenance shops and automobile dealers employed the majority of these workers, with 31 percent working in shops and 28 percent employed by dealers. In addition, automotive parts, accessories, and tire stores employed 7 percent of automotive service technicians. Others worked in gasoline stations; automotive equipment rental and leasing companies; Federal, State, and local governments; and other organizations. About 16 percent of service technicians were self-employed, compared with 7 percent of all installation, maintenance, and repair occupations.

Job Outlook

The number of jobs for automotive service technicians and mechanics is projected to grow slower than the average for all occupations, although many job openings will arise as experienced technicians retire. Opportunities should be good for those who complete postsecondary automotive training programs, as some employers report difficulty finding workers with the right skills; those without formal automotive training are likely to face competition for entry-level jobs.

Employment change. Employment of automotive service technicians and mechanics is expected to increase by 5 percent between 2008 and 2018, slower than the average for all occupations. Continued growth in the number of vehicles in use in the United States will lead to new jobs for workers performing basic car maintenance and repair. More entry-level workers will be needed to perform these services, such as oil changes and replacing worn brakes. Additionally, the average lifespan of vehicles is increasing, which will further increase the demand for repair services, especially post-warranty work. The increasing use of advanced technology in automobiles will also lead to new opportunities for repair technicians, especially those with specialized skills or certifications. Workers with expertise in certain makes or models of vehicles, or with an advanced understanding of certain systems, such as hybrid-fuel technology, will be in demand. At the same time, consolidation in the automobile dealer industry, a significant employer of technicians, will limit the need for new workers.

Job prospects. In addition to openings from growth, many job openings will be created by the need to replace retiring tech-

nicians. Job opportunities are expected to be very good for those who complete postsecondary automotive training programs and who earn ASE certification. Some employers report difficulty in finding workers with the right skills. People with good diagnostic and problem-solving abilities, training in electronics, and computer skills are expected to have the best opportunities. Those without formal automotive training are likely to face competition for entry-level jobs.

Most new job openings will be in automobile dealerships and independent repair shops where most automobile service technicians currently work. However, the large-scale restructuring and closing of many automobile dealerships will lead to fewer openings in dealer service centers for the initial part of the next decade.

Earnings

Median hourly wages of automotive service technicians and mechanics, including commission, were \$16.88 in May 2008. The middle 50 percent earned between \$12.44 and \$22.64 per hour. The lowest 10 percent earned less than \$9.56, and the highest 10 percent earned more than \$28.71 per hour. Median annual wages in the industries employing the largest numbers of service technicians were as follows:

Local government.....	\$20.07
Automobile dealers	19.61
Automotive repair and maintenance	15.26
Gasoline stations	15.22
Automotive parts, accessories, and tire stores.....	14.90

Many experienced technicians employed by automobile dealers and independent repair shops receive a commission related to the labor cost charged to the customer. Under this system, weekly earnings depend on the amount of work completed. Employers frequently guarantee commissioned technicians a minimum weekly salary. Some employees offer health and retirement benefits, but such compensation packages are not universal and can vary widely.

Related Occupations

Diesel Service Technicians and Mechanics

Significant Points

- In addition to high school course offerings in automotive repair and electronics, programs in diesel engine repair are offered by many community colleges and trade and technical schools.
- Opportunities are expected to be very good for people who complete formal training programs; applicants without formal training will face competition for jobs.
- National certification, the recognized standard of achievement, enhances a diesel service technician's advancement opportunities.

Nature of the Work

Diesel-powered engines are more efficient and durable than their gasoline-burning counterparts. These powerful engines are standard in our Nation's trucks, locomotives, and buses and are becoming more prevalent in light vehicles, including passenger vehicles, pickups, and other work trucks.

Diesel service technicians and mechanics, including *bus and truck mechanics* and *diesel engine specialists*, repair and maintain the diesel engines that power transportation equipment. Other diesel technicians and mechanics work on other heavy vehicles and mobile equipment, including bulldozers, cranes, road graders, farm tractors, and combines. Others repair diesel-powered passenger automobiles, light trucks, or boats. (For information on technicians and mechanics working primarily on gasoline-powered automobiles, heavy vehicles and mobile equipment, or boat engines, see the *Handbook* sections on automotive service technicians, heavy vehicle and mobile equipment service technicians and mechanics, and small engine mechanics.)

Increasingly, diesel technicians must be versatile enough to adapt to customers' needs and to new technologies. It is common for technicians to handle all kinds of repairs, working on a vehicle's electrical system one day and doing major engine repairs the next. Diesel maintenance is becoming increasingly complex, as more electronic components are used to control the operation of an engine. For example, microprocessors now regulate and manage fuel injection and engine timing, increasing the engine's efficiency. Also, new emissions standards may require mechanics to retrofit engines with emissions control systems, such as emission filters and catalysts, to comply with pollution regulations. In modern shops, diesel service technicians use hand-held or laptop computers to diagnose problems and adjust engine functions.

Technicians who work for organizations that maintain their own vehicles spend most of their time doing preventive maintenance. During a routine maintenance check, technicians follow a checklist that includes inspecting brake systems, steering mechanisms, wheel bearings, and other important parts. Following inspection, technicians repair or adjust parts that do not work properly or remove and replace parts that cannot be fixed.

Diesel service technicians and mechanics repair large trucks to keep them running smoothly.

Diesel service technicians use a variety of tools in their work, including power tools, such as pneumatic wrenches that remove bolts quickly; machine tools, such as lathes and grinding machines to rebuild brakes; welding and flame-cutting equipment to remove and repair exhaust systems; and jacks and hoists to lift and move large parts. Common hand tools—screwdrivers, pliers, and wrenches—are used to work on small parts and get at hard-to-reach places. Diesel service technicians and mechanics also use a variety of computerized testing equipment to pinpoint and analyze malfunctions in electrical systems and engines. Employers typically furnish expensive power tools, computerized engine analyzers, and other diagnostic equipment, but workers usually accumulate their own hand tools over time.

Work environment. Technicians normally work in well-lighted and ventilated areas. However, some shops are drafty and noisy. Many employers provide lockers and shower facilities. Diesel technicians usually work indoors, although they occasionally repair vehicles on the road or at the jobsite. Diesel technicians may lift heavy parts and tools, handle greasy and dirty parts, and stand or lie in awkward positions while making repairs. Minor cuts, burns, and bruises are common, although serious accidents can usually be avoided when safety procedures are followed. Technicians may work as a team or be assisted by an apprentice or helper when doing heavy work, such as removing engines and transmissions.

Most service technicians work a standard 40-hour week, although some work longer hours, particularly if they are self-employed. A growing number of shops have expanded their hours to speed repairs and offer more convenience to customers. Some truck and bus firms provide maintenance and repair service around the clock and on weekends.

Training, Other Qualifications, and Advancement

Employers prefer to hire graduates of formal training programs because those workers are able to advance quickly to the journey level of diesel service. Other workers who learn diesel engine repair through on-the-job training need 3 to 4 years of experience before becoming journey-level technicians.

Education and training. High school courses in automotive repair, electronics, English, mathematics, and physics provide a strong educational background for a career as a diesel service technician or mechanic. Many mechanics have additional training after high school.

A large number of community colleges and trade and vocational schools offer programs in diesel engine repair. These programs usually last from 6 months to 2 years and may lead to a certificate of completion or an associate degree. Some offer about 30 hours per week of hands-on training with equipment; others offer more lab or classroom instruction. Formal training provides a foundation in the latest diesel technology and

instruction in the service and repair of the equipment that technicians will encounter on the job. Training programs also teach technicians to interpret technical manuals and to communicate well with co-workers and customers. Increasingly, employers work closely with representatives of educational programs, providing instructors with the latest equipment, techniques, and tools and offering jobs to graduates.

Although formal training programs lead to the best prospects, some technicians and mechanics learn through on-the-job training. Unskilled beginners generally are assigned tasks such as cleaning parts, fueling and lubricating vehicles, and driving vehicles into and out of the shop. Beginners are usually promoted to trainee positions as they gain experience and as vacancies become available.

After a few months' experience, most trainees can perform routine service tasks and make minor repairs. These workers advance to increasingly difficult jobs as they improve their ability and competence. After technicians master the repair and service of diesel engines, they learn to work on related components, such as brakes, transmissions, and electrical systems. Generally, technicians with at least 3 to 4 years of on-the-job experience will qualify as journey-level diesel technicians.

Employers often send experienced technicians and mechanics to special training classes conducted by manufacturers and vendors, in which workers learn about the latest technology and repair techniques.

Other qualifications. Employers usually look for applicants who have mechanical aptitude and strong problem-solving skills and who are at least 18 years old and in good physical condition. Technicians need a State commercial driver's license to test-drive trucks or buses on public roads. Many companies also require applicants to pass a drug test. Practical experience in automobile repair at an automotive service station, in the Armed Forces, or as a hobby is valuable as well.

Certification and advancement. Experienced diesel service technicians and mechanics with leadership ability may advance to shop supervisor or service manager, and some open their own repair shops. Technicians and mechanics with sales ability sometimes become sales representatives.

Although national certification is not required for employment, many diesel engine technicians and mechanics find that it increases their ability to advance. Certification by the National Institute for Automotive Service Excellence (ASE) is the recognized industry credential for diesel and other automotive service technicians and mechanics. Diesel service technicians may be certified in specific areas of truck repair, such as drive-trains, brakes, suspension and steering, electrical and electronic systems, or preventive maintenance and inspection. For certification in each area, a technician must pass one or more of the ASE-administered exams and present proof of 2 years of relevant work experience. To become what's known as a master

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Bus and truck mechanics and diesel engine specialists	49-3031	263,100	278,000	14,900	6

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

technician, all the tests in a given series must be passed. To remain certified, technicians must be retested every 5 years.

Employment

Diesel service technicians and mechanics held about 263,100 jobs in 2008. These workers were employed in almost every industry, particularly those that use trucks, buses, and equipment to haul, deliver, and transport materials, goods, and people. The largest employer, the truck transportation industry, employed about 17 percent of diesel service technicians and mechanics. About 8 percent were employed by automotive repair and maintenance facilities. The rest were employed throughout the economy, including construction, manufacturing, retail and wholesale trade, and automotive leasing. About 6 percent were self-employed. Nearly every area of the country employs diesel service technicians and mechanics, although most work is found in towns and cities where trucking companies, bus lines, and other fleet owners have large operations.

Job Outlook

The number of jobs for diesel service technicians and mechanics is projected to grow slower than the average for all occupations. Opportunities should be very good for people who complete formal training in diesel mechanics; applicants without formal training will face competition for jobs.

Employment change. Employment of diesel service technicians and mechanics is expected to grow by 6 percent from 2008 to 2018, slower than the average for all occupations. The diesel engine, because of its durability and fuel efficiency, is the preferred engine for heavy-duty trucks, buses, and other large vehicles. As more freight is shipped across the country, additional trucks, and corresponding truck repairers, will be needed. Despite this trend, the increasing durability of new vehicles will limit the need for additional workers. Most new jobs will continue to be in the freight trucking and automotive repair and maintenance industries. Beyond the growth in the number of vehicles that need to be serviced, there will be additional demand for diesel engines mechanics to retrofit and modernize existing vehicles to comply with environmental regulations.

Due to higher fuel efficiency requirements for automakers, diesel engines are expected to be used in a small but increasing number of cars and light trucks. This will create additional jobs for diesel service technicians, specifically in the automotive repair and maintenance and automobile dealer industries.

Job prospects. People who enter diesel engine repair will find favorable opportunities, especially as the need to replace workers who retire increases over the next decade. Opportunities should be very good for people with strong technical skills and who complete formal training in diesel mechanics at community colleges or vocational schools. Applicants without formal training will face competition for jobs.

Earnings

Median hourly wages of bus and truck mechanics and diesel engine specialists, including incentive pay, were \$18.94 in May 2008. The middle 50 percent earned between \$15.25 and \$23.58 an hour. The lowest 10 percent earned less than \$12.50, and the highest 10 percent earned more than \$28.41 an hour. Median hourly wages in the industries employing the largest numbers

of bus and truck mechanics and diesel engine specialists in May 2008 were as follows:

Automotive equipment rental and leasing.....	\$19.27
Motor vehicle and motor vehicle parts and supplies merchant wholesalers	19.04
General freight trucking	18.00
Automotive repair and maintenance	17.83
Specialized freight trucking	16.99

Because many experienced technicians employed by truck fleet dealers and independent repair shops receive a commission related to the labor cost charged to the customer, weekly earnings depend on the amount of work completed. Beginners usually earn from 50 to 75 percent of the rate of skilled workers and receive increases as they become more skilled.

About 23 percent of diesel service technicians and mechanics are members of labor unions, including the International Association of Machinists and Aerospace Workers; the Amalgamated Transit Union; the International Union, United Automobile, Aerospace and Agricultural Implement Workers of America; the Transport Workers Union of America; the Sheet Metal Workers' International Association; and the International Brotherhood of Teamsters. Labor unions may provide additional benefits for their members.

Related Occupations

Diesel service technicians and mechanics repair trucks, buses, and other diesel-powered equipment. Related technician and mechanic occupations include:

	Page
Aircraft and avionics equipment mechanics and service technicians.....	684
Automotive body and related repairers	687
Automotive service technicians and mechanics.....	690
Heavy vehicle and mobile equipment service technicians and mechanics	697
Small engine mechanics.....	700

Sources of Additional Information

More details about work opportunities for diesel service technicians and mechanics may be obtained from local employers such as trucking companies, truck dealers, or bus lines; locals of the unions previously mentioned; and local offices of your State employment service. Local State employment service offices also may have information about training programs. State boards of postsecondary career schools have information on licensed schools with training programs for diesel service technicians and mechanics.

General information about a career as a diesel service technician or mechanic is available from:

Heavy Vehicle and Mobile Equipment Service Technicians and Mechanics

Significant Points

- Opportunities should be excellent for people with formal postsecondary training in heavy equipment repair; those without formal training will face competition.
- Generally, a service technician with at least 3 to 4 years of on-the-job experience is accepted as fully qualified.
- Wages for mobile heavy equipment mechanics are higher than the average for all installation, maintenance, and repair workers.

Nature of the Work

Heavy vehicles and mobile equipment are indispensable to many industrial activities, from construction to railroad transportation. Various types of equipment move materials, till land, lift beams, and dig earth to pave the way for development and production.

Heavy vehicle and mobile equipment service technicians and mechanics often work on hydraulic equipment, performing needed repairs.

Heavy vehicle and mobile equipment service technicians and mechanics repair and maintain engines and hydraulic, transmission, and electrical systems for this equipment. Farm machinery, cranes, bulldozers, and railcars are all examples of heavy vehicles that require such service. (For information on service technicians specializing in diesel engines, see the section on diesel service technicians and mechanics elsewhere in the *Handbook*.)

Service technicians perform routine maintenance checks on agricultural, industrial, construction, and rail equipment. They service fuel, brake, and transmission systems to ensure peak performance, safety, and longevity of the equipment. Maintenance checks and comments from equipment operators usually alert technicians to problems. After locating the problem, these technicians rely on their training and experience to use the best possible technique to solve it.

With many types of modern equipment, technicians can use diagnostic computers to diagnose components needing adjustment or repair. If necessary, they may partially dismantle affected components to examine parts for damage or excessive wear. Then, using hand-held tools, they repair, replace, clean, and lubricate parts as necessary. In some cases, technicians re-calibrate systems by typing codes into the onboard computer. After reassembling the component and testing it for safety, they put it back into the equipment and return the equipment to the field.

Many types of heavy and mobile equipment use hydraulic systems to raise and lower movable parts. When hydraulic components malfunction, technicians examine them for fluid leaks, ruptured hoses, or worn gaskets on fluid reservoirs. Occasionally, the equipment requires extensive repairs, as when a defective hydraulic pump needs replacing.

Service technicians diagnose electrical problems and adjust or replace defective components. They also disassemble and repair undercarriages and track assemblies. Occasionally, technicians weld broken equipment frames and structural parts, using electric or gas welders.

Technicians use a variety of tools in their work: power tools, such as pneumatic wrenches to remove bolts quickly, machine tools, like lathes and grinding machines, to rebuild brakes, welding and flame-cutting equipment to remove and repair exhaust systems, and jacks and hoists to lift and move large parts. Service technicians also use common hand tools—screwdrivers, pliers, and wrenches—to work on small parts and to get at hard-to-reach places. They may use a variety of computerized testing equipment to pinpoint and analyze malfunctions in electrical systems and other essential systems. Tachometers and dynamometers, for example, can be used to locate engine malfunctions. Service technicians also use ohmmeters, ammeters, and voltmeters when working on electrical systems. Employers typically furnish expensive power tools, computerized engine analyzers, and other diagnostic equipment, but hand tools are normally accumulated with experience, and many experienced technicians have thousands of dollars invested in them.

It is common for technicians in large shops to specialize in one or two types of repair. For example, a shop may have individual specialists in major engine repair, transmission work, electrical systems, and suspension or brake systems. Technicians in smaller shops, on the other hand, generally perform multiple functions.

Technicians also specialize in types of equipment. *Mobile heavy equipment mechanics and service technicians*, for example, keep construction and surface mining equipment, such as bulldozers, cranes, graders, and excavators in working order. Typically, these workers are employed by equipment wholesale distribution and leasing firms, large construction and mining companies, local and Federal governments, and other organizations operating and maintaining heavy machinery and equipment fleets. Service technicians employed by the Federal Government may work on tanks and other armored military equipment.

Farm equipment mechanics service, maintain, and repair farm equipment, as well as smaller lawn and garden tractors sold to homeowners. What once was a general repairer's job around the farm has evolved into a specialized technical career. Farmers have increasingly turned to farm equipment dealers to service and repair their equipment because the machinery has grown in complexity. Modern equipment uses more computers, electronics, and hydraulics, making it difficult to perform repairs without specialized training and tools.

Railcar repairers specialize in servicing railroad locomotives and other rolling stock, streetcars and subway cars, or mine cars. Most railcar repairers work for railroads, public and private transit companies, and railcar manufacturers.

Work environment. Heavy vehicle and mobile equipment service technicians usually work indoors. To repair vehicles and equipment, technicians often lift heavy parts and tools, handle greasy and dirty parts, and stand or lie in awkward positions. Minor cuts, burns, and bruises are common. However, serious accidents normally can be avoided as long as safety practices are observed. Although some shops are drafty and noisy, technicians usually work in well-lighted and ventilated areas. Many employers provide uniforms, locker rooms, and shower facilities. Mobile heavy equipment mechanics and railcar repairers generally work a standard 40-hour week.

When heavy or mobile equipment breaks down at a construction site, it may be too difficult or expensive to bring into a repair shop, so the shop will send a field service technician to the site to make repairs. Field service technicians work outdoors and spend much of their time away from the shop. Generally, more experienced service technicians specialize in field service. They drive trucks specially equipped with replacement parts and tools. On occasion, they must travel many miles to reach disabled machinery.

The hours of work for farm equipment mechanics vary according to the season of the year. During the busy planting and harvesting seasons, farm equipment mechanics often work 6 or 7 days a week, 10 to 12 hours daily. In slow winter months, however, they may work fewer than 40 hours a week.

Training, Other Qualifications, and Advancement

Although industry experts recommend that applicants complete a formal diesel or heavy equipment mechanic training program after graduating from high school, many people qualify for service technician jobs by training on the job. Employers seek people with mechanical aptitude who are knowledgeable about diesel engines, transmissions, electrical systems, computers, and hydraulics.

Education and training. High school courses in automobile repair, physics, chemistry, and mathematics provide a strong foundation for a career as a service technician or mechanic. After high school, those interested in heavy vehicle repair can choose to attend community colleges or vocational schools that offer programs in diesel technology. Some of these schools tailor programs to heavy equipment mechanics. These programs teach the basics of analytical and diagnostic techniques, electronics, and hydraulics. The increased use of electronics and computers makes training in electronics essential for new heavy and mobile equipment mechanics. Some 1-year to 2-year programs lead to a certificate of completion, while others lead to an associate degree in diesel or heavy equipment mechanics. Formal training programs enable trainee technicians to advance to the journey, or experienced worker, level sooner than with informal ones.

Entry-level workers with no formal background in heavy vehicle repair begin to perform routine service tasks and make minor repairs after a few months of on-the-job training. As they prove their ability and competence, workers advance to harder jobs. Generally, a service technician with at least 3 to 4 years of on-the-job experience is accepted as fully qualified.

Many employers send trainee technicians to training sessions conducted by heavy equipment manufacturers. The sessions, which typically last up to 1 week, provide intensive instruction in the repair of the manufacturer's equipment. Some sessions focus on particular components found in the equipment, such as diesel engines, transmissions, axles, or electrical systems. Other sessions focus on particular types of equipment, such as crawler-loaders and crawler-dozers. When appropriate, experienced technicians attend training sessions to gain familiarity with new technology or equipment.

Other qualifications. Technicians must read and interpret service manuals, so reading ability and communication skills are both important. The technology used in heavy equipment is becoming more sophisticated, and technicians should feel comfortable with computers and electronics because handheld diagnostic computers are often used to make engine adjustments and diagnose problems. Experience in the Armed Forces working on diesel engines and heavy equipment provides valuable background for these positions.

Certification and advancement. There is no one certification that is recognized throughout the various industries that employ heavy vehicle mobile equipment service technicians. Rather, graduation or completion of an accredited postsecondary program in heavy vehicle repair is seen as the best credential for employees to have. Manufacturers also offer certificates in specific repairs or working with particular equipment. Such credentials allow employees to take on more responsibilities and advance faster.

Experienced technicians may advance to field service jobs, where they have a greater opportunity to tackle problems independently and earn additional pay. Field positions may require a commercial driver's license and a clean driving record. Technicians with administrative ability may become shop supervisors or service managers. Some technicians open their own repair shops or invest in a franchise.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Heavy vehicle and mobile equipment service technicians and mechanics.....	49-3040	190,700	206,100	15,500	8
Farm equipment mechanics	49-3041	31,200	33,400	2,100	7
Mobile heavy equipment mechanics, except engines	49-3042	136,300	148,100	11,800	9
Rail car repairers.....	49-3043	23,100	24,600	1,500	7

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Employment

Heavy vehicle and mobile equipment service technicians and mechanics held about 190,700 jobs in 2008. Approximately 136,300 were mobile heavy equipment mechanics, 31,200 were farm equipment mechanics, and 23,100 were railcar repairers.

About 29 percent were employed by machinery, equipment, and supplies merchant wholesalers. About 13 percent worked in construction, primarily for specialty trade contractors and highway, street, and bridge construction companies; another 11 percent were employed by Federal, State, and local governments. Other service technicians worked in mining; rail transportation; and commercial and industrial machinery and equipment rental, leasing, and repair. A small number repaired equipment for machinery and railroad rolling stock manufacturers. About 6 percent of service technicians were self-employed.

Nearly every area of the country employs heavy and mobile equipment service technicians and mechanics, although most work in towns and cities where equipment dealers, equipment rental and leasing companies, and construction companies have repair facilities.

Job Outlook

The number of heavy vehicle and mobile equipment service technicians and mechanics is expected to grow about as fast as the average for all occupations. Those who have completed postsecondary training programs should find excellent opportunities, as employers report difficulty finding candidates with this training to fill available positions. Those without a formal background in diesel engine or heavy vehicle repair will face competition.

Employment change. Employment of heavy vehicle and mobile equipment service technicians and mechanics is expected to grow by 8 percent through the year 2018, about as fast as the average for all occupations. Demand will be driven primarily by growth in the use of heavy equipment in the construction industry, although growth will be slower in this industry than in recent years. In addition, the increasing sophistication of the technology used in heavy vehicles and mechanics should lead to greater demand for technicians and mechanics with specialized skills.

Growth in other industries that use heavy equipment, such as energy exploration and mining, will also contribute to the need for new workers. The need to feed a growing population, and the increased use of agriculture products to make biofuels, will lead to additional farm mechanic jobs, while the continued expansion of railways for freight shipping and transportation will lead to new openings for railcar repairers. Many new mobile heavy equipment

and farm equipment mechanic positions are expected to be in firms that sell, rent, or lease such machines, as their repair services make up an important part of their business. Employment of mobile heavy equipment mechanics is expected to grow by 9 percent from 2008-18, while jobs for farm equipment mechanics and rail car repairers are expected to increase by 7 percent.

Job prospects. Opportunities for heavy vehicle and mobile equipment service technicians and mechanics should be excellent for those who have completed formal training programs in diesel or heavy equipment mechanics. Employers report difficulty finding candidates with formal postsecondary training to fill available service technician positions. People without formal training are expected to encounter growing difficulty entering these jobs. Most job openings for mobile, rail, and farm equipment technicians will arise from the need to replace experienced repairers who retire or change occupations.

Construction and mining operations, which use large numbers of heavy vehicles and mobile equipment, are particularly sensitive to changes in the level of economic activity. While the increased use of such equipment increases the need for periodic service and repair, heavy and mobile equipment may be idle during downturns. As a result, opportunities for service technicians who work on construction and mining equipment may fluctuate with the cyclical nature of these industries. In addition, opportunities for farm equipment mechanics are seasonal and are best in warmer months.

Earnings

Median hourly wages of mobile heavy equipment mechanics were \$20.59 in May 2008, higher than the \$18.60 per hour median for all installation, maintenance, and repair occupations. The middle 50 percent earned between \$16.71 and \$24.85. The lowest 10 percent earned less than \$13.61, and the highest 10 percent earned more than \$30.57. Median hourly wages in the industries employing the largest numbers of mobile heavy equipment mechanics were as follows:

Local government.....	\$21.93
Machinery, equipment, and supplies merchant wholesalers	20.49
Other specialty trade contractors.....	19.83
Commercial and industrial machinery and equipment rental and leasing	19.39
Commercial and industrial machinery and equipment (except automotive and electronic) repair and maintenance.....	18.93

Median hourly wages of farm equipment mechanics were \$15.32 in May 2008. The middle 50 percent earned between \$12.54 and \$18.61. The lowest 10 percent earned less than \$10.28, and the highest 10 percent earned more than \$22.37. In machinery, equipment, and supplies merchant wholesalers, the industry employing the largest number of farm equipment mechanics, median wages were \$15.64.

Median hourly wages of railcar repairers were \$21.48 in May 2008. The middle 50 percent earned between \$16.83 and \$25.84. The lowest 10 percent earned less than \$13.49, and the highest 10 percent earned more than \$30.23. Median hourly wages were \$23.82 in rail transportation, the industry employing the largest number of railcar repairers.

About 23 percent of heavy vehicle and mobile equipment service technicians and mechanics are members of unions, including the International Association of Machinists and Aerospace Workers, the International Union of Operating Engineers, and the International Brotherhood of Teamsters. Members may enjoy job benefits in addition to what employers provide.

Small Engine Mechanics

Significant Points

- Job prospects should be excellent for people who complete formal training programs.
- Average job growth is expected.
- Use of motorcycles, motorboats, and outdoor power equipment is seasonal in many areas, so mechanics may service other types of equipment or work reduced hours in the winter.

Nature of the Work

Small engine mechanics repair and service power equipment ranging from jet skis to chainsaws. Mechanics usually specialize in the service and repair of one type of equipment, such as motorcycles, motorboats, and outdoor power equipment, although they may work on closely related products.

When a piece of equipment breaks down, mechanics use various techniques to diagnose the source and extent of the problem. The mark of a skilled mechanic is the ability to diagnose mechanical, fuel, and electrical problems and to make repairs quickly. Quick and accurate diagnosis requires problem-solving ability and a thorough knowledge of the equipment's operation.

Some jobs require minor adjustments or the replacement of a single item, but a complete engine overhaul could require hours to disassemble the engine and replace worn valves, pistons, bearings, and other internal parts. Some highly skilled mechanics use specialized components and the latest computerized equipment to customize and tune motorcycles and motorboats for racing.

Hand tools are the most important work-related possessions of mechanics. Small engine mechanics use wrenches, pliers, and screwdrivers on a regular basis. Mechanics usually provide their own tools, although employers will furnish expensive power tools, computerized engine analyzers, and other diagnostic equipment. Computerized engine analyzers, compression gauges, ammeters and voltmeters, and other testing devices help mechanics locate faulty parts and tune engines. This equipment provides a systematic performance report of

Motorcycle mechanics use hand tools to make needed adjustments and repairs.

various components to compare against normal ratings. After pinpointing the problem, the mechanic makes the needed adjustments, repairs, or replacements.

Small engines also require periodic service to minimize the chance of breakdowns and to keep them operating at peak performance. During routine maintenance, mechanics follow a checklist that includes the inspection and cleaning of brakes, electrical systems, fuel injection systems, plugs, carburetors, and other parts. Following inspection, mechanics usually repair or adjust parts that do not work properly or replace unfixable parts.

Motorcycle mechanics specialize in the repair and overhaul of motorcycles, motor scooters, mopeds, dirt bikes, and all-terrain vehicles. Besides repairing engines, they may work on transmissions, brakes, and ignition systems and make minor body repairs. Mechanics often service just a few makes and models of motorcycles because most work for dealers that service only the products they sell.

Motorboat mechanics and *marine equipment mechanics* repair and adjust the electrical and mechanical equipment of inboard and outboard boat engines. Most small boats have portable outboard engines that are removed and brought into the repair shop. Larger craft, such as cabin cruisers and commercial fishing boats, are powered by diesel or gasoline inboard or inboard-outboard engines, which are removed only for major overhauls. Most of these repairs, therefore, are performed at docks or marinas. Motorboat mechanics also may work on propellers, steering mechanisms, marine plumbing, and other boat equipment.

Outdoor power equipment and other small engine mechanics service and repair outdoor power equipment such as lawnmowers, garden tractors, edge trimmers, and chain saws. They also may occasionally work on portable generators and go-carts. In addition, small engine mechanics in certain parts of the country may work on snowblowers and snowmobiles, but demand for this type of repair is both seasonal and regional.

Work environment. Small engine mechanics usually work in repair shops that are well lighted and ventilated but are sometimes noisy when engines are tested. Motorboat mechanics may work outdoors in poor weather conditions when making repairs aboard boats. They may also work in cramped or awkward positions to reach a boat's engine. Outdoor power equipment mechanics face similar conditions when they need to make on-site repairs.

During the winter months in the northern United States, mechanics may work fewer than 40 hours a week because the amount of repair and service work declines when lawnmowers, motorboats, and motorcycles are not in use. Many mechanics work full time only during the busy spring and summer seasons. However, they often schedule time-consuming engine overhauls

or work on snowmobiles and snowblowers during winter downtime. Mechanics may work considerably more than 40 hours a week when demand is strong.

Training, Other Qualifications, and Advancement

Due to the increasing complexity of motorcycles and motorboats, employers prefer to hire mechanics who have graduated from formal training programs. However, because the number of these specialized postsecondary programs is limited, most mechanics still learn their skills on the job or while working in related occupations.

Education and training. Employers prefer to hire high school graduates for trainee mechanic positions, but many will accept applicants with less education if they possess adequate reading, writing, and math skills. Helpful high school courses include small engine repair, automobile mechanics, science, and business math. Many equipment dealers employ high school students part time and during the summer to help assemble new equipment and perform minor repairs.

Once employed, trainees learn routine service tasks under the guidance of experienced mechanics by replacing ignition points and spark plugs or by taking apart, assembling, and testing new equipment. As they gain experience and proficiency, trainees progress to more difficult tasks, such as advanced computerized diagnosis and engine overhauls. Anywhere from several months to 3 years of on-the-job training may be necessary before a novice worker becomes competent in all aspects of the repair of motorcycle and motorboat engines. Repair of outdoor equipment, because of fewer moving parts, requires less on-the-job training.

A growing number of motorcycle and marine equipment mechanics graduate from formal motorcycle and motorboat postsecondary programs. Employers prefer to hire these workers for their advanced knowledge of small engine repair. These workers also need far less on-the-job training and tend to advance quickly to more demanding small engine repair jobs.

Employers often send mechanics and trainees to courses conducted by motorcycle, motorboat, and outdoor power equipment manufacturers or distributors. These courses, which can last up to 2 weeks, upgrade workers' skills and provide information on repairing new models. Manufacturer classes are usually a prerequisite for any mechanic who performs warranty work for manufacturers or insurance companies.

Other qualifications. For trainee jobs, employers hire people with mechanical aptitude who are knowledgeable about the fundamentals of small engines. Many trainees get their start by working on automobiles, motorcycles, motorboats, or outdoor power equipment as a hobby. Knowledge of basic electronics is essential because many parts of small vehicles and engines are electric.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Small engine mechanics.....	49-3050	70,400	75,100	4,800	7
Motorboat mechanics.....	49-3051	22,100	23,400	1,200	6
Motorcycle mechanics.....	49-3052	18,800	20,500	1,600	9
Outdoor power equipment and other small engine mechanics.....	49-3053	29,400	31,300	1,900	6

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Advancement. The skills needed for small engine repair can transfer to other occupations, such as automobile, diesel, or heavy vehicle and mobile equipment mechanics. Experienced mechanics with leadership ability may advance to shop supervisor or service manager jobs. Mechanics with sales ability sometimes become sales representatives or open their own repair shops or dealerships.

Employment

Small engine mechanics held about 70,400 jobs in 2008. Motorcycle mechanics held around 18,800 jobs, motorboat mechanics held approximately 22,100 jobs, and outdoor power equipment and other small engine mechanics held about 29,400 jobs. Thirty-seven percent of small engine mechanics worked for motor vehicle and parts dealers, while 13 percent were employed in retail lawn and garden equipment and supplies stores. Nine percent were employed by repair and maintenance shops. Most of the remainder worked in wholesale distributors, equipment rental and leasing companies, and landscaping services. About 13 percent were self-employed, compared to about 7 percent of workers in all installation, maintenance, and repair occupations.

Job Outlook

Average employment growth is projected for small engine mechanics. Job prospects should be excellent for people who complete formal training programs. Use of motorcycles, motorboats, and outdoor power equipment is seasonal in many areas, so mechanics may service other types of equipment or work reduced hours in the winter.

Employment change. Employment of small engine mechanics is expected to grow by 7 percent between 2008 and 2018, about as fast as the average for all occupations. Growth will vary by the type of equipment these mechanics repair.

The number of registered motorcycles has increased steadily in recent years, leading to corresponding greater demand for motorcycle repair services. This trend is expected to continue, leading to new opportunities for motorcycle mechanics. Most new jobs will continue to be in the motorcycle dealer industry, as service operations are an important aspect of business for many firms in this industry. The increasing sophistication of motorcycles will create new opportunities for specialists in independent repair shops as well, however. Overall, motorcycle mechanics will grow by 9 percent.

By contrast, the number of additional motorboats in use has been limited in recent years. The retail boat industry, the primary employer of repair technicians, has consolidated, creating fewer new opportunities for mechanics. As such, motorboat mechanics are expected to grow by 6 percent.

Outdoor equipment mechanics will also grow by 6 percent. Demand for repair services is expected to rise over time as outdoor machines become more complex. Growth is also projected in the landscaping services industry, which frequently uses small engine equipment that needs regular servicing. Most new jobs in this in this occupation will continue to be in outdoor small engine equipment retail shops.

Job prospects. Job prospects should be excellent for people who complete formal training programs. Employers prefer mechanics that have knowledge of multiple types of engines and emissions-reducing technology as the government increases

regulation of the emissions produced by small engines. Many of the job openings for small engine mechanics will result from the need to replace the many experienced small engine mechanics who are expected to transfer to other occupations, retire, or stop working for other reasons.

Earnings

Median wages of motorcycle mechanics were \$15.08 an hour in May 2008, as compared to \$18.60 for all installation, maintenance, and repair occupations. The middle 50 percent earned between \$12.10 and \$19.20. The lowest 10 percent earned less than \$9.76, and the highest 10 percent earned more than \$24.27. Median hourly wages in the industry employing the largest number of motorcycle mechanics, other motor vehicle dealers, or retail shops selling vehicles other than cars and trucks, were \$15.13.

Median wages of motorboat mechanics were \$16.60 an hour in May 2008. The middle 50 percent earned between \$13.31 and \$20.68. The lowest 10 percent earned less than \$10.74, and the highest 10 percent earned more than \$25.41. Median hourly wages in other motor vehicle dealers, the industry employing the largest number of motorboat mechanics, were \$16.48.

Median wages of outdoor power equipment and other small engine mechanics were \$13.91 an hour in May 2008. The middle 50 percent earned between \$11.24 and \$17.03. The lowest 10 percent earned less than \$9.12, and the highest 10 percent earned more than \$20.40. Median hourly wages in lawn and garden equipment and supplies stores, the industry employing the largest number of outdoor power equipment and other small engine mechanics, were \$13.66.

Small engine mechanics in small shops usually receive few benefits, but those employed in larger shops often receive typical benefits such as paid vacations, sick leave, and health insurance. Some employers also pay for work-related training, provide uniforms, and help mechanics purchase new tools.

Related Occupations

Miscellaneous Installation, Maintenance, and Repair Occupations

Heating, Air-conditioning, and Refrigeration Mechanics and Installers

Significant Points

- Job prospects are expected to be excellent.
- Employment is projected to grow much faster than the average.
- Employers prefer to hire those who have completed technical school training or a formal apprenticeship.

Nature of the Work

Heating and air-conditioning systems control the temperature, humidity, and the total air quality in residential, commercial, industrial, and other buildings. By providing a climate controlled environment, refrigeration systems make it possible to store and transport food, medicine, and other perishable items. *Heating, air-conditioning, and refrigeration mechanics and installers*—also called *technicians*—install, maintain, and repair such systems. Because heating, ventilation, air-conditioning, and refrigeration systems often are referred to as HVACR systems, these workers also may be called HVACR technicians.

Heating, air-conditioning, and refrigeration systems consist of many mechanical, electrical, and electronic components, such as motors, compressors, pumps, fans, ducts, pipes, thermostats, and switches. In central forced air heating systems, for example, a furnace heats air, which is then distributed through a system of metal or fiberglass ducts. Technicians maintain, diagnose, and correct problems throughout the entire system. To do this, they adjust system controls to recommended settings and test the performance of the system using special tools and test equipment.

A heating, air-conditioning, and refrigeration mechanic works on a thermostat for a heating and air-conditioning system.

Technicians often specialize in either installation or maintenance and repair, although they are trained to do both. They also may specialize in doing heating work or air-conditioning or refrigeration work. Some specialize in one type of equipment—for example, hydronics (water-based heating systems), solar panels, or commercial refrigeration.

Technicians are often required to sell service contracts to their clients. Service contracts provide for regular maintenance of the heating and cooling systems, and they help to reduce the seasonal fluctuations of this type of work.

Technicians follow blueprints or other specifications to install oil, gas, electric, solid-fuel, and multiple-fuel heating systems and air-conditioning systems. After putting the equipment in place, they install fuel and water supply lines, air ducts and vents, pumps, and other components. They may connect electrical wiring and controls and check the unit for proper operation. To ensure the proper functioning of the system, furnace installers often use combustion test equipment, such as carbon dioxide testers, carbon monoxide testers, combustion analyzers, and oxygen testers. These tests ensure that the system will operate safely and at peak efficiency.

After a furnace or air-conditioning unit has been installed, technicians often perform routine maintenance and repair work to keep the systems operating efficiently. They may adjust burners and blowers and check for leaks. If the system is not operating properly, technicians check the thermostat, burner nozzles, controls, or other parts to diagnose and correct the problem.

Technicians also install and maintain heat pumps, which are similar to air conditioners but can be reversed so that they both heat and cool a home. Because of the added complexity, and the fact that they run both in summer and winter, these systems often require more maintenance and need to be replaced more frequently than traditional furnaces and air conditioners.

During the summer, when heating systems are not being used, heating equipment technicians do maintenance work, such as replacing filters, ducts, and other parts of the system that may accumulate dust and impurities during the operating season. During the winter, air-conditioning mechanics inspect the systems and do required maintenance, such as overhauling compressors.

Refrigeration mechanics install, service, and repair industrial and commercial refrigerating systems and a variety of refrigeration equipment. They follow blueprints, design specifications, and manufacturers' instructions to install motors, compressors, condensing units, evaporators, piping, and other components. They connect this equipment to the ductwork, refrigerant lines, and electrical power source. After making the connections, refrigerator mechanics charge the system with refrigerant, check it for proper operation and leaks, and program control systems.

When air-conditioning and refrigeration technicians service equipment, they must use care to conserve, recover, and recycle the refrigerants used in air-conditioning and refrigeration systems. The release of these refrigerants can be harmful to the

environment. Technicians conserve the refrigerant by making sure that there are no leaks in the system; they recover it by venting the refrigerant into proper cylinders; they recycle it for reuse with special filter-dryers; or they ensure that the refrigerant is properly disposed of.

Heating, air-conditioning, and refrigeration mechanics and installers are adept at using a variety of tools to work with refrigerant lines and air ducts, including hammers, wrenches, metal snips, electric drills, pipe cutters and benders, measurement gauges, and acetylene torches. They use voltmeters, thermometers, pressure gauges, manometers, and other testing devices to check airflow, refrigerant pressure, electrical circuits, burners, and other components.

Other craft workers sometimes install or repair cooling and heating systems. For example, on a large air-conditioning installation job, especially where workers are covered by union contracts, ductwork might be done by sheet metal workers and duct installers; electrical work by electricians; and installation of piping, condensers, and other components by pipelayers, plumbers, pipefitters, and steamfitters. Home appliance repairers usually service room air-conditioners and household refrigerators. (Additional information about each of these occupations appears elsewhere in the *Handbook*.)

Work environment. Heating, air-conditioning, and refrigeration mechanics and installers work in homes, retail establishments, hospitals, office buildings, and factories—anywhere there is climate-control equipment that needs to be installed, repaired, or serviced. They may be assigned to specific job sites at the beginning of each day or may be dispatched to a variety of locations if they are making service calls.

Technicians may work outside in cold or hot weather, or in buildings that are uncomfortable because the air-conditioning or heating equipment is broken. In addition, technicians might work in awkward or cramped positions, and sometimes they are required to work in high places. Hazards include electrical shock, burns, muscle strains, and other injuries from handling heavy equipment. Appropriate safety equipment is necessary when handling refrigerants because contact can cause skin damage, frostbite, or blindness. When working in tight spaces, inhalation of refrigerant is a possible hazard.

The majority of mechanics and installers work at least 40 hours per week. During peak seasons, they often work overtime or irregular hours. Maintenance workers, including those who provide maintenance services under contract, often work evening or weekend shifts and are on call. Most employers try to provide a full workweek year-round by scheduling both installation and maintenance work, and many manufacturers and contractors now provide or even require year-round service contracts. In most shops that service both heating and air-conditioning equipment, employment is stable throughout the year.

Training, Other Qualifications, and Advancement

Because of the increasing sophistication of heating, air-conditioning, and refrigeration systems, employers prefer to hire those who have completed technical school training or a formal apprenticeship. Some mechanics and installers, however, still learn the trade informally on the job.

Education and training. Many heating, air-conditioning, and refrigeration mechanics and installers receive their primary training in secondary and postsecondary technical and trade schools and junior and community colleges that offer programs in heating, air-conditioning, and refrigeration. These programs can take between 6 months and 2 years to complete. Others get their training in the Armed Forces.

High school students interested in some initial training for this industry should take courses in shop math, mechanical drawing, applied physics and chemistry, electronics, blueprint reading, and computer applications. Some knowledge of plumbing or electrical work and a basic understanding of electronics are beneficial for an HVACR technician. Secondary and postsecondary students studying HVACR learn about theory of temperature control, equipment design and construction, and electronics. They also learn the basics of installation, maintenance, and repair.

Three accrediting agencies have set academic standards for HVACR programs: HVAC Excellence; the National Center for Construction Education and Research; and the Partnership for Air-Conditioning, Heating, and Refrigeration Accreditation. After completing these programs, new technicians generally need between 6 months to 2 years of field experience before they are considered proficient.

Many other technicians train through apprenticeships. Apprenticeship programs frequently are run by joint committees representing local chapters of the Air-Conditioning Contractors of America, the Mechanical Contractors Association of America, Plumbing-Heating-Cooling Contractors—National Association, and locals of the Sheet Metal Workers' International Association or the United Association of Journeymen and Apprentices of the Plumbing and Pipefitting Industry of the United States and Canada. Local chapters of the Associated Builders and Contractors and the National Association of Home Builders sponsor other apprenticeship programs. Formal apprenticeship programs normally last 3 to 5 years and combine paid on-the-job training with classroom instruction. Classes include subjects such as safety practices, the use and care of tools, blueprint reading, and the theory and design of heating, ventilation, air-conditioning, and refrigeration systems. In addition to understanding how systems work, technicians must learn about refrigerant products and the legislation and regulations that govern their use.

Applicants for apprenticeships must have a high school diploma or equivalent. Math and reading skills are essential. After completing an apprenticeship program, technicians are considered skilled trades workers and capable of working alone. These programs are also a pathway to certification and, in some cases, college credits.

Those who acquire their skills on the job usually begin by assisting experienced technicians. They may begin by performing simple tasks such as carrying materials, insulating refrigerant lines, or cleaning furnaces. In time, they move on to more difficult tasks, such as cutting and soldering pipes and sheet metal and checking electrical and electronic circuits.

Licensure. Heating, air-conditioning, and refrigeration mechanics and installers are required to be licensed by some States and localities. Requirements for licensure vary greatly, but all States or localities that require a license have a test that must

be passed. The contents of these tests vary by State or locality, with some requiring extensive knowledge of electrical codes and others focusing more on HVACR-specific knowledge. Completion of an apprenticeship program or 2 to 5 years of experience are also common requirements.

In addition, all technicians who purchase or work with refrigerants must be certified in their proper handling. To become certified to purchase and handle refrigerants, technicians must pass a written examination specific to the type of work in which they specialize. The three possible areas of certification are: Type I—servicing small appliances; Type II—high-pressure refrigerants; and Type III—low-pressure refrigerants. Exams are administered by organizations approved by the U.S. Environmental Protection Agency, such as trade schools, unions, contractor associations, or building groups.

Other qualifications. Because technicians frequently deal directly with the public, they should be courteous and tactful, especially when dealing with an aggravated customer. They should be in good physical condition because they sometimes have to lift and move heavy equipment.

Certification and advancement. Throughout the learning process, technicians may have to take a number of tests that measure their skills. For those with relevant coursework and less than 2 years of experience, the industry has developed a series of exams to test basic competency in residential heating and cooling, light commercial heating and cooling, and commercial refrigeration. These are referred to as “Entry-level” certification exams and are commonly conducted at both secondary and postsecondary technical and trade schools.

Additionally, HVACR technicians who have at least 1 year of experience performing installations and 2 years of experience performing maintenance and repair can take a number of different tests to certify their competency in working with specific types of equipment, such as oil-burning furnaces. The Air Conditioning, Heating, and Refrigeration Institute offers an Industry Competency Exam; HVAC Excellence offers both a Secondary Employment Ready Exam and a Secondary Heat and Heat Plus exams; and National Occupational Competency Testing Institute offers a secondary exam; and the Refrigeration Service Engineers Society offers two levels of certification, as well. Employers increasingly recommend taking and passing these tests and obtaining certification; doing so may increase advancement opportunities.

Another way to increase advancement opportunities is to take advantage of any courses that will improve competency with computers; these courses are useful because of the increasing complexity of automated computer controls in larger buildings.

Advancement usually takes the form of higher wages. Some technicians, however, may advance to positions as supervisor or service manager. Others may move into sales and

marketing. Still others may become building superintendents, cost estimators, system test and balance specialists, or, with the necessary certification, teachers. Those with sufficient money and managerial skill can open their own contracting business.

Employment

Heating, air-conditioning, and refrigeration mechanics and installers held about 308,200 jobs in 2008; about 54 percent worked for plumbing, heating, and air-conditioning contractors. The rest were employed in a variety of industries throughout the country, reflecting a widespread dependence on climate-control systems. Some worked for refrigeration and air-conditioning service and repair shops, schools, and stores that sell heating and air-conditioning systems. Local governments, the Federal Government, hospitals, office buildings, and other organizations that operate large air-conditioning, refrigeration, or heating systems also employed these workers. About 16 percent of these workers were self-employed.

Job Outlook

With much faster than average job growth and numerous expected retirements, heating, air-conditioning, and refrigeration mechanics and installers should have excellent employment opportunities.

Employment change. Employment of heating, air-conditioning, and refrigeration mechanics and installers is projected to increase 28 percent during the 2008-18 decade, much faster than the average for all occupations. As the population and stock of buildings grows, so does the demand for residential, commercial, and industrial climate-control systems. Residential HVACR systems generally need replacement after 10 to 15 years; the large number of homes built in recent years will enter this replacement timeframe by 2018. The increased complexity of HVACR systems, which increases the possibility that equipment may malfunction, also will create opportunities for service technicians. A growing focus on improving indoor air quality and the increasing use of refrigerated equipment by a rising number of stores and gasoline stations that sell food should also create more jobs for heating, air-conditioning, and refrigeration technicians.

Concern for the environment and the need to reduce energy consumption overall has prompted the development of new energy-saving heating and air-conditioning systems. This emphasis on better energy management is expected to lead to the replacement of older systems and the installation of newer, more efficient systems in existing homes and buildings. Also, demand for maintenance and service work should rise as businesses and homeowners strive to keep increasingly complex systems operating at peak efficiency. Regulations prohibiting the discharge and production of older types of refrigerants that pollute the atmosphere should continue to result in

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018 Number	Percent
Heating, air conditioning, and refrigeration mechanics and installers	49-9021	308,200	394,800	86,600	28

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

the need to replace many existing air conditioning systems or to modify them to use new environmentally safe refrigerants. The pace of replacement in the commercial and industrial sectors will quicken if Congress or individual States change tax rules designed to encourage companies to buy new HVACR equipment.

Job prospects. Job prospects for heating, air-conditioning, and refrigeration mechanics and installers are expected to be excellent, particularly for those who have completed training from an accredited technical school or a formal apprenticeship. A growing number of retirements of highly skilled technicians are expected to generate many more job openings. Many contractors have reported problems finding enough workers to meet the demand for service and installation of HVACR systems.

Technicians who specialize in installation work may experience periods of unemployment when the level of new construction activity declines, but maintenance and repair work usually remains relatively stable. People and businesses depend on their climate-control or refrigeration systems and must keep them in good working order, regardless of economic conditions.

In light of the complexity of new computer-controlled HVACR systems in modern high-rise buildings, prospects should be best for those who can acquire and demonstrate computer competency. Training in new techniques that improve energy efficiency will also make it much easier to enter the occupation.

Earnings

Median hourly wages of heating, air-conditioning, and refrigeration mechanics and installers were \$19.08 in May 2008. The middle 50 percent earned between \$14.94 and \$24.84 an hour. The lowest 10 percent earned less than \$12.19, and the top 10 percent earned more than \$30.59. Median hourly wages in the industries employing the largest numbers of heating, air-conditioning, and refrigeration mechanics and installers were:

Local government.....	\$22.79
Hardware, and plumbing and heating equipment and supplies merchant wholesalers	22.18
Commercial and industrial machinery and equipment (except automotive and electronic) repair and maintenance.....	20.83
Direct selling establishments.....	20.03
Building equipment contractors.....	18.26

Apprentices usually earn about 50 percent of the wage rate paid to experienced workers. As they gain experience and improve their skills, they receive periodic increases until they reach the wage rate of experienced workers.

Heating, air-conditioning, and refrigeration mechanics and installers generally receive a variety of employer-sponsored benefits. In addition to typical benefits such as health insurance and pension plans, some employers pay for work-related training and provide uniforms, company vans, and tools.

About 15 percent of heating, air-conditioning, and refrigeration mechanics and installers are members of a union. The unions to which the greatest numbers of mechanics and installers belong are the Sheet Metal Workers International Association and the United Association of Journeymen and Ap-

prentices of the Plumbing and Pipefitting Industry of the United States and Canada.

Related Occupations

Heating, air-conditioning, and refrigeration mechanics and installers work with sheet metal and piping, and repair machinery, such as electrical motors, compressors, and burners. Other workers who have similar duties include:

Home Appliance Repairers

Significant Points

- Little or no change in employment is projected; however, excellent job opportunities are expected, particularly for those with formal training in appliance repair and electronics.
- Good customer service skills and a driver's license are essential.

Nature of the Work

Home appliance repairers, more commonly referred to as home appliance repair technicians, install and repair home appliances such as refrigerators, dishwashers, washers and dryers, ranges, microwave ovens, and window air-conditioning units. This work is typically done on site. (Workers whose primary responsibility is the installation and repair of heating and central air-conditioning units are covered in a separate *Handbook* statement on heating, air-conditioning, and refrigeration mechanics and installers.) A small number of home appliance repair technicians service small appliances such as vacuum cleaners, small

kitchen appliances, and microwaves that are portable and usually repaired in a central repair shop rather than in the home.

When installing major appliances such as refrigerators, washing machines, and cooking products, technicians may have to connect the appliances to a gas or water line. In these cases, once the connections are in place, they turn on the gas or water and check for leaks. When complete, they may show the customer how to work the appliance and answer customers' questions about the care and use of the appliance.

When problems with major home appliances occur, home appliance repair technicians will usually make a site visit to visually inspect the appliance and make the repair. To determine the cause of the failure, they will check for unusual noises, excessive vibration, leakage of fluid, or loose parts. Technicians disassemble the appliance to examine its internal parts for signs of wear or corrosion. They follow service manual diagnostic procedures and use testing devices such as ammeters, voltmeters, and wattmeters to check electrical systems for shorts and faulty connections.

After identifying problems, home appliance repair technicians replace or repair defective belts, motors, heating elements, switches, gears, or other items. They tighten, align, clean, and lubricate parts as necessary. Technicians use common handtools, including screwdrivers, wrenches, files, and pliers, as well as soldering guns and tools designed for specific appliances. Appliances with electronic parts often require new circuit boards or other electronic components.

When repairing refrigerators and window air-conditioners, repairers must take care to conserve, recover, and recycle chlorofluorocarbon (CFC) and hydrochlorofluorocarbon (HCFC) refrigerants used in the cooling systems, as is required by law. Federal regulations also require that home appliance repair technicians document the capture and disposal of refrigerants.

In addition to making repairs, technicians keep records of parts used and hours worked, prepare bills, and collect payments. If an appliance is under warranty, a technician may need to confer with the manufacturer of the appliance to recoup monetary claims for work performed.

Work environment. When they are fully qualified to work alone, home appliance repair technicians usually work with little or no direct supervision and spend much of the day on the road driving to and from appointments and emergency calls. Those who work on portable appliances generally work in service center repair shops. Although many home appliance repair technicians work a standard 40-hour week, some work weekends and early morning or evening shifts to cover hours as needed and some remain on call for emergencies. In summer, demand for repairs to refrigerators and window air conditioners go up and may cause additional work and overtime.

Technicians sometimes work in cramped and uncomfortable positions when they are replacing parts in hard-to-reach areas of appliances, but the jobs are generally not hazardous as long as workers exercise care and follow safety precautions to avoid electrical shocks and gas leaks, and use safety measures when lifting and moving large appliances.

Training, Other Qualifications, and Advancement

Most entry-level workers in this profession enter without any specific training or experience and learn on the job, although employers prefer to hire those who have completed programs in electronics

Most home appliance repairers enter the occupation with a high school diploma and little or no training repairing appliances.

or appliance repair. A driver's license and good customer service skills are essential to work on appliances in customer's homes.

Education and training. Most home appliance repair technicians enter the occupation with a high school diploma or its equivalent and little training in repairing appliances. Most learn their jobs while working with more experienced workers and by attending in-house classes sponsored by the employer. Some appliance manufacturers and employers have formal training programs that include home study and shop classes, in which trainees work with demonstration appliances and other training equipment. Many technicians also receive supplemental instruction through 2- or 3-week seminars conducted by appliance manufacturers. Technicians authorized for warranty work by manufacturers are required to attend periodic training sessions. Training can last from several months to a few years.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Home appliance repairers	49-9031	49,600	50,600	1,100	2

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

In businesses that fix portable appliances in a repair shop, trainees work on a single type of appliance, such as a vacuum cleaner, until they master its repair. Then they move on to others, until they can work on all appliances repaired by the shop.

While on-the-job training is the most common method of training, employers prefer to hire workers that have attended high school or postsecondary vocational or technical programs in electronics or appliance repair. These programs can last 1 to 2 years and include courses in basic electricity and electronics as most home appliances contain electronic components. These programs can help reduce the amount of on-the-job training required for entry-level workers.

Most home appliance repair technicians will need to take periodic classes throughout their careers to keep their skills up to date and to be able to repair the latest home appliance models.

Licensure. The U.S. Environmental Protection Agency (EPA) has mandated that all repair technicians who buy or work with refrigerants pass a written examination to become certified in proper refrigerant handling. Exams are administered by EPA-approved organizations, such as trade schools, unions, and employer associations. There also are EPA-approved take-home certification exams. Although no formal training is required for certification, many of these organizations offer training programs designed to prepare workers for the certification examination.

Certification and other qualifications. A helpful manner with customers and good communication skills are essential for those who work in clients' homes. Technicians must be courteous and tactful. They must also be dependable. A driver's license with a clean driving record is also usually required to drive to customers' homes, and some employers may require a background check and drug test. Mechanical and electrical aptitudes are desirable. Those who are self-employed need good business and financial skills to maintain a business. Membership in a trade association can help business owners learn from others in the field.

Home appliance repair technicians may demonstrate their competence by passing one of several certification examinations offered by various organizations. Although voluntary, such certifications can be helpful when seeking employment. The National Appliance Service Technician Certification (NASTeC), which is administered by the International Society of Certified Electronics Technicians (ISCET), requires technicians to pass a comprehensive examination that tests their competence in the diagnosis, repair, and maintenance of major home appliances. The Professional Service Association (PSA) administers a similar certification program based on skill competencies developed by the industry and updated annually. Those who pass the PSA examination can earn the Master Certified Appliance Professional (MCAP) designation.

Advancement. Technicians in large shops or service centers may be promoted to supervisor, assistant service manager, or service manager. Some technicians advance to managerial positions such as regional service manager or parts manager for

appliance or tool manufacturers. Experienced technicians who have sufficient funds and knowledge of small-business management frequently open their own repair shops.

Employment

Home appliance repair technicians are employed throughout the country, but a higher concentration of jobs can be found in more populated areas. Home appliance repair technicians held 49,600 jobs in 2008. About 32 percent of salaried technicians worked for retail trade establishments, mainly electronics and appliance stores. Another 21 percent worked in the personal and household goods repair and maintenance industry. About 27 percent of repairers were self-employed.

Job Outlook

Little to no change in employment of home appliance repairers is projected. However, excellent job opportunities are projected, particularly for individuals with formal training in appliance repair and electronics.

Employment change. Employment of home appliance repairers will increase by 2 percent between 2008 and 2018, reflecting the difficulty of employers in finding qualified applicants. Although the number of home appliances in use is expected to increase with growth in the numbers of households, companies report difficulty in hiring repair technicians. In addition, the decision to repair an appliance often depends on the price to replace the appliance versus the cost to make the repairs. So while higher priced major appliances designed to have a long life are more likely to be repaired, small and cheaper appliances are increasingly being discarded rather than be repaired. With sales of high-end appliances growing, demand for major appliance repair technicians should be strong into the future, but weaker for those specializing in small, portable appliances.

Job prospects. Job opportunities for home appliance repair technicians are expected to be excellent over the 2008-18 period, with job openings continuing to outnumber jobseekers. Companies report numerous unfilled vacancies and the expected retirement of many older technicians. Opportunities will be best in metropolitan areas. Individuals with formal training in appliance repair and electronics should have the best opportunities.

Jobs are expected to be increasingly concentrated in larger household goods repair services companies as stores increasingly outsource repair work to companies that specialize in maintenance and repair. Employment is relatively steady and workers are rarely laid off because demand for major appliance repair services is fairly constant.

Earnings

Median hourly wages, including commissions, of home appliance repairers were \$16.30 in May 2008. The middle 50 percent earned between \$12.87 and \$20.92 an hour. The lowest 10 percent earned less than \$9.98, and the highest 10 percent earned more than \$25.92 an hour. In May 2008, median hourly wages of home appliance repairer technicians in the largest employing industries were \$15.05 in electronics and appliance stores and \$17.58 in personal and household goods repair and maintenance.

Earnings of home appliance repairer technicians vary with skill level, geographic location, and type of equipment repaired.

Many repairers receive a commission along with their salary, therefore earnings increase with the number of jobs a repairer can complete in a day.

Many larger dealers, manufacturers, and service stores offer typical benefits such as health insurance coverage, sick leave, and retirement and pension programs. Some provide company vehicles.

Industrial Machinery Mechanics and Millwrights

Significant Points

- Most workers are employed in manufacturing.
- Machinery maintenance workers learn on the job, industrial machinery mechanics usually need some education after high school, and millwrights typically learn through formal apprenticeship programs.
- Applicants with broad skills in machine repair and maintenance should have favorable job prospects.

Nature of the Work

Imagine an automobile assembly line: a large conveyor system moves unfinished automobiles down the line, giant robotic welding arms bond the different body panels together, hydraulic lifts move the motor into the body of the car, and giant presses stamp body parts from flat sheets of steel. All these complex machines need workers to install them and service them to make sure they function properly. Assembling and setting up these machines on the factory floor is the job of millwrights, while industrial machinery mechanics and machinery maintenance workers maintain and repair these machines.

Millwrights are the highly skilled workers who install, assemble, and, when necessary, dismantle machinery in factories, power plants, and construction sites. These workers consult with engineers and managers to determine the best location to place a machine. Millwrights then transport the machine parts to the desired location, using fork lifts, hoists, winches, cranes and other equipment. Machines do not arrive in one piece, and millwrights need to assemble them from their component parts. Millwrights must understand how a machine functions to assemble and disassemble it properly; this may involve knowledge of electronics, pneumatics, and computer systems. They use complex instruction books that detail the assembly of the machinery and use tools such as levels, welding machines, and hydraulic torque wrenches. Millwrights use micrometers, precision measuring devices, to achieve the extreme tolerances required by modern machines. On large projects, the use of cranes and trucks is common.

Assembly of a machine can take a few days or several weeks. Aside from assembly, millwrights are also involved in major repairs and disassembly of machines. If a manufacturing plant needs to clear floor space for new machinery, it can sell or trade-in old equipment. The breaking down of a machine is normally just as complicated as assembling it; all parts must be carefully taken apart, categorized and packaged for shipping.

While major repairs may require the assistance of a millwright, keeping machines in good working order is the primary responsibility of *industrial machinery mechanics*, also called industrial machinery repairers or maintenance machinists. To do this effectively, these workers must be able to detect minor problems and correct them before they become larger problems. Machinery mechanics use technical manuals, their understanding of the equipment, and careful observation to discover the cause of the problem. For example, after hearing a vibration from a machine, the mechanic must decide whether it is due to worn belts, weak motor bearings, or some other problem. Mechanics often need years of training and experience to fully diagnose all problems, but computerized diagnostic systems and vibration analysis techniques provide aid in determining the nature of the problem.

After diagnosing the problem, the industrial machinery mechanic may disassemble the equipment to repair or replace the necessary parts. Increasingly, mechanics are expected to have the electrical, electronics, and computer programming skills to repair sophisticated equipment on their own. Once a repair is made, mechanics perform tests to ensure that the machine is running smoothly. Primary responsibilities of industrial machinery mechanics also include preventive maintenance; for

example, they adjust and calibrate automated manufacturing equipment, such as industrial robots.

The most basic maintenance and repair tasks are performed by *machinery maintenance workers*. These employees are responsible for cleaning and lubricating machinery, performing basic diagnostic tests, checking performance, and testing damaged machine parts to determine whether major repairs are necessary. In carrying out these tasks, maintenance workers must follow machine specifications and adhere to maintenance schedules. Maintenance workers may perform minor repairs, but major repairs generally are left to machinery mechanics.

Industrial machinery mechanics and machinery maintenance workers use a variety of tools to perform repairs and preventive maintenance. They may use handtools to adjust a motor or a chain hoist to lift a heavy printing press off the ground. When replacements for broken or defective parts are not readily available, or when a machine must be returned quickly to production, mechanics may create a new part using lathes, grinders, or drill presses. Mechanics use catalogs to order replacement parts and often follow blueprints, technical manuals, and engineering specifications to maintain and fix equipment. By keeping complete and up-to-date records, mechanics try to anticipate trouble and service equipment before factory production is interrupted. If an industrial machinery mechanic is unable to repair a machine and a major overhaul is needed, a millwright with expertise on the machine may be hired to make the repair.

Work environment. In production facilities, these workers are subject to common shop injuries such as cuts, bruises, and strains. In the construction setting, workers must be careful of heavy equipment. They also may work in awkward positions, including on top of ladders or in cramped conditions under large machinery, which exposes them to additional hazards. To avoid injuries, workers must follow safety precautions and use protective equipment, such as hardhats, safety glasses, steel-tipped shoes, hearing protectors, and belts.

Because factories and other facilities cannot afford to have industrial machinery out of service for long periods, mechanics may be on call or assigned to work nights or on weekends. Overtime is common among these occupations, as about 30 percent of employees worked over 40 hours per week, on average, in 2008.

Millwrights are typically employed on a contract basis and may only spend a few days or weeks at a single site. As a result, schedules of work can be unpredictable, and workers may experience down time in between jobs.

Training, Other Qualifications, and Advancement

Millwrights typically go through formal apprenticeship programs that last a few years and involve both classroom and on-the-job training. Industrial machinery mechanics usually need some education after high school plus experience working on specific machines before they can be considered a mechanic. Machinery maintenance workers can usually get a job with little more than a high school diploma or its equivalent; most workers learn on the job.

Education and training. All machinery maintenance and millwright worker positions generally require a high school diploma, GED, or its equivalent. However, employers increasingly prefer to hire machinery maintenance workers with some training in industrial technology. Employers also prefer to hire

Millwrights install and inspect power generating turbines.

those who have taken high school or postsecondary courses in mechanical drawing, mathematics, blueprint reading, computer programming, or electronics.

Most millwrights, and some industrial machinery mechanics, enter the occupation through an apprenticeship program that typically lasts about 4 years. Apprenticeships can be sponsored by local union chapters, employers, or the State labor department. Training in these apprenticeships involves a combination of on-the-job training and classroom learning. Jobseekers can apply for union apprenticeships, and qualified applicants may begin training in local training facilities and factories.

Industrial machinery mechanics usually need a year or more of formal education and training after high school to learn the growing range of mechanical and technical skills that they need. While mechanics used to specialize in one area, such as hydraulics or electronics, many factories now require every mechanic to have knowledge of electricity, electronics, hydraulics, and computer programming.

Workers can get this training in a number of different ways. A 2-year associate degree program in industrial maintenance provides good preparation. Other mechanics may start as helpers or in other factory jobs and learn the skills of the trade informally and by taking courses offered through their employer. It is common for experienced production workers to move into maintenance positions if they show good mechanical abilities.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Industrial machinery mechanics and millwrights	—	408,300	433,300	25,000	6
Industrial machinery mechanics	49-9041	287,700	308,600	20,900	7
Maintenance workers, machinery	49-9043	75,400	78,800	3,400	5
Millwrights.....	49-9044	45,200	45,900	600	1

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

ties. Employers may offer on-site classroom training or send workers to local technical schools while they receive on-the-job training. Classroom instruction focuses on subjects such as shop mathematics, blueprint reading, welding, electronics, and computer training. In addition to classroom training, it is important that mechanics train on the specific machines they will repair. They can get this training on the job, through dealer or manufacturer's representatives, or in a classroom.

Machinery maintenance workers typically receive on-the-job training lasting a few months to a year to perform routine tasks, such as setting up, cleaning, lubricating, and starting machinery. This training may be offered by experienced workers, professional trainers, or representatives of equipment manufacturers.

Other qualifications. Machinery mechanics must have good problem-solving abilities, as it is important for them to be able to discover the cause of a problem to repair it. Mechanical aptitude and manual dexterity are also important. Good reading comprehension is necessary to understand the technical manuals of a wide range of machines; and good communications skills are also essential in order for millwrights, mechanics and maintenance workers to understand the needs of other workers and managers. In addition, good physical conditioning and agility are necessary because repairers sometimes have to lift heavy objects or climb to reach equipment.

Advancement. Opportunities for advancement vary by specialty. Machinery maintenance workers, if they take classes and gain additional skills, may advance to industrial machinery mechanic or supervisor. Industrial machinery mechanics also advance by working with more complicated equipment and gaining additional repair skills. The most highly skilled repairers can be promoted to supervisor, master mechanic, or millwright. Experienced millwrights can advance into team leading roles.

Employment

Industrial machinery mechanics, machinery maintenance workers and millwrights held about 408,300 jobs in 2008. 45,200 of these jobs were held by millwrights, with the largest concentration of workers in manufacturing and construction industries. In manufacturing, many of these workers are employed in the transportation equipment, wood product, and paper manufacturing industries. In construction, most workers were employed in the nonresidential building, and building equipment contractors, industries. Also, some millwrights work in the utilities industry.

Industrial machinery mechanics held about 287,700 jobs, while machinery maintenance workers accounted for 75,400 jobs. Many of both types of workers were employed in the manufacturing sector in industries such as food processing and chemical, fabricated metal product, machinery, and motor

vehicle and parts manufacturing. Additionally, about 10 percent work in wholesale trade, mostly for dealers of industrial equipment. Manufacturers often rely on these dealers to make complex repairs to specific machines. About 9 percent of mechanics work for the commercial and industrial machinery and equipment repair and maintenance industry, often making site visits to companies to repair equipment.

Job Outlook

Employment is projected to grow more slowly than average, and applicants with broad skills in machine repair and maintenance should have favorable job prospects.

Employment change. Employment of industrial machinery mechanics and millwrights is expected to grow 6 percent from 2008 to 2018, more slowly than the average for all occupations. The increased use of machinery in manufacturing will require more millwrights to install this equipment and more mechanics and maintenance workers to keep it in good working order.

Employment of millwrights is expected to grow 1 percent from 2008 to 2018. The demand for millwrights is driven by the purchasing of machinery in the construction and manufacturing industries. Cost-cutting pressures will drive manufacturers to further automate production and increase machinery presence on the factory floor. The growth of the power industry will also generate work for millwrights, as they install and repair turbines on wind mills, coal plants, and hydroelectric dams.

Employment of industrial machinery mechanics and maintenance workers is expected to grow 7 percent from 2008 to 2018. As factories become increasingly automated, these workers will be needed to maintain and repair the automated equipment. However, many new computer-controlled machines are capable of diagnosing problems quickly, resulting in faster and easier repair, which somewhat slows the growth of these occupations.

Job prospects. Applicants with broad skills in machine repair and maintenance should have favorable job prospects. In addition to job openings from growth, there will be a need to replace the many older workers who are expected to retire, and those who leave the occupation for other reasons. Some employers have reported difficulty in recruiting young workers with the necessary skills.

Mechanics and millwrights are not as affected by changes in production levels as other manufacturing workers, as mechanics and millwrights often are retained during production downtime to complete major equipment overhaul and to keep expensive machinery in working order.

Earnings

Median hourly wages of millwrights were \$22.87 in May 2008. The middle 50 percent earned between \$17.85 and \$30.53. The lowest 10 percent earned less than \$14.37, and the highest 10 percent earned more than \$37.02.

Median hourly wages of industrial machinery mechanics were \$20.99 in May 2008. The middle 50 percent earned between \$16.87 and \$25.82. The lowest 10 percent earned less than \$13.63, and the highest 10 percent earned more than \$31.40.

Machinery maintenance workers earned somewhat less than the higher skilled industrial machinery mechanics. Median hourly wages of machinery maintenance workers were \$17.69 in May 2008. The middle 50 percent earned between \$13.75 and \$22.82. The lowest 10 percent earned less than \$10.83, and the highest 10 percent earned more than \$28.10.

Earnings vary by industry and geographic region. Median hourly wages in the industries employing the largest numbers of industrial machinery mechanics are:

Motor vehicle parts manufacturing	\$24.04
Machinery, equipment, and supplies merchant wholesalers	20.17
Plastics product manufacturing	20.05
Commercial and industrial machinery and equipment (except automotive and electronic) repair and maintenance.....	18.65
Animal slaughtering and processing	16.65

In 2008, almost half of all millwrights belonged to unions, while about 19 percent of industrial machinery mechanics were union members.

Line Installers and Repairers

Significant Points

- Earnings are higher in this occupation than in many other occupations that do not require postsecondary education.
- A growing number of retirements should create very good job opportunities, especially for electrical power-line installers and repairers.
- Line installers and repairers often work outdoors, and conditions can be hazardous.
- Most positions require several years of long-term on-the-job training.

Nature of the Work

Every time you turn on your lights, call someone on the phone, watch cable television, or access the Internet, you are connecting to complex networks of lines and cables that provide you with electricity and connect you with the outside world. *Line installers and repairers*, also known as *line workers* or *linemen*, are the people who install and maintain these networks.

Because these systems are so complicated, most line workers specialize in certain skill areas; the areas in which they specialize depend on their employers and on what part of the network the workers service. Line workers can be divided into two categories: *electrical power-line installers and repairers*, and *telecommunications line installers and repairers*. Workers can further specialize in either installation or repair. Electrical line workers can also be divided into workers who install and maintain the multistate power grids, and those who work for local utilities. Similarly, telecommunications line workers specialize in telephone, cable, fiber-optic, and other networks. Each of these specializations requires specific skills, and it may be difficult to transfer skills learned in one area to another. In many cases, two or more skills sets will be combined, especially for experienced workers and supervisors.

Electrical power-line installers and repairers install and maintain the power grid—the network of power lines that moves electricity from generating plants to customers. They routinely work with high voltage electricity, which requires extreme caution. This can range from hundreds of thousands of volts for long-distance transmission lines that make up the power grid to less than 10,000 volts for distribution lines that supply electricity to homes and businesses. Line workers who maintain the interstate power grid work in crews that travel to work locations throughout a large region to maintain transmission lines and towers. Workers employed by local utilities work mainly with lower voltage distribution lines, maintaining equipment such as transformers, voltage regulators, and switches. They may also work on traffic lights and streetlights.

In contrast, telecommunications line installers and repairers install and maintain the lines and cables used by local and long-distance telephone services, cable television, the Internet, and other communications networks. These services use a variety of different types of cables, including fiber-optic cables. Un-

like metallic cables that carry electricity, fiber optic cables are made of glass or plastic and transmit signals using light. Working with fiber optics requires special skills, such as splicing and terminating optical cables. Additionally, workers must be able to test and troubleshoot cables and networking equipment.

Line installers are workers who install new cable. They may work for construction contractors, utilities, or telecommunications companies. They generally start a new job by digging underground trenches or erecting utility poles and towers to carry the wires and cables. They use a variety of construction equipment, including digger derricks, which are trucks equipped with augers and cranes used to dig holes in the ground and set poles in place. Line installers also use trenchers, cable plows, and borers, which are used to cut openings in the earth for the laying of underground cables. Once the infrastructure is in place, line installers string cable along poles and towers or through tunnels and trenches.

Line repairers are employed by utilities and telecommunications companies that maintain existing power and telecommunications lines. Maintenance needs may be identified in a variety of ways, including remote monitoring equipment, inspections by airplane or helicopter, and customer reports of service outages. Workers may also replace aging or outdated equipment. Many of these workers have installation duties in addition to their repair duties.

When a problem is reported, line repairers must identify its cause and fix it. This usually involves testing equipment and replacing it as necessary. In order to work on poles, line installers usually use bucket trucks to elevate themselves to the top of the structure, although all line workers must be adept at climbing poles when necessary. Workers use special safety equipment to keep them from falling when climbing utility poles. Storms and other natural disasters can cause extensive damage to networks of lines. When a connection goes out, line repairers must work quickly to restore service to customers.

Work environment. The work of line installers and repairers can be very physically demanding. Line installers must be comfortable working both at heights and in confined spaces. While bucket trucks have reduced the amount of climbing workers must do, all line workers must be able to climb utility poles and balance while working on them. They must also be able to lift equipment and work in a variety of positions, such as stoop-

Most line installers need several years of on-the-job training.

ing or kneeling. Their work often requires that they drive utility vehicles, travel long distances, and work outdoors under poor weather conditions.

Line workers encounter serious hazards on their jobs and must follow safety procedures to minimize potential danger. They wear safety equipment when entering utility holes and test for the presence of gas before going underground. Electric power-line workers have somewhat hazardous jobs. High-voltage power lines can instantly electrocute a worker who comes in contact with a live cable. When possible, workers arrange for lines to be de-energized and test to make sure that any remaining voltage has been neutralized. When workers must work with live wires, they use electrically insulated protective devices and tools to ensure their safety. Power lines are typically higher than telephone and cable television lines, increasing the risk of severe injury due to falls. To prevent injuries, line installers must use fall-protection equipment when working on poles or towers.

While safety procedures and training have significantly reduced the danger that line workers face, the job is still among the most dangerous jobs in the American economy. Both telecommunications and electrical line workers have relatively high rates of nonfatal occupational injuries. In the early days of electricity, one in four line workers suffered fatal injuries on the job. Today, however, fatalities are extremely rare.

Workers on the interstate power grid or on long-distance communications systems are often required to travel extensively as part of their jobs. Since line installers and repairers fix damage from storms, they may be asked to work long and irregular hours during unpleasant weather. They can expect to frequently be on-call and work overtime. When performing normal maintenance and constructing new lines, line installers work more traditional hours.

Training, Other Qualifications, and Advancement

Most line installers and repairers require several years of long-term on-the-job training and some classroom work to become proficient. Formal apprenticeships are common.

Education and training. Most companies require that line installers and repairers have a high school diploma or the equivalent. Employers look for people with basic knowledge of algebra and trigonometry and good reading and writing skills. Technical knowledge of electricity or electronics obtained through military service, vocational programs or community colleges can be helpful, but it is rarely required for new employees.

Many community colleges offer programs in telecommunications, electronics, or electricity. Some programs work with local companies to offer 1-year certificates that emphasize hands-on field work. More advanced 2-year associate degree programs provide students with a broader knowledge of the technology

used in telecommunications and electrical utilities. They offer courses in electricity, electronics, fiber optics, and microwave transmission.

Line installers and repairers receive most of their training on the job. Electrical line installers and repairers often must complete formal apprenticeships or other employer training programs. These programs, which can last up to 5 years, combine on-the-job training with formal classroom courses and are sometimes administered jointly by the employer and the union representing the workers. Safety regulations strictly define the training and educational requirements for apprentice electrical line installers, but licensure is not required.

Line installers and repairers working for telephone and cable television companies receive several years of on-the-job training. They also may attend training or take online courses provided by equipment manufacturers, schools, unions, or industry training organizations.

Other qualifications. Physical fitness is important because line workers must be able to climb, lift heavy objects (many employers require applicants to be able to lift at least 50 pounds), and do other physical activity that requires stamina, strength, and coordination. They often must work at a considerable height above the ground, so they cannot be afraid of heights. They must also work underground and in bucket trucks, so they must also be comfortable working in confined spaces. Normal ability to distinguish colors is necessary because wires and cables are often color coded. In addition, line workers usually need commercial driver's licenses to operate company-owned vehicles, and a good driving record is important.

Line installers and repairers must also be able to read instructions, write reports, and solve problems. They should also be mechanically inclined and like working with computers and new technology. Workers often rely on their fellow crew members for their safety, so teamwork is critical. Being able to get along with other people is very important in this job.

Advancement. Entry-level line workers generally begin with classroom training and begin an apprenticeship. Their on-the-job training begins with basic tasks, such as ground work and tree trimming. As they continue to learn additional skills from more experienced workers, they may advance to stringing cable and performing service installations. In time, they advance to more sophisticated maintenance and repair positions in which they are responsible for increasingly larger portions of the network.

After about 3 to 5 years of working, qualified line workers reach the journeyman level. A journeyman line worker is no longer considered apprenticed, and can do most tasks without supervision. Journeyman line workers may also qualify for positions at other companies. Workers with many years of ex-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Line installers and repairers	49-9050	284,900	291,600	6,600	2
Electrical power-line installers and repairers	49-9051	113,900	119,000	5,100	4
Telecommunications line installers and repairers	49-9052	171,000	172,600	1,600	1

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

perience may become first-line supervisors or may advance to trainer positions.

Employment

Line installers and repairers held about 284,900 jobs in 2008. Approximately 171,000 were telecommunications line installers and repairers while the remaining 113,900 were electrical power-line installers and repairers. Nearly all line installers worked for telecommunications companies, including both cable television distribution and telecommunications companies; construction contractors; and electric power generation, transmission, and distribution companies.

Job Outlook

Little or no change in employment is expected. Retirements are expected to create very good job opportunities for new workers, particularly for electrical power-line installers and repairers.

Employment change. Overall employment of line installers and repairers will grow by 2 percent between 2008 and 2018. Despite employment declines in some of the major industries that employ these workers, some growth will occur as population growth and expansion of cities create increased need for power and communications lines. Further, the emphasis of both the electrical power and telecommunications industries on reliability will lead to reinforcement of these networks, which will require more workers.

Employment of telecommunications line installers and repairers will grow by about 1 percent over the 2008–2018 decade. As the population grows, installers will continue to be needed to provide new telephone, cable, and Internet services for new developments. Additionally, the exponential growth of the Internet will require more long-distance fiber-optic lines, including interstate and undersea cables.

Employment of electrical power-line installers and repairers is expected to grow by about 4 percent between 2008 and 2018. As with telecommunications line installers and repairers, growth will be largely attributable to the growing population and expansion of cities. With each new development, new lines are installed which will require maintenance. In addition, the interstate power grid will continue to grow in complexity to ensure reliability.

Job prospects. Very good job opportunities are expected, especially for electrical power-line installers and repairers. Because of layoffs in the 1990s, more of the electrical power industry is near retirement age than in most industries. This is of special concern for electrical line workers, who must be in good physical shape and cannot necessarily put off retirement in response to incentives. Telecommunications line workers face a similar demographic challenge. Additionally, technically skilled workers who do not have a college degree have an increasing number of employment opportunities, creating competition among employers. As a result, opportunities for new entrants should be very good.

Earnings

Earnings for line installers and repairers are above the average for occupations that do not require postsecondary education. In May 2008, median annual wages for electrical power-line installers and repairers were \$55,100. The middle 50 percent

earned between \$41,340 and \$66,030. The lowest 10 percent earned less than \$31,420, and the highest 10 percent earned more than \$78,780. Median annual wages in the industries employing the largest numbers of electrical power-line installers and repairers in May 2008 are shown below:

Natural gas distribution	\$84,350
Electric power generation, transmission and distribution	58,530
Local government	52,900
Building equipment contractors	52,870
Utility system construction	45,420

Median annual wages for telecommunications line installers and repairers were \$48,090 in May 2008. The middle 50 percent earned between \$33,680 and \$60,670. The lowest 10 percent earned less than \$25,790, and the highest 10 percent earned more than \$67,990. Median annual wages in the industries employing the largest numbers of telecommunications line installers and repairers in May 2008 are shown below:

Other telecommunications	\$58,100
Wired telecommunications carriers	54,860
Cable and other subscription programming	39,970
Building equipment contractors	37,760
Utility system construction	34,580

Many line installers and repairers belong to unions, principally the Communications Workers of America, the International Brotherhood of Electrical Workers, and the Utility Workers Union of America. For these workers, union contracts set wage rates and wage increases and determine the time needed to advance from one wage level to the next.

Good health, education, and vacation benefits are common in the occupation.

Related Occupations

Other workers who install and repair electrical and electronic equipment include:

Maintenance and Repair Workers, General

Significant Points

- General maintenance and repair workers are employed in almost every industry.
- Many workers learn their skills informally on the job; obtaining certification may result in better advancement opportunities in higher paying industries.
- Job growth and turnover in this large occupation should result in excellent job opportunities, especially for people with experience in maintenance and related fields.

Nature of the Work

Most craft workers specialize in one kind of work, such as plumbing or carpentry. *General maintenance and repair workers*, however, have skills in many different crafts. They repair and maintain machines, mechanical equipment, and buildings and work on plumbing, electrical, and air-conditioning and heating systems. They build partitions, make plaster or drywall repairs, and fix or paint roofs, windows, doors, floors, woodwork, and other parts of building structures. They also maintain and repair specialized equipment and machinery found in cafeterias, laundries, hospitals, stores, offices, and factories.

Maintenance and repair workers need to know about computer controls of various building systems.

Typical duties include troubleshooting and fixing faulty electrical switches, repairing air-conditioning motors, and unclogging drains. New buildings sometimes have computer-controlled systems that allow maintenance workers to make adjustments in building settings and monitor for problems from a central location. For example, they can remotely control light sensors that turn off lights automatically after a set amount of time or identify a broken ventilation fan that needs to be replaced.

General maintenance and repair workers inspect and diagnose problems and determine the best way to correct them, frequently checking blueprints, repair manuals, and parts catalogs. They obtain supplies and repair parts from distributors or store-rooms. Using common hand and power tools such as screwdrivers, saws, drills, wrenches, and hammers, as well as specialized equipment and electronic testing devices, these workers replace or fix worn or broken parts, where necessary, or make adjustments to correct malfunctioning equipment and machines.

General maintenance and repair workers also perform routine preventive maintenance and ensure that machines continue to run smoothly, building systems operate efficiently, and the physical condition of buildings does not deteriorate. Following a checklist, they may inspect drives, motors, and belts, check fluid levels, replace filters, and perform other maintenance actions. Maintenance and repair workers keep records of their work.

Employees in small establishments, where they are often the only maintenance worker, make all repairs, except for very large or difficult jobs. In larger establishments, duties may be limited to the maintenance of everything in a single workshop or a particular area.

Work environment. General maintenance and repair workers often carry out many different tasks in a single day, at any number of locations, including indoor and outdoor. They may work inside a single building, such as a hotel or hospital, or be responsible for the maintenance of many buildings, such as those in an apartment complex or college campus. They may have to stand for long periods, lift heavy objects, and work in uncomfortably hot or cold environments, in awkward and cramped positions, or on ladders. Those employed in small establishments often work with only limited supervision. Those in larger establishments frequently work under the direct supervision of an experienced worker. Some tasks put workers at risk of electrical shock, burns, falls, cuts, and bruises. Data from the U.S. Bureau of Labor Statistics show that full-time general maintenance workers experienced a work-related injury and illness rate that was much higher than the national average. Most general maintenance workers work a 40-hour week. Some work evening, night, or weekend shifts or are on call for emergency repairs.

Training, Other Qualifications, and Advancement

Many general maintenance and repair workers learn their skills informally on the job as helpers to other repairers or to carpenters, electricians, and other construction workers. Certification is available for entry-level workers, as well as experienced workers seeking advancement.

Education and training. General maintenance and repair workers often learn their skills informally on the job. They start as helpers, watching and learning from skilled maintenance

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Maintenance and repair workers, general	49-9042	1,361,300	1,509,200	147,900	11

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

workers. Helpers begin by performing simple jobs, such as fixing leaky faucets and replacing light bulbs, and progress to more difficult tasks, such as overhauling machinery or building walls. Some learn their skills by working as helpers to other types of repair or construction workers, including machinery repairers, carpenters, or electricians.

Several months of on-the-job training are required to become fully qualified, depending on the skill level required. Some jobs require a year or more to become fully qualified. Because a growing number of new buildings rely on computers to control their systems, general maintenance and repair workers may need basic computer skills, such as how to log onto a central computer system and navigate through a series of menus. Companies that install computer-controlled equipment usually provide on-site training for general maintenance and repair workers.

Many employers prefer to hire high school graduates. High school courses in mechanical drawing, electricity, woodworking, blueprint reading, science, mathematics, and computers are useful. Because of the wide variety of tasks performed by maintenance and repair workers, technical education is an important part of their training. Maintenance and repair workers often need to do work that involves electrical, plumbing, and heating and air-conditioning systems, or painting and roofing tasks. Although these basic tasks may not require a license to do the work, a good working knowledge of many repair and maintenance tasks is required. Many maintenance and repair workers learn some of these skills in high school shop classes and postsecondary trade or vocational schools or community colleges.

Licensure. Licensing requirements vary by State and locality. In some cases, workers may need to be licensed in a particular specialty such as electrical or plumbing work.

Other qualifications. Technical and mechanical aptitude, the ability to use shop mathematics, and manual dexterity are important attributes. Good health is necessary because the job involves much walking, climbing, standing, reaching, and heavy lifting. Difficult jobs require problem-solving ability, and many positions require the ability to work without direct supervision.

Certification and advancement. The International Management Institute (IMI) offers certification for three levels of competence, focusing on a broad range of topics, including blueprints, mathematics, basic electricity, piping systems, landscape maintenance, and troubleshooting skills. The lowest level of certification is Certified Maintenance Technician, the second level is Certified Maintenance Professional, and the highest level of certification is Certified Maintenance Manager. To become certified, applicants must meet several prerequisites and pass a comprehensive written examination.

Many general maintenance and repair workers in large organizations advance to maintenance supervisor or become craftwork-

ers such as electricians, heating and air-conditioning mechanics, or plumbers. Within small organizations, promotion opportunities may be limited. Obtaining IMI certification may lead to better advancement opportunities in higher paying industries.

Employment

General maintenance and repair workers held about 1.4 million jobs in 2008. They were employed in almost every industry. Around 18 percent worked in manufacturing industries, while about 11 percent worked for Government. Others worked for wholesale and retail firms and for real estate firms that operate office and apartment buildings.

Job Outlook

Average employment growth is expected. Job growth and the need to replace those who leave this large occupation should result in excellent job opportunities, especially for those with experience in maintenance and related fields.

Employment change. Employment of general maintenance and repair workers is expected to grow 11 percent during the 2008-18 decade, about as fast as the average for all occupations. Employment is related to the number of buildings—for example, office and apartment buildings, stores, schools, hospitals, hotels, and factories—and the amount of equipment needing maintenance and repair. One factor limiting job growth is that computers allow buildings to be monitored more efficiently, partially reducing the need for workers.

Job prospects. Job opportunities should be excellent, especially for those with experience in maintenance or related fields. Those who obtain certification will also face excellent opportunities. General maintenance and repair is a large occupation, generating many job openings due to growth and the need to replace those who leave the occupation. Many job openings are expected to result from the retirement of experienced maintenance workers over the next decade.

Earnings

Median hourly wages of general maintenance and repair workers were \$16.21 in May 2008. The middle 50 percent earned between \$12.44 and \$21.09. The lowest 10 percent earned less than \$9.78, and the highest 10 percent earned more than \$25.94. Median hourly wages in the industries employing the largest numbers of general maintenance and repair workers in May 2008 are shown in the following tabulation:

Local government.....	\$17.11
Elementary and secondary schools	16.86
Activities related to real estate	14.41
Lessors of real estate	13.91
Traveler accommodation	12.65

About 15 percent of general maintenance and repair workers are members of unions, including the American Federation of State, County, and Municipal Employees and the United Auto Workers.

Related Occupations

Some duties of general maintenance and repair workers are similar to those of:

	Page
Boilermakers	613
Carpenters	618
Electricians.....	641
Heating, air-conditioning, and refrigeration mechanics and installers.....	703
Plumbers, pipelayers, pipefitters, and steamfitters.....	659
Other, more specific, duties are similar to those of:	
Coin, vending, and amusement machine servicers and repairers.....	720
Electrical and electronics installers and repairers.....	675
Electronic home entertainment equipment installers and repairers.....	678
Radio and telecommunications equipment installers and repairers.....	680

Medical Equipment Repairers

Significant Points

- Employment is projected to grow 27 percent, which is much faster than the average for all occupations.
- Excellent job opportunities are expected.
- Employers generally prefer applicants with an associate's degree in biomedical equipment technology or engineering; a bachelor's degree often is needed for advancement.
- Repairers may be on-call around the clock in case of emergencies.

Nature of the Work

Medical equipment repairers, also known as *biomedical equipment technicians* (BMET), maintain, adjust, calibrate, and repair a wide variety of electronic, electromechanical, and hydraulic equipment used in hospitals and other medical environments, including health practitioners' offices. They may work on patient monitors, defibrillators, medical imaging equipment (x rays, CAT scanners, and ultrasound equipment), voice-controlled operating tables, electric wheelchairs, as well as other sophisticated dental, optometric, and ophthalmic equipment.

Medical equipment repairers use a wide variety of tools to conduct their work, including multimeters, specialized software, and computers designed to communicate with specific pieces of hardware. They may also use hand tools, soldering irons, and other electronic tools to fix or adjust malfunctioning equipment, such as a broken wheelchair. If a machine is not functioning to its potential, the repairer may have to adjust the mechanical or hydraulic components, or adjust the software to bring the equipment back into calibration. Most medical equipment is powered by electricity, but because many also have mechanical and hydraulic components, being familiar with all of these systems is critical.

In some cases, medical equipment repairers perform routine scheduled maintenance to ensure that all equipment is in good working order. Since many doctors, particularly specialty practitioners, regularly use complex medical devices to run tests and diagnose patients, they must be guaranteed that the readings are accurate. For less complicated equipment, such as electric hospital beds, many repairs may take place on an as-needed-basis.

In a hospital setting, specialists must be comfortable working around patients because repairs occasionally must take place while equipment is being used. When this is the case, the repairer must take great care to ensure that repairs do not disturb patients.

Many medical equipment repairers are employed in hospitals. Some, however, work for electronic equipment repair and maintenance companies that service medical equipment used by other health practitioners, including gynecologists, orthodontists, veterinarians, and other diagnostic medical professionals. Whereas some medical equipment repairers are trained to fix a wide variety of equipment, others specialize and become proficient at repairing one or a small number of machines.

Work environment. Medical equipment repairers usually work daytime hours, but are often expected to be on call. Still, like other hospital employees, some repairers work irregular hours and may be required to work overtime if an important piece of medical equipment malfunctions. Medical equipment repairers often must work in a patient environment, which has the potential to expose them to diseases and other health risks. Because medical equipment is often used in life-saving therapies, diagnosing and repairing equipment can be urgent. Although this may be gratifying, it can also be very stressful. Those who work as contractors often have to travel—sometimes long distances—to perform needed repairs.

Training, Other Qualifications, and Advancement

Employers generally prefer candidates with an associate's degree in biomedical technology or engineering; a bachelor's degree often is needed for advancement.

In some cases, medical equipment repairs must be performed while equipment is in use.

Education and training. Although education requirements vary depending on a worker’s experience and area of specialization, the most common education path for repairers is an associate degree in biomedical equipment technology or engineering. Those who repair less complicated equipment, such as hospital beds or electric wheelchairs, may learn entirely through on-the-job training. Others, particularly those who work on more sophisticated equipment such as CAT scanners and defibrillators, may need a bachelor’s degree. New workers generally start by observing and assisting experienced repairers over a period of 3 to 6 months, learning a single piece of equipment at a time. Gradually, they begin working more independently, while still under close supervision. Each piece of equipment is different, and medical equipment repairers must learn each one separately. In some cases, this requires careful study of a machine’s technical specifications and manual. Medical device manufacturers also may provide training courses in a classroom or online.

Because medical equipment technology is rapidly evolving and new devices are frequently introduced, repairers must constantly update their skills and knowledge of equipment. As a result, they must constantly learn new technologies and equipment through seminars, self-study, and certification exams.

Certification and other qualifications. Medical equipment repairers are problem solvers—diagnosing and repairing equipment, often under time constraints—therefore, being able to work under pressure is critical. As in most repair occupations, having mechanical and technical aptitude, as well as manual dexterity, is important.

Some associations offer certifications for medical equipment repairers. For example, the Association for the Advancement of Medical Instrumentation (AAMI) offers certification in three specialty areas—Certified Biomedical Equipment Technician (CBET), Certified Radiology Equipment Specialists (CRES), and Certified Laboratory Equipment Specialist (CLEB). Those who wish

to become certified must satisfy a combination of education and experience requirements prior to taking the AAMI examination. Candidates who meet the necessary criteria can begin pursuing the desired certification on the basis of their qualifications. Certification demonstrates a level of competency and can make an applicant more attractive to employers, as well as increase one’s opportunities for advancement. Most employers, particularly hospitals, often pay for their in-house medical repairers to become certified.

Advancement. Most medical equipment repairers advance by demonstrating competency at lower levels, which allows them to repair more complex equipment. Some may become supervisors or managers, but these positions usually require a bachelor’s degree. Experienced repairers also may serve as mentors for new employees or teach training courses on specific products.

Employment

Medical equipment repairers held 41,400 jobs in May 2008. Industries employing the largest number of medical equipment repairers in 2008 were:

Professional and commercial equipment and supplies merchant wholesalers	9,400
Hospitals, public and private	7,100
Electronic and precision equipment repair and maintenance.....	5,700
Health and personal care stores.....	2,300
Consumer goods rental.....	2,300

Job Outlook

Medical equipment repairers are projected to grow much faster than average between 2008 and 2018. Opportunities should be excellent for qualified job seekers.

Employment change. Employment of medical equipment repairers is expected to grow 27 percent over the 2008-18 decade, which is much faster than the average for all occupations. As the proportion of people in older age groups will grow faster than the total population between 2008 and 2018, demand for overall healthcare will increase. Increased demand for healthcare services and increasing complexity of the medical equipment used in hospitals and by private practitioners will result in a greater need for repairers. For example, a growing number of hospital diagnostic, electromedical, and patient monitoring equipment including CAT scans, electrocardiogram, magnetic resonance imaging, ultrasound, and x-ray machines, as well as hospital furniture, such as full electric beds and wheelchairs, will all need to be maintained and repaired. Additionally, machines used by private practitioners and technicians to diagnose and treat vision, teeth, and other parts of the human body also are becoming increasingly sophisticated, and will further spur growth of medical equipment repairers.

Job prospects. A combination of employment growth and the need to replace workers leaving the occupation will result

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Medical equipment repairers.....	49-9062	41,400	52,600	11,300	27

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

in excellent job prospects over the next decade. The number of job openings is expected to outnumber the number of qualified applicants; therefore, applicants should have little difficulty finding jobs. Candidates with an associate's degree in biomedical equipment technology or engineering should have the best prospects. Opportunities should be even more abundant for those who are willing to relocate because relatively few qualified applicants can be found in rural areas.

Earnings

Median annual wages for medical equipment repairers in May 2008 were \$41,520. The middle 50 percent earned between \$31,590 and \$53,720. The lowest 10 percent earned less than \$25,860, and the highest 10 percent earned more than \$65,930.

Median annual wages for medical equipment repairers in the largest industries were:

General medical and surgical hospitals.....	\$45,990
Electronic and precision equipment repair and maintenance.....	44,740
Professional and commercial equipment and supplies merchant wholesalers.....	42,950
Health and personal care stores.....	32,770
Consumer goods rental.....	29,020

Related Occupations

Other workers who repair precision mechanical and electronic equipment include:

	Page
Coin, vending, and amusement machine servicers and repairers.....	720
Computer, automated teller, and office machine repairers.....	672
Medical, dental, and ophthalmic laboratory technicians.....	774

Sources of Additional Information

For information about medical equipment technicians and a list of schools with related programs of study, contact:

► Association for the Advancement of Medical Instrumentation (AAMI), 1110 North Glebe Rd., Suite 220, Arlington, VA 22201-4795. Internet: <http://www.aami.org>

The Occupational Information Network (O*NET) provides information on a wide range of occupational characteristics. Links to O*NET appear at the end of the Internet version of this occupational statement, accessible at <http://www.bls.gov/ooh/ocos355.htm>

Other Installation, Maintenance, and Repair Occupations

Camera and Photographic Equipment Repairers

Nature of the Work

Camera and photographic equipment repairers fix broken film and digital cameras and other optical devices.

Education and Training

Most camera repairers undergo internships or apprenticeships; these usually last about 2 years.

Job Outlook

Current and projected employment:

2008 Employment.....	4,600
2018 Employment.....	3,900
Employment change.....	-700
Growth rate.....	-15%

Employment change. Employment is expected to decline rapidly. Technological improvements mean that most consumers prefer to replace broken cameras with newer models, even at the high end, saving on the high cost of repair.

Job prospects. Competition for jobs is expected. Decline of the occupation is expected to make job opportunities scarce, although there continue to be some positions working for warranty repair centers.

Earnings

Median annual wages for camera and photographic equipment repairers were \$34,300 in May 2008.

Coin, Vending, and Amusement Machine Servicers and Repairers

Nature of the Work

Coin, vending, and amusement machine servicers and repairers install, service, adjust, or repair machines, including arcade games, food and beverage machines, slot machines, jukeboxes,

and other similar machines that dispense games or merchandise for money or credit. Servicers usually stock the machines and record the items sold and money collected. Repairers ensure the machines are operating correctly and make repairs as needed.

Education and Training

Most workers learn their skills on the job, but employers increasingly prefer to hire applicants with some high school or vocational school courses in electronics, refrigeration, and machine repair. A driver's license is required for those who need to drive to stock or repair machines.

Job Outlook

Current and projected employment:

2008 Employment	43,800
2018 Employment	46,900
Employment change.....	3,100
Growth rate.....	7%

Employment change. Average growth is expected. While the number of vending and slot machines are expected to rise, they are also becoming easier to service and require fewer repairs. There will be fewer video arcade machines as people play more of these games at home.

Job prospects. Job opportunities should be excellent for repairers who have training in electronics, and who are willing to travel and work at times outside regular business hours. Opportunities will be fair for servicers, or route drivers.

Earnings

Median annual wages of coin, vending, and amusement machine servicers and repairers were \$29,930 in May 2008.

Musical Instrument Repairers and Tuners

Nature of the Work

Musical instrument repairers and *tuners* are craft workers who use a variety of techniques and tools to bring damaged or out-of-tune instruments into proper working order. They

often specialize by type of instrument and in either tuning or repair.

Education and Training

Most musical instrument repairers and tuners learn their craft through trade schools or apprenticeships. A basic ability to play the instruments being repaired is normally required.

Job Outlook

Current and projected employment:

2008 Employment	6,100
2018 Employment	6,100
Employment change.....	0
Growth rate.....	0%

Employment change. Musical instrument repairers and tuners are expected to experience little or no change in employment from 2008-18. Band and orchestra programs in high schools provide most of the business for repairers, and they are not as prevalent as they once were, but this has been offset somewhat by population growth.

Job prospects. Job prospects should be excellent. As the baby boomer generation retires and many skilled workers leave the workforce, new workers will be needed to replace them.

Earnings

Median annual wages for musical instrument repairers and tuners were \$33,080 in May 2008.

Related Occupations

Watch Repairers

Nature of the Work

Watch repairers, also known as *watchmakers* or *horologists*, use precision tools to fix expensive and antique timepieces. They diagnose problems and repair, clean, adjust, and replace parts as necessary to return watches to proper working condition.

Education and Training

Developing proficiency in watch repair requires several years of education and experience. Some workers take advanced train-

ing courses and earn certifications, such as the Certified Watchmaker (CW) title.

Job Outlook

Current and projected employment:

2008 Employment	3,200
2018 Employment	2,800
Employment change.....	-400
Growth rate.....	-14%

Employment change. Employment of watch repairers is expected to decline rapidly. The high cost of repairs will compel many consumers to replace their watches rather than have them fixed.

Job prospects. Good job prospects are expected. There will be many openings for new entrants as baby boomers retire.

Earnings

Median annual wages for watch repairers were \$34,660 in May 2008.

Production Occupations

Assemblers and Fabricators

Significant Points

- Most assemblers work on teams, making good communication skills and the ability to get along with others important.
- A high school diploma is sufficient for most jobs, but experience and extra training is needed for more advanced assembly work.
- Employment is projected to experience little or no change between 2008 and 2018.
- Job opportunities are expected to be good in the manufacturing sector, particularly in growing, high-technology industries.

Nature of the Work

Assemblers and fabricators play an important role in the manufacturing process. They assemble both finished products and the pieces that go into them. The products they assemble using tools, machines, and their hands range from entire airplanes to children's toys. They fabricate and assemble household appliances, automobiles, computers, electronic devices, and more.

Changes in technology have transformed the manufacturing and assembly process. Modern manufacturing systems use robots, computers, programmable motion control devices, and various sensing technologies. These systems change the way in which goods are made and affect the jobs of those who make them. The more advanced assemblers must be able to work with these new technologies and use them to produce goods.

The job of an assembler or fabricator ranges from very easy to very complicated, requiring a range of knowledge and skills. Skilled assemblers putting together complex machines, for example, begin by reading detailed schematics or blueprints that show how to assemble the machine. After determining how parts should connect, they use hand or power tools to trim, shim, cut, and make other adjustments to fit components together and align properly. Once the parts are properly aligned, they connect them with bolts and screws or by welding or soldering pieces together.

Careful quality control is important throughout the assembly process, so assemblers look for faulty components and mistakes in the assembly process. They help to fix problems before more defective products are produced.

Manufacturing techniques are evolving away from traditional assembly line systems toward "lean" manufacturing systems, which are causing the nature of assemblers' work to change. Lean manufacturing uses teams of workers to produce entire products or components. *Team assemblers* may still work on an assembly line, but they rotate through different tasks, rather than specializing in a single task. The team also may decide how the work is assigned and how different tasks are performed.

This worker flexibility helps companies cover for absent workers, improves productivity, and increases companies' ability to respond to changes in demand by shifting labor from one product line to another. For example, if demand for a product drops, companies may reduce the total number of workers producing it, asking the remaining workers to perform more stages of the assembly process. Some aspects of lean production, such as rotating tasks and seeking worker input on improving the assembly process, are common to all assembly and fabrication occupations.

Although most assemblers and fabricators are classified as team assemblers, others specialize in producing one type of product or perform the same or similar tasks throughout the assembly process. These workers are classified according to the products they assemble or produce. *Electrical and electronic equipment assemblers*, for example, build products such as electric motors, computers, electronic control devices, and sensing equipment. Automated systems have been put in place as many small electronic parts are too small or fragile for human assembly. Much of the remaining work of electrical and electronic assemblers is manual assembly during the small-scale production of electronic devices used in avionic systems, military systems, and medical equipment. Manual production requires these workers to use devices such as soldering irons. *Electromechanical equipment assemblers* assemble and modify electromechanical devices such as household appliances, CT scanners, or vending machines. The workers use a variety of tools, such as rulers, rivet guns and soldering irons. *Coil winders, tapers, and finishers* wind wire coil used in a variety of electric and electronic products, including resistors, transformers, generators, and electric motors.

Engine and other machine assemblers construct, assemble, or rebuild engines and turbines, and machines used in automobiles, construction and mining equipment, and power generators. *Aircraft structure, surfaces, rigging, and systems assemblers* assemble, fit, fasten, and install parts of airplanes, space vehicles, or missiles, including tails and wings, landing gear, and heating and ventilation systems. *Structural metal fabricators and fitters* cut, align, and fit together structural metal parts and may assist in welding or riveting the parts together. *Fiberglass laminators and fabricators* develop products made of fiberglass, mainly boat decks and hulls. *Timing device assemblers, adjusters, and calibrators* perform precision assembling or adjusting of timing devices within very narrow tolerances.

It has become more common to involve assemblers and fabricators in product development. Designers and engineers consult manufacturing workers during the design stage to improve product reliability and manufacturing efficiency. For example, an assembler may tell a designer that the dashboard of a new car design will be too difficult to install quickly and consistently. The designer could then redesign it to make it easier to install.

Some experienced assemblers work with designers and engineers to build prototypes or test products. These assemblers must be able to read and interpret complex engineering specifications from text, drawings, and computer-aided drafting systems. They also may need to use a variety of tools and precision measuring instruments.

Work environment. Most assemblers and manufacturers work in manufacturing plants. The working environment is improving, but varies by plant and by industry. Many physically difficult tasks have been automated or made easier through the use of power tools, such as tightening massive bolts or moving heavy parts into position. Assembly work, however, may still involve long periods of standing or sitting.

Most factories today are generally clean, well-lit, and well-ventilated; and depending on what type of work is being performed, they may also need to be dirt and dust-free. Electronic and electromechanical assemblers particularly must work in environments free of dust that could affect the operation of the products they build. Some assemblers may come into contact with potentially harmful chemicals or fumes, but ventilation systems and other safety precautions normally minimize any harmful effects. Other assemblers may come in contact with oil and grease, and their working areas may be quite noisy. Fiberglass laminators and fabricators are exposed to fiberglass, which may irritate the skin; these workers wear gloves and long sleeves and must use respirators for safety.

Most full-time assemblers work a 40-hour week, although overtime and shift work are common in some industries. Work schedules of assemblers may vary at plants with more than one shift.

Training, Other Qualifications, and Advancement

The education level and qualifications needed to enter these jobs vary depending on the industry and employer. While a high school diploma or GED is sufficient for most jobs, experience and extra training is needed for more advanced assembly work.

Education and training. Most applicants for assembler positions need only a high school diploma or GED, with workers learning the skills they need through on-the-job training, sometimes including employer-sponsored classroom instruction. Some employers may require specialized training or an associate degree for the most skilled assembly jobs. For example, jobs with electrical, electronic, and aircraft and motor vehicle products manufacturers typically require more formal education through technical schools.

Certification and other qualifications. Assembly workers must be able to follow instructions carefully, which may require some basic reading skills and the ability to follow diagrams and pictures. Manual dexterity and the ability to carry out complex, repetitive tasks quickly and methodically also are important. For some positions, the ability to lift heavy objects may be needed. Team assemblers also need good interpersonal and communication skills to be able to work well with their teammates. Good eyesight and manual dexterity is necessary for assemblers and fabricators who work with small parts. Plants that make electrical and electronic products may test applicants for color vision, because their products often contain many differently colored wires.

Certifications are not common for most types of assemblers and fabricators. However, many employers that hire electrical

Assemblers test circuits in electronic devices.

and electronic assembly workers, especially those in the aerospace and defense industries, require certifications in soldering, such as those offered by the IPC.

Advancement. As assemblers and fabricators become more experienced, they may progress to jobs that require greater skill and may be given more responsibility. Experienced assemblers may become product repairers, if they have learned the many assembly operations and understand the construction of a product. These workers fix assembled pieces that operators or inspectors have identified as defective. Assemblers also can advance to quality control jobs or be promoted to supervisor. Experienced assemblers and fabricators also may become members of research and development teams, working with engineers and other project designers to design, develop, and build prototypes, and test new product models.

Employment

Assemblers and fabricators held about 2.0 million jobs in 2008. They worked in many industries, but over 75 percent worked in manufacturing. Within the manufacturing sector, assembly of transportation equipment, such as aircraft, autos, trucks, and buses, accounted for 20 percent of all jobs. Assembly of computers and electronic products accounted for another 11 percent of all jobs. Other industries that employ many assemblers and fabricators are machinery manufacturing and electrical equipment, appliance, and component manufacturing.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Assemblers and fabricators	51-2000	1,950,900	1,913,100	-37,800	-2
Aircraft structure, surfaces, rigging, and systems assemblers	51-2011	44,100	48,200	4,100	9
Electrical, electronics, and electromechanical assemblers	51-2020	297,500	254,200	-43,200	-15
Coil winders, tapers, and finishers	51-2021	22,100	16,500	-5,600	-25
Electrical and electronic equipment assemblers	51-2022	213,300	182,000	-31,300	-15
Electromechanical equipment assemblers	51-2023	62,100	55,700	-6,400	-10
Engine and other machine assemblers	51-2031	39,900	36,700	-3,200	-8
Structural metal fabricators and fitters	51-2041	114,100	113,700	-400	0
Miscellaneous assemblers and fabricators	51-2090	1,455,400	1,460,200	4,900	0
Fiberglass laminators and fabricators	51-2091	30,300	28,900	-1,400	-5
Team assemblers	51-2092	1,112,300	1,112,700	400	0
Timing device assemblers, adjusters, and calibrators	51-2093	2,700	2,600	-100	-4
All other assemblers and fabricators.....	51-2099	309,900	316,000	6,000	2

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

The following tabulation shows the employment of assemblers and fabricators in the manufacturing industries that employed the most workers in 2008:

Motor vehicle parts manufacturing	134,900
Semiconductor and other electronic component manufacturing.....	94,800
Motor vehicle manufacturing	85,000
Navigational, measuring, electromedical, and control instruments manufacturing.....	72,400
Architectural and structural metals manufacturing	71,700

Assemblers and fabricators also work in many other non-manufacturing industries. Twelve percent were employed by employment services firms, mostly as temporary workers; these temporary workers were mostly assigned to manufacturing plants. Wholesale and retail trade firms employed the next highest number of assemblers and fabricators. Many of these assemblers perform the final assembly of goods before the item is delivered to the customer. For example, most imported furniture is shipped in pieces and assemblers for furniture wholesalers and retailers put together the furniture prior to delivery.

Team assemblers, the largest specialty, accounted for 57 percent of assembler and fabricator jobs. The distribution of employment among the various types of assemblers was as follows in 2008:

Team assemblers	1,112,300
Electrical and electronic equipment assemblers	213,300
Structural metal fabricators and fitters	114,100
Electromechanical equipment assemblers.....	62,100
Aircraft structure, surfaces, rigging, and systems assemblers	44,100
Engine and other machine assemblers	39,900
Fiberglass laminators and fabricators.....	30,300
Coil winders, tapers, and finishers	22,100
Timing device assemblers, adjusters, and calibrators	2,700
Assemblers and fabricators, all other	309,900

Job Outlook

Employment is projected to experience little or no change, primarily reflecting productivity growth and strong foreign com-

petition in manufacturing. Job opportunities are expected to be good for qualified applicants in the manufacturing sector, particularly in growing, high-technology industries.

Employment change. Employment of assemblers and fabricators is expected to experience little or no change between 2008 and 2018, declining by 2 percent. Within the manufacturing sector, employment of assemblers and fabricators will be determined largely by the growth or decline in the production of certain manufactured goods. In general, despite projected growth in the output of manufactured goods, overall employment is not expected to grow as the whole sector becomes more efficient and is able to produce more with fewer workers. However, some individual industries are projected to have more jobs than others. The aircraft products and parts industry is projected to gain jobs over the decade as demand for new commercial planes grows significantly. Thus, the need for aircraft structure, surfaces, rigging, and systems assemblers is expected to grow. Also, industries such as electromedical product manufacturing, which includes magnetic resonance imaging (MRI) machines, pacemakers, and other devices, should grow with an aging population requiring additional medical technology.

In most other manufacturing industries, employment of assemblers and fabricators will be negatively affected by increasing productivity, which will come from improved processes, tools, and, in some cases, automation. Automation is limited in assembly by intricate products and complicated techniques. Automation will replace workers in operations with a large volume of simple, repetitive work. Automation will have less effect on the assembly of products that are low in volume or very complicated.

The use of team production techniques has been one factor in the continuing success of the manufacturing sector, boosting productivity and improving the quality of goods. Thus, while the number of assemblers overall is expected to decline in manufacturing, the number of team assemblers should grow as more manufacturing plants convert to using team production techniques.

Some manufacturers have sent their assembly functions to countries where labor costs are lower. Decisions by U.S. corporations to move manufacturing to other nations may limit employment growth for assemblers in some industries.

The largest increase in the number of assemblers and fabricators is projected to be in the employment services industry, which supplies temporary workers to various industries. Temporary workers are gaining in importance in the manufacturing sector and elsewhere, as companies facing cost pressures strive for a more flexible workforce to meet fluctuations in the market.

Job prospects. Job opportunities for assemblers are expected to be good for qualified applicants in the manufacturing sector, particularly in growing, high-technology industries, such as aerospace and electromedical devices. Some employers report difficulty finding qualified applicants looking for manufacturing employment. Many job openings will result from the need to replace workers leaving or retiring from this large occupational group.

Earnings

Wages vary by industry, geographic region, skill, educational level, and complexity of the machinery operated. Median hourly wages of team assemblers were \$12.32 in May 2008. The middle 50 percent earned between \$9.75 and \$15.60. The lowest 10 percent earned less than \$8.20, and the highest 10 percent earned more than \$19.69. Median hourly wages in the manufacturing industries employing the largest numbers of team assemblers were as follows:

Motor vehicle manufacturing	\$24.91
Motor vehicle body and trailer manufacturing.....	14.13
Motor vehicle parts manufacturing	13.76
Plastics product manufacturing	11.31
Employment services	9.61

Median hourly wages of electrical and electronic equipment assemblers were \$13.22 in May 2008. The middle 50 percent earned between \$10.52 and \$16.85. The lowest 10 percent earned less than \$8.77, and the highest 10 percent earned more than \$21.15. Median hourly wages in the manufacturing industries employing the largest numbers of electrical and electronic equipment assemblers were as follows:

Navigational, measuring, electromedical, and control instruments manufacturing.....	\$14.76
Electrical equipment manufacturing	13.25
Other electrical equipment and component manufacturing	12.62
Semiconductor and other electronic component manufacturing.....	12.59
Employment services	10.68

In May 2008, other assemblers and fabricators had the following median hourly wages:

Aircraft structure, surfaces, rigging, and systems assemblers	\$21.22
Engine and other machine assemblers	15.70
Structural metal fabricators and fitters	15.58
Electromechanical equipment assemblers.....	14.11
Timing device assemblers, adjusters, and calibrators	13.73
Fiberglass laminators and fabricators.....	13.48
Coil winders, tapers, and finishers	13.33
Assemblers and fabricators, all other	13.37

Some assemblers and fabricators are members of labor unions. These unions include the International Association of Machinists and Aerospace Workers; the United Automobile, Aerospace and Agricultural Implement Workers of America; the International Brotherhood of Electrical Workers; and the United Steelworkers of America.

Food Processing Occupations

Significant Points

- Most workers in manual food processing jobs require little or no training prior to being hired.
- As more jobs involving cutting and processing meat shift from retail stores to food processing plants, job growth will be concentrated among lesser skilled workers, who are employed primarily in manufacturing.
- Highly skilled bakers should be in demand.

Nature of the Work

Food processing occupations include many different types of workers who process raw food products into the finished goods sold by grocers, wholesalers, restaurants, or institutional food services. These workers perform a variety of tasks and are responsible for producing many of the food products found in every household. Some of these workers are bakers, others slaughter or process meat, and still others operate food processing equipment.

Bakers mix and bake ingredients according to recipes to produce varying types and quantities of breads, pastries, and other baked goods. Bakers commonly are employed in commercial bakeries that distribute breads and pastries through established wholesale and retail outlets, mail order, or manufacturers' outlets. In these manufacturing facilities, bakers produce mostly standardized baked goods in large quantities, using high-volume mixing machines, ovens, and other equipment. Grocery stores and specialty shops produce smaller quantities of breads, pastries, and other baked goods for consumption on their premises or for sale as specialty baked goods. Although the quantities prepared and sold in these stores are often small, they often come in a wide variety of flavors and sizes.

Other food processing workers convert animal carcasses into manageable pieces of meat, known as boxed meat or case-ready meat, suitable for sale to wholesalers and retailers. The nature of their jobs varies significantly depending on the stage of the process in which they are involved. In animal slaughtering and processing plants, slaughterers and meat packers slaughter cattle, hogs, and sheep, and cut carcasses into large wholesale cuts, such as rounds, loins, ribs, tenders, and chucks, to facilitate the handling, distribution, marketing, and sale of meat. In most plants, some *slaughterers and meat packers* further process the large parts into case-ready cuts that are ready for retail stores. Retailers and grocers increasingly prefer such prepackaged meat products because a butcher isn't needed to further portion the cuts for sale. Slaughterers and meat packers also produce hamburger meat and meat trimmings, and prepare sausages, luncheon meats, and other fabricated meat products. They usually work on assembly lines, with each individual responsible for only a few of the many cuts needed to process a carcass. Depending on the type of cut, these workers use knives; cleavers; meat saws; band-saws; or other potentially dangerous equipment.

Poultry cutters and trimmers slaughter and cut up chickens, turkeys, and other types of poultry. Although the packaging end of the poultry processing industry is becoming increasingly automated, many jobs, such as slaughtering, trimming, and deboning, are still done manually. Most poultry cutters and trimmers perform routine cuts on poultry as it moves along production lines.

Meat, poultry, and fish cutters and trimmers also prepare ready-to-cook foods, often at processing plants, but increasingly at grocery and specialty food stores. This preparation often entails filleting meat, poultry, or fish; cutting it into bite-sized pieces or tenders; preparing and adding vegetables; and applying sauces and flavorings, marinades, or breading. These case-ready products are gaining in popularity as they offer quick and easy preparation for consumers while, in many cases, also offering healthier options.

Manufacturing and retail establishments are both likely to employ fish cutters and trimmers, also called fish cleaners. These workers primarily scale, cut, and dress fish by removing the head, scales, and other inedible portions and then cut the fish into steaks or fillets. In retail markets, these workers also may wait on customers and clean fish to order. Some fish processing is done aboard ships where fish can be caught, processed, and often flash frozen to preserve freshness.

Butchers and meat cutters generally process meat at later stages of production, although some are employed at meat

processing plants. Most work for grocery stores, wholesale establishments that supply meat to restaurants, or institutional food service facilities that separate wholesale cuts of meat into retail cuts or smaller pieces, known as primals. These butchers cut meat into steaks and chops, shape and tie roasts, and grind beef for sale as chopped meat. Boneless cuts are prepared using knives, slicers, or power cutters, while bandsaws and cleavers are required to cut bone-in pieces of meat. Butchers and meat cutters in retail food stores also may weigh, wrap, and label the cuts of meat; arrange them in refrigerated cases for display; and prepare special cuts to fill orders by customers.

Others who work in food processing include *food batchmakers*, who set up and operate equipment that mixes, blends, or cooks ingredients used in the manufacture of food products according to formulas or recipes; *food cooking machine operators and tenders*, who operate or tend cooking equipment, such as steam-cooking vats, deep-fry cookers, pressure cookers, kettles, and boilers to prepare a wide range of cooked food products, and *food and tobacco roasting, baking, and drying machine operators and tenders*, who use equipment to reduce the moisture content of food or tobacco products or to prepare food for canning. The machines they use include hearth ovens, kiln driers, roasters, char kilns, steam ovens, and vacuum drying equipment. These workers monitor equipment for temperature, humidity, or

Food processing workers cut meat into smaller sizes and wrap them for sale.

other factors and make the appropriate adjustments to ensure proper cooking and processing.

All workers who work with food must regularly clean and sanitize utensils, work surfaces, and equipment used to process food to comply with health and sanitation guidelines to prevent the spread of disease.

Work environment. Working conditions vary by occupation and by type and size of establishment, but all employees are required to maintain good personal hygiene and keep equipment clean. Facilities that process food, regardless of industry or location, are regularly inspected to ensure that equipment and employees comply with health and sanitation regulations.

Most bakers work in bakeries, grocery stores, and restaurants. Bakeries are often hot and noisy. Bakers typically work under strict order deadlines and critical time-sensitive baking requirements, both of which can induce stress. Bakers usually work odd hours and may work early mornings, evenings, weekends, and holidays.

Butchers and meat cutters in animal slaughtering and processing plants and in large grocery stores, work in large meat cutting rooms equipped with power machines, extremely sharp knives, and conveyors. In smaller retail shops, butchers or fish cleaners may work in a cramped space behind the meat or fish counter where they also can keep track of customers.

Butchers and meat cutters, poultry and fish cutters and trimmers, and slaughterers and meatpackers often work in cold, damp rooms where meat is kept to prevent spoiling. In addition, long periods of standing and repetitious physical tasks make the work tiring. Working with sharp knives on slippery floors makes butchers and meat cutters more susceptible to injury than almost all other workers in the economy; however, injury rates for the animal slaughtering and processing industry have been declining. Injuries include cuts and occasional amputations, which occur when knives, cleavers, or power tools are used improperly. Also, repetitive slicing and lifting often lead to cumulative trauma injuries, such as carpal tunnel syndrome and back strains. To reduce the incidence of cumulative trauma injuries, some employers have reduced employee workloads, added prescribed rest periods, redesigned jobs and tools, and promoted increased awareness of early warning signs as steps to prevent further injury. Nevertheless, workers in the occupation still face the potential threat that some injuries may be disabling.

Workers who operate food processing machinery typically work in production areas that are specially designed for food preservation or processing. Food batchmakers, in particular, work in kitchen-type, assembly-line production facilities. The ovens, as well as the motors of blenders, mixers, and other equipment, often make work areas very warm and noisy. Hazards created by the equipment that these workers use can cause injuries such as cuts and scrapes from cleaning and handling sharp tools and utensils and burns from being in contact with hot surfaces and liquids.

Food batchmakers; food and tobacco roasting, baking, and drying machine operators; and food cooking machine operators and tenders spend a great deal of time on their feet and generally work a regular 40-hour week that may include night and early morning shifts.

Training, Other Qualifications, and Advancement

No formal education is required for most food processing jobs. Employers generally provide most of the training for these occupations upon being hired.

Education and training. Bakers need to become skilled in baking, icing, and decorating. They often start their careers as apprentices or trainees. Apprentice bakers usually start in craft bakeries, while trainees usually begin in store bakeries, such as those in supermarkets. Many apprentice bakers participate in correspondence study and may work towards a certificate in baking.

The skills needed to be a baker are often underestimated. Bakers need to learn how to combine ingredients and to learn how ingredients are affected by heat. They need to learn how to operate and maintain a range of equipment used in the production process. Courses in nutrition are helpful for those selling baked goods or developing new recipes. If running a small business, they need to know how to operate a business. All bakers must follow government health and sanitation regulations.

Most butchers and meat, poultry, and fish cutters and trimmers acquire their skills through on-the-job training programs. The length of training varies significantly. Simple cutting operations require a few days to learn, while more complicated tasks, such as eviscerating slaughtered animals, generally require several months of training. The training period for highly skilled butchers at the retail level may be 1 or 2 years.

Generally, trainees begin by doing less difficult jobs, such as making simple cuts or removing bones. Under the guidance of experienced workers, trainees learn the proper use and care of tools and equipment, while also learning how to prepare various cuts of meat. After demonstrating skill with various meat cutting tools, trainees learn to divide carcasses into wholesale cuts and wholesale cuts into retail and individual portions. Trainees also may learn to roll and tie roasts, prepare sausage, and cure meat. Those employed in retail food establishments often are taught to perform basic business operations, such as inventory control, meat buying, and recordkeeping. In addition, growing concern about food-borne pathogens in meats has led employers to offer numerous safety seminars and extensive training in food safety to employees.

On-the-job training is common among food machine operators and tenders. They learn to run the different types of equipment by watching and helping other workers. Training can last anywhere from a month to a year, depending on the complexity of the tasks and the number of products involved. A degree in an appropriate area—dairy processing for those working in dairy product operations, for example—is helpful for advancement to a lead worker or a supervisory role. Most food batchmakers participate in on-the-job training, usually from about a month to a year. Some food batchmakers learn their trade through an approved apprenticeship program.

Other qualifications. Bakers need to be able to follow instructions, have an eye for detail, and communicate well with others. Meat, poultry, and fish cutters and trimmers need manual dexterity, good depth perception, color discrimination, and good hand-eye coordination. They also need physical strength to lift and move heavy pieces of meat. Butchers and fish cleaners who wait on customers should have a pleasant personality, a neat

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Food processing occupations	51-3000	706,700	734,000	27,400	4
Bakers	51-3011	151,600	151,900	300	0
Butchers and other meat, poultry, and fish processing workers....	51-3020	397,100	413,900	16,800	4
Butchers and meat cutters	51-3021	129,100	131,000	1,900	1
Meat, poultry, and fish cutters and trimmers.....	51-3022	169,600	180,400	10,800	6
Slaughterers and meat packers.....	51-3023	98,400	102,500	4,100	4
Miscellaneous food processing workers	51-3090	157,900	168,200	10,300	7
Food and tobacco roasting, baking, and drying machine operators and tenders	51-3091	18,100	18,200	100	0
Food batchmakers	51-3092	100,500	109,200	8,800	9

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

appearance, and the ability to communicate clearly. In some States, a health certificate is required for employment.

Certification and advancement. Bakers have the option of obtaining certification through the Retail Bakers of America. While not mandatory, obtaining certification assures the public and prospective employers that the baker has sufficient skills and knowledge to work at a retail baking establishment.

The Retail Bakers of America offers certification for four levels of competence with a focus on several broad areas, including baking sanitation, management, retail sales, and staff training. Those who wish to become certified must satisfy a combination of education and experience requirements prior to taking an examination. The education and experience requirements vary by the level of certification desired. For example, a certified journey baker requires no formal education but a minimum of 1 year of work experience. By contrast, a certified master baker must have earned the certified baker designation, and must have completed 30 hours of sanitation coursework approved by a culinary school or government agency, 30 hours of professional development courses or workshops, and a minimum of 8 years of commercial or retail baking experience.

Food processing workers in retail or wholesale establishments may progress to supervisory jobs, such as department managers or team leaders in supermarkets. A few of these workers may become buyers for wholesalers or supermarket chains. Some food processing workers go on to open their own markets or bakeries. In processing plants, workers may advance to supervisory positions or become team leaders.

Employment

Food processing workers held 706,700 jobs in 2008. Employment among the various types of food processing occupations was distributed as follows:

Meat, poultry, and fish cutters and trimmers.....	169,600
Bakers.....	151,600
Butchers and meat cutters	129,100
Food batchmakers	100,500
Slaughterers and meat packers	98,400
Food cooking machine operators and tenders	39,300
Food and tobacco roasting, baking, and drying machine operators and tenders	18,100

Fifty-eight percent of all food processing workers were employed in food manufacturing, including animal slaughtering and processing plants, the largest industry component. Food and beverage stores, which include grocery and specialty food stores, employed another 27 percent. Butchers, meat cutters, and bakers are employed in stores in almost every city and town in the Nation, while most other food processing jobs are concentrated in communities with food processing plants.

Job Outlook

Increased demand for processed food and meat by a growing population will increase the need for food processing workers; however, processing plant and distribution efficiencies will offset growing output and cause employment of these workers to grow more slowly than the average between 2008 and 2018. In addition, job opportunities should be good as the need to replace experienced workers who transfer to other occupations or leave the labor force should generate additional job openings.

Employment change. Overall employment in the food processing occupations is projected to increase 4 percent during the 2008–18 decade, more slowly than the average for all occupations. As the Nation's population grows, the demand for meat, poultry, and seafood, baked goods, and other processed foods will increase requiring additional people to work in these occupations. Additionally, consumers are increasingly seeking out more convenient methods of preparing meals, which is driving up demand for convenient ready-to-eat or heat foods. These foods are increasingly being prepared at the factory, as well as the local grocery store for carry-out, thus increasing the need for workers in both locations. However, increasing productivity at meat and food processing plants should offset some of the need for more workers at these plants.

Slaughterers and meat packers, meat, poultry, and fish cutters and trimmers, and butchers and meat cutters are all expected to experience some growth in employment. For these occupations in particular, faster growth will take place at the processing plant and away from retail stores, as meats are increasingly processed at processing plants or centralized facilities for delivery to stores. This shift from retail stores to food processing plants will cause demand for lesser skilled workers, who are employed primarily in meat packing manufacturing plants, to be greater than for butchers and meat cutters.

Many of these same reasons apply to employment in food processing jobs; however, these jobs are more automated than the meat processing occupations, thus productivity improvements will likely impact these workers more. Food batchmakers will experience average employment growth largely due to improved packaging and distribution operations; employment of food cooking machine operators and tenders will grow more slowly than the average; and food and tobacco roasting, baking, and drying machine operators and tenders will show little or no growth.

A growing number of stores that sell cookies, bread, and other specialty baked goods, will spur demand for bakers, particularly in grocery and other specialty stores, but increased use of off-site contract bakers with larger baking capacities will offset increased demand and cause employment to show little or no change.

Job prospects. Jobs should be available in all food processing specialties because of the need to replace experienced workers who transfer to other occupations or leave the labor force. Highly skilled bakers should be especially in demand because of growing demand for specialty products and the time it takes to learn to make these products.

Earnings

Earnings vary by industry, skill, geographic region, and educational level. Median annual wages of bakers were \$23,290 in May 2008. The middle 50 percent earned between \$18,760 and \$29,720. The lowest 10 percent earned less than \$16,420, and the highest 10 percent earned more than \$37,250. Median annual wages in the industries employing the largest numbers of bakers in May 2008 were:

Bakeries and tortilla manufacturing	\$23,860
Grocery stores	23,700
Other general merchandise stores	23,610
Full-service restaurants	22,300
Limited-service eating places.....	20,500

Median annual wages of butchers and meat cutters were \$28,290 in May 2008. The middle 50 percent earned between \$21,700 and \$36,670. The lowest 10 percent earned less than \$17,600, and the highest 10 percent earned more than \$45,060. Butchers and meat cutters employed at the retail level typically earned more than those in manufacturing. Median annual wages in the industries employing the largest numbers of butchers and meat cutters in May 2008 were:

Other general merchandise stores	\$33,830
Grocery stores	29,090
Grocery and related products merchant wholesalers	28,710
Specialty food stores	25,830
Animal slaughtering and processing	24,060

Meat, poultry, and fish cutters and trimmers typically earn less than butchers and meat cutters. In May 2008, median annual wages for these lower skilled workers were \$21,810. The middle 50 percent earned between \$18,520 and \$25,130. The lowest 10 percent earned less than \$16,640, while the highest 10 percent earned more than \$30,070. Median annual

wages in the industries employing the largest numbers of meat, poultry, and fish cutters and trimmers in May 2008 were:

Grocery and related product merchant wholesalers	\$23,030
Animal slaughtering and processing	22,100
Grocery stores	21,360
Specialty food stores	19,490
Seafood product preparation and packaging	18,600

In May 2008, median annual wages for slaughterers and meat packers were \$23,030. The middle 50 percent earned between \$19,700 and \$26,450. The lowest 10 percent earned less than \$17,130, and the highest 10 percent earned more than \$30,740. Median annual wages in animal slaughtering and processing, the industry employing the largest number of slaughterers and meat packers, were \$23,040 in May 2008.

In May 2008, median annual wages for food and tobacco roasting, baking, and drying machine operators and tenders were \$26,640. The middle 50 percent earned between \$21,100 and \$35,470. The lowest 10 percent earned less than \$17,610, and the highest 10 percent earned more than \$42,370. Median annual wages in bakeries and tortilla manufacturing, the industry employing the largest number of food and tobacco roasting, baking, and drying machine operators and tenders, were \$29,700 in May 2008.

Median annual earnings of food batchmakers were \$24,170 in May 2008. The middle 50 percent earned between \$18,820 and \$31,980. The lowest 10 percent earned less than \$16,260, and the highest 10 percent earned more than \$40,210. Median annual wages in the industries employing the largest numbers of food batchmakers in May 2008 were:

Dairy product manufacturing	\$31,840
Other food manufacturing	25,780
Fruit and vegetable preserving and specialty food manufacturing	24,190
Sugar and confectionery product manufacturing	23,310
Bakeries and tortilla manufacturing	22,800

Median annual wages for food cooking machine operators and tenders were \$22,880 in May 2008. The middle 50 percent earned between \$18,650 and \$28,680. The lowest 10 percent earned less than \$16,370, and the highest 10 percent earned more than \$34,330. Median annual wages in the industries employing the largest numbers of food cooking machine operators and tenders in May 2008 were:

Other food manufacturing	\$26,820
Fruit and vegetable preserving and specialty food manufacturing	25,520
Bakeries and tortilla manufacturing	22,900
Animal slaughtering and processing	22,090
Grocery stores	19,710

Food processing workers generally received typical benefits, including pension plans for union members or those employed by grocery stores. However, poultry workers rarely earned substantial benefits. In 2008, 16 percent of all food processing workers were union members or were covered by a union contract. Many food processing workers are members of the United Food and Commercial Workers International Union.

Related Occupations

Food processing workers must be skilled at both hand and machine work and must have some knowledge of processes and techniques that are involved in handling and preparing food. Other occupations that require similar skills and knowledge include

Metal Workers and Plastic Workers

Computer Control Programmers and Operators

Significant Points

- Manufacturing industries employ almost all of these workers.
- Workers learn in apprenticeship programs, informally on the job, and in secondary, vocational, or postsecondary schools; many entrants have previously worked as machinists or machine setters, operators, and tenders.
- Applicants are expected to face competition for jobs.

Nature of the Work

Computer control programmers and operators use computer numerically controlled (CNC) machines to produce a wide variety of products, from automobile engines to computer keyboards. CNC machines operate by reading the code included in a computer-controlled module, which drives the machine tool and performs the functions of forming and shaping a part formerly done by machine operators. CNC machines include tools such as lathes, laser cutting machines, roll forms, press brakes and printing presses. CNC machines use the same techniques as many other mechanical manufacturing machines but are controlled by a central computer instead of a human operator or electric switchboard. Many old-fashioned machines can be retrofitted with a computer control, which can greatly improve the productivity of a machine. Computer control programmers and operators normally produce large quantities of one part, although they may produce small batches or one-of-a-kind items. These machines are most commonly used in metalworking industries where precision is imperative, because computers can be more accurate than humans in this work.

CNC programmers—also referred to as *numerical tool and process control programmers*—develop the programs that run the machine tools. They often review three-dimensional computer-aided/automated design (CAD) blueprints of a part and determine the sequence of events that will be needed to make the part. This may involve calculating where to cut or

bore into the workpiece, how fast to feed the metal into the machine, and how much metal to remove.

Next, CNC programmers turn the planned machining operations into a set of instructions. These instructions are translated into a computer aided/automated manufacturing (CAM) program containing a set of commands for the machine to follow. On a CNC machine, commands normally are a series of numbers (hence, numerical control) that may describe where cuts should occur, where a roll should bend a piece, or the speed of the feed into the machine. After the program is developed, CNC programmers and operators check the programs to ensure that the machinery will function properly and that the output will meet specifications. Because a problem with the program could damage costly machinery and cutting tools or simply waste valuable time and materials, computer simulations may be used to check the program before a trial run. If errors are found, the program must be changed and retested until the problem is resolved. In addition, growing connectivity between CAD/CAM software and CNC machine tools is raising productivity by automatically translating designs into instructions for the computer controller on the machine tool. Many new machines take advantage of easy-to-use graphical user interface programs that use pictures and buttons, instead of long strings of a computer programming language. This improvement in usability has pushed many manufacturing companies to combine the jobs of CNC programmers and machine operators.

After the programming work is completed, *CNC setup operators*—also referred to as *computer-controlled machine tool operators, metal and plastic*—set up the machine for the job. They download the program into the machine, load the proper tools into the machine, position the workpiece on the CNC machine tool—spindle, lathe, milling machine, or other machine—and then start the machine. During the test run of a new program, the setup operator, who may also have some programming skills, or the CNC programmer closely monitors the machine for signs of problems, such as a vibrating work piece, the breakage of cutting tools, or an out-of-specification final product. If a problem is detected, a setup operator or CNC programmer will modify the program using the control module to eliminate the problems or to improve the speed and accuracy of the program.

Once a program is completed, the operation of the CNC machine may move from the more experienced setup operator to a less-skilled machine operator. Operators load workpieces and

Applicants for computer control programmer and operator jobs are expected to face competition.

tools into a machine, press the start button, monitor the machine for problems, and measure the parts produced to check that they match specifications. If they encounter a problem that requires modification to the cutting program, they shut down the machine and wait for a more experienced CNC setup operator to fix the problem. Many CNC operators start at this basic level and gradually perform more setup tasks as they gain experience.

Regardless of skill level, all CNC operators detect some problems by listening for specific sounds—for example, a dull cutting tool that needs changing or excessive vibration. Machine tools rotate at high speeds, which can create problems with harmonic vibrations in the workpiece. Vibrations cause the machine tools to make minor cutting errors, hurting the quality of the product. Operators listen for vibrations and then adjust the cutting speed to compensate. For common errors in the machine, programmers write code that displays an error code to help operators, who are expected to make minor repairs, and machine mechanics fix a problem quickly. CNC operators also ensure that the workpiece is being properly lubricated and cooled, since the machining of metal products generates a significant amount of heat.

Since CNC machines can operate with limited input from the operator, a single operator may monitor several machines simultaneously. Typically, an operator might monitor two machines cutting relatively simple parts from softer materials, while devoting most of his or her attention to a third machine cutting a much more difficult part from hard metal, such as stainless steel. Operators are often expected to carefully schedule their work so that all of the machines are always operating.

Work environment. Most machine shops are clean, well lit, and ventilated. Most modern CNC machines are partially or totally enclosed, minimizing the exposure of workers to noise, debris, and the lubricants used to cool workpieces during machining. People working in this occupation report fewer injuries than most other manufacturing jobs; nevertheless, working around machine tools can be noisy and presents certain dangers, and workers must follow safety precautions to minimize injuries. Computer-controlled machine tool operators, metal and plastic, wear protective equipment, such as safety glasses to shield against bits of flying metal and earplugs to dampen

machinery noise. They also must exercise caution when handling hazardous coolants and lubricants. The job requires stamina, because operators stand most of the day and, at times, may need to lift moderately heavy workpieces.

Numerical tool and process control programmers work on desktop computers that may be in offices or on the shop floor. The office areas usually are clean, well lit, and free of machine noise. On the shop floor, CNC programmers encounter the same hazards and exercise the same safety precautions as do CNC operators.

Many computer control programmers and operators work a 40-hour week. CNC operators increasingly work evening and weekend shifts as companies justify investments in more expensive machinery by extending hours of operation. Overtime is common during peak production periods.

Training, Other Qualifications, and Advancement

Computer control programmers and operators train in various ways—in apprenticeship programs, informally on the job, and in secondary, vocational, or postsecondary schools. In general, the more skills needed for the job, the more education and training are needed to qualify. Many entrants have previously worked as machinists or machine setters, operators, and tenders.

Education and training. The amount and type of education and training needed depends on the type of job. Entry-level CNC machine operators may need at least a few months of on-the-job training to reach proficiency. Setup operators and programmers, however, may need years of experience or formal training to write or modify programs. Programmers and operators can receive their training in various ways—in apprenticeship programs, informally on the job, and in secondary, vocational, or postsecondary schools. A growing number of computer control programmers and more skilled operators receive their formal training from community or technical colleges. For some specialized types of programming, such as that needed to produce complex parts for the aerospace or shipbuilding industries, employers may prefer individuals with a degree in engineering.

For those interested in becoming computer control programmers or operators, high school or vocational school courses in mathematics (trigonometry and algebra), blueprint reading, computer programming, metalworking, and drafting are recommended. Apprenticeship programs consist of shop training and related classroom instruction. In shop training, apprentices learn filing, handtapping, and dowel fitting, as well as the operation of various machine tools. Classroom instruction includes math, physics, programming, blueprint reading, CAD software, safety, and shop practices. Skilled computer control programmers and operators need an understanding of the machining process, including the complex physics that occur at the cutting point. Thus, most training programs teach CNC operators and programmers to perform operations on manual machines prior to operating CNC machines.

As new technology is introduced, computer control programmers and operators normally receive additional training to update their skills. This training usually is provided by a representative of the equipment manufacturer or a local technical school. Many employers offer tuition reimbursement for job-related courses.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Computer control programmers and operators	51-4010	157,800	164,500	6,700	4
Computer-controlled machine tool operators, metal and plastic.....	51-4011	141,000	150,300	9,300	7
Numerical tool and process control programmers	51-4012	16,800	14,200	-2,600	-15

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Certification and other qualifications. Employers prefer to hire workers who have a basic knowledge of computers and electronics and experience with machine tools. In fact, many entrants to these occupations have experience working as machine setters, operators, and tenders or machinists. Persons interested in becoming computer control programmers or operators should be mechanically inclined and able to work independently and do highly accurate work.

To boost the skill level of all metalworkers and to create a more uniform standard of competency, a number of training facilities and colleges have formed certification programs. Employers may pay for training and certification tests after hiring an entry-level worker.

Advancement. Computer control programmers and operators can advance in several ways. Experienced CNC operators may become CNC programmers or machinery mechanics, and some are promoted to supervisory or administrative positions in their firms. Some highly skilled workers move into tool and die making, and a few open their own shops.

Employment

Computer control programmers and operators held about 157,800 jobs in 2008. About 90 percent were computer-controlled machine tool operators, metal and plastic, and about 10 percent were numerical tool and process control programmers. The manufacturing industry employs almost all these workers. Employment was concentrated in fabricated metal products manufacturing, machinery manufacturing, plastics products manufacturing, and transportation equipment manufacturing making mostly aerospace and automobile parts. Although computer control programmers and operators work in all parts of the country, jobs are most plentiful in the areas where manufacturing is concentrated.

Job Outlook

Despite the projected increase in employment, applicants are expected to face competition for jobs, as there are more trained workers than available jobs.

Employment change. Overall employment of computer control programmers and operators is expected to increase by 4 percent over the 2008–18 period, which is slower than average for all occupations. Employment of computer controlled machine tool operators, metal and plastic is expected to increase by 7 percent, which is about as fast as the average for all occupations. The increasing use of CNC machine tools in all sectors of the manufacturing industry, replacing older mechanical metal and plastic working machines, will increase demand for computer-controlled machine tool operators. However, the demand for computer control programmers will be negatively affected by the increasing use of software (CAD/CAM) that automatically translates part and

product designs into CNC machine tool instructions, and by simpler interfaces that allow machine operators to program the machines themselves. As a result, employment of numerical tool and process control programmers will decline by 15 percent over the projection period.

Job prospects. Computer control programmers and operators should face competition for jobs, as many workers currently operating mechanical machines will be retrained to operate computer controlled machines and programming activities are increasingly done by these operators; however, workers with the ability to operate multiple CNC machine types should have better opportunities, as companies are increasingly demanding more versatile workers.

Earnings

Median hourly wages of computer-controlled machine tool operators, metal and plastic, were \$16.03 in May 2008. The middle 50 percent earned between \$12.83 and \$19.45. The lowest 10 percent earned less than \$10.49, whereas the top 10 percent earned more than \$23.84. Median hourly wages in the manufacturing industries employing the largest numbers of computer-controlled machine tool operators, metal and plastic, in May 2008 were:

Aerospace product and parts manufacturing.....	\$18.89
Metalworking machinery manufacturing	18.08
Machine shops; turned product; and screw, nut, and bolt manufacturing.....	15.57
Motor vehicle parts manufacturing	15.18
Plastics product manufacturing	14.19

Median hourly wages of numerical tool and process control programmers were \$21.30 in May 2008. The middle 50 percent earned between \$16.94 and \$26.55. The lowest 10 percent earned less than \$13.65, while the top 10 percent earned more than \$32.59.

Many employers, especially those with formal apprenticeship programs, offer tuition assistance for training classes.

Related Occupations

Occupations most closely related to computer control programmers and operators are other metal and plastic working occupations, which include:

Machine Setters, Operators, and Tenders—Metal and Plastic

Significant Points

- Manufacturing industries employ over 90 percent of workers.
- A few weeks of on-the-job training is sufficient for most workers to learn basic machine tending operations, but a year or more is required to become a highly skilled operator or setter.
- Employment is projected to decline rapidly.
- Those who can operate multiple machines will have the best opportunities for advancement and for gaining jobs with more long-term potential.

Nature of the Work

Consider the parts of a toaster, such as the metal or plastic housing or the lever that lowers the toast. These parts, and many other metal and plastic products, are produced by machines that are controlled by machine setters, operators, and tenders—metal and plastic. In fact, machine operators in the metalworking and plastics industries play a major role in producing most of the consumer products on which we rely daily.

In general, these workers can be separated into two groups—those who set up machines for operation and those who operate the machines during production. *Machine setters*, or setup workers, prepare the machines prior to production, perform initial test runs producing a part, and may adjust and make minor repairs to the machinery during its operation. *Machine operators and tenders* primarily monitor the machinery during its operation; sometimes they load or unload the machine or make minor adjustments to the controls. Many workers both set up and operate equipment.

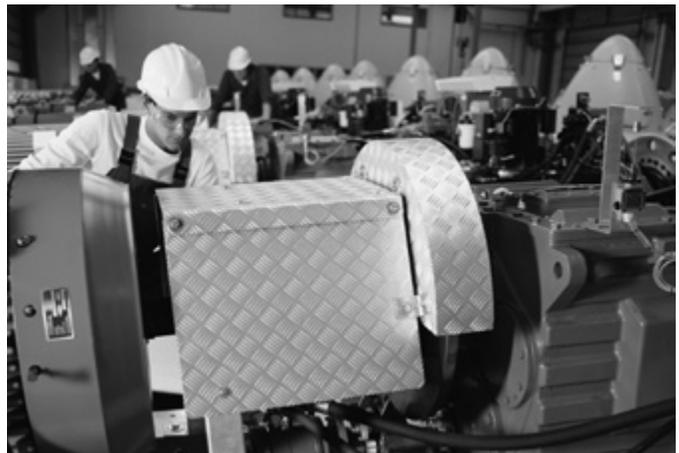

Setup workers prepare machines for production runs. Most machines can make a variety of products, and these different items are made by using different inputs or tooling. For instance, a single machine may use different sized tools to produce both large and small wheels for cars. The tools inside the machine must be changed and maintained by setup workers. On some machines, tools may become dull after extended use and must be sharpened. It is common for a setter to remove the tool, use a grinder or file to sharpen the tool, and place the tool back in the machine. New tools are produced by tool and die makers. (See

statement on tool and die makers elsewhere in the *Handbook*.) After installing the tools into a machine, setup workers often produce the initial batch of goods, inspect the products, and turn the machine over to an operator.

Machine operators and tenders are responsible for running machines in manufacturing plants. After a setter prepares a machine for production, an operator observes the machine and the objects it produces. Operators may have to load the machine with materials for production or adjust machine speeds during production. Operators must periodically inspect the parts a machine produces by comparing the parts to blueprint using rulers, micrometers, and other specialized measuring devices. If the products do not meet design parameters, the machine is shut down; if it is a common, minor error the operator may fix the machine, but if it is more serious an industrial machinery mechanic is called to make a repair. (See the statement on industrial machinery mechanics and millwrights elsewhere in the *Handbook*.) Some machines don't require constant input or attention, so the operator may oversee multiple machines at a given time. In many cases, operators must document production numbers in a notebook or computer database at the end of every hour or shift.

Setters, operators, and tenders usually are identified by the type of machine with which they work. Some examples of specific titles are drilling-machine and boring-machine setup workers, milling-machine and planing-machine tenders, and lathe-machine and turning-machine tool operators. Job duties usually vary with the size of the firm and the type of machine being operated. Although some workers specialize in one or two types of machinery, many are trained to set up or operate a variety of machines. Increasing automation allows machine setters to operate multiple machines simultaneously. In addition, newer production techniques, such as team-oriented “lean” manufacturing, require machine operators to rotate between different machines. Rotating assignments results in more varied work, but also requires workers to have a wider range of skills.

Work environment. Most machine setters, operators, and tenders—metal and plastic work in areas that are clean, well lit, and well ventilated. Nevertheless, stamina is required, because machine operators and setters are on their feet much of the

Machine operators stop production when faulty parts are produced.

day and may do moderately heavy lifting. Also, these workers operate powerful, high-speed machines that can be dangerous if strict safety rules are not observed. Most operators wear protective equipment, such as safety glasses, earplugs, and steel-toed boots, to protect against flying particles of metal or plastic, noise from the machines, and heavy objects that could be dropped. Many modern machines are enclosed, minimizing the exposure of workers to noise, dust, and lubricants used during machining. Other required safety equipment varies by work setting and machine. For example, those in the plastics industry who work near materials that emit dangerous fumes or dust must wear respirators.

Overtime is common during periods of increased production for most machine setters, operators, and tenders—metal and plastic, but they usually work a 40-hour week. Because many metalworking and plastics working shops operate more than one shift daily, some operators work nights and weekends.

Training, Other Qualifications, and Advancement

A few weeks of on-the-job training is sufficient for most workers to learn basic machine operations, but a year or more is required to become a highly skilled operator or setter.

Education and training. Employers generally prefer workers who have a high school diploma or equivalent for jobs as machine setters, operators, and tenders. Those interested in this occupation can improve their employment opportunities by completing high school courses in shop and blueprint reading and by gaining a working knowledge of the properties of metals and plastics. A solid math background, including courses in algebra, geometry, trigonometry, and basic statistics, also is useful, along with experience working with computers.

Machine operator trainees begin by observing and assisting experienced workers, sometimes in formal training programs or apprenticeships. Under supervision, they may start by supplying materials, starting and stopping the machine, or removing finished products from it. Then they advance to the more difficult tasks performed by operators, such as adjusting feed speeds, changing cutting tools, or inspecting a finished product for defects. Eventually, some develop the skills and experience to set up machines and assist newer operators.

The complexity of the equipment largely determines the time required to become an operator. Most operators learn the basic machine operations and functions in a few weeks, but a year or more may be needed to become skilled operators or to advance to the more highly skilled job of setter. Although many operators learn on the job, some community colleges and other educational institutions offer courses and certifications in operating metal and plastics machines. In addition to providing on-the-job training, some employers send promising machine operators to classes. Other employers prefer to hire workers who have completed, or currently are enrolled in, a training program.

Setters or technicians often plan the sequence of work, make the first production run, and determine which adjustments need to be made. As a result, these workers need a thorough knowledge of the machinery and of the products being manufactured. Strong analytical abilities are particularly important for this job. Some companies have formal training programs for

operators and setters, which often combine classroom instruction with on-the-job training.

Other qualifications. As the machinery in manufacturing plants becomes more complex and with changes to shop-floor organization that require more teamwork among employees, employers increasingly look for persons with good communication and interpersonal skills. Mechanical aptitude, manual dexterity, and experience working with machinery also are helpful.

Certification and advancement. Job opportunities and advancement can be enhanced by becoming certified in a particular machine skill. There are many trade groups that offer certification for machine operators and setup workers, and certifications vary greatly depending upon the skill level involved. Certifications may allow operators and setters to switch jobs more easily because they can prove their skills to a potential employer.

Advancement usually takes the form of higher pay and a wider range of responsibilities. With experience and expertise, workers can become trainees for more highly skilled positions; for instance, it is common for machine operators to move into setup or machinery maintenance positions. Setup workers may also move into maintenance, machinist, or tool and die maker roles. (See the statements on industrial machinery mechanics and millwrights, machinists, and tool and die makers elsewhere in the *Handbook*.) Skilled workers with good communication and analytical skills can move into supervisory positions.

Employment

Machine setters, operators, and tenders, metal and plastic held about 1.0 million jobs in 2008. About 9 out of 10 jobs were found in manufacturing—primarily in fabricated metal products, plastics and rubber products, primary metal, machinery, and motor vehicle parts manufacturing.

Job Outlook

Employment is expected to decline rapidly. Those who can operate multiple machines will have the best opportunities for advancement and for gaining jobs with more long-term potential.

Employment change. Employment in the various machine setter, operator, and tender occupations is expected to decline rapidly by 13 percent from 2008 to 2018. Employment will be affected by technological advances, changing demand for the goods they produce, foreign competition, and the reorganization of production processes.

One of the most important factors influencing employment change in this occupation is the implementation of labor-saving machinery. Many firms are adopting new technologies, such as computer-controlled machine tools and robots in order to improve quality, lower production costs, and remain competitive. The switch to computer-controlled machinery requires the employment of computer control programmers and operators (see this statement elsewhere in the *Handbook*) instead of machine setters, operators and tenders. The lower-skilled manual machine tool operators and tenders jobs are more likely to be eliminated by these new technologies, because the functions they perform may be more effectively completed with computer-controlled machinery.

The demand for machine setters, operators, and tenders—metal and plastic is also affected by the demand for the parts they

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Machine setters, operators, and tenders—metal and plastic	—	1,028,400	899,000	-129,400	-13

Grinding, lapping, polishing, and buffing machine tool setters, operators, and tenders, metal and plastic	51-4033	92,700	77,900	-14,800	-16
Lathe and turning machine tool setters, operators, and tenders, metal and plastic	51-4034	55,700	40,800	-14,900	-27
Milling and planing machine setters, operators, and tenders, metal and plastic	51-4035	26,200	22,000	-4,100	-16
Metal furnace and kiln operators and tenders	51-4050	34,100	31,000	-3,100	-9
Metal-refining furnace operators and tenders	51-4051	19,100	17,400	-1,600	-9
Pourers and casters, metal	51-4052	15,100	13,600	-1,500	-10
Model makers and patternmakers, metal and plastic	51-4060	17,100	16,100	-1,000	-6
Model makers, metal and plastic	51-4061	10,100	9,500	-600	-6
Patternmakers, metal and plastic	51-4062	7,000	6,600	-400	-6
Molders and molding machine setters, operators, and tenders, metal and plastic	51-4070	158,800	150,700	-8,200	-5
Foundry mold and coremakers	51-4071	15,000	13,200	-1,800	-12
Molding, coremaking, and casting machine setters, operators, and tenders, metal and plastic	51-4072	143,800	137,400	-6,400	-4
Multiple machine tool setters, operators, and tenders, metal and plastic	51-4081	86,000	73,400	-12,600	-15
Miscellaneous metalworkers and plastic workers	51-4190	134,900	121,800	-13,100	-10
Heat treating equipment setters, operators, and tenders, metal and plastic	51-4191	23,200	20,700	-2,500	-11
Lay-out workers, metal and plastic	51-4192	8,300	7,300	-1,000	-12
Plating and coating machine setters, operators, and tenders, metal and plastic	51-4193	39,500	34,600	-4,900	-12
Tool grinders, filers, and sharpeners	51-4194	18,800	17,400	-1,400	-7
All other metal workers and plastic workers	51-4199	45,000	41,700	-3,300	-7

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

produce. Both the plastic and metal manufacturing industries face stiff foreign competition that is limiting the demand for domestically produced parts. Some domestic firms have outsourced their production to foreign countries, which has limited employment of machine setters and operators. Another way domestic manufacturers compete with low-wage foreign competition is by increasing their use of automated systems, which can make manufacturing establishments more competitive by improving their productivity. This increased automation also limits employment growth.

Job prospects. Despite the overall projected employment decline, a number of machine setter, operator, and tender jobs will become available because of an expected

surge in retirements, primarily baby boomers, in the coming years. Workers with a thorough background in machine operations, certifications from industry associations, exposure to a variety of machines, and a good working knowledge of the properties of metals and plastics will be better able to adjust to the changing environment. In addition, new shop-floor arrangements will reward workers with good basic mathematics and reading skills, good communication skills, and the ability and willingness to learn new tasks. As workers adapt to team-oriented production methods, those who can operate multiple machines will have the best opportunities for advancement and for gaining jobs with more long-term potential.

Earnings

Wages for machine operators can vary by size of the company, union status, industry, and skill level and experience of the operator. Also, temporary employees, who are being hired in greater numbers, usually get paid less than permanently employed workers. The median hourly wages in May 2008 for a variety of machine setters, operators, and tenders—metal and plastic were:

Model makers, metal and plastic.....	\$19.55
Patternmakers, metal and plastic.....	17.75
Metal-refining furnace operators and tenders	17.47
Lay-out workers, metal and plastic	16.79
Rolling machine setters, operators, and tenders, metal and plastic.....	16.40
Milling and planing machine setters, operators, and tenders, metal and plastic.....	16.00
Lathe and turning machine tool setters, operators, and tenders, metal and plastic.....	15.84
Pourers and casters, metal	15.66
Heat treating equipment setters, operators, and tenders, metal and plastic.....	15.40
Tool grinders, filers, and sharpeners.....	15.37
Forging machine setters, operators, and tenders, metal and plastic.....	14.90

Machinists

Significant Points

- Machinists learn their job skills in apprenticeship programs, informally on the job, in vocational high schools, and in community or technical colleges.
- Many entrants previously have worked as machine setters, operators, or tenders.
- Employment is projected to decline slowly, but job opportunities are expected to be good.

Nature of the Work

Machinists use machine tools, such as lathes, milling machines, and grinders, to produce precision metal parts. Although they may produce large quantities of one part, precision machinists often produce small batches or one-of-a-kind items. They use their knowledge of the working properties of metals and their skill with machine tools to plan and carry out the operations needed to make machined products that meet precise specifications. The parts that machinists make range from bolts to automobile pistons.

Machinists first review electronic or written blueprints or specifications for a job before they machine a part. Next, they calculate where to cut or bore into the workpiece—the piece of steel, aluminum, titanium, plastic, silicon, or any other material that is being shaped. They determine how fast to feed the workpiece into the machine and how much material to remove. They then select tools and materials for the job, plan the sequence of cutting and finishing operations, and mark the workpiece to show where cuts should be made.

After this layout work is completed, machinists perform the necessary machining operations. They position the workpiece on the machine tool—drill press, lathe, milling machine, or other type of machine—set the controls, and make the cuts. During the machining process, they must constantly monitor the feed rate and speed of the machine. Machinists also ensure that the workpiece is properly lubricated and cooled, because the machining of metal products generates a significant amount of heat. The temperature of the workpiece is a key concern, because most metals expand when heated; machinists must adjust the size of their cuts relative to the temperature.

During the cutting process, machinists detect problems by listening for specific sounds—for example, that of a dull cutting tool or excessive vibration. Dull cutting tools are removed and replaced. Cutting speeds are adjusted to compensate for harmonic vibrations, which can decrease the accuracy of cuts, particularly on newer high-speed spindles and lathes. After the work is completed, machinists use both simple and highly sophisticated

Machinists remove and replace worn-out machine tools.

measuring tools to check the accuracy of their work against the blueprints.

Some machinists, often called *production machinists*, may produce large quantities of one part, especially parts requiring the use of complex operations and great precision. Many modern machine tools are computer numerically controlled (CNC). CNC machines, following a computer program, control the cutting tool speed, change dull tools, and perform all necessary cuts to create a part. Frequently, machinists work with computer control programmers to determine how the automated equipment will cut a part. (See the section on computer control programmers and operators elsewhere in the *Handbook*.) The machinist determines the cutting path, speed of the cut and the feed rate, and the programmer converts path, speed, and feed information into a set of instructions for the CNC machine tool. Many machinists must be able to use both manual and computer-controlled machinery in their job.

Because most machinists train in CNC programming, they may write basic programs themselves and often modify programs in response to problems encountered during test runs. Modifications, called offsets, not only fix problems, but they also improve efficiency by reducing manufacturing time and tool wear. After the production process is designed, computer control operators implement it by performing relatively simple and repetitive operations.

Some manufacturing techniques employ automated parts loaders, automatic tool changers, and computer controls, allowing machines to operate without anyone present. One production machinist, working 8 hours a day, might monitor equipment, replace worn cutting tools, check the accuracy of parts being produced, adjust offsets, and perform other tasks on several CNC machines that operate 24 hours a day. In the off-hours, during what is known as “lights out manufacturing,” which is the practice of running machines while the operators are not present, a factory may need only a few workers to monitor the entire factory.

Maintenance machinists repair or make new parts for existing machinery. After an industrial machinery mechanic or maintenance worker discovers the broken part of a machine, they give the broken part to the machinist. (See the section on industrial machinery mechanics and millwrights elsewhere

in the *Handbook*.) To replace broken parts, maintenance machinists refer to blueprints and perform the same machining operations that were needed to create the original part. While production machinists are concentrated in a few industries, maintenance machinists work in many manufacturing industries.

Because the technology of machining is changing rapidly, machinists must learn to operate a wide range of machines. Some newer machines use lasers, water jets, or electrified wires to cut the workpiece. While some of the computer controls are similar to other machine tools, machinists must understand the unique cutting properties of these different machines. As engineers create new types of machine tools and new materials to machine, machinists must constantly learn new machining properties and techniques.

Work environment. Today, many machine shops are relatively clean, well lit, and ventilated. Computer-controlled machines often are partially or totally enclosed, minimizing the exposure of workers to noise, debris, and the lubricants used to cool workpieces during machining. Nevertheless, working around machine tools presents certain dangers, and workers must follow safety precautions. Machinists wear protective equipment, such as safety glasses to shield against bits of flying metal, and earplugs to dampen machinery noise. They also must exercise caution when handling hazardous coolants and lubricants, although many common water-based lubricants present little hazard. The job requires stamina, because machinists stand most of the day and, at times, may need to lift moderately heavy workpieces. Modern factories use autoloaders and overhead cranes to reduce heavy lifting.

Many machinists work a 40-hour week. Evening and weekend shifts are becoming more common, as companies extend hours of operation to make better use of expensive machines. However, this trend is somewhat offset by lights-out manufacturing that uses fewer machinists and the use of machine operators for less desirable shifts. Overtime work is common during peak production periods.

Training, Other Qualifications, and Advancement

Machinists train in apprenticeship programs, vocational schools, or community or technical colleges, or informally on the job. Many entrants previously have worked as machine setters, operators, or tenders.

Education and training. There are many different ways to become a skilled machinist. Many entrants previously have worked as machine setters, operators, or tenders. In high school, students should take math courses, especially trigonometry and geometry and, if available, courses in blueprint reading, metalworking, and drafting. Some advanced positions, such as those in the aircraft manufacturing industry, require the use of advanced applied calculus and physics. Due to the increasing use of computer controlled machinery, basic computer skills are needed before entering a training program. After high school, some machinists learn entirely on the job, but most acquire their skills in a mix of classroom and on-the-job training. Formal apprenticeship programs, typically sponsored by a union or manufacturer, are an excellent way to learn the job of machinist, but are often hard

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Machinists	51-4041	421,500	402,200	-19,300	-5

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

to get into. Apprentices usually must have a high school diploma, GED, or the equivalent; and most have taken algebra and trigonometry classes.

Apprenticeship programs consist of paid shop training and related classroom instruction lasting up to 4 years. In shop training, apprentices work almost full time and are supervised by an experienced machinist, while learning to operate various machine tools. Classroom instruction includes math, physics, materials science, blueprint reading, mechanical drawing, and quality and safety practices. In addition, as machine shops have increased their use of computer-controlled equipment, training in the operation and programming of CNC machine tools has become essential. Apprenticeship classes are often taught in cooperation with local community colleges or vocational-technical schools. A growing number of machinists are learning the trade through 2-year associate degree programs at community or technical colleges. Graduates of these programs still need significant on-the-job experience as machinists' assistants before they are fully qualified.

Certification and other qualifications. People interested in becoming machinists should be mechanically inclined, have good problem-solving abilities, be able to work independently, and be able to do highly accurate work (tolerances may reach 50/1,000,000ths of an inch) that requires concentration and physical effort. Experience working with machine tools is helpful. In fact, many entrants have worked as machine setters, operators, or tenders.

To boost the skill level of machinists and to create a more uniform standard of competency, a number of training facilities, State apprenticeship boards, and colleges offer certification programs. Completing a recognized certification program provides a machinist with better career opportunities and helps employers better judge the abilities of new hires. Journey-worker certification can be obtained from State apprenticeship boards after completing an apprenticeship; this certification is recognized by many employers and often leads to better career opportunities.

As new automation is introduced, machinists normally receive additional training to update their skills. This training usually is provided by a representative of the equipment manufacturer or a local technical school. Some employers offer tuition reimbursement for job-related courses.

Advancement. Machinists can advance in several ways. Experienced machinists may become CNC programmers, tool and die makers, or mold makers, or be promoted to supervisory or administrative positions in their firms. A few open their own machine shops.

Employment

Machinists held about 421,500 jobs in 2008. About 78 percent of machinists work in manufacturing industries, such as

machine shops and machinery, motor vehicle and parts, aerospace products and parts, and other transportation equipment manufacturing. Maintenance machinists work in most industries that use production machinery.

Job Outlook

Although employment of machinists is projected to decline slowly, job prospects are expected to be good.

Employment change. Employment of machinists is projected to decline by 5 percent over the 2008–18 decade, due to rising productivity among these workers and strong foreign competition in the manufacture of goods. Machinists are becoming more efficient as a result of the expanded use of and improvements in technologies such as CNC machine tools, autoloading, high-speed machining, and lights out manufacturing. This allows fewer machinists to accomplish the same amount of work. Technology is not expected to affect the employment of machinists as significantly as that of some other production workers, however, because machinists monitor and maintain many automated systems. Due to modern production techniques, employers prefer workers, such as machinists, who have a wide range of skills and are capable of performing almost any task in a machine shop.

Job prospects. Despite the projected decline in employment, job opportunities for machinists should continue to be good, as employers value the wide-ranging skills of these workers. Also, many young people with the necessary educational and personal qualifications needed to become machinists prefer to attend college or may not wish to enter production occupations. Therefore, the number of workers learning to be machinists is expected to be less than the number of job openings arising each year from the need to replace experienced machinists who retire or transfer to other occupations. Employment levels in this occupation are influenced by economic cycles—as the demand for machined goods falls, machinists involved in production may be laid off or forced to work fewer hours.

Earnings

Median hourly wages of machinists were \$17.41 in May 2008. The middle 50 percent earned between \$13.66 and \$21.85. The lowest 10 percent earned less than \$10.79, while the top 10 percent earned more than \$26.60. Median hourly wages in the manufacturing industries employing the largest number of machinists were:

Aerospace product and parts manufacturing	\$19.49
Metalworking machinery manufacturing	17.90
Motor vehicle parts manufacturing	17.06
Machine shops; turned product; and screw, nut, and bolt manufacturing	16.93
Employment services	12.94

Apprentices earn much less than experienced machinists, but earnings increase quickly as they improve their skills. Also, most employers pay for apprentices' training classes.

Tool and Die Makers

Significant Points

- Tool and die makers are one of the highest paid and most highly skilled production occupations.
- Most tool and die makers need 4 or 5 years of classroom instruction and on-the-job training to become fully qualified.
- Employment is projected to decline moderately, but job opportunities should be excellent, as many employers report difficulty finding qualified applicants.

Nature of the Work

Tool and die makers are among the most highly skilled workers in manufacturing. These workers produce and repair tools, dies, and special guiding and holding devices that enable machines to produce a variety of products we use daily—from clothing and furniture to heavy equipment and parts for aircraft. They may work in manufacturing plants that produce tools in house, or in machine shops that only produce specialized machine tools for other manufacturers.

Toolmakers craft precision tools and machines that are used to cut, shape, and form metal and other materials. They also

produce jigs and fixtures—devices that hold metal while it is bored, stamped, or drilled—and gauges and other measuring devices. *Die makers* construct metal forms, called dies, that are used to shape metal in stamping and forging operations. They also make metal molds for diecasting and for molding plastics, ceramics, and composite materials. Some tool and die makers craft prototypes of parts, and then, working with engineers and designers, determine how best to manufacture the part. In addition to developing, designing, and producing new tools and dies, these workers also may repair worn or damaged tools, dies, gauges, jigs, and fixtures.

To perform these functions, tool and die makers employ many types of machine tools and precision measuring instruments. They also must be familiar with the machining properties, such as hardness and heat tolerance of a wide variety of common metals, alloys, plastics, ceramics, and other composite materials. Tool and die makers are knowledgeable in machining operations, mathematics, and blueprint reading. In fact, tool and die makers often are considered highly specialized machinists. Machinists typically produce less elaborate parts for machinery, while tool and die makers craft very durable, complex machine tools. As a result, tool and die makers must have a general understanding of the mechanics of machinery. (See the section on machinists elsewhere in the *Handbook*.)

While many tools and dies are designed by engineers or tool designers, tool and die makers are also trained to design tools and often do. They may travel to a customer's plant to observe the operation and suggest ways in which a new tool could improve the manufacturing process.

Once a tool or die is designed, tool and die makers, working from blueprints, plan the sequence of operations necessary to manufacture the tool or die. They measure and mark the pieces of metal that will be cut to form parts of the final product. At this point, tool and die makers cut, drill, or bore the part as required, checking to ensure that the final product meets specifications. Finally, these workers assemble the parts and perform finishing jobs, such as filing, grinding, and polishing surfaces. While manual machining has declined, it is still used for unique parts and sharpening of used tools.

Many tool and die makers use computer-aided design (CAD) to develop products and parts. Specifications entered into computer programs can be used to electronically develop blueprints for the required tools and dies. Numerical tool and process control programmers use CAD or computer-aided manufacturing (CAM) programs to convert electronic drawings into CAM-based computer programs that contain instructions for a sequence of cutting tool operations. (See the section on computer control programmers and operators elsewhere in the *Handbook*.) Once these programs are developed, computer numerically controlled (CNC) machines follow the set of instructions contained in the program to produce the part. Computer-controlled machine tool operators or machinists normally operate CNC machines, but tool and die makers are often trained in both operating CNC machines and writing CNC programs; and they may perform either task. CNC programs are stored electronically for future use, saving time and increasing worker productivity.

After machining the parts, tool and die makers carefully check the accuracy of the parts using many tools, including coordinate measuring machines, which use sensor arms and software to compare the dimensions of the part to electronic blueprints. Next, they assemble the different parts into a functioning machine. They file, grind, shim, and adjust the different parts to properly fit them together. Finally, tool and die makers set up a test run, using the tools or dies they have made to make sure that the manufactured parts meet specifications. If problems occur, they compensate by adjusting the tools or dies.

Work environment. Tool and die makers may either work in toolrooms or manufacturing production floors. Toolrooms are generally kept clean and cool to minimize heat-related expansion of metal workpiece, while specialty machine shops have a factory floor covered with machinery. To minimize the exposure of workers to moving parts, machines have guards and shields. Most computer-controlled machines are totally enclosed, minimizing workers' exposure to noise, dust, and the lubricants used to cool workpieces during machining. Working around this machinery can still be dangerous, so tool and die makers must follow safety rules and wear protective equipment, such as safety glasses to shield against bits of flying metal, earplugs to protect against noise, and gloves and masks to reduce exposure to hazardous lubricants and cleaners. These workers also need stamina, because they often spend much of the day on their feet and may do moderately heavy lifting. Companies employing tool and die makers have traditionally operated only one shift per day. Overtime and weekend work are common, especially during peak production periods.

Training, Other Qualifications, and Advancement

It usually takes 4 or 5 years of classroom and paid on-the-job training to become a fully trained tool and die maker. Good math, problem-solving, and computer skills are important requirements for these workers.

Education and training. Most tool and die makers learn their trade through 4 or 5 years of education and training in formal apprenticeships or in other postsecondary programs offered at local community colleges or technical schools. These programs often include a mix of classroom instruction and paid hands-on experience. According to most employers, apprenticeship programs are the best way to learn all aspects of tool and die making. Most apprentices must have a high school diploma, GED, or equivalent. In high school, students should take courses in physics and mathematics, including trigonometry and geometry.

Traditional apprenticeships usually require that the apprentice complete a specific number of work and classroom hours to complete the program, which typically takes 4 or 5 years. Some companies and State apprenticeship programs, however, are now shifting from time-based programs to competency-based programs. Under competency-based programs, apprentices can move ahead more quickly by passing a series of exams and demonstrating competency in a particular job skill.

While formal apprenticeship programs may be the best way to learn the job, many tool and die makers receive most of their formal classroom training from community and technical colleges, while working for a company that often supports

the employee's training goals and provides the needed on-the-job training less formally. Apprentices usually work 40 hours per week and attend technical college courses at night. These trainees often begin as machine operators and gradually take on more difficult assignments. Many machinists become tool and die makers.

During their training, tool and die maker trainees learn to operate milling machines, lathes, grinders, laser and water cutting machines, wire electrical discharge machines, and other machine tools. They also learn to use handtools for fitting and assembling gauges and other mechanical and metal-forming equipment. In addition, they study metalworking processes, such as heat treating and plating. Classroom training usually consists of tool designing, tool programming, blueprint reading, and mathematics courses, including algebra, geometry, calculus, trigonometry, and statistics. Tool and die makers must have good computer skills to work with CAD/CAM technology, CNC machine tools, and computerized measuring machines.

Even after completing a formal training program, tool and die makers still need years of experience to become highly skilled. Most specialize in making certain types of tools, molds, or dies.

Certification and other qualifications. State apprenticeship boards certify tool and die makers as journey workers after they have completed a licensed program. While a State certification is not necessary to work as a tool and die maker, it gives workers more flexibility in employment, as many employers require this certification. Apprentices usually must be at least 18 years old, in addition to having a high school education and high school mathematics classes.

Because tools and dies must meet strict specifications—precision to one ten-thousandth of an inch is common—the work of tool and die makers requires skill with precision measuring devices and a high degree of patience and attention to detail. Good eyesight is essential. People entering this occupation also should be mechanically inclined, able to work and solve problems independently, have strong mathematical skills, and be capable of doing work that requires concentration and physical effort. Tool and die makers who visit customers' plants need good communication, interpersonal, and sales skills.

Tool and die makers wear safety glasses for eye protection.

Employers generally look for someone with a strong educational background, as they desire intelligent, dependable workers. Problem-solving skills are also a must in this occupation, as technologies and skills are constantly changing in this profession. As automation continues to change the way tools and dies are made, workers regularly need to update their skills to learn how to operate new equipment. Also, as materials such as alloys, ceramics, polymers, and plastics are increasingly used, tool and die makers need to learn new machining techniques to deal with these new materials.

Advancement. There are several ways for skilled workers to advance. Some move into supervisory and administrative positions in their firms or they start their own shop. Others may take computer courses and become computer-controlled machine tool programmers. With a college degree, a tool and die maker can go into engineering or tool design.

Employment

Tool and die makers held about 84,300 jobs in 2008. Most worked in industries that manufacture metalworking machinery, transportation equipment, such as motor vehicle parts, fabricated metal products, and plastics products. Although they are found throughout the country, jobs are most plentiful in the Midwest and the Northeast, where many metalworking companies are located.

Job Outlook

Employment is projected to decline moderately. However, excellent job opportunities are expected, as many employers report difficulty finding qualified applicants.

Employment change. Employment of tool and die makers is projected to decline by 8 percent over the 2008–18 decade, due to foreign competition in manufacturing and advances in automation, including CNC machine tools and computer-aided design, that should improve worker productivity. On the other hand, tool and die makers play a key role in building and maintaining advanced automated manufacturing equipment, which makes them less susceptible to lay-offs from automation than other less skilled production workers. As firms invest in new equipment, modify production techniques, and implement product design changes more rapidly, they will continue to rely heavily on skilled tool and die makers for retooling.

Job prospects. Despite declining employment, excellent job opportunities are expected as many openings will result from workers retiring or leaving the occupation for other reasons. Employers in certain parts of the country report difficulty attracting skilled workers and apprenticeship candidates with the necessary abilities to fill openings. The number of workers receiving training in this occupation is expected to continue to be fewer than the number of openings created each

year by tool and die makers who retire or transfer to other occupations. A major factor limiting the number of people entering the occupation is that many young people who have the educational and personal qualifications necessary to learn tool and die making usually prefer to attend college or do not wish to enter production occupations.

Earnings

Median hourly wages of tool and die makers were \$22.32 in May 2008. The middle 50 percent earned between \$18.00 and \$27.99. The lowest 10 percent had earnings of less than \$14.69, while the top 10 percent earned more than \$34.76. Median hourly wages in the manufacturing industries employing the largest numbers of tool and die makers were as follows:

Motor vehicle parts manufacturing	\$27.99
Forging and stamping	21.80
Plastics product manufacturing	21.55
Machine shops; turned product; and screw, nut, and bolt manufacturing	20.73
Metalworking machinery manufacturing	20.46

The pay of apprentices is tied to their skill level. As they gain more skills and reach specific levels of performance and experience, their pay increases. About 22 percent of tool and die makers belong to unions.

teristics. Links to O*NET appear at the end of the Internet version of this occupational statement, accessible at <http://www.bls.gov/ooh/ocos225.htm>

Welding, Soldering, and Brazing Workers

Significant Points

- About 2 out of 3 jobs in this occupation are in manufacturing industries.
- Training ranges from a few weeks to several years of school and on-the-job training.
- Employment is projected to experience little or no change.
- Job prospects should be good for skilled welders because employers are reporting difficulty finding enough qualified people.

Nature of the Work

Welding is the most common way of permanently joining metal parts. In this process, heat is applied to metal pieces, melting and fusing them to form a permanent bond. Because of its strength, welding is used in shipbuilding, automobile manufacturing and repair, aerospace applications, and thousands of other manufacturing activities. Welding also is used to join beams in the construction of buildings, bridges, and other structures and to join pipes in pipelines, powerplants, and refineries.

Welders may work in a wide variety of industries, from car racing to manufacturing. The work done in the different industries and the equipment used may vary greatly. The most common and simplest type of welding today is arc welding, which uses electrical currents to create heat and bond metals together, but there are over 100 different processes that a welder can employ. The type of weld used is normally determined by the types of metals being joined and the conditions under which the welding is to take place. Steel, for instance, can be welded more easily than titanium. Some of these processes involve manually using a rod and heat to join metals, while others are semiautomatic, with a welding machine feeding wire to bond materials. Automated welding, done completely by robots, is increasingly being used in the manufacturing industry.

Like welders, *soldering and brazing workers* use molten metal to join two pieces of metal. However, the metal added during the soldering and brazing process has a melting point lower than that of the piece, so only the added metal is melted, not the piece. Soldering uses metals with a melting point below 840 degrees Fahrenheit; brazing uses metals with a higher melting point. Because soldering and brazing do not melt the pieces being joined, these processes normally do not create the distortions or weaknesses in the pieces that can occur with welding. Soldering commonly is used to make electrical and electronic circuit boards, such as computer chips. Soldering workers tend to work with small pieces

that must be precisely positioned. Brazing often is used to connect copper plumbing pipes and thinner metals that the higher temperatures of welding would warp. Brazing also can be used to apply coatings to parts to reduce wear and protect against corrosion.

Skilled welding, soldering, and brazing workers generally plan work from drawings, called blueprints, or specifications and use their knowledge of welding processes and base metals to determine how best to join the parts. The difficulty of the weld is determined by its position—horizontal, vertical, overhead, or 6G (circular, as in large pipes)—and by the type of metals to be fused. Highly skilled welders often are trained to work with a wide variety of materials, such as titanium, aluminum, or plastics, in addition to steel. Welders then select and set up welding equipment, execute the planned welds, and examine the welds to ensure that they meet standards or specifications.

Automated welding is being used in an increasing number of production processes. In these instances, a machine or robot performs the welding tasks while being monitored by a welding machine operator. *Welding, soldering, and brazing machine setters, operators, and tenders* follow specified layouts, work orders, or blueprints. Operators must load parts correctly and monitor the machine constantly to ensure that it produces the desired bond. About 12 percent of all welding, soldering, and brazing workers operate automated machinery.

Welders inspect the placement of parts before bonding metals.

The work of *arc, plasma, and oxy-gas cutters* is closely related to that of welders. However, instead of joining metals, cutters use the heat from an electric arc, a stream of ionized gas called plasma, or burning gases to cut and trim metal objects to specific dimensions. Cutters also dismantle large objects, such as ships, railroad cars, automobiles, buildings, or aircraft. Some operate and monitor cutting machines similar to those used by welding machine operators.

Work environment. Welding, soldering, and brazing workers often are exposed to a number of hazards, including very hot materials and the intense light created by the arc. They wear safety shoes, goggles, masks with protective lenses, and other devices designed to prevent burns and eye injuries and to protect them from falling objects. The Occupational Safety and Health Administration (OSHA) requires that welders work in safely ventilated areas to avoid the danger from inhalation of gases and particulates that can result from welding processes. Because of these hazards, welding, soldering, and brazing workers suffer more work-related injuries than do workers in most occupations, but injuries can be minimized if proper safety procedures are followed. Automated welding, soldering, and brazing machine operators are not exposed to as many dangers, and a face shield or goggles usually provide adequate protection for these workers.

Welders and cutters may work outdoors, often in inclement weather, or indoors, sometimes in a confined area designed to contain sparks and glare. Outdoors, they may work on a scaffold or platform high off the ground. In addition, they may be required to lift heavy objects and work in a variety of awkward positions while bending, stooping, or standing to perform work overhead.

Although about 50 percent of welders, solderers, and brazers work a 40-hour week, overtime is common, and about 1 out of 5 welder works 50 hours per week or more. Many manufacturing firms offer two or three shifts, ranging from 8 to 12 hours, which allows them to continue production around the clock if needed.

Training, Other Qualifications, and Advancement

Training for welding, soldering, and brazing workers can range from a few weeks of school or on-the-job training for low-skilled positions to several years of combined school and on-the-job training for highly skilled jobs.

Education and training. Formal training is available in high schools and postsecondary institutions, such as vocational-technical institutes, community colleges, and private welding, soldering, and brazing schools. The U.S. Armed Forces operate welding and soldering schools as well. Some employers are willing to hire inexperienced entry-level workers and train them on the job, but many prefer to hire workers who have been through formal training programs. Courses in blueprint reading, shop mathematics, mechanical drawing, physics, chemistry, and metallurgy are helpful. An understanding of electricity also is very helpful, and knowledge of computers is gaining importance, especially for welding, soldering, and brazing machine operators, who are becoming more responsible for programming robots and other computer-controlled machines. Because understand-

ing the welding process and inspecting welds is important for both welders and welding machine operators, companies hiring machine operators prefer workers with a background in welding.

Certification and other qualifications. Some welding positions require general certifications in welding or certifications in specific skills such as inspection or robotic welding. The American Welding Society certification courses are offered at many welding schools. Some employers have developed their own internal certification tests. Some employers are willing to pay training and testing costs for employees, while others require workers to pay for classes and certification themselves.

The Institute for Printed Circuits offers certifications and training in soldering. In industries such as aerospace and defense, where highly accurate and skilled work is required, many employers require these certifications. In addition, the increasing use of lead-free soldering techniques, which require more skill than traditional lead-based soldering techniques, has increased the importance of certification to employers.

Welding, soldering, and brazing workers need good eyesight, hand-eye coordination, and manual dexterity, along with good math, problem-solving, and communication skills. They should be able to concentrate on detailed work for long periods and be able to bend, stoop, and work in awkward positions. In addition, welders increasingly must be willing to receive training and perform tasks required in other production jobs.

Advancement. Welders can advance to more skilled welding jobs with additional training and experience. For example, they may become welding technicians, supervisors, inspectors, or instructors. Some experienced welders open their own repair shops. Other welders, especially those who obtain a bachelor's degree or have many years of experience, may become welding engineers.

Employment

In 2008, welders, cutters, solderers, and brazers held about 412,300 jobs and welding, soldering, and brazing machine setters, operators, and tenders held about 54,100 jobs. About 65 percent of welding jobs were found in manufacturing. Jobs were concentrated in fabricated metal product manufacturing, transportation equipment manufacturing, machinery manufacturing, architectural and structural metals manufacturing, and construction.

Job Outlook

Employment is projected to experience little or no change over the next decade. Good job opportunities are expected for skilled welders because some employers are reporting difficulty finding qualified workers.

Employment change. Employment of welders, cutters, solderers, and brazers is expected to experience little or no change, declining by about 2 percent over the 2008–18 decade, while employment of welding, soldering, and brazing machine setters, operators, and tenders is expected to decline about 7 percent over the same decade. Continued enhancements in productivity and increased automation will reduce the need for welders, although the outlook for welders in man-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Welding, soldering, and brazing workers.....	51-4120	466,400	455,900	-10,500	-2
Welders, cutters, solderers, and brazers	51-4121	412,300	405,600	-6,700	-2
Welding, soldering, and brazing machine setters, operators, and tenders	51-4122	54,100	50,300	-3,800	-7

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

ufacturing is stronger than that for other occupations in this industry because of the importance and versatility of welding as a manufacturing process. The basic skills of welding are the same across industries, so welders can easily shift from one industry to another, depending on where they are needed most. For example, welders laid off in the automotive manufacturing industry may be able to find work in the oil and gas industry, although the shift may require relocating.

Automation will affect welders and welding machine operators differently than other manufacturing occupations. Semi-automated and automated welding machines can be used for many types of welds, but welders still are needed to operate the machines and to inspect the weld and make adjustments. In addition, much of the work in custom applications is difficult or impossible to automate. This type of work includes manufacturing small batches of items, construction work, and making repairs in factories.

Job prospects. Job prospects for welders will vary with the welder's skill level. Prospects should be good for welders trained in the latest technologies. Welding schools report that graduates have little difficulty finding work, and many welding employers report difficulty finding properly skilled welders. However, welders without up-to-date training may face competition for job openings. For all welders, prospects will be better for workers who are willing to relocate to different parts of the country.

Earnings

Median wages of welders, cutters, solderers, and brazers were \$16.13 an hour in May 2008. The middle 50 percent earned between \$13.20 and \$19.61. The lowest 10 percent earned less than \$10.85, and the top 10 percent earned more than \$24.38. The range of wages of welders reflects the wide range of skill levels in the occupation. Median hourly wages of welders, cutters, solderers, and brazers in the industries employing the largest numbers of them were as follows:

Other general purpose machinery manufacturing	\$16.34
Agriculture, construction, and mining machinery manufacturing.....	16.28
Commercial and industrial machinery and equipment (except automotive and electronic) repair and maintenance.....	15.93
Architectural and structural metals manufacturing	15.05
Motor vehicle body and trailer manufacturing.....	14.73

Median wages of welding, soldering, and brazing machine setters, operators, and tenders were \$15.20 an hour in May 2008. The middle 50 percent earned between \$12.62 and \$18.63. The lowest 10 percent earned less than \$10.47, and the top 10 percent earned more than \$23.92. Median wages in motor vehicle parts manufacturing, the industry employing these workers in the largest numbers, were \$15.34 an hour in May 2008.

About 20 percent of welders belong to labor unions; the particular unions that welders belong to depend on the industry and company in which the welder is employed.

Printing Occupations

Bookbinders and Bindery Workers

Significant Points

- Employment is expected to decline rapidly, reflecting the use of more productive machinery and the growth of electronic media.
- Opportunities for hand bookbinders are limited because of the declining demand for this highly specialized work and the resulting decline in the number of establishments that do this work.
- Most bookbinders and bindery workers train on the job.

Nature of the Work

The process of combining printed sheets into finished products such as books, magazines, catalogs, folders, and directories is known as “binding.” When publications or advertising supplements have been printed, they must then be folded, glued, stitched, stapled, trimmed, or otherwise turned into the finished product that will be seen by the public. *Bindery workers* set up, operate, and maintain the machines that perform these various tasks, while *bookbinders* perform highly skilled hand finishing operations.

Job duties depend on the material being bound. Some types of binding and finishing jobs consist of only one step. Preparing leaflets or newspaper inserts, for example, requires only folding and trimming. Binding books and magazines, on the other hand, requires a number of steps. Bindery workers first assemble the books and magazines from large, flat, printed sheets of paper. They then operate machines that first fold printed sheets into “signatures,” which are groups of pages arranged sequentially. They then assemble the signatures in sequence and join them by means of a saddle-stitch process or perfect binding (where no stitches are used).

Bookbinders and bindery workers use automated binding machines to finish printed reports.

In firms that do “edition binding,” workers bind books produced in large numbers, or “runs.”

Bookbinders also do repair work on rare books, such as sewing, stitching, or gluing the assembled printed sheets. They also shape book bodies with presses and trimming machines and reinforce them with glued fabric strips. Covers are created separately and glued, pasted, or stitched onto the book bodies. The books then undergo a variety of finishing operations, often including wrapping in paper jackets. In establishments that print new books, this work is done mechanically.

A small number of bookbinders work in hand binderies. These highly skilled workers design original or special bindings for limited editions, or restore and rebind rare books. Some binders repair books and provide other specialized binding services to libraries.

Bookbinders and bindery workers in small shops may perform many binding tasks, while those in large shops tend to specialize. Tasks may include performing perfect binding or operating laminating machinery. Others specialize as folder operators or cutter operators, and may perform adjustments and minor repairs to equipment as needed.

Work environment. Binderies often are noisy and jobs can be strenuous, requiring considerable lifting, standing, and carrying. Binding often resembles an assembly line on which workers perform repetitive tasks. The jobs also may require stooping, kneeling, and crouching. Equipment and protective clothing that help minimize injuries is available; however, minor injuries occur frequently in the occupation.

Bookbinders and bindery workers normally work 40 hours per week, although weekend and holiday hours may be necessary to meet production schedules. Some bindery workers may work on shifts for larger printers that operate around the clock. Part-time and on-call schedules are common to meet fluctuating demand or impending deadlines.

Training, Other Qualifications, and Advancement

On-the-job training remains the most common form of training for entry level bindery workers, but new technology will require workers to obtain more formal training. Attention to detail and mechanical aptitude are important for these jobs.

Education and training. High school students interested in bindery careers should take shop courses or attend a vocational-technical high school. Occupational skill centers also provide an introduction to bindery work and bookbinding. For entry-level positions, most employers look for high school graduates or those with associate degrees.

Training in graphic communications also can be an asset. Vocational-technical institutes offer postsecondary programs in the graphic arts, as do some skill-updating or retraining programs and community colleges. Other programs are made available by unions to their members. Four-year colleges also offer programs related to printing and publishing, but their emphasis is on preparing people for careers as graphic artists, educators, or managers in the graphic arts field.

While postsecondary education is available, most bookbinders and bindery workers learn the craft through on-the-job training. Inexperienced workers may start out as helpers and perform simpler tasks, such as moving paper from cutting machines to folding machines or catching stock as it comes off machines. They learn basic binding skills, including the characteristics of paper and how to cut large sheets of paper into different sizes with the least amount of waste. Usually, it takes one to three months to learn to operate simpler machines but it can take up to one year to become completely familiar with more complex equipment, such as computerized binding machines. As workers gain experience, they learn to operate more types of equipment. To keep pace with changing technology, retraining is increasingly important for bindery workers.

Formal apprenticeships are not as common as they used to be, but still are offered by some employers. Apprenticeships allow beginners to acquire skills by working alongside skilled workers while also taking classes. The more structured apprenticeship programs enable workers to acquire the high levels of specialization and skill needed for some bindery and bookbinding jobs.

Other qualifications. Bindery work requires careful attention to detail. Accuracy, patience, neatness, and good eyesight are all important. Mechanical aptitude is necessary to operate automated equipment, and workers with computer skills will increasingly be in demand. Manual dexterity is needed in order to count, insert, and fold. In addition, creativity and artistic ability are necessary for hand bookbinding.

Certification and advancement. With experience, binders can expect increased salaries and more responsibility. Completion of a formal certification program can further advancement opportunities. Without additional training, advancement opportunities outside of bindery work are limited. In large binderies, experienced bookbinders or bindery workers may advance to supervisory positions.

Employment

In 2008, bookbinders and bindery workers held about 66,500 jobs, including 6,100 as bookbinders and 60,400 as bindery workers. More than 8 out of 10 bookbinding and bindery jobs were in printing and related support activities. Traditionally, the largest employers of bindery workers were bindery trade shops, which are companies that specialize in providing binding services for printers without binderies or whose printing production exceeds their binding capabilities. However, this type of binding is now being done increasingly in-house, and is now called “in-line finishing.” The publishing industry employed 5 percent of bookbinders and bindery workers.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Bookbinders and bindery workers	51-5010	66,500	53,600	-12,900	-19
Bindery workers	51-5011	60,400	48,200	-12,100	-20
Bookbinders	51-5012	6,100	5,400	-700	-12

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Job Outlook

Employment of bookbinders and bindery workers is projected to decline rapidly between 2008 and 2018, but opportunities for skilled, specialized bindery workers should be good because of their experience and expertise. Many job openings also will be created by bindery workers who transfer to other occupations.

Employment change. Overall employment of bookbinders and bindery workers is expected to decline rapidly by 19 percent between 2008 and 2018. Over this period, demand for bindery workers will slow as distribution of advertising supplements shifts from print to electronic media even as print productivity increases. Employment declines, however, may be ameliorated somewhat, because the demand for quick turnaround of print work, typical for most commercial printing work, makes work less amenable to being outsourced to foreign countries. To a great extent, sophisticated equipment has automated much of the mechanical bindery work, allowing more companies to perform bindery services in-house rather than send work to specialized binding shops. Also, more efficient and flexible binding machinery will slow the growth in demand for workers to do specialized binding.

Job prospects. Experienced workers will continue to have the best opportunities for skilled jobs. Prospects for all bindery jobs will be best for workers who have completed training or certification programs, internships, or who have experience in a related production occupation.

Earnings

Median hourly wages of bookbinders were \$14.92 in May 2008, compared to \$13.99 per hour for all production occupations. The middle 50 percent earned between \$10.34 and \$19.46 an hour. The lowest 10 percent earned less than \$8.35, and the highest 10 percent earned more than \$27.68.

Median hourly wages of bindery workers were \$13.17 in May 2008. The middle 50 percent earned between \$10.23 and \$17.02 an hour. The lowest 10 percent earned less than \$8.42, and the highest 10 percent earned more than \$21.31.

Prepress Technicians and Workers

Significant Points

- Most prepress technician jobs now require formal postsecondary graphic communications training in the various types of computer software used in digital imaging.
- Employment is projected to decline rapidly as the increased use of computers in typesetting and page layout requires fewer prepress technicians.

Nature of the Work

The printing process has three stages: prepress, press, and binding or finishing. While workers in small print shops are usually responsible for all three stages, in most printing firms, formatting print jobs and correcting layout errors before the job goes to print is the responsibility of a specialized group of workers. *Prepress technicians and workers* are responsible for this prepress work. They perform a variety of tasks to help transform text and pictures into finished pages and prepare the pages for print.

Some prepress technicians, known as “preflight technicians,” take images from graphic designers, customer service staff, team leaders, or directly from customers and check them for completeness. They review job specifications and design either from submitted sketches or clients’ electronic files to ensure that everything is correct and all files and photos are included. Once clients and preflight technicians agree that everything is in order, preflight technicians forward the files to prepress technicians to set up printers.

Offset printing plates are thin sheets of metal that carry the final image to be printed. Printing presses use this plate to copy the image to the final printed products. Once a printing plate has been created, prepress technicians collaborate with printing press operators to check for any potential printing problems. Several plates may be needed if a job requires color, but advanced printing technology generally does not require plates.

Prepress workers generally use a photographic process to make offset printing plates. This is a complex process involving ultraviolet light and chemical exposure through which the text and images of a print job harden on a metal plate and become water repellent. These hard, water repellent portions of the metal plate are in the form of the text and images that will be printed. More recently, however, the printing industry has moved to technology known as “direct-to-plate,” by which the prepress technicians send the data directly to a plating system, bypassing the need for the photographic technique. The direct-to-plate technique is just one example of digital imaging technology that has largely replaced cold-type print technology.

Using direct-to-plate technology, the technicians produce an electronic image of the printed pages. The electronic image is used to create a “proof” which is printed and delivered or mailed to the customer. Alternatively, the electronic file can be e-mailed to the client for a final check. Once the customer approves the proofs, technicians use laser “imagesetters” to expose digital images of the pages directly onto the thin metal printing plates or directly to a digital press and skip the plate-making process altogether.

Advances in computer software and printing technology continue to change prepress work. Prepress workers often receive files from customers on a computer disk, via e-mail, or through an Internet site that contains typeset material already laid out in pages. This work is usually done by desktop publishers or graphic designers who have knowledge of publishing software. (Sections on desktop publishers and graphic designers appear elsewhere in the Handbook.) Despite the shortcuts that technological advancements allow, workers still need to understand the basic processes behind prepress, press, and finishing operations. Some workers, known as job printers, perform prepress and print operations.

Prepress technicians and workers ensure that printing presses are set correctly and that images and colors are correct before the full job order is printed.

Job printers often are found in small establishments where work combines several job skills.

Work environment. Prepress technicians and workers usually work in clean, air-conditioned areas with little noise. Some workers may develop eyestrain from working in front of a video display terminal or other problems, such as muscle aches or back pain. Workers are often subject to stress and the pressures of deadlines and tight work schedules.

Prepress employees usually work an 8-hour day. Some workers—particularly those employed by newspapers—work night shifts. Weekend and holiday work may be required, particularly when a print job is behind schedule. Part-time job printers and prepress technicians made up about 14 percent of this occupation in 2008.

Training, Other Qualifications, and Advancement

Employers prefer workers with formal training in printing or publishing. Familiarity with the printing process, including the technology used, and attention to detail are the qualities that employers will seek most in job applicants.

Education and training. Many employers consider the best candidates for prepress jobs to be individuals with a combination of work experience in the printing industry and formal training in new digital technology. The experience of these applicants provides them with an understanding of how printing plants operate and demonstrates their interest in advancing within the industry.

Traditionally, prepress technicians and workers started as helpers and were trained on the job. Some of these jobs required years of experience performing detailed manual work to become skillful enough to perform the most difficult tasks. Today, however, employers expect workers to have some formal postsecondary graphic communications training in the various types of computer software used in digital imaging and will train workers on the job as needed.

For beginners, 2-year associate degree programs offered by community colleges, junior colleges, and technical schools teach the latest prepress skills and allow students to practice applying them. There are also 4-year bachelor's degree programs in graphic design aimed primarily at students who plan to move into management positions in printing or design. For workers who do not wish to enroll in a degree program, prepress-related courses are offered at many community colleges, junior colleges, 4-year colleges and universities, vocational-technical institutes, and private trade and technical schools. Workers with experience in other printing techniques can take a few college-level graphic communications courses to upgrade their skills and qualify for prepress jobs.

Other qualifications. Employers prefer workers with good communication skills, both oral and written. When prepress problems arise, prepress technicians should be able to deal courteously with customers to resolve them. In small shops, they may take customer orders and provide pricing information. Persons interested in working for firms using advanced printing technology need to be comfortable with electronics and computers. At times, prepress personnel may have to perform computations in order to estimate job costs or operate many of the machines used to run modern printing equipment.

Prepress technicians and workers need manual dexterity and accurate eyesight. Good color vision helps workers find mistakes and locate potential problems. It is essential for prepress workers to be able to pay attention to detail and work independently. Artistic ability is often a plus. Employers also seek persons who are comfortable with the pressures of meeting deadlines, using new software, and operating new equipment.

Advancement. Employers may send experienced technicians to industry-sponsored programs to update or develop new skills. Retraining due to technology and equipment changes is a constant as printing firms continually seek ways to improve efficiency and lower production costs. This kind of prepress training is sometimes offered in-house or through equipment makers and unions in the printing industry.

Employment

Prepress technicians and workers overall held about 106,900 jobs in 2008. Most prepress jobs are found in the printing and related support activities industry, while newspaper publishers employ the second largest number of prepress technicians and workers.

The printing and publishing industries are among the most geographically dispersed in the United States. While prepress jobs thus are found throughout the country, large numbers are concentrated in large printing centers such as the Chicago, Los Angeles–Long Beach, New York City, Minneapolis–St. Paul, Philadelphia, Boston, and Washington, DC metropolitan areas.

Job Outlook

Employment of prepress technicians and workers is projected to decline rapidly through 2018, because of improvements in printing technology that require fewer of these workers. Despite this, job prospects are good for prepress technicians with good computer and customer service skills.

Employment change. Overall employment of prepress technicians and workers is expected to decline by 13 percent over

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Prepress technicians and workers	–	106,900	92,600	-14,300	-13
Job printers	51-5021	45,700	42,200	-3,500	-8
Prepress technicians and workers	51-5022	61,200	50,400	-10,800	-18

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

the 2008–2018 period. Demand for printed material, especially product packaging, should grow, reflecting an increase in consumer demand for manufactured goods and an expanding population. But the growing use of computers and publishing software by even the smallest of printing shops will result in rising productivity of prepress technicians, offsetting the growth of new jobs.

Computer software now allows office workers to specify text typeface and style and to format pages. This development shifts traditional prepress functions away from printing plants into advertising and public relations agencies, graphic design firms, and large corporations. As page layout and graphic design capabilities of computer software become less expensive and more user-friendly, many companies are turning to in-house desktop publishing. Some organizations also find it less costly to prepare their own newsletters and other reports. At some publishing companies, writers and editors do more composition of their stories using publishing software to gauge layout needs, but generally rely on prepress technicians to perform the actual layout. The rapid growth in the use of digital printing and desktop publishing has eliminated many prepress technician jobs associated with older printing technologies. In addition, new technologies are increasing the amount of automation in printing companies, requiring fewer prepress workers to do the same work.

Job prospects. Despite a decline in the number of new prepress positions, opportunities will be favorable for workers with strong computer and customer service skills, such as pre-flight technicians who electronically check materials prepared by clients and adapt them for printing. Electronic prepress technicians, digital proofers, platemakers, and graphic designers are using new equipment and ever-improving software to design and lay out publications and complete their printing more quickly.

To remain competitive and profitable, commercial printing companies are offering other services in addition to printing to increase the value of their core service and provide customers with a one-stop option. For example, printers are looking for database administrators, Web site developers, and information technology specialists to assist with providing e-mail distribution and graphic design services. Individuals who are technologically savvy can pick up sales or customer service functions; those who have completed postsecondary programs in printing technology or graphic communications will have the best opportunities.

Earnings

Wage rates for prepress technicians and workers depend on basic factors such as employer, education, and location. Median hourly wages of prepress technicians and workers were \$16.84 in May 2008, compared to \$13.99 per hour for all production occupations. The middle 50 percent earned between \$12.74 and \$21.80 an hour. The lowest 10 percent earned less than \$10.01, and the highest 10 percent earned more than \$26.30 an hour. Median hourly wages in printing and related support activities were \$17.39 in May 2008, while workers at newspaper, periodical, book, and directory publishers earned \$15.82 an hour.

For job printers, median hourly wages were \$16.21 in May 2008. The middle 50 percent earned between \$12.59 and \$20.57 an hour. The lowest 10 percent earned less than \$9.91, and the highest 10 percent earned more than \$25.38 an hour. Median hourly wages in the industries employing the largest numbers of job printers in May 2008 were \$16.77 in printing and related support activities, and \$15.18 in the newspaper, periodical, book, and directory publishers industry.

Printing Machine Operators

Significant Points

- Most printing machine operators are trained on the job.
- Retirements among older press operators are expected to create openings for skilled workers.
- Rising demand for customized print jobs will mean those skilled in digital printing operations will have the best job opportunities.

Nature of the Work

Printing machine operators, also known as *press operators*, prepare, operate, and maintain printing presses. Duties vary according to the type of press they operate. Traditional printing methods, such as offset lithography, gravure, flexography, and letterpress, use a plate or roller that carries the final image that is to be printed and copies the image to paper. In addition to the traditional printing processes, plateless or nonimpact processes are coming into general use. Plateless processes—including digital, electrostatic, and ink-jet printing—are used for copying, duplicating, and document and specialty printing, usually by quick printing shops and smaller in-house printing shops. Digital presses with longer run capabilities are increasingly being used by commercial printers for short-run or customized printing jobs. Digital presses also allow printers to transfer files, blend colors, and proof images electronically, thus avoiding the costly and time-consuming steps of making printing plates that are common to lithographic or off-set printing.

Printing machine operators' jobs differ from one shop to another because of differences in the types and sizes of presses. Small commercial shops with relatively small presses, those that print only one or two colors at a time, can be operated by one person, often an owner or manager who performs all business activities. To attract a wider range of clients, larger commercial

Printing machine operators monitor each print job to ensure proper printer maintenance and to minimize malfunctions.

print shops may run several presses with different size and color capacities. Press operators typically specialize in operating one type of press but may operate more than one press at a time. However, press operators who are trained on more than one type of printing press are valuable because they can work on multiple types of printing jobs. Large newspaper, magazine, and book printers use giant “in-line web” presses that require a crew of several press operators and press assistants.

After working with prepress technicians (who are covered elsewhere in the Handbook) to identify and resolve any potential problems with a job, press operators prepare machines for printing. To prepare presses, operators install the printing plate with the images to be printed and adjust the pressure at which the machine prints. They then ink the presses, load paper, and adjust the press to the paper size. Operators ensure that paper and ink meet specifications, and adjust the flow of ink to the inking rollers accordingly. They then feed paper through the press cylinders and adjust feed and tension controls. New digital technology, in contrast, is able to automate much of this work.

While printing presses are running, press operators monitor their operation and keep the paper feeders well stocked. They make adjustments to manage ink distribution, speed, and temperature in the drying chamber, if the press has one. If paper tears or jams and the press stops, which can happen with some offset presses, operators quickly correct the problem to minimize downtime. Similarly, operators working with other high-speed presses constantly look for problems, and when necessary make quick corrections to avoid expensive losses of paper and ink. Throughout the run, operators must regularly pull sheets to check for any printing imperfections. Most printers have, or will soon have, presses with computers and sophisticated instruments to control press operations, making it possible to complete printing jobs in less time. With this equipment, press operators set up, monitor, and adjust the printing process on a control panel or computer monitor, which allows them to control the press electronically.

In most shops, press operators also perform preventive maintenance. They oil and clean the presses and make minor repairs.

Work environment. Operating a press can be physically and mentally demanding, and sometimes tedious. Press operators are on their feet most of the time. Operators often work under pressure to meet deadlines. Most printing presses are capable of high printing speeds, and adjustments must be made quickly to avoid waste. Pressrooms are noisy, and workers in certain areas wear ear protection. Working with press machinery can be hazardous, but the threat of serious accidents has decreased. Newer computerized presses are equipped with safety features and allow operators to make most adjustments from a control panel.

Many press operators, particularly those who work for newspapers, work weekends, nights, and holidays as many presses operate continuously. They also may work overtime to meet deadlines. Most operators worked 40 hours per week in 2008.

Training, Other Qualifications, and Advancement

Although employers prefer that beginners complete a formal apprenticeship or a postsecondary program in printing equipment operation, many press operators are trained on the job. Attention to detail and familiarity with electronics and computers are essential for operators.

Education and training. Beginning press operators load, unload, and clean presses. With time and training, they may become fully qualified to operate that type of press. Operators can gain experience on more than one kind of printing press during the course of their career.

Experienced operators will periodically receive retraining and skill updating. For example, printing plants that change from sheet-fed offset presses to digital presses have to retrain the entire press crew because skill requirements for the two types of presses are different.

Apprenticeships for press operators, once the dominant method for preparing for this occupation, are becoming less prevalent. When they are offered by the employer, they include on-the-job instruction and related classroom training or correspondence school courses.

Formal postsecondary programs in printing equipment operation offered by technical and trade schools, community colleges, and universities are growing in importance. Postsecondary courses in printing provide the theoretical and technical knowledge needed to operate advanced equipment. Some postsecondary school programs require two years of study and award an associate degree.

Because of technical developments in the printing industry, courses in chemistry, electronics, color theory, and physics are helpful.

Other qualifications. Persons who wish to become press operators need mechanical aptitude to make press adjustments and repairs. Workers need good vision and attention to detail to locate and fix problems with print jobs. Oral and written communication skills also are required. Operators should possess the mathematical skills necessary to compute percentages, weights, and measures, and to calculate the amount of ink and paper needed to do a job. Operators now also need basic computer skills to work with newer printing presses.

Certification and advancement. As press operators gain experience, they may advance in pay and responsibility by working on more complex printing presses. For example, operators who have demonstrated their ability to work with one-color sheet-fed presses may be trained to operate four-color sheet-fed presses. Voluntarily earning formal certification may also help press operators advance. Operators also may advance to pressroom supervisors and become responsible for an entire press crew. In addition, press operators can draw on their knowledge of press operations to become cost estimators, providing estimates of printing jobs to potential customers, sales representatives, and instructors of printing-related courses, or move into other administrative or executive occupations.

Employment

Printing machine operators held about 195,600 jobs in 2008. Over half of all press operator jobs were in printing and related sup-

port activities. Paper manufacturing and newspaper publishers also were large employers. Additional jobs were in advertising, public relations, and related services and plastics product manufacturing.

The printing and newspaper publishing industries are two of the most geographically dispersed in the United States. While printing machine operators thus can find jobs throughout the country, large numbers of jobs are concentrated in large printing centers such as the Chicago, Los Angeles-Long Beach, New York, Minneapolis-St. Paul, Philadelphia, Boston, and Washington, DC metropolitan areas.

Job Outlook

Employment of printing machine operators is projected to decline moderately through 2018, as newer printing presses require fewer operators. Despite this, job opportunities are expected to be favorable because a large number of these workers are expected to retire or leave the occupation over the next decade. The best opportunities will be available to skilled press operators.

Employment change. Employment of press operators is expected to decline by 5 percent over the 2008-18 period. Employment will fall because increasing printer speed and automation require fewer press operators to maintain production levels. This will be especially true among the large printing press operations such as those used by the newspaper industry. Expansion of digital printing technologies and related increases in production cost efficiencies, however, will allow printers to print smaller quantities more profitably and meet the growing interest in the print-on-demand and electronic publishing markets. This should widen the market for printed materials, offsetting some of the employment loss from increased productivity. Short-run print capabilities will permit printers to distribute a wider variety of catalogs, direct mail enclosures, newspaper inserts, and other kinds of print as advertisers are better able to identify the specific interests of a targeted market or audience.

Job prospects. Opportunities for employment in printing press operations should be favorable. Retirements of older printing machine operators and the need for workers trained on computerized printing equipment will create many job openings. For example, small printing jobs will increasingly be run on sophisticated high-speed digital printing equipment that requires a complex set of skills, such as knowledge of database management software. Those who complete postsecondary training programs in printing and who are comfortable with computers will have the best employment opportunities.

Earnings

Median hourly wages of printing machine operators were \$15.46 in May 2008, compared to \$13.99 per hour for all production occupations. The middle 50 percent earned between \$11.65 and \$20.08 an hour. The lowest 10 percent earned less than \$9.13,

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Printing machine operators	51-5023	195,600	185,000	-10,700	-5

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

and the highest 10 percent earned more than \$24.98 an hour. Median hourly wages in May 2008 were \$17.70 in newspaper, periodical, book and directory publishers and \$15.85 in printing and related support activities, industries employing among the largest numbers of printing machine operators.

The basic wage rate for a printing machine operator depends on the geographic area in which the work is located and on the size and complexity of the printing press being operated.

Textile, Apparel, and Furnishings Occupations

Significant Points

- Most workers learn their skills informally on the job, working alongside more experienced workers.
- International competition and greater worker productivity will result in rapidly declining employment for most occupations; upholsterers and laundry and dry-cleaning workers, however, are expected to experience some employment growth.
- The need to replace workers who retire or leave the occupation for other reasons will lead to numerous job openings.
- Earnings of most workers are relatively low.

Nature of the Work

Textile, apparel, and furnishings workers produce fibers, cloth, and upholstery, and fashion them into a wide range of products that we use in our daily lives. Textiles are the basis of towels, bed linens, hosiery and socks, and nearly all clothing, but they also are a key ingredient in products ranging from roofing to tires. This statement covers a wide variety of occupations related to the production and care of textiles, apparel, and furnishings, ranging from heavy industrial machine operators to craft workers who make custom clothing and upholster furniture.

Laundry and dry-cleaning workers, the largest specialty, clean garments, linens, draperies, blankets, and other articles. They also may clean leather, suede, furs, and rugs. Laundry and dry-cleaning workers ensure proper cleaning by adjusting machine settings for a given fabric or article, as determined by the cleaning instructions

on each item of clothing. When necessary, workers treat spots and stains on articles before laundering or dry-cleaning. They tend machines during cleaning and ensure that items are not lost or misplaced with those of another customer.

Closely related to dry-cleaning workers are *pressers, textile, garment, and related materials*. These workers often work in dry-cleaning establishments and are responsible for starching, steaming and ironing clothing and other items to remove wrinkles. When finished, they assemble each customer's items, bag or box the articles, and prepare an itemized bill for the customer.

Tailors, dressmakers, and custom sewers alter and repair garments in local neighborhood shops, department stores, or dry-cleaning establishments. Alterations may include hemming pants or dresses, and repairs commonly consist of patching or sewing a torn article of clothing. Some workers may be required to make elaborate custom clothing for special occasions or other unique events.

Most workers in apparel occupations, however, are found in manufacturing, performing specialized tasks in the production of large numbers of garments that are shipped to retail establishments for sale. *Fabric and apparel patternmakers* convert a clothing designer's original model of a garment into separate parts that can be laid out on a length of fabric. They use computers to outline the parts and draw in details to indicate the position of pleats, buttonholes, and other features. They then alter the size of the pieces in the pattern to produce garments of various sizes and, in doing so, determine the best layout of pieces to minimize waste of material. Once a pattern has been created, mass production of the garment begins.

The first step in manufacturing textiles is preparing the fibers. *Extruding and forming machine setters, operators, and tenders, synthetic and glass fibers*, set up and operate machines that extrude or force liquid synthetic material, such as rayon, fiberglass, or liquid polymers through small holes and draw out filaments. Other operators put natural fibers such as cotton or wool through carding and combing machines that clean and align them into short lengths. *Textile winding, twisting, and drawing-out machine setters, operators, and tenders* make yarn from this material, taking care to repair any breaks. *Textile bleaching and dyeing machine operators and tenders* control machines that wash, bleach, and dye yarn or finished fabrics.

When the yarn or fiber has been prepared, the next step is to produce fabric. *Textile knitting and weaving machine setters, operators, and tenders* put the yarn on machines that weave, knit, loop, or tuft it into a product. Different types of machines are used for these processes, but operators may perform similar tasks, repairing breaks in the yarn and monitoring the yarn supply. Some products, such as hosiery and carpeting, emerge nearly finished. In other cases, the fabric goes on to the next step in the manufacturing process.

Textile cutting machine setters, operators, and tenders use patterns—those from patternmakers—to prepare the pieces from which finished apparel will be made. *Sewing machine operators* then join these pieces together, reinforce seams, and attach buttons, hooks, zippers, and accessories. In some cases, *hand sewers* may be employed to make adjustments and perform specialty work. After the product is sewn, other workers remove lint and loose threads, inspect, and package the garments.

Shoe machine operators and tenders tend machines used in making footwear. They perform a variety of duties including cutting, joining, decorating, reinforcing, and finishing shoes and shoe parts. *Shoe and leather workers and repairers* may finish work that cannot be done by machine. Most repairers are employed in cobbler shops, where they fix shoes and other leather products, such as luggage and saddles.

Upholsterers make, fix, and restore furniture that is covered with fabric. Those who produce new furniture typically start with bare wooden frames. First, they install webbing, tacking it to one side of the frame, stretching it tight, and tacking it to the other side. They then tie each spring to the webbing and its neighboring springs, covering it with filler, such as foam or polyester batting. Next, they measure and cut pieces of fabric for the arms, backs, seats, sides, and other surfaces, leaving as little waste as possible. Finally, they sew the fabric pieces together and attach them to frames with tacks, staples, or glue, while also affixing any ornaments, such as fringes, buttons, or rivets. Some upholsterers work with used furniture, often repairing or replacing fabric that is in poor condition.

Work environment. Most people in textile, apparel, and furnishings occupations work a standard 5-day, 35- to 40-hour week. Working on evenings and weekends is common for shoe and leather workers, laundry and dry-cleaning workers, and tailors, dressmakers, and sewers, who often are employed in retail stores. Many textile and fiber mills often use rotating schedules of shifts so that employees do not continuously work nights or days.

Upholsterers make, fix, and restore furniture that is covered with fabric.

Working conditions vary by establishment and by occupation. For example, machinery in textile mills is often noisy, as are areas in which sewing and pressing are performed in apparel factories; patternmaking and spreading areas tend to be much quieter. Older factories are cluttered, hot, and poorly lit and ventilated, but more modern facilities usually have more work-space and are well lit and ventilated. Textile machinery operators use protective glasses and masks that cover their noses and mouths to protect against airborne particles. Many machines operate at high speeds, and textile machinery workers must be careful not to wear clothing or jewelry that could get caught in moving parts. In addition, extruding and forming machine operators wear protective shoes and clothing when working with certain chemical compounds.

Work in apparel production can be physically demanding. Some workers sit for long periods, and others spend many hours on their feet, leaning over tables and operating machinery. Operators must be attentive while running sewing machines, pressers, automated cutters, and the like. A few workers may need to wear protective clothing, such as gloves. Data from the U.S. Bureau of Labor Statistics show that full-time shoe machine operators and tenders experienced a work-related injury and illness rate that was higher than the national average.

Laundries and dry-cleaning establishments are often hot and noisy. Employees also may be exposed to harsh solvents, but newer environmentally-friendly and less-toxic cleaning solvents are improving the work environment in these establishments. Areas in which shoe and leather workers make or repair shoes and other leather items can be noisy, and odors from leather dyes and stains frequently are present. Workers must take care to avoid punctures, lacerations, and abrasions.

Upholstery work can be dangerous, and upholsterers usually wear protective gloves and clothing when using sharp tools and lifting and handling furniture or springs. During most of the workday, upholsterers stand and may do a lot of bending and heavy lifting. They also may work in awkward positions for short periods. Full-time upholsterers also experienced a work-related injury and illness rate that was much higher than the national average.

Training, Other Qualifications, and Advancement

Most textile, apparel, and furnishings workers learn their skills informally on the job, working alongside more experienced workers.

Education and training. Most workers in these jobs have a high school diploma or less education. However, applicants with postsecondary vocational training or previous work experience may have a better chance of getting a more skilled job and advancing to a supervisory position.

Machine operators usually are trained on the job by more experienced employees or by machinery manufacturers' representatives. Operators begin with simple tasks and are assigned more difficult operations as they gain experience.

Precision shoe and leather workers and repairers also learn their skills on the job. Manual dexterity and mechanical aptitude are important in shoe repair and leatherworking. Beginners start as helpers for experienced workers, but in manufacturing, they may attend more formal in-house training programs. Beginners gradually take on more tasks until they are fully qualified, a process that takes about 2 years in an apprenticeship program or as a helper in a shop. Other workers spend 6 months to a year in a vocational training program.

Custom tailors, dressmakers, and sewers often have previous experience in apparel production, design, or alteration. Knowledge of fabrics, design, and construction is very important. Custom tailors sometimes learn these skills through courses in high school or a community college. Tailors who perform alterations usually learn informally by observing other, more experienced workers.

Laundry and dry-cleaning workers, including pressers, usually learn on the job. Although laundries and dry-cleaners prefer entrants with previous work experience, they routinely hire inexperienced workers.

Most upholsterers learn their skills on the job, but a few do so through apprenticeships. Inexperienced persons also may take training in basic upholstery in vocational schools and some community colleges. The length of training may vary from 6 weeks to 3 years. Upholsterers who work on custom-made pieces may train for 8 to 10 years.

Other qualifications. In manufacturing, textile and apparel workers need good hand-eye coordination, manual dexterity, physical stamina, and the ability to perform repetitive tasks for long periods. As machinery in the industry continues to become more complex, knowledge of the basics of computers and electronics will increasingly be an asset. In addition, the trends toward cross-training of operators and working in teams will increase the time needed to become fully trained on all machines and require interpersonal skills to work effectively with others.

Upholsterers should have manual dexterity, good coordination, and the strength to tightly stretch fabric and lift heavy furniture. An eye for detail, a flair for color, and the ability to use fabrics creatively also are helpful.

Advancement. Some production workers may become first-line supervisors. A small number of workers in shoemaking and leatherworking occupations begin as workers or repairers and advance to salaried supervisory and managerial positions. Some open their own shops. These workers are more likely to succeed if they understand business practices and management

and offer good customer service, in addition to their technical skills.

Upholsterers, too, can open their own shops. However, the upholstery business is highly competitive, and successfully operating a shop is difficult. Some experienced or highly skilled upholsterers may become supervisors or sample makers in large shops and factories.

Employment

Textile, apparel, and furnishings workers held 787,500 jobs in 2008. Employment in the detailed occupations that make up this group was distributed as follows:

Laundry and dry-cleaning workers	235,400
Sewing machine operators	212,400
Pressers, textile, garment, and related materials	66,600
Tailors, dressmakers, and custom sewers	54,600
Upholsters	52,700
Textile winding, twisting, and drawing out machine setters, operators, and tenders	34,900
Textile knitting and weaving machine setters, operators, and tenders	29,200
Textile cutting machine setters, operators, and tenders	19,400
Textile bleaching and dyeing machine operators and tenders	16,000
Extruding and forming machine setters, operators, and tenders, synthetic and glass fibers	14,100
Sewers, hand	12,200
Shoe and leather workers and repairers	9,200
Fabric and apparel patternmakers	8,200
Shoe machine operators and tenders	4,800
All other textile, apparel, and furnishings workers	17,900

Many manufacturing jobs can be found in California, New York, North Carolina, Texas, and Pennsylvania. Jobs in reupholstery, shoe repair and custom leatherwork, and laundry and dry-cleaning establishments are found in cities and towns throughout the Nation. Overall, about 11 percent of all workers in textile, apparel, and furnishings occupations were self-employed; however, about 43 percent of all tailors, dressmakers, and sewers and about 29 percent of all upholsterers were self-employed.

Job Outlook

Overall employment of textile, apparel, and furnishings workers is expected to decline rapidly through 2018, but outlook varies by detailed occupation. In addition to some employment growth in a few specialties, the vast majority of openings will stem from the need to replace workers who leave the occupation each year.

Employment change. Employment in textile, apparel, and furnishing occupations is expected to decline by 15 percent between 2008 and 2018. Apparel workers have been among the most rapidly declining occupational groups in the economy. Increasing imports, the growing use of offshore assembly, and greater productivity through automation will contribute to additional job losses. Also, many new textiles require less production and processing.

Domestic production of apparel and textiles will continue to move abroad, and imports to the U.S. market are expected to increase. Fierce competition in the market for apparel will

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018

Textile winding, twisting, and drawing out machine setters, operators, and tenders.....	51-6064	34,900	20,700	-14,200	-41
Miscellaneous textile, apparel, and furnishings workers.....	51-6090	92,900	87,200	-5,700	-6
Extruding and forming machine setters, operators, and tenders, synthetic and glass fibers.....	51-6091	14,100	9,300	-4,800	-34
Fabric and apparel patternmakers.....	51-6092	8,200	6,000	-2,200	-27
Upholsterers.....	51-6093	52,700	56,300	3,600	7
All other textile, apparel, and furnishings workers.....	51-6099	17,900	15,600	-2,300	-13

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

keep domestic apparel and textile firms under intense pressure to cut costs and produce more with fewer workers. Although the textile industry already is highly automated, it will continue to seek to increase worker productivity through the introduction of labor-saving machinery and the invention of new fibers and fabrics that reduce production costs. Technological developments, such as computer-aided marking and grading, computer-controlled cutters, semiautomatic sewing and pressing machines, and automated material-handling systems have increased output while reducing the need for some workers in larger firms.

Despite advances in technology, the apparel industry has had difficulty utilizing automated equipment for assembly tasks because of the delicate properties of many textiles. Also, the industry produces a wide variety of apparel items that change frequently with changes in style and season. Even so, increasing numbers of sewing machine operator jobs are expected to be lost to workers abroad. Employment of sewing machine operators is expected to decline rapidly by 34 percent.

Tailors, dressmakers, and custom sewers—the most skilled apparel workers—are expected to experience little or no change in employment. Most of these workers are self-employed or work in clothing stores. The demand for custom home furnishings and tailored clothes is diminishing in general, but remains steady in upscale stores and by certain clients. Designer apparel and other handmade goods also appeal to people looking for one-of-a-kind items.

Employment of shoe and leather workers and repairers is expected to decline by 14 percent through 2018 as a result of growing imports of less expensive shoes and leather goods and of increasing productivity of U.S. manufacturers. Also, buying new shoes often is cheaper than repairing worn or damaged ones.

Employment of laundry and dry-cleaning workers is expected to grow 3 percent, slower than the average for all occupations. Many of these jobs continue to be locally-based, thus an expanding population will result in some employment growth.

Employment of upholsterers is expected to grow 7 percent, which is about as fast as the average for all occupations. Employment growth will be driven by custom upholstery services, which is expected to increase as consumers seek to restore antique furniture and items with sentimental or intrinsic value.

The following table shows the projected growth rates from 2008 to 2018 for detailed textile and apparel manufacturing occupations:

Upholsters.....	7
Laundry and dry-cleaning workers.....	3
Tailors, dressmakers, and custom sewers.....	-2
Pressers, textile, garment, and related materials.....	-8
Sewers, hand.....	-8
Shoe and leather workers and repairers.....	-14
Fabric and apparel patternmakers.....	-27
Textile cutting machine setters, operators, and tenders.....	-31
Extruding and forming machine setters, operators, and tenders, synthetic and glass fibers.....	-34
Sewing machine operators.....	-34
Shoe machine operators and tenders.....	-35
Textile knitting and weaving machine setters, operators, and tenders.....	-39
Textile winding, twisting, and drawing out machine setters, operators, and tenders.....	-41
Textile bleaching and dyeing machine operators and tenders.....	-45
All other textile, apparel, and furnishings workers.....	-13

Job prospects. Despite a rapid decline in overall employment, the need to replace workers who transfer to other occupations, retire, or leave the occupation for other reasons will lead to numerous job openings. Relatively low earnings and poor working conditions will continue to result in a high job turnover.

Earnings

Earnings of textile, apparel, and furnishings workers vary by occupation. Because many production workers in apparel manufacturing are paid according to the number of acceptable pieces they produce, their total earnings depend on skill, speed, and accuracy. Workers covered by union contracts tend to have higher earnings. Median hourly wages by occupation in May 2008 were as follows:

Fabric and apparel patternmakers	\$18.15
Extruding and forming machine setters, operators, and tenders, synthetic and glass fibers.....	14.98
Upholsters	13.94
Textile knitting and weaving machine setters, operators, and tenders.....	12.21
Shoe machine operators and tenders.....	12.06
Tailors, dressmakers, and custom sewers.....	12.01
Textile winding, twisting, and drawing out machine setters, operators, and tenders.....	11.53
Textile bleaching and dyeing machine operators and tenders.....	11.38
Shoe and leather workers and repairers.....	11.00
Textile cutting machine setters, operators, and tenders.....	10.88
Sewers, hand.....	10.58
Sewing machine operators	9.55
Pressers, textile, garment, and related materials	9.15
Laundry and dry-cleaning workers	9.14
All other textile, apparel, and furnishings workers	11.85

Benefits vary by size of company and work that is done. Apparel workers in retail trade also may receive a discount on their purchases from the company for which they work. In

addition, some of the larger manufacturers operate company stores from which employees can purchase apparel products at significant discounts. Some small firms and dry-cleaning establishments, however, offer only limited benefits. Self-employed workers generally have to purchase their own insurance.

In the manufacturing industry, many workers are union members. Workers who are covered by union contracts often have higher pay and better benefits.

Related Occupations

Textile, apparel, and furnishings workers are primarily light manufacturing workers. Similar occupations include:

Woodworkers

Significant Points

- Most woodworkers are trained on the job; becoming a skilled woodworker often requires several years of experience.
- Job prospects should be excellent for highly skilled woodworkers who are proficient users of computerized numerical control machines.
- Employment is highly sensitive to economic cycles; during economic downturns, workers are subject to layoffs or reductions in hours.

Nature of the Work

Despite the abundance of plastics, metals, and other materials, wood products continue to be an important part of our daily lives.

Many of these products are mass produced, including most furniture, kitchen cabinets, and musical instruments. Other products are custom-crafted in shops using specialized tools. The people who design, produce, and test these products are called *woodworkers*.

Although the term woodworker may evoke the image of a craftsman who builds ornate furniture using hand tools, the modern woodworking trade is highly technical and relies on advanced equipment and highly-skilled operators. Workers use automated machinery, such as computerized numerical control (CNC) machines to do much of the work. Even specialized artisans generally use a variety of power tools in their work. Much of the work is often done in a high production assembly line facility, but there is also some work that is customized and does not lend itself to assembly line fabrication. Woodworkers are employed in every part of the secondary

wood products industry—from sawmill to finished product—and their activities vary greatly.

Woodworkers set up, operate and tend all types of machines, such as drill presses, lathes, shapers, routers, sanders, planers, and wood-nailing machines. Operators set up the equipment, cut and shape wooden parts, and verify dimensions using a template, caliper, or rule. After wood parts are made, woodworkers add fasteners and adhesives and connect the pieces to form a complete unit. Products are then sanded, stained, and, if necessary, coated with a sealer, such as a lacquer or varnish.

In some cases, these tasks are managed by different workers with specialized training. For instance, *woodworking machine setters, operators, and tenders* may specialize in operating specific pieces of woodworking machinery. *Furniture finishers* stain and seal wood products; they often work with antiques and must make judgments about how to best preserve and repair them.

On the other hand, some woodworkers are less specialized, and must know how to complete many stages of the process. *Cabinetmakers* and *bench carpenters* often design and create sets of cabinets that are customized for particular spaces. In some cases, their duties could begin with designing a set of cabinets to particular specifications and end with installing them. *Architectural woodworkers* design and create customized wooden furniture and accents that are part of a building. This might include a desk that is built into a hotel lobby, a bar in

a pub, or booths in a restaurant. Other woodworkers, such as *model makers*, create scale models of products or buildings that are used in construction; *patternmakers* construct dies that are used for castings.

Work environment. Working conditions vary greatly, depending on specific job duties. Workers may have to handle heavy, bulky materials and often encounter excessive noise and dust. Workers must often wear earplugs, gloves, and goggles to protect themselves. These occupations tend to have relatively high non-fatal injury rates, since woodworkers spend much of their time using power tools, which can be dangerous. Data from the U.S. Bureau of Labor Statistics show that sawing machine operators experienced a work-related injury and illness rate that was much higher than the national average.

Training, Other Qualifications, and Advancement

Becoming a fully-trained woodworker requires many skills, and generally takes several years of on-the-job training. Skill with computers and computer-controlled machinery is increasingly important.

Education and training. Many employers seek applicants with a high school diploma or the equivalent because of the growing sophistication of machinery and the constant need for retraining. People seeking woodworking jobs can enhance their employment and advancement prospects by completing high school and receiving training in mathematics and computer applications.

Some woodworkers acquire skills through technical schools or community college courses. Others may attend universities that offer training in wood technology, furniture manufacturing, wood engineering, and production management. These programs prepare students for positions in production, supervision, engineering, and management and are increasingly important as woodworking technology advances.

While education is helpful, woodworkers are primarily trained on the job, where they learn skills from experienced workers. Beginning workers are assigned basic tasks, such as putting a piece of wood through a machine or catching the wood at the end of the process. As they gain experience, they perform more complex jobs with less supervision. They can learn basic machine operations and job tasks in about a year. Skilled workers learn to read blueprints, set up machines, and plan work sequences. Becoming a skilled woodworker often requires 3 or more years.

Other qualifications. In addition to training, woodworkers need mechanical ability, manual dexterity, and the ability to pay attention to detail and safety. They should be comfortable working with geometric concepts; for example, they must be able to visualize how shapes will fit together in three dimensions. Skill with computers and computer-controlled machinery is increasingly important in this high-tech occupation.

Advancement. Advancement opportunities depend on education and training, seniority, and a worker's skills and initiative. Experienced woodworkers often become supervisors responsible for the work of a group of woodworkers. Others may become full-time CNC operators, designing woodwork using computer aided design software. Still others become inspec-

Woodworkers set up equipment, verify dimensions, and cut and shape wooden parts.

tors, making sure that products are built to proper specifications. Production workers can advance into these positions by assuming additional responsibilities and attending workshops, seminars, or college programs. Those who are highly skilled may set up their own woodworking shops.

Employment

Woodworkers held about 323,300 jobs in 2008. Self-employed woodworkers accounted for 12 percent of these jobs. About 76 percent of woodworkers were employed in manufacturing. About 39 percent worked in establishments manufacturing furniture and related products, and 32 percent worked in wood product manufacturing, producing a variety of raw, intermediate, and finished woodstock. Wholesale and retail lumber dealers, furniture stores, reupholstery and furniture repair shops, and construction firms also employ woodworkers.

Woodworking jobs are found throughout the country. However, lumber and wood products-related production jobs are concentrated in the Southeast, Midwest, and Northwest, close to the supply of wood. Furniture-making jobs are more prevalent in the Southeast. Custom shops can be found everywhere, but generally are concentrated in or near highly populated areas.

Job Outlook

Employment of woodworkers is expected to grow more slowly than the average for all occupations. Job prospects will be excellent for highly qualified workers

Employment change. Employment of woodworkers is expected to grow by 6 percent during the 2008-18 decade, which is slower than the average for all occupations. Increased automation in the wood products manufacturing industry has led to slow job growth for some time, but this has been tempered in recent years by increased demand for domestic wood products. Technology has become very important to this industry, and automation has greatly reduced the number of people required to produce a finished product. While this has slowed employment growth somewhat, improved efficiency has made domestic wood products more competitive with imports.

Demand for these workers will stem from increases in population, personal income, and business expenditures and from the continuing need for repair and renovation of residential and commercial properties. Therefore, opportunities should be

available for workers who specialize in items such as moldings, cabinets, stairs, and windows. Firms that focus on custom woodwork will be best able to compete against imports without transferring jobs offshore.

Employment in all woodworking specialties is highly sensitive to economic cycles. During economic downturns, workers are subject to layoffs or reductions in hours.

Job prospects. Prospects should be excellent for highly qualified workers. In general, opportunities for more highly skilled woodworkers will be better than for woodworkers in specialties susceptible to automation and competition from imported wood products. The need for woodworkers with technical skills to operate their increasingly advanced computerized machinery will be especially great. Workers who know how to create and execute custom designs on a computer will be in strong demand. These jobs require an understanding of wood and a strong understanding of computers—a combination that can be somewhat difficult to find.

The number of new workers entering these occupations has declined greatly in recent years, as training programs become less available or popular. Opportunities should be best for woodworkers who, through vocational education or experience, develop highly specialized woodworking skills or knowledge of CNC machine tool operation.

Earnings

Median hourly wages of cabinetmakers and bench carpenters were \$13.93 in May 2008. The middle 50 percent earned between \$11.14 and \$17.40. The lowest 10 percent earned less than \$9.22, and the highest 10 percent earned more than \$21.73.

Median hourly wages of sawing machine setters, operators, and tenders, wood were \$12.41. The middle 50 percent earned between \$9.96 and \$15.24. The lowest 10 percent earned less than \$8.35, and the highest 10 percent earned more than \$18.92.

Median hourly wages of woodworking machine setters, operators, and tenders, except sawing were \$11.89. The middle 50 percent earned between \$9.69 and \$14.73. The lowest 10 percent earned less than \$8.28, and the highest 10 percent earned more than \$17.89.

Median hourly wages were \$12.93 for furniture finishers and \$11.57 for all other woodworkers.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018

Plant and System Operators

Power Plant Operators, Distributors, and Dispatchers

Significant Points

- Overall employment is projected to experience little or no change over the next decade, but job prospects are expected to be excellent for qualified applicants as many workers retire.
- Several years of classroom and on-the-job training are required to become fully qualified.
- Familiarity with computers and a basic understanding of science and math are helpful for those entering the field.

Nature of the Work

Electricity is one of our nation's most vital resources. It powers everything from light bulbs and appliances that you use around your house to supercomputers that power the Internet. From the moment you flip the first switch each morning, you are connecting to a huge network of people, electric lines, and generating equipment. *Power plant operators* control the machinery that generates electricity. *Power plant distributors and dispatchers* control the flow of electricity as it travels through a network of transmission lines from the power plant to industrial plants and substations, and then flows through distribution lines to residential users.

Power plant operators control and monitor boilers, turbines, generators, and auxiliary equipment in power-generating plants. They distribute power among generators, regulate the output from several generators, and monitor instruments to maintain voltage and regulate electricity flows from the plant. When demand changes, power plant operators communicate with dispatchers at distribution centers to match production with system the load. On the basis of this communication, they start and stop generators, altering the amount of electricity

output. They also go on rounds to check that everything in the plant is operating correctly and keep records of switching operations and loads on generators, lines, and transformers. In all of these tasks, they use computers to report unusual incidents, malfunctioning equipment, or maintenance performed during their shifts.

Nuclear power reactor operators perform similar tasks at a nuclear power plant. Most start working as equipment operators or auxiliary operators. At this stage, they help the more senior workers with equipment maintenance and operation while learning the basics of plant operation. With experience and training they may be licensed by the Nuclear Regulatory Commission as reactor operators, making them authorized to control equipment that affects the power of the reactor in a nuclear power plant. Senior reactor operators supervise the operation of all controls in the control room. At least one senior operator must be on duty during each shift to act as the plant supervisor.

Power distributors and dispatchers, also called load dispatchers or systems operators, work for utility companies, non-utility generators, and other companies that access the power grid. They control the flow of electricity through transmission lines to industrial plants and substations that supply residential and commercial needs for electricity. They monitor and operate current converters, voltage transformers, and circuit breakers. Dispatchers also monitor other distribution equipment and record readings at a map board—a diagram of the transmission grid system showing the status of transmission circuits and connections with substations and industrial plants. In doing this, they communicate closely with power plant operators, energy traders, and local utilities to route energy from generating stations to customers.

Dispatchers anticipate changes in power needs caused by weather, such as increased demand for power on a hot day or outages during a thunderstorm. They also react to changes in the structure of the grid due to transformer or transmission line failures and route current around affected areas. In substations, they operate and monitor equipment that increases or decreases

voltage and they operate switchboard levers to control the flow of electricity in and out of the substations.

Work environment. Operators, distributors, and dispatchers who work in control rooms generally sit or stand at a control station. The work is not physically strenuous, but it does require constant attention. When operators are on rounds or performing other work outside of the control room, they may be exposed to danger from electric shock, falls, and burns. In addition, nuclear reactor operators may be exposed to small amounts of ionizing radiation during the course of their work.

Because power transmission is both vitally important and sensitive to attacks, security is a major concern for energy companies. Nuclear power plants and transmission stations have especially high security, and workers should be prepared to work in secured environments.

Because electricity is provided around the clock, operators, distributors, and dispatchers usually work one of three 8-hour shifts or one of two 12-hour shifts on a rotating basis. Shift assignments may change periodically so that all operators share less desirable shifts. Work on rotating shifts can be stressful and fatiguing because of the constant changes in living and sleeping patterns.

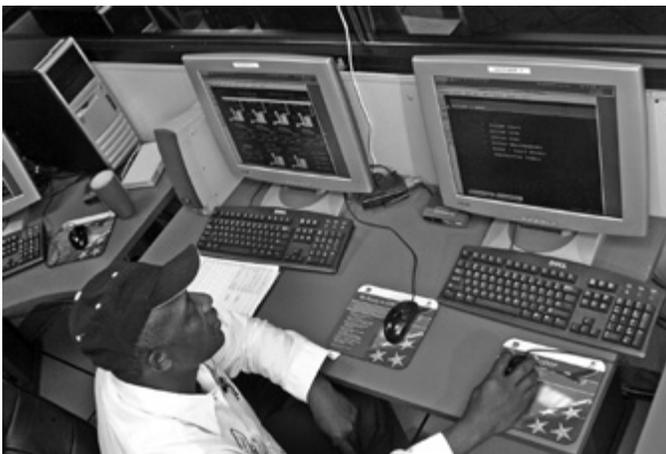

Training, Other Qualifications, and Advancement

Power plant operators, dispatchers, and distributors generally need a combination of education, on-the-job training, and experience. Candidates with strong mechanical, technical and computer skills are generally preferred.

Both operators and dispatchers are subject to random drug and alcohol tests. Nuclear reactor operators must pass a medical examination every 2 years.

Education and training. Operator and dispatcher jobs require at least a high school diploma. Workers with college or vocational school degrees will have advantages in finding a job, as well as more advancement opportunities, especially in nuclear power plants. Although it is not a prerequisite, many nuclear power reactor operators have bachelor's degrees in engineering or the physical sciences.

Workers selected for training as power plant operators or distributors undergo extensive on-the-job training and classroom

Power plant operators use computers to report unusual incidents, malfunctioning equipment, or maintenance performed during their shifts.

instruction. Several years of training and experience are necessary to become fully qualified.

In addition to receiving initial training, a power plant operator, distributor, or dispatcher, is required to spend a certain number of hours each year taking refresher courses. Operators train on plant simulators designed to replicate situations that could occur at the plant. Similarly, dispatchers and system operators train extensively on power system simulators to keep skills sharp to prevent blackouts.

Licensure and certification. Some power plant operators, distributors and dispatchers must earn and maintain licenses. The specific requirements vary by job function and jurisdiction.

Power plant operators not working in a nuclear facility are often licensed as engineers or firemen by State licensing boards. Requirements vary from State to State and also depend on the specific job function of the operator and the license needed.

Nuclear power reactor operators must pass an examination and maintain licenses administered by the Nuclear Regulatory Commission (NRC). Before beginning training, a nuclear power plant operator must have 3 years of power plant experience. At least 1 of the 3 years must be at the nuclear power plant where the operator is to be licensed, and 6 months should be as a nonlicensed operator at the plant. Training generally takes at least 1 year, after which the worker must take an NRC-administered written examination and operating test. To maintain their licenses, reactor operators must pass an annual practical plant-operating exam and a biennial written exam administered by their employers. Reactor operators can upgrade their licenses to the senior-reactor-operator level after a year of licensed experience at the plant by taking another examination given by the NRC. Individuals with a bachelor's degree in engineering or the equivalent may apply for senior operator's licenses directly if they have 3 years of nuclear power plant experience, with at least 6 months at the site. Training includes simulator and on-the-job training, classroom instruction, and individual study. Experience in other power plants or with Navy nuclear-propulsion plants also is helpful. Although waivers are possible, licensed nuclear power reactor operators and senior operators generally have to pass a new written examination and operating test administered by the NRC if they transfer to another facility.

Power distributors and dispatchers who are in positions in which they could affect the power grid must be certified by the North American Energy Reliability Corporation (NERC). There are three types of certification offered by NERC: reliability coordinator, transmission operator, and balancing authority. Each of these qualifies a worker to handle a different job function. Distributors and dispatchers who distribute power within local utilities generally do not need to be licensed or certified.

Other qualifications. Electric company recruiters generally look for individuals with strong math and science backgrounds for these highly technical jobs. Understanding electricity and math—especially algebra and trigonometry—are important, although workers learn many of these concepts and skills in specialized training courses. Workers should also be good at working with tools. Problem solving is an important part of most electrical workers' jobs, so recruiters usually look for

people who can easily figure out how things work. Successful utility workers are generally good with mechanics and enjoy fixing things.

In order to measure these aptitudes, many companies require that their workers take the Power Plant Maintenance (MASS) and Plant Operator (POSS) exams administered by the Edison Electrical Institute. These tests measure reading comprehension, understanding of mechanical concepts, spatial ability, and mathematical ability.

Advancement. After finishing work in the classroom, most entry-level workers start as helpers or laborers and advance to more responsible positions as they become comfortable in the plant. Workers are generally classified into 3-5 levels based on experience. For each level, there are training requirements, mandatory waiting times, and exams. With sufficient training and experience, workers can become shift supervisors, trainers, or consultants.

Because power plants have different systems and safety mechanisms, it can sometimes be difficult to advance by moving to a different company, although this is not always the case. Most power companies promote from within and most workers advance within a particular plant or by moving to another plant owned by the same utility.

Employment

Power plant operators, distributors, and dispatchers held about 50,400 jobs in 2008, of which 5,000 were nuclear power reactor operators, 10,000 were power distributors and dispatchers, and 35,400 were power plant operators. Jobs were located throughout the country.

Job Outlook

Overall employment of power plant operators, distributors, and dispatchers is projected to experience little or no change, but job opportunities are expected to be excellent because of the large number of retiring workers who must be replaced, an increased demand for energy, and recent legislation that paves the way for a number of new plants.

Employment change. Between 2008 and 2018, overall employment of power plant operators, distributors, and dispatchers is expected to experience little or no change. Although Americans' energy use continues to grow annually, the intense competition among generators resulting from deregulation will temper that growth.

Power plant operators in non-nuclear power plants are expected to decline by 2 percent between 2008 and 2018, representing little or no change, as energy companies continue to promote efficiency and build more efficient plants. While most

of the major employment effects of deregulation have already occurred, generators continue to focus on cost cutting. As older, less efficient plants are retired, they are being replaced with new plants that have higher capacities and require fewer workers. Because the capacity of the new plants is higher, fewer are needed to produce the same amount of electricity.

Employment of nuclear power reactor operators is expected to grow by 19 percent between 2008 and 2018, faster than the average for all occupations, because of plant construction and new rules on operator fatigue. Although no new plants have been licensed since the 1990s, many sites have applied for permits which will need to be staffed before the end of the projections decade. Further, newly enacted NRC regulations on fatigue limit the length of shifts, meaning that nuclear facilities may need more operators.

On the other hand, power distributor and dispatcher employment is expected to experience little or no change, declining by 2 percent between 2008 and 2018, reflecting further industry consolidation.

Job prospects. Job opportunities are expected to be excellent for well-qualified applicants because of a large number of retirements in the electric power industry. During the 1990s, the emphasis on cost cutting among utilities led to hiring freezes and the laying off of younger workers. The result is that many power plant operators, distributors, and dispatchers are nearing retirement age. Utilities have responded by setting up new education programs at community colleges and high schools throughout the country. While many individuals are showing interest in these high-paying jobs, prospects will be best for workers with strong technical and mechanical skills and an understanding of science and mathematics.

Earnings

Median annual wages of power plant operators were \$58,470 in May 2008. The middle 50 percent earned between \$47,850 and \$68,250. The lowest 10 percent earned less than \$38,020, and the highest 10 percent earned more than \$80,390.

Median annual wages of nuclear power reactor operators were \$73,320 in May 2008. The middle 50 percent earned between \$63,440 and \$82,540. The lowest 10 percent earned less than \$55,730, and the highest 10 percent earned more than \$96,480.

Median annual wages of power distributors and dispatchers were \$65,890 in May 2008. The middle 50 percent earned between \$55,520 and \$77,780. The lowest 10 percent earned less than \$45,010, and the highest 10 percent earned more than \$88,500.

About 40 percent of power plant operators, distributors, and dispatchers were members of unions in 2008.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Power plant operators, distributors, and dispatchers.....	51-8010	50,400	50,600	200	0
Nuclear power reactor operators.....	51-8011	5,000	6,000	1,000	19
Power distributors and dispatchers.....	51-8012	10,000	9,800	-200	-2
Power plant operators.....	51-8013	35,400	34,800	-600	-2

Stationary Engineers and Boiler Operators

Significant Points

- Workers usually acquire their skills through a formal apprenticeship program or through on-the-job training.
- Licensure is required in many States and is a prerequisite for many job openings.
- Employment is projected to grow more slowly than average, and applicants may face competition for jobs.

Nature of the Work

Most large office buildings, malls, warehouses, and other commercial facilities have extensive heating, ventilation, and air-

conditioning systems that keep them comfortable all year long. Industrial plants often have additional facilities to provide electrical power, steam, or other services. *Stationary engineers* and *boiler operators* control and maintain these systems, which include boilers, chillers, air-conditioning and refrigeration equipment, diesel engines, turbines, generators, pumps, condensers, and compressors. The equipment that stationary engineers and boiler operators control is similar to equipment operated by locomotive or marine engineers, except that it is used to generate heat or electricity rather than to move a train or ship.

Stationary engineers and boiler operators start up, regulate, repair, and shut down equipment. They ensure that the equipment operates safely, economically, and within established limits by monitoring meters, gauges, and computerized controls. When necessary, they control equipment manually and make adjustments using hand and power tools. They watch and listen to machinery and routinely check safety devices, record data in logs, and identify any potential problems.

Routine maintenance is a regular part of the work of stationary engineers and boiler operators. Engineers use tools to perform repairs ranging from a complete overhaul to replacing defective valves, gaskets, or bearings. They lubricate moving parts, replace filters, and remove soot and corrosion that can reduce the boiler's operating efficiency. They also test the water in the boiler and add chemicals to prevent corrosion and harmful deposits.

In most facilities, stationary engineers are responsible for the maintenance and balancing of air systems, as well as hydronic systems that heat or cool buildings by circulating fluid (such as water or water vapor) in a closed system of pipes. They may check the air quality of the ventilation system and make adjustments to keep the operation of the boiler within mandated guidelines. Servicing, troubleshooting, repairing, and monitoring modern systems all require the use of sophisticated electrical and electronic test equipment.

In a large building or industrial plant, a senior stationary engineer may be in charge of all mechanical systems in the building and may supervise a team of assistant stationary engineers, turbine operators, boiler tenders, and air-conditioning and refrigeration operators and mechanics. In small buildings, there may be only one stationary engineer who operates and maintains all of the systems.

Work environment. Engine rooms, power plants, boiler rooms, mechanical rooms, and electrical rooms are usually clean and well lit. Even under the most favorable conditions, however, some stationary engineers and boiler operators are exposed to high temperatures, dust, dirt, and high noise levels from the equipment. Maintenance duties also may require contact with oil, grease, or smoke. Workers spend much of the time on their feet. They also may have to crawl inside boilers and work while crouched or kneeling to inspect, clean, or repair equipment.

Safety is a major concern for these workers. Stationary engineers and boiler operators work around hazardous machinery, and must follow procedures to guard against burns, electric shock, noise, dangerous moving parts, and exposure to hazardous materials. Despite these precautions, however, sta-

Stationary engineers and boiler operators control and maintain equipment that is used to generate heat or electricity.

tionary engineers and boiler operators have a relatively high rate of occupational injuries.

Stationary engineers and boiler operators generally have steady, year-round employment. The average workweek is 40 hours. In facilities that operate around the clock, engineers and operators usually work one of three daily 8-hour shifts on a rotating basis. Weekend and holiday work are often required, as many buildings are open 365 days a year.

Training, Other Qualifications, and Advancement

Many stationary engineers and boiler operators begin their careers in mechanic or helper positions and are trained on the job by more experienced engineers. Others begin by entering formal apprenticeships or training programs. Licensure is required in many States and jurisdictions, and is a prerequisite for many job openings.

Education and training. Most employers prefer to hire people with at least a high school diploma or the equivalent for stationary engineers and boiler operator jobs. Workers acquire their skills primarily on the job and usually start as apprentices or helpers. This practical experience may be supplemented by postsecondary vocational training in subjects such as computerized controls and instrumentation. Becoming an engineer or operator without completing a formal apprenticeship program usually requires many years of work experience.

The International Union of Operating Engineers sponsors apprenticeship programs and is the principal union for stationary engineers and boiler operators. Apprenticeships usually last 4 years and include 6,000 hours of on-the-job training. Apprentices learn to operate boilers, generators, compressors, motors, and air-conditioning and refrigerating equipment.

Apprentices also receive 600 hours of classroom instruction, studying elementary physics, practical chemistry, blueprint reading, instrumentation, and other technical subjects.

Continuing education—such as vocational school or college courses—is becoming increasingly important for stationary engineers and boiler operators, in part because of the growing complexity of the equipment with which engineers and operators now work.

Most large and some small employers encourage and pay for skill-improvement training for their employees. Training is almost always provided when new equipment is introduced or when regulations concerning some aspect of the workers' duties change.

Licensure. Many State and local governments have licensing requirements for stationary engineers and boiler operators. Applicants for licensure usually must be at least 18 years of age, reside for a specified period in the State or locality in which they wish to work, meet experience requirements, and pass a written examination. A stationary engineer or boiler operator who moves from one State or city to another may have to pass an examination for a new license because of regional differences in licensing requirements.

There are generally four or five classes of stationary engineer licenses. Each class specifies the type and size of equipment the engineer is permitted to operate without supervision. A top-level stationary engineer is qualified to run a large facility, supervise others, and operate equipment of all types and capacities. An applicant for this license may be required to have a high school education, have completed an apprenticeship or lengthy on-the-job training, and have several years of experience working with a lower class license. Engineers with licenses below this level are limited in the types or capacities of equipment they may operate without supervision.

Many job openings require that workers be licensed before starting the job, although some jobs may offer apprenticeships.

Other qualifications. In addition to training, stationary engineers and boiler operators need mechanical aptitude and manual dexterity. Most employers of entry-level workers and apprenticeship committees prefer applicants with a basic understanding of mathematics, science, computers, mechanical drawing, machine shop practice, and chemistry. Being in good physical condition is also important.

Advancement. Generally, engineers advance as they obtain higher class licenses. These licenses permit boiler operators to work with larger, more powerful, or more varied equipment. In jurisdictions where licenses are not required, workers generally advance by taking company-administered exams. Some stationary engineers and boiler operators advance to become boiler inspectors, chief plant engineers, building and plant superintendents, or building managers. A few obtain jobs as examining engineers or technical instructors.

Because most stationary engineering staffs are relatively small, workers may find it difficult to advance, especially within a company. Most high-level positions are held by experienced workers with seniority. Workers wishing to move up to these positions must often change employers or wait for older workers to retire before they can advance.

Employment

Stationary engineers and boiler operators held about 41,600 jobs in 2008. They worked throughout the country, generally in the more heavily populated areas in which large industrial and commercial establishments are located. Jobs were dispersed throughout a variety of industries. The majority of jobs were in manufacturing, Government, public and private educational services, and public and private hospitals.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Stationary engineers and boiler operators.....	51-8021	41,600	43,800	2,200	5

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Job Outlook

Employment in this occupation is expected to grow more slowly than average through 2018. Applicants may face competition for jobs. Employment opportunities will be best for those who have apprenticeship training and are licensed in their jurisdictions.

Employment change. Employment of stationary engineers and boiler operators is expected to grow by 5 percent between 2008 and 2018, which is slower than the average for all occupations. Continuing commercial and industrial development will increase the amount of equipment to be operated and maintained. Although automated systems and computerized controls are making newly installed equipment more efficient, experienced workers will increasingly be needed to maintain and repair these complex systems.

While employment of stationary engineers and boiler operators is spread across all industries, some industries will experience more growth than others. The largest employment growth will occur in industries with the need for precise temperature control, such as hospitals.

Job prospects. People interested in working as stationary engineers and boiler operators should expect to face competition for these relatively high-paying positions. Although many opportunities will be created by the retirement of the baby-boomer generation, finding an entry-level job can be difficult—especially for inexperienced and unlicensed workers. While there are workers employed in most establishments with large buildings, the typical engineering staff is relatively small. The tendency of experienced workers to stay in a job for decades can make it difficult for entry-level workers to find a job.

Workers who have completed a training course or apprenticeship will have the best prospects. Additionally, in States and jurisdictions where licenses are required, workers who are licensed prior to beginning employment will have better opportunities.

Earnings

Median annual wages of stationary engineers and boiler operators were \$49,790 in May 2008. The middle 50 percent earned between \$39,390 and \$61,670. The lowest 10 percent earned less than \$30,630, and the highest 10 percent earned more than \$74,500.

Related Occupations

Workers who monitor and operate stationary machinery include:

	Page
Chemical plant and system operators.....	831
Gas plant operators.....	831
Petroleum pump system operators, refinery operators, and gaugers.....	832
Power plant operators, distributors, and dispatchers.....	760
Water and liquid waste treatment plant and system operators.....	765

Other workers who maintain the equipment and machinery in a building or plant are:

Industrial machinery mechanics and millwrights	709
Maintenance and repair workers, general	716

Sources of Additional Information

Information about apprenticeships, vocational training, and work opportunities is available from State employment service offices, local chapters of the International Union of Operating Engineers, vocational schools, and State and local licensing agencies. Apprenticeship information is also available from the U.S. Department of Labor's toll-free helpline: (877) 872-5627

Water and Liquid Waste Treatment Plant and System Operators

Significant Points

- Employment is concentrated in local government and water, sewage, and other systems utilities.
- Because of expected much faster than average employment growth and a large number of upcoming retirements, job opportunities will be excellent.
- Completion of an associate degree or a 1-year certificate program in environmental studies or a related field may help applicants to find jobs and advance more quickly.

Nature of the Work

Water is one of our society's most important resources. While most people take it for granted, it takes a lot of work to get water from natural sources—reservoirs, streams, and groundwater—into our taps. Similarly, it is a complicated process to convert the wastewater in our drains and sewers into a form that is safe to release into the environment. *Water treatment plant and system operators* run the equipment, control the processes, and monitor the plants that treat water so that it is safe to drink.

Liquid waste treatment plant and system operators do similar work to remove pollutants from domestic and industrial waste.

Fresh water is pumped from wells, rivers, streams, and reservoirs to water treatment plants, where it is treated and distributed to customers. Used water, also known as wastewater, travels through sewage pipes to treatment plants where it is treated and either returned to streams, rivers, and oceans, or reused for irrigation. Operators in both types of plants control equipment and monitor processes that remove or destroy harmful materials, chemicals, and microorganisms from the water. They also run tests to make sure that the processes are working correctly and keep records of water quality and other indicators.

Water and wastewater treatment plant operators operate and maintain the pumps and motors that move water and wastewater through filtration systems. They monitor the indicators at their plants and make adjustments as necessary. They read meters and gauges to make sure that plant equipment is working properly. They take samples and run tests to determine the quality of the water being produced. At times, they may adjust the amount of chemicals, such as chlorine and fluorine, being added to the water.

The specific duties of plant operators depend on the type and size of the plant. In a small plant, one operator may be responsible for maintaining all of the systems. This operator would most likely work during the day and be on call during nights and weekends. In medium-size plants, operators may work in shifts to monitor the plant at all hours of the day. In large plants, multiple operators work the same shifts and are more specialized in their duties, often relying on computerized systems to help monitor plant processes.

Occasionally, operators must work during emergencies. Weather conditions may cause large amounts of storm water and wastewater to flow into sewers, exceeding a plant's capacity. Emergencies also may be caused by malfunctions within a plant, such as chemical leaks or oxygen deficiencies. Operators are trained in emergency management procedures and use safety equipment to protect their health, as well as that of the public.

Both tap water and wastewater are highly regulated by the U.S. Environmental Protection Agency. Plant operators must be familiar with these regulations and ensure that their high standards are met. Operators are also responsible for keeping records that document compliance and for being aware of new regulations that are enacted.

Work environment. Water and wastewater treatment plant and system operators work both indoors and outdoors and may be exposed to noise from machinery and to unpleasant odors. Operators' work is physically demanding and often is performed in locations that are difficult to access or unclean. They must pay close attention to safety procedures because of the presence of hazardous conditions, such as slippery walkways, dangerous gases, and malfunctioning equipment. As a result, operators have a higher-than-average occupational injury rate.

Plants operate 24 hours a day, 7 days a week. In small plants, operators may work during the day and be on call in the evening, at night, and on weekends. Medium-size and large plants that require constant monitoring may employ workers in three 8-hour shifts. Because larger plants require constant monitoring, weekend and holiday work is generally required. Operators may be required to work overtime.

Water and liquid waste treatment plant and system operators read meters and gauges to make sure that plant equipment is working properly.

Training, Other Qualifications, and Advancement

Employers usually hire high school graduates who are trained on the job. Completion of a training program may enhance an applicant's competitiveness in the job market.

Education and training. A high school diploma is usually required for an individual to become a water or wastewater treatment plant operator. Some applicants complete certificate or associate degree programs in water-quality and wastewater-treatment technology. Employers prefer to hire such candidates, because completion of a program minimizes the training needed at the plant and also shows a commitment to working in the industry. These programs are offered by community colleges, technical schools, and trade associations, and can be found throughout the country. In some cases, a degree or certificate program can be substituted for experience, allowing a worker to become licensed at a higher level more quickly.

Trainees usually start as attendants or operators-in-training and learn their skills on the job under the direction of an experienced operator. They learn by observing and doing routine tasks such as recording meter readings, taking samples of wastewater and sludge, and performing simple maintenance and repair work on pumps, electric motors, valves, and other plant equipment. Larger treatment plants generally combine this on-the-job training with formal classroom or self-paced study programs.

Licensure and certification. Both water and liquid waste plant and system operators must be certified by their States. Requirements and standards vary widely depending on the State. Most States have four different levels of certification, depending on the operator's experience and training. Although some States will honor licenses from other States, operators who move may have to take a new set of exams to become certified in a different State. The Association of Boards of Certification (ABC) offers a certificate program that may be helpful for operators who plan to move to a different State.

Other qualifications. Water and wastewater treatment plant operators need mechanical aptitude and the ability to solve problems intuitively. They also should be competent in basic mathematics, chemistry, and biology. They must have the ability to apply data to formulas that determine treatment requirements, flow levels, and concentration levels. Some basic familiarity with

computers also is necessary, because operators generally use them to record data. Some plants also use computer-controlled equipment and instrumentation.

Advancement. Most States have four levels of certification for water and liquid waste treatment plant and system operators. On the basis of criteria such as the size of the plant and the treatment processes employed, each plant is given a corresponding level. A small system may only require the lowest level of certification. An operator who has that certification would be able to operate the plant without any supervision. In some States, operators in small plants can earn higher certifications through knowledge tests, while in other States, experience in a larger plant is required. Either way, operators in these plants will find it difficult to advance in their careers without moving to a larger plant.

As plants get larger and more complicated, operators need more skills before they are allowed to work without supervision. At the largest plants, operators who have the highest level of certification work as shift supervisors and may be in charge of large teams of operators. Operators in these plants can start as trainees and work through the different levels of certification until they advance to the level of shift supervisor.

Some experienced operators get jobs as technicians with State drinking-water-control or water-pollution-control agencies. In that capacity, they monitor and provide technical assistance to plants throughout the State. Vocational-technical school or community-college training generally is preferred for technician jobs. Experienced operators may transfer to related jobs with industrial liquid-waste treatment plants, water or liquid waste treatment equipment and chemical companies, engineering consulting firms, or vocational-technical schools.

Employment

Water and wastewater treatment plant and system operators held about 113,400 jobs in 2008. About 78 percent of all operators worked for local governments. Others worked primarily for water, sewage, and other systems utilities and for waste treatment and disposal and waste management services. Jobs were located throughout the country.

Job Outlook

Water and wastewater treatment plant and system operator jobs are expected to grow much faster than the average for all occupations. Job opportunities should be excellent for qualified workers.

Employment change. Employment of water and liquid waste treatment plant and system operators is expected to grow by 20 percent between 2008 and 2018, which is much faster than the average for all occupations. A growing population and the increasingly suburban geography of the United States are expected to boost demand for water and wastewater-treatment services. As new plants are constructed to meet this demand,

new water and wastewater treatment plant and system operator jobs will arise.

Local governments are the largest employers of water and wastewater treatment plant and system operators. Employment in privately owned facilities will grow faster, because Federal certification requirements have increased utilities' reliance on private firms specializing in the operation and management of water- and wastewater-treatment facilities.

Job prospects. Job opportunities should be excellent, both because of the expected much faster than average employment growth and because the retirement of the baby-boomer generation will require that many operators be replaced. Further, the number of applicants for these jobs is normally low, primarily because of the physically demanding and unappealing nature of some of the work. Opportunities should be best for people with mechanical aptitude and problem-solving skills.

Earnings

Median annual wages of water and wastewater treatment plant and system operators were \$38,430 in May 2008. The middle 50 percent earned between \$30,040 and \$48,640. The lowest 10 percent earned less than \$23,710, and the highest 10 percent earned more than \$59,860. Median annual wages of water and liquid waste treatment plant and systems operators in May 2008 were \$38,510 in local government and \$37,620 in water, sewage, and other systems.

In addition to their annual salaries, water and wastewater treatment plant and system operators usually receive benefits that may include health and life insurance, a retirement plan, and educational reimbursement for job-related courses.

Miscellaneous Production Occupations

Inspectors, Testers, Sorters, Samplers, and Weighers

Significant Points

- About 69 percent are employed in manufacturing establishments.
- Although a high school diploma is sufficient for the basic testing of products, complex precision-inspecting positions are filled by experienced workers.
- Employment is expected to decline slowly.

Nature of the Work

Inspectors, testers, sorters, samplers, and weighers, often called *quality-control inspectors* or another, similar name, ensure that your food will not make you sick, that your car will run properly, and that your pants will not split the first time you wear them. These workers monitor or audit quality standards for virtually all manufactured products, including foods, textiles, clothing, glassware, motor vehicles, electronic components, computers, and structural steel. As product quality becomes increasingly important to the success of many manufacturing firms, daily duties of inspectors place more focus on this aspect of their jobs.

Regardless of title, all inspectors, testers, sorters, samplers, and weighers work to guarantee the quality of the goods their firms produce. Specific job duties vary across the wide range of industries in which these workers are found. Materials inspectors may check products by sight, sound, feel, smell, or even taste to locate imperfections such as cuts, scratches, missing pieces, or crooked seams. These workers may verify dimensions, color, texture, strength, or other physical characteristics of objects. Mechanical inspectors generally verify that parts fit, move correctly, and are properly lubricated; check the pressure of gases and the level of liquids; test the flow of electricity; and do a test run to check for proper operation of a machine or piece of equipment. Some jobs involve only a quick visual inspection; others require a longer, detailed one. Sorters may separate goods according to length, size, fabric type, or color, while samplers test or inspect a sample taken from a batch or production run for malfunctions or defects. Weighers weigh quantities of materials for use in production. Testers repeatedly test existing products or prototypes under real-world conditions. Through these tests, companies determine how long a product will last, what parts will break down first, and how to improve durability.

Quality-control workers are involved at every stage of the production process. Some examine materials received from a supplier before sending them to the production line. Others inspect components and assemblies or perform a final check on the finished product. Depending on their skill level, inspectors also may set up and test equipment, calibrate precision instruments, repair defective products, or record data.

These workers rely on a number of tools to perform their jobs. Although some still use hand-held measurement devices such as micrometers, calipers, and alignment gauges, it is more common for them to operate electronic inspection equipment, such as coordinate-measuring machines (CMMs). These machines use sensitive probes to measure a part's dimensional accuracy and allow the inspector to analyze the results with computer software. Inspectors testing electrical devices may use voltmeters, ammeters, and ohmmeters to test potential difference, current flow, and resistance, respectively. All the tools that inspectors use are maintained by calibration technicians, who ensure that they work properly and generate accurate readings.

Inspectors mark, tag, or note problems. They may reject defective items outright, send them for repair, or fix minor problems themselves. If the product is acceptable, the inspector will certify it. Quality-control workers record the results of their inspections, compute the percentage of defects and other statistical measures, and prepare inspection and test reports. Some electronic inspection equipment automatically provides test reports containing these inspection results. When defects are found, inspectors notify supervisors and help to analyze and correct the production problems.

The emphasis on finding the root cause of defects is a basic tenet of modern management and production philosophies. Current philosophies emphasize constant quality improvement through analysis and correction of the causes of defects. The nature of inspectors' work has changed from merely checking for defects to determining the cause of those defects.

This increased emphasis on quality means that companies now have integrated teams of inspection and production workers who jointly review and improve product quality. In addition, many companies use self-monitoring production machines to ensure that the output is produced within quality standards. These machines not only can alert inspectors to production problems, but also sometimes automatically repair defects.

Some firms have completely automated inspection with the help of advanced vision inspection systems using machinery installed at one or several points in the production process.

Working conditions for inspectors, testers, sorters, samplers and weighers vary by industry and establishment size.

Inspectors in these firms monitor the equipment, review output, and perform random product checks.

Work environment. Working conditions vary by industry and establishment size. As a result, some inspectors examine similar products for an entire shift, whereas others examine a variety of items.

In manufacturing, it is common for most inspectors to remain at one workstation. Inspectors in some industries may be on their feet all day and may have to lift heavy objects, whereas in other industries they sit during most of their shift and read electronic printouts of data. Workers in heavy manufacturing plants may be exposed to the noise and grime of machinery; in other plants, inspectors work in clean, air-conditioned environments suitable for carrying out controlled tests. As a result of these varied working conditions, injuries are not uncommon for this occupation, and workers must follow proper procedures to minimize risks.

Some inspectors work evenings, nights, or weekends. Shift assignments generally are made on the basis of seniority. Overtime may be required to meet production goals.

Training, Other Qualifications, and Advancement

Although a high school diploma is sufficient for the basic testing of products, complex precision-inspecting positions are filled by experienced workers.

Education and training. Training requirements vary with the responsibilities of the quality-control worker. For workers who perform simple “pass/fail” tests of products, a high school diploma generally is sufficient, together with limited in-house training. Training for new inspectors may cover the use of special meters, gauges, computers, and other instruments; quality-control techniques; blueprint reading; safety; and reporting requirements. There are some postsecondary training programs, but many employers prefer to train inspectors on the job.

The chances of finding work in this occupation can be improved by studying industrial trades, including computer-aided design, in high school or in a postsecondary vocational program. Laboratory work in the natural or biological sciences also may improve one’s analytical skills and increase one’s chances of finding work in medical or pharmaceutical labs, where many of these workers are employed.

As companies implement more automated inspection techniques that require less manual inspection, workers in this occupation will have to learn to operate and program more sophisticated equipment and learn software applications. Because these operations require additional skills, the need for higher education may be necessary. To address this need, some colleges are offering associate’s degrees in fields such as quality control management.

Other qualifications. In general, inspectors, testers, sorters, samplers, and weighers need mechanical aptitude, math and communication skills, and good hand-eye coordination and vision. Another important skill is the ability to analyze and interpret blueprints, data, manuals, and other material to determine specifications, inspection procedures, formulas, and methods for making adjustments.

Certification and advancement. The American Society for Quality offers 15 different types of certifications for workers in quality control. These certifications may assist workers in advancing within the occupation. They generally require a certain number of years of experience in the field and passage of an exam.

Advancement for workers with the necessary skills frequently takes the form of additional duties and responsibilities. Complex inspection positions are filled by experienced assemblers, machine operators, or mechanics who already have a thorough knowledge of the products and production processes. To advance to these positions, experienced workers may need training in statistical process control, new automation, or the company’s quality assurance policies. Because automated inspection equipment and electronic recording of results are becoming common, computer skills also are important.

Employment

Inspectors, testers, sorters, samplers, and weighers held about 464,700 jobs in 2008. About 69 percent worked in manufacturing establishments that produced such products as motor vehicle parts, plastics products, semiconductor and other electronic components, and aerospace products and parts. Inspectors, testers, sorters, samplers, and weighers also were found in employment services; wholesale trade; and professional, scientific, and technical services.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Inspectors, testers, sorters, samplers, and weighers.....	51-9061	464,700	447,800	-16,900	-4

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Job Outlook

Like many other occupations concentrated in manufacturing industries, employment is expected to decline slowly, primarily because of the growing use of automated inspection and the redistribution of some quality-control responsibilities from inspectors to production workers.

Employment change. Employment of inspectors, testers, sorters, samplers, and weighers is expected to decline by 4 percent between 2008 and 2018. Because the majority of these employees work in the manufacturing sector, their outlook is greatly affected by what happens to manufacturing companies. The emphasis on improving quality and productivity has led many manufacturers to invest in automated inspection equipment and to take a more systematic approach to quality inspection. Continued improvements in technologies allow firms to automate inspection tasks, increasing workers' productivity and reducing the demand for inspectors.

In addition, work in many manufacturing companies continues to move abroad. As more production moves offshore, the number of quality-control workers is expected to decline as well.

Firms increasingly are integrating quality control into the production process. Many inspection duties are being redistributed from specialized inspectors to fabrication and assembly workers, who monitor quality at every stage of the production process. In addition, the growing implementation of statistical process control is resulting in "smarter" inspection. Using this system, firms survey the sources and incidence of defects so that they can better focus their efforts on reducing the number of defective products manufactured.

In some industries, however, automation is not a feasible alternative to manual inspection. Where key inspection elements are oriented toward size, such as length, width, or thickness, automation will become more important in the future. But where taste, smell, texture, appearance, complexity of fabric, or performance of the product is important, inspection will continue to be done by workers.

Job prospects. Although numerous job openings will arise through the need to replace workers who move out of this large occupation, many of these jobs will be open only to experienced workers with advanced skills. There will be better opportunities in the employment services industry, as more manufacturers use contract inspection workers, and in growing manufacturing industries, such as medical equipment and pharmaceuticals.

Earnings

Median hourly wages of inspectors, testers, sorters, samplers, and weighers were \$15.02 in May 2008. The middle 50 percent earned between \$11.58 and \$19.52 an hour. The lowest 10 percent earned less than \$9.28 an hour, and the highest 10 percent earned more than \$25.47 an hour. Median hourly wages in the industries

employing the largest numbers of inspectors, testers, sorters, samplers, and weighers in May 2008 were as follows:

Aerospace product and parts manufacturing.....	\$22.10
Motor vehicle parts manufacturing.....	16.39
Semiconductor and other electronic component manufacturing.....	14.22
Plastics product manufacturing.....	13.87
Employment services.....	11.64

Related Occupations

Other workers who conduct inspections include the following:

	Page
Agricultural inspectors.....	612
Construction and building inspectors.....	628
Fire inspectors and investigators.....	525
Occupational health and safety specialists.....	428
Occupational health and safety technicians.....	431
Transportation inspectors.....	833

Jewelers and Precious Stone and Metal Workers**Significant Points**

- About 54 percent of all jewelers and precious stone and metal workers are self-employed.
- Jewelers usually learn their trade in vocational or technical schools, through distance-learning centers, or on the job.
- Prospects for bench jewelers and other skilled jewelers should be favorable; keen competition is expected for lower skilled manufacturing jobs, such as assemblers and polishers.

Nature of the Work

Jewelers and precious stone and metal workers use a variety of common and specialized equipment to design and manufacture

new pieces of jewelry; cut, set, and polish gem stones; repair or adjust rings, necklaces, bracelets, earrings, and other jewelry; and appraise jewelry, precious metals, and gems. Jewelers usually specialize in one or more of these areas and may work for large jewelry manufacturing firms, for small retail jewelry shops, or as owners of their own businesses. Regardless of the type of work done or the work setting, jewelers need a high degree of skill, precision, and attention to detail.

Some jewelers design or make their own jewelry. Following their own designs or those created by designers or customers, they begin by shaping the metal or by carving wax to make a model for casting the metal. Individual parts then are soldered together, and the jeweler may mount a diamond or other gem or may engrave a design into the metal. Other jewelers do finishing work, such as setting stones, polishing, or engraving, or make repairs. Typical repair work includes enlarging or reducing ring sizes, resetting stones, and replacing broken clasps and mountings.

Bench jewelers usually work in jewelry retailers. They perform a wide range of tasks, from simple jewelry cleaning and repair to moldmaking and fabricating pieces from scratch. In larger manufacturing businesses, jewelers usually specialize in a single operation. *Mold and model makers* create models or tools for the jewelry that is to be produced. *Assemblers* solder or fuse jewelry and their parts; they also may set stones. *Engravers* etch designs into metal with specialized tools, and *polishers* bring a finished luster to the final product.

Jewelers typically do the handiwork required to produce a piece of jewelry, while *gemologists* and laboratory graders analyze, describe, and certify the quality and characteristics of gem stones. Gemologists may work in gemological laboratories or as quality control experts for retailers, importers, or manufacturers. After using microscopes, computerized tools, and other grading instruments to examine gem stones or finished pieces of jewelry, they write reports certifying that the items are of a particular quality. Many jewelers also study gemology to become familiar with the physical properties of the gem stones with which they work.

Jewelry appraisers carefully examine jewelry to determine its value, after which they write appraisal documents. They determine the value of a piece by researching the jewelry market and by using reference books, auction catalogs, price lists, and the Internet. They may work for jewelry stores, appraisal firms, auction houses, pawnbrokers, or insurance companies. Many gemologists also become appraisers.

In small retail stores or repair shops, jewelers and appraisers may be involved in all aspects of the work. Those who own or manage stores or shops also hire and train employees; order, market, and sell merchandise; and perform other managerial duties.

New technology is helping to produce jewelry of high quality at a reduced cost and in a shorter amount of time. For example, lasers are often used for cutting and improving the quality of stones, for applying intricate engraving or design work, and for inscribing personal messages or identification on jewelry. Jewelers also use lasers to weld metals together in milliseconds with no seams or blemishes, improving the quality and appearance of jewelry.

Some manufacturing firms use computer-aided design and manufacturing (CAD/CAM) to facilitate product design and automate some steps in the moldmaking and modelmaking process. CAD allows jewelers to create a virtual-reality model of a piece of jewelry. Using CAD, jewelers can modify the design, change the stone, or try a different setting and see the contemplated changes on a computer screen before cutting a stone or performing other costly steps. Once they are satisfied with the model, they use CAM to produce a mold. After the mold is made, it is easier for manufacturing firms to produce numerous copies of a given piece of jewelry, which can be distributed to retail establishments across the country. Similar techniques may be used in the retail setting, allowing customers to review their jewelry designs with the jeweler and make modifications before committing themselves to the expense of a customized piece of jewelry.

Work environment. A jeweler's work involves a great deal of concentration and attention to detail. Trying to satisfy customers' and employers' demands for speed and quality while working on precious stones and metal can cause fatigue and stress. However, the use of more ergonomically correct jewelers' benches has eliminated most of the strain and discomfort caused by spending long periods over a workbench.

Jewelers need a high degree of skill and must pay attention to detail.

Lasers require both careful handling to avoid injury and steady hands to direct precision tasks. In larger manufacturing plants and some smaller repair shops, chemicals, sharp or pointed tools, and jewelers' torches pose safety threats and may cause injury if proper care is not taken. Most dangerous chemicals, however, have been replaced with synthetic, less toxic products to meet safety requirements.

In repair shops, jewelers usually work alone with little supervision. In retail stores, they may talk with customers about repairs, perform custom design work, and even do some selling. Because many of their materials are valuable, jewelers must observe strict security procedures, including working behind locked doors that are opened only by a buzzer, working on the other side of barred windows, making use of burglar alarms, and, in larger jewelry establishments, working in the presence of armed guards.

Training, Other Qualifications, and Advancement

Jewelers usually learn their trade on-the-job over the course of several months; however, vocational or technical schools or distance-learning centers are becoming more common ways for workers to learn their skills. Formal training enhances employment and advancement opportunities.

Education and training. Jewelers have traditionally learned their trade through several months of on-the-job training; while this method is still common, particularly in manufacturing plants, many are also learning their skills in vocational or technical schools or through distance-learning centers. Computer-aided design is becoming increasingly important to retail jewelers and students may wish to obtain training in it. This skill can usually be obtained through technical school; however, some employers may provide training in it, as well.

In jewelry manufacturing plants, workers traditionally develop their skills through informal apprenticeships and on-the-job training. The apprenticeship or training period lasts up to 1 year, depending on the difficulty of the specialty. Training usually focuses on casting, setting stones, making models, or engraving.

There are also many technical schools offering training designed for jewelers. Some manufacturers prefer graduates because they require less on-the-job training. Course topics can include blueprint reading, math, and shop theory.

For jewelers who work in retail stores or repair shops, vocational training or college courses offer the best job preparation. These programs may vary in length from 6 months to a year and teach jewelry making and repairing skills, such as designing, casting, setting and polishing stones, as well as the use and care of jeweler's tools and equipment.

There are various institutes that offer courses and programs in gemology. These programs cover a wide range of topics,

including the identification and grading of diamonds and gem stones.

While it is not required, some students may wish to obtain a higher level degree. For them, art and design schools offer programs leading to the degree of bachelor of fine arts or master of fine arts in jewelry design.

Other qualifications. The precise and delicate nature of jewelry work requires finger and hand dexterity, good hand-eye coordination, patience, and concentration. Artistic ability and fashion consciousness are major assets, particularly in jewelry design and jewelry shops, because jewelry must be stylish and attractive. Those who work in jewelry stores have frequent contact with customers and should be neat, personable, and knowledgeable about the merchandise. In addition, employers require workers of good character because jewelers work with valuable materials.

Certification and advancement. Jewelers of America offers four credentials, ranging from Certified Bench Jeweler Technician to Certified Master Bench Jeweler, for bench jewelers who pass a written and practical exam. Certification is not required to work as a bench jeweler, but it may help jewelers to show expertise and to advance.

Advancement opportunities are limited and depend greatly on an individual's skill and initiative. In manufacturing, some jewelers advance to supervisory jobs, such as master jeweler or head jeweler. Jewelers who work in jewelry stores or repair shops may become managers; some open their own businesses.

Those interested in starting their own business should first establish themselves and build a reputation for their work within the jewelry trade. Once they obtain sufficient credit from jewelry suppliers and wholesalers, they can acquire the necessary inventory. Also, because the jewelry business is highly competitive, jewelers who plan to open their own store should have sales experience and knowledge of marketing and business management. Courses in these subjects often are available from technical schools and community colleges.

Employment

Jewelers and precious stone and metal workers held about 52,100 jobs in 2008. About 54 percent of these workers were self-employed; many operated their own store or repair shop, and some specialized in designing and creating custom jewelry.

About 21 percent of salaried jobs for jewelers and precious stone and metal workers were in retail trade, primarily in jewelry, luggage, and leather goods stores. Another 15 percent of jobs were in jewelry and silverware manufacturing. A small number of jobs were with merchant wholesalers of miscellaneous durable goods and in repair shops providing repair and maintenance of personal and household goods. Although jewelry stores and repair shops were found in every city and in many small towns, most jobs were in larger metropolitan areas.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Jewelers and precious stone and metal workers.....	51-9071	52,100	54,800	2,800	5

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Job Outlook

Employment is expected to grow more slowly than average. Prospects for bench jewelers and other skilled jewelers should be favorable; keen competition is expected for lower skilled manufacturing jobs, such as assemblers and polishers.

Employment change. Employment of jewelers and precious stone and metal workers is expected to grow by 5 percent between 2008 and 2018, more slowly than the average for all occupations. Most jewelry is currently imported, and continued growth in imports will limit demand, particularly for lower-skilled workers. However, demand for bench jewelers or other skilled jewelers will grow as consumers seek more customized jewelry.

Additionally, the consolidation and increased online presence of many jewelry outlets will constrain employment growth in the near future. Although nontraditional jewelry marketers, such as Internet retailers and discount stores, have expanded in recent years, many traditional retailers have countered with their own successful online presence. Since nontraditional retailers require fewer sales staff, which limits employment opportunities for jewelers, any slowdown in their expansion at the expense of jewelry shops is a positive sign for employment growth.

Traditional jewelers may continue to lose some of their market share to nontraditional outlets, but they will maintain a large customer base. Many buyers prefer to see and try on jewelry before purchasing it, or to enjoy the experience of shopping in a store. Jewelry stores also have the advantage of being able to offer personalized service and build client relationships. Additionally, new jewelry sold by nontraditional retailers will create demand for skilled jewelers for sizing, cleaning, and repair work.

Job prospects. Despite limited employment growth, opportunities should be favorable for bench jewelers and other skilled jewelers. New jewelers will be needed to replace those who retire or who leave the occupation for other reasons. When master jewelers retire, they take with them years of experience that require substantial time and financial resources to replace. Many employers have difficulty finding and retaining jewelers with the right skills and the necessary knowledge. Opportunities in jewelry stores and repair shops will be best for graduates from training programs for jewelers or gemologists and for those workers with training in CAD/CAM.

Keen competition is expected for lower skilled manufacturing jobs that are amenable to automation, such as assemblers and polishers. Jewelry designers who wish to create their own jewelry lines should expect intense competition. Although demand for customized and boutique jewelry is strong, it is difficult for independent designers to establish themselves.

The jewelry industry can be cyclical. During economic downturns, demand for jewelry products and for jewelers tends to decrease. However, demand for repair workers should remain strong even during economic slowdowns because maintaining and repairing jewelry is an ongoing process. In fact, demand for jewelry repair may increase during recessions, as people repair or restore existing pieces rather than purchase new ones.

Earnings

Median annual wages for jewelers and precious stone and metal workers were \$32,940 in May 2008. The middle 50 percent

earned between \$24,370 and \$43,440. The lowest 10 percent earned less than \$19,000, and the highest 10 percent earned more than \$55,130.

Most jewelers start out with a base salary, but once they become more proficient, they may begin charging by the number of pieces completed. Jewelers who work in retail stores may earn a commission for each piece of jewelry sold. Many jewelers also enjoy a variety of benefits, including reimbursement from their employers for work-related courses and discounts on jewelry purchases.

Related Occupations

Jewelers and precious stone and metal workers do precision handwork. Other skilled workers who do similar jobs include:

	Page
Welding, soldering, and brazing workers.....	743
Woodworkers	757

Some jewelers and precious stone and metal workers create their own jewelry designs. Other occupations that require visual arts abilities include:

Artists and related workers.....	301
Commercial and industrial designers.....	304
Fashion designers.....	307

Some jewelers and precious stone and metal workers are involved in the buying and selling of stones, metals, or finished pieces of jewelry. Similar occupations include:

Retail salespersons	543
Sales representatives, wholesale and manufacturing	547

Medical, Dental, and Ophthalmic Laboratory Technicians

Significant Points

- Around 58 percent of jobs were in medical equipment and supplies manufacturing, usually in small, privately owned businesses.
- Most technicians learn their craft on the job, but many employers prefer to hire those with formal training.
- Faster than average employment growth is expected for dental and ophthalmic laboratory technicians, while average employment growth is expected for medical appliance technicians.
- Job opportunities should be favorable because few people seek these positions.

Nature of the Work

When patients require a medical device to help them see clearly, chew and speak well, or walk, their healthcare providers send requests to medical, dental, and ophthalmic laboratory technicians. These technicians produce a variety of implements to help patients.

Medical appliance technicians construct, fit, maintain, and repair braces, artificial limbs, joints, arch supports, and other surgical and medical appliances. They follow prescriptions or detailed instructions from podiatrists, orthotists, prosthetists or other healthcare professionals for patients who need them because of a birth defect, disease, accident, or amputation. Podiatrists or orthotists request orthoses—braces, supports, corrective shoes, or other devices; while prosthetists order prostheses—replacement limbs, such as an arm, leg, hand, or foot. Medical appliance technicians who work with these types of devices are called *orthotic and prosthetic (O&P) technicians*. Other medical appliance technicians work with appliances, such as hearing aids, that help correct other medical problems.

For O&P technicians, creating orthoses and prostheses takes several steps. First, technicians construct or receive a plaster cast of the patient's limb or foot to use as a pattern. Increasingly, technicians are using digital files sent by the prescribing practitioner who uses a scanner and uploads the images using computer software. When fabricating artificial limbs or braces, O&P technicians utilize many different materials including plaster, thermoplastics, carbon fiber, acrylic and epoxy resins. More advanced prosthetic devices are electronic, using information technology. Next, O&P technicians carve, cut, or grind the material using hand or power tools. Then they weld the parts together and use grinding and buffing wheels to smooth and polish the devices. Next, they may cover or pad the devices with leather, felt, plastic, or another material. Finally, technicians may mix pigments according to formulas to match the patient's skin color and apply the mixture to create a cosmetic cover for the artificial limb.

After fabrication, medical appliance technicians test devices for proper alignment, movement, and biomechanical stability using meters and alignment fixtures. Over time the appliance

will wear down, so technicians must repair and maintain the device. They also may service and repair the machinery used for the fabrication of orthotic and prosthetic devices.

Dental laboratory technicians fill prescriptions from dentists for crowns, bridges, dentures, and other dental prosthetics. First, dentists send a prescription or work authorization for each item to be manufactured, along with an impression or mold of the patient's mouth or teeth. With new technology, a technician may receive a digital impression rather than a physical mold. Then dental laboratory technicians, also called dental technicians, create a model of the patient's mouth by pouring plaster into the impression and allowing it to set. They place the model on an apparatus that mimics the bite and movement of the patient's jaw. The model serves as the basis of the prosthetic device. Technicians examine the model, noting the size and shape of the adjacent teeth, as well as gaps within the gumline. Based upon these observations and the dentist's specifications, technicians build and shape a wax tooth or teeth model, using small hand instruments called wax spatulas and wax carvers. The wax model is used to cast the metal framework for the prosthetic device.

After the wax tooth has been formed, dental technicians pour the cast and form the metal and, using small hand-held tools, prepare the surface to allow the metal and porcelain to bond. They then apply porcelain in layers to mimic the precise shape and color of a tooth. Technicians place the tooth in a porcelain furnace to bake the porcelain onto the metal framework, and then they adjust the shape and color with subsequent grinding and addition of porcelain to achieve a sealed finish. The final product is a nearly exact replica of the lost tooth or teeth.

In some laboratories, technicians perform all stages of the work, whereas in other labs, each technician does only a few. Dental laboratory technicians can specialize in one of five areas—orthodontic appliances, crowns and bridges, complete dentures, partial dentures, or ceramics. Job titles can reflect specialization in these areas. For example, technicians who make porcelain and acrylic restorations are called *dental ceramists*.

Ophthalmic laboratory technicians—also known as manufacturing opticians, optical mechanics, or optical goods workers—make prescription eyeglass or contact lenses. Ophthalmic laboratory technicians cut, grind, edge, polish, and finish lenses according to specifications provided by dispensing opticians, optometrists, or ophthalmologists. Although some lenses still are produced by hand, technicians are increasingly using automated equipment to make lenses. To make a pair of glasses, typically the technician cuts the prescription lenses, bevels the edges to fit the frame, dips each lens into dye if the prescription calls for tinted or coated lenses, polishes the edges, and combines the lenses and frame parts. Some ophthalmic laboratory technicians manufacture lenses for other optical instruments, such as telescopes and binoculars.

In small laboratories, technicians usually handle every phase of the operation. In large ones, in which virtually every phase of the operation is automated, technicians may be responsible for operating computerized equipment. Technicians also inspect the final product for quality and accuracy.

Ophthalmic laboratory technicians should not be confused with workers in other vision care occupations, such as ophthalmologists, optometrists, and dispensing opticians. (See the

Dental laboratory technicians create crowns, bridges, dentures, and other dental prosthetics.

statement on physicians and surgeons, which includes ophthalmologists, as well as the statements on optometrists and opticians, dispensing, elsewhere in the *Handbook*.)

Work environment. Medical, dental, and ophthalmic laboratory technicians generally work in clean, well-lighted, and well-ventilated laboratories. They have limited contact with the public. Most salaried laboratory technicians work 40 hours a week, but a few work part time. At times, technicians wear goggles to protect their eyes, gloves to handle hot objects, or masks to avoid inhaling dust. They may spend a great deal of time standing. Medical appliance technicians should be particularly careful when working with tools because there is a risk of injury.

Dental technicians usually have their own workbenches, which can be equipped with Bunsen burners, grinding and polishing equipment, and hand instruments, such as wax spatulas and wax carvers. Some dental technicians have computer-aided milling equipment to assist them with creating artificial teeth.

Training, Other Qualifications, and Advancement

Most medical, dental, and ophthalmic laboratory technicians learn their craft on the job. Many employers prefer to hire those with formal training or at least a high school diploma.

Education and training. Although there are no formal education or training requirements to become a medical, dental, or ophthalmic laboratory technician, having a high school diploma is typically the standard requirement for obtaining a job. High school students interested in becoming medical, dental, or ophthalmic laboratory technicians should take courses in mathematics and science. Courses in metal and wood shop, art, drafting, and computers are recommended. Courses in management and business may help those wishing to operate their own laboratories.

Most medical, dental, and ophthalmic laboratory technicians are hired with a high school diploma and learn their tasks through on-the-job training. They usually begin as helpers and gradually learn new skills as they gain experience. For example, dental laboratory technicians begin by pouring plaster into an impression, and progress to more complex procedures, such as making porcelain crowns and bridges. Ophthalmic laboratory technicians may start by marking or blocking lenses for grinding and move onto grinding, cutting, edging, and beveling lenses as they progress.

The length of time spent in on-the-job training varies for each of these occupations. For example, medical appliance technicians usually receive long-term training, while ophthalmic laboratory technicians usually spend less time in training. The length of the training period also varies by the laboratory where the technician is employed, since each laboratory operates differently.

Formal training also is available. In 2008, there were 5 orthotic- and prosthetic-technician programs accredited by the National Commission on Orthotic and Prosthetic Education (NCOPE). These programs offer either an associate degree or a 1-year certificate for orthotic or prosthetic technicians.

Training in dental laboratory technology is available through universities, community and junior colleges, vocational-technical institutes, and the Armed Forces. In 2008, 20 programs in dental laboratory technology were accredited by the Commission on Dental Accreditation in conjunction with the American Dental Association. Accredited programs normally take 2 years to complete, although a few programs can take up to 4 years to complete.

A few ophthalmic laboratory technicians learn their trade in the Armed Forces or in the few programs in optical technology offered by vocational-technical institutes or trade schools. In 2008, there were two programs in ophthalmic technology accredited by the Commission on Opticianry Accreditation (COA).

Licensure and certification. Three States—Kentucky, South Carolina, and Texas—require a dental laboratory to employ at least one Certified Dental Technician in order to operate. This certification is administered by the National Board for Certification in Dental Laboratory Technology (NBC) and the requirements are discussed under Certification and Advancement. In Florida, laboratories must register with the State and at least one dental technician in each dental laboratory must complete 18 hours of continuing education every two years.

Other qualifications. A high degree of manual dexterity, good vision, and the ability to recognize very fine color shadings and variations in shape are necessary for medical, dental, and

ophthalmic laboratory technicians. An artistic aptitude for detailed work also is important. Computer skills are valuable for technicians using automated systems.

Certification and advancement. Certification may increase chances of advancement. Voluntary certification for orthotic and prosthetic technicians is available through the American Board for Certification in Orthotics and Prosthetics (ABC). Applicants are eligible for an exam after completing a program accredited by NCOPE or obtaining 2 years of experience as a technician under the direct supervision of an ABC-certified practitioner. After successfully passing the appropriate exam, technicians receive the Registered Orthotic Technician, Registered Prosthetic Technician, or Registered Prosthetic-Orthotic Technician credential.

With additional formal education, medical appliance technicians who make orthotics and prostheses can advance to become orthotists or prosthetists—practitioners who work with patients who need braces, prostheses, or related devices and help to determine the specifications for those devices.

Dental laboratory technicians may obtain the Certified Dental Technician designation from the National Board for Certification in Dental Laboratory Technology (NBC), an independent board established by the National Association of Dental Laboratories. Certification, which is voluntary except in three States, can be obtained in five specialty areas: crowns and bridges, ceramics, partial dentures, complete dentures, and orthodontic appliances. To qualify for the CDT credential, technicians must meet educational requirements and pass two written exams and one practical exam. The educational requirement may be obtained through graduation from a dental technology program or at least 5 years of experience as a dental laboratory technician. CDT's must complete twelve hours of continuing education each year to maintain their certification. Dental technicians who only perform certain tasks in a laboratory can take a written and practical exam in modules of dental technology. These result in a Certificate of Competency in a specific skill area and do not require continuing education.

In large dental laboratories, dental technicians may become supervisors or managers. Experienced technicians may teach or take jobs with dental suppliers in such areas as product development, marketing, and sales. Opening one's own laboratory is another, and more common, way to advance and earn more.

Ophthalmic laboratory technicians also can become supervisors and managers. Some become dispensing opticians, although further education or training is generally required to advance.

Employment

Medical, dental, and ophthalmic laboratory technicians held about 95,200 jobs in 2008. About 58 percent of jobs were in medical equipment and supplies manufacturing, which usually are small, privately owned businesses with fewer than five employees. However, some laboratories are large; a few employ more than 1,000 workers. The following tabulation shows employment by occupation:

Dental laboratory technicians.....	46,000
Ophthalmic laboratory technicians	35,200
Medical appliance technicians	13,900

In addition to manufacturing laboratories, many medical appliance technicians worked in health and personal care stores, while others worked in public and private hospitals, professional and commercial equipment and supplies merchant wholesalers, or consumer goods rental centers. Some were self-employed. In addition to manufacturing laboratories, many dental laboratory technicians worked in offices of dentists. Some dental laboratory technicians open their own offices.

Most ophthalmic laboratory technician jobs were in medical equipment and supplies manufacturing laboratories. Others worked in health and personal care stores, offices of optometrists, and professional and commercial equipment and supplies merchant wholesalers.

Job Outlook

Overall employment of medical, dental, and ophthalmic laboratory technicians is expected to grow faster than the average, but varies by detailed occupation. Job opportunities should be favorable because few people seek these positions.

Employment change. Overall employment for these occupations is expected to grow 14 percent from 2008 to 2018, which is faster than the average for all occupations. Medical appliance technicians will grow at 11 percent, about as fast as the average for all occupations, because of the increasing prevalence of the two leading causes of limb loss—diabetes and cardiovascular disease—and because of the increasing rate of obesity. The demand for orthotic devices, such as braces and orthopedic footwear, will increase as more people will need these support devices. In addition, advances in technology may spur demand for prostheses that allow for greater movement.

Employment of dental laboratory technicians is expected to grow 14 percent, which is faster than the average for all occupations. During the last few years, increased demand has arisen from an aging public that is growing increasingly interested in cosmetic prostheses. For example, many dental laboratories are filling orders for composite fillings that are the same shade of white as natural teeth to replace older, less attractive fillings. Additionally, the growing and aging population will require more dental products fabricated by dental technicians, such as bridges and crowns, since more people are retaining their original teeth. This job growth will be limited, however, by productivity gains stemming from continual technological advancements in laboratories.

Ophthalmic laboratory technicians are expected to experience employment growth of 15 percent, faster than the average for all occupations. Demographic trends make it likely that many more Americans will need vision care in the years ahead. Not only will the population grow, but also the proportion of middle-aged and older adults is projected to increase rapidly. Middle age is a time when many people use corrective lenses for the first time, and the need for vision care continues to increase with age. However, the increasing use of automated machinery will temper job growth for ophthalmic laboratory technicians.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Medical, dental, and ophthalmic laboratory technicians	51-9080	95,200	108,300	13,100	14
Dental laboratory technicians	51-9081	46,000	52,400	6,400	14
Medical appliance technicians	51-9082	13,900	15,400	1,500	11
Ophthalmic laboratory technicians	51-9083	35,200	40,400	5,200	15

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Job prospects. Job opportunities for medical, dental, and ophthalmic laboratory technicians should be favorable, due to expected faster than average growth. Few people seek these jobs, reflecting the relatively limited public awareness and low starting wages. Those with formal training in a medical, dental, or ophthalmic laboratory technology program will have the best job prospects. In addition to openings from job growth, many job openings also will arise from the need to replace technicians who transfer to other occupations or who leave the labor force.

Earnings

Median annual wages of wage and salary medical appliance technicians were \$34,460 in May 2008. The middle 50 percent earned between \$26,600 and \$47,210. The lowest 10 percent earned less than \$21,720, and the highest 10 percent earned more than \$63,750.

Median annual wages of wage and salary dental laboratory technicians were \$34,170 in May 2008. The middle 50 percent earned between \$26,260 and \$44,790. The lowest 10 percent earned less than \$20,740, and the highest 10 percent earned more than \$58,140. In the two industries that employed the most dental laboratory technicians—medical equipment and supplies manufacturing and offices of dentists—median annual wages were \$33,700 and \$35,000, respectively.

Median annual wages of wage and salary ophthalmic laboratory technicians were \$27,210 in May 2008. The middle 50 percent earned between \$21,580 and \$34,810. The lowest 10 percent earned less than \$18,080, and the highest 10 percent earned more than \$42,890. Median annual wages were \$25,250 in medical equipment and supplies manufacturing and \$25,580 in health and personal care stores, the two industries that employ the most ophthalmic laboratory technicians.

Painting and Coating Workers, except Construction and Maintenance

Significant Points

- About 2 out of 3 jobs are in manufacturing establishments.
- Most workers acquire their skills on the job; training usually lasts from a few days to several months, but becoming skilled in all aspects of painting can require 1 to 2 years of experience and training.
- Overall employment is projected to grow.
- Good job prospects are expected for skilled workers with painting experience.

Nature of the Work

Millions of items ranging from cars to candy are covered by paint, plastic, varnish, chocolate, or some other type of coating solution. Painting or coating is used to make a product more attractive or protect it from the elements. The paint finish on an automobile, for example, makes the vehicle more attractive and provides protection from corrosion. Achieving this end result is the work of *painting and coating workers*.

Before painting and coating workers can begin to apply the paint or other coating, they often need to prepare the surface. A metal, wood, or plastic part may need to be sanded or ground to correct imperfections or rough up a surface so that paint will stick to it. After preparing the surface, the product is carefully cleaned to prevent any dust or dirt from becoming trapped under the paint. Metal parts are often washed or dipped in chemical baths to prepare the surface for painting and protect against corrosion. If the product has more than one color or has unpainted parts, masking is required. Masking normally involves carefully covering portions of the product with tape and paper.

After the product is prepared for painting, coating, or varnishing, a number of techniques may be used to apply the paint. Perhaps the most straightforward technique is simply dipping an item in a large vat of paint or other coating. This is the technique used by *dippers*, who immerse racks or baskets of articles in vats of paint, liquid plastic, or other solutions by means of a power hoist. This technique is commonly used for small parts in electronic equipment, such as cell phones.

Spraying products with a solution of paint or some other coating is also quite common. *Spray machine operators* use spray guns to coat metal, wood, ceramic, fabric, paper, and food products with paint and other coating solutions. Following a formula, operators fill the machine's tanks with a mixture of paints or chemicals, adding prescribed amounts of solution. Then they adjust nozzles on the spray guns to obtain the proper dispersion of the spray and hold or position the guns to direct the spray onto the article. Operators also check the flow and viscosity of the paint or solution and visually inspect the quality of the coating. When products are drying, these workers often must regulate the temperature and air circulation in drying ovens.

Some factories use automated painting systems that are operated by *coating, painting, and spraying machine setters, operators, and tenders*. When setting up these systems, opera-

tors position the automatic spray guns, set the nozzles, and synchronize the action of the guns with the speed of the conveyor carrying articles through the machine and drying ovens. The operator also may add solvents or water to the paint vessel to prepare the paint for application. During the operation of the painting machines, these workers tend the equipment, observe gauges on the control panel, and check articles for evidence of any variation from specifications. The operator uses a manual spray gun to "touch up" flaws.

Individuals who paint, coat, or decorate articles such as furniture, glass, pottery, toys, cakes, and books are known as *painting, coating, and decorating workers*. Some workers coat confectionery, bakery, and other food products with melted chocolate, cheese, oils, sugar, or other substances. Paper is often coated to give it its gloss or finish and silver, tin, and copper solutions are often sprayed on glass to make mirrors.

The best known group of painting and coating workers are those who refinish old or damaged cars, trucks, and buses in automotive body repair and paint shops. *Transportation equipment painters* who work in repair shops are among the most highly skilled manual spray operators, because they perform intricate, detailed work and mix paints to match the original color, a task that is especially difficult if the color has faded. The preparation work on an old car is similar to painting other metal objects. The paint is normally applied with a manually controlled spray gun.

Transportation equipment painters who work on new cars oversee several automated steps. A modern car is first dipped in an anti-corrosion bath, then coated with colored paint, and then painted in several coats of clear paint, which prevents scratches from damaging the colored paint.

Most other transportation equipment painters either paint equipment too large to paint automatically—such as ships or giant construction equipment—or perform touch-up work to

Automotive painters wear ventilators to ensure safety.

repair flaws in the paint caused either by damage during assembly or flaws during the automated painting process.

With all types of coating, it is common for the painting process to be repeated several times to achieve a thick, smooth, protective coverage.

Work environment. Painting and coating workers typically work indoors and may be exposed to dangerous fumes from paint and coating solutions, although in general, workers' exposure to hazardous chemicals has decreased because of regulations limiting emissions of volatile organic compounds and other hazardous air pollutants. Painting usually is done in special ventilated booths with workers typically wearing masks or respirators that cover their noses and mouths. More sophisticated paint booths and fresh-air systems are increasingly used to provide a safer work environment.

Operators have to stand for long periods, and when using a spray gun, they may have to bend, stoop, or crouch in uncomfortable positions to reach different parts of the products.

Most painting and coating workers work a normal 40-hour week, but automotive painters in repair shops can work more than 50 hours a week, depending on the number of vehicles that need repainting.

Training, Other Qualifications, and Advancement

A high school diploma or equivalent is required for most workers; training for new workers usually lasts from a few days to several months, but becoming skilled in all aspects of painting can require 1 to 2 years of experience.

Education and training. Painting and coating workers employed in the manufacturing sector are usually required to have a high school degree or equivalent; employers in other sectors may be willing to hire workers without a high school diploma. Training for beginning painting and coating machine setters, operators, and tenders and for painting, coating, and decorating workers, may last from a few days to a couple of months. Coating, painting, and spraying machine setters, operators, and tenders who modify the operation of computer-controlled equipment may require additional training in computer operations and minor programming. Transportation equipment painters typically learn their jobs through either apprenticeships as helpers or postsecondary education in painting.

Becoming skilled in all aspects of painting usually requires 1 to 2 years of experience and sometimes requires some formal classroom instruction and on-the-job training. Beginning helpers usually remove trim, clean, and sand surfaces to be painted; mask surfaces they do not want painted; and polish finished work. As helpers gain experience, they progress to more complicated

tasks, such as mixing paint to achieve a good match and using spray guns to apply primer coats or final coats to small areas.

Additional instruction in safety, equipment, and techniques is offered at some community colleges and vocational or technical schools. Employers also sponsor training programs to help their workers become more productive. Additional training is available from manufacturers of chemicals, paints, or equipment, explaining their products and giving tips about techniques.

Other qualifications. Painting and coating workers in factories need to be able to read and follow detailed plans or blueprints. Some workers also need artistic talent to paint furniture, decorate cakes, or make sure that the paint on a car or other object is the right color. Applicants should be able to breathe comfortably wearing a respirator.

Certification and advancement. Voluntary certification by the National Institute for Automotive Service Excellence (ASE) is recognized as the standard of achievement for automotive painters. For certification, painters must pass a written examination and have at least 2 years of experience in the field. High school, trade or vocational school, or community or junior college training in automotive refinishing that meets ASE standards may substitute for up to 1 year of experience. To retain the certification, painters must retake the examination at least every 5 years. Outside of automobile painters, few receive certifications.

Some automotive painters go to technical schools to learn the intricacies of mixing and applying different types of paint. Such programs can improve employment prospects and speed up promotion. Experienced painting and coating workers with leadership ability may become team leaders or supervisors. Many become paint and coating inspectors. Those who get practical experience or formal training may become sales or technical representatives for chemical or paint companies. Some automotive painters eventually open their own shops.

Employment

Painting and coating workers held about 192,700 jobs in 2008. Coating, painting, and spraying machine setters, operators, and tenders accounted for about 107,800 jobs, while transportation equipment painters constituted about 52,200. Another 32,700 jobs were held by painting, coating, and decorating workers.

Approximately 2 out of 3 workers were employed by manufacturing establishments, particularly those that manufacture fabricated metal products, transportation equipment, industrial machines, household and office furniture, and plastic, wood, and paper products. Outside manufacturing, workers were

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Painting workers	51-9120	192,700	199,900	7,300	4
Coating, painting, and spraying machine setters, operators, and tenders	51-9121	107,800	111,300	3,500	3
Painters, transportation equipment.....	51-9122	52,200	52,600	400	1
Painting, coating, and decorating workers	51-9123	32,700	36,000	3,300	10

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

employed by independent automotive repair shops and by motor vehicle dealers. About 6 percent were self-employed.

Job Outlook

Overall employment is expected to grow slower than the average for all occupations, but employment change will vary by specialty. Good job prospects are expected for skilled workers with painting experience.

Employment change. Overall employment of painting and coating workers is expected to increase by 4 percent from 2008-2018, which is slower than the average for all occupations. This growth will be driven primarily by the increasing number of goods requiring painting or coating. However, growth will be limited by gains in efficiency from automation and other processes. For example, operators will be able to coat goods more rapidly as sophisticated industrial machinery moves and aims spray guns more efficiently. Much of the growth in these occupations will be seen in the retail sector, as automation is less common in this industry.

Job prospects. Like many manufacturing occupations, employers report difficulty finding qualified workers. Opportunities should be good for those with painting experience. Job openings will result from the need to replace workers who leave the occupation and from increased specialization in manufacturing.

Earnings

Median hourly wages coating, painting, and spraying machine setters, operators, and tenders were \$13.66 in May 2008. The middle 50 percent earned between \$11.00 and \$16.97 an hour. The lowest 10 percent earned less than \$9.18, and the highest 10 percent earned more than \$20.35 an hour.

Median hourly wages transportation equipment painters were \$17.86 in May 2008. The middle 50 percent earned between \$13.99 and \$24.01 an hour. The lowest 10 percent earned less than \$11.31, and the highest 10 percent earned more than \$29.93 an hour. Median hourly wages of transportation equipment painters were \$17.86 in automotive repair and maintenance shops and \$26.61 in motor vehicle manufacturing.

Median hourly wages of painting, coating, and decorating workers were \$11.57 in May 2008. The middle 50 percent earned between \$9.46 and \$14.60 an hour. The lowest 10 percent earned less than \$8.15, and the highest 10 percent earned more than \$18.55 an hour.

Many automotive painters employed by motor vehicle dealers and independent automotive repair shops receive a commission, based on the labor cost charged to the customer. Under this method, earnings depend largely on the amount of work a painter does and how fast it is completed. Employers frequently guarantee commissioned painters a minimum weekly salary. Helpers and trainees usually receive an hourly rate until they become sufficiently skilled to work on commission. Trucking companies, bus lines, and other organizations that repair and refinish their own vehicles usually pay by the hour.

Some painting and coating machine operators belong to unions, including the United Auto Workers and the International Brotherhood of Teamsters. Most union operators work for manufacturers and large motor vehicle dealers.

Semiconductor Processors

Significant Points

- Employment is expected to decline rapidly over the next 10 years, despite increased demand for semiconductor products.
- Opportunities will be best for applicants who have an associate degree in a relevant subject and work experience in high-tech manufacturing.
- Although applicants may face competition, many skills learned in this occupation are transferable to other high-tech manufacturing jobs.

Nature of the Work

Semiconductors are unique substances, which, under different conditions, can act as either conductors or insulators of electricity. Semiconductor processors turn one of these substances—silicon—into integrated circuits, also known as microchips. These integrated circuits contain anywhere from dozens to millions of tiny electronic components, and are used in a wide range of products, from personal computers and cellular telephones to airplanes and missile guidance systems.

Semiconductor processors—often referred to in the industry as *technicians* or *process technicians*—oversee the manufacturing process of microchips. This process begins with the production of cylinders of silicon called ingots. The ingots then are sliced into thin wafers. Using automated equipment, robots polish the wafers, imprint precise microscopic patterns of the

circuitry onto them using photolithography, etch out patterns with acids, and replace the patterns with conductors, such as aluminum or copper. The wafers then receive a chemical bath to make them smooth, and the imprint process begins again on a new layer with the next pattern. A complex chip may contain more than 20 layers of circuitry. Once the process is complete, wafers are then cut into individual chips, which are enclosed in a casing and shipped to equipment manufacturers.

The manufacturing and slicing of wafers to create semiconductors takes place in clean rooms—production areas that are kept free of all airborne matter, because the circuitry on a chip is so small that even microscopic particles can make it unusable. All semiconductor processors working in clean rooms must wear special lightweight outer garments known as “bunny suits.” These garments fit over clothing to prevent lint and other particles from contaminating the clean room.

Semiconductor processors troubleshoot production problems and make equipment adjustments and repairs. They take the lead in assuring quality control and in maintaining equipment. They also test completed chips to make sure they work properly. To keep equipment repairs to a minimum, technicians perform diagnostic analyses and run computations. For example, technicians may determine if a flaw in a chip is due to contamination and peculiar to that wafer, or if the flaw is inherent in the manufacturing process.

Work environment. Workers begin their shift by putting on a bunny suit. For new workers, this often can take as much as 40 minutes, but experienced workers can generally do it in 5 minutes or less. The work pace in clean rooms is deliberately slow. Limited movement keeps the air in clean rooms as free as possible of dust and other particles, which can destroy microchips during their production. Because the machinery sets the operators’ rate of work, workers maintain a relaxed pace. Technicians are on their feet most of the day, walking through the clean room to oversee production activities.

The temperature in the clean rooms must be kept within a narrow range and generally is comfortable for workers. Although bunny suits cover virtually the entire body, their lightweight fabric keeps the temperature inside fairly comfortable. Entry

Semiconductor processors troubleshoot problems in the production of microchips and make equipment adjustments and repairs.

and exit of workers from the clean room are controlled to minimize contamination, and workers must be reclothed in a clean bunny suit and decontaminated each time they return to the clean room.

Semiconductor fabricating plants operate around the clock. Night and weekend work is common. In some plants, workers maintain standard 8-hour shifts, 5 days a week. In other plants, employees are on duty for 12-hour shifts to minimize the disruption of clean room operations brought about by changes. Managers also may allow workers to alternate schedules, thereby distributing the overnight shift equitably.

Training, Other Qualifications, and Advancement

Semiconductor processors typically have associate degrees or technical school certificates, as well as math and science skills.

Education and training. For semiconductor processor jobs, employers prefer applicants who have completed associate degrees in highly automated systems, electromechanical automation, or electronics. However, completion of a 1-year certificate program in semiconductor technology or high-tech manufacturing, offered by some community colleges, may be sufficient. Some semiconductor technology programs at community colleges include internships at semiconductor fabricating plants. Hands-on training is an important part of degree and certificate programs.

To ensure that operators and technicians keep their skills current, employers provide regular on-the-job training. Some employers also provide financial assistance to employees who want to earn associate or bachelor’s degrees, especially if the employee is working toward becoming a technician.

Other qualifications. People interested in becoming semiconductor processors—either operators or technicians—need strong technical skills, an ability to solve problems intuitively, and an ability to work in teams. Mathematics, including statistics, and physical science knowledge are useful. Communication skills and an understanding of manufacturing principles also are very important.

Advancement. Workers advance as they become more comfortable with the equipment and better understand the manufacturing process. Employees train workers for several months, after which they become entry-level operators or technicians. After a few years, as they become more knowledgeable about the operations of the plant, they generally advance to the intermediate level. This entails greater responsibilities. Over time, usually 7 to 10 years, workers may become senior technicians, who lead teams of technicians and work directly with engineers to develop processes in the plant.

Employment

Semiconductor processors held approximately 31,600 jobs in 2008. Nearly all of them were employed in the computer and electronic product manufacturing industry.

Job Outlook

Employment of semiconductor processors is projected to decline rapidly through 2018. Opportunities will be best for those with associate degrees and experience working in high-tech manufacturing.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Semiconductor processors	51-9141	31,600	21,600	-10,000	-32

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Employment change. Employment of semiconductor processors is projected to decline by 32 percent between 2008 and 2018. This reflects a changing manufacturing environment in which technological advances have reduced the need for workers.

Most of the microchips produced in the United States are highly complex. The success of these chips depends chiefly on their speed and flexibility. Meeting both of these goals requires smaller individual components, which are now measured in nanometers (one millionth of a millimeter). Because the components are so small, it is now impossible for humans to handle chips in production, since these chips are so sensitive to dust and other particles. As a result, there has been a decline in semiconductor processor employment for many years, despite a strong domestic industry. As technology advances, the decline in employment is expected to continue.

Job prospects. Jobseekers can expect competition for these positions, in response to the rapid decline in employment. Nonetheless, some jobs will open up due to the need to replace workers who leave the occupation. Prospects will be best for applicants with associate degrees and experience in high-tech manufacturing. Like most manufacturing industries, the semiconductor industry is highly sensitive to economic downturns.

Despite competition for these jobs, however, people who are interested in this type of work should be aware that the duties of semiconductor processors closely resemble those of other high-tech manufacturing jobs. Many of the skills learned in an associate degree or technical school program—as well as on the job—are transferable to other occupations.

Earnings

Median annual wages of wage-and-salary semiconductor processors were \$32,230 in May 2008. The middle 50 percent earned between \$26,650 and \$40,220. The lowest 10 percent earned less than \$21,980, and the top 10 percent earned more than \$50,400.

Technicians with associate degrees in a related field generally start at higher salaries than those with less education.

Semiconductor processors generally received good benefits packages, including healthcare, disability plans and life insurance, stock options and retirement.

Related Occupations

Other occupations involved in high-tech manufacturing production include:

	Page
Assemblers and fabricators	723
Electrical engineers	161
Engineering technicians	173
Inspectors, testers, sorters, samplers, and weighers	768
Science technicians	230
Tool and die makers	740

Sources of Additional Information

For more information on semiconductor processor careers, contact:

► Maricopa Advanced Technology Education Center, 4110 E. Wood St., Suite 1, Phoenix, AZ 85040. Internet: <http://www.matec.org>

► SEMI, 3081 Zanker Rd., San Jose, CA 95134. Internet: <http://www.semi.org>

► Semiconductor Industry Association, 181 Metro Dr., Suite 450, San Jose, CA 95110. Internet: <http://www.sia-online.org>

The Occupational Information Network (O*NET) provides information on a wide range of occupational characteristics. Links to O*NET appear at the end of the Internet version of this occupational statement, accessible at <http://www.bls.gov/ooh/ocos257.htm>

Other Production Occupations

Photographic Process Workers and Processing Machine Operators

Nature of the Work

Photographic processing machine operators use various machines to create prints from film or digital photographs. Most digital processing is done automatically by computer software. *Photographic process workers* perform more delicate tasks, such as retouching photographic negatives, prints, and images to emphasize or correct specific features.

Education and Training

Most skills needed for these jobs can be learned on-the-job in a few months.

Job Outlook**Current and projected employment:**

2008 Employment	73,000
2018 Employment	61,200
Employment change	-11,800
Growth rate	-16%

Employment change. Employment is expected to decline rapidly. Self-service machines, home printers, and online ordering services will be able to meet most of the demand for digital prints, but there still will be some demand for professionals to operate the machines, and to develop and print photos from people who continue to use film cameras. Using digital cameras and technology, consumers who have a personal computer are able to edit and to retouch pictures on their computers.

Job prospects. Job opportunities will be best for individuals with experience using computers and digital technology.

Earnings

Median annual wages in May 2008 were as follows:

Photographic process workers.....	\$26,010
Photographic processing machine operators.....	20,360

Related Occupations

	Page
Clinical laboratory technologists and technicians.....	411
Computer operators.....	589
Jewelers and precious stone and metal workers.....	770
Prepress technicians and workers.....	748

Transportation and Material Moving Occupations

Air Transportation Occupations

Air Traffic Controllers

Significant Points

- The vast majority of air traffic controllers are employed by the Federal Aviation Administration (FAA), an agency of the Federal Government.
- Applicants without prior air traffic control experience must be 30 years of age or younger.
- Replacement needs will continue to account for most job openings, reflecting the large number of air traffic controllers who will be eligible to retire over the next decade.
- Competition for jobs will remain keen.

Nature of the Work

The National Airspace System (NAS) is a vast network of people and equipment that ensures the safe operation of commercial and private aircraft. *Air traffic controllers* work within the NAS to coordinate the movement of air traffic to make certain that planes stay a safe distance apart. Their immediate concern is safety, but controllers also must direct planes efficiently to minimize delays. Some regulate airport traffic through designated airspaces; others regulate airport arrivals and departures.

Terminal controllers watch over all planes traveling in an airport's airspace. Their main responsibility is to organize the flow of aircraft into and out of the airport. They work in either the control tower or the terminal radar approach control (TRACON) room or building. Relying on visual observation, the *tower local controllers* sequence arrival aircraft for landing and issue departure clearances for those departing from the airport. Other controllers in the tower control the movement of aircraft on the taxiways, handle flight data, and provide flight plan clearances. *Terminal radar controllers* manage aircraft departing from or arriving to an airport by monitoring each aircraft's movement on radar to ensure that a safe distance is maintained between all aircraft under their control. In addition, terminal controllers keep pilots informed about weather and runway conditions.

Many different controllers are involved in the departure of an airplane. If the plane is flying under instrument flight rule conditions, a flight plan is filed prior to departure. The *tower flight data controller* receives the flight plan in the form of a flight strip, which is output from a computer, and arranges it in sequence. When an aircraft calls for clearance the *clearance delivery controller* issues the clearance and moves the strip over

to the *ground controller* who manages the movement of aircraft on the airport surface, except the active runway. When the aircraft arrives at the active runway the strip is moved to the local controller who issues the departure clearance, observes the takeoff and turns the plane over to the departure controller. The TRACON departure controller identifies the plane on radar, climbs it, and directs it on course.

After each plane departs, terminal controllers notify *en route controllers*, who take charge next. There are 20 air route traffic control centers located around the country, each employing 300 to 700 controllers, with more than 150 on duty during peak hours at the busiest facilities. Airplanes usually fly along designated routes; each center is assigned a certain airspace containing many different routes. En route controllers work either individually or in teams of two, depending on how heavy traffic is; each team is responsible for a sector of the center's airspace.

As the plane proceeds on its flight plan to its destination it is handed off from sector to sector both within the center and to adjoining centers. To prepare for planes about to enter the team's sector, the *radar associate controller* organizes flight plans output from a printer into strip bays. If two planes are scheduled to enter the team's sector in conflict, the controller may arrange with the preceding sector unit for one plane to change its flight path or altitude. As a plane approaches a team's airspace, the radar controller accepts responsibility for the plane from the previous sector. The controller also delegates responsibility for the plane to the next sector when the plane leaves the team's airspace.

When the plane is approximately 50 miles from the destination airport, it is handed off to that airport's *terminal radar arrival controller* who sequences it with other arrivals, and issues an approach clearance. As the plane nears the runway, the pilot is issued a clearance to contact the tower. The local controller issues the landing clearance. Once the plane has landed, the ground controller directs it along the taxiways to its assigned gate. The local and ground controllers usually work entirely by sight, but may use airport surface radar if visibility is very poor.

Both airport tower and en route controllers usually control several planes at a time, often making quick decisions about completely different activities. For example, a controller might direct a plane on its landing approach and at the same time provide pilots entering the airport's airspace with information about conditions at the airport. While instructing these pilots, the controller also might observe other planes in the vicinity, such as those in a holding pattern waiting for permission to land, to ensure that they remain well separated.

In addition to airport towers and en route centers, air traffic controllers also work in flight service stations at 17 locations in Alaska. These *flight service specialists* provide pilots with

Competition for air traffic controller jobs is expected to remain keen.

preflight and in-flight weather information, suggested routes, and other aeronautical information important to the safety of a flight. Flight service specialists relay air traffic control clearances to pilots not in direct communications with a tower or center, assist pilots in emergency situations, and initiate and coordinate searches for missing or overdue aircraft. At certain locations where there is no airport tower or the tower has closed for the day, flight service specialists provide airport advisory services to landing and departing aircraft. However, they are not involved in actively managing and separating air traffic.

Some air traffic controllers work at the FAA's Air Traffic Control Systems Command Center in Herndon, VA, where they oversee the entire system. They look for situations that will create bottlenecks or other problems in the system and then respond with a management plan for traffic into and out of the troubled sector. The objective is to keep traffic levels in the trouble spots manageable for the controllers working at en route centers.

Work environment. During busy times, controllers must work rapidly and efficiently. Total concentration is required to keep track of several planes at the same time and to make certain that all pilots receive correct instructions. The mental stress of being responsible for the safety of several aircraft and their passengers can be exhausting. Unlike tower controllers, radar controllers also have the extra stress of having to work in semi-darkness, never seeing the actual aircraft they control except as a small "blip" on the radarscope. Controllers who work in flight service stations work in offices close to the communications and computer equipment.

Controllers work a basic 40-hour week; however, they may work additional hours, for which they receive overtime, or premium pay, or equal time off. Because most control towers and centers operate 24 hours a day, 7 days a week, controllers rotate night and weekend shifts. Contract towers and flight service station working conditions may vary somewhat from the FAA.

Training, Other Qualifications, and Advancement

To become an air traffic controller with the FAA, a person must achieve a qualifying score on the FAA-authorized pre-employment test and meet the basic qualification requirements

in accordance with Federal law. Those without prior air traffic control experience must be 30 years of age or younger.

Education and training. There are three main pathways to become an air traffic controller with the FAA. The first is air traffic controllers with prior experience through either the FAA or the Department of Defense as a civilian or veteran. Second are applicants from the general public. These applicants must have 3 years of progressively responsible full-time work experience, have completed a full 4 years of college, or a combination of both. In combining education and experience, 1 year of undergraduate study—30 semester or 45 quarter hours—is equivalent to 9 months of work experience. The third way is for an applicant to have successfully completed an aviation-related program of study through the FAA's Air Traffic-Collegiate Training Initiative (AT-CTI) program. In 2008, there were 31 schools in the AT-CTI program.

AT-CTI program schools offer 2-year or 4-year non-engineering degrees that teach basic courses in aviation and air traffic control. In addition to graduation, AT-CTI candidates need a recommendation from their school before being considered for employment as an air traffic controller by the FAA.

Candidates with prior experience as air traffic controllers are automatically qualified for FAA air traffic controller positions. However, applicants from the general public and the AT-CTI program must pass the FAA-authorized pre-employment test that measures their ability to learn the duties of a controller. The test is administered by computer and takes about 8 hours to complete. To take the test, an applicant must apply under an open advertisement for air traffic control positions and be chosen to take the examination. When there are many more applicants than available testing positions, applicants are selected randomly. However, the FAA guarantees that all AT-CTI students in good standing in their programs will be given the FAA pre-employment test. Those who achieve a qualifying score on the test become eligible for employment as an air traffic controller. Candidates must be granted security and medical clearance and are subject to drug screening. Additionally, applicants must meet other basic qualification requirements in accordance with Federal law. These requirements include United States citizenship and the ability to speak English.

Upon selection, employees attend the FAA Academy in Oklahoma City, OK, for 12 weeks of training, during which they learn the fundamentals of the airway system, FAA regulations, controller equipment, and aircraft performance characteristics, as well as more specialized tasks. Graduates of the AT-CTI program are eligible to bypass the Air Traffic Basics Course, which is the first 5 weeks of qualification training at the FAA Academy.

After graduation from the FAA Academy in Oklahoma City, candidates are assigned to an air traffic control facility and are classified as "developmental controllers" until they complete all requirements to be certified for all of the air traffic control positions within a defined area of a given facility. Generally, it takes new controllers with only initial controller training between 2 and 4 years, depending on the facility and the availability of facility staff or contractors to provide on-the-job training, to complete all the certification requirements to become certified professional controllers. Individuals who have had prior

controller experience normally take less time to become fully certified. Controllers who fail to complete either the academy or the on-the-job portions of the training usually are dismissed. Controllers must pass a physical examination each year and a job performance examination twice each year. Failure to become certified in any position at a facility within a specified time also may result in dismissal. Controllers also are subject to drug screenings as a condition of continuing employment.

Other qualifications. Air traffic controllers must be articulate to give pilots directions quickly and clearly. Intelligence and a good memory also are important because controllers constantly receive information that they must immediately grasp, interpret, and remember. Decisiveness also is required because controllers often have to make quick decisions. The ability to concentrate is crucial because controllers must make these decisions in the midst of noise and other distractions.

Advancement. At airports, new controllers begin by supplying pilots with basic flight data and airport information. They then advance to the position of ground controller, local controller, departure controller, and, finally, arrival controller. At an air route traffic control center, new controllers first deliver printed flight plans to teams, gradually advancing to radar associate controller and then to radar controller.

Controllers can transfer to jobs at different locations or advance to supervisory positions, including management or staff jobs—such as air traffic control data systems computer specialist—in air traffic control, and top administrative jobs in the FAA. However, there are only limited opportunities for a controller to switch from a position in an en route center to a tower.

Employment

Air traffic controllers held about 26,200 jobs in 2008. The vast majority were employed by the FAA, while a small number of civilian controllers also work for the U.S. Department of Defense. In addition to controllers employed by the Federal Government, some work for private air traffic control companies providing service to non-FAA towers and contract flight service stations.

Job Outlook

Air traffic controllers should experience about as fast as average employment growth, but most opportunities are expected to result from the need to replace workers who retire or leave the occupation for other reasons. Keen competition is expected for air traffic controller positions.

Employment change. Employment of air traffic controllers is projected to grow by 13 percent from 2008 to 2018, which is about as fast as the average for all occupations. Increasing air traffic will require more controllers to handle the additional work. Job growth, however, is not expected to keep pace with the increasing number of aircraft flying due to advances in technology.

The FAA is implementing an automated air traffic control system that will allow controllers to more efficiently deal with the demands of increased air traffic. It includes the replacement of aging equipment and the introduction of new systems, technologies, and procedures to enhance safety and security and support future aviation growth. Future developments will include the use of the Global Positioning System (GPS) to eliminate radar-based air traffic control and give controllers real-time displays of aircraft locations. This will allow for more efficient flight paths and reduced air traffic congestion, and it will also allow controllers to handle more traffic, increasing their productivity.

Job prospects. Most job opportunities are expected as the result of replacement needs from workers leaving the occupation. The majority of today's air traffic controllers will be eligible to retire over the next decade, although not all are expected to do so. Despite the increasing number of job openings for air traffic controllers, competition to get into the FAA Academy is expected to remain keen, as there generally are many more test applicants than there are openings.

Air traffic controllers who continue to meet the proficiency and medical requirements enjoy more job security than do most workers. While demand for air transportation declines during recessions, controllers are rarely laid off.

Earnings

Air traffic controllers earn relatively high pay and have good benefits. Median annual wages of air traffic controllers in May 2008 were \$111,870. The middle 50 percent earned between \$71,050 and \$143,780. The lowest 10 percent earned less than \$45,020, and the highest 10 percent earned more than \$161,010. The average annual salary, excluding overtime earnings, for air traffic controllers in the Federal Government—which employs 90 percent of all controllers—was \$109,218 in March 2009.

The Air Traffic Control pay system classifies each air traffic facility into one of eight levels with corresponding pay bands. Under this pay system, controllers' salaries are determined by the rating of the facility. Higher ratings usually mean higher controller salaries and greater demands on the controller's judgment, skill, and decision-making ability.

Depending on length of service, air traffic controllers receive 13 to 26 days of paid vacation and 13 days of paid sick leave each year, in addition to life insurance and health benefits. Controllers also can retire at an earlier age and with fewer years of service than other Federal employees. Air traffic controllers are eligible to retire at age 50 with 20 years of service as an active air traffic controller or after 25 years of active service at any age. There is a mandatory retirement age of 56 for controllers who manage air traffic. However, Federal law provides for exemptions to the mandatory age of 56, up to age 61 in certain cases, but controllers must have exceptional skills and experience. Earnings and benefits for controllers working in contract towers or flight service stations

Aircraft Pilots and Flight Engineers

Significant Points

- Regional and low-cost airlines offer the best opportunities; pilots face strong competition for jobs at the major airlines, which offer better pay and benefits.
- Many pilots have learned to fly in the military, but growing numbers have college degrees with flight training from civilian flying schools that are certified by the Federal Aviation Administration (FAA).
- Newly hired pilots at major airlines typically have about 4,000 hours of flight experience.

Nature of the Work

Pilots are highly trained professionals who fly airplanes or helicopters to carry out a wide variety of tasks. Most are *airline pilots*, *copilots*, and *flight engineers* who transport passengers and cargo. However, 34 percent are commercial pilots involved in dusting crops, spreading seed for reforestation, testing aircraft, flying passengers and cargo to areas not served by regular airlines, directing firefighting efforts, tracking criminals, monitoring traffic, and rescuing and evacuating injured persons.

Except on small aircraft, two pilots usually make up the cockpit crew. Generally, the most experienced pilot, the *captain*, is in command and supervises all other crew members. The pilot and the copilot, often called the *first officer*, share flying and other duties, such as communicating with air traffic controllers and monitoring the instruments. Some large aircraft have a third crewmember, the flight engineer, who assists the pilots by monitoring and operating many of the instruments and systems, making minor in-flight repairs, and watching for other aircraft. The flight engineer also assists the pilots with the company, air

traffic control, and cabin crew communications. New technology can perform many flight tasks, however, and virtually all new aircraft now fly with only two pilots, who rely more heavily on computerized controls.

Before departure, pilots plan their flights carefully. They thoroughly check their aircraft to make sure that the engines, controls, instruments, and other systems are functioning properly. They also make sure that baggage or cargo has been loaded correctly. They confer with flight dispatchers and aviation weather forecasters to find out about weather conditions en route and at their destination. Based on this information, they choose a route, altitude, and speed that will provide the safest, most economical, and smoothest flight. When flying under instrument flight rules—procedures governing the operation of the aircraft when there is poor visibility—the pilot in command, or the company dispatcher, normally files an instrument flight plan with air traffic control so that the flight can be coordinated with other air traffic.

Takeoff and landing are the most difficult parts of the flight, and require close coordination between the two pilots. For example, as the plane accelerates for takeoff, the pilot concentrates on the runway while the copilot, scans the instrument panel. To calculate the speed they must attain to become airborne, pilots consider the altitude of the airport, outside temperature, weight of the plane, and speed and direction of the wind. The moment the plane reaches takeoff speed, the copilot informs the pilot, who then pulls back on the controls to raise the nose of the plane. Captains and first officers usually alternate flying each leg from takeoff to landing.

Unless the weather is bad, the flight itself is relatively routine. Airplane pilots, with the assistance of autopilot and the flight management computer, steer the plane along their planned route and are monitored by the air traffic control stations they pass along the way. They regularly scan the instrument panel to check their fuel supply; the condition of their engines; and the air-conditioning, hydraulic, and other systems. Pilots may request a change in altitude or route if circumstances dictate. For example, if the ride is rougher than expected, pilots may ask air traffic control if pilots flying at other altitudes have reported better conditions; if so, they may request an altitude change. This procedure also may be used to find a stronger tailwind or a weaker headwind to save fuel and increase speed. In contrast, because helicopters are used for short trips at relatively low altitude, helicopter pilots must be constantly on the lookout for trees, bridges, power lines, transmission towers, and other dangerous obstacles as well as low-flying general aviation aircraft. Regardless of the type of aircraft, all pilots must monitor warning devices designed to help detect sudden shifts in wind conditions that can cause crashes.

Pilots must rely completely on their instruments when visibility is poor. On the basis of altimeter readings, they know how high above ground they are and whether they can fly safely over mountains and other obstacles. Special navigation radios give pilots precise information that, with the help of special charts, tells them their exact position. Other very sophisticated equipment provides directions to a point just above the end of a runway and enables pilots to land completely without an outside visual reference. Once on the ground, pilots must complete

Before every flight, pilots inspect the aircraft.

records on their flight and the aircraft maintenance status for their company and the FAA.

The number of nonflying duties that pilots have depends on the employment setting. Airline pilots have the services of large support staffs and, consequently, perform few nonflying duties. However, because of the large numbers of passengers, airline pilots may be called upon to coordinate handling of disgruntled or disruptive passengers. Also, under the Federal Flight Deck Officer program airline pilots who undergo rigorous training and screening are deputized as Federal law enforcement officers and are issued firearms to protect the cockpit against intruders and hijackers. Pilots employed by other organizations, such as charter operators or businesses, have many other duties. They may load the aircraft, handle all passenger luggage to ensure a balanced load, and supervise refueling; other nonflying responsibilities include keeping records, scheduling flights, arranging for major maintenance, and performing minor aircraft maintenance and repairs.

Some pilots are flight instructors. They teach their students in ground-school classes, in simulators, and in dual-controlled planes and helicopters. A few specially trained pilots are examiners or check pilots. They periodically fly with other pilots or pilot's license applicants to make sure that they are proficient.

Work environment. Most pilots spend a considerable amount of time away from home because the majority of flights involve overnight layovers. According to the Airline Pilot's Association, pilots spend approximately 360 hours a month away from their home base. When pilots are away from home, the airlines provide hotel accommodations, transportation between the hotel and airport, and an allowance for meals and other expenses.

Airline pilots, especially those on international routes, often experience jet lag—fatigue caused by many hours of flying through different time zones. To guard against pilot fatigue, which could result in unsafe flying conditions, the FAA requires airlines to allow pilots at least 8 hours of uninterrupted rest in the 24 hours before finishing their flight duty.

Commercial pilots face other types of job hazards. The work of test pilots, who check the flight performance of new and experimental planes, may be dangerous. Pilots who are crop dusters may be exposed to toxic chemicals and seldom have the benefit of a regular landing strip. Helicopter pilots involved in rescue and police work may be subject to personal injury. All

pilots face the potential risk of hearing loss due to prolonged exposure to the constant noise coming from an aircraft's engines.

Although flying does not involve much physical effort, the mental stress of being responsible for a safe flight, regardless of the weather, can be tiring. Pilots must be alert and quick to react if something goes wrong, particularly during takeoff and landing.

FAA regulations limit flying time of airline pilots of large aircraft to a maximum of 100 hours a month and 1,000 hours a year. Most airline pilots fly an average of 75 hours a month and work an additional 140 hours a month performing nonflying duties, which includes waiting for delays to clear and their aircraft to arrive. Most pilots have variable work schedules, working several days on, then several days off. Airlines operate flights at all hours of the day and night, so work schedules often are irregular. Flight assignments are based on seniority; the sooner pilots are hired, the stronger their bidding power is for preferred assignments.

Commercial pilots also may have irregular schedules, flying 30 hours one month and 90 hours the next. Because these pilots frequently have many nonflying responsibilities, they have much less free time than do airline pilots. Except for corporate flight department pilots, most commercial pilots do not remain away from home overnight, although they may work odd hours. However, if the company owns a fleet of planes, pilots may fly a regular schedule.

Flight instructors may have irregular and seasonal work schedules, depending on their students' available time and the weather. Instructors frequently work in the evening or on weekends.

Training, Other Qualifications, and Advancement

Many pilots have learned to fly in the military, but growing numbers have college degrees with flight training from civilian flying schools that are certified by the FAA. All pilots who are paid to transport passengers or cargo must have a commercial pilot's license.

Education and training. Although some small airlines hire high school graduates, most airlines require at least 2 years of college and prefer to hire college graduates. In fact, most entrants to this occupation have a college degree. Because the number of college-educated applicants continues to increase, many employers are making a college degree an educational requirement. Preferred courses in preparation for a career as an airline pilot include English, mathematics, physics, and aeronautical engineering.

Pilots also need flight experience to qualify for a license. The U.S. Armed Forces have always been an important source of experienced pilots because of the extensive flying time and experience on jet aircraft and helicopters. However, an increasing number of people are becoming pilots by attending flight schools or by taking lessons from FAA-certified flight instructors. Completing classes at a flight school approved by the FAA can reduce the amount of flight experience required for a pilot's license. In 2009, the FAA certified about 600 civilian flying schools, including some colleges and universities that offer degree credit for pilot training. Initial training for airline pilots typically includes a week of company indoctrination; 3 to 6 weeks of ground school and simulator training; and 25 hours of initial operating experience, including a check-ride with an

FAA aviation safety inspector. Once trained, pilots are required to attend recurrent training and simulator checks once or twice a year throughout their career.

Licensure. To qualify for FAA licensure, applicants must be at least 18 years old and have at least 250 hours of flight experience. Applicants also must pass a strict physical examination to make sure that they are in good health and have 20/20 vision with or without corrective lenses, good hearing, and no physical handicaps that could impair their performance. They must pass a written test that includes questions on the principles of safe flight, navigation techniques, and FAA regulations, and must demonstrate their flying ability to FAA or designated examiners.

To fly during periods of low visibility, pilots must be rated by the FAA to fly by instruments. Pilots may qualify for this rating by having the required hours of flight experience, including 40 hours of experience in flying by instruments; they also must pass a written examination on procedures and FAA regulations covering instrument flying and demonstrate to an examiner their ability to fly by instruments. Requirements for the instrument rating vary depending on the certification level of flight school.

Airline pilots must fulfill additional requirements. Captains must have an air transport pilot’s license. Applicants for this license must be at least 23 years old and have a minimum of 1,500 hours of flying experience, including cross country, night, and instrument flying, and must pass FAA written and flight examinations. Usually, they also have one or more advanced ratings depending on the requirements of their particular job. Because pilots must be able to make quick decisions and accurate judgments under pressure, many airline companies reject applicants who do not pass required psychological and aptitude tests. All licenses are valid so long as a pilot can pass the periodic physical and eye examinations and tests of flying skills required by the FAA and company regulations.

Other qualifications. Depending on the type of aircraft, new airline pilots start as first officers or flight engineers. Although some airlines favor applicants who already have a flight engineer’s license, they may provide flight engineer training for those who have only the commercial license. Many pilots begin with smaller regional or commuter airlines, where they obtain experience flying passengers on scheduled flights into busy airports in all weather conditions. These jobs often lead to higher paying jobs with bigger, national or major airlines. Newly hired pilots at major airlines typically have about 4,000 hours of flight experience.

Companies other than airlines usually require less flying experience. However, a commercial pilot’s license is a minimum requirement, and employers prefer applicants who have experi-

ence in the type of craft they will be flying. New employees usually start as first officers, or fly less sophisticated equipment.

Advancement. Advancement for pilots usually is limited to other flying jobs. Many pilots start as flight instructors, building up their flying hours while they earn money teaching. As they become more experienced, these pilots occasionally fly charter planes or perhaps get jobs with small air transportation firms, such as air-taxi companies. Some advance to flying corporate planes. A small number get flight engineer jobs with the airlines.

In the airlines, advancement usually depends on seniority provisions of union contracts. After 1 to 5 years, flight engineers advance according to seniority to first officer and, after 5 to 15 years, to captain. Seniority also determines which pilots get the more desirable routes. In a nonairline job, a first officer may advance to captain and, in large companies, to chief pilot or director of aviation in charge of aircraft scheduling, maintenance, and flight procedures.

Employment

Civilian aircraft pilots and flight engineers held about 116,000 jobs in 2008. About 76,800 worked as airline pilots, copilots, and flight engineers. The rest were commercial pilots who worked as flight instructors at local airports or for large businesses that fly company cargo and executives in their own airplanes or helicopters. Some commercial pilots flew small planes for air-taxi companies, usually to or from lightly traveled airports not served by major airlines. Others worked for a variety of businesses, performing tasks such as dusting crops, inspecting pipelines, or conducting sightseeing trips.

Pilots are located across the country, but airline pilots usually are based near major metropolitan airports or airports operating as hubs for the major airlines.

Job Outlook

Aircraft pilots and flight engineers are expected to grow about as fast as the average for all occupations. Regional airlines and low-cost carriers will present the best opportunities; pilots attempting to get jobs at the major airlines will face strong competition.

Employment change. Employment of aircraft pilots and flight engineers is projected to grow 12 percent from 2008 to 2018, which is about as fast as the average for all occupations. Population growth and an expanding economy in the long run are expected to boost the demand for air travel, contributing to job growth. New jobs will be created as airlines expand their capacity to meet this rising demand by increasing the number of planes in operation and the number of flights offered.

Job prospects. Job opportunities are expected to be best for experienced pilots with the regional airlines and low-cost carriers, which are expected to grow faster than the major air-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Aircraft pilots and flight engineers	53-2010	116,000	129,700	13,700	12
Airline pilots, copilots, and flight engineers	53-2011	76,800	83,300	6,400	8
Commercial pilots	53-2012	39,200	46,500	7,300	19

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

lines. Opportunities with air cargo carriers also should arise because of increasing security requirements for shipping freight on passenger airlines, growth in electronic commerce, and increased demand for global freight. Business, commuter, corporate, and on-demand air taxi travel also should provide some new jobs for pilots.

Pilots attempting to get jobs at the major airlines will face strong competition, as those firms tend to attract many more applicants than the number of job openings. Applicants also will have to compete with laid-off pilots for any available jobs. Pilots who have logged the greatest number of flying hours using sophisticated equipment typically have the best prospects. For this reason, military pilots often have an advantage over other applicants.

In addition to job openings arising from employment growth, opportunities will result from the need to replace workers transferring to other occupations or leaving the labor force. Additional openings will result from the mandatory retirement of commercial airline pilots at age 65.

Employment of pilots is sensitive to cyclical swings in the economy. During recessions, when a decline in the demand for air travel forces airlines to ground planes and curtail the number of flights, airlines may temporarily furlough some pilots.

Earnings

Earnings of aircraft pilots and flight engineers vary greatly depending whether they work as airline or commercial pilots. Earnings also depend on factors such as rank, seniority, and the size and type of aircraft flown. For example, pilots who fly jet aircraft usually earn higher salaries than pilots who fly turboprops. Airline pilots and flight engineers may earn extra pay for night and international flights. In May 2008, median annual wages of airline pilots, copilots, and flight engineers were \$111,680. The middle 50 percent earned between \$81,580 and \$150,480.

Median annual wages of commercial pilots were \$65,340 in May 2008. The middle 50 percent earned between \$45,680 and \$89,540. The lowest 10 percent earned less than \$32,020, and the highest 10 percent earned more than \$129,580.

Airline pilots usually are eligible for life and health insurance plans. They also receive retirement benefits and, if they fail the FAA physical examination at some point in their careers, they get disability payments. In addition, pilots receive an expense allowance, or “per diem,” for every hour they are away from

home. Some airlines also provide allowances to pilots for purchasing and cleaning their uniforms. As an additional benefit, pilots and their immediate families usually are entitled to free or reduced-fare transportation on their own and other airlines.

More than half of all aircraft pilots are members of unions. Most of the pilots who fly for the major airlines are members of the Air Line Pilots Association, International, but those employed by one major airline are members of the Allied Pilots Association.

Related Occupations

Although they are not in the cockpit, other occupations that also play an important role in making sure flights are safe and on schedule, and participate in many of the decisions that pilots must make, include:

Motor Vehicle Operators

Bus Drivers

Significant Points

- Opportunities should be good, although applicants for higher paying public transit bus driver positions may encounter competition.
- State and Federal governments establish bus driver qualifications and standards, which include a commercial driver's license.
- Work schedules vary considerably among various types of bus drivers.
- Bus drivers must possess strong customer service skills, including communication skills and the ability to manage large groups of people with varying needs.

Nature of the Work

Bus drivers provide transportation for millions of people, from commuters to school children to vacationers. There are two major kinds of bus drivers. *Transit and intercity bus drivers* transport people within or across States, along routes run within a metropolitan area or county, or on chartered excursions and tours. *School bus drivers* take children to and from schools and school-related activities.

Bus drivers pick up and drop off passengers at bus stops, stations, or—in the case of students—at regularly scheduled neighborhood locations and school, all according to strict time schedules. Drivers must operate vehicles safely, sometimes in heavy traffic. They also cannot let light traffic put them ahead of schedule so that they miss passengers. Bus drivers drive a range of vehicles from 15-passenger buses to 60-foot articulated buses that can carry more than 100 passengers.

Transit and intercity bus drivers can be further divided into those who work for local transportation agencies, those who drive on regularly scheduled intercity routes, and those who op-

Bus drivers must be alert, especially in heavy traffic or in bad weather, to prevent accidents.

erate motor coaches. Both transit and regularly scheduled intercity service drivers begin a day's work at their garage or bus terminal. There, they may stock up on tickets or transfers and prepare trip reports before starting their first scheduled routes. In some transportation firms, maintenance departments are responsible for keeping vehicles in good condition; in others, drivers check their vehicles' tires, brakes, windshield wipers, lights, oil, fuel, and water supplies before beginning their routes. Drivers usually verify that buses have proper safety equipment, such as fire extinguishers, first aid kits, and emergency reflectors.

Local transit and intercity bus drivers collect fares; answer questions about schedules, routes, and transfer points; and sometimes announce stops. Intercity bus drivers may make only one to two stops between distant cities, or they may stop at towns just a few miles apart. Local transit bus drivers usually cover several routes each day over the same city and suburban streets, stopping as frequently as every few blocks or whenever passengers request stops.

Local transit bus drivers submit daily trip reports with a record of trips, significant schedule delays, and mechanical problems. Intercity drivers who drive across State or national boundaries must comply with U.S. Department of Transportation reporting regulations, including vehicle inspection reports, distances traveled and the time they spend driving.

Motor coach operators transport passengers on chartered trips and sightseeing tours. Whereas other bus drivers make predetermined stops on a schedule, these drivers work at the convenience of the groups they transport. Drivers routinely interact with customers and tour guides to make the trip as comfortable and informative as possible. They are directly responsible for making sure tours stay on-time and ensuring the overall success of each trip. These drivers act as customer service representatives, tour guides, program directors, and safety guides. Trips frequently last more than a day, so coach operators may spend extended periods away from home.

School bus drivers usually drive the same routes each day, stopping to pick up pupils in the morning and returning them to their homes in the afternoon. Some school bus drivers also transport students and teachers on field trips or to sporting events. In addition to driving, some school bus drivers work part time in the school system as janitors, mechanics, or classroom assistants, when not driving buses.

Bus drivers must be alert, especially in heavy traffic or in bad weather to prevent accidents, and to avoid sudden stops or swerves that jar passengers. School bus drivers must exercise particular caution when children are getting on or off the bus. They must maintain order on their bus and enforce school safety standards by allowing only students to board. In addition, they must know and enforce the school system's rules regarding student conduct. As the number of students with physical or behavioral disabilities increases, school bus drivers must learn how to accommodate their special needs.

Some school bus drivers can take their bus home or park it in a more convenient area, rather than reporting to an assigned terminal or garage. School bus drivers do not collect fares. In-

stead, they prepare weekly reports on the number of students, trips or “runs,” work hours, miles, and fuel consumption. Their supervisors set time schedules and routes for the day or week.

Work environment. Driving a bus through heavy traffic while dealing with passengers is more stressful and fatiguing than physically strenuous. Many drivers enjoy the opportunity to work without direct supervision, with full responsibility for their bus and passengers. To improve working conditions and retain drivers, many bus lines provide ergonomically designed seats and controls for drivers.

Transit and intercity bus drivers are often at high risk, mainly because they work alone and some passengers may be dangerous. Data from the U.S. Bureau of Labor Statistics show that transit and intercity bus drivers experienced a work-related injury and illness rate that was higher than the national average. School bus drivers, in contrast, have an average rate of non-fatal occupational injuries similar to all other occupations.

About 35 percent of all bus drivers worked part time in 2008. School bus drivers work only when schools are in session. Some work 20 hours a week or less, driving one or two routes in the morning and afternoon. Drivers taking field or athletic trips, or who also have midday kindergarten routes, may work more hours a week.

Regular local transit and intercity bus drivers usually have a 5 or 6 day workweek. They may have to work one or both weekend days on a regular basis. Some drivers work in the early morning, in the evening, or after midnight. To accommodate commuters, many work “split shifts”—for example, 6 a.m. to 10 a.m. and 3 p.m. to 7 p.m., with time off in between. Depending on the length of their routes, intercity bus drivers may spend one or more nights away from home at a time. Others may make a round-trip (or several round-trips) during a single day and come home at the end of each shift.

Motor coach operators may work any day and all hours of the day, including weekends and holidays. Their hours are dictated by the destinations, schedules, and itineraries of chartered tours. Like all commercial drivers, their weekly hours must be consistent with the Department of Transportation’s rules and regulations concerning hours of service and they are required to document their time in a logbook.

Training, Other Qualifications, and Advancement

State and Federal governments establish bus driver qualifications and standards, which include a commercial driver’s license (CDL) with the proper endorsements. Many employers provide several weeks of training and help new employees obtain their CDL.

Education and training. Some employers prefer high school graduates and require a written test of ability to follow complex bus schedules, but the ability to drive and a clean license are usually more important.

Most companies give driver trainees 2 to 8 weeks of classroom and behind-the-wheel instruction. In the classroom, trainees learn Department of Transportation and company work rules, safety regulations, State and municipal driving regulations, and safe driving practices. They also learn to read schedules, determine fares, keep records, and deal courteously with passengers.

During training, all bus drivers practice driving on set courses. They practice turns and zigzag maneuvers, backing up, and driving in narrow lanes. Then, they drive in light traffic and, eventually, on congested highways and city streets. They also make trial runs without passengers to improve their driving skills and learn the routes. Local transit trainees memorize and drive each of the runs operating out of their assigned garage. New drivers make regularly scheduled trips with passengers, accompanied by an experienced driver who gives helpful tips, answers questions, and evaluates the new driver’s performance. Most bus drivers get brief supplemental training periodically to stay informed of safety issues and regulatory changes.

Licensure. All drivers must obtain commercial driver’s licenses (CDL) with the proper endorsements. Qualifications and standards for drivers are established by State and Federal regulations. Bus drivers are responsible for complying with regulations within their own States, as well as those of other States (or countries) where they operate.

To qualify for a commercial driver’s license, applicants must pass a knowledge test on rules and regulations and then demonstrate in a skills test that they can operate a bus safely. The Department of Transportation keeps a national database of all driving violations incurred by CDL holders, and a State may not issue a license to a person who has already had a license suspended or revoked in another State. Drivers may only hold one license at a time, and must surrender all other driver’s licenses upon receiving their new CDLs.

Bus drivers must also have passenger endorsements for their licenses. Transit, intercity, and motor coach operators must have a passenger vehicle (P) endorsement, while school bus drivers must have both a passenger (P) and a school bus (S) endorsement. Both of these endorsements require a passing score on knowledge and skills tests administered by the State licensing agency or partner institution. The knowledge test is a written exam that covers laws of the road, whereas the skills test is administered by a certified examiner in the appropriate commercial vehicle. Information on how to apply for a commercial driver’s license and each type of endorsement can be obtained from State motor vehicle administrations and the Federal Motor Carrier Safety Administration.

Although many States allow those who are 18 years of age and older to drive buses within State borders, the U.S. Department of Transportation establishes minimum qualifications for bus drivers engaged in interstate commerce. Federal Motor Carrier Safety Regulations require drivers to be at least 21 years old and to pass a physical examination once every 2 years. All drivers also must be able to read and speak English well enough to read road signs, prepare reports, and communicate with law enforcement officers and the public.

The main physical requirements include good hearing, at least 20/40 vision with or without glasses or corrective lenses, and a 70-degree field of vision in each eye. Drivers must also be able to distinguish the colors on a traffic light and hear a forced whisper in one ear at not less than 5 feet (with a hearing aid, if necessary). Drivers must have normal blood pressure and normal use of their arms and legs. They may not use any controlled substances, unless prescribed by a licensed physician.

People with epilepsy or with diabetes controlled by insulin are not permitted to be interstate bus drivers.

Federal regulations also require employers to test their drivers for alcohol and drug use as a condition of employment and require periodic random tests of the drivers while they are on duty. In addition, a driver must not have been convicted of a felony involving the use of a motor vehicle or a crime involving drugs, driving under the influence of drugs or alcohol, refusing to submit to an alcohol test required by a State or its implied consent laws or regulations, leaving the scene of a crime, or causing a fatality through negligent operation of a commercial vehicle.

Other qualifications. Many employers prefer applicants who are at least 24 years old. Because bus drivers deal with passengers, they must be courteous. They need an even temperament and emotional stability because driving in heavy, fast-moving, or stop-and-go traffic and dealing with passengers can be stressful. Drivers must have strong customer service skills, including communication skills and the ability to coordinate and manage large groups of people. In some States, school bus drivers must pass a background investigation to uncover any criminal record or history of mental problems.

Advancement. New intercity and local transit drivers usually are placed on an “extra” list to drive chartered runs, extra buses on regular runs, and special runs, such as those during morning and evening rush hours and to sports events. New drivers also substitute for regular drivers who are ill or on vacation. New drivers remain on the extra list and may work only part time, perhaps for several years, until they have enough seniority to get a regular run.

Senior drivers may bid for the runs that they prefer, such as those with more work hours, lighter traffic, weekends off, or—in the case of intercity bus drivers—higher earnings or fewer workdays per week.

Opportunities for promotion are generally limited, but experienced drivers may become supervisors or dispatchers. In transit agencies with rail systems, drivers may become train operators or station attendants. Some bus drivers become either instructors of new bus drivers or master-instructors, who train new instructors. Few drivers become managers. Promotion in publicly owned bus systems is often determined by competitive civil service examination. Some motor coach drivers purchase their own equipment and open their own business.

Employment

Bus drivers held about 647,500 jobs in 2008. Around 70 percent of all bus drivers were school bus drivers working primarily for school systems or for companies providing school bus services under contract. Most of the remainder worked for private and

local government transit systems; some also worked for intercity and charter bus lines.

Job Outlook

Bus drivers should expect average job growth and good employment opportunities. Those seeking higher paying public transit bus driver positions may encounter competition. Individuals who have clean driving records and who are willing to work part-time or irregular schedules will have the best job prospects.

Employment change. Overall employment of bus drivers is expected to grow by 7 percent between 2008 and 2018, which is about as fast as the average for all occupations. This growth will be spread among the various occupational specialties.

Employment growth for local transit and intercity bus drivers is projected to be 8 percent over the 2008-18 decade, about as fast as the average for all occupations, mainly as a result of a changing attitude toward public transit in the U.S. High gas prices in recent years have convinced many people to use public transportation. At the same time, public transportation is seen as an environmentally friendly alternative to driving. As a result, many State and local governments have increased funding for public transportation. This trend is expected to continue, and will lead to incrementally higher employment of transit bus drivers over the course of the projections decade. At the same time, however, inexpensive airline tickets and competition from train services will limit the growth of intercity bus travel.

Employment of school bus drivers is expected to grow by 6 percent over the 2008-18 decade, which is slower than the average for all occupations. The growth that does occur will be in response to an increase in the number of school-age children in the U.S. While enrollment continues to increase, however, growth will be tempered by budget cuts by local school districts, which has led to service reductions and greater emphasis on route efficiency.

Job prospects. People seeking jobs as bus drivers likely will have good opportunities. New jobs will be created, but most job openings are expected because of the need to replace workers who take jobs in other occupations or retire. School bus driving jobs, particularly in rapidly growing suburban areas, should be plentiful because most are part-time positions with high turnover. Those seeking higher paying public transit bus driver positions may encounter competition.

Individuals who have clean driving records and who are willing to work a part-time or irregular schedule probably will have the best job prospects. Opportunities for intercity driving positions should be good, although employment prospects for motor coach drivers will depend on tourism, which fluctuates with the economy.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Bus drivers	53-3020	647,500	691,400	43,900	7
Bus drivers, transit and intercity	53-3021	193,900	209,900	16,000	8
Bus drivers, school.....	53-3022	453,600	481,500	27,900	6

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Full-time bus drivers rarely are laid off during recessions, but competition for jobs increases significantly during periods of high unemployment. The majority of workers in this occupation are employed by local governments and schools. The number of students who need transportation to school does not change during times of economic distress, and mass transit ridership often goes up. However, during recessions, when workers in other industries lose their jobs, many try to become bus drivers, as it is a relatively high-paying job given that it requires so little training. As a result, people who want to become bus drivers during such times may face keen competition for jobs. In contrast, during times when unemployment is low, employers may have difficulty attracting enough people to this occupation.

Earnings

Median hourly wages for wage-and-salary transit and intercity bus drivers were \$16.32 in May 2008. The middle 50 percent earned between \$12.44 and \$21.58 per hour. The lowest 10 percent earned less than \$9.82, and the highest 10 percent earned more than \$26.74 per hour.

Median hourly wages of wage-and-salary school bus drivers were \$12.79 in May 2008. The middle 50 percent earned between \$9.61 and \$15.78 per hour. The lowest 10 percent earned less than \$7.38, and the highest 10 percent earned more than \$19.11 per hour.

Bus drivers generally receive good benefits from their employers. Most intercity and local transit bus drivers receive paid health and life insurance, sick leave, vacation leave, and free bus rides on any of the regular routes of their line or system. School bus drivers receive sick leave, and many are covered by health and life insurance and pension plans. Because they generally do not work when school is not in session, they do not get vacation leave.

About 38 percent of bus drivers were members of unions or were covered by union contracts in 2008. Many intercity and local transit bus drivers are members of the Amalgamated Transit Union or Transport Workers Union of America.

Taxi Drivers and Chauffeurs

Significant Points

- Taxi drivers and chauffeurs may work any schedule, including full time, part time, night, evening, weekend, and on a seasonal basis.
- Very few drivers are paid an hourly wage; most rent their vehicles from a cab fleet, although many own their vehicles.
- Local taxi commissions set licensing standards for driving experience and training.
- Job opportunities should be plentiful.

Nature of the Work

Taxi and limousine services make it easy for customers to get around when driving their own cars or using public transportation is inconvenient. *Taxi drivers* and *chauffeurs* take passengers to and from their homes, workplaces, and recreational pursuits, such as dining, entertainment, and shopping, and to and from business-related events. These professional drivers help both residents and out-of-town guests get around a city or urban area. In addition to regular point-to-point services, some drivers offer sight-seeing services around their cities.

Drivers must be alert to conditions on the road, especially in heavy and congested traffic or in bad weather. They must take precautions to prevent accidents and avoid sudden stops, turns, and other driving maneuvers that would jar passengers.

The majority of people in this occupation work as taxi drivers. Typically, taxi drivers own their vehicles or rent them from a company called a fleet. Drivers who rent their vehicles usually report to a garage where they are assigned a vehicle, most frequently a large, conventional automobile modified for commercial passenger transport. Drivers check their cabs' fuel and oil levels and make sure that the lights, brakes, and windshield wipers are in good working order. If anything is not working properly, the driver who discovers the problem reports it to a dispatcher or company mechanic. Some drivers own their own cabs. Generally, they park at their homes overnight, so they

simply drive to their first pickup when they start working. Like other car owners, they are responsible for their own insurance, maintenance, and for making sure that the car is in good working order.

Taxi drivers usually find fares in one of three ways. Most commonly, they work with dispatch services, which allow customers to call in a request for a cab. Dispatchers relay the information to drivers by two-way radio, cellular telephone, or onboard computer. This is the most common method in smaller cities, late at night, or in low-traffic areas. Drivers may also pick up passengers waiting at cabstands or in taxi lines at airports, train stations, hotels, restaurants, and other places where people frequently seek taxis. In major cities, drivers “cruise” the streets looking for fares, although this is not legal in all jurisdictions.

Good drivers are familiar with streets in the areas they serve so they can choose the most efficient route to destinations and avoid traffic. They know the locations of frequently requested destinations, such as airports, bus and railroad terminals, convention centers, hotels, and other points of interest. In case of emergency, drivers should know the location of fire and police stations, as well as hospitals.

Upon arrival at the final destination, the driver determines the fare and announces it to the passenger. Each jurisdiction has its own regulations that set the structure of the fare system covering licensed taxis. In most areas, a taximeter measures the fare based on the distance covered and the amount of time spent in traffic. Drivers start their meters when passengers enter the cab and turn them off when they reach their final destinations. The fare may also include surcharges, such as base fares, dispatcher fees, or fees for additional passengers, tolls, luggage, or other services. Passengers usually add a tip or gratuity to the fare. The amount of the gratuity depends, in part, on the passengers’ satisfaction with the quality and efficiency of the ride and the courtesy of the driver. Drivers issue receipts upon request. They may also fill out logs for use by their fleets.

Chauffeurs operate limousines, vans, and private cars. They may work for hire, as taxicabs do; or they may work for private businesses, government agencies, or wealthy individuals. Chauffeur services differ from taxi services in that all trips are prearranged. Many chauffeurs transport customers in large vans between hotels and airports, bus terminals, or train stations. Others drive luxury automobiles, such as private cars or limousines.

At the beginning of each workday, chauffeurs prepare their automobiles or vans for use. They inspect their vehicles for cleanliness and, when needed, clean the interior and wash the exterior body, windows, and mirrors. They check fuel and oil levels and make sure the lights, tires, brakes, and windshield wipers work. Chauffeurs may perform routine maintenance and make minor repairs, such as changing tires or adding oil and other fluids. If a vehicle requires a more complicated repair, they take it to a professional mechanic.

Chauffeurs cater to passengers by providing attentive customer service and paying attention to detail. They help riders into the car by holding open doors, holding umbrellas when it is raining, and loading packages and luggage into the trunk of the car. Chauffeurs may perform errands for their employers such as delivering packages or picking up clients arriving at

airports. To ensure a pleasurable ride in their limousines, many chauffeurs offer conveniences and luxuries such as newspapers, magazines, music, drinks, televisions, and telephones. Increasingly, chauffeurs work as full-service executive assistants, simultaneously acting as driver, secretary, and itinerary planner.

Some drivers transport individuals with special needs, such as those with disabilities and the elderly. These drivers, known as *paratransit drivers*, operate specially equipped vehicles designed to accommodate a variety of needs in non-emergency situations. Although special certification is not necessary, some additional training on the equipment and passenger needs may be required.

Work environment. Driving for long periods can be tiring and stressful, especially in densely populated urban areas. Being seated in the same position for most of the day can also be very uncomfortable. Taxi drivers and chauffeurs often have to load and unload heavy luggage and packages. They are also at high risk for robbery, because they work alone and often carry large amounts of cash. Data from the U.S. Bureau of Labor Statistics show that taxi drivers and chauffeurs experienced a work-related injury and illness rate that was much higher than the national average.

Work hours of taxi drivers and chauffeurs vary greatly. Some jobs offer full-time or part-time employment with work hours that can change from day to day or remain the same. It is often necessary for drivers to report to work on short notice. Chauffeurs who work for a single employer may be on call much of the time. Evening and weekend work is common for drivers and chauffeurs employed by limousine and taxicab services.

Whereas the needs of the client or employer dictate the work schedule for chauffeurs, the work of taxi drivers is much less structured. Working free of supervision, they may break for a meal or a rest whenever their vehicle is unoccupied. Many taxi drivers like the independent, unsupervised work of driving.

This occupation is attractive to individuals, such as college and postgraduate students, seeking flexible work schedules and to anyone seeking a second source of income. Other service workers, such as ambulance drivers and police officers, sometimes moonlight as taxi drivers or chauffeurs.

Full-time taxi drivers usually work one shift a day, which may last 8 to 12 hours. Part-time drivers may work half a shift

Job opportunities for taxi drivers and chauffeurs should be plentiful.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Taxi drivers and chauffeurs	53-3041	232,300	268,400	36,100	16

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

each day, or work a full shift once or twice a week. Drivers may work shifts at all times of the day and night, because most taxi companies offer services 24 hours a day. Early morning and late night shifts are not uncommon. Drivers work long hours during holidays, weekends, and other special times when demand for their services is heavier. Independent drivers set their own hours and schedules.

Training, Other Qualifications, and Advancement

Local governments set licensing standards and requirements for taxi drivers and chauffeurs, which may include minimum amounts of driving experience and training.

Education and training. Little formal education is needed for taxi drivers or chauffeurs, but many have at least a high school diploma, GED, or its equivalent. Drivers need to be able to communicate effectively, read maps, and use basic math. A basic understanding of auto mechanics can also be very useful.

Most taxi and limousine companies give new drivers on-the-job training. This training generally only lasts about a week or two, and is required by law in some jurisdictions. Companies show drivers how to operate the taximeter and communications equipment and how to complete paperwork. Other topics covered include driver safety, customer service, and the best routes to popular sightseeing and entertainment destinations.

Many companies have contracts with social service agencies and transportation services to transport elderly and disabled citizens in non-emergency situations. To support these services, new drivers may get special training in how to handle wheelchair lifts and other mechanical devices.

Licensure. Taxicab or limousine drivers must first have a regular automobile driver's license. In many States, applicants must get a taxi driver or chauffeur's license, commonly called a "hack" license. The Federal Motor Carrier Safety Administration requires a commercial driver's license (CDL) with a passenger (P) endorsement for drivers transporting 16 or more passengers (including the driver). While this is not a concern for taxi drivers, some stretch limousines and other such vehicles may be large enough to require a CDL.

While States set licensing requirements, local regulatory bodies set other terms and conditions. Most cities and urban areas have taxi commissions. These commissions set requirements for drivers, license vehicles to be used as cabs, and even set the rates that drivers are allowed to charge. In many cases, these regulations do not affect chauffeurs.

In most areas, taxis must have medallions that certify them as legally recognized cabs. Passengers generally prefer cars with medallions, as they are guaranteed to be law-abiding by local commissions. Drivers who receive too many complaints can lose their medallions, which discourages unethical behavior.

Regulations can vary greatly among localities. Some areas require new drivers to enroll in up to 80 hours of classroom

instruction, to take an exam, or both before they are allowed to work. Some localities require an English proficiency test, usually in the form of listening comprehension; applicants who do not pass the English exam must take an English course, in addition to any formal driving programs.

Other qualifications. Taxi drivers and chauffeurs work almost exclusively with the public, and should be able to get along with many different types of people. They must be patient when waiting for passengers and when dealing with rude customers. It also is helpful for drivers to be tolerant and level-headed when driving in heavy and congested traffic. Drivers should be dependable, since passengers expect to be picked up at a prearranged time and taken to the correct destinations. Drivers must be responsible and self-motivated, because they work with little supervision. Increasingly, companies encourage drivers to develop loyal customers to improve their business.

Many municipalities and taxicab and chauffeur companies require drivers to have a neat appearance. Many chauffeurs wear formal attire, such as tuxedos, suits, dresses, or uniforms.

Advancement. Taxi drivers and chauffeurs have limited advancement opportunities. Experienced drivers may obtain preferred routes or shifts. Some advance to become lead drivers, who help to train new drivers. Others take dispatching and managerial positions. Some drivers become managers at taxi or limousine fleets. Some people start their own taxi or limousine companies.

In many communities, drivers can purchase their own taxis or limousines and go into business for themselves. Independent owner-drivers need an additional permit allowing them to operate as a business. Some big cities limit the number of operating permits, which keeps many owner-drivers out of the market. In these cities, drivers become owner-drivers by buying or renting permits from owner-drivers who leave the business. Although many owner-drivers are successful, some fail to cover expenses and eventually lose their permits and automobiles. Individuals starting their own taxi companies face many obstacles because of the difficulty in running a small fleet. The lack of dispatch and maintenance facilities often is hard for an owner to overcome. Chauffeurs often have a good deal of success as owner-drivers and many companies begin as individually owned and operated businesses.

For both taxi and limousine service owners, good business sense and courses in accounting, business, and business arithmetic can help an owner-driver be successful. Knowledge of mechanics enables owner-drivers to perform their own routine maintenance and minor repairs to cut expenses.

Employment

Taxi drivers and chauffeurs held about 232,300 jobs in 2008. About 26 percent of taxi drivers and chauffeurs were self-employed. Jobs were located throughout the country, but were

concentrated in large cities. Metropolitan areas with the largest employment of taxi drivers and chauffeurs in May 2008 were:

New York-Northern New Jersey-Long Island, NY-NJ-PA.....	16,360
Las Vegas-Paradise, NV	10,160
Los Angeles-Long Beach-Santa Ana, CA.....	7,510
Chicago-Naperville-Joliet, IL-IN-WI	5,300
Boston-Cambridge-Quincy, MA-NH.....	5,040

Job Outlook

Employment of taxi drivers and chauffeurs is expected to grow faster than the average for all occupations. Job opportunities should be plentiful. Applicants with good driving records, good customer service instincts, and the ability to work flexible schedules should have the best prospects.

Employment change. Employment of taxi drivers and chauffeurs is expected to grow 16 percent during the 2008–18 projection period, faster than the average for all occupations. Drivers should see increased business as a result of growth in tourism and business travel. Also, as the number of elderly people increases, taxis will be needed to take them around town. Some growth will stem from Federal legislation requiring increased services for people with disabilities.

Because the demand for taxi and limousine services is very sensitive to economic cycles, drivers may see declining demand for their services during economic downturns. This is especially true for chauffeurs, as expensive limousine services are considered a luxury. Chauffeurs who work for private companies or individuals may face layoffs or reduced hours during times of economic distress.

Job prospects. Opportunities for taxi drivers and chauffeurs are expected to be plentiful, because of the need to replace the many people who work in this occupation for short periods and then leave. Also, the occupation has very low barriers to entry. Because most drivers are paid strictly based on fares, companies take on very little risk when they hire a new driver. Applicants who have clean driving records and who are willing to work flexible schedules should have the best prospects. People who are easy going and make their passengers comfortable will be most likely to succeed, as a significant part of drivers’ salaries come from the tips they receive.

Opportunities fluctuate significantly with the overall movements of the economy, because the demand for transportation depends on business travel and tourism. Because most drivers own or rent their vehicles, taxi drivers are seldom laid off, but they may have to increase their work hours, and earnings may decline. When the economy is strong, many drivers transfer to other occupations, which often leads to fewer cabs on the road. Extra drivers may be hired during holiday seasons, as well as during peak travel and tourist times.

Rapidly growing metropolitan areas and cities experiencing economic growth should offer the best job opportunities.

Earnings

Earnings of taxi drivers and chauffeurs vary greatly, depending on factors such as the number of hours worked, regulatory conditions, customer tips, and geographic location. Hybrid vehicles, which have improved gas mileage, offer taxi drivers better

earnings, because drivers pay for their gas out of pocket. Median annual wages of wage and salary taxi drivers and chauffeurs, including tips, were \$21,550 in May 2008. The middle 50 percent earned between \$17,770 and \$26,800. The lowest 10 percent earned less than \$15,620, and the highest 10 percent earned more than \$34,210.

Many taxi drivers pay a daily, weekly, or monthly fee to the company allowing them to lease their vehicles and depend on fares for their livelihood. The fee also may include charges for vehicle maintenance, insurance, and a deposit on the vehicle. This occupation includes many self-employed drivers. BLS does not have data on earnings for self-employed taxi and limousine drivers.

Most taxi drivers and chauffeurs do not receive benefits. Drivers may wish to purchase private health insurance.

Truck Drivers and Driver/Sales Workers

Significant Points

- Truck drivers and driver/sales workers comprise one of the largest occupations, holding 3.2 million jobs.
- Overall job opportunities should be favorable, especially for long-haul drivers.
- A commercial driver’s license is the most important qualification for most jobs.

Nature of the Work

Almost every product sold in the United States spends at least some time in a truck. While planes, trains, and ships are also used to transport goods, no other form of transportation has the same level of flexibility as a truck. As a result, trucks are used to transport everything from canned food to automobiles. *Truck drivers* and *driver/sales workers* operate these vehicles.

Drivers are responsible for picking up and delivering freight from one place to another. This may be from a manufacturer to a distribution center, from a distribution center to a customer, or between distribution centers. In addition, drivers may be responsible for loading and unloading their cargo. They are also responsible for following applicable laws, keeping logs of their activities, and making sure that their equipment is in good working condition.

Heavy truck and tractor-trailer drivers operate trucks or vans with a capacity of at least 26,001 pounds gross vehicle weight (GVW). The vast majority of these are *over-the-road* or *long-haul drivers*, meaning they deliver goods over intercity routes that may span several States. Some drivers have regular routes or regions where they drive the most, while others take on routes throughout the country or even to Canada and Mexico.

Long-haul drivers are often responsible for planning their own routes. In most cases, operators are given a delivery location and deadline, and they must determine how to get the shipment to its destination on time. This can be difficult, as drivers must find routes that allow large trucks, and must work within the rules imposed by the U.S. Department of Transportation. Drivers must fill out logs to show that they have followed these rules, which mandate maximum driving times and rest periods between shifts. Companies sometimes use two drivers on long runs to minimize downtime. On these “sleeper” runs, one driver sleeps in a berth behind the cab while the other operates the truck.

Light or delivery services truck drivers, often called *pick-up and delivery* or *P&D drivers* deliver goods within an urban area or small region. In most cases, they carry shipments from distribution centers to businesses or households. Drivers who work for package delivery services may have a single load and make many stops over the course of the day, while other drivers might have several loads in the course of a day. Depending on the load, drivers may have helpers who load and unload their vehicles. When making deliveries, they may accept payments for cash-on-delivery shipments, or handle paperwork, such as delivery confirmations and receipts.

Specialized truck drivers work with unusual loads. While most trucks carry freight loads in semi-trailers or vans, some carry liquids, oversized loads, or cars. Others carry hazardous materials, such as dangerous chemicals needed for industrial purposes, or waste from chemical processes that must be stored in approved facilities. Drivers who work with these types of loads must follow strict procedures to make sure their loads are delivered safely.

Some drivers, called *driver/sales workers* or *route drivers*, have sales responsibilities. For example, many driver/sales workers deliver and arrange goods to be sold in grocery stores. They may recommend that a store increase their inventory or encourage store managers to sell new products. Companies that

Heavy truck and tractor-trailer drivers are often responsible for planning their own routes to their shipment destinations.

rent linens, towels, or uniforms employ driver/sales workers to visit businesses regularly to replace soiled laundry. Driver/sales workers may also be responsible for soliciting new customers along their routes.

Work environment. Despite new technologies such as power steering, driving a truck is still a physically demanding job. Driving for many hours at a stretch, loading and unloading cargo, and making many deliveries can be tiring. Making the decision to work as a long-haul driver is a major lifestyle choice—drivers may be away from home for days or weeks at a time, and they often spend a great deal of time alone. Local truck drivers usually return home in the evening.

The U.S. Department of Transportation regulates work hours and other working conditions of truck drivers engaged in interstate commerce. A long-distance driver may drive for no more than 11 hours per day, and work a total of no more than 14 hours—including driving and non-driving duties. Between working periods, a driver must have at least 10 hours off duty. Drivers also cannot work more than 60 hours in a week without being off-duty for at least 34 hours straight. Drivers are required to document their time in a log, which shows working hours and mileage by day. Many drivers, particularly on long runs, work close to the maximum time permitted because they are usually compensated according to the number of miles they drive. Drivers on long runs face boredom, loneliness, and fatigue. Drivers often travel nights, holidays, and weekends.

Local truck drivers frequently work 50 or more hours a week. Drivers who handle food for chain grocery stores, produce markets, or bakeries typically work long hours—often late at night or early in the morning. Most drivers have regular routes, although some have different routes each day. Many local truck drivers—particularly driver/sales workers—do a considerable amount of lifting, carrying, and walking.

Training, Other Qualifications, and Advancement

Drivers who operate trucks with a gross vehicle weight of 26,001 pounds, or who operate a vehicle carrying hazardous materials or oversized loads, need a commercial driver's license (CDL). Training for the CDL is offered by many private and public vocational-technical schools. A standard driver's license is required to drive all other trucks. Many jobs driving smaller trucks require only brief on-the-job training.

Education and training. Most prospective truck drivers take driver-training courses at a technical or vocational school to prepare for CDL testing. Driver-training courses teach students how to maneuver large vehicles on crowded streets and in highway traffic. These courses also train drivers how to properly inspect trucks and freight for compliance with regulations.

Some States require prospective drivers to complete a training course in basic truck driving before getting their CDL. Some companies have similar requirements. People interested in attending a driving school should check with local trucking companies to make sure the school's training is acceptable. The Professional Truck Driver Institute (PTDI) certifies driver-training courses at truck driver training schools that meet industry standards and Federal Highway Administration guidelines for training tractor-trailer drivers.

Employers usually have training programs for new drivers who have already earned their CDL. This is often informal and may consist of only a few hours of instruction from an experienced driver. Some companies give 1 to 2 days of classroom instruction covering general duties, the operation and loading of a truck, company policies, and the preparation of delivery forms and company records. New drivers may also ride with and observe experienced drivers before getting their own assignments. Drivers receive additional training to drive special types of trucks or handle hazardous materials. Driver/sales workers receive training on the various types of products their company carries so that they can effectively answer questions about the products and more easily market them to their customers.

Licensure. Federal and State regulations govern the qualifications and standards for truck drivers. Drivers must comply with all Federal regulations and any State regulations that are in excess of those Federal requirements when under that State's jurisdiction.

Truck drivers must have a driver's license issued by the State in which they live. Drivers of trucks with a GVW of 26,001 pounds or more—including most tractor-trailers, as well as bigger straight trucks—must obtain a CDL. All drivers who operate trucks transporting hazardous materials or oversized loads must obtain a CDL and a special endorsement, regardless of truck capacity. In order to receive the hazardous materials endorsement, a driver must be fingerprinted and submit to a criminal background check by the Transportation Security Administration. In many States, a regular driver's license is sufficient for driving light trucks and vans.

To qualify for a CDL, applicants must have clean driving records, pass written tests on rules and regulations, and demonstrate that they can operate commercial trucks safely. A national database permanently records all driving violations committed by those with a CDL, and issuing authorities reject applicants who have suspended or revoked licenses in other States. Li-

censed drivers must accompany trainees until they get their own CDLs. A person may not hold more than one driver's license at a time and must surrender any other licenses when issued a CDL. Information on how to apply for a CDL may be obtained from State motor vehicle administrations.

Although many States allow 18 year-olds to drive trucks within their borders, a driver must be at least 21 years of age to cross State lines or get special endorsements. Regulations also require drivers to pass a physical examination every 2 years. Physical qualifications include good hearing, at least 20/40 vision with glasses or corrective lenses, and a 70-degree field of vision in each eye. They must also be able to distinguish between colors on traffic lights. Drivers must also have normal use of arms and legs and normal blood pressure. People with epilepsy or diabetes controlled by insulin are not permitted to be interstate truck drivers.

Other qualifications. Federal regulations require employers to test their drivers for alcohol and drug use as a condition of employment and require periodic random tests of the drivers while they are on duty. Drivers may not use any controlled substances, unless prescribed by a licensed physician. A driver must not have been convicted of a felony involving the use of a motor vehicle or a crime involving drugs, driving under the influence of drugs or alcohol, refusing to submit to an alcohol test required by a State or its implied consent laws or regulations, leaving the scene of a crime, or causing a fatality through negligent operation of a motor vehicle. All drivers must be able to read and speak English well enough to read road signs, prepare reports, and communicate with law enforcement officers and the public.

Many trucking companies have higher standards than those required by Federal and State regulations. For example, firms often require that drivers be at least 22 years old, be able to lift heavy objects, and have driven trucks for 3 to 5 years. They may also prefer to hire high school graduates and require annual physical examinations.

Drivers must get along well with people because they often deal directly with customers. Employers seek driver/sales workers who speak well and have self-confidence, initiative, tact, and a neat appearance. Employers also look for responsible, self-motivated individuals who are able to work well with little supervision.

Advancement. Although most new truck drivers are assigned to regular driving jobs immediately, some start as extra drivers—substituting for regular drivers who are ill or on vacation. Extra drivers receive a regular assignment when an opening occurs.

Truck drivers can advance to jobs that provide higher earnings, preferred schedules, or better working conditions. Long-haul truck drivers primarily look for new contracts that offer better pay per mile or higher bonuses. Because companies entrust drivers with millions of dollars worth of equipment and freight, drivers who have a long record of safe driving earn far more than new drivers. Local truck drivers may advance to driving heavy or specialized trucks or transfer to long-distance truck driving. Truck drivers occasionally advance to become dispatchers or managers.

Some long-haul truck drivers—called owner-operators—purchase or lease trucks and go into business for themselves.

Although some are successful, others fail to cover expenses and go out of business. Owner-operators should have good business sense as well as truck driving experience. Courses in accounting, business, and business mathematics are helpful. Knowledge of truck mechanics can enable owner-operators to perform their own routine maintenance and minor repairs.

Employment

Truck drivers and driver/sales workers held about 3.2 million jobs in 2008. Of these workers, 56 percent were heavy truck and tractor-trailer drivers; 31 percent were light or delivery services truck drivers; and 13 percent were driver/sales workers. Most truck drivers find employment in large metropolitan areas or along major interstate roadways where trucking, retail, and wholesale companies tend to have their distribution outlets. Some drivers work in rural areas, providing specialized services such as delivering newspapers to customers.

The truck transportation industry employed 27 percent of all truck drivers and driver/sales workers in the United States. Another 26 percent worked for companies engaged in wholesale or retail trade. The remaining truck drivers and driver/sales workers were distributed across many industries, including construction and manufacturing.

Around 8 percent of all truck drivers and driver/sales workers were self-employed. Of these, a significant number were owner-operators who either served a variety of businesses independently or leased their services and trucks to a trucking company.

Job Outlook

Overall job opportunities should be favorable for truck drivers, especially for long-haul drivers. However, opportunities may vary greatly in terms of earnings, weekly work hours, number of nights spent on the road, and quality of equipment. Competition is expected for jobs offering the highest earnings or most favorable work schedules. Average employment growth is expected.

Employment change. Overall employment of truck drivers and driver/sales workers is expected to grow 9 percent over the 2008-18 decade, which is about as fast as the average for all occupations. As the economy grows, the demand for goods will increase, which will lead to more job opportunities. Because it is such a large occupation, 291,900 new jobs will be created over the 2008-18 period.

The number of heavy and tractor-trailer truck drivers is expected to grow 13 percent between 2008 and 2018, which is about as fast as average, mainly as a result of increasing demand for goods in the U.S. As the economy continues to grow, companies and households will continue to increase their spending

on these products, many of which must be shipped over long distances.

Employment of light or delivery services truck drivers should grow 4 percent over the projections decade, which is more slowly than average. Though experiencing slower growth than heavy trucking, light and delivery trucking will similarly be closely tied to the state of the economy. As economic growth occurs, there will be an increasing need for light trucking services, from the distribution of goods from warehouses to the package delivery to households. The number of driver/sales workers is also expected to grow 4 percent between 2008 and 2018, more slowly than average, for the same basic reasons.

Job prospects. Job opportunities should be favorable for truck drivers, especially for long-haul drivers. In addition to occupational growth, numerous job openings will occur as experienced drivers leave this large occupation to transfer to other fields of work, retire, or leave the labor force. As workers leave these jobs, employers work hard to recruit experienced drivers from other companies. As a result, there may be competition for the jobs with the highest earnings and most favorable work schedules. Jobs with local carriers are often more competitive than those with long-distance carriers because of the more desirable working conditions of local carriers.

Despite projected employment growth, the demand for workers may vary greatly depending on the performance of the American economy. During times of expansion, companies may be forced to pay premiums to attract drivers, while during recessions even experienced drivers may find difficulty keeping steady work. Independent owner-operators will be particularly vulnerable to slowdowns. Industries least likely to be affected by economic fluctuation, such as grocery stores, will be the most stable employers of truck drivers and driver/sales workers.

Earnings

Median hourly wages of heavy truck and tractor-trailer drivers were \$17.92 in May 2008. The middle 50 percent earned between \$14.21 and \$22.56. The lowest 10 percent earned less than \$11.63, and the highest 10 percent earned more than \$27.07.

Median hourly wages of light or delivery services truck drivers were \$13.27 in May 2008. The middle 50 percent earned between \$10.07 and \$17.74. The lowest 10 percent earned less than \$8.10, and the highest 10 percent earned more than \$24.15.

Median hourly wages of driver/sales workers, including commissions, were \$10.70 in May 2008. The middle 50 percent earned between \$7.74 and \$15.82. The lowest 10 percent earned less than \$7.09, and the highest 10 percent earned more than \$21.32.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Driver/sales workers and truck drivers.....	53-3030	3,189,300	3,481,200	291,900	9
Driver/sales workers.....	53-3031	406,400	424,100	17,700	4
Truck drivers, heavy and tractor-trailer.....	53-3032	1,798,400	2,031,300	232,900	13
Truck drivers, light or delivery services.....	53-3033	984,500	1,025,900	41,400	4

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Employers typically pay long-haul drivers by the mile, with bonus opportunities available for drivers who save the company money. Local truck drivers tend to be paid by the hour, with extra pay for working overtime. The per-mile rate can vary greatly from employer to employer and may even depend on the type of cargo being hauled. Some long-distance drivers—especially owner-operators—are paid a share of the revenue from shipping. Typically, pay increases with experience, seniority, and the size and type of truck driven. Most driver/sales workers receive commissions based on their sales in addition to their wages.

Many truck drivers are members of the International Brotherhood of Teamsters. Some truck drivers employed by companies outside the trucking industry are members of unions representing the plant workers of the companies for which they work. In 2008, about 16 percent of truck drivers and driver/sales workers were union members or covered by union contracts.

Rail Transportation Occupations

Significant Points

- Opportunities are expected to be good for qualified applicants since a large number of workers are expected to retire or leave these occupations from 2008 to 2018.
- 76 percent of these workers are members of unions, and earnings are relatively high.

Nature of the Work

Rail transportation workers are employed by three types of railroads: freight, passenger, and urban transit (subway and light rail). Freight railroads transport billions of tons of goods to destinations within the United States and to ports to be shipped abroad. Passenger railroads deliver millions of passengers and long-distance commuters to destinations throughout the country. Subways and light-rail systems move passengers within metropolitan areas and their surrounding suburbs. All of these modes of rail transportation require employees to operate, oversee, and assist in rail operations. Rail transportation workers not

only work on trains, but also can be found working in rail yards where railcars are inspected, repaired, coupled, and uncoupled.

Locomotive engineers operate large trains carrying cargo or passengers between stations. Most engineers run diesel-electric locomotives, although a few operate locomotives powered by battery or externally supplied electricity. Before each run, engineers check the mechanical condition of their locomotives, making any necessary minor adjustments and documenting issues that require more thorough inspection. While trains are in motion, engineers move controls such as throttles and airbrakes. They also monitor instruments that measure speed, amperage, battery charge, and air pressure, both in the brake lines and in the main reservoir. Engineers must have thorough knowledge of their routes and must be constantly aware of the condition and makeup of their train, because trains react differently to the grade and condition of the rail, the number of cars, the ratio of empty cars to loaded cars, and the amount of slack in the train.

Railroad conductors coordinate all activities of freight or passenger train crews. Conductors assigned to freight trains review schedules, switching orders, waybills, and shipping records to obtain loading and unloading information regarding their cargo.

In addition, they are responsible for the distribution of tonnage in the train and the operation of freight cars within rail yards and terminals that use remote control locomotive technology. Conductors assigned to passenger trains also ensure passenger safety and comfort as they go about collecting tickets and fares, making announcements for the benefit of passengers, and coordinating the activities of the crew.

Before trains leave a terminal, the conductor and the engineer discuss any concerns regarding the train's route, timetable, and cargo. During runs and in rail yards, engineers and conductors interface with traffic-control-center personnel, dispatchers, and personnel on other trains to issue or receive information concerning stops, delays, and the locations of trains. While engineers interpret and comply with orders, signals, speed limits, and railroad rules and regulations, conductors use dispatch or electronic monitoring devices to relay information about equipment problems on the train or the rails. Conductors may arrange for the removal of defective cars from the train for repairs at the nearest station or stop, and discuss alternative routes with the engineer and dispatcher if there is a defect in, or obstruction on, the rails.

Railroad brake operators assist with the coupling and uncoupling of cars and operate some switches. In an effort to reduce costs, most railroads have phased out brake operators, and many trains use only an engineer and a conductor. *Signal operators* install, maintain, and repair the signals on tracks and in yards.

Yardmasters, where present, coordinate the activities of workers engaged in railroad yard operations. These activities, which are also performed by conductors, include making up or breaking up trains and switching inbound or outbound traffic to a specific section of the line. Some cars are sent to unload their cargo on special tracks, while others are moved to different tracks to await assembly into new trains on the basis of their destinations. Yardmasters tell yard engineers or other personnel where to move the cars to fit the planned train configuration. Switches—many of them operated remotely by computer—divert trains or railcars to the proper track for coupling and uncoupling.

Also included in rail transportation occupations are several less prevalent occupations. *Switch operators* control the track switches within a rail yard. In rail yards without remote control technology, *rail yard engineers* operate engines within the rail yard. Similarly, *hostlers* operate engines—without attached cars—within the yard, and drive them to and from maintenance shops.

In contrast to other rail transportation workers, subway and streetcar operators generally work for public transit authorities instead of railroads. *Subway operators* control trains that transport passengers through cities and their suburbs. The trains run in underground tunnels, on the surface, or on elevated tracks. Operators must stay alert to observe signals along the track that indicate when they must start, slow, or stop their trains. They also make announcements to riders, may open and close the doors of the train, and ensure that passengers get on and off the subway safely. Increasingly, the train's speed and the amount of time spent at each station are controlled by computers and not by the operator. During breakdowns or emergencies, operators contact their dispatcher or supervisor and may have to evacuate cars.

Streetcar operators drive electric-powered streetcars, trolleys, or light-rail vehicles that transport passengers around metropolitan areas. Some tracks may be built directly into street

Many rail transportation employees work more than 40 hours per week, although minimum rest hours are mandated by Federal regulations.

pavement or have grade crossings, so operators must observe traffic signals and cope with car and truck traffic. Operators start, slow, and stop their cars so that passengers may get on and off easily. Operators may collect fares and issue change and transfers. They also interact with passengers who have questions about fares, schedules, or routes.

Work environment. Rail transportation employees work nights, weekends, and holidays to operate trains that run 24 hours a day, 7 days a week. Many work more than 40 hours per week, although minimum rest hours are mandated by Federal regulations. Engineers and conductors may be placed on an “extra board” on which workers receive assignments only when a railroad needs substitutes for workers who are absent because of vacation, illness, or other reasons. Seniority usually dictates who receives the more desirable shifts, as do union agreements at large unionized railroads. Working conditions also vary by the mode of rail transport.

Freight trains generally are dispatched according to the needs of customers. As a result, train crews may have irregular schedules. It is common for workers to place their name on a list and wait for their turn to work. Jobs usually are assigned on short notice and often at odd hours. Working weekends is common in freight train transportation. Those who work on trains operating between

Projections data from the National Employment Matrix

Rail transportation workers, all other.....	53-4099	4,800	5,000	200	4

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

points hundreds of miles apart may spend consecutive nights away from home. Because of the distances involved on some routes, many railroad employees work without direct supervision.

Workers on passenger trains ordinarily have regular and reliable shifts. Also, the appearance, temperature, and accommodations of passenger trains are more comfortable than those of freight trains.

Rail yard workers spend most of their time outdoors and work regardless of weather conditions. These workers climb up and down equipment, which can be strenuous and can also be dangerous if safety rules are not followed. The work of conductors and engineers on local runs, on which trains frequently stop at stations or local rail yards to pick up and deliver cars, is also physically demanding.

Training, Other Qualifications, and Advancement

Rail transportation workers start out in a variety of positions as they gain the experience needed for more demanding assignments. Rail transportation workers generally must begin training to become a conductor before they may be considered for an engineer position; engineer positions also require Federal licensure. Nearly all rail transportation workers complete formal classroom and hands-on training before beginning work. Most applicants must pass a drug screening, background check, and physical examination before being hired.

Education and training. Railroads require that applicants have a minimum of a high school diploma or equivalent, and most training is done through a company’s formal training program and on-the-job training. Rail yard jobs usually require the successful completion of a company training program before workers are allowed to begin. For brake and signal operator jobs, railroad firms train applicants either in a company program or—especially with smaller railroads—at an outside training facility. Typical training programs combine classroom and on-site training lasting from a few weeks to a few months. Entry-level conductors are either trained by their employers or are required to complete a formal conductor training program through a community college.

Most transit systems that operate subways and streetcars also operate buses. In these systems, subway and streetcar operators usually gain experience by first driving buses. New operators then complete training programs that last from a few weeks to 6 months. After finishing classroom and on-the-job training, operators usually must pass qualifying examinations covering the operating system, troubleshooting, and evacuation and emergency procedures.

Licensure. Locomotive engineers must be federally licensed to operate freight and passenger trains. Federal regulations require beginning engineers to complete a formal engineer train-

ing program, including classroom, simulator, and hands-on instruction in locomotive operation. At the end of the training period, candidates must pass a hearing and visual acuity test, a safety conduct background check, a railroad operation knowledge test, and a skills performance test before receiving an engineer’s license. Engineers must periodically pass an operational rules efficiency test to maintain their licensure. The test is an unannounced event requiring engineers to take active or responsive action in certain situations, such as maintaining a particular speed through a curve or yard or complying with a signal.

Because of recent legislation, conductors will soon be subject to Federal licensing requirements similar to those of railroad engineers. For yard occupations, a commercial driver’s license may be required because these workers often operate trucks and other heavy vehicles.

Other qualifications. Rail transportation workers must have good hearing, eyesight, and color vision, as well as good hand-eye coordination, manual dexterity, and mechanical aptitude. Physical stamina is required for most rail transportation jobs. Applicants for locomotive engineer jobs and some conductor jobs must be at least 21 years old.

All applicants must have good communication skills and be able to make quick, responsible judgments. Employers require railroad transportation job applicants to pass a physical examination, drug and alcohol screening, and a criminal background check. Under Federal regulation, all people licensed to operate engines are subject to random drug and alcohol testing while on duty; engineers also must undergo periodic physical examinations.

Advancement. Most railroad transportation workers begin as laborers, brake operators, or conductors after completing training on signals, timetables, operating rules, and related subjects. Although new employees may be hired as conductors, seniority determines whether an employee may hold a conductor position full time. Employers almost always fill engineer positions with workers who have experience in other railroad-operating occupations. Subway and streetcar operators with sufficient seniority can advance to station manager or another supervisory position.

Employment

Rail transportation workers held 130,500 jobs in 2008. Employment was distributed as follows:

Locomotive engineers and operators.....	51,100
Railroad conductors and yardmasters	41,300
Railroad brake, signal, and switch operators	25,600
Subway and streetcar operators.....	7,700
Rail transportation workers, all other.....	4,800

Most rail transportation workers were employed in the rail transportation industry or in support activities for the industry. Rail transportation and rail transportation support activities made up 87 percent jobs in 2008. The rest worked primarily for local governments that operate subway or streetcar systems.

Job Outlook

Employment in most railroad transportation occupations is expected to grow about as fast as average through the year 2018. Opportunities are expected to be good for qualified applicants, in large part because of the number of workers expected to retire or leave these occupations through 2018.

Employment change. Employment is expected to increase by 9 percent from 2008 through 2018, which is about as fast as the average for all occupations. This will largely be the result of expected increases in the demand for freight and passenger rail transportation as fuel costs increase and rail becomes a cheaper alternative to trucks and automobiles. Despite the slowdown in the economy, in the long term freight transportation should continue to expand as global trade expands and rail freight benefits from the shipment of more goods. However, advances such as remote control locomotive technology, discussed previously, and positive train control technology, which allows for the electronic monitoring of mechanical difficulties and track problems, will allow railroads to improve productivity and consolidate duties. To some extent, this will offset the need for new employees in occupations not essential for railroad operations.

Although demand for passenger rail service is anticipated to increase with the growing population, as is demand for public transit authorities, employment growth for workers in passenger rail will be slow because the addition of new service will be limited by the lack of track, which is not expected to increase by any great extent over the 2008–18 period. Employment of subway and streetcar operators is expected to increase modestly because more commuter and light-rail transportation systems are being proposed around the country.

A law recently passed by the U.S. Congress may have a positive impact on employment in rail transportation occupations. The Rail Safety Improvement Act of 2008 increases the number of hours that train crews must rest between shifts. It also requires more safety improvements to railroad crossings. This law may generate more jobs for engineers and conductors as well as signal operators.

Job prospects. Opportunities for rail transportation workers will be good for workers who meet basic qualifications, because a large number of older workers are expected to retire over the next decade, particularly at freight railroads. Prospects will be best for those positions that are also expected to see growth, like locomotive engineers and conductors.

Entry-level occupations such as brake operator and conductor should be plentiful for applicants with clean drug and criminal records. Opportunities for long-distance train crews are also expected to be good because many of those working in the yards prefer not to travel long distances. Subway and streetcar operators will have the best opportunities in cities where the construction of commuter or light-rail transit systems is underway.

Earnings

Median hourly wages of rail transportation occupations in May 2008 are indicated in the tabulation below. These wages were relatively high compared with \$13.14 per hour, the median wage for all transportation occupations.

Subway and streetcar operators.....	\$25.59
Railroad conductors and yardmasters	25.40
Railroad brake, signal, and switch operators	22.94
Locomotive engineers and operators.....	22.54
Rail transportation workers, all other.....	21.12

Most railroad transportation workers are paid according to miles traveled or hours worked, whichever leads to higher earnings. Factors such as seniority, job assignments, and location affect potential earnings.

76 percent of railroad transportation workers are members of unions, compared with 12 percent for all occupations. There are many different railroad unions, and they represent various crafts on the railroads. Among the largest of the railroad employee unions are the United Transportation Union and the Brotherhood of Locomotive Engineers and Trainmen. Many subway operators are members of the Amalgamated Transit Union, while others belong to the Transport Workers Union of North America.

Water Transportation Occupations

Significant Points

- Some merchant mariners spend extended periods at sea; others operate boats close to port and go home at night.
- Entry, training, and educational requirements for many water transportation occupations are established and regulated by the U.S. Coast Guard.
- Excellent job opportunities are expected, especially for marine officers.

Nature of the Work

The movement of huge amounts of cargo, as well as passengers, in and out of U.S. waters and sometimes over the oceans depends on workers in water transportation occupations, also known as *merchant mariners*. They operate and maintain civilian-owned deep-sea merchant ships, tugboats, towboats, ferries, barges, offshore supply vessels, cruise ships, and other waterborne craft on the oceans, the Great Lakes, rivers, canals, and other waterways, as well as in harbors. (Workers who operate watercraft used in commercial fishing are described in the section on fishers and fishing vessel operators elsewhere in the *Handbook*.)

Captains, mates, and pilots of water vessels operating on domestic waterways or on U.S.-flagged deep sea ships command or supervise the operations of these ships and water vessels. *Captains or masters* are in overall command of the operation of a vessel, and they supervise the work of all other officers and crew. Together with their department heads, captains ensure that proper procedures and safety practices are followed, check to make sure that machinery and equipment are in good working order, and oversee the loading and discharging of cargo or passengers. They also maintain logs and other records tracking the ships' movements, efforts at controlling pollution, and cargo and passengers carried.

Deck officers or mates direct the routine operation of the vessel for the captain during the shifts when they are on watch. On smaller vessels, there may be only one mate (called a *pilot* on some inland towing vessels), who alternates watches with the captain. The mate would assume command of the ship if the captain became incapacitated. When more than one mate is necessary aboard a ship, they typically are designated chief mate or first mate, second mate, third mate, etc. Mates also supervise and coordinate activities of the crew aboard the ship.

Captains and mates determine the course and speed of the vessel, maneuvering to avoid hazards and continuously monitoring the vessel's position with charts and navigational aides. Captains and mates oversee crew members who steer the vessel, determine its location, operate engines, communicate with other vessels, perform maintenance, handle lines, and operate equipment on the vessel. They inspect the cargo holds during loading to ensure that the load is stowed according to specifications and regulations. Captains and mates also supervise crew members engaged in maintenance and the primary upkeep of the vessel.

Pilots guide ships in and out of harbors, through straits, and on rivers and other confined waterways where a familiarity with local water depths, winds, tides, currents, and hazards such as reefs and shoals are of prime importance. Pilots on river and canal vessels usually are regular crew members, like mates. Harbor pilots are generally independent contractors who accompany vessels while they enter or leave port. *Harbor pilots* may pilot many ships in a single day.

Ship engineers operate, maintain, and repair propulsion engines, boilers, generators, pumps, and other machinery. Merchant marine vessels usually have four engineering officers: A chief engineer and a first, second, and third assistant engineer. Assistant engineers stand periodic watches, overseeing the safe operation of engines and machinery.

Work schedules for water transportation workers vary based upon the type of ship and length of voyage.

Marine oilers and more experienced *qualified members of the engine department*, or QMEDs, assist the engineers to maintain the vessel in proper running order in the engine spaces below decks. These workers lubricate gears, shafts, bearings, and other moving parts of engines and motors; read pressure and temperature gauges; record data; and sometimes assist with repairs and adjust machinery.

Sailors or deckhands operate the vessel and its deck equipment under the direction of the ship's officers and keep the non-engineering areas in good condition. They stand watch, looking out for other vessels and obstructions in the ship's path, as well as for navigational aids such as buoys and lighthouses. They also steer the ship, measure water depth in shallow water, and maintain and operate deck equipment such as lifeboats, anchors, and cargo-handling gear. When docking or departing, they handle lines. They also perform routine maintenance chores, such as repairing lines, chipping rust, and painting and cleaning decks or other areas. On vessels handling liquid cargo, mariners designated as *pumpmen* hook up hoses, operate pumps, and clean tanks; on tugboats or tow vessels, they tie barges together into tow units, inspect them periodically, and disconnect them when the destination is reached. Experienced sailors are designated *able seamen* on oceangoing vessels, but may be called simply deckhands on inland waters; larger vessels usually have a *boatswain*, or *head seaman*.

A typical deep-sea merchant ship has a captain, three deck officers or mates, a chief engineer and three assistant engineers, plus six or more seamen, such as able seamen, oilers, QMEDs, and a cook. The size and service of the ship determine the number of crewmembers for a particular voyage. Small vessels operating in harbors, on rivers, or along the coast may have a crew comprising only a captain and one deckhand. On smaller vessels the cooking responsibilities usually fall under the deckhands' duties.

On larger coastal ships, the crew may include a captain, a mate or pilot, an engineer, and seven or eight seamen. Unlicensed positions on a large ship may include a full-time cook, an electrician, and machinery mechanics. Some ships may have special unlicensed positions for entry-level apprentice trainees.

Motorboat operators operate small, motor-driven boats that carry six or fewer passengers. They may operate fishing charters, serve as liaisons between ships or between ship and shore, or perform area patrol.

Work environment. Water transportation workers' schedules vary based upon the type of ship and length of voyage. While on the water, crews are normally on duty for half of the day, 7 days a week.

Merchant mariners on survey and long distance cargo vessels can spend extended periods at sea. Most deep-sea mariners are hired for one or more voyages that last for several months; there is no job security after that. The length of time between voyages varies depending on job availability and personal preference.

Workers on supply vessels transport workers, supplies (water, drilling mud, fuel, and food), and equipment to oil and gas drilling platforms mostly in the Gulf of Mexico. Their voyages can last a few hours to a couple of weeks. As oil and gas exploration pushes into deeper waters, these trips take more time.

Workers on tugs and barges operate on the rivers, lakes, inland waterways, and along the coast. Most tugs have two crews

and operate constantly. The crews will alternate, each working for 2-3 weeks and then taking 2-3 weeks off.

Many of those employed on Great Lakes ships work 60 days and have 30 days off, but do not work in the winter when the lakes are frozen. Others work steadily for a week or a month and then have an extended period off. Those on smaller vessels, such as tugs, supply boats and Great Lakes ships, are normally assigned to one vessel and have steady employment.

Workers on ferries transporting commuters work on week-days in the morning and evening. Other ferries make frequent trips lasting a few hours. Ferries servicing vacation destinations often operate on seasonal schedules. Workers in harbors generally have year-round work. Work in harbors and on ferries is highly sought after because workers return home every day.

People holding water transportation jobs work in all kinds of weather, except when frozen waters make travel impossible. Although merchant mariners try to avoid severe storms while at sea, working in damp and cold conditions often is inevitable. While it is uncommon for vessels to suffer disasters such as fire, explosion, or sinking, workers face the possibility that they may have to abandon their craft on short notice if it collides with another vessel or runs aground. They also risk injury or death from falling overboard and hazards associated with working with machinery, heavy loads, and dangerous cargo. However, modern safety management procedures, advanced emergency communications, and effective international rescue systems have greatly improved mariner safety.

Many companies are working to improve the living conditions on vessels to reduce employee turnover. Most of the Nation's newest vessels are air conditioned, soundproofed to reduce machinery noise, and equipped with comfortable living quarters. Some companies have added improved entertainment systems and hired full-time cooks. These amenities lessen the difficulty of spending long periods away from home. Advances in communications, particularly e-mail, better link mariners to their families. Nevertheless, some mariners dislike the long periods away from home and the confinement aboard ship and consequently leave the occupation.

Training, Other Qualifications, and Advancement

Entry, training, and experience requirements for many water transportation occupations are established and regulated by the U.S. Coast Guard. As of April 15, 2009, mariners on board most ships have to obtain two credentials, a Transportation Worker Identification Credential (TWIC) and a Merchant Mariner Credential (MMC).

Education and training. Entry-level workers are classified as ordinary seamen or deckhands. Workers take some basic training, lasting a few days, in areas such as first aid and firefighting.

There are two paths of education and training for a deck officer or an engineer: applicants must either accumulate thousands of hours of experience while working as a deckhand, or graduate from one of seven merchant marine academies in the United States. In both cases, applicants must pass a written examination. It is difficult to pass the examination without substantial formal schooling or independent study. The academies offer a 4-year academic program leading to a bachelor-of-science degree, a MMC endorsement (issued only by the Coast Guard) as a third mate (deck officer) or third assistant engineer (engineering officer), and, if the person chooses, a commission as ensign

in the U.S. Naval Reserve, Merchant Marine Reserve, or Coast Guard Reserve. With experience and additional training, third officers may qualify for higher rank. Generally officers on deep water vessels are academy graduates and those in supply boats, inland waterways, and rivers rose to their positions through years of experience.

Harbor pilot training usually consists of an extended apprenticeship with a towing company or a harbor pilots' association. Entrants may be able seamen or licensed officers.

In recent years, to generate interest in the maritime industry, 18 high schools have been designated "maritime high schools" with a curriculum created by the U.S. Maritime Administration. Graduation from one of these schools can help one's entry in the academies or with jobs elsewhere in the industry.

Licensure. All mariners that are required to obtain Coast Guard credentials are required to obtain a TWIC from the U.S. Department of Homeland Security. This credential states that you are a U.S. citizen or a permanent resident and have passed a security screening.

In addition, with few exceptions, the Coast Guard requires that mariners applying for a credential after April 15, 2009, obtain a MMC. Entry level seamen or deckhands on vessels operating in harbors or on rivers or other waterways do not need a MMC. The MMC replaces the Merchant Mariner Document, the license, and Standards of Training, Certification, and Watchkeeping for Seafarers endorsement. The MMC incorporates the licenses into the credential, which varies by occupational specialty, type of vessel, and by body of water (river, inland waterway, Great Lakes, and oceans). Requirements for the credential increase as the skill level of the occupational specialty and the size of the vessel increase and applicants must pass a test in order to qualify. Applicants for the credential must also pass a drug screen, take a medical exam, and meet the minimum age requirements. For more information on credentialing requirements see the Coast Guard's Web site listed in the sources of additional information.

Radio operators are licensed by the Federal Communications Commission.

Other qualifications. Most positions require excellent health, good vision, and color perception. Good general physical condition is needed because many jobs require the ability to lift heavy objects, withstand heat and cold, stand or stoop for long periods of time, dexterity to maneuver through tight spaces, and good balance on uneven and wet surfaces and in rough water.

Advancement. Experience and passing exams are required to advance. Deckhands who wish to advance must decide whether they want to work in the wheelhouse or the engine room. They

will then assist the engineers or deck officers. With experience, assistant engineers and deck officers can advance to become chief engineers or captains. On smaller boats, such as tugs, a captain may choose to become self-employed by buying a boat and working as an owner-operator.

Employment

Water transportation workers held more than 81,100 jobs in 2008. The total number who worked at some point in the year was significantly larger because many merchant marine officers and seamen work only part of the year. The following tabulation shows employment in the occupations that make up this group:

Captains, mates, and pilots of water vessels	33,100
Sailors and marine oilers	32,900
Ship engineers	11,500
Motorboat operators	3,700

About 40 percent of all workers were employed in water transportation services. Another 26 percent worked in establishments related to port and harbor operations, marine cargo handling, or navigational services to shipping. Governments employed 11 percent of all water transportation workers, many of whom worked on supply ships and are civilian mariners of the Navy Department's Military Sealift Command.

Job Outlook

Employment in water transportation occupations is projected to grow faster than average. Excellent job opportunities are expected as demand for people working in the shipping industry, particularly officers, is expected to be greater than the number of people wishing to enter these occupations.

Employment change. Employment in water transportation occupations is projected to grow 15 percent over the 2008-2018 period, faster than the average for all occupations. Job growth will stem from increasing tourism and growth in offshore oil and gas production. Employment will also rise in and around major port cities due to increasing international trade.

Employment in deep-sea shipping for American mariners is expected to remain stable. A fleet of deep-sea U.S.-flagged ships is considered vital to the Nation's defense, so some receive Federal support through a maritime security subsidy and other provisions in laws that limit certain Federal cargoes to ships that fly the U.S. flag.

Employment growth also is expected in passenger cruise ships within U.S. waters. Vessels that operate between U.S. ports are required by law to be U.S.-flagged vessels. The staff-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2008	Projected Employment, 2018	Change, 2008-2018	
				Number	Percent
Water transportation occupations.....	53-5000	81,100	93,100	12,000	15
Sailors and marine oilers.....	53-5011	32,900	36,700	3,800	12
Ship and boat captains and operators.....	53-5020	36,800	42,800	6,000	16
Captains, mates, and pilots of water vessels	53-5021	33,100	38,800	5,700	17
Motorboat operators.....	53-5022	3,700	4,000	300	8
Ship engineers.....	53-5031	11,500	13,600	2,100	19

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

ing needs for several new U.S. flagged cruise ships that will travel to the Hawaiian Islands will create new opportunities for employment. In addition, a small, but growing interest in using ferries to handle commuter traffic around major metropolitan areas should create some opportunities.

Some growth in water transportation occupations is projected in vessels operating in the Great Lakes and inland waterways as the economy recovers from the recession. Growth will be driven by demand for bulk products, such as coal, iron ore, petroleum, sand and gravel, grain, and chemicals. Since current pipelines cannot transport ethanol, some growth will come from shipping ethanol. Problems with congestion in the rail transportation system will increase demand for inland water transportation.

Job prospects. Excellent job opportunities are anticipated over the next decade as the need to replace workers, particularly officers, will generate many job openings. High turnover, the prospect of many retirements in the water transportation industry as a whole, and growth in the level of trade occurring worldwide will cause more jobs to be created than there will be people interested in taking them. The number of graduates from maritime academies has not kept up with the demand for officers on board ships. In addition, higher regulatory and security requirements has limited the pool of potential seamen. And a limited number of berths (beds) on board ships also is making it difficult for potential seamen to get the required number of hours on board ships to qualify for certain credentials. However, as the industry acknowledges these problems, living conditions, training, and opportunities for advancement should go up to attract more people to the occupations.

Earnings

Earnings vary widely with the particular water transportation position and the worker’s experience. Earnings are higher than most other occupations with similar educational requirements for entry-level positions. While wages are lower for sailors than for mates and engineers, sailors’ on-board experience is important for advancing into those higher paying positions. Workers are normally paid by the day. Since companies provide food and housing at sea and it is difficult to spend money while working, sailors are able to save a large portion of their pay.

Median annual wages of captains, mates, and pilots of water vessels were \$61,960 in May 2008. The middle 50 percent earned between \$42,810 and \$83,590. The lowest 10 percent had wages of less than \$29,330, while the top 10 percent earned over \$108,120. Annual pay for captains of larger vessels, such as container ships, oil tankers, or passenger ships may exceed \$100,000, but only after many years of experience. Similarly, earnings of captains of tugboats are dependent on the port and the nature of the cargo.

Median annual wages of sailors and marine oilers were \$34,390 in May 2008. The middle 50 percent earned between \$26,550 and \$44,080. The lowest 10 percent had wages of less than \$21,110, while the top 10 percent earned over \$51,890.

Median annual wages of ship engineers were \$60,690 in May 2008. The middle 50 percent earned between \$45,520 and

\$79,800. The lowest 10 percent had wages of less than \$34,420, while the top 10 percent earned over \$102,850.

Median annual wages of motorboat operators were \$31,910 in May 2008. The middle 50 percent earned between \$26,600 and 48,310. The lowest 10 percent had wages of less than \$20,420, while the top 10 percent earned over \$59,120.

The rate of unionization for these workers is about 12 percent. Unionization rates vary by region. In unionized areas, merchant marine officers and seamen, both veterans and beginners, are hired for voyages through union hiring halls or directly by shipping companies. Hiring halls rank the candidates by the length of time the person has been out of work and fill open slots accordingly. Most major seaports have hiring halls.

Related Occupations

Other occupations that make their living on the seas and coastal waters include:

- Fishers and fishing vessel operators..... 601
- Other technicians and mechanics that perform work similar to shipboard engineers, include:
 - Heavy vehicle and mobile equipment service technicians and mechanics 697
 - Employment opportunities in the Navy and Coast guard are discussed in:
 - Job opportunities in the armed forces 813

Material Moving Occupations

Significant Points

- Despite little or no change in employment, numerous job openings will be created by the need to replace workers who leave this very large occupation.
- Most jobs require little work experience or training.
- Pay is low for many positions, and the seasonal nature of the work may reduce earnings.

Nature of the Work

Think about a common bicycle; over the course of its creation many workers have to transport a variety of materials to get it to your local store. First, the raw metal must be produced, either from a mine where an *excavator operator* digs into the earth to gather rocks with the proper minerals and places them on a conveyor operated by a *conveyor tender*; or by a *recyclable material collector* that picks up unwanted metal household goods. Next, the metal is refined in a foundry, at which point a *crane operator* or *hoist and winch operator* may place it on a trailer for shipping. After arriving at a factory, an *industrial truck operator* unloads the metal and a *machine feeder* loads it into a machine for production. After being assembled, the bicycle is placed into a box by a *hand packager* and then moved into a tractor trailer by a *truck loader*. Many products, like this bicycle, are handled by a variety of workers because, even with the use of machinery, moving goods and materials around worksites still requires significant human effort. Material moving workers are generally categorized into two groups—operators, who control the machines that move materials, and laborers, who move materials by hand.

Operators use machinery to move construction materials, earth, petroleum products, and other heavy materials. Generally, they move materials over short distances—around construction sites, factories, or warehouses. Some move materials onto or off of trucks and ships. Operators control equipment by moving levers, wheels, or foot pedals; operating switches; or turning dials. They also may set up and inspect equipment, make adjustments, and perform minor maintenance or repairs.

Laborers and hand material movers move freight, stock, or other materials by hand; clean vehicles, machinery, and other equipment; feed materials into or remove materials from machines or equipment; and pack or package products and materials.

Industrial truck and tractor operators drive and control industrial trucks or tractors that move materials around warehouses, storage yards, factories, construction sites, or other worksites. A typical industrial truck, often called a forklift or lift truck, has a hydraulic lifting mechanism and forks for moving heavy and large objects. Industrial truck and tractor operators also may operate tractors that pull trailers loaded with materials, goods, or equipment within factories and warehouses or around outdoor storage areas.

Excavating and loading machine and dragline operators tend to operate machinery equipped with scoops, shovels, or buck-

ets to dig and load sand, gravel, earth, or similar materials into trucks or onto conveyors. These machines are primarily used in the construction and mining industries. *Dredge operators* excavate waterways, removing sand, gravel, rock, or other materials from harbors, lakes, rivers, and streams. Dredges are used primarily to maintain navigable channels but also are used to restore wetlands and other aquatic habitats; reclaim land; and create and maintain beaches. *Underground mining loading machine operators* load coal, ore, or rock into shuttles and mine cars or onto conveyors. Loading equipment may include power shovels, hoisting engines equipped with cable-drawn scrapers or scoops, and machines equipped with gathering arms and conveyors.

Crane and tower operators use mechanical boom and cable or tower and cable equipment to lift and move materials, machinery, and other heavy objects. Operators extend and retract horizontally mounted booms and lower and raise hooks attached to load lines. Most operators are guided by other workers using hand signals or a radio. Operators position loads from an on-board console or from a remote console at the site. Although crane and tower operators are noticeable at office building and other construction sites, the biggest group works in manufacturing industries that use heavy, bulky materials. Operators also work at major ports, loading and unloading large containers on and off ships. *Hoist and winch operators* control movement of cables, cages, and platforms to move workers and materials for manufacturing, logging, and other industrial operations. They work in positions such as derrick operators and hydraulic boom operators. Many hoist and winch operators are found in manufacturing or construction industries.

Pump operators tend, control, and operate pump and manifold systems that transfer gases, oil, or other materials to vessels or equipment. They maintain the equipment and regulate the flow of materials according to a schedule set up by petroleum engineers or production supervisors. *Gas compressor and gas pumping station operators* operate steam, gas, electric motor, or internal combustion engine-driven compressors. They transmit, compress, or recover gases, such as butane, nitrogen, hydrogen,

Material movers often work in the construction industry.

and natural gas. *Wellhead pumpers* operate pumps and auxiliary equipment to produce flows of oil or gas from extraction sites.

Tank car, truck, and ship loaders operate ship-loading and ship-unloading equipment, conveyors, hoists, and other specialized material-handling equipment such as railroad tank car-unloading equipment. They may gauge or sample shipping tanks and test them for leaks. *Conveyor operators and tenders* control and tend conveyor systems that move materials to or from stockpiles, processing stations, departments, or vehicles. *Shuttle car operators* run diesel or electric-powered shuttle cars in underground mines, transporting materials to mine cars or conveyors.

Laborers and hand freight, stock, and material movers manually move materials and perform other unskilled, general labor. These workers move freight, stock, and other materials to and from storage and production areas, loading docks, delivery vehicles, ships, and containers. Their specific duties vary by industry and work setting. In factories, they may move raw materials or finished goods between loading docks, storage areas, and work areas, as well as sort materials and supplies and prepare them according to their work orders. Specialized workers within this group include baggage and cargo handlers—who work in transportation industries—and truck loaders and unloaders.

Hand packers and packagers manually pack, package, or wrap a variety of materials. They may label cartons, inspect items for defects, stamp information on products, keep records of items packed, and stack packages on loading docks. This group also includes order fillers, who pack materials for shipment, as well as gift wrappers. In grocery stores, they may bag groceries, carry packages to customers' cars, and return shopping carts to designated areas.

Machine feeders and offbearers feed materials into or remove materials from equipment or machines tended by other workers.

Cleaners of vehicles and equipment clean machinery, vehicles, storage tanks, pipelines, and similar equipment using water and cleaning agents, vacuums, hoses, brushes, or cloths.

Refuse and recyclable material collectors gather refuse and recyclables from homes and businesses into their trucks for transport to a dump, landfill, or recycling center. They lift and empty garbage cans or recycling bins by hand or, using hydraulic lifts on their vehicles, pick up and empty dumpsters. Some in this group drive the large garbage or recycling truck along the scheduled routes.

(For information on operating engineers; paving, surfacing, and tamping equipment operators; and pile-driver operators, see the statement on construction equipment operators elsewhere in the *Handbook*.)

Work environment. Material moving work tends to be repetitive and physically demanding. Workers may lift and carry heavy objects and stoop, kneel, crouch, or crawl in awkward positions. Some work at great heights and some work outdoors—regardless of weather and climate. Some jobs expose workers to fumes, odors, loud noises, harmful materials and chemicals, or dangerous machinery. To protect their eyes, respiratory systems, and hearing, these workers wear safety clothing, such as gloves, hardhats, and other safety devices such as respirators. These jobs have become less dangerous as safety equipment—such as overhead guards on lift trucks—has become common. Accidents usually can be avoided by observing proper operating procedures and safety practices.

Material movers generally work 8-hour shifts—though longer shifts are not uncommon. In industries that work around the clock, material movers may work overnight shifts. Some do

Material moving workers, all other.....	53-7199	41,000	40,000	-1,000	-2

(NOTE) Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

this because their employers do not want to disturb customers during normal business hours. Refuse and recyclable material collectors often work shifts starting at 5 or 6 a.m. Some material movers work only during certain seasons, such as when the weather permits construction activity.

Training, Other Qualifications, and Advancement

Many material moving occupations require little or no formal training. Most training for these occupations is done on the job. For those jobs requiring physical exertion, employers may require that applicants pass a physical exam.

Education and training. Material movers generally learn skills informally, on the job, from more experienced workers or their supervisors. Many employers prefer applicants with a high school diploma or GED, but most simply require workers to be at least 18 years old and physically able to perform the work.

Workers who handle toxic chemicals or use industrial trucks or other dangerous equipment must receive specialized training in safety awareness and procedures. Many of the training requirements are standardized through the Occupational Safety and Health Administration (OSHA), but training for workers in mining is regulated by the Mine Safety and Health Administration (MSHA). This training is usually provided by the employer. Employers also must certify that each operator has received the training and evaluate each operator at least once every 3 years.

For other operators, such as crane operators and those working with specialized loads, there are some training and apprenticeship programs available, such as that offered by the International Union of Operating Engineers. Apprenticeships combine paid on-the-job training with classroom instruction.

Licensure. Seventeen States and 6 cities have laws requiring crane operators to be licensed. Licensing requirements typically include a written test as well as a skills test to demonstrate that the licensee can operate a crane safely.

Certification and other qualifications. Some types of equipment operators can become certified by professional associations, such as the National Commission for the Certification of Crane Operators, and some employers may require operators to be certified.

Material moving equipment operators need a good sense of balance, the ability to judge distances, and eye-hand-foot coordination. For jobs that involve dealing with the public, such as baggers or grocery store courtesy clerks, workers should be pleasant and courteous. Most jobs require basic arithmetic skills, the ability to read procedural manuals, and the capacity to understand orders and other billing documents. Experience operating mobile equipment—such as tractors on farms or heavy equipment in the Armed Forces—is an asset. As material moving equipment becomes more advanced, workers will need to be increasingly comfortable with technology.

Advancement. In many of these occupations, experience may allow workers to qualify or become trainees for jobs such as construction trades workers; assemblers or other production workers; or motor vehicle operators. In many workplaces, new employees gain experience in a material moving position before being promoted to a better paying and more highly skilled job. Some may eventually advance to become supervisors.

Employment

Material movers held 4.6 million jobs in 2008. They were distributed among the detailed occupations as follows:

Laborers and freight, stock, and material movers, hand.....	2,317,300
Packers and packagers, hand.....	758,800
Industrial truck and tractor operators	610,300
Cleaners of vehicles and equipment.....	348,900
Refuse and recyclable material collectors.....	149,000
Machine feeders and offbearers	140,600
Excavating and loading machine and dragline operators.....	75,700
Crane and tower operators.....	43,900
Conveyor operators and tenders	41,000
Wellhead pumpers	18,600
Tank car, truck, and ship loaders.....	12,000
Pump operators, except wellhead pumpers	9,700
Loading machine operators, underground mining	4,400
Gas compressor and gas pumping station operators	4,300
Shuttle car operators.....	3,100
Hoist and winch operators.....	2,800
Dredge operators	2,200
Material moving workers, all other	41,000

About 29 percent of all material movers worked in the wholesale trade or retail trade industries. Another 20 percent worked in manufacturing; 17 percent were in transportation and warehousing; 4 percent were in construction and mining; and 12 percent worked in the employment services industry, on a temporary or contract basis. For example, companies that need workers for only a few days, to move materials or to clean up a site, may contract with temporary help agencies specializing in providing suitable workers on a short-term basis. A small proportion of material movers were self-employed.

Material movers work in every part of the country. Some work in remote locations on large construction projects such as highways and dams, while others work in factories, warehouses, or mining operations.

Job Outlook

Despite little or no change in employment, numerous job openings will be created by the need to replace workers who leave this very large occupation.

Employment change. Employment in material moving occupations is projected to decline by 1 percent between 2008 and 2018. Improvements in equipment, such as automated storage and retrieval systems and conveyors, and in supply management processes, such as automatic identification and data collection (AIDC), will continue to raise productivity and reduce the demand for material movers.

Job growth for material movers depends on the growth or decline of employing industries and the type of equipment the workers operate or the materials they handle. Employment should grow in the warehousing and storage industry as more firms contract out their warehousing functions to this industry. Opportunities for material movers should decline in manufacturing due to productivity improvements and outsourcing of warehousing and other activities that depend on material movers. Opportunities will vary by establishment size as well, as

large establishments are more likely to have the resources to invest in automated systems for their material moving needs. Although increasing automation will eliminate some routine tasks, many jobs will remain to meet the need to operate and maintain new equipment.

Job prospects. Despite the projected employment decline, a relatively high number of job openings will be created by the need to replace workers who transfer to other occupations, retire, or leave this very large occupation for other reasons—characteristic of occupations requiring little prior or formal training. Many industries where material moving workers are employed are sensitive to changes in economic conditions, so the number of job openings fluctuates with the economy.

Earnings

Median hourly wages of material moving workers in May 2008 were relatively low, as indicated by the following tabulation:

Gas compressor and gas pumping station operators	\$21.45
Loading machine operators, underground mining	20.54
Shuttle car operators.....	20.29
Crane and tower operators.....	20.13
Pump operators, except wellhead pumpers	18.81
Wellhead pumpers	18.20
Tank car truck and ship loaders.....	18.14
Hoist and winch operators.....	17.50
Excavating and loading machine and dragline operators.....	16.93
Dredge operators	16.70
Refuse and recyclable material collectors.....	14.93
Industrial truck and tractor operators	13.98
Conveyor operators and tenders	13.95
Machine feeders and offbearers	12.29
Laborers and freight stock and material movers, hand	10.89
Cleaners of vehicles and equipment.....	9.35
Packers and packagers, hand.....	9.16
Material moving workers, all other	15.68

Wages vary according to experience and job responsibilities. Wages usually are higher in metropolitan areas. Seasonal peaks and lulls in workload can affect the number of hours scheduled, which affects earnings. Some crane operators, such as those unloading containers from ships at major ports, earn substantially more than their counterparts in other industries or establish-

ments. Some material movers are union members, and these workers tend to earn higher wages.

Job Opportunities in the Armed Forces

Significant Points

- Some training and duty assignments are hazardous, even in peacetime; hours and working conditions can be arduous and vary substantially, and personnel must strictly conform to military rules at all times.
- Requirements vary by branch of service, but enlisted personnel need at least a high school diploma or its equivalent while officers need a bachelor's or graduate degree.
- Opportunities should be excellent in all branches of the Armed Forces for applicants who meet designated standards.
- Military personnel are eligible for retirement after 20 years of service.

Nature of the Work

Maintaining a strong national defense requires workers who can do such diverse tasks as run a hospital, command a tank, program a computer system, operate a nuclear reactor, or repair and maintain a helicopter. The military provides training and work experience in these and many other fields for more than 2.4 million people. More than 1.4 million people serve in the active Army, Navy, Marine Corps, and Air Force, and more than 1.0 million serve in their Reserve components and the Air and Army National Guard. (The Coast Guard, which also is discussed in this *Handbook* statement, is part of the Department of Homeland Security.)

The military distinguishes between enlisted and officer careers. Enlisted personnel, who make up about 82 percent of the Armed Forces, carry out the fundamental operations of the

The military provides training and work experience in many fields for more than 2.4 million people.

military in combat, administration, construction, engineering, healthcare, human services, and other areas. Officers, who make up the remaining 18 percent of the Armed Forces, are the leaders of the military, supervising and managing activities in every occupational specialty.

The sections that follow discuss the major occupational groups for enlisted personnel and officers.

Enlisted occupational groups. Administrative careers include a wide variety of positions. The military must keep accurate information for planning and managing its operations. Both paper and electronic records are kept on personnel and on equipment, funds, supplies, and all other aspects of the military. Administrative personnel record information, prepare reports, maintain files, and review information to assist military officers. Personnel may work in a specialized area, such as finance, accounting, legal affairs, maintenance, supply, or transportation.

Combat specialty occupations include enlisted specialties, such as infantry, artillery, and Special Forces, whose members operate weapons or execute special missions during combat. People in these occupations normally specialize by type of weapon system or combat operation. They maneuver against enemy forces and positions, and fire artillery, guns, mortars, and missiles to destroy enemy positions. They also may operate tanks and amphibious assault vehicles in combat or on scouting missions. When the military has especially difficult or specialized missions to perform, it calls upon Special Forces teams. These elite combat forces maintain a constant state of readiness to strike anywhere in the world on a moment's notice. Team members from the Special Forces conduct offensive raids, demolitions, intelligence, search-and-rescue missions, and other operations from aboard aircraft, helicopters, ships, or submarines.

Construction occupations in the military include personnel who build or repair buildings, airfields, bridges, foundations, dams, bunkers, and the electrical and plumbing components of these structures. Personnel in construction occupations operate bulldozers, cranes, graders, and other heavy equipment. Construction specialists also may work with engineers and other building specialists as part of military construction teams. Some personnel specialize in areas such as plumbing or electrical wiring. Plumbers and pipefitters install and repair the plumbing and pipe systems needed in buildings and on aircraft and ships. Building electricians install and repair electrical-wiring systems in offices, airplane hangars, and other buildings on military bases.

Electronic and electrical equipment repair personnel repair and maintain electronic and electrical equipment used in the military. Repairers normally specialize by type of equipment, such as avionics, computers, optical equipment, communications, or weapons systems. For example, electronic instrument repairers install, test, maintain, and repair a wide variety of elec-

Construction specialists may work with engineers and other building specialists as part of military construction teams.

tronic systems, including navigational controls and biomedical instruments. Weapons maintenance technicians maintain and repair weapons used by combat forces; most of these weapons have electronic components and systems that assist in locating targets and in aiming and firing the weapon.

Engineering, science, and technical personnel in the military require specific knowledge to operate technical equipment, solve complex problems, or provide and interpret information. Personnel normally specialize in one area, such as space operations, information technology, environmental health and safety, or intelligence. Space operations specialists use and repair ground-control command equipment related to spacecraft, including electronic systems that track the location and operation of a craft. Information technology specialists develop software programs and operate computer systems. Environmental health and safety specialists inspect military facilities and food supplies for the presence of disease, germs, or other conditions hazardous to health and the environment. Intelligence specialists gather and study aerial photographs and use various types of radar and surveillance systems to discover information needed by the military.

Healthcare personnel assist medical professionals in treating and providing services for men and women in the military. They may work as part of a patient-service team in close contact with doctors, dentists, nurses, and physical therapists. Some specialize in providing emergency medical treatment, operating diagnostic tools such as x-ray and ultrasound equipment, laboratory testing of tissue and blood samples, maintaining pharmacy supplies or patients' records, constructing and repairing dental equipment or eyeglasses, or some other healthcare task.

Human resources development specialists recruit qualified personnel, place them in suitable occupations, and provide training programs. Personnel in this career area normally specialize

by activity. For example, recruiting specialists provide information about military careers to young people, parents, schools, and local communities, and explain the Armed Service's employment and training opportunities, pay and benefits, and service life. Personnel specialists collect and store information about the people in the military, including information on their previous and current training, job assignments, promotions, and health. Training specialists and instructors teach classes, give demonstrations, and instruct military personnel on how to perform their jobs.

Machine operator and production personnel operate industrial equipment, machinery, and tools to fabricate and repair parts for a variety of items and structures. They may operate engines, turbines, nuclear reactors, and water pumps. Often, they specialize by type of work performed. Welders and metalworkers, for instance, work with various types of metals to repair or form the structural parts of ships, submarines, buildings, or other equipment. Survival equipment specialists inspect, maintain, and repair survival equipment such as parachutes and aircraft life support equipment.

Media and public affairs personnel assist with the public presentation and interpretation of military information and events. They take photographs; film, record, and edit audio and video programs; present news and music programs; and produce artwork, drawings, and other visual displays. Other public affairs specialists act as interpreters and translators to convert written or spoken foreign languages into English or other languages.

Protective service personnel include those who enforce military laws and regulations and provide emergency responses to natural and human-made disasters. For example, military police control traffic, prevent crime, and respond to emergencies. Other law enforcement and security specialists investigate crimes committed on military property and guard inmates in military correctional facilities. Firefighters put out, control, and help prevent fires in buildings, on aircraft, and aboard ships.

Support service personnel provide subsistence services and support the morale and well-being of military personnel and their families. Food service specialists prepare all types of food in dining halls, hospitals, and ships. Counselors help military personnel and their families deal with personal issues. They work as part of a team that may include social workers, psychologists, medical officers, chaplains, personnel specialists, and commanders. Religious program specialists assist chaplains with religious services, religious education programs, and related administrative duties.

Transportation and material-handling specialists ensure the safe transport of people and cargo. Most personnel within this occupational group are classified according to mode of transportation, such as aircraft, motor vehicle, or ship. Aircrew members operate equipment on aircraft. Vehicle drivers operate all types of heavy military vehicles, including fuel or water tank trucks, semitrailers, heavy troop transports, and passenger buses. Quartermasters and boat operators navigate and pilot many types of small watercraft, including tugboats, gunboats, and barges. Cargo specialists load and unload military supplies, using equipment such as forklifts and cranes.

Vehicle and machinery mechanics conduct preventive and corrective maintenance on aircraft, automotive and heavy equip-

ment, heating and cooling systems, marine engines, and powerhouse station equipment. These workers typically specialize by the type of equipment that they maintain. For example, aircraft mechanics inspect, service, and repair helicopters, airplanes, and drones. Automotive and heavy equipment mechanics maintain and repair vehicles, such as humvees, trucks, tanks, self-propelled missile launchers, and other combat vehicles. They also repair bulldozers, power shovels, and other construction equipment. Heating and cooling mechanics install and repair air-conditioning, refrigeration, and heating equipment. Marine engine mechanics repair and maintain gasoline and diesel engines on ships, boats, and other watercraft. They also repair shipboard mechanical and electrical equipment. Powerhouse mechanics install, maintain, and repair electrical and mechanical equipment in power-generating stations.

Officer occupational groups. Combat specialty officers plan and direct military operations, oversee combat activities, and serve as combat leaders. This category includes officers in charge of tanks and other armored assault vehicles, artillery systems, Special Forces, and infantry. Combat specialty officers normally specialize by the type of unit they lead. Within the unit, they may further specialize by type of weapon system. Artillery and missile system officers, for example, direct personnel as they target, launch, test, and maintain various types of missiles and artillery. Special operations officers lead their units in offensive raids, demolitions, intelligence gathering, and search-and-rescue missions.

Engineering, science, and technical officers have a wide range of responsibilities based on their area of expertise. They lead or perform activities in areas such as space operations, environmental health and safety, and engineering. These officers may direct the operations of communications centers or the development of complex computer systems. Environmental health and safety officers study the air, ground, and water to identify and analyze sources of pollution and its effects. They also direct programs to control safety and health hazards in the workplace. Other personnel work as aerospace engineers, designing and directing the development of military aircraft, missiles, and spacecraft.

Executive, administrative, and managerial officers oversee and direct military activities in key functional areas, such as finance, accounting, health administration, international relations, and supply. Health services administrators, for instance, are responsible for the overall quality of care provided at the hospitals and clinics they operate. They must ensure that all of the departments work together. As another example, purchasing and contracting managers negotiate and monitor contracts for the purchase of the billions of dollars worth of equipment, supplies, and services that the military buys from private industry each year.

Healthcare officers provide health services at military facilities on the basis of their area of specialization. Officers who examine, diagnose, and treat patients with illness, injury, or disease include physicians, registered nurses, and dentists. Other officers provide therapy, rehabilitative treatment, and additional healthcare services for patients. Physical and occupational therapists plan and administer therapy to help patients adjust to disabilities, regain independence, and return to work. Speech

therapists evaluate and treat patients with hearing and speech problems. Dietitians manage food service facilities and plan meals for hospital patients and for outpatients who need special diets. Pharmacists manage the purchase, storage, and dispensing of drugs and medicines. Physicians and surgeons in this occupational group provide the majority of medical services to the military and their families. Dentists treat diseases, disorders, and injuries of the mouth. Optometrists treat vision problems by prescribing eyeglasses or contact lenses. Psychologists provide mental healthcare and also conduct research on behavior and emotions.

Human resource development officers manage recruitment, placement, and training strategies and programs in the military. Recruiting managers direct recruiting efforts and provide information about military careers to young people, parents, schools, and local communities. Personnel managers direct military personnel functions, such as job assignment, staff promotion, and career counseling. Training and education directors identify training needs and develop and manage educational programs designed to keep military personnel current in the skills they need.

Media and public affairs officers oversee the development, production, and presentation of information or events for the public. These officers may produce and direct motion pictures, videos, and television and radio broadcasts that are used for training, news, and entertainment. Some plan, develop, and direct the activities of military bands. Public information officers respond to inquiries about military activities and prepare news releases and reports to keep the public informed.

Protective service officers are responsible for the safety and protection of individuals and property on military bases and vessels. Emergency management officers plan and prepare for all types of natural and human-made disasters by developing warning, control, and evacuation procedures to be used in the event of a disaster. Law enforcement and security officers enforce all applicable laws on military bases and investigate crimes when the law has been broken.

Support services officers manage food service activities and perform services in support of the morale and well-being of military personnel and their families. Food services managers oversee the preparation and delivery of food services within dining facilities located on military installations and vessels. Social workers focus on improving conditions that cause social problems, such as drug and alcohol abuse, racism, and sexism. Chaplains conduct worship services for military personnel and perform other spiritual duties according to the beliefs and practices of various religious faiths.

Transportation officers manage and perform activities related to the safe transport of military personnel and material by air and water. These officers normally specialize by mode of transportation or area of expertise, because, in many cases, they must meet licensing and certification requirements. Pilots in the military fly various types of specialized airplanes and helicopters to execute combat missions and to carry troops and equipment. Navigators use radar, radio, and other navigation equipment to determine their position and plan their route of travel. Officers on ships and submarines work as a team to manage the various departments aboard their vessels. Ships' engineers direct

engineering departments aboard ships and submarines, including engine operations, maintenance, repair, heating, and power generation.

Work environment. Specific work environments and conditions depend on the branch of service, the occupational specialty, and other factors. Most military personnel live and work on or near military bases and facilities throughout the United States and the world. These bases and facilities usually offer comfortable housing and amenities, such as stores and recreation centers. Service members move regularly to complete their training or to meet the needs of their branch of service. Some are deployed to defend national interests. Military personnel must be physically fit, mentally stable, and ready to participate in or support combat missions that may be difficult and dangerous and involve time away from family. Some personnel are never deployed near combat areas.

In many circumstances, military personnel work standard hours, but personnel must be prepared to work long hours to fulfill missions, and they must conform to strict military rules at all times. Work hours depend on the occupational specialty and mission.

Training, Other Qualifications, and Advancement

To join the military, applicants must meet age, educational, aptitude, physical, and character requirements. These requirements vary by branch of service and vary between officers, who usu-

Some military personnel are deployed to defend national interests.

ally have a college degree, and enlisted personnel, who often do not. People are assigned an occupational specialty based on their aptitude, former training, and the needs of the military. All service members must sign a contract and commit to a minimum term of service. After joining the military, all enlistees receive general and occupation-specific training.

Those considering enlisting in the military should learn as much as they can about military life before making a decision. Doing so is especially important when one is thinking about making the military a career. Speaking to friends and relatives with military experience is a good idea, as is comparing the pros and cons. The next step is talking to a recruiter, who can determine whether the applicant qualifies for enlistment, explain the various enlistment options, and tell which military occupational specialties currently have openings. Applicants must bear in mind that the recruiter's job is to recruit promising applicants into his or her branch of military service, so the information that the recruiter gives is likely to stress the positive aspects of military life in the branch in which he or she serves.

Applicants should ask their recruiter for the branch they have chosen to assess their chances of being accepted for training in the occupation of their choice or, better still, take the aptitude exam to see how well they score. The military uses this exam as a placement exam, and test scores largely determine an individual's chances of being accepted into a particular training program. Selection for a particular type of training depends on the needs of the service and the applicant's general and technical aptitudes and personal preferences. Because all prospective recruits are required to take the exam, those who do so before committing themselves to enlisting have the advantage of knowing in advance whether they stand a good chance of being accepted for training in a particular specialty. The recruiter can schedule applicants to take the Armed Services Vocational Aptitude Battery without any obligation to join. Many high schools offer the exam as an easy way for students to explore the possibility of a military career, and the test also affords an insight into career areas in which the student has demonstrated aptitudes and interests. The exam is not part of the process of joining the military as an officer.

If an applicant decides to join the military, the next step is to pass the physical examination and sign an enlistment contract. Negotiating the contract involves choosing, qualifying for, and agreeing on a number of enlistment options, such as the length of active-duty time, which may vary according to the option. Most active-duty programs have first-term enlistments of 4 years, although there are some 2-year, 3-year, and 6-year programs. The contract also will state the date of enlistment and other options—for example, bonuses and the types of training to be received. If the service is unable to fulfill any of its obligations under the contract, such as providing a certain kind of training, the contract may become null and void.

All branches of the Armed Services offer a delayed entry program (DEP) by which an individual can delay entry into active duty for up to 1 year after enlisting. High school students can enlist during their senior year and enter a service after graduation. Others choose this program because the job training they desire is not currently available, but will be within the coming year, or because they need time to arrange their personal affairs.

The process of joining the military as an officer is different: officers must meet educational, physical, and character requirements, but they do not take an aptitude test. The education and training section that follows includes more information.

Education and training. All branches of the Armed Forces usually require their members to be high school graduates or have equivalent credentials, such as a GED. In 2008, more than 98 percent of recruits were high school graduates. Officers usually need a bachelor's or graduate degree. Training varies for enlisted and officer personnel and varies by occupational specialty. Currently, the U.S. Military is working with several different certifying bodies to ensure that soldiers who separate from the Armed Forces receive formal recognition in the private sector for their military-based technical training.

Enlisted personnel training. Following enlistment, new members of the Armed Forces undergo initial-entry training, better known as "basic training" or "boot camp." Through courses in military skills and protocol, recruit training provides a 6- to 13-week introduction to military life. Days and nights are carefully structured and include rigorous physical exercise designed to improve strength and endurance and build each unit's cohesion.

Following basic training, most recruits take additional training at technical schools that prepare them for a particular military occupational specialty. The formal training period generally lasts from 10 to 20 weeks, although training for certain occupations—nuclear power plant operator, for example—may take as long as a year. Recruits not assigned to classroom instruction receive on-the-job training at their first duty assignment.

Many service people get college credit for the technical training they receive on duty. Combined with off-duty courses, such training can lead to an associate's degree through programs in community colleges such as the Community College of the Air Force. In addition to receiving on-duty training, military personnel may choose from a variety of educational programs. Most military installations have tuition assistance programs for people wishing to take courses during off-duty hours. The courses may be correspondence courses or courses in degree programs offered by local colleges or universities. Tuition assistance pays up to 100 percent of college costs, up to a credit-hour and annual limit. Each branch of the service provides opportunities for full-time study to a limited number of exceptional applicants. Military personnel accepted into these highly competitive programs receive full pay, allowances, tuition, and related fees. In return, they must agree to serve an additional amount of time in the service. Other highly selective programs enable enlisted personnel to qualify as commissioned officers through additional military training.

Warrant officer training. Warrant officers are technical and tactical leaders who specialize in a specific technical area; for example, Army aviators make up one group of warrant officers. The Army Warrant Officer Corps constitutes less than 5 percent of the total Army. Although the Corps is small in size, its level of responsibility is high. Its members receive extended career opportunities, worldwide leadership assignments, and increased pay and retirement benefits. Selection to

attend Warrant Officer Candidate School is highly competitive and restricted to those who meet rank and length-of-service requirements. The only exception is for Army aviator warrant officer, which has no requirement of prior military service.

Officer training. Officer training in the Armed Forces is provided through the Federal service academies (Military, Naval, Air Force, and Coast Guard); the Reserve Officers Training Corps (ROTC) program offered at many colleges and universities; Officer Candidate School (OCS) or Officer Training School (OTS); the National Guard (State Officer Candidate School programs); the Uniformed Services University of Health Sciences; and other programs. All are highly selective and are good options for those wishing to make the military a career. Some personnel are directly appointed to attend one of these academies or programs. People interested in obtaining training through the Federal service academies must be unmarried and without dependents in order to enter and graduate, while those seeking training through OCS, OTS, or ROTC need not be single.

Federal service academies provide a 4-year college program leading to a bachelor-of-science (B.S.) degree. Midshipmen or cadets are provided free room and board, tuition, medical and dental care, and a monthly allowance. Graduates receive regular or reserve commissions and have a 5-year active-duty obligation, or more if they are entering flight training.

To become a candidate for appointment as a cadet or midshipman in one of the service academies, applicants are required to obtain a nomination from an authorized source, usually a member of Congress. Candidates do not need to personally know a member of Congress to request a nomination. Nominees must have an academic record of the requisite quality, college aptitude test scores above an established minimum, and recommendations from teachers or school officials; they also must pass a medical examination. Appointments are made from the list of eligible nominees. Appointments to the Coast Guard Academy, however, are based strictly on merit and do not require a nomination.

ROTC programs train students in approximately 270 Army, 130 Navy and Marine Corps, and 140 Air Force units at participating colleges and universities. In addition to taking regular college courses, trainees take 3 to 5 hours of military instruction a week. After graduation, they may serve as officers on active duty for a stipulated period. Some may serve their obligation in the Reserves or National Guard. In the last 2 years of an ROTC program, students typically receive a monthly allowance while attending school, as well as additional pay for summer training. ROTC scholarships for 2, 3, and 4 years are available on a competitive basis. All scholarships pay for tuition and have allowances for textbooks, supplies, and other costs.

College graduates can earn a commission in the Armed Forces through OCS or OTS programs in the Army, Navy, Air Force, Marine Corps, Coast Guard, and National Guard. These programs consist of several weeks of intensive academic, physical, and leadership training. Those who graduate as officers generally must serve their obligation on active duty.

Personnel with training in certain health professions may qualify for direct appointment as officers. In the case of peo-

ple studying for the health professions, financial assistance and internship opportunities are available from the military in return for specified periods of military service. Prospective medical students can apply to the Uniformed Services University of Health Sciences, which offers a salary and free tuition in a program leading to a doctor-of-medicine (M.D.) degree. In return, graduates must serve for 7 years in either the military or the Public Health Service. Direct appointments also are available for those qualified to serve in other specialty areas, such as the judge advocate general (legal) or chaplain corps. Flight training is available to commissioned officers in each branch of the Armed Forces. In addition, the Army has a direct enlistment option to become a warrant officer aviator.

Other qualifications. In order to join the services, enlisted personnel must sign a legal agreement called an enlistment contract, which usually involves a commitment of up to 8 years of service. Depending on the terms of the contract, 2 to 6 years are spent on active duty and the balance is spent in the National Guard or Reserves. The enlistment contract obligates the service to provide the agreed-upon job, rating, pay, cash bonuses for enlistment in certain occupations, medical and other benefits, occupational training, and continuing education. In return, enlisted personnel must serve satisfactorily for the period specified.

Requirements for each service vary, but certain qualifications for enlistment are common to all branches. In order to enlist, usually one must be at least 17 years old, be a U.S. citizen or an alien holding permanent resident status, not have a felony record, and possess a birth certificate. Applicants who are 17 years old must have the consent of a parent or legal guardian before entering the service. For active service in the Army, the maximum age is 42; for the Navy, 34; for the Air Force and Coast Guard, 27; and for the Marine Corps, 29. All applicants must pass a written examination—the Armed Services Vocational Aptitude Battery—and meet certain minimum physical standards—for example, for height, weight, vision, and overall health. Officers must meet different age and physical standards, depending on their branch of service.

Women are eligible to enter most military specialties; for example, they may become mechanics, missile maintenance technicians, heavy equipment operators, and fighter pilots, or they may enter into medical care, administrative support, and intelligence specialties. Generally, only occupations involving direct exposure to combat are excluded.

Advancement. Each service has different criteria for promoting personnel. Generally, the first few promotions for both enlisted personnel and officers come easily; subsequent promotions are much more competitive. Criteria for promotion may include time in service and in grade, job performance, a fitness

report (supervisor’s recommendation), and passing scores on written examinations. Table 1 shows the officers, warrant officers, and enlisted ranks by service.

People planning to apply the skills they gained through military training to a civilian career should first determine how good the prospects are for civilian employment in jobs related to the military specialty that interests them. Second, they should know the prerequisites for the related civilian job. Because many civilian occupations require a license, certification, or minimum level of education, it is important to determine whether military training is sufficient for a person to enter the civilian equivalent occupation or, if not, what additional training will be required. Other *Handbook* statements discuss the job outlook, training requirements, and other aspects of civilian occupations for which military training and experience are helpful. Additional information often can be obtained from school counselors.

Employment

In 2009, more than 2.4 million people served in the Armed Forces. More than 1.4 million were on active duty—about 561,000 in the Army, 327,000 in the Navy, 325,000 in the Air Force, and 202,000 in the Marine Corps. In addition, more than 1.0 million people served in their Reserve components and in the Air and Army National Guard, and 41,000 individuals served in the Coast Guard, which is now part of the Department of Homeland Security. Table 2 shows the occupational composition of the active-duty and Coast Guard enlisted personnel in January 2009; table 3 presents similar information for active-duty and Coast Guard officers, including noncommissioned warrant officers.

Military personnel are stationed throughout the United States and in many countries around the world. About half of all military jobs in the U.S. are located in California, Texas, North Carolina, Virginia, Florida, and Georgia. Approximately 265,000 service members were deployed in support of Operations Enduring Freedom and Iraqi Freedom as of June 1, 2009. An additional 378,000 individuals were stationed outside the United States, including 160,000 assigned to ships at sea. About 95,000 were stationed in Europe, mainly in Germany, and an-

In 2009, 41,000 individuals served in the Coast Guard, which is now part of the Department of Homeland Security.

other 71,000 were assigned to East Asia and the Pacific area, mostly in Japan and the Republic of Korea.

Job Outlook

Opportunities should be excellent for qualified individuals in all branches of the Armed Forces.

Employment change. The United States spends a significant portion of its overall budget on national defense. The num-

SOURCE: U.S. Department of Defense, Defense Manpower Data Center

ber of active-duty personnel is expected to remain roughly constant through 2018. However, recent conflicts and the resulting strain on the military may lead to an increase in the number of active-duty personnel. The current goal of the Armed Forces is to maintain a force sufficient to fight and win two major regional conflicts at the same time. Political events, however, could lead to a significant restructuring with or without an increase in size.

Job prospects. Opportunities should be excellent for qualified individuals in all branches of the Armed Forces through 2018. Many military personnel retire with a pension after 20 years of service, while they still are young enough to start a new career. About 184,000 personnel must be recruited each year to replace those who complete their commitment or retire. Since the end of the draft in 1973, the military has met its personnel requirements with volunteers. When the economy is good and civilian employment opportunities generally are more favorable, it is more difficult for all the services to meet their recruitment quotas. When there are economic downturns, recruits may face more competition for various occupational specialties. It

is also more difficult to meet these goals during times of war, when recruitment goals typically rise.

Educational requirements will continue to rise as military jobs become more technical and complex. High school graduates and applicants with a college background will be sought to fill the ranks of enlisted personnel, while virtually all officers will need at least a bachelor's degree and, in some cases, a graduate degree as well.

Earnings

The earnings structure for military personnel is shown in table 4. Most enlisted personnel started as recruits at Grade E-1 in 2009; however, those with special skills or above-average education started as high as Grade E-4. Most warrant officers started at Grade W-1 or W-2, depending upon their occupational and academic qualifications and the branch of service of which they were a member, but warrant officer typically is not an entry-level occupation and, consequently, most of these individuals had previous military service. Most commissioned officers started at Grade O-1; some with advanced education started at Grade O-2, and some highly trained officers—for example, physicians and dentists—started as high as Grade O-3. Pay varies by total years of service as well as rank. Because it usually takes many years to reach the higher ranks, most personnel in higher ranks receive the higher pay rates awarded to those with many years of service.

In addition to receiving their basic pay, military personnel are provided with free room and board (or a tax-free housing and subsistence allowance), free medical and dental care, a military clothing allowance, military supermarket and department store shopping privileges, 30 days of paid vacation a year (referred to as leave), and travel opportunities. In many duty stations, military personnel may receive a housing allowance that can be used for off-base housing. This allowance can be substantial, but varies greatly by rank and duty station. For example, in fiscal year 2009, the basic allowance for housing for an E-4 with dependents was \$681.90 per month; for a comparable individual without dependents, it was \$511.50. The allowance for an O-4 with dependents was \$1,297.80 per month; for a comparable individual without dependents, it was \$1,128.60. Other allowances are paid for foreign duty, hazardous duty, submarine and flight duty, and employment as a medical officer. Athletic and other facilities—such as gymnasiums, tennis courts, golf courses, bowling centers, libraries, and movie theaters—are

Educational requirements will continue to rise as military jobs become more technical and complex.

Table 4. Military basic monthly pay by grade for active duty personnel, April 2009

SOURCE: U.S. Department of Defense—Defense Finance and Accounting Service

available on many military installations. Military personnel are eligible for retirement benefits after 20 years of service.

The Veterans Administration (VA) provides numerous benefits to those who have served at least 24 months of continuous active duty in the Armed Forces. Veterans are eligible for free care in VA hospitals for all service-related disabilities, regardless of time served; those with other medical problems are eligible for free VA care if they are unable to pay the cost of hospitalization elsewhere. Admission to a VA medical center depends on the availability of beds, however. Veterans also are eligible for certain loans, including loans to purchase a home. Regardless of their health, veterans can convert a military life insurance policy to an individual policy with any participating company upon separation from the military. In addition, job counseling, testing, and placement services are available.

Veterans who participate in the Montgomery GI Bill Program receive education benefits. Under this program, Armed Forces personnel may elect to deduct up to \$100 a month from their pay during the first 12 months of active duty, putting the money toward their future education. In fiscal year 2009, veterans who served on active duty for 3 or more years or who spent 2 years in active duty plus 4 years in the Selected Reserve received \$1,321 a month in basic benefits for 36 months of full-time institutional training. Those who enlisted and served less than 3 years received \$1,073 a month for 36 months of the same. In addition, each service provides its own contributions to the enlistee's future education. The sum of the amounts from all these sources becomes the service member's educational fund. Upon

separation from active duty, the fund can be used to finance educational costs at any VA-approved institution. Among those institutions which are approved by the VA are many vocational, correspondence, certification, business, technical, and flight training schools; community and junior colleges; and colleges and universities. The new Post-9/11 GI Bill is an alternative education benefit. There is no deductible for service personnel. The size of the benefit is scaled to the State and to the institution that the veteran is attending. Service personnel must carefully choose which program will be of the most benefit to them in their planned educational future.

Sources of Additional Information

Each of the military services publishes handbooks, fact sheets, and pamphlets describing its entrance requirements, its training and advancement opportunities, and other aspects of military careers. These publications are widely available at all recruiting stations, at most State employment service offices, and in high schools, colleges, and public libraries. Information on educational and other veterans' benefits is available from VA offices located throughout the country.

In addition, the Defense Manpower Data Center, an agency of the Department of Defense, publishes *Military Career Guide Online*, a compendium of military occupational, training, and career information designed for use by students and jobseekers. This information is available on the Internet at <http://www.todaysmilitary.com>.

The Occupational Outlook Quarterly also provides information about military careers and training; see the spring 2007 article “Military training for civilian careers (Or: How to gain practical experience while serving your country),” available online at <http://www.bls.gov/opub/ooq/2007/spring/art02.pdf>.

The Occupational Information Network (O*NET) provides information on a wide range of occupational characteristics. Links to O*NET appear at the end of the Internet version of this occupational statement, accessible at <http://www.bls.gov/ooh/ocos249.htm>

Data for Occupations Not Covered in Detail

Employment in the hundreds of occupations covered in detail in the main body of the *Handbook* accounts for more than 134 million, or 89 percent, of all jobs in the economy. Although occupations covering the full spectrum of work are included, those requiring lengthy education or training generally are given the most attention.

This chapter presents summary data on 127 additional occupations, for which employment projections are prepared, but for which detailed occupational information is not developed. These occupations account for about 7 percent of all jobs. For each occupation, the Occupational Information Network (O*NET) code, a brief description of the nature of the work, the number of jobs in 2008, a phrase describing the projected

employment change from 2008 to 2018, and the most significant source of postsecondary education or training are presented. For a complete list of O*NET codes cited in the *Handbook*, refer to a later chapter, *Occupational Information Network (O*NET) Coverage*. For guidelines on interpreting the description of projected employment change, refer to a chapter in the front of the *Handbook*, *Occupational Information Included in the Handbook*.

The approximately 4 percent of all jobs not covered either in the detailed occupational descriptions in the main body of the *Handbook* or in the summary data presented in this chapter are mainly residual categories, such as “all other managers,” for which little meaningful information could be developed.

Management, business, and financial occupations

Agents and business managers of artists, performers, and athletes

Represent and promote artists, performers, and athletes to prospective employers. May handle contract negotiations and other business matters for clients.

2008 Employment: 22, 700

Projected 2008-18 employment change: Much faster than average

Most significant source of postsecondary education or training: Bachelor's or higher degree, plus work experience

Compliance officers, except agriculture, construction, health and safety, and transportation

Examine, evaluate, and investigate eligibility for or conformity with laws and regulations governing contract compliance of licenses and permits, and other compliance and enforcement inspection activities not classified elsewhere. Exclude tax examiners, collectors, and revenue agents and financial examiners.

2008 Employment: 260,200

Projected 2008-18 employment change: Much faster than average

Most significant source of postsecondary education or training: Long-term on-the-job training

Credit analysts

Analyze current credit data and financial statements of individuals or firms to determine the degree of risk involved in extending credit or lending money. Prepare reports with this credit information for use in decision-making.

2008 Employment: 73,200

Projected 2008-18 employment change: Faster than average

Most significant source of postsecondary education or training: Bachelor's degree

Emergency management specialists

Coordinate disaster response or crisis management activities, provide disaster preparedness training and prepare emergency plans and procedures for natural (e.g. hurricanes, floods, earthquakes), wartime,

or technological (e.g., nuclear power plant emergencies, hazardous materials spills) disasters or hostage situations.

2008 Employment: 12,800

Projected 2008-18 employment change: Much faster than average

Most significant source of postsecondary education or training: Work experience in a related occupation

Financial examiners

Enforce or ensure compliance with laws and regulations governing financial and securities institutions and financial and real estate transactions. May examine, verify correctness of, or establish authenticity of records.

2008 Employment: 27,000

Projected 2008-18 employment change: Much faster than average

Most significant source of postsecondary education or training: Bachelor's degree

Legislators

Develop laws and statutes at the Federal, State, or local level. Includes only elected officials.

2008 Employment: 67,600

Projected 2008-18 employment change: Little or no change

Most significant source of postsecondary education or training: Bachelor's or higher degree, plus work experience

Loan counselors

Provide guidance to prospective loan applicants who have problems qualifying for traditional loans. Guidance may include determining the best type of loan and explaining loan requirements or restrictions.

2008 Employment: 32,400

Projected 2008-18 employment change: Faster than average

Most significant source of postsecondary education or training: Bachelor's degree

Logisticians

Analyze and coordinate the logistical functions of a firm or organization. Responsible for the entire life cycle of a product, including acquisition, distribution, internal allocation, delivery, and final disposal of resources.

2008 Employment: 100,400

Projected 2008-18 employment change: Much faster than average
Most significant source of postsecondary education or training: Bachelor's degree

Postmasters and mail superintendents

Direct and coordinate operational, administrative, management, and supportive services of a U.S. post office; or coordinate activities of workers engaged in postal and related work in assigned post office.

2008 Employment: 25,600

Projected 2008-18 employment change: Decline rapidly
Most significant source of postsecondary education or training: Work experience in a related occupation

Social and community service managers

Plan, organize, or coordinate the activities of a social service program or community outreach organization. Oversee the program or organization's budget and policies regarding participant involvement, program requirement, and benefits. Work may involve directing social workers, counselors, or probation officers.

2008 Employment: 130,600

Projected 2008-18 employment change: Faster than average
Most significant source of postsecondary education or training: Bachelor's degree

Tax preparers

Prepare tax returns for individuals or small businesses but do not have the background or responsibilities of an accredited or certified public accountant.

2008 Employment: 95,800

Projected 2008-18 employment change: More slowly than average
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Transportation, storage, and distribution managers

Plan, direct, or coordinate transportation, storage, or distribution activities in accordance with governmental policies and regulations. Includes logistics managers.

2008 Employment: 99,700

Projected 2008-18 employment change: Decline slowly
Most significant source of postsecondary education or training: Work experience in a related occupation

Professional and related occupations

Audio-visual collections specialists

Prepare, plan, and operate audio-visual teaching aids for use in education. May record, catalogue, and file audio-visual materials.

2008 Employment: 6,800

Projected 2008-18 employment change: About as fast as average
Most significant source of postsecondary education or training: Bachelor's degree

Clergy

Conduct religious worship and perform other spiritual functions associated with beliefs and practices of religious faith or denomination. Provide spiritual and moral guidance and assistance to members.

2008 Employment: 670,100

Projected 2008-18 employment change: About as fast as average
Most significant source of postsecondary education or training: Master's degree

Dietetic technicians

Assist dietitians in the provision of food service and nutritional programs. Under the supervision of dietitians, may plan and produce meals based on established guidelines, teach principles of food and nutrition, or counsel individuals.

2008 Employment: 25,200

Projected 2008-18 employment change: Faster than average
Most significant source of postsecondary education or training: Postsecondary vocational award

Directors, religious activities and education

Direct and coordinate activities of a denominational group to meet religious needs of students. Plan, direct, or coordinate church school programs designed to promote religious education among church membership. May provide counseling and guidance relative to marital, health, financial, or religious problems.

2008 Employment: 80,400

Projected 2008-18 employment change: About as fast as average
Most significant source of postsecondary education or training: Bachelor's degree

Farm and home management advisors

Advise, instruct, and assist individuals and families engaged in agriculture, agricultural-related processes, or home economics activities. Demonstrate procedures and apply research findings to solve problems; instruct and train in product development, sales, and the utilization of machinery and equipment to promote general welfare. Include county agricultural agents, feed and farm management advisors, home economists, and extension service advisors.

2008 Employment: 13,100

Projected 2008-18 employment change: Little or no change
Most significant source of postsecondary education or training: Bachelor's degree

Law clerks

Assist lawyers or judges by researching or preparing legal documents. May meet with clients or assist lawyers and judges in court. Excludes lawyers, and paralegal and legal assistants.

2008 Employment: 37,700

Projected 2008-18 employment change: Faster than average
Most significant source of postsecondary education or training: Bachelor's degree

Mathematical technicians

Apply standardized mathematical formulas, principles, and methodology to technological problems in engineering and physical sciences in relation to specific industrial and research objectives, processes, equipment, and products.

2008 Employment: 1,200

Projected 2008-18 employment change: About as fast as average
Most significant source of postsecondary education or training: Associate degree

Merchandise displayers and window trimmers

Plan and erect commercial displays, such as those in windows and interiors of retail stores and at trade exhibitions.

2008 Employment: 85,200

Projected 2008-18 employment change: About as fast as average
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Orthotists and prosthetists

Assist patients with disabling conditions of limbs and spine or with partial or total absence of limb by fitting and preparing orthopedic braces and prostheses.

2008 Employment: 5,900

Projected 2008-18 employment change: Faster than average

Most significant source of postsecondary education or training: Bachelor's degree

Psychiatric technicians

Care for mentally impaired or emotionally disturbed individuals, following physician instructions and hospital procedures. Monitor patients' physical and emotional well-being and report to medical staff. May participate in rehabilitation and treatment programs, help with personal hygiene, and administer oral medications and hypodermic injections.

2008 Employment: 57,100

Projected 2008-18 employment change: More slowly than average

Most significant source of postsecondary education or training: Postsecondary vocational award

Set and exhibit designers

Design special exhibits and movie, television, and theater sets. May study scripts, confer with directors, and conduct research to determine appropriate architectural styles.

2008 Employment: 10,900

Projected 2008-18 employment change: Faster than average

Most significant source of postsecondary education or training: Bachelor's degree

Social science research assistants

Assist social scientists in laboratory, survey, and other social research. May perform publication activities, laboratory analysis, quality control, or data management. Normally these individuals work under the direct supervision of a social scientist and assist in those activities which are more routine. Excludes graduate teaching assistants, who both teach and do research.

2008 Employment: 21,000

Projected 2008-18 employment change: Faster than average

Most significant source of postsecondary education or training: Associate degree

Title examiners, abstractors, and searchers

Search real estate records, examine titles, or summarize pertinent legal or insurance details for a variety of purposes. May compile lists of mortgages, contracts, and other instruments pertaining to titles by searching public and private records for law firms, real estate agencies, or title insurance companies.

2008 Employment: 69,500

Projected 2008-18 employment change: Little or no change

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Service occupations**Amusement and recreation attendants**

Perform a variety of attending duties at amusement or recreation facilities. May schedule use of recreations facilities, maintain and provide equipment to participants of sporting events or recreational pursuits, or operate amusement concessions and rides.

2008 Employment: 263,000

Projected 2008-18 employment change: About as fast as average

Most significant source of postsecondary education or training: Short-term on-the-job training

Animal control workers

Handle animals for the purpose of investigations of mistreatment, or control of abandoned, dangerous, or unattended animals.

2008 Employment: 16,100

Projected 2008-18 employment change: About as fast as average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Baggage porters and bellhops

Handle baggage for travelers at transportation terminals or for guests at hotels or similar establishments.

2008 Employment: 50,500

Projected 2008-18 employment change: About as fast as average

Most significant source of postsecondary education or training: Short-term on-the-job training

Concierges

Assist patrons at hotel, apartment or office building with personal services. May take messages, arrange or give advice on transportation, business services or entertainment, or monitor guest requests for housekeeping and maintenance.

2008 Employment: 20,800

Projected 2008-18 employment change: Faster than average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Costume attendants

Select, fit and take care of costumes for cast members, and aid entertainers.

2008 Employment: 5,100

Projected 2008-18 employment change: Faster than average

Most significant source of postsecondary education or training: Short-term on-the-job training

Crossing guards

Guide or control vehicular or pedestrian traffic at such places as streets, schools, railroad crossings, or construction sites.

2008 Employment: 69,900

Projected 2008-18 employment change: About as fast as average

Most significant source of postsecondary education or training: Short-term on-the-job training

Embalmers

Prepare bodies for interment in conformity with legal requirements.

2008 Employment: 8,500

Projected 2008-18 employment change: More slowly than average

Most significant source of postsecondary education or training: Postsecondary vocational award

First-line supervisors/managers of personal service workers

Supervise and coordinate activities of personal service workers, such as supervisors of flight attendants, hairdressers, or caddies.

2008 Employment: 213,200

Projected 2008-18 employment change: Faster than average

Most significant source of postsecondary education or training: Work experience in a related occupation

Funeral attendants

Perform a variety of tasks during a funeral, such as placing casket in parlor or chapel prior to service; arranging floral offerings or lights around casket; directing or escorting mourners; closing casket; and issuing and storing funeral equipment.

2008 Employment: 34,500

Projected 2008-18 employment change: Much faster than average
Most significant source of postsecondary education or training: Short-term on-the-job training

Lifeguards, ski patrol, and other recreational protective service workers

Monitor recreational areas, such as pools, beaches, or ski slopes to provide assistance and protection to participants.

2008 Employment: 115,200

Projected 2008-18 employment change: About as fast as average
Most significant source of postsecondary education or training: Short-term on-the-job training

Locker room, coatroom, and dressing room attendants

Provide personal items to patrons or customers in locker rooms, dressing rooms, or coatrooms.

2008 Employment: 18,500

Projected 2008-18 employment change: About as fast as average
Most significant source of postsecondary education or training: Short-term on-the-job training

Medical equipment preparers

Prepare, sterilize, install, or clean laboratory or healthcare equipment. May perform routine laboratory tasks and operate or inspect equipment.

2008 Employment: 46,800

Projected 2008-18 employment change: About as fast as average
Most significant source of postsecondary education or training: Short-term on-the-job training

Motion picture projectionists

Set up and operate motion picture projection and related sound reproduction equipment.

2008 Employment: 10,800

Projected 2008-18 employment change: Little or no change
Most significant source of postsecondary education or training: Short-term on-the-job training

Parking enforcement workers

Patrol assigned area, such as public parking lot or section of city to issue tickets to overtime parking violators and illegally parked vehicles.

2008 Employment: 10,000

Projected 2008-18 employment change: Little or no change
Most significant source of postsecondary education or training: Short-term on-the-job training

Residential advisors

Coordinate activities for residents of boarding schools, college fraternities or sororities, college dormitories, or similar establishments. Order supplies and determine need to maintenance, repairs, and furnishings. May maintain household records and assign rooms. May refer residents to counseling resources if needed.

2008 Employment: 56,900

Projected 2008-18 employment change: About as fast as average
Most significant source of postsecondary education or training: Short-term on-the-job training

Tour guides and escorts

Escort individuals or groups on sightseeing tours or through places of interest, such as industrial establishments, public buildings, and art galleries.

2008 Employment: 38,400

Projected 2008-18 employment change: About as fast as average
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Transportation attendants, except flight attendants and baggage porters

Provide services to ensure the safety and comfort of passengers aboard ships, buses, trains, or within the station or terminal. Perform duties, such as greeting passengers, explaining the use of safety equipment, serving meals or beverages, or answering questions related to travel.

2008 Employment: 21,700

Projected 2008-18 employment change: About as fast as average
Most significant source of postsecondary education or training: Short-term on-the-job training

Travel guides

Plan, organize, and conduct long distance cruises, tours, and expeditions for individuals or groups.

2008 Employment: 5,600

Projected 2008-18 employment change: Little or no change
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Ushers, lobby attendants, and ticket takers

Assist patrons at entertainment events by performing duties, such as collecting admission tickets and passes from patrons, assisting in finding seats, searching for lost articles, and locating such facilities as rest rooms and telephones.

2008 Employment: 106,100

Projected 2008-18 employment change: Faster than average
Most significant source of postsecondary education or training: Short-term on-the-job training

Veterinary assistants and laboratory animal caretakers

Feed, water, and examine pets and other nonfarm animals for signs of illness, disease, or injury in laboratories and animal hospitals and clinics. Clean and disinfect cages and work areas, and sterilize laboratory and surgical equipment. May provide routine postoperative care, administer medication orally or topically, or prepare samples for laboratory examination under the supervision of veterinary or laboratory animal technologists or technicians, veterinarians, or scientists. Excludes nonfarm animal caretakers.

2008 Employment: 75,200

Projected 2008-18 employment change: Much faster than average
Most significant source of postsecondary education or training: Short-term on-the-job training

Sales and related occupations

Door-to-door sales workers, news and street vendors, and related workers

Sell goods or services door-to-door or on the street.

2008 Employment: 181,600

Projected 2008-18 employment change: Decline rapidly
Most significant source of postsecondary education or training: Short-term on-the-job training

Parts salespersons

Sell spare and replacement parts and equipment in repair shop or parts store.

2008 Employment: 227,500

Projected 2008-18 employment change: Little or no change

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Telemarketers

Solicit orders for goods and services over the telephone.

2008 Employment: 341,600

Projected 2008-18 employment change: Decline rapidly

Most significant source of postsecondary education or training: Short-term on-the-job training

Office and administrative support occupations**Correspondence clerks**

Compose letters in reply to request for merchandise, damage claims, credit and other information, delinquent accounts, incorrect billings, or unsatisfactory services. Duties may include gathering data to formulate reply and typing correspondence.

2008 Employment: 14,200

Projected 2008-18 employment change: Decline rapidly

Most significant source of postsecondary education or training: Short-term-on-the-job training

Court, municipal, and license clerks

Perform clerical duties in courts of law, municipalities, and governmental licensing agencies and bureaus. May prepare docket of cases to be called; secure information for judges and court; prepare draft agendas or bylaws for town or city council; answer official correspondence; keep fiscal records and accounts; issue licenses or permits; record data, administer tests, or collect fees.

2008 Employment: 122,100

Projected 2008-18 employment change: About as fast as average

Most significant source of postsecondary education or training: Short-term-on-the-job training

Insurance claims and policy processing clerks

Process new insurance policies, modifications to existing policies, and claims forms. Obtain information from policyholders to verify the accuracy and completeness of information on claims forms, applications and related documents, and company records. Update existing policies and company records to reflect changes requested by policyholders and insurance company representatives. Excludes claims adjusters, examiners, and investigators.

2008 Employment: 253,800

Projected 2008-18 employment change: Little or no change

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Mail clerks and mail machine operators, except Postal Service

Prepare incoming and outgoing mail for distribution. Use hand or mail handling machines to time, stamp, open, read, sort, and route incoming mail; and address, seal, stamp, fold, stuff, and affix postage to outgoing mail or packages. Duties may also include keeping necessary records and completed forms.

2008 Employment: 141,400

Projected 2008-18 employment change: Decline rapidly

Most significant source of postsecondary education or training: Short-term on-the-job training

New accounts clerks

Interview persons desiring to open bank accounts. Explain banking services available to prospective customers and assist them in preparing application form.

2008 Employment: 87,300

Projected 2008-18 employment change: Little or no change

Most significant source of postsecondary education or training: Work experience in a related occupation

Office machine operators, except computer

Operate one or more of a variety of office machines, such as photocopying, photographic, and duplicating machines, or other office machines. Excludes computer operators; mail clerks and mail machine operators; and billing and posting clerks and machine operators.

2008 Employment: 79,900

Projected 2008-18 employment change: Decline slowly

Most significant source of postsecondary education or training: Short-term on-the-job training

Proofreaders and copy markers

Read transcript or proof type setup to detect and mark for correction any grammatical, typographical, or compositional errors. Excludes workers whose primary duty is editing copy. Includes proofreaders of Braille.

2008 Employment: 18,200

Projected 2008-18 employment change: Decline slowly

Most significant source of postsecondary education or training: Short-term on-the-job training

Statistical assistants

Compile and compute data according to statistical formulas for use in statistical studies. May perform actuarial computations and compile charts and graphs for use by actuaries. Includes actuarial clerks.

2008 Employment: 17,900

Projected 2008-18 employment change: More slowly than average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Farming, fishing, and forestry occupations**Supervisors, farming, fishing, and forestry workers**

This broad occupation includes two detailed occupations—first-line supervisors/managers of farming, fishing, and forestry workers; and farm labor contractors. First-line supervisors/managers of farming, fishing, and forestry workers directly supervise and coordinate the activities of agricultural, forestry, aquacultural, and related workers. Farm labor contractors recruit, hire, furnish, and supervise seasonal or temporary agricultural laborers for a fee. May transport, house, and provide meals for workers. Excludes first-line supervisors/managers of landscaping, lawn service, and groundskeeping workers.

2008 Employment: 48,600

Projected 2008-18 employment change: About as fast as average

Most significant source of postsecondary education or training: Work experience in a related occupation

Construction and extraction occupations

Continuous mining machine operators

Operate self-propelled mining machines that rip coal, metal and non-metal ores, rock, stone, or sand from the face and load it onto conveyors or into shuttle cars in a continuous operation.

2008 Employment: 11,200

Projected 2008-18 employment change: Decline slowly

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Derrick operators, oil and gas

Rig derrick equipment and operate pumps to circulate mud through drill hole.

2008 Employment: 25,000

Projected 2008-18 employment change: Decline rapidly

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Earth drillers, except oil and gas

Operate a variety of drills—such as rotary, churn, and pneumatic—to tap subsurface water and salt deposits, to remove core samples during mineral exploration or soil testing, and to facilitate the use of explosives in mining or construction. May use explosives. Includes horizontal and earth boring machine operators.

2008 Employment: 23,300

Projected 2008-18 employment change: About as fast as average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Explosives workers, ordnance handling experts, and blasters

Place and detonate explosives to demolish structures or to loosen, remove, or displace earth, rock, or other materials. May perform specialized handling, storage, and accounting procedures. Includes seismograph shooters. Excludes earth drillers, except oil and gas who may also work with explosives.

2008 Employment: 6,300

Projected 2008-18 employment change: More slowly than average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Fence erectors

Erect and repair metal and wooden fences and fence gates around highways, industrial establishments, residences, or farms, using hand and power tools.

2008 Employment: 33,600

Projected 2008-18 employment change: Faster than average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

First-line supervisors/managers of construction trades and extraction workers

Directly supervise and coordinate activities of construction or extraction workers.

2008 Employment: 698,100

Projected 2008-18 employment change: Faster than average

Most significant source of postsecondary education or training: Work experience in a related occupation

Helpers—brickmasons, blockmasons, stonemasons, and tile and marble setters

Help brickmasons, blockmasons, stonemasons, or tile and marble setters by performing duties of lesser skill. Duties include using, supplying, or holding materials or tools, and cleaning work area and equipment. Excludes apprentice workers and report them with the appropriate skilled construction trade occupation. Excludes construction laborers who do not primarily assist brickmasons, blockmasons, and stonemasons or tile and marble setters.

2008 Employment: 50,800

Projected 2008-18 employment change: Faster than average

Most significant source of postsecondary education or training: Short-term on-the-job training

Helpers—carpenters

Help carpenters by performing duties of lesser skill. Duties include using, supplying, or holding materials or tools, and cleaning work area and equipment. Excludes apprentice workers and report them with the appropriate skilled construction trade occupation. Excludes construction laborers who do not primarily assist carpenters.

2008 Employment: 79,800

Projected 2008-18 employment change: Much faster than average

Most significant source of postsecondary education or training: Short-term on-the-job training

Helpers—electricians

Help electricians by performing duties of lesser skill. Duties include using, supplying, or holding materials or tools, and cleaning work area and equipment. Excludes apprentice workers and report them with them with the appropriate skilled construction trade occupation. Excludes construction laborers who do not primarily assist electricians.

2008 Employment: 105,600

Projected 2008-18 employment change: Much faster than average

Most significant source of postsecondary education or training: Short-term on-the-job training

Helpers—extraction workers

Help extraction craft workers, such as earth drillers, blasters and explosives workers, derrick operators, and mining machine operators, by performing duties of lesser skill. Duties include supplying equipment or cleaning work area. Excludes apprentice workers.

2008 Employment: 26,200

Projected 2008-18 employment change: Decline rapidly

Most significant source of postsecondary education or training: Short-term on-the-job training

Helpers—painters, paperhangers, plasterers, and stucco masons

Help painters, paperhangers, plasterers, or stucco masons by performing duties of lesser skill. Duties including using, supplying, or holding materials or tools, and cleaning work area and equipment. Excludes apprentice workers and report them with the appropriate skilled construction trade occupation. Excludes construction laborers who do not primarily assist painters, paperhangers, plasterers, or stucco masons.

2008 Employment: 19,400

Projected 2008-18 employment change: Decline slowly

Most significant source of postsecondary education or training: Short-term on-the-job training

Helpers—pipelayers, plumbers, pipefitters, and steamfitters

Help pipelayers, plumbers, pipefitters, or steamfitters by performing duties of lesser skill. Duties including using, supplying, or holding materials or tools, and cleaning work area and equipment. Excludes apprentice workers and report them with the appropriate skilled construction trade occupation. Excludes construction laborers who do not primarily assist pipelayers, plumbers, pipefitters or steamfitters.

2008 Employment: 80,300

Projected 2008-18 employment change: Much faster than average

Most significant source of postsecondary education or training: Short-term on-the-job training

Helpers—roofers

Help roofers by performing duties of lesser skill. Duties include using, supplying, or holding materials or tools, and cleaning work area and equipment. Excludes apprentice workers and report them with the appropriate skilled construction trade occupation. Excludes construction laborers who do not primarily assist roofers.

2008 Employment: 18,700

Projected 2008-18 employment change: Decline slowly

Most significant source of postsecondary education or training: Short-term on-the-job training

Highway maintenance workers

Maintain highways, municipal and rural roads, airport runways, and rights-of-way. Duties include patching broken or eroded pavement, repairing guard rails, highway markers, and snow fences. May also mow or clear brush from along road or plow snow from roadway. Excludes tree trimmers and pruners.

2008 Employment: 145,900

Projected 2008-18 employment change: About as fast as average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Mine cutting and channeling machine operators

Operate machinery—such as longwall shears, plows, and cutting machines—to cut or channel along the face or seams of coal mines, stone quarries, or other mining surfaces to facilitate blasting, separating, or removing minerals or materials from mines or from the earth's surface. Includes shale planers.

2008 Employment: 9,400

Projected 2008-18 employment change: More slowly than average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Rail-track laying and maintenance equipment operators

Lay, repair, and maintain track for standard or narrow-gauge railroad equipment used in regular railroad service or in plant yards, quarries, sand and gravel pits, and mines. Includes ballast cleaning machine operators and railroad bed tamping machine operators.

2008 Employment: 15,500

Projected 2008-18 employment change: Faster than average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Rock splitters, quarry

Separate blocks of rough dimension stone from quarry mass using jackhammer and wedges.

2008 Employment: 4,400

Projected 2008-18 employment change: Little or no change

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Roof bolters, mining

Operate machinery to install roof support bolts in underground mine.

2008 Employment: 5,100

Projected 2008-18 employment change: Decline slowly

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Rotary drill operators, oil and gas

Set up or operate a variety of drills to remove petroleum products from the earth and to find and remove core samples for testing during oil and gas exploration.

2008 Employment: 28,600

Projected 2008-18 employment change: Decline rapidly

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Roustabouts, oil and gas

Assemble or repair oil field equipment using hand and power tools. Perform other tasks as needed.

2008 Employment: 65,700

Projected 2008-18 employment change: Decline rapidly

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Septic tank servicers and sewer pipe cleaners

Clean and repair septic tanks, sewer lines, or drains. May patch walls and partitions of tank, replace damaged drain tile, or repair breaks in underground piping.

2008 Employment: 25,900

Projected 2008-18 employment change: Much faster than average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Service unit operators, oil, gas, and mining

Operate equipment to increase oil flow from producing wells or to remove stick pipe, casing, tools, or other obstructions from drilling wells. May also perform similar services in mining exploration operations. Includes fishing-tool technicians.

2008 Employment: 39,100

Projected 2008-18 employment change: Decline rapidly

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Installation, maintenance, and repair occupations**Bicycle repairers**

Repair and service bicycles.

2008 Employment: 10,100

Projected 2008-18 employment change: Faster than average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Commercial divers

Work below surface of water, using scuba gear to inspect, repair, remove, or install equipment and structures. May use a variety of power and hand tools, such as drills, sledgehammers, torches, and welding equipment. May conduct tests or experiments, rig explosives, or photograph structures or marine life. Excludes fishers and related fishing workers, athletes and sports competitors, and police and sheriff's patrol officers.

2008 Employment: 2,400

Projected 2008-18 employment change: More slowly than average

Most significant source of postsecondary education or training: Postsecondary vocational award

Control and valve installers and repairers, except mechanical door

Install, repair, and maintain mechanical regulating and controlling devices, such as electric meters, gas regulators, thermostats, safety and flow valves, and other mechanical governors.

2008 Employment: 44,500

Projected 2008-18 employment change: Little or no change

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Fabric menders, except garment

Repair tears, holes, and other defects in fabrics, such as draperies, linens, parachutes, and tents.

2008 Employment: 1,100

Projected 2008-18 employment change: Decline rapidly

Most significant source of postsecondary education or training: Moderate-term on-the-job training

First-line supervisors/managers of mechanics, installers, and repairers

Supervise and coordinate the activities of mechanics, installers, and repairers. Excludes team or work leaders.

2008 Employment: 448,500

Projected 2008-18 employment change: More slowly than average

Most significant source of postsecondary education or training: Work experience in a related occupation

Helpers—installation, maintenance, and repair workers

Help installation, maintenance, and repair workers in maintenance, parts replacement, and repair of vehicles, industrial machinery, and electrical and electronic equipment. Perform duties, such as furnishing tools, materials, and supplies to other workers; cleaning work area, machines, and tools; and holding materials or tools for other workers.

2008 Employment: 150,900

Projected 2008-18 employment change: About as fast as average

Most significant source of postsecondary education or training: Short-term on-the-job training

Locksmiths and safe repairers

Repair and open locks; make keys; change locks and safe combinations; and install and repair safes.

2008 Employment: 22,100

Projected 2008-18 employment change: About as fast as average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Manufactured building and mobile home installers

Move or install mobile homes or prefabricated buildings.

2008 Employment: 10,300

Projected 2008-18 employment change: More slowly than average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Mechanical door repairers

Install, service, or repair opening and closing mechanisms of automatic doors and hydraulic door closers. Includes garage door mechanics.

2008 Employment: 17,100

Projected 2008-18 employment change: About as fast as average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Recreational vehicle service technicians

Diagnose, inspect, adjust, repair, or overhaul recreational vehicles including travel trailers. May specialize in maintaining gas, electrical, hydraulic, plumbing, or chassis/towing systems as well as repairing generators, appliances, and interior components. Includes workers who perform customized van conversions. Excludes automotive service technicians and mechanics, and bus and truck mechanics and diesel engine specialists who also work on recreation vehicles.

2008 Employment: 13,700

Projected 2008-18 employment change: About as fast average

Most significant source of postsecondary education or training: Long-term on-the-job training

Refractory materials repairers, except brickmasons

Build or repair furnaces, kilns, cupolas, boilers, converters, ladles, soaking pits, ovens, etc., using refractory materials.

2008 Employment: 2,500

Projected 2008-18 employment change: Decline slowly

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Riggers

Set up or repair rigging for construction projects, manufacturing plants, logging yards, ships and shipyards, or for the entertainment industry.

2008 Employment: 13,500

Projected 2008-18 employment change: Little or no change

Most significant source of postsecondary education or training: Short-term on-the-job training

Security and fire alarm systems installers

Install, program, maintain, and repair security and fire alarm wiring and equipment. Ensure that work is in accordance with relevant codes. Excludes electricians who do a broad range of electrical wiring.

2008 Employment: 66,200

Projected 2008-18 employment change: Much faster than average

Most significant source of postsecondary education or training: Postsecondary vocational award

Signal and track switch repairers

Install, inspect, test, maintain, or repair electric gate crossings, signals, signal equipment, track switches, section lines, or intercommunications systems within a railroad system.

2008 Employment: 6,800

Projected 2008-18 employment change: Little or no change

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Tire repairers and changers

Repair and replace tires.

2008 Employment: 103,200

Projected 2008-18 employment change: Little or no change

Most significant source of postsecondary education or training: Short-term on-the-job training

Production occupations

Cementing and gluing machine operators and tenders

Operate or tend cementing and gluing machines to join items for further processing or to form a completed product. Processes include joining veneer sheets into plywood; gluing paper; joining rubber and rubberized fabric parts, plastic, simulated leather, or other materials. Excludes shoe machine operators and tenders.

2008 Employment: 19,800

Projected 2008-18 employment change: Decline rapidly

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Chemical equipment operators and tenders

Operate or tend equipment to control chemical changes or reactions in the processing of industrial or consumer products. Equipment used includes devulcanizers, steam-jacketed kettles, and reactor vessels. Excludes chemical plant and system operators.

2008 Employment: 53,000

Projected 2008-18 employment change: Decline rapidly

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Chemical plant and system operators

Control or operate an entire chemical process or system of machines.

2008 Employment: 45,100

Projected 2008-18 employment change: Decline rapidly

Most significant source of postsecondary education or training: Long-term on-the-job training

Cleaning, washing, and metal pickling equipment operators and tenders

Operate or tend machines to wash or clean products, such as barrels or kegs, glass items, tin plate, food, pulp, coal, plastic, or rubber, to remove impurities.

2008 Employment: 18,000

Projected 2008-18 employment change: Decline slowly

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Cooling and freezing equipment operators and tenders

Operate or tend equipment, such as cooling and freezing units, refrigerators, batch freezers, and freezing tunnels, to cool or freeze products, food, blood plasma, and chemicals.

2008 Employment: 9,900

Projected 2008-18 employment change: Little or no change

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Crushing, grinding, and polishing machine setters, operators, and tenders

Set up, operate, or tend machines to crush, grind, or polish materials, such as coal, glass, grain, stone, food, or rubber.

2008 Employment: 41,200

Projected 2008-18 employment change: Little or no change

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Cutters and trimmers, hand

Use hand tools or hand-held power tools to cut and trim a variety of manufactured items, such as carpet, fabric, stone, glass, or rubber.

2008 Employment: 24,200

Projected 2008-18 employment change: Decline rapidly

Most significant source of postsecondary education or training: Short-term on-the-job training

Cutting and slicing machine setters, operators, and tenders

Set up, operate, or tend machines that cut or slice materials, such as glass, stone, cork, rubber, tobacco, food, paper, or insulating material. Excludes woodworking machines setters, operators, and tenders; cut-

ting, punching, and press machine setters, operators, and tenders, metal and plastic; and textile cutting machine setters, operators, and tenders.

2008 Employment: 75,200

Projected 2008-18 employment change: Decline slowly

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Etchers and engravers

Engrave or etch metal, wood, rubber, or other materials for identification or decorative purposes. Includes such workers as etcher-circuit processors, pantograph engravers, and silk screen etchers. Includes photoengravers with prepress technicians and workers.

2008 Employment: 12,000

Projected 2008-18 employment change: Little or no change

Most significant source of postsecondary education or training: Long-term on-the-job training

Extruding, forming, pressing, and compacting machine setters, operators, and tenders

Set up, operate, or tend machines, such as glass forming machines, plodder machines, and tuber machines, to shape and form products, such as glassware, food, rubber, soap, brick, tile, clay, wax, tobacco, or cosmetics. Excludes paper goods machine setters, operators, and tenders; and shoe machine operators and tenders.

2008 Employment: 83,300

Projected 2008-18 employment change: Faster than average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

First-line supervisors/managers of production and operating workers

Supervise and coordinate the activities of production and operating workers, such as inspectors, precision workers, machine setters, and operators, assemblers, fabricators, and plant and system operators. Excludes team or work leaders.

2008 Employment: 681,200

Projected 2008-18 employment change: Decline slowly

Most significant source of postsecondary education or training: Work experience in a related occupation

Furnace, kiln, oven, drier, and kettle operators and tenders

Operate or tend heating equipment other than basic metal, plastic or food processing equipment. Includes activities, such as annealing glass, drying lumber, curing rubber, removing moisture from materials, or boiling soap.

2008 Employment: 24,500

Projected 2008-18 employment change: Decline slowly

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Gas plant operators

Distribute or process gas for utility companies and others by controlling compressors to maintain specified pressures on main pipelines.

2008 Employment: 14,900

Projected 2008-18 employment change: Decline slowly

Most significant source of postsecondary education or training: Long-term on-the-job training

Grinding and polishing workers, hand

Grind, sand, or polish, using hand tools or hand-held power tools, a variety of metal, wood, stone, clay, plastic, or glass objects. Includes chippers, buffers, and finishers.

2008 Employment: 40,100

Projected 2008-18 employment change: About as fast as average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Helpers—production workers

Help production workers by performing duties of lesser skill. Duties include supplying or holding materials or tools, and cleaning work area and equipment. Excludes apprentice workers.

2008 Employment: 484,000

Projected 2008-18 employment change: Little or no change

Most significant source of postsecondary education or training: Short-term on-the-job training

Mixing and blending machine setters, operators, and tenders

Set up, operate, or tend machines to mix or blend materials, such as chemicals, tobacco, liquids, color pigments, or explosive ingredients. Excludes food batchmakers.

2008 Employment: 141,500

Projected 2008-18 employment change: Faster than average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Molders, shapers, and casters, except metal and plastic

Mold, shape, form, cast, or carve products such as food products, figurines, tile, pipes, and candles consisting of clay, glass, plaster, concrete, stone, or combinations of materials.

2008 Employment: 48,200

Projected 2008-18 employment change: More slowly than average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Packaging and filling machine operators and tenders

Operate or tend machines to prepare industrial or consumer products for storage or shipment. Includes cannery workers who pack food products.

2008 Employment: 349,000

Projected 2008-18 employment change: Little or no change

Most significant source of postsecondary education or training: Short-term on-the-job training

Paper goods machine setters, operators, and tenders

Set up, operate, or tend paper goods machines that perform a variety of functions, such as converting, sawing, corrugating, banding, wrapping, boxing, stitching, forming, or sealing paper or paperboard sheets into products.

2008 Employment: 103,300

Projected 2008-18 employment change: Decline rapidly

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Petroleum pump system operators, refinery operators, and gaugers

Control the operation of petroleum refining or processing units. May specialize in controlling manifold and pumping systems, gauging or testing oil in storage tanks, or regulating the flow of oil into pipelines.

2008 Employment: 47,100

Projected 2008-18 employment change: Decline rapidly

Most significant source of postsecondary education or training: Long-term on-the-job training

Separating, filtering, clarifying, precipitating, and still machine setters, operators, and tenders

Set up, operate, or tend continuous flow or vat-type equipment; filter presses; shaker screens; centrifuges; condenser tubes; precipitating, fermenting, or evaporating tanks; scrubbing towers; or batch stills. These machines extract, sort, or separate liquids, gases, or solids from other materials to recover a refined product. Includes dairy processing equipment operators. Excludes chemical equipment operators and tenders.

2008 Employment: 40,800

Projected 2008-18 employment change: About as fast as average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Tire builders

Operate machines to build tires from rubber components.

2008 Employment: 21,400

Projected 2008-18 employment change: Decline rapidly

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Transportation and material moving occupations

Aircraft cargo handling supervisors

Direct ground crew in the loading, unloading, securing, and staging of aircraft cargo and baggage. Determine the quantity and orientation of cargo and compute aircraft center of gravity. May accompany aircraft as member of flight crew and monitor and handle cargo in flight, and assist and brief passengers on safety and emergency procedures. Includes loadmasters.

2008 Employment: 4,900

Projected 2008-18 employment change: About as fast as average

Most significant source of postsecondary education or training: Work experience in a related occupation

Airfield operations specialists

Ensure the safe takeoff and landing of commercial and military aircraft. Duties include coordination between air-traffic control and maintenance personnel; dispatching; using airfield landing and navigational aids; implementing airfield safety procedures; monitoring and maintaining flight records; and applying knowledge of weather information.

2008 Employment: 8,100

Projected 2008-18 employment change: About as fast as average

Most significant source of postsecondary education or training: Long-term on-the-job training

Ambulance drivers and attendants, except emergency medical technicians

Drive ambulance or assist ambulance drivers in transporting sick, injured, or convalescent persons. Assist in lifting patients.

2008 Employment: 22,200

Projected 2008-18 employment change: About as fast as average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Bridge and lock tenders

Operate and tend bridges, canal locks, and lighthouses to permit marine passage on inland waterways, near shores, and at danger points in waterway passages. May supervise such operations. Includes draw-bridge operators, lock tenders and operators, and slip bridge operators.

2008 Employment: 4,700

Projected 2008-18 employment change: About as fast as average
Most significant source of postsecondary education or training: Short-term on-the-job training

First-line supervisors/managers of helpers, laborers, and material movers, hand

Supervise and coordinate the activities of helpers, laborers, or material movers.

2008 Employment: 183,500

Projected 2008-18 employment change: More slowly than average
Most significant source of postsecondary education or training: Work experience in a related occupation

First-line supervisors/managers of transportation and material moving machine and vehicle operators

Directly supervise and coordinate activities of transportation and material-moving machine and vehicle operators and helpers.

2008 Employment: 217,600

Projected 2008-18 employment change: Decline slowly
Most significant source of postsecondary education or training: Work experience in a related occupation

Parking lot attendants

Park automobiles or issue tickets for customers in parking lot or garage. May collect fee.

2008 Employment: 136,200

Projected 2008-18 employment change: More slowly than average
Most significant source of postsecondary education or training: Short-term on-the-job training

Service station attendants

Service automobiles, buses, trucks, boats, and other automotive or marine vehicles with fuel, lubricants, and accessories. Collect payment for services and supplies. May lubricate vehicle, change motor oil, install antifreeze, or replace lights or other accessories, such as windshield wiper blades or fan belts. May repair or replace tires.

2008 Employment: 83,300

Projected 2008-18 employment change: Little or no change
Most significant source of postsecondary education or training: Short-term on-the-job training

Traffic technicians

Conduct field studies to determine traffic volume, speed, effectiveness of signals, adequacy of lighting, and other factors influencing traffic conditions, under direction of traffic engineer.

2008 Employment: 7,400

Projected 2008-18 employment change: About as fast as average
Most significant source of postsecondary education or training: Short-term on-the-job training

Transportation inspectors

Inspect equipment or goods in connection with the safe transport of cargo or people. Includes rail transport inspectors, such as freight inspectors, car inspectors, rail inspectors, and other nonprecision inspectors of other types of transportation vehicles.

2008 Employment: 26,900

Projected 2008-18 employment change: Faster than average
Most significant source of postsecondary education or training: Work experience in a related occupation

Assumptions and Methods Used in Preparing Employment Projections

Occupational statements in the *Handbook* include numerical projections of the change in employment between 2008 and 2018. These projections are developed using the Bureau of Labor Statistics (BLS) employment projections model system. Projections of occupational employment are the final step in the system; these steps are listed in the discussion of methods below. A discussion of projections methods also is accessible on the Internet at http://www.bls.gov/opub/hom/homch13_a.htm. The November 2009 *Monthly Labor Review* presents a comprehensive discussion of the 2008-18 projections of the economy, labor force, and industry and occupation employment. The winter 2009-10 *Occupational Outlook Quarterly* presents the projections in a series of charts.

The projections reflect the knowledge and judgment of staff in the BLS Office of Occupational Statistics and Employment Projections and of knowledgeable people from other BLS offices, other government agencies, colleges and universities, industries, unions, professional societies, and trade associations, who furnished data and information, prepared reports, or reviewed the projections. BLS takes full responsibility, however, for the projections.

Assumptions. The information in the *Handbook* is based on an economic projection which, in turn, is based on assumptions about several key variables that affect the U.S. economy. The United States entered a severe recession in December 2007, leading to declining output and high unemployment. However, BLS expects the economy to return to its long-term trend rate of growth over the next decade. Consequently, the employment projections are based on an anticipated growth rate of 2.4 percent of Gross Domestic Product (GDP) per year from 2008 to 2018.

Other key assumptions include slower growth in the labor force (0.8 percent annually from 2008 to 2018 compared with 1.1 percent annually over the past 10-year period, 1998–2008) as a large number of workers retire, and a slowdown in labor productivity (1.8 percent average annual growth compared with 2.6 percent annually over the 1998–2008 period). The projections model also assumes an unemployment rate of 5.1 percent in 2018.

Growth in personal consumption expenditures, the largest single component of GDP, is expected to slow to 2.5 percent annually from 2008-18, down from the 3 percent annual average from 1998–2008. Underlying this assumption is an expected slowdown in the growth of spending on non-durable goods (defined as goods lasting less than three years) and durable goods (such as cars and large appliances). Growth in spending on consumer services is anticipated to be stronger than overall personal consumption growth, however, driven in part by continued increases in medical care spending.

Residential investment (the construction of new homes and dwellings) is expected to increase 5.1 percent annually over the projections period, reflecting the severe housing slump

downturn that began in 2006 and the historically low starting point. Non-residential investment, which includes purchases by firms of equipment and software as well as construction of non-residential structures, should see 3.0 percent growth per year from 2008 to 2018, similar to the 3.1 percent annual growth from 1998-2008. Underlying this assumption is an anticipated slowdown (compared to the prior decade) in non-residential structure investment. Total investment, consisting of residential plus non-residential investment, is expected to increase by 3.9 percent annually from 2008-18, reaching 15.7 percent of GDP in 2018, higher than the 14.0 percent mark of 2008.

BLS expects the trade deficit to be 4.4 percent of GDP in 2018, below the 2004 peak of 5.6 percent, but still equivalent to about \$650 billion. Inflation is expected to average 1.9 percent from 2008 to 2018, reflecting low levels of inflation during the initial years due to the recession, followed by a return to the long-term trend.

Although BLS considers these assumptions reasonable, the economy may follow a different course, resulting in a different pattern of occupational growth. Real growth also could be different because most occupations are sensitive to a much wider variety of factors than those considered in the various projections models. Unforeseen changes in consumer, business, or government spending patterns and in the ways in which goods and services are produced as well as advances in technology could greatly alter the growth of individual occupations.

Methods. This section summarizes the steps involved in BLS projections of employment by occupation. BLS uses U.S. Census Bureau projections of the population by age, gender, ethnicity, and race, combined with projections of labor force participation rates—the percent of the specified group of the population working or seeking work—to arrive at estimates of the civilian labor force for the projected year.

BLS projections are developed in a series of steps, each of which is based on separate projections procedures, models, and various related assumptions. These steps, or system components, deal with:

1. Size and demographic composition of the labor force
2. Growth of the aggregate economy (GDP)
3. Inter-industry relationships (input-output) used to allocate components of final demand to commodities
4. Industry output and employment
5. Occupational employment

These components provide the overall analytical framework needed to develop detailed employment projections. Each component is developed in order, with the results of each used as input for successive components and with some results feeding back into earlier steps. Each step is repeated a number of times to ensure internal consistency as assumptions and results are reviewed and revised.

The projections of the labor force and assumptions about other demographic variables, fiscal and monetary policies, foreign economic activity, and energy prices form the input to the macroeconomic model. This model projects GDP (all final sales in the economy) and the distribution of GDP by its major demand components (consumer expenditures, investment, government consumption and gross investment, and exports and imports).

Estimating the intermediate flows of goods and services—for example, the steel incorporated into automobiles—is the next step in the projections process. The resulting estimates of demand for goods and services are used to project industry output of final products as well as total output by industry.

Industry output of goods and services is then used to estimate industry employment. Trends in productivity are used to evaluate the future output per worker hour, and additional analysis is used to calculate worker hours. These estimates, along with output projections, are used to develop the final industry employment projections.

An industry-occupation matrix, also known as the National Employment Matrix, is used to project employment for wage and salary workers. The matrix shows occupational staffing patterns—each occupation as a percent of employment in every industry. The matrix covering the 2008-18 period includes 276 detailed industries and 750 detailed occupations. Data for current staffing patterns in the matrix come from the BLS Occupational Employment Statistics (OES) survey, which collects data from employers on a 3-year cycle.

The occupational staffing patterns for each industry were projected based on anticipated changes in the ways in which goods and services are produced, and were then applied to projected

industry employment. The resulting employment was summed across industries to derive total wage and salary employment by occupation. Using this method, rapid employment growth is projected for healthcare workers, such as pharmacists and physical therapists, while employment of newspaper publishing workers, such as reporters and correspondents, is expected to decline, reflecting the projected changes in the healthcare and newspaper publishing industries, respectively.

Employment in an occupation also may grow or decline as a result of many other factors. For example, relatively fast growth is expected among computer systems analysts and software engineers as organizations continue to adopt increasingly sophisticated technology. On the other hand, automation, the expanding use of computers, and developments in computer software will result in declining employment among procurement clerks, order clerks, and word processors and typists. The projected-year matrix incorporates these expected changes.

Data on self-employed workers in each occupation come from the Current Population Survey (CPS). Numbers of self-employed workers were projected separately.

Replacement needs. In most occupations, replacement needs provide more job openings than growth. Replacement openings occur as people leave occupations. Some individuals transfer to other occupations as a step up the career ladder or to change careers; some stop working temporarily, perhaps to return to school or care for a family; other workers—retirees for example—leave the labor force permanently. A discussion of replacements and the methods used to prepare estimates is presented on the Bureau's Employment Projections homepage at <http://www.bls.gov/emp>.

Occupational Information Network Coverage

The *Occupational Information Network* (O*NET), which replaced the *Dictionary of Occupational Titles*, is used by public employment service offices to classify and place job-seekers. O*NET was developed by job analysts. The information on job duties, knowledge and skills, education and training, and other occupational characteristics comes directly from workers and employers. Information on O*NET is available from O*NET Project, U.S. Department of Labor/ETA, 200 Constitution Ave. NW., Room S-4231, Washington, DC 20210-0001. Telephone (202) 693-3660. Internet: <http://www.doleta.gov/programs/onet>.

The structure of O*NET reflects the *Standard Occupational Classification* (SOC) system, and represents the Federal

Government's effort to analyze the occupational structure in the United States and to provide a national occupational classification system. The 2000 SOC includes about 820 detailed occupations. The Government is developing the 2010 SOC. Information on the SOC, including its occupational structure, is available on the Internet: <http://www.bls.gov/soc>.

Occupational statements in this 2010-11 edition of the *Handbook* are based on the 2000 SOC, which relates to or matches the definitions used in the Bureau's Occupational Employment Statistics (OES) survey—the principal source of occupational employment data in the *Handbook*. The table below lists O*NET codes and titles that are related to occupations in the *Handbook*.
