September 13, 2005

Producer Price Indexes -- August 2005

The Producer Price Index for Finished Goods rose 0.6 percent in August, seasonally adjusted, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. This increase followed a 1.0-percent gain in July and no change in June. At the earlier stages of processing, prices received by manufacturers of intermediate goods advanced 0.7 percent, after moving up 1.0 percent in the preceding month. The crude goods index climbed 2.3 percent in August, following a 6.7-percent rise in July. (See table A.)

Hurricane Katrina

Hurricane Katrina struck Florida and the Gulf Coast after the Producer Price Index's August pricing date, and therefore did not affect the PPI in August. The PPI pricing date for September 2005 is Tuesday, September 13.

Table A. Monthly and annual percent changes in selected stage-of-processing price indexes, seasonally adjusted

Month	Finished goods					Inter- mediate goods	Crude goods
	Total	Foods	Energy	Except foods and energy	Change in finished goods from 12 months ago (unadj.)

Aug.	.6	-.3	3.7	0	5.1	.7	2.3

r=revised. Some of the figures shown above and elsewhere in this release may differ from those previously reported because data for April 2005 have been revised to reflect the availability of late reports and corrections by respondents.

Among finished goods, prices for goods other than foods and energy showed no change in August, after increasing 0.4 percent in the prior month. The finished energy goods index rose 3.7 percent, compared with a 4.4-percent gain in July. Finished consumer foods prices declined 0.3 percent in August, the same rate of decrease as in the preceding month.

Before seasonal adjustment, the Producer Price Index for Finished Goods advanced 0.5 percent in August to 156.1 (1982=100). From August 2004 to August 2005, prices for finished goods rose 5.1 percent. Over the same period, the index for finished energy goods increased 19.2 percent, prices for finished goods other than foods and energy went up 2.4 percent, and the finished consumer foods index rose 1.2 percent. For the 12 months ended August 2005, intermediate goods prices moved up 6.1 percent, and the crude goods index increased 11.3 percent.

Finished goods

The index for finished consumer goods other than foods and energy edged down 0.1 percent in August, after rising 0.4 percent in the previous month. Accounting for about half of this downturn, prices for passenger cars declined 1.3 percent, following a 1.5-percent gain in July. The indexes for alcoholic beverages, tires, and periodical circulation also fell, after advancing in the preceding month. The rates of increase in prices for pharmaceutical preparations and light motor trucks slowed from July to August. By contrast, the cosmetics and other toilet preparations index inched up 0.1 percent in August, compared with a 0.4-percent decrease a month earlier. Prices for home electronic equipment and for women's, girls', and infants' apparel also turned up, while the sanitary paper products index rose more than it had in July. (See table 2.)

Table B. Monthly and annual percent changes in selected price indexes for intermediate goods and crude goods, seasonally adjusted

Month	Intermediate goods				Crude goods			
	Foods	Energy	Except foods and energy	Change in intermediate goods from 12 months ago (unadj.)	Foods	Energy (unadj.)	Except foods and energy	Change in crude goods from 12 months ago (unadj.)
2004

r= revised. Some of the figures shown above and elsewhere in this release may differ from those previously reported because data for April 2005 have been revised to reflect the availability of late reports and corrections by respondents.

Prices for capital equipment decreased 0.1 percent in August, following a 0.5-percent rise in the preceding month. The civilian aircraft index showed no change, after increasing 1.0 percent in July. Prices for passenger cars, commercial furniture, and communication and related equipment turned down, following gains in the prior month. The indexes for light motor trucks and heavy motor trucks advanced less than they had in July. Alternatively, railroad equipment prices moved up 0.9 percent in August, after dropping 0.6 percent in the previous month. The indexes for agricultural machinery and equipment and for metal cutting machine tools also turned up, following declines a month earlier. Electronic computer prices fell less in August than in the prior month, while the index for pumps, compressors, and equipment went up, after showing no change in July.

Subsequent to a 4.4-percent increase in July, prices for finished energy goods rose 3.7 percent in August. The residential natural gas index moved up 2.5 percent, compared with a 3.7-percent gain in the previous month. The rates of increase in the indexes for gasoline and residential electric power also slowed from July to August, and home heating oil prices fell, after climbing in the prior month. By contrast, the liquefied petroleum gas index jumped 10.7 percent in August, following a 5.6-percent rise in the preceding month. Prices for diesel fuel and kerosene also advanced more than they had in July, while the finished lubricants index turned up in August.

Prices for finished consumer foods decreased 0.3 percent for the second consecutive month. In August, declining prices for beef and veal, eggs for fresh use, dairy products, fresh fruits and melons, and roasted coffee outweighed rising prices for pork, processed young chickens, fresh and dry vegetables, soft drinks, and finfish and shellfish.

Intermediate goods

The Producer Price Index for Intermediate Materials, Supplies, and Components advanced 0.7 percent in August, following a 1.0-percent gain in July. Most of this slower rate of increase can be attributed to prices for intermediate energy goods, which rose less in August than they had a month earlier. The index for intermediate foods and feeds turned down, after moving up in July. By contrast, prices for materials and components for construction were unchanged in August, after falling in the previous month. The materials for nondurable manufacturing index increased slightly more than it had in July, while materials for durable manufacturing prices fell slightly less than in the preceding month. In August, the index for intermediate goods excluding foods and energy decreased 0.1 percent, its fourth consecutive monthly decline. (See table B.)

Prices for intermediate energy goods climbed 3.3 percent in August, following a 5.2-percent advance in July. The gasoline index rose 9.5 percent in August, compared with a 10.9-percent gain a month earlier. Prices for residual fuel and commercial natural gas also went up at slower rates than they had in July. The indexes for jet fuels, commercial electric power, and home heating oil turned down in August, after moving up in the prior month. Alternatively, diesel fuel prices increased 3.1 percent, following a 0.2-percent advance in July. The indexes for liquefied petroleum gas and natural gas to electric utilities also rose more in August than in the previous month. (See table 2.)

The index for intermediate foods and feeds declined 0.4 percent in August, after increasing 0.9 percent in July. Prices for prepared animal feeds fell 1.6 percent, subsequent to a 2.7-percent jump in the prior month. The dairy products index also turned down in August. Prices for beef and veal and for flour decreased at faster rates than in July, while the index for processed young chickens rose less than it had in the previous month. By contrast, pork prices advanced 4.8 percent in August, compared with a 0.6-percent drop a month earlier. The indexes for shortening and cooking oils, sausages and deli meats, and refined sugar and byproducts also moved up, following declines in July.

The index for materials and components for construction was unchanged in August, after falling 0.2 percent in July. Prices for asphalt felts and coatings jumped 8.5 percent, following no change in the preceding month. The indexes for building paper and board and for steel mill products declined less in August than they had a month earlier. Prices for gypsum products, nonferrous wire and cable, and paving mixtures and blocks rose more than they had in July. Alternatively, prices for concrete products advanced 0.6 percent, following a 1.9-percent increase in July. The plastic construction products index decreased at a faster rate in August compared with the prior month, while prices for millwork moved down after rising in July.

The materials for nondurable manufacturing index climbed 0.2 percent in August, following a 0.1-percent advance in the preceding month. In August, rising prices for primary basic organic chemicals, inedible fats and oils, phosphates, paint materials, and synthetic fibers outweighed falling prices for paperboard, intermediate basic organic chemicals, plastic resins and materials, and processed yarns and threads.

The materials for durable manufacturing index declined 0.8 percent in August, after moving down 0.9 percent in July. In August, decreasing prices for both hot and cold rolled steel sheet and strip; cold finished steel bars; hot rolled steel bars, plates, and structural shapes; aluminum mill shapes; building paper and board; and plywood more than offset increasing prices for primary nonferrous metals, copper and brass mill shapes, semifinished steel mill products, and prepared paint.

Crude goods

The Producer Price Index for Crude Materials for Further Processing rose 2.3 percent in August, following a 6.7-percent advance in July. Prices for crude energy materials increased less in August than in the prior month. The index for crude foodstuffs and feedstuffs turned down, after remaining unchanged in July. By contrast, prices for basic industrial materials increased more than in the previous month. (See table B.)

The index for crude energy materials gained 3.8 percent in August, after climbing 12.8 percent in July. Prices for natural gas rose 4.6 percent, following a 14.9-percent surge in the previous month. Crude petroleum prices went up 3.7 percent in August, after jumping 13.1 percent in July. The coal index moved down 0.8 percent, after edging up 0.3 percent a month earlier. (See table 2.)

The index for crude foodstuffs and feedstuffs declined 1.4 percent in August, after remaining unchanged in July. The fluid milk index decreased 3.5 percent in August, compared with a 6.2-percent increase in the prior month. Prices for corn and soybeans also turned down, following gains in July. The indexes for Irish potatoes for processing and unprocessed finfish advanced less in August than they had a month earlier. By contrast, the index for slaughter cattle fell 2.2 percent, following a 3.9-percent decline in July. Prices for wheat also declined less in August than they had a month earlier. The indexes for slaughter broilers and fryers and for fresh vegetables (except potatoes) turned up, following declines in July. Prices for slaughter hogs increased at more than they had in the previous month.

Prices for crude nonfood materials less energy advanced 4.6 percent in August, following a 3.1-percent gain in July. Most of this acceleration is attributable to the index for iron and steel scrap, which jumped 19.7 percent following a 2.7-percent advance in the prior month. The indexes for gold ores and for construction sand, gravel, and crushed stone also increased at faster rates in August, compared with July. Prices for pulpwood turned up, after falling a month earlier. Conversely, the index for copper ores decreased 3.6 percent, after climbing 20.7 percent in July. Prices for raw cotton and miscellaneous roundwood products also turned down, after rising in the previous month. The index for copper base scrap increased less in August than it had a month earlier, and prices for iron ore were unchanged, after advancing in July.

Net output price indexes for mining, manufacturing, and services industries

Mining. The Producer Price Index for the Net Output of Total Mining Industries advanced 3.6 percent in August, after rising 10.4 percent in the preceding month. (Net output price indexes are not seasonally adjusted.) This slower rate of increase is mostly due to prices received by the crude petroleum and natural gas extraction industry, which moved up 5.3 percent, following a 13.3-percent gain in July. The industry indexes for natural gas liquid extraction and for oil and gas well drilling also rose less than they had in the prior month. Prices paid to miners of copper ore and nickel ore, underground bituminous coal, and phosphate rock fell in August, after rising a month earlier. By contrast, prices received by the gold ore mining industry advanced 5.0 percent, compared with a 0.2-percent gain in July. The industry indexes for oil and gas operations support activities and for crushed and broken granite mining and quarrying turned up, after falling a month earlier. In August, the Producer Price Index for Total Mining Industries was 201.1 (December 1984=100), 26.2 percent above its year-ago level.

Manufacturing. The Producer Price Index for the Net Output of Total Manufacturing Industries rose 0.5 percent in August, after climbing 0.9 percent in the prior month. Leading this deceleration, prices received by the petroleum and coal products manufacturing industry group advanced 5.1 percent, following an 8.4-percent gain in July. The industry group indexes for transportation equipment, food manufacturing, computer and electronic products, and furniture and related product manufacturing turned down in August, after rising in the preceding month. Conversely, prices received by the chemical manufacturing industry group turned up 0.3 percent, following a 0.1-percent decline in the previous month. The industry group index for machinery rose in August, after showing no change a month earlier. Prices received by manufacturers of beverages and tobacco turned up, following declines in July. In August, the Producer Price Index for Total Manufacturing Industries was 151.6 (December 1984=100), 5.5 percent above its year-ago level.

Services. Among services industries in August, higher prices were received by investment banking and securities dealers, lessors of nonresidential buildings (except miniwarehouses), employee leasing services, direct property and casualty insurance carriers, and offices of certified public accountants. Alternatively, lower prices were paid to the industries for scheduled passenger air transportation, commercial banking, cellular and other wireless services, and hotels and motels (excluding casinos).

Producer Price Index data for September 2005 are scheduled to be released on Tuesday, October 18, 2005, at 8:30 a.m. (EDT).

Technical Note

Brief Explanation of Producer Prices Indexes

The Producer Price Index (PPI) of the Bureau of Labor Statistics (BLS) is a family of indexes that measure the average change over time in the prices received by domestic producers of goods and services. PPIs measure price change from the perspective of the seller. This contrasts with other measures, such as the Consumer Price Index (CPI). CPIs measure price change from the purchaser's perspective. Sellers' and purchasers' prices can differ due to government subsidies, sales and excise taxes, and distribution costs.

More than 8,000 PPIs for individual products and groups of products are released each month. PPIs are available for the products of virtually every industry in the mining and manufacturing sectors of the U.S. economy. New PPIs are gradually being introduced for the products of industries in the trade, finance, and services sectors of the economy.

More than 100,000 price quotations per month are organized into three sets of PPIs: (1) Stage-of-processing indexes; (2) commodity indexes; and (3) indexes for the net output of industries and their products. The stage-of-processing structure organizes products by class of buyer and degree of fabrication. The commodity structure organizes products by similarity of end use or material composition. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products.

Stage-of-Processing Indexes

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final-demand user, either an individual consumer or business firm. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durable goods such as automobiles, household furniture, and appliances, as well as nondurable goods such as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses nondurable, physically complete items purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

Commodity Indexes

The commodity classification structure of the PPI organizes products by similarity of end use or material composition, disregarding industry of origin. Fifteen major commodity groupings (2-digit commodity codes) make up the All Commodities Index. Each major commodity grouping includes (in descending order of aggregation) subgroups (3-digit), product classes (4-digit), subproduct classes (6-digit), and individual items (8-digit). Nearly all 8-digit commodities under the traditional commodity coding system are now derived from corresponding industry-classified product indexes. In such instances, movements in the traditional commodity price indexes and corresponding percent changes will be virtually identical to their industry-based counterparts, even if their index levels differ.

Industry Net-Output Price Indexes

PPIs for the net output of industries and their products are grouped according to the North American Industry Classification System (NAICS). Prior to the release of January 2004, industry-based PPIs were published according to the Standard Industrial Classification (SIC) system. Industry price indexes are compatible with other economic time series organized by industry, such as data on employment, wages, and productivity. Table 5 of the *PPI Detailed Report* includes data for NAICS industries and industry groups (3-, 4-, 5-, and 6-digit codes); Census product classes (7- and 8-digits), products (9-digits), and more detailed subproducts (11-digits); and, for some industries, indexes for other sources of revenue.

Indexes may represent one of three kinds of product indexes. Every industry has primary product indexes to show changes in prices received by establishments classified in the industry for products made primarily, but not necessarily exclusively, by that industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, most industries have secondary product indexes that show changes in prices received by establishments classified in the industry for products chiefly made in some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from sales of their products, for example, resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Data Collection

PPIs are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. The BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices submitted by survey respondents are effective on the Tuesday of the week containing the 13th day of the month. This survey is conducted primarily through the mail.

Price data are provided on a voluntary and confidential basis; only sworn BLS employees are allowed access to individual company price reports. BLS publishes price indexes instead of unit dollar prices. All PPIs are subject to revision 4 months after original publication to reflect the availability of late reports and corrections by respondents.

BLS periodically updates the PPI sample of survey respondents to better reflect current conditions when the structure, membership, technology, or product mix of an industry shifts significantly and to spread reporting burden among smaller firms. Results of these resampling efforts are incorporated into the PPI with the release of data for January and July.

As part of an ongoing effort to expand coverage to sectors of the economy other than mining and manufacturing, an increasing number of service sector industries have been introduced into the PPI. The following list of recently introduced industries includes the month and year in which an article describing the industry's content appeared in the *PPI Detailed Report*.

<i>Title</i>	<i>Code</i>	<i>PPI Detailed Report Issue</i>
	<i>SIC</i>	
Wireless telecommunications	4812	July 1999
Telephone communications, except radio telephone	4813	July 1995

Fitness and recreational sports centers	713940	July 2005

Weights

Weights for most traditional commodity groupings of the PPI, as well as weights for commodity-based aggregate indexes calculated using traditional commodity groupings, such as stage-of-processing indexes, currently reflect 1997 values of shipments as reported in the *Census of Manufactures* and other sources. From January 1996 through December 2001, PPI weights were derived from 1992 shipment values. Industry indexes also are now calculated with 1997 net output weights. This periodic update of the value weights used to calculate the PPI is done to more accurately reflect changes in production and marketing patterns in the economy. Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments within the industry to buyers outside the industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes, such as the PPI for All Commodities, are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently correct for this at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends.

Price Index Reference Base

Effective with publication of January 1988 data, many important PPI series (including stage-of-processing groupings and most commodity groups and individual items) were placed on a new reference base, 1982=100. From 1971 through 1987, the standard reference base for most PPI series was 1967=100. Except for rounding differences, the shift to the new reference base did not alter any previously published percent changes for affected PPI series. (See "Calculating Index Changes," below.) The 1982 reference base is not used for commodity indexes with a base later than December 1981 or for industry net output indexes and their products.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 14, "Producer Prices," in *BLS Handbook of Methods* (April 1997), Bulletin 2490. This document can be downloaded from the BLS Web site at (http://www.bls.gov/opub/hom/homch14_etc.htm), and reprints are available on request.

Calculating Index Changes

Each PPI measures price changes from a reference period which equals 100.0. An increase of 5.5 percent from the reference period in the Finished Goods Price Index, for example, is shown as 105.5. This change also can be expressed in dollars, as follows: Prices received by domestic producers of a sample of finished goods have risen from \$100 in 1982 to \$105.50. Likewise, a current index of 90.0 would indicate that prices received by producers of finished goods are 10 percent lower than they were in 1982.

Movements of price indexes from one month to another are usually expressed as percent changes, rather than as changes in index points. Index point changes are affected by the level of the index in relation to its base period, whereas percent changes are not. The following example shows the computation of index point and percent changes.

<i>Index point change</i>	
Finished Goods Price Index	107.5
Less previous index	104.0
Equals index point change	3.5
<i>Index percent change</i>	
Index point change	3.5
Divided by the previous index	104.0
Equals	0.034
Result multiplied by 100	0.034 x 100
Equals percent change	3.4

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, BLS publishes seasonally adjusted and unadjusted changes each month. Seasonally adjusted data are preferred for analyzing general price trends in the economy, because these data eliminate the effect of changes that normally occur at about the same time, and in about the same magnitude, every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying cyclical trends. Unadjusted data are of primary interest to users who need information that can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited when escalating long-term contracts such as purchasing agreements or real estate leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 807, September 1991, available on request from the BLS.)

In 1998, the PPI implemented the X-12-ARIMA Seasonal Adjustment Method; prior to that year the PPI employed the X-11 method. Each year, the seasonal status of most commodity indexes is re-evaluated to reflect more recent price behavior. Industry net output indexes are not seasonally adjusted. For time series that exhibit seasonal pricing patterns, new seasonal factors are estimated and applied to the unadjusted data for the previous 5 years. These updated seasonally adjusted indexes replace the most recent 5 years of seasonal data.

Seasonal factors may be applied to series using either a direct or aggregative method. Generally, commodity indexes are seasonally adjusted using direct seasonal adjustment, which produces a more complete elimination of seasonal movements than the aggregative method. However, the direct seasonal adjustment process may not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonal movements for stage-of-processing indexes are derived indirectly through an aggregative method that combines movements of a wide variety of subproduct class (6-digit) series.

Seasonally adjusted indexes can become problematic when previously stable and predictable price patterns abruptly change. If the new pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will become chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.

Since January 1988, the PPI has used Intervention Analysis Seasonal Adjustment methods to enhance the calculation of seasonal factors. With this technique, outlier values that may distort the seasonal pattern are removed from the data prior to applying the standard seasonal factor estimation procedure. For example, a possible economic cause for large price movements for petroleum-based products might have been the Persian Gulf War. In this case, intervention techniques allowed for better estimates of seasonally adjusted data. On the whole, very few series have required intervention. Out of nearly 900 seasonally adjusted series, only 16 interventions were performed in 1997.

For more information relating to seasonal adjustment methods, see (1) “Appendix A: Seasonal Adjustment Methodology at BLS,” in the *BLS Handbook of Methods* (April 1997), Bulletin 2490 and (2) “Summary of Changes to the PPI’s Seasonal Adjustment Methodology” in the January 1995 issue of *Producer Price Indexes*.

Producer Price Index Data Via the Internet

In 1995, the BLS began posting PPI series, news releases, and technical information to both a World Wide Web (WWW) site and a file transfer protocol (FTP) site. During the years following the introduction of PPI Internet services, usage of these sites eclipsed more traditional methods of data dissemination, such as subscriptions to the *PPI Detailed Report*. There were more than 1.6 million accesses of PPI series over the Internet during the 12 months ended December 31, 2003.

Retrieving PPI data from the PPI Website

PPI data can be obtained from the WWW address (<http://www.bls.gov/ppi>). Scrolling down the page to the “Get Detailed Statistics” header reveals the following 5 methods of data retrieval:

- **Most Requested Series** is a form-based application that allows the user to quickly obtain PPI time series data by selecting from two separate lists (commodity and industry) of the most commonly requested time series, including the All Commodities Index and the stage-of-processing indexes (for example, Finished Goods). Within each list, any one—or all—of the time series shown can be selected. A user can modify the date range and output options after executing the query, using the reformat button above the data output table.
- **Create Customized Tables** is a form-based query application designed for users unfamiliar with the PPI coding structure. It guides a user through the PPI classification system by listing index titles and does not require knowledge of commodity or industry codes. Data retrieved are based on a query formulated by selecting data characteristics from lists provided. Two options are available to create customized tables, depending on a user’s browser capability. The one-screen option is a JavaScript application that uses a single screen to guide a user through the available time series data. The second option is a multiple screen, nonJava-based application. Both methods allow a user to browse the PPI coding structure and select multiple series codes. Using the one-screen option, users can modify the date range and output options after executing the query using the reformat button above the data output table.
- **Series Report** is a form-based application that uses formatted PPI time series identifiers (commodity or industry codes) as input in extracting data according to a specified set of date ranges and output options. This application provides the most efficient path for those users who are familiar with the format of PPI time series identifiers. Up to 300 indexes can be extracted at one time.

There are three basic formats for creating a unique PPI time series identifier. For commodity and stage-of-processing indexes, enter a “wpu” prefix (not seasonally adjusted) or a “wps” prefix (seasonally adjusted) in combination with a commodity-based code to create a series identifier.

Commodity code

wps063
wpu063803
wpsop3000

Will provide data for:

Drugs and pharmaceuticals, seasonally adjusted
Pharmaceutical preparations, cardiovascular system
Finished goods, not seasonally adjusted

For a current industry-based price index organized according to the North American Industry Classification System (NAICS), enter the prefix “pcu” followed by the industry-product code. The series identifier for products primary to an industry include 12 numeric digits, the six-digit industry code is repeated, and up to seven additional digits of product detail. Dashes are used as place holders for higher-level industry group codes.

Industry-product code, Current NAICS series

pcu325---325---
pcu336110336110
pcu621111621111411

Will provide data for:

Chemical manufacturing, not seasonally adjusted
Automobile and light duty motor vehicle manufacturing
Offices of physicians, one and two physician practices and single specialty group practices, general/family practice

To identify a discontinued industry-product code based on the Standard Industrial Classification (SIC), enter a “pdu” prefix and “#” between the fourth and fifth characters of the product code. A series identifier for the discontinued dataset uses underscores as placeholders to complete a reference to an SIC industry group code of less than four digits. (All PPI industry-based indexes organized by SIC were discontinued with the introduction of the NAICS.) *In all cases, no spaces are permitted.*

Industry-product code, Discontinued SIC series

pdu28_#
pdu331_#
pdu3711#111

Will provide data for:

Chemicals and allied products, not seasonally adjusted
Blast furnaces, steel works, and rolling and finishing mills, not seasonally adjusted
Passenger cars

- **Flat Files** and the FTP server are best suited for those users requiring access to either a large volume of time series data or other PPI-related documentation (such as, seasonal factor and relative importance tables). The FTP site can be accessed at (<ftp://ftp.bls.gov>) or directly from the links on the “Get Detailed Statistics” page or the PPI homepage. Data and documentation available for download include:

Directory:

- NAICS Current Series /[pub/time.series/pc](#)
- SIC Discontinued Series /[pub/time.series/pd](#)
- Commodity Series /[pub/time.series/wp](#)
- Special Requests /[pub/special.requests/ppi](#)
- Latest News Release /[pub/news.release/ppi.txt](#)

The FTP site maintains files to help with searches and downloads. These files are centrally located in the **/pub/doc** directory. Within this directory, go to the **overview.txt** file for an overview relating to all BLS data available through the FTP site. For commodity-based PPI data (which appear in tables 1, 2, 3, 6, 7, and 8 of the PPI monthly detailed report and tables 1, 2, 3, and 5 of the monthly news release), the program help file is **wp.txt**. For *current* industry-based PPI data based on the NAICS (which appear in tables 4, 5, and 9 of the monthly PPI report and table 4 of the monthly news release), the file is **pc.txt**. For industry-based SIC time series that have been *discontinued*, go to **pd.txt**. (These and other help files are also maintained within each of the five directories listed above.)

Other Sources of PPI Data

PPI data can also be accessed via the BLS homepage (**<http://www.bls.gov>**). After clicking the “Get Detailed Statistics” link at the top of the homepage a chart appears listing all of the available BLS programs. The following four methods are available for PPI data: Most requested statistics, create customized tables (one screen or multiple screens), and flat files. Additional sources of BLS data also are accessible from this page including: Economic news releases, series report, and economy at a glance.

Additional information

The PPI homepage (**<http://www.bls.gov/ppi>**) contains additional information regarding PPI data and methodology. The top section of the homepage provides PPI news releases, both current and archived, as well as general PPI information. The “Tables Created by BLS” section found beneath the statistics section provides relative importance and seasonal factor tables. The remaining sections offer special notices and publications pertaining to PPI methodology and applications.

For questions or comments regarding PPI data classification, methodology, or data availability on the Internet, call or e-mail the Section of Index Analysis and Public Information directly at (202) 691-7705 or ppi-info@bls.gov. Data also can be obtained by calling the national fax-on-demand service at (202) 691-6325. This service enables customers to request faxes of BLS data 24 hours a day, 7 days a week.

Table 1. Producer price indexes and percent changes by stage of processing (1982=100)

Grouping	Relative importance	Unadjusted index				Unadjusted percent change to Aug. 2005 from:		Seasonally adjusted percent change from:		
		Dec.	Apr.	July	Aug.	Aug.	July	May to	June to	July to
		2004 1/	2005 2/	2005 2/	2005 2/	2004	2005	June	July	Aug.
Finished goods.....	100.000	154.4	155.4	156.1	5.1	0.5	0	1.0	0.6

1/ Comprehensive relative importance figures are initially computed after the publication of December indexes and are recalculated after final December indexes are available.
2/ The indexes for April 2005 have been recalculated to incorporate late reports and corrections by respondents. All indexes are subject to revision 4 months after original publication.
3/ Includes crude petroleum.

4/ Excludes crude petroleum.
5/ Percent of total finished goods.
6/ Percent of total intermediate materials.
7/ Formerly titled "Crude materials for further processing, excluding crude foodstuffs and feedstuffs, plant and animal fibers, oilseeds, and leaf tobacco."
8/ Percent of total crude materials.

Table 2. Producer price indexes and percent changes for selected commodity groupings by stage of processing (1982=100 unless otherwise indicated)

Commodity code	Grouping	Unadjusted index			Unadjusted percent change to Aug. 2005 from:		Seasonally adjusted percent change from:		
		Apr. 2005 1/	July 2005 1/	Aug. 2005 1/	Aug. 2004	July 2005	May to June	June to July	July to Aug.
	FINISHED GOODS.....	154.4	155.4	156.1	5.1	0.5	0	1.0	0.6

721	Accommodation	12/96	130.7	135.4	134.9	6.2	-.4

1/ Indexes in this table are derived from the net-output-weighted industry price indexes. Because of differences in coverage and aggregation methodology, they will generally not match the movements of similarly titled indexes which are derived from traditional commodity groupings.

2/ The indexes for April 2005 have been recalculated to incorporate late reports and corrections by respondents. All indexes are subject to revision four months after original publication.

3/ Not available.

Note: NAICS 2002 replaced the SIC system beginning with the release of PPI data for January 2004.

Table 5. Producer price indexes by stage of processing, seasonally adjusted
(1982=100)

Grouping	Index 1/					
	Mar. 2005	Apr. 2005	May 2005	June 2005	July 2005	Aug. 2005
Finished goods.....	153.7	154.4	153.5	153.5	155.1	156.0
