This Issue in Brief

Immigration laws are apparently not responsible for the "scarcity" of domestic servants about which many complaints are now being made. Complaints of a similar character were made prior to the war, when immigration was unrestricted and very large. The real difficulty seems to be the fact that both native American and foreign-born women prefer other means of earning a living, and for the past 50 years there has been a decline in the proportion of the population engaged in domestic service occupations (p. 1).

Current and emergency needs often force the wage earner to borrow.—A study of 4,000 credit union loans shows that expenses of illness were the most common cause of financial stress, and purchase of the family supply of coal, family expenses, and accumulation of previous debts were also important. About three-fourths of the male borrowers were married and 85 per cent had dependents (p. 6).

About one-half the money spent for the erection of nonresidential buildings during the past six years was spent for industrial and commercial buildings.—Reports from cities having a population of 200,000 or over also show that in most of the cities more money was spent for garages than for schools, churches, or amusement buildings. The average annual per capita expenditure for new buildings in 257 cities was \$74.78. Of this amount 35.8 per cent was for nonresidential building and 64.2 per cent for residential building (p. 17).

Mutual benefit associations assisted by the company were found in nearly half of the 430 establishments visited in connection with a study of industrial personnel activities by the Bureau of Labor Statistics. More than three-fourths of the employees were members of the associations in those plants reporting on membership. The dues charged range, in the majority of cases, between 25 and 75 cents per month, varying according to the proportion of the expenses paid by the employer and the amount of weekly benefits. Disability benefits usually cover both sickness and accident but exclude cases which are covered by the workmen's compensation laws, although payments are sometimes made for the period intervening between the date of injury and the date of the first payment of workmen's compensation benefits (p. 20).

Physical examinations of a group of 2,000 working boys in New York City with a view to determining the relation of health and environmental conditions to the development of tuberculosis showed a large proportion of serious defects among these boys. Only 225 boys were found to be normal, and in addition to many cases of diseased tonsils and infections of the upper respiratory tract there were six cases of active tuberculosis discovered; 31 boys were listed as tuberculosis suspects, and 10 had chronic, inactive tuberculosis. The conditions found among these boys point to the need for stricter supervision of the health of the school child and for consideration in the issuance of work papers not only of his age but also of his physical condition and the probable tax upon his strength (p. 48).

The farm laborer or "hired man" introduces very definite problems into the community in which he is placed.—Such persons seldom form an integral part of the community life and circumstances tend to make of them a separate class, very often with lower moral standards and lower standards of living. The author of a recent study of this subject believes that "those sections which have developed a thoroughgoing system of hired-men farming constitute the rural slums of the Nation" (p. 27).

A wage survey of the bituminous coal industry, made by the Bureau of Labor Statistics, gives data on wages and hours of labor in 1926 by principal occupations and by State, with comparisons with conditions in 1924. The wage situation in 1926 was complicated by the fact that in November and December numerous temporary wage increases were made because of the heavy foreign demand for coal following the British coal strike. Such increases, however, in nearly all cases were continued in effect only a short time, after which the rates were reduced to those in effect prior to the increase (p. 89).

The seasonal character of the construction industry is in large part unnecessary, according to a recent study for the State of Ohio. It is shown that much of the present seasonal factor is due to custom rather than necessity, and that winter building is possible on a very extensive scale (p. 117).

A conference on the elimination of waste in industry, under the auspices of organized labor, was recently held. Delegates included trade-unionists, economists, industrial engineers, and educationists. Discussion covered a wide field, but emphasis was placed on the benefits to be derived by the workers from the eliminating of waste and wasteful methods of conducting industry (p. 41).

Cooperative stores make possible substantial savings to their members. Rebates on purchases and capital received by six resigning members of a certain cooperative society in the Middle West ranged from \$130 for a member who had belonged to the society for 2 years and 4 months to \$660 for one who had been a member for 6 years and 9 months (p. 66).

VOL. 25, NO. 1

WASHINGTON

JULY, 1927

Immigration Restriction and the "Scarcity" of Domestic Servants

SEVERAL statements have been made recently complaining of the scarcity of domestic servants and attributing this scarcity to the restrictive immigration laws of 1921 and 1924. Conclusive evidence on this subject is not available, but the information accessible indicates that the difficulty complained of is due to persistent economic and social causes having little or no relation to immigration or to immigration policies.

There are two senses in which the term "shortage of domestic servants" may be employed. In the first place, it may mean merely that the demand for such labor is in excess of the supply. In the second place, it may mean that there is a scarcity of efficient domestic servants at wage rates and under employment conditions which the average householder regards as reasonable.

As regards the first point—the available supply of domestic labor of all classes—there does not seem to be any widespread or general shortage. Recent reports from public employment offices, for example, show rather wide variations between communities and at different dates. Some report an excess in the demand for domestic servants, some an excess in the supply, and many report an excess in demand or supply according to the season of the year. In general, however, the reported shortages are neither large nor continuous.

Thus, in January, 1926, the New York State employment offices reported 99.1 applicants for domestic and personal service to each 100 requests for such workers, representing a slight shortage in the supply. In January, 1927, however, the ratio of applicants to jobs offered was 119.5 to 100.0.

In Illinois, according to the reports of the State public employment offices, in January, 1926, the number of applicants for domestic service, including hotels and restaurants, was 151.3 for each 100 jobs; and in January, 1927, the proportion of applicants to jobs offered had increased to 189.5. The reports of the Ohio public employment offices show for the fiscal year ending June 30, 1926, 23,510 applications by female workers for domestic and personal service as compared with 16,974 offers of positions; while during the six-month period ended December 31, 1926, there were 8,557 applications as against almost exactly the same number, 8,631, of positions offered. For the same offices the first three months of 1927 showed a surplus of applicants of 786.

Again, it must be remembered that to some extent domestic service is a seasonal trade. Thus, the August, 1926, issue of the *New York Industrial Bulletin* (p. 316) states that in July of that year "women for domestic places were less in demand as homes continued to close for the summer."

Two months later (in the October, 1926, number of the *Industrial Bulletin*, p. 21) it is reported that "returns to the cities after vacations and the reopening of households caused the calls for domestic workers to jump from 600 in August to 1,300 in September. The number of workers seeking jobs also increased, but the supply fell short of requirements and a small shortage was again reported in this group." In the next issue (November, 1926, p. 50) it was noted that the shortage was over: "Requests for domestic help approximated the supply after the September [1926] shortage." In the spring of 1927 a surplus of labor manifested itself again: "Anticipating the demand for domestic help caused by spring housecleaning women workers started enrolling for this type of employment. The number of available workers increased from 1,064 in February [1927] to 1,509 in March [1927]. As the demand was proportionately less there was an increase in the unemployment ratio."¹

Summarizing these statements, it may be said that, while the records of employment offices do not reflect with complete accuracy the conditions of the labor market, they do usually indicate the major movements. It would, therefore, seem that if there were any great unsatisfied demand for domestic servants, the number of householders seeking help would outnumber very greatly the number of applicants for jobs.

The Question of Efficiency and Wages

AS regards the second interpretation placed upon the term "shortage of domestic labor," it is sometimes stated and is probably true that many of the applicants for jobs as domestic servants are not efficient and that the efficient ones often desire wage and employment conditions which many housekeepers regard as unreasonable. In this sense there may well be a scarcity of good domestic servants. But this is no new condition. In the year 1897 Lucy Maynard Salmon published a comprehensive study entitled *Domestic Service*.² In it she quotes the opinions of a number of housewives regarding the domestic service problem. These voice exactly the same complaint regarding the scarcity of good servants as are being made to-day. Thus one woman wrote: "When I began housekeeping in 1870 I had one general housework girl who stayed with me nine years. Now I consider myself fortunate to retain a cook or a second girl as many weeks."

Another wrote as follows: "Thirty years ago I had no difficulty whatever. I do not think my character has changed meantime, or my method of treating servants, or our style of living, yet now it is almost impossible to secure servants."

¹ The *Industrial Bulletin* (Albany, N. Y.), April, 1927, p. 194.

² Salmon, Lucy Maynard: *Domestic Service*. New York, The Macmillan Co., 1897.

A third reported: "The question is very different now from what it was 40 years ago"; and a fourth states that "The problem in this place grows more perplexing every year."

These statements, it must be remembered, were made 30 years ago, at a time when immigration was unrestricted and very heavy.

Nor does this particular period appear to be at all exceptional. During the decade just preceding the beginning of the World War in 1914, immigration into the United States reached its maximum, in some years exceeding a million a year. Yet, in 1915, with this great mass of accumulated alien labor of all classes, the same complaints about the difficulties of securing efficient domestic servants were made. Thus, a report of the commission on household employment made to the annual convention of the Y. W. C. A. in May, 1915, seeks to find a "solution of the so-called servant problem," and makes the following significant remarks regarding the lack of domestic servants and the unwillingness of women, especially the foreign born, to enter domestic service:

Another interesting item is that the proportion of foreign-born to native-born white women in this occupation is changing. More and more we shall have to depend on native-born Americans to fill the ranks of household employment, as the present immigrants prefer the factory.

What is the cause of this boycott of household employment on the part of wage-earning young women—a boycott the more serious because unconscious, unpremeditated, unorganized, and of steadily increasing proportions? This would be sufficiently distressing even though only the employers, and indirectly routine family life, were suffering, but in the present crowded condition of the business and industrial fields the wage-earning young women are fighting desperately for a bare existence. Stenographers, clerks, factory employees have no work, while hundreds of housewives can get no help. It would seem such an easy, simple thing to transfer all these girls without work to the positions without workers, but they will not go. When the situation among the unemployed was at the most acute stages in New York this past winter, the head of the city employment bureau said he could place 5,000 young women in domestic employment if he could get them.

In the same year (1915) in which the above report was made there was published another study of domestic service, entitled "Wanted a Young Woman to do Housework," by C. H. Barker. In it the following statement is made regarding the scarcity of domestic help existing at that time: "With a few notable exceptions, only those who are unqualified to compete with the business woman are left to help the householder, and the problem confronting her to-day is not so much how to change inefficient to efficient help, but how to obtain any help at all."

Analysis of Immigration Statistics

FROM the above citations it would appear that the complaint regarding the scarcity of good domestic servants has been a perennial one, and has been just as strong in times of heavy immigration as it is now. An analysis of the recent immigration figures, moreover, indicates that the restrictive immigration laws could not well have had any serious effect upon the supply of foreign domestic servants for the reason that there has been no important decrease in the immigration of alien females belonging to the races from which domestic servants have been chiefly drawn.

It is true that since the passage of the quota immigration laws there has been a sharp decline in the number of immigrants classed in the

immigration returns as domestic servants. The detailed figures were given in an article in the Labor Review for February, 1927.³ Thus for the four years 1911-1914 the average number of immigrants classed as servants was 127,077, while for the two years 1925-1926 the average number was only 28,756. Classification by sex is not given in the official reports, but it is known that the servant classification in the immigration returns includes so few males that for practical purposes it may be regarded as composed of females.

These figures, however, by no means tell the whole story regarding the actual number of immigrants who enter domestic service after arrival in the United States. In the first place, the classification of an immigrant in a particular occupation at the time of entry depends on the immigrant's statement as to previous occupation. Very many who class themselves as of a certain occupation at time of arrival later enter entirely different pursuits. A foreign woman calling herself a domestic servant and having little or no idea at the time of what the future may actually offer may become a clothing worker in New York, and the wife of a gardener, classified as "no occupation" at time of arrival, may later with her husband obtain employment in the service of a country or suburban house which desires a man gardener and a woman cook or housekeeper.

That this actually occurs on a large scale is evident from the fact that decennial censuses of occupations show no such number of foreign-born females in domestic and personal service as would be there if all those who classed themselves as "servants" on arrival actually entered such service after arrival.

As a result of this inevitable following by many immigrants (women as well as men) of occupations in this country of which they had no idea at the time of landing, the occupational classification in the immigration returns can not be taken as indicative of the actual occupational distribution of such persons after entry into the American labor market.

As regards female domestic servants, indeed, it would seem that the potential supply from immigration is most accurately represented by the total number of arrivals belonging to the races preferred for domestic service by most American housewives. When this analysis is made, it appears that while the total number of female immigrants entering this country has decreased markedly since the war and since the passage of the restrictive acts, there has been little or no decrease in the number of females of the races generally preferred by American households for domestic service, such as the Irish, English, and German.

This is brought out in the following table which shows the average yearly number of immigrant females 10 years of age and over, by principal races, for the two years immediately preceding the war (1913 and 1914), when immigration was unrestricted, and for the two years 1925 and 1926. The races are arranged in two groups, the first group including those which in the past have probably furnished the largest number of foreign-born domestic servants and seem to be generally preferred for such service by employers of this class of labor, namely, English, French, German, Irish, Scandinavian, Scotch, and Japanese.

³ "Changes in occupational character of immigration since the war," p. 1.

TABLE 1.—AVERAGE YEARLY IMMIGRATION OF FEMALES IN SPECIFIED TWO-YEAR PERIODS, BY RACE¹

Race or people	Average yearly immigration	
	1913 and 1914	1925 and 1926
Group I:		
English.....	23, 514	22, 218
French.....	8, 397	9, 715
German.....	34, 970	26, 459
Irish.....	17, 528	19, 835
Scandinavian.....	13, 275	7, 905
Scotch.....	9, 206	13, 890
Japanese.....	5, 397	243
Total for Group I.....	112, 287	100, 205
Group II:		
Croatian and Slovenian.....	10, 658	371
Finnish.....	4, 880	387
Hebrew.....	53, 664	5, 612
Italian.....	71, 919	4, 502
Lithuanian.....	8, 940	237
Magyar.....	15, 497	543
Mexican.....	5, 550	9, 520
Polish.....	54, 206	1, 761
Russian.....	6, 393	538
Ruthenian.....	12, 372	232
Slovak.....	10, 900	254
Other races.....	37, 474	8, 329
Total for Group II.....	292, 453	32, 286
Total.....	404, 740	132, 491

¹ U. S. Department of Labor. Bureau of Immigration. Annual reports for the years ending June 30, 1913 (p. 46), 1914 (p. 42), 1925 (p. 45), and 1926 (p. 42).

From this table it appears that, comparing 1925 and 1926 with pre-war years, the number of immigrant females of the races principally in demand for domestic service, decreased from 112,287 to 100,205, or less than 11 per cent, and that the number of French, Irish, and Scotch actually increased. Significant decreases in this group, indeed, occurred only in the case of the Scandinavian and Japanese. In other words, the great decline in the total number of female immigrants between these two periods occurred among those races—such as the Slavs and Hebrews—which probably furnish very few domestic servants to American households and which, as a rule, are not preferred for this service.

Decrease in Domestic Servants Over a Period of Years

FROM the above analysis it would seem that the immigration restriction laws have probably not had much effect on the potential supply of foreign domestic servants, certainly no such effect as the crude immigration figures would suggest. This would lead to the conclusion that any existing shortage of domestic servants must be due to other causes. This conclusion, moreover, is strengthened by the fact that for a period of 50 years, irrespective of immigration conditions, there has been a decline in the proportion of the population of the United States engaged in domestic service occupations. This point is brought out in an article in the Labor Review for May, 1925 (p. 16), where is shown the proportion of the population engaged in various employments over a period of years.

The data there presented show that the domestic and personal service class (listed in the study as “servants, housekeepers, stewards,

stewardesses, etc.") constituted 2.5 per cent of the population in 1870, 2.1 in 1880, 2.3 in 1890, 2.3 in 1900, 2.0 in 1910, and 1.6 in 1920. It thus appears that the proportion of the population in domestic and personal service has never in subsequent years been so great as it was in 1870. Still more striking is the fact that the percentage figures decreased from 2.3 in 1900 to 2.0 in 1910; that is to say, during a decade of unrestricted and extremely heavy immigration.

The increasing disinclination of females to enter domestic service is also shown in the following table which gives the percentage of gainfully employed females 10 years of age and over employed in domestic and personal service, by race, for 1900, 1910, and 1920.

TABLE 2.—PER CENT OF GAINFULLY OCCUPIED FEMALES 10 YEARS OF AGE AND OVER OF SPECIFIED RACE AND PARENTAGE EMPLOYED IN DOMESTIC AND PERSONAL SERVICE, 1900, 1910, AND 1920¹

Race and parentage	1900	1910	1920
	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>
Native white, native parentage.....	30.3	23.0	17.4
Native white, foreign or mixed parentage.....	30.3	23.2	16.1
Foreign-born white.....	53.2	45.9	35.8
Negro.....	51.8	42.4	50.3

¹ United States Department of Commerce, Bureau of the Census, Twelfth Census, 1900, Special Reports, Occupations, Washington, 1904, p. cv; and Fourteenth Census, 1920, Vol. IV, Population, Occupations, Washington, 1923, p. 341.

This table shows that not only did the percentage of females of every race except the negro in domestic and personal service decline between 1910 and 1920, but also that the percentage for every race without exception declined during the period 1900 to 1910, when immigration, as noted, was unrestricted and of a very large volume.

In view of the facts set forth above the conclusion seems inevitable that any present shortage of efficient domestic servants which may exist is not due to immigration restriction, but to far-reaching and continuing economic and social causes entirely unrelated to immigration.⁴

Why Workers Borrow: A Study of Four Thousand Credit Union Loans

By MILDRED JOHN, FELLOW IN RESEARCH DEPARTMENT WOMEN'S EDUCATIONAL AND INDUSTRIAL UNION, BOSTON, MASS.

THE credit union is a twentieth century attempt to provide credit facilities for people who are independent but have no margin of savings and hence no standing with the banks. This investigation was undertaken in order to discover something of the financial backgrounds of such people, their family responsibilities, and the crises in life for which they are forced to borrow. Four thousand records were gathered from seven credit unions in Boston and one in Milwaukee. The amounts and purposes of the loans, ages, occupations and salaries of the borrowers, and the number of dependents were reported. Many records showed also the property owned and insurance carried.

⁴ An article entitled "America's Domestic Servant," by Ethel M. Smith, in the May, 1927, issue of Current History, gives additional data regarding certain of the points covered in this article.

Credit unions are like people—no two are identical. They can not be fitted arbitrarily into classes, but can with reservations be grouped into general, neighborhood, company, sectarian or racial, and fraternal types. They are grouped in this fashion because of the limitation they place upon membership. In Massachusetts, where the most extensive development of credit unions in the United States has taken place, the earliest ones were of the sectarian or parish type. They were organized among the French-Canadians, and limited membership to persons in parishes where the credit unions were located. Some few years later numerous general credit unions were organized. They have been found less successful than other types because their almost unrestricted membership makes it very difficult to appraise the reliability of those applying for membership, and to make certain the repayment of loans granted. Recently, credit unions independent of the management have been formed among the employees of large corporations. These as a rule have been prosperous, and are the predominating type at the present time.

Credit union organization is so elastic that it can be made to fit varied situations, and because of this adaptability it has succeeded admirably. The first credit union in Massachusetts, chartered in 1909, started with a capital of a few dollars. In 1925 there were 86 credit unions operating in the State, with gross assets of \$8,500,000. The growth has been rapid but not too rapid to insure stability. Between 1909 and 1925 only 16 credit unions failed, and while 48 liquidated it was without loss to the member shareholders. These figures indicate clearly that the credit union has passed the experimental stage, and may be considered as a permanent economic factor.

Membership in the various credit unions of Massachusetts has grown from the few who started the first one in 1909 to 55,000 in 1925. Most of these people are permanent members who borrow when they must and save when they can.

Nationality, Marital Condition, and Age of Borrowers

TABLE 1 shows the membership of the eight credit unions studied and the per cent covered by the present study. As the table shows, there were approximately 14,000 members in the eight credit unions; the majority of these had belonged to their respective organization three years or more.

TABLE 1.—CREDIT UNIONS WHICH SUPPLIED RECORDS FOR THIS STUDY

Credit union	Approximate membership	Sample studied	
		Number	Per cent of membership
Telephone Workers' Credit Union.....	6,000	1,000	16.7
City of Boston Employees Credit Union.....	1,800	600	33.3
Blue Hill Neighborhood Credit Union.....	2,000	500	25.0

Total.....	811	2,237	3,048	732	220	952	1,543	2,457	4,000

Of the 4,000 records of loans gathered, 3,048 were for men and 952 for women. In the telephone workers' credit union the number of woman borrowers exceeded the number of men who were granted loans, but only because five-sevenths of the employees were women.

It was not possible to determine exactly the nationality grouping of the borrowers, but the great majority were American born, largely of Irish, English, and Russian-Jewish stock. There were few southern Europeans, and Germans were rare in any but the Milwaukee Credit Union. The fact that there are so few immigrants is due to the credit unions chosen for the study. There are many credit unions largely composed of foreign born who appreciate their value because they are familiar with people's banks and other cooperative credit societies which are quite common in Europe.

Over 73 per cent of the men and 23 per cent of the women who were borrowers from the credit unions studied were married.¹ However, two-thirds of the married women were members of two general credit unions and were not employed outside the home.

Most of the men who borrowed were between 25 and 40 years old. They were at the prime of life when their family responsibilities were heaviest but when their earning power should have been greatest. The women fell into two divisions: The younger ones under 25 who might in a short time leave their jobs to marry, and the older ones, also in the prime of life, who found it necessary to borrow for their dependents and to make provision for themselves in old age. In one credit union composed of civil-service employees, who have long tenure of service, there were more older men borrowing than anywhere else.

¹ Unfortunately no data were available which indicated the number of divorced, separated and widowed. Space on the application blanks merely called for a check opposite the word "married" or "single."

Occupations and Wages of Borrowers

THE number of borrowers, classified by occupation and sex, is shown in Table 3:

TABLE 3.—OCCUPATIONAL DISTRIBUTION OF BORROWERS

Occupation	Men		Women		Both sexes	
	Num-ber	Per-cent	Num-ber	Per-cent	Num-ber	Per-cent
Skilled artisans.....	1,064	34.9	28	2.9	1,092	27.3
Clerical workers.....	616	20.2	273	28.7	889	22.2
Unskilled laborers.....	239	7.8	8	.8	247	6.2
Salesmen.....	114	3.7			114	2.9
Small business men.....	165	5.4	22	2.3	187	4.7
Professional workers.....	31	1.0	30	3.2	61	1.5
Firemen.....	455	14.9			455	11.4
Policemen.....	76	2.5	2	.2	78	2.0
Telephone operators.....			429	45.1	429	10.7
Housewives.....			131	13.8	131	3.3
Other occupations.....	276	9.1	29	3.0	305	7.6
No data.....	12	.4			12	.3
Total.....	3,048	100.0	952	100.0	4,000	100.0

As is seen, the occupations of the men fell into four main classifications: The skilled artisans, the clerical workers, firemen, and the unskilled laborers. The largest single group was that of firemen. In both municipal credit unions they formed the majority of borrowers. Men in the skilled trades formed one-third, clerical workers one-fifth, and unskilled laborers one-thirteenth of the total number of borrowers. There were in the two general credit unions a number of men who had independent businesses—small stores and shops of various kinds—and many of the artisans were self-employed, particularly the tailors and painters. There was a noticeable lack of professional men among those who were granted loans, even in the general credit unions to which they have access. This may be accounted for in three ways: They do not know anything about credit unions, they have no need to use them, or they are too proud to do so. The last reason is perhaps the most important, for it was found that many men in comfortable circumstances had an idea that credit unions were semicharitable institutions and therefore reserved for the use of the "poor working men."

Forty-five per cent of the women in the sample group were employed as telephone operators and 29 per cent as clerical workers. The group in professional pursuits, mainly school-teachers and nurses, is small, but three times greater in proportion than among the men studied. There is also a group of women who have embarked on enterprises of their own and often need help to tide them over dull periods. Housewives, whose cherished ambitions may be new sideboards or rugs, also belong to credit unions. Although they have no earnings, most of them save enough out of their housekeeping allowances to pay up their loans, and there were almost no cases of the husband's having to pay a defaulted loan.

As Table 4 shows, the modal wage for men lies between \$36 and \$40 a week, and for women between \$21 and \$25. In the neighborhood credit union, where 61 per cent of the men were self-employed, the

weekly earnings ran higher, the mode being between \$46 and \$50. On the other hand, in the railway credit union the mode lay between \$31 and \$35. Few of these borrowers earned more than \$250 a month.

TABLE 4.—WEEKLY EARNINGS OF BORROWERS FROM SIX CREDIT UNIONS, BY SEX¹

Classified weekly earnings	Number earning each classified amount					
	Men		Women		Both sexes	
	Number	Per cent	Number	Per cent	Number	Per cent
\$20 or under.....	11	0.4	276	30.8	287	8.2
\$21 to \$25.....	70	2.7	290	32.3	360	10.3
\$26 to \$30.....	314	12.1	129	14.4	443	12.7

\$41 to \$45.....	479	18.4	10	1.1	489	14.0
\$46 to \$50.....	262	10.1	4	.4	266	7.6
\$51 to \$55.....	84	3.2	1	.1	85	2.4
\$56 to \$60.....	115	4.4	2	.2	117	3.3
\$61 to \$65.....	94	1.3	1	.1	95	1.0
\$66 to \$70.....	27	1.0	27	.8
\$71 to \$75.....	53	2.0	1	.1	54	1.5
Over \$75.....	52	2.0	52	1.5
Housewives.....	131	14.6	131	3.7
No data.....	27	1.0	27	.8
Total.....	2,603	100.0	897	100.0	3,500	100.0

¹ Modal earnings only (piecework) were available for two credit unions. In these, those of skilled men lay between \$35 and \$40, of unskilled men between \$25 and \$30, and of women between \$20 and \$22.50.

Property Owned and Insurance Carried

SOME of the more thrifty and ambitious have, with the aid of building and loan associations, bought their own homes. In four credit unions it was possible to find out whether or not the borrowers possessed property. Of 1,702 male borrowers 483, or 28 per cent, owned property, while of 298 female applicants for loans 80, or 21 per cent, owned property. The neighborhood credit union required the applicants to state the value of their holdings. These averaged between \$10,000 and \$20,000 apiece, but it should be stated in this connection that the real estate was in an outlying district where land values had increased rapidly. The amount does not represent their actual investment, but rather the appreciation in the value of the land. Nor do the figures represent complete ownership. Often the equity which the men owned was small, but mortgage payments had to be met and to do this they had to save. There was no way of discovering what other savings the applicants for loans had, as they were not asked to list their securities or savings accounts. However, it was customary for men, when they could, to offer collateral for their loans, since they could secure a lower interest rate—5 instead of 6 per cent. When a loan was thus covered the borrower was not required to give any information about himself, and that excellent source was therefore closed to the investigator. In one credit union a third of the loans were made on collateral, and in another fully one-half. The percentage in the other associations does not run nearly so high as this, and in one no collateral loans are made. On one application

blank borrowers were required to designate whether they owned automobiles; it was found that 180 of 491, or 36 per cent, did possess them, while but 32 per cent of the men owned real estate.

Where statistics were available, information concerning insurance was gathered. In three credit unions, 87 per cent of the men carried insurance. The policies were not large (usually less than \$3,000), but it is encouraging to see such a large proportion of the men of small means thus safeguarding themselves and families. A good many women—nearly 40 per cent of the borrowers in these three organizations—were carrying insurance, particularly those single women who had dependents, and women who had insurance before they were married did not as a rule let their policies lapse.

Dependents of Borrowers

OVER 73 per cent of the men were married but an even greater proportion had dependents, as 85 per cent had persons whom they were supporting:

TABLE 5.—NUMBER OF DEPENDENTS OF BORROWERS FROM SIX CREDIT UNIONS

Number of dependents	Borrowers having specified number of dependents					
	Men		Women		Total	
	Number	Per cent	Number	Per cent	Number	Per cent
One.....	461	17.7	97	10.8	558	15.9

Eight.....	24	.9			24	.7
Nine.....	6	.2			6	.2
Ten or more.....	8	.3			8	.2
No dependents.....	376	14.4	731	81.5	1,107	31.6
No data.....	6	.2	12	1.3	18	.5
Total.....	2,603	100.0	897	100.0	3,500	100.0

Many of the single men had aged parents or younger brothers and sisters for whom they were caring. Only 18 per cent of the women claimed dependents, but the large group of single women borrowers in the telephone workers' credit union contained also the highest proportion of women with dependents; only 31 of these women out of a total of 548 were married, but 108 had dependents. In the neighborhood credit union, where 135 of 162 women were married, only 6 had dependents. These figures indicate that it is the men who bear the heavier social burdens, and that single women with dependents, like the men, must seek financial protection.

Although the types of people belonging to the credit union studied differ considerably, the size of their families runs about the same. In the neighborhood and municipal credit unions, three was the most common number of dependents, while two was the usual number in the industrial and telephone workers' credit unions, and the railroad workers most frequently supported but one. There is not a great deal of difference between the numbers of men who had one, two,

and three dependents, but there is a decided drop after the third, as, for example, 505 men had two dependents, 492 had three, but only 386 had four. The modal class for the men was that with two dependents, for the women, one dependent. Most of the men, as has been stated, belonged to the skilled trades or clerical group. However, the members of the credit union that listed the largest number of unskilled workers had the greatest proportion of families numbering more than three. This seems a very impersonal way to discuss the human factor, but it shows as nothing else can the burdens these borrowers are carrying. They have given hostages to fortune, and they must provide for emergencies, since their jobs are often insecure. Thus credit unions assist men in carrying their social responsibilities—they are a kind of insurance against family misfortunes.

Purposes and Amounts of Loans

THE purposes for which people borrow reveal dramatically the crises which come into their lives and the need of the average worker for some source of credit at such times. These purposes are shown in Table 6 and the two accompanying charts:

TABLE 6.—PURPOSES FOR WHICH LOANS WERE GRANTED

Purpose of loan	Loans granted for each purpose to—					
	Men		Women		Both sexes	
	Number	Per cent	Number	Per cent	Number	Per cent

Total.....	3,048	100.0	952	100.0	4,000	100.0

The most common reason for borrowing is to meet expenses incurred during illness—18.9 per cent in the case of the men, and 37 per cent for the women. The term "medical" also includes dental bills, of which there were a great number. In one credit union 47 per cent of the women and 20 per cent of the men listed under "medical" borrowed specifically to pay dentists' bills. Even though the reason given may not always have been the real reason, yet these numerous loans to maintain health would appear to be one of the best arguments for health insurance. Although no effort is made to appeal for sympathy, for those who pass on the application are members of their own group who know what their needs are, the circumstances are sometimes pitiful. One girl of 22 had borrowed, and

repaid over a period of several years, nearly \$600 for surgical and hospital care for her crippled brother. In other cases, the birth of children necessitated borrowing, for, in addition to the medical care, household expenses increased during the mother's absence from her tasks. Although many of the men were entitled to sick benefits

CHART I.—PERCENTAGE DISTRIBUTION OF PURPOSES OF LOANS

from various sources, they found the sums paid inadequate, and were forced to borrow if they were out of work for any length of time. Education in preventive medicine is very directly related to credit union borrowing, for many loans were granted "to have my boy's teeth straightened" or tonsils removed.

Coal was the need second in importance for which borrowing was necessary. Many men could not raise the money needed to meet their coal bills, and the coal merchants were not so willing to extend credit as is often supposed. It is costly and unsatisfactory to buy coal in small quantities, and one man remarked that he would rather pay

CHART II.—PERCENTAGE DISTRIBUTION, BY SEXES, OF PURPOSES OF LOANS

6 per cent interest than be dunned all winter. Taxes and insurance, like coal, must be paid for at stated times, and so again men must borrow.

“Family expenses” may mean anything from a new kitchen stove, around which so much of the family life in these homes revolves, to

new tires for the Ford. One man, when asked what he meant by family expense, grinned as he recited, "The butcher, the baker, the candlestick maker." He went on to explain that he had been laid off for several weeks and that although the income had stopped the bills piled up and the rent came due.

The reason "various bills" indicates a kind of despair. A man may have a number of bills outstanding which he can not pay, and for which he is constantly being dunned—he may even have his wages attached—and so he groups them and borrows the entire amount preferring to pay the credit union in weekly installments. People whose margins are so small find it impossible to escape situations like these, for no matter how carefully they planned emergencies would arise.

Clothing did not play such an important part for the men as it did for the women, and when the men did borrow it was usually to buy clothing for their families, not for themselves.

Loans for medical expenses, coal, family expenses, "various bills," and clothing formed four-fifths of the total number of loans granted. They were made to satisfy current and emergency needs—to enable the borrowers to keep their heads above water. There was, however, a second group of loans which were made for progressive purposes. These loans comprised only one-fifth of the total number granted, but even this was an increase over former years, and thus a hopeful sign.

Paying for their homes, improving, and repairing them were among the most important purposes of this second group. Many people were buying their homes through cooperative banks (building and loan associations) and would need to borrow occasionally to make their payments. The same was true of interest payments on mortgages privately held. Often a man needed several hundred dollars to complete the down payment on a house he wanted to buy. Such loans do not mean improvidence, but that because of illness or some other cause these persons were forced to use the money they had planned to set aside. After they had acquired their homes, they wished to keep them in good condition and improve them. Many loans were granted to put in furnaces, bathrooms, and other modern equipment. One man had borrowed each year for five years, first to buy additional property, then to build a garage. The next year he added a sun porch, then repaired the roof, and finally bought an oil burner. His loans never exceeded \$250, and were always promptly repaid. His willingness to carry this continuous burden of debt for the benefit of his family entitled him to the help the credit union could give.

"Investment" as used here covers loans to small business men who needed help to tide them over a dull period or to expand when their business seemed to warrant it. Many of the shopkeepers also borrowed in order to make cash payments on stock when they could buy it more cheaply that way. The most extensive borrowing for investment occurred in the two general credit unions to which these small business men could belong. However, some money was loaned to buy securities, as at the telephone workers' credit union, whose members borrowed in order to buy company stock.

Vacations, automobiles, and radios came in for their small shares, but to borrow for such purposes a man must have a very good record

and indorsers. However, because radios and automobiles are sold so largely on the installment plan, there was not a large demand for loans of this kind.

Education formed but a small part of the total loans made. Five per cent of the men and 1 per cent of the women borrowed to improve their own education or to provide it for others. One man earning \$40 a week paid his daughter's college tuition, and another—a Jewish immigrant—borrowed to send his son to the Harvard School of Business Administration. Younger men borrowed to take technical training which would help them advance in their work. The women borrowed chiefly for their own education.

The amounts loaned differed with the policies of the credit unions, with the records and characters of the applicants, and with the purposes for which they needed the loans, as is shown in Table 7. The last named was probably the most important factor, and, since four-fifths of the borrowing was to satisfy current and emergency needs, men rarely borrowed more than was absolutely necessary. Most of the loans ranged between \$51 and \$100, with the latter figure the most common. Those who borrowed for home payment and investment were granted larger sums, also those whose need for other purposes was urgent, but even these rarely borrowed more than \$500.

TABLE 7.—SIZE OF LOANS TO BORROWERS FROM SIX CREDIT UNIONS

Amount of loan	Number of loans of specified amounts to—			Amount of loan	Number of loans of specified amounts to—		
	Men	Women	Total		Men	Women	Total
\$50 and under.....	179	134	313	\$401 to \$450.....	13	6	19

\$251 to \$300.....	219	70	289	Total.....	2,603	897	3,500
\$301 to \$350.....	17	5	22				
\$351 to \$400.....	49	9	58				

Often a member's account is not touched for several years, but the members know that if any emergency arises they can demand and receive help. On the other hand, many members in the organizations studied borrowed continuously; as soon as one loan was paid up they applied for others. In one credit union where a record was kept of the number of times members had been granted loans, it was found that 390 out of 600 had borrowed once a year or oftener since joining. One man had borrowed sixteen times during nine years. It would seem at first to be a habit—a rather bad one too—but the loans meant a college education for his son, a new roof on his house, and medical attention for his wife. Some one will say that he should have accumulated the money before he spent it and saved the interest. The only answer to that is, that on \$35 a week it does not seem to be within the power of human nature to save without some pressure, and the fact that he owed the credit union supplied that pressure. It is not the accepted way of saving, but it is better than not saving at all.

Per Capita Expenditure for Nonresidential Buildings in Representative Cities

IN GATHERING and publishing information concerning building operations in the cities of the United States, the Bureau of Labor Statistics has always placed emphasis on residential building,¹ and previous articles have covered this phase of the subject. While the building of homes is the most important part of the construction industry, the building of factories, schools, stores, theaters, churches, etc., is also of great importance and interest. The purpose of the present article is to show the annual per capita expenditure for the various types of this nonresidential building in the more important cities of the United States. The study covers the six-year period from 1921 to 1926.

The statement below shows the average annual per capita expenditure for each of the different groups of nonresidential buildings in the 257 identical cities for which reports were received for the six years 1921 to 1926. For purposes of comparison the data for residential buildings as a whole are also given.

In these 257 cities there was an average annual per capita expenditure of \$26.79 for nonresidential buildings during the six-year period. This compares with a per capita expenditure of \$47.99 for residential building. The per capita expenditure for all new buildings was \$74.78.

Of the \$26.79 spent for nonresidential buildings, nearly one-half, or \$13.06, was spent in industrial and commercial construction, that is, for factories and workshops, stores, warehouses, and office buildings. The automobile, although a comparatively new factor in American life, accounted for the next largest expenditure during this period, more money being spent for the erection of garages and service stations than for schools, churches or amusement buildings.

In this six-year period nonresidential building accounted for only 35.8 per cent of all new building, and residential building 64.2 per cent.

	Annual per capita expenditure	Per cent
Amusement buildings.....	\$2. 02	2. 7
Garages and service stations.....	3. 84	5. 1
Churches.....	1. 27	1. 7
Schools and libraries.....	3. 62	4. 8
Institutions ² 97	1. 3
Factories, stores, warehouses, and office buildings.....	13. 06	17. 5
Public buildings and public works ³	1. 51	2. 0
Total nonresidential buildings⁴.....	26. 79	35. 8
Residential buildings.....	47. 99	64. 2
Total new buildings.....	74. 78	100. 0

The table on page 19 shows the per capita expenditure for each of the different kinds of nonresidential buildings, and for residential build-

¹ See Labor Review for May and June, 1927.

² Includes hospitals, asylums, sanitariums, homes, etc.

³ Includes Government buildings, courthouses, city halls, jails, prisons, railroad stations, car barns, bridges, electric light plants, etc.

⁴ Includes per capita expenditure for sheds, stables and barns, etc., not included in the distribution.

ings as a whole in each of the cities of the United States having an estimated population of 200,000 or over on July 1, 1926.⁵ Data are shown separately for each of the five boroughs of New York City.

The greatest per capita expenditure for nonresidential building as a whole was in the Borough of Manhattan, where \$52.44 was the average annual expenditure for each inhabitant during this six-year period. Dallas, Tex., spent \$38.34 annually for each inhabitant, a greater per capita expenditure than for any other city including New York as a whole. The smallest expenditure for nonresidential buildings was in New Orleans, where the annual expenditure was only \$14.52 per inhabitant.

The honor of leading in expenditure for educational buildings falls to Jersey City, which spent an average of \$6.34 per person for this class of structure, while Newark, its near neighbor, spent only 98 cents. The Borough of Queens and Richmond in New York City spent annually \$7.87 and \$6.81, respectively, for schools and libraries during this period, while Boston spent an average of only \$1.67 per person per year for school buildings.

In each city shown in the table more money was spent for industrial and commercial buildings than for any of the other kinds of nonresidential buildings. The annual per capita disbursement for these buildings ranged from \$6.26 in San Antonio, Tex., to \$39.94 in the Borough of Manhattan. New York City (all boroughs) spent \$20.56 per inhabitant, being surpassed only by Dallas with \$24.15.

Garages and service stations accounted for a greater outlay in most cities than any other group except the industrial and commercial buildings. There was, however, a great difference in the amount expended in the different cities, ranging from 64 cents in New Orleans to \$10.43 in Providence.

In most of the cities more money was spent for amusement buildings than for churches. In New York there was a per capita expenditure for amusement buildings of \$3.51 and for churches of only \$1.03. In Chicago the amounts were \$2.23 and \$1.54, respectively. On the other hand, Baltimore spent only 42 cents annually per inhabitant for theaters, movie houses, etc., and \$1.07 for religious buildings, and Toledo showed an annual per capita expenditure of only 33 cents for amusement buildings and \$2.02 for churches.

There is a wide difference in the expenditure of cities of nearly the same size and in the same territory. In Dallas, for instance, there was a per capita expenditure for nonresidential buildings of \$38.34 and in San Antonio only \$16.47, or less than half that of Dallas. In Newark and Jersey City, while the total per capita expenditure for nonresidential buildings was practically the same, the expenditure for the different classes of buildings differed widely. Newark spent larger than average amounts for industrial and commercial buildings and garages, and lower than average amounts for churches and schools, while Jersey City's per capita disbursements were far above the average for educational and religious buildings and below the average for stores, factories, etc., and for garages and service stations.

⁵ As Census Bureau did not estimate the population of Akron, Ohio, Atlanta, Ga., Los Angeles, Calif., Portland, Oreg., or Seattle, Wash., data could not be presented for these cities.

The highest per capita outlay for public buildings and public works was in St. Paul (\$8.43) and the lowest in St. Louis (9 cents). Washington, D. C., spent only 27 cents annually for each resident for this class of structure. Institutions, such as hospitals, sanitariums, etc., account for the lowest per capita expenditure of any of the groups of nonresidential buildings in most of the cities.

For residential buildings the per capita disbursement was highest in New York City, where the average for all boroughs was \$89.80, in the Borough of Queens \$214.56, and in the Bronx \$125.48. New Orleans showed the lowest amount for dwelling places, \$18.24. Among the cities which spent large sums for residential buildings were Washington, D. C. (\$71.88), Detroit (\$71.73), Dallas (\$68.12), and Chicago (\$63.83).

AVERAGE ANNUAL PER CAPITA EXPENDITURE FOR DIFFERENT KINDS OF NON-RESIDENTIAL BUILDINGS IN CITIES OF 200,000 OR OVER, 1921 TO 1926

City and State	Amusement buildings	Garages and service stations	Churches	Schools and libraries	Institutions ¹	Factories, stores, warehouses, office buildings, etc.	Public buildings and works	Total non-residential	Total residential

³ Includes per capita expenditure for sheds, stables and barns, etc., not included in distribution.

Establishment Funds for the Benefit of Disabled Workers

A STUDY of the costs, benefits paid, and methods of management of establishment disability funds was made in connection with a recent survey by the Bureau of Labor Statistics of the personnel activities carried on by 430 companies engaged in manufacturing or in commercial or transportation enterprises.

Mutual benefit associations are frequently maintained by the employees of an establishment without any assistance from the firm or with only the promise of financial aid by the company if a deficit should occur. These associations have been excluded from the report as being practically independent organizations. On the other hand, the associations which have been included vary greatly as to the extent of the assistance rendered by the firm. In some cases this takes the form of clerical assistance only, while in others the company pays a percentage of the expenses, gives the association a stated sum, or in a few instances maintains the fund and pays all the costs of operation as well. The details asked for in the study of industrial benefit associations were the amount of the firm's contribution, the amount of dues brought to a monthly basis, the amount of the weekly sick and accident benefits and of death benefits, the number of sick, accident, and death benefits paid, and the amount paid out in benefits in the last fiscal year.

Of the 430 establishments visited, 214 reported benefit associations in which some material assistance, either in the operation of the fund or in the payment of benefits, was given by the firm. One hundred and seventy-seven of these establishments, with a total of approximately 993,000 employees, reported on the association membership. In these 177 associations, the membership was 758,067, or 76 per cent of the total number of employees. This may be considered quite a high percentage, as in many cases there is a period varying from 2 weeks to a year after employment before an employee is eligible for membership.

The dues charged vary according to the proportion of the expenses paid by the employer and the amount of the weekly benefits. In nearly half of the associations, however, the dues range between 25 and 75 cents per month, while in 81 cases the dues vary according to wages or amount of benefits, but in general keep within these limits.

Fifty-six associations report that an initiation fee is charged. These fees vary from 25 cents to \$2, the usual fee being \$1, and in addition to the entrance fee many of the associations charge a fee of \$1 or \$2 to cover the cost of the physical examination.

Disability benefits in most cases cover both sickness and accident but usually exclude cases of sickness or injury which entitle the employee to payments under the workmen's compensation laws of the different States. Since most of these laws do not provide for payments for the first week or the first two weeks of disability, the plans frequently provide for payments for the period intervening between the date of injury and the date of the first payment of workmen's compensation benefits. In a few cases, however, employees are paid for disability occurring as a result of employment. The mutual

benefit association of an electric power company, for example, allows one-half pay for each secular day of disability for a period not to exceed one year from the date of the accident.

Tables 1 and 2 show, by industries, the number of associations, the membership, the classified dues and benefits, and the percentage of expenses contributed by the companies.

Employees of the large railroad systems are not, in general, subject to the workmen's compensation laws, and these have well-organized relief departments which receive substantial assistance from the companies. Compensation for disability from accidents occurring in the service varies for the different classes of membership and is paid for a period of 52 weeks and at half these rates thereafter, during the continuance of the disability.

Membership and Management of Associations

OF THE companies reporting on this point, 31 stated either that membership was compulsory or that employees were expected to join the association. In the latter case even though there is no definite rule to this effect, strong indirect pressure is brought to bear upon employees to become members. In some plants membership in the association is automatic, that is, employees become members as soon as employed, while in a few cases employees are required to join, if eligible, after a waiting period usually of 2, 3, or 6 months. One

company which does not require employees to join nevertheless gives preference to association members in laying off men, while another company requires employees to join the association if they wish to benefit by the provisions of the group insurance plan.

Among the companies in which there is no pressure exerted upon employees to join the association there is very often a waiting period before becoming eligible. Fifty companies reported the length of time required before eligibility; of these 26 have a waiting period of one month after employment, 20 from two to six months, and 2 one year, while 2 companies required less than one month. In several cases, however, in which membership in the benefit association is optional with the employees they are allowed to join as soon as they are employed. A number of the associations require applicants for membership to be approved either by the membership as a whole, by the officials of the organization, or by the board of directors before they are allowed to become members.

Membership in these societies, especially the larger ones, is frequently conditioned on passing a physical examination, in which case the examination may be given by a physician specially employed for this purpose or the employee may choose one of several designated physicians. In a number of cases the medical department of the plant works in close cooperation with the benefit association and in such cases the plant physicians examine applicants for membership, while in a few instances the medical department is turned over to the benefit association to manage.

In associations not requiring a physical examination it is customary for the prospective member to sign a statement to the effect that so far as he knows he has no disease which would debar him from membership. The penalty for making an untrue or fraudulent statement of this character is the forfeiture of membership in the association.

In the event the physical examination reveals some condition which would ordinarily debar from membership, some associations admit such persons if they receive a majority vote of the board of directors or other officials on the condition that they exempt the association from liability for such ailments or for ailments for which such conditions may be responsible.

The management of the benefit associations is participated in largely by employees except in those cases where the funds are financed entirely by the companies. Many of the associations are managed by the employees alone while some stipulate that one or more of the offices shall be held by company officials. In large plants with many departments it is usual to divide the representation among the different departments so that there is equality of representation in the management of the association.

Length of Membership Required Before Becoming Eligible for Benefits

THE length of time which must elapse before the member is eligible for benefits is reported by 103 of the associations. In 27 of the societies members are entitled to receive benefits as soon as their application for membership is approved, while 40 have a waiting period of four weeks, 5 of two months, 11 of three months, and 2 of six months. In the remaining 18 cases the period varies from 3 to 15 days or is fixed for the first day of the month following admission

to membership. In a few cases, although there is a waiting period for sick benefits, employees are eligible for accident relief at once, and several associations require a longer period of membership before death benefits are paid than for sick and accident benefits.

The length of service required by companies which pay the entire costs of the disability funds varies for the companies reporting from 30 days to 2 years. A metal manufacturing company in the South, which has a large proportion of negro employees, pays benefits to each employee absent on account of sickness who has been in the service of the company 30 days. The payments, which are made for each day lost from work over six working-days, amount to half of the average daily wages for the 30 days preceding the sickness with a stated maximum, and in case of death, unless caused by violence or accident covered by the workmen's compensation act, the company pays \$100.

Another company manufacturing metal products maintains a fund which pays benefits after six months' membership. The benefits cover sickness of both employees and their dependents and include both hospital and medical care. It is necessary for an employee to pass a physical examination before being admitted to membership. The affairs of the association are administered by the usual officers and a board of trustees who are elected annually from the different departments of the plant.

A large oil-refining company maintains a fund from which disability and death benefits are paid after one year's employment. The length of time for which sickness benefits are paid in any one year increases with length of service from a minimum of 6 weeks for 1 year's service to 52 weeks for service of 10 years and over. A large rubber company in the East pays sickness and nonindustrial accident benefits to factory employees who have been in the continuous service of the company for three months or more. Disability benefits vary according to length of service but may not exceed 70 per cent of the average wage of the employee during the preceding three months, the length of time for which benefits are paid varying from 7 to 52 weeks. The death benefit ranges from \$200 for service of three to six months to \$1,000 for service of five years or more.

Time Between Beginning of Disability and Payment of Benefits

THE necessity of guarding against the feigning of sickness or the making of slight illness an excuse to be absent from work is undoubtedly the reason that so large a proportion of the associations do not pay from the beginning of sickness. Many of these associations which provide for a waiting period in cases of sickness pay from the date of injury in accident cases, since the risk of malingering in cases of injury is generally not so great. Of 143 associations reporting on the number of days intervening between the beginning of the disability and the payment of benefits, 92 pay after 6 to 8 days disability, 6 pay from the first, 18 pay after the third day, 6 pay after 4 or 5 days and only one waits as long as 10 days, while a number pay from the first if the disability lasts a stated length of time.

The maximum time for which benefits are paid in any 12 months varies greatly. Twenty associations pay for 10 weeks, 45 for three months, 34 for six months, 9 for one year, and 29 for various frac-

tions of a year, while 7 pay for various periods according to length of service. Eight associations report that benefits are paid for more than one year, in five cases the length of time being unlimited.

Forfeiture of Membership

IN THE majority of the associations membership is forfeited upon leaving the employ of the company, but in a number of cases it may be retained under certain conditions. Only one company reports that membership may be retained unconditionally, but a number allow members to remain in the association for the death benefit and several may remain several months during furlough or suspension, while it is a quite general provision that membership may not be terminated while a person is receiving benefits. One association refunds 50 per cent of the dues to any person leaving the association for any reason whatever if no sick benefits have been paid to date, or, if the sick benefits paid amount to less than 50 per cent of dues, the difference between the benefits paid and that amount is refunded.

The following table shows the sick and accident and death benefits paid during the fiscal year preceding the date of the schedule covering the association. The benefits paid for sickness and accidents are shown together, because few of the firms reported on these items separately.

In addition to the cash benefits which are the principal features of the benefit funds, a number of the associations do constructive work in promoting healthful conditions among employees and in furnishing medical and hospital care for them. A power company on the eastern coast provides the services of a health officer who cooperates with the organization in furthering health measures for employees, advises employees, makes inspections in case of sickness, and gives physical examinations to employees. Treatment in case of sickness is obtained, however, by the employees from their own physicians. Other associations provide medical and surgical care, treatment by specialists including X rays and various necessary laboratory tests, and nursing service.

It seems evident from the number of benefit associations and the degree of interest shown by the firms in the operation of the funds that these societies are regarded as of considerable importance to the welfare of the employees and several firms stated they considered the employees' benefit association to be one of the most helpful factors in their plan of industrial relations.

INDUSTRIAL RELATIONS AND LABOR CONDITIONS

The Farm Laborer as a Human Being

ARE we developing on our farms a low class of farm labor? Is the farm hired man one of low moral character whose influence tends to disrupt the unity of the family life and who, if he is a married man, is compelled to maintain a low standard of living as a result of which the educational, religious, and community life all suffer? These questions are suggested by a chapter on farm labor presented as part of a work on Rural Sociology by Carl C. Taylor.¹ This study considers the major problems of rural living and appears to substantiate the opinion expressed in the editor's introduction that "not until our schools and colleges devote more careful attention to the social side of farm living will our rural civilization improve and develop to its proper relationship with city living."

The author recognizes that the farm-labor situation is a real problem, due to a number of reasons—the seasonal character of the work, the inability to secure help when wanted, the superior social and monetary attractions and more favorable working conditions offered by the city, the inefficiency of transient labor due to lack of real interest in the work, the inability to pay sufficient wages to attract competent labor, and many others which serve to complicate the matter and render it difficult of constructive solution. It is estimated that 46 per cent of all demands for hired help on the farm is for short-term laborers, and that 1,500,000 farmers use their hired men only a portion of the year. This emphasizes an important phase of the agricultural labor problem and leads the author to conclude that "unless agricultural production is so organized as to eliminate the demand for these great masses of transient laborers, it is inevitable that we shall continue to have difficulty in supplying our farm-labor needs."

Farm labor is recruited from several sources. The operator and his family constitute the permanent supply, and many farmers are compelled to depend upon this source largely. Transient or seasonal workers, professional groups, including the threshing, shelling, and shredding gangs, exchange laborers, and neighbors are other sources, to which should be added the work of animals and machines. The nonhuman elements, because of their place in lessening the irksomeness of farm work, determine in large measure the ease or difficulty attending the procuring of farm labor. Farm work is essentially manual, with long hours. "The immensity of it during a lifetime is almost incomprehensible." This applies equally to the farm woman, whose household duties apparently are never ended. Hence the introduction of machinery wherever possible, both in the field and in the home, not only reduces the burdens of the operator and his

¹ Taylor, Carl C.: *Rural Sociology: A Study of Rural Problems*. New York and London, Harper & Bros., 1926. pp. 55-79.

family, but has a tendency to encourage the enlistment of outside labor and thus contribute to a solution of the labor problem. Not only does the introduction of machinery lessen the irksome character of the work, but it "increases the productivity of man power many fold by saving time and multiplying the directive power of the human element."

In 1830 it took 3 hours and 3 minutes of human labor to produce a bushel of wheat in the United States. In 1894 it required but 10 minutes. Improvements have been made since that time and the human labor is to-day considerably less arduous than it was in 1830, when cradle and flail were the chief tools. In 1855 it required 4 hours and 34 minutes of human labor to produce a bushel of corn. In 1894 it required 41 minutes. It took 35½ hours to produce, harvest, and bale a ton of hay in 1860. In 1894 it took but 11½ hours. In 1841 it took 13.4 minutes to produce a pound of seed cotton. In 1895 it took but 4.7 minutes.

It is stated that in 1922 the amount of time saved in the production of the wheat crop by modern methods as compared with those used in 1830, was 2,713,179,166 hours of work. This is a striking contrast. The quite general use of machinery, in the opinion of the author, has had a very marked social effect on the farm, making possible a shorter day, freeing the farmer from much drudgery, standardizing farm processes and farm work, lightening farm women's work, inspiring the farm boy with creative interest, and removing much of the feeling that farm labor is menial, thus lending some dignity to the farmer's position. However, it must not be overlooked that the use of farm machinery has greatly increased the possibility of farm accidents. The introduction of machinery has, of course, decreased the need for man power and has increased the requirements for efficiency and knowledge, making a demand for a somewhat higher type of farm labor than a half century ago. From this angle the solution of the problem, it is suggested, "must lie in the direction of a farming enterprise which pays its entrepreneurs a better return for efforts and a system of farming and mode of farm life which rather than forbidding is inviting to future generations to live upon and love the farm."

The author suggests several factors which go to make up the farm labor problem, but adds that when remedies are offered to farmers it is difficult to induce them to listen to or adopt plans which vary widely from their habitual practices, even though the plans outlined may be working well elsewhere. Force of circumstances will, it is believed, overcome this difficulty. Farmers must provide "comfortable, neat, and convenient" homes for their married help, who must be assured fairly permanent employment. As high a degree of standardization of hours and tasks as is possible on the farm must be adopted, although it is recognized that standardization is difficult in this industry. If this can be accomplished at times like harvest and threshing it can be done to a much greater degree at other times and in other farm enterprises. Surveys indicate that the average field day of the farm worker is between 9 and 10 hours, to which must be added the time required for "chores." If the total time required exceeds 10 hours the laborer is compelled to do the necessary work about his own home at night and on Sundays and he then feels that he is unduly crowded.

The matter of farm wages, which have materially increased since 1917, presents a problem very difficult of solution. They do not

compare at all favorably with wages in other lines of industry, and while farmers may not be able to meet these scales of city wages and yet make farming pay, "it does not obviate the fact that they will have to do so or leave their farm-labor problem unsolved."

This solution may lie outside of the farmer's present scope of power. If so, we may expect him to develop a scope of power equal to the occasion through the means of controlling the profits of his enterprise by the development of farm-marketing organizations, which will place him in a position to control prices of farm produce; or we may have to wait until the depleted labor supply on the farm makes itself felt in lessened production and consequently better farm prices.

The author cites the fact that there is a tendency toward specialization of farm tasks as well as toward specialized farming, but the development is so slow and the percentage of farm work done by these classes is so small that few are cognizant of the tendency. However, he sees in this trend a possible solution of some of the farmer's problems.

One thing that tends to discourage labor from seeking employment on the farm, according to this report, is that the general conditions under which farm labor is carried on do not compare favorably with standards in other occupations. Organized labor has forced the adoption of better working conditions in many industries, and although "it may be a far cry to expect the agricultural situation to lend itself to these standards in the near future," this is not impossible. The author points out the difficulties that have stood in the way of standardization, as follows:

1. Agriculture is a seasonal occupation to a marked degree, thus rendering standardization difficult.
2. The length of the farm laborer's working day is irregular, so that he can have no set habits of life.
3. Farm labor demands versatility, and it is not easily learned.
4. The work is to a large extent heavy labor.
5. Agriculture is more or less a solitary occupation.
6. The farm laborer retains a large measure of individual initiative and personal responsibility.
7. Farming is not an especially hazardous occupation.
8. Labor organizations have no influence on labor conditions on the farm.
9. The farm labor situation is not subject to industrial upheavals, such as strikes or lockouts.
10. The hired man on the farm has no opportunity to develop a neighborhood or community life of his own.

The author concludes that from a sociological standpoint the farm laborer's position is very unsatisfactory to himself and to the community life in which he is placed, and that his removal is much to be desired. He is pictured as a man too often of low moral character whose presence in the operator's family "many times tends to lower the whole tenor of the home life." If married, his wife and children generally pay the penalty of his social and financial status, for they are often compelled to maintain a rather low standard of living which in turn may have a marked effect upon the community, especially if there are great numbers of such hired men's families. They are seldom an integral part of the institutional life of the community. The apparent fact that the hired-man situation is becoming more and more of a problem is not looked upon with complacency, and "those sections which have developed a thorough going system of hired-men farming constitute the rural slums of the Nation." It is

admitted that the situation would be much more encouraging if these men ultimately became owners of farms, but it appears that a very small percentage of them are of the type to achieve that goal.

If we must have anything like a large hired-man class to maintain American agriculture, if the farm owner finds it necessary to assume all initiative in the conduct of the farm enterprise, and if the members who fail to move on up the agricultural ladder continue to increase, it will be folly to close our eyes to the fact that we are developing a class of tillers of the soil who must continue to live lives most unsatisfactory to themselves and most damaging to the future of rural civilization in America.

It is because of conditions such as these that farm laborers look elsewhere for employment where working standards are such as to render living less monotonous and give the worker a more hopeful outlook for the greatest advancement of himself and his family.

Results of Cooperation of Workers and Management on Railroads

THE "Baltimore & Ohio plan" of union-management cooperation is not a technique, not a formula, but "a state of mind."

The plan—its inception, operation, and actual results—is discussed in two articles in the May, 1927, issue of *Industrial Management*, the first by Daniel Willard, president of the road under whose direction the plan has been developed, and the second by O. S. Beyer, jr., who, together with William H. Johnston, then president of the International Association of Machinists, first conceived the idea of the plan and has supervised its working.

The scheme was intended (1) to provide for "the utilization of the facilities of the railroad company to the fullest possible extent for the maintenance, rebuilding, and remodeling of locomotives, and car equipment, as well as for the manufacture of supplies and material needed for mechanical and other purposes"; and (2) "to help the stabilization of employment on the Baltimore & Ohio Railroad, thereby producing a situation of satisfied and contented personnel with improved morale, and consequently improvement in the service and production by greater efficiency and better quality of work."

The plan was first suggested to Mr. Willard in the spring of 1922, just before the shopmen's strike. The Baltimore & Ohio Railroad had always recognized the right of its workers to organize into unions, and had negotiated agreements with them on questions of wages, hours, and working conditions, but its position had been one simply of toleration.

At the beginning of Mr. Willard's presidency he was struck by the lack of confidence between men and management. This he found to be due primarily to the fact that "while the officers made agreements with the men and put them in writing, there was not a proper appreciation on the part of the officers that an agreement, having been made, should be lived up to as long as it was an agreement, whether we liked it or not. The result was that agreements were made in conference and then broken the next day by the officers." A definite effort was made from that time to develop a real basis for understanding and mutual trust, and that this had been attended

by some measure of success was attested by the fact that this railroad was chosen by the originators of the plan as the field for its initiation.

The idea was accepted, but the actual putting into practice was delayed by the shopmen's strike. It had, however, taken root so strongly that during the course of the strike the Baltimore & Ohio management had been "careful not to do anything that we could avoid doing that would create a state of mind that would make it impossible after the strike was over."

Inauguration of Plan

AFTER the settlement of the strike the plan was inaugurated in the shop where conditions were most adverse—the repair shop at Pittsburgh. The men employed were of many nationalities and had always been more or less dissatisfied; employment was not always steady; and bitterness had been engendered between the old and new men during the course of the strike.

The experiment was tried out at this shop for nearly a year but the results were unsatisfactory and the shop was closed. Later, when some of the grievances and misunderstandings had been cleared up, it was opened again and this time, with the same shop, the same tools, the same wages, and the same working conditions, the plan was successful. Mr. Willard states: "I tried to analyze it, and it seemed to me that the only thing that had happened was a change in the attitude of the men and of the management; there had been brought about a different state of mind, and, after all, as I look at it, that is about the essence of the whole movement. We have, I believe, succeeded in bringing about a different point of view between our managers and our men."

It was understood that the benefits derived from the new plan were to be shared with the men. The management promised to do all in its power to stabilize employment, provided the men would contribute to raising the morale of the shop. Mr. Beyer states:

To this they readily agreed. And the management, in keeping with its promise, sent a new line of work to Pittsburgh in the form of cars and locomotives to be rebuilt, in order to help stabilize employment. The men appreciated this action, for it gave tangible significance to the cooperative idea. The first locomotive, No. 1003, turned out under this program of "Baltimore & Ohio work in Baltimore & Ohio shops" thus became a monument to cooperation. Here was living evidence of how cooperation was helping the men to steadier jobs and hence greater wage income.

The men "became very active in observing opportunities for improvements, working out practical suggestions and presenting them at their local union meetings and to their representatives for submission to the shop management." A committee system was developed, a committee of the men meeting with representatives of the management, at first irregularly, but later at stated intervals. It was soon decided to keep written records of subjects discussed and action taken.

After the scheme had been in operation for six months it was formally ratified by a convention of the shopmen of the railroad, and its inauguration at each of the 45 shops of the system was provided for by agreement with the railroad in February, 1924.

The plan is now in operation not only in all the shops of the Baltimore & Ohio Railroad, but has also been adopted on three other railroad systems—the Canadian National Railways, the Chicago & North Western Railway Co., and the Chicago, Milwaukee & St. Paul Railway Co.

Essentials of the Plan

UNDER the scheme each shop has its own machinery, and its work is reviewed every three months by a "joint system cooperative committee" which meets also for the purpose of considering and acting upon propositions applicable to the road as a whole. No grievances are considered at either local or joint meetings.

The essentials to the success of the scheme are listed by Mr. Beyer as follows:

1. Full and cordial recognition of the standard labor unions as the properly accredited organizations of the employees.
2. Acceptance by the management of these unions as helpful, necessary, and constructive in the conduct of industry.
3. Development between unions and managements of written agreements governing wages, working conditions, and the prompt and orderly adjustment of disputes.
4. Systematic cooperation between unions and managements for improved service, increased efficiency, and the elimination of waste.
5. Willingness on the part of managements to help the unions solve some of their problems in return for the constructive help rendered by the unions in the solution of some of managements' problems.
6. Stabilization of employment.
7. Measuring and sharing the gains of cooperation.
8. Provision of definite joint union and management machinery to promote and maintain cooperative effort.

The sixth and seventh requirements, namely, stabilization of employment and sharing the gains of cooperation, are reasons why the employees through their unions are warranted whole-heartedly in supporting the cooperative policy. Even should a railroad or industrial plant be run better from either the public's or management's point of view, the union employee's interest in cooperation will not endure if he does not himself get direct and tangible benefits from cooperation. These benefits must take the form, first, of steady employment; second, better working conditions; third, greater yearly wage income; and fourth, better wage rates. Above all else the workers in industry must be assured that management will do everything within its power to stabilize employment; for obviously, if, as a result of greater efficiency they are apt to work themselves out of a job, they will soon lose any enthusiasm they might otherwise have had for cooperation.

Results of the Plan

IN THE shops of the Baltimore & Ohio road some 18,000 suggestions have been brought forward by the men for consideration. Of that number, 15,000 (83 per cent) have been accepted, 500 are still under investigation, 500 are regarded as good but too expensive to adopt, and 1,600 have been rejected as impracticable.

The management makes a special effort to see merit in the suggestions wherever possible, but Mr. Willard points out that rejections do not result in bad feeling:

A lot of the men, 1,600 men, perhaps, had ideas in their minds that they thought were practical; they found the company was not following those ideas and they thought the company was inefficient because it didn't do 1,600 things that they thought ought to be done. After a full discussion they themselves discovered that those 1,600 things were impracticable, and to the extent that that had seemed to reflect inefficiency on the part of the management they were cleaned up, and that led to a better understanding.

About one-third of the suggestions do not benefit the carrier directly but deal with conditions that the men desire to see improved.

The scope of the scheme has been enlarged so that it includes not only the shopmen but also practically all the men in the service of the road.

The plan has, according to Mr. Beyer, resulted in the following benefits to the men:

1. Reduction in grievances—i. e., fairer application of working rules. It is estimated that the number of grievances has been reduced approximately 75 per cent since the inauguration of the cooperative plan. In the year preceding the adoption of the plan there was 1 case of grievance appeal for every 58 men; in 1925, 1 case for every 131 men; and in 1926 the number was still further reduced.

2. Quicker adjustment of grievances.

3. Improvements in apprentice training.

4. Better working conditions.

5. Better tools and methods for doing work.

6. Higher standards of workmanship.

7. Stabilization of employment. From 1924 to 1925 the period of employment of shopmen on the Baltimore & Ohio was increased, on an average, two weeks. This is equivalent to an increase of \$44 per year for each man or 2¼ cents per hour. On the Canadian National Railways similar progress has been made, while the Chicago & North Western road, by virtue of the more systematic distribution of work throughout the year plus the policy of doing railroad work in railroad shops, has been able to tide over several declines in traffic without reductions in staff.

8. Financial participation in the gains of cooperation.

Among the advantages accruing to the management are listed the following:

1. Better shop discipline.

2. Reduced labor turnover.

3. Improvements in employee training.

4. Better grade of employees secured.

5. Conservation of materials.

6. Reduction of defects and failures.

7. Better workmanship.

8. Increased output.

9. New business. Some of this is secured by the employees' active efforts, and Mr. Beyer states that on "more than one occasion the employees have, out of their own pockets, paid for advertisements soliciting traffic for their railroads."

10. Better morale.

11. Improved public good will. "It has become more and more evident that the reputation enjoyed by railroads in respect to their ability to get along well with their employees and secure their systematic cooperation for good service has been a big feature in promoting the sympathy and interest of the public toward such railroads."

The general results are summed up by President Willard as having been "eminently satisfactory up to date."

Attitude of Certain American Economists Toward Labor Problems

MANY books have been written by economists in an endeavor to bring about a better understanding of the labor movement and the problems incident thereto, by presenting in a manner carefully outlined and diligently prepared such studies as *Wages and the State*, *Labor Economics*, *The Labor Problem in the United States and Great Britain*, *The Government and Labor*, *American Labor and American Democracy*, *The Causes of Industrial Unrest*, and *Labor Relations in Industry*. A review of these publications, in an effort to show how they are falling short in accomplishing their real purpose because, while emphasizing the desirability of education and its extension among the workers, they do not give sufficient attention to how that shall be brought about, appears in a recent issue of the *Quarterly Journal of Economics*.¹ The article is entitled "Labor problems as treated by American economists," and is by Charles E. Persons, of Boston University.

The chief criticism offered of all these volumes covering familiar aspects of the labor movement is that, while they represent extensive study and are "backed by mature scholarship," they "do not advance us beyond the line of to-day and in general they are satisfied once they have discovered and recorded what has happened up to to-day." The reason for this is ascribed, in part at least, to the unhistorical character of the studies, with little real attempt to disclose the forces that changed medieval to modern industry. The reading public "may rightfully expect from students of labor questions both a clear exposition of their past effects and a diagnosis of their present significance and at least a suggestion as to their future potency." Especially is this historical perspective lacking in the discussion of trade-unionists and trade-unionism, thus creating a wrong impression as to the progress of the trade-union movement. Mr. Persons attempts to correct this by pointing out that, man for man, trade-union membership is to-day far superior to that of the early days, for it commands respect and assumes power which it is fitted to use wisely. There are, of course, exceptions to this, particularly among recently arrived immigrants. A distinction is made between the wage earner and the trade-union:

Wage earners and trade-unions are not interchangeable and identical, like parts in a modern machine. Rather, in the United States, they represent different industrial centuries and widely separated sociological strata. It is fair to expect writers of labor texts to recognize this and to temper their absolutistic pronouncements with exposition of the nature of the wage earner and trade-unionist in the flesh.

The tendency of economists to deal in criticism of employers and of judges and public officials is deplored. The employer oftentimes is bound by competition, it is pointed out, which compels him to a policy of speeding up and overstrain of modern industry. Frank acceptance of this fact is regarded as essential if authors on labor subjects are to be fair in their presentations. It is the supposed conflict between an individualistic philosophy and social action, revealed in these writings, which disturbs the reviewer of these books.

¹ *Quarterly Journal of Economics*, Cambridge, Mass., May, 1927, pp. 487-519: "Labor problems as treated by American economists," by Charles E. Persons.

Regret it as we may, social organization has replaced individualistic self-sufficiency, and an individualistic philosophy is as obsolete for most workers as dependence on a private well for a water supply. Recognition of this truth might be hastened by intensified historical study and analysis. Should it not be a foundation stone in any twentieth-century labor text?

A failure to grapple with the question of the right relationship between our trade-unions and our democracy is given as the most fundamental lack in books on labor questions. The Constitution of the United States was written before labor problems as they exist to-day were known, and it "would be more worthy of our great democracy and productive of an immeasurably greater result if we gathered in a new constitutional convention and faced squarely the problem of formulating a set of principles which would furnish a firm foundation for legislation and adjudication in labor problems." Some writers apparently have made an effort to advance that cause, but disappointment is expressed because the scholars who might be expected to formulate the premises on which judgments should be based have not met the issue. This, it is suggested, forces labor to be the innovator, but labor "lacks education, trained leadership, and powerful organs which command public attention." Its opponents, on the other hand, "are well served in all these respects," and are protected by "massive bulwarks of established institutions and accepted traditions."

Is it not fair to expect that twentieth-century text books on labor will point the way to the next forward step and analyze the situation so definitely that underlying principles will become evident? It is a reproach if they are wise only after the event. The books are not worth while if they shift the burdens of scholarship to sorely burdened and ill-equipped labor.

If the shop committee plans are to succeed, if the unions are to be wisely officered and intelligently directed, if, indeed, the democracy is to grapple successfully with the increasingly intricate and difficult problems which vex it, we must raise the average of intelligence and wisdom of the trade-union member and of the citizen. It has been recently suggested that what over-prosperous America most greatly needs is "a big job." Here is one ready to its hand. It may undertake the herculean labor of banishing illiteracy and ignorance; of alleviating the inevitable monotony of labor by fitting the laborers to live, and live more abundantly, outside the workshop. It may so train its workers that they will no longer be mute and helpless victims of unrest. Instead, they will present their case convincingly at the bar of an intelligent public opinion, and the scholar will record the judgment, as always, with approval. We might even be allowed to hope that economists, philosophers, and statesmen in that newer day will formulate the "underlying set of principles" which will guide them to a favorable judgment before the event."

The Italian "Labor Charter"¹

IN JANUARY, 1927, the Fascist Grand Council approved a resolution for the establishment of a "labor charter," the preparation of which was to be intrusted to Mr. Mussolini as Minister of Corporations. This charter, of which the following is the official text, was issued on April 21, 1927, the anniversary of Rome's foundation, which is Labor Day in Italy:

The corporate State and its organizations

SECTION 1. The Italian nation is an organism with specific ends, a separate life, and methods of action superior to those of the individuals or groups which

¹ International Labor Office, Industrial and Labor Information, Geneva, May 9 (pp. 193-197) and May 23, 1927 (pp. 321, 322).

compose it. It constitutes a moral, political, and economic unity the complete realization of which is found in the Fascist State.

SEC. 2. Labor in all its forms, intellectual, technical and manual, is a social duty. On this count, and on this count alone, it is protected by the State. Production as a whole must be regarded as a unit from the national point of view. Its objectives are all of the same kind, and may be summarized as the well-being of producers and the development of the national power.

SEC. 3. Occupational or trade-union organization is free, but only trade-unions which are legally recognized and subject to State control are entitled legally to represent all the categories of employers or workers for whom they are constituted, to protect their interests vis-à-vis the State or other occupational associations, to conclude collective labor agreements which are compulsory for all persons belonging to their category, to impose contributions on their members, and on their behalf to exercise delegated powers in the public interest.

SEC. 4. The concrete expression of solidarity between the various factors in production is the collective agreement, through the conciliation of the opposing interests of employers and workers, and their subordination to the higher interests of production.

SEC. 5. The industrial courts ("magistracy of labor") constitute the organization through which the State intervenes to settle labor disputes, whether in connection with the observance of agreements or other existing provisions, or in connection with the determination of new conditions of labor.

SEC. 6. Legally recognized occupational associations secure juridical equality between employers and workers, and maintain and seek to improve the régime of discipline in production and labor. As representatives of the united interests of production, the corporations themselves may issue binding regulations governing the discipline of labor relations and the coordination of production, whenever they have received a mandate from the affiliated associations. The corporations are the unifying organization of the forces of production, and fully represent its interests. In virtue of this plenary representation, the corporations are legally recognized as State organizations, since the interests of production are national interests.

SEC. 7. The corporate State considers private enterprise in the sphere of production as being the most effective and useful method of securing the interests of the nation. Since private organization of production is a work of national importance, the head of an undertaking is responsible to the State for the development of production. From the collaboration between the forces of production is derived a reciprocity of rights and duties. The worker, whether a technician, a salaried employee, or a manual laborer, collaborates actively in the work of an economic undertaking, and the direction of the undertaking devolves upon the employer, who is responsible for it.

SEC. 8. Occupational associations of employers are required by all means in their power to increase and improve the production of the goods which they produce, and to reduce the cost thereof. The representatives of persons who carry on a liberal profession or an art, and associations of employees in public undertakings, are required to combine in protecting the interests of art, science and letters, in the improvement of production, and in the achievement of the moral objects of the corporate system.

SEC. 9. State intervention in economic production takes place only when private enterprise is wanting or inadequate, or when the political interests of the State are at stake. Such intervention may take the form of control, encouragement, or direct administration.

SEC. 10. In the event of collective labor disputes, legal action can not take place unless the corporate organization has first made attempts at conciliation. In individual disputes concerning the interpretation and enforcement of collective labor agreements, occupational associations are allowed to proffer their good offices for conciliation. Competence in such disputes belongs to the ordinary courts, with the assistance of assessors appointed by the occupational associations concerned.

Collective labor agreement and labor guaranties

SEC. 11. Occupational associations are compelled to regulate labor relations between the categories of employers and workers whom they represent, by means of the collective agreement. The collective labor agreement is concluded between associations of the first degree, under the direction and control of the central organizations; but the association of the first degree may be replaced by the association of the higher degree in the cases provided for in the laws and statutes.

All collective agreements must, under pain of being null and void, contain precise rules concerning disciplinary relations, the period of probation, rates of wages and the methods of paying wages, and hours of work.

DETERMINATION OF FAIR WAGES

SEC. 12. Trade-union action, the conciliation work of the corporate organizations and the awards of the labor courts all constitute guaranties that wages will correspond to the normal requirements of life, to the possibilities of production, and to the output of labor. The work of determining the wage is carried out without reference to any general rules and is intrusted to the parties to the collective agreement.

SEC. 13. Data established by the public departments, by the Central Statistical Institute and by the legally recognized occupational associations, concerning conditions of production and of labor, the situation of the money market and variations in the standard of existence of the workers will, when coordinated and collated by the Ministry of Corporations, supply the criteria for the reconciliation of the interests of the various categories and of the various classes among themselves, and also of their interests in comparison with the higher interests of production.

PIECE RATES

SEC. 14. Payment should be made in the manner which best meets the needs of the worker and of the undertaking. When payment is calculated on a piece basis and is made for periods longer than a fortnight, accounts by the fortnight or the week are required.

Night work not carried out in regular shifts is paid for at a higher rate than day work. When payment for labor is made on a piece basis, the piece rates must be determined in such a way that the hard worker with a normal capacity for work receives a minimum remuneration higher than the basic wage.

THE WEEKLY REST

SEC. 15. The worker is entitled to a weekly rest coinciding with Sunday. Collective agreements will enforce this principle, taking account of existing legislation and of the technical requirements of the undertaking and, within the limits of these requirements, will take steps to secure that civil and religious holidays are respected in accordance with local tradition. Hours of work must be fully and strictly observed by the worker.

PAID HOLIDAYS

SEC. 16. After one year's uninterrupted service a worker in a continuous process undertaking is entitled to an annual holiday with pay.

DISMISSAL INDEMNITIES

SEC. 17. In continuous process undertakings the worker is entitled, in the event of his dismissal through no fault of his own, to an indemnity proportionate to his years of service. Such indemnity is also due in the event of the worker's death.

SEC. 18. In continuous process undertakings the transfer of the undertaking does not cancel the labor agreement, and the staff of such an undertaking preserve their rights as against the new proprietor. Similarly, sickness on the part of the worker, which does not exceed a certain period, does not cancel the labor agreement. A worker may not be dismissed because he is called up for service in the army or in the militia.

SEC. 19. Infringement of discipline and acts committed by workers calculated to disturb the normal working of the undertaking are punished, according to the gravity of the delict, by fines, suspension from work, and, in serious cases, immediate dismissal without an indemnity. The cases in which the employer may inflict fines, suspend from work, or dismiss on the spot without indemnity will be specified.

PROBATION PERIODS

SEC. 20. When a worker is engaged, he must undergo a period of probation, during which period the agreement may be canceled on either side, provided only that work actually done during the period in question must be paid for.

SEC. 21. Collective labor agreements are extended, both as regards their benefits and the discipline which they impose, to home workers also. Special rules will be laid down by the State for securing conditions of cleanliness and hygiene for home work.

Employment exchanges

SEC. 22. The State is the only body which can ascertain and control the state of employment and unemployment among the workers, which is the final index of conditions of production and of labor.

PREFERENTIAL CLAUSES

SEC. 23. The joint employment office is under the control of the corporate organizations. Employers are compelled to take workers registered with these offices, and are entitled to choose them from a list of persons registered, giving the preference to members of the party, to Fascist trade-unionists, and also to seniority of registration.

SEC. 24. Workers' occupational associations are compelled to make a certain choice among the workers, with the object of improving continuously their technical capacity and their moral worth.

SEC. 25. The corporate organizations see to the observance of legislation concerning the prevention of accidents, and labor regulations on the part of individuals affiliated to the federated associations.

Welfare, social assistance, and education

SEC. 26. Welfare is an important manifestation of the principle of collaboration. The employer and the worker must contribute proportionately to welfare charges. The State, through the medium of the corporate organizations and the occupational associations, will, so far as possible, coordinate and standardize the system and the various welfare institutions.

SEC. 27. The Fascist State proposes: (1) to perfect the system of accident insurance; (2) to improve and extend maternity insurance; (3) to set up a system of insurance against occupational diseases and tuberculosis, as a first step towards a general system of insurance against all diseases; (4) to perfect the system of insurance against involuntary unemployment; (5) to adopt a special insurance system for endowing young workers.

SEC. 28. It is for the workers' associations to protect the interests of their members in administrative and judicial matters connected with accident insurance and social insurance in general. In collective agreements, whenever technically possible, mutual benefit funds for sickness will be set up, fed by contributions from employers and workers, and administered by representatives of both, under the control of the corporate organizations.

SEC. 29. It is both the right and the duty of the occupational associations to assist the persons they represent, whether members or nonmembers. The occupational associations must exercise their functions of assistance directly through the medium of their own organizations, and may not delegate them to other bodies or institutions, except for reasons of general interest which go beyond the scope of the interests of any single category of producers.

SEC. 30. Education and instruction, in particular, the technical instruction of the persons they represent, whether members or nonmembers, is one of the chief duties of the occupational associations. They must collaborate in the work of the various National Workers' Spare Time Institutes, and in other educational schemes.

In the same issue of the *Gazzetta Ufficiale* (quoted in *Industrial and Labor Information*) in which the full text of the "labor charter" was carried the statement given below was also published:

On the occasion of the promulgation of this charter, one of the basic documents of the Fascist revolution, inasmuch as it lays down the rights and duties of all forces of production [the Grand Council] seizes the opportunity to bring it to the attention of the whole Italian people, and of all those throughout the world who are concerned with the social problems of our time; because by this act of will and faith, the Black Shirts show that the forces of production may be harmonized, and that their harmony is the sine qua non of their fertility.

Fascism thus demonstrates that, as opposed to the absurd and ruinous socialist demagogies which are everywhere bankrupt, discredited and impotent, its effect

is to raise the moral and material standard of the most numerous classes of society, which have consciously taken their place in the national existence, both in theory and in fact.

In connection with its approval of the "charter" the following resolution was passed by the Fascist Grand Council:

The Grand Council expresses the wish that the Government should, on the initiative of its head, the Minister of Corporations, and in agreement with the other ministers concerned, prepare the necessary legislative measures for the promulgation of the principles affirmed to-day, the object of which is to develop Fascist legislation on the legal disciplining of collective labor relations and on the corporate organization of the State; and decides that, in the present year, there should be concluded, either in a new or in a modified form, collective agreements on the basis of the clauses contained in the "charter," and that the duration of the agreements should be such as to allow undertakings the possibility of a sufficient lapse of time to adapt themselves to the new financial situation and to the difficulties of international competition.

Mr. Mussolini declared that the charter "may be transformed into law as regards its various parts" but that the document itself has even now "an executive value." He also gave expression to his assurance that the provisions with reference to employment exchanges, collective labor agreements, and activities in connection with social welfare would be carried into practice in the near future.

Annual Convention of the Association of Governmental Labor Officials

THE fourteenth annual convention of the Association of Governmental Labor Officials of the United States and Canada was held May 31 to June 3, inclusive, at the Alexander Hamilton Hotel, Paterson, N. J.

At the opening dinner held the evening of May 31, the labor bureaus and industrial commissions of 16 States and Provinces were represented, as well as the Federal departments of labor of the United States and Canada. In addition there was a large representation from the New Jersey Department of Labor and from the Employers' Association of New Jersey, chamber of commerce, and business interests. The association was welcomed by a representative of the governor, the mayor, president of the chamber of commerce, and then listened to two addresses delivered by James Wilson, seventh vice president of the American Federation of Labor, and John Fergusson, vice president of the Employers' Association of New Jersey.

The formal sessions of the convention opened Wednesday, June 1, and continued through Friday, June 3. Questions relating to employment methods, machinery accidents, labor laws as a means of preventing diseases of occupation, mine safety work, and problems connected with general inspection work, certification matters, and questions relating to the employment of children, and home work were discussed.

A feature of the convention was a visit to the department building of the New Jersey Department of Labor, Jersey City. After the delegates to the convention had visited the industrial museum of safety, the rehabilitation clinic, the compensation court room, and the public employment offices of the department, an address on the

activities of the department was delivered by Dr. Andrew F. McBride, commissioner of the department of labor of New Jersey. Later the delegates made an inspection of the factory of the Singer Sewing Machine Co.

The following officers were elected: H. M. Stanley, commissioner, department of commerce and labor, Atlanta, Ga., president; Dr. Andrew F. McBride, commissioner, department of labor, Trenton, N. J., first vice president; Maud Swett, field director, woman and child labor, industrial commission, Milwaukee, Wis., second vice president; James H. H. Ballantyne, deputy minister, department of labor, Toronto, Ontario, third vice president; W. A. Rooksbery, commissioner, bureau of labor and statistics, Little Rock, Ark., fourth vice president; Charlotte Carr, director, bureau of women and children, Harrisburg, Pa., fifth vice president; Louise E. Schutz, superintendent, division of women and children, industrial commission, St. Paul, Minn., secretary-treasurer.

The association will hold its next meeting in New Orleans, La., some time after May 15, 1928.

PRODUCTIVITY OF LABOR AND INDUSTRY

Labor's Conference on the Elimination of Waste¹

THE increased interest being taken by the organized labor movement in the problems of industry is evidenced by the calling of labor's first conference on the elimination of waste. The conference was held at the Philadelphia Labor Institute, April 9 and 10, 1927, and was attended by more than 200 delegates, including not only representatives of labor unions, but economists, educationists, and industrial engineers.

Union Efforts to Eliminate Industrial Waste

THE International Printing Pressmen and Assistants Union has for some time been giving particular attention to the problems of the printing industry. It has directed its efforts toward the technical advancement of its members and the industry in several ways. It has established a school both for apprentices and for postgraduate courses in presswork and a school in New York City for newspaper pressmen. It also has an "engineering service" which is free to all unionized newspapers in the United States. Each newspaper furnishes two copies of its edition each day, and these are studied by printer experts with a view to improving them from the printing standpoint. Suggestions are made to the newspaper in question and if necessary an expert is sent to the plant to oversee the changes necessary.

The question of waste in the manufacture of full-fashioned hosiery was dealt with by the president of the local hosiery workers' union. Waste in that industry can occur in three ways:

(1) Through the use of poor silk, a problem that must be solved by the manufacturer.

(2) Through lack of skill on the part of the machine fixers. The knitting machine on which silk stockings are made is characterized as being "probably the most delicate and complicated piece of mechanism now in use in any type of industrial establishment. The machine has 50,000 parts and all of them must be in perfect order or the stockings will have defects and will lack the proper appearance. A sudden change in the atmosphere may so affect these machines as to produce, temporarily at least, spoiled work.

¹ Journal of Electrical Workers and Operators, May, 1927, and American Federationist, June, 1927, pp. 668-733.

(3) Through the carelessness, lack of attention or lack of training of the operative, and, most of all, through "the disturbed mental condition of the man or woman in the shop" which results from an unsatisfactory relation between the employer and his employees. The union recognizes its joint responsibility with the employer in maintaining satisfactory relations in the industry. It is realizing the losses caused by strikes and lost time, and pointing out to its members that "the union must win increased benefits for the workers by making the services our members render to the industry so invaluable that the industry will be bound to recognize the need for encouraging this improved service." Definite improvement in production in shop after shop is claimed to have resulted from the union's efforts.

The losses to industry through such causes as industrial accidents, strikes and lockouts, and the present system of distribution were pointed out by Mr. Mathew Woll.

Unemployment as a Source of Waste

THE change that has taken place in the attitude of both men and management as regards industrial waste was discussed by Mr. William Green, president of the American Federation of Labor. Formerly labor's suggestions were resented, and such questions as duplication of effort, increased efficiency, and productivity were considered as being outside labor's province. But, although management assumed full responsibility for industrial success or failure, the losses of industry through any mismanagement fell heavily upon the workers, and demands for the broadening of the field of collective bargaining became more insistent and began to secure compliance.

The desire of labor to interest itself in the problem of waste is based upon its wish to secure higher wages and to enjoy improved conditions of employment. So long as industry is only partially efficient, labor believes that the wages paid can be substantially increased through an increase in industrial efficiency and the elimination of waste. By the same process the cost of manufactured articles to the public can be materially reduced.

Mr. Morris L. Cooke, industrial engineer and referee in the cloak industry of Cleveland, pointed out that "unemployment is the most important single source of waste." Unemployment is largely preventable and regularity of the provision of work has come to be considered as one of the best tests of the ability of the management.

Increased production * * * involves more than simply getting the employees to work more intently or to turn out more units per hour. Every increase in the expertness of the workers, and every improvement in the morale of the working force, calls for a betterment in the management. To manufacture effectively, the working force must be backed up by an effective sales force and a socially minded sales policy.

What we all want, employers and employees alike, is the substance of continuous employment rather than protection against unemployment.

Elimination of Waste Through Scientific Management

SEVERAL speakers emphasized the part of scientific management in removing the causes of waste in industry. The first of these speakers, Mr. Fred J. Miller, consulting engineer, asserted that improved methods of management, by lessening the labor costs in production through the introduction of labor-saving machinery and in

other ways, tended directly to lessen the employer's resistance to paying higher wages. Prof. Irving Fisher urged the unions not only to cooperate with the employers in introducing scientific management but to take the lead in inducing the employers to introduce scientific methods, on the ground which labor is thereby serving its own interests. For "anything that lowers cost of production tends either to raise money wages or to lower prices, or both." He urged the unions to "let the employer have a free hand in introducing improvements, and get the profits, the lure of which induced him to save waste." But labor should not be made to bear the cost of the change.

[The employer] should be induced or, if need be, compelled through trade-unions, or even by law, to see to it that any workman whose job is lost through improvements in production shall be provided, at the expense of the employer who profits by the change, with every reasonable opportunity to get another equally good job.

The success of scientific management, in the opinion of Mr. Geoffrey Brown, consulting engineer, lies in recognizing that the cooperation of the men is necessary, and he urged that in every plant a job analysis committee should be formed on which the workers should have their representatives. The job that makes demands upon the workman's intelligence is the one that brings satisfaction to the doer. Job analysis calls for the greatest exercise of intelligence and should therefore appeal to the men.

The value of job analysis was also stressed by Mr. Sanford E. Thompson, industrial engineer. He was of the opinion that standards of production are necessary in order that labor may receive fair remuneration, and these can be determined only by job analysis.

Greater standardization of equipment and greater use of mechanical power as a means of lowering production costs were urged by Robert T. Kent, engineer in charge of Sing Sing and other prisons.

The American workman has at his disposal more than twice the horsepower that the workman of any other nation has. Standardization of product and of equipment enables a man to do more work and better work in a given time than he can do in the same time with unstandardized products or tools. That means that the work is produced at less expense and that we are * * * increasing the profits to be divided among the producers.

The views presented by these engineers were criticised in three particulars by the representatives of labor.

One criticism was that the workers are not always given an incentive in eliminating waste, through being allowed a share in the gains therefrom. Also, they want more than wages; they want "culture and a chance for self-development." The piecework method of compensation was attacked as being unfair and autocratic unless the workers have a voice in determining the piece rates; also as tending to break up the group spirit of the shop "by arousing jealousies and rivalries, and by placing undue emphasis upon the individual."

Scientific Management in Europe

THE extent to which scientific management has been adopted in European countries is reviewed briefly in a memorandum¹ prepared for the use of the International Economic Conference held at Geneva in May, 1927.

Scientific management is the science "which studies the relations between the different factors in production, and especially those between the human and the mechanical factors. Its object is to obtain, by the rational utilization of these various factors, the optimum output." It may be analyzed into its various aspects, as follows:

Technique

Production planning; choice of site and construction of buildings; arrangement of workshops, choice and layout of equipment and raw materials, organization and maintenance of storerooms; transport within the factory; supply of materials and tools.

Research and planning offices; routing, use of card indexes, classification, use of statistics and charts.

Accountancy, costing; purchasing and sales departments; advertising.

Psycho-physiology of the individual

Time study (by stop watch); motion study.

Vocational selection; vocational education; study of the functions of management.

Fatigue study: Attention, monotony, absent-mindedness.

Study of optimum material, working conditions: Improvement of equipment, lighting, heating, ventilation, general workshop hygiene, as affecting the human factor.

Occupational diseases; safety.

Welfare (housing, transport, cooperative restaurants).

Collective psychology

Study of the different systems of wages payment, profit sharing and copartnership.

Industrial relations (study of the various theories and their practical application).

Personnel department, workers' representation.

Study of methods of collaboration inside and outside the factory, with a view to improving output.

General organization of production

Study of methods for stabilizing production and employment.

Standardization (normalization, unification, simplification).

Elimination of waste.

Horizontal and vertical combination: National and international industrial agreements, cartels, trusts, syndicates; action by governments, by public services, by employers' and workers' organizations.

Specialization; mass production and distribution; study of the general problems of the distribution of raw materials, the organization of markets, transport power, and labor supply.

It is stated that since the war scientific management, modified to meet the circumstances, has made rapid progress in Europe, and there is an increasing tendency to apply its methods to general economic problems. Psycho-physiological research is especially advanced in Germany and Great Britain, although in the latter

¹ League of Nations. Economic and Financial Section. C. E. I. No. 13: Scientific management in Europe. Geneva, 1927

country, in spite of the results obtained, labor is still hostile and employers are still indifferent.

In Russia, Germany, and Czechoslovakia "scientific management has become the guiding principle of the national economic system."

Public opinion in the principal European countries is becoming more and more inclined to accept the new methods. The employers, who some years ago tended to consider them from the narrow standpoint of their own undertaking, now recognize the importance of their effects on the economic conditions of the whole country; the approval of the technicians has universally been won; while the workers, who at first were taken by surprise, and frequently hostile, now recognize the advantages they may derive from a properly conducted application of scientific management methods.

In Czechoslovakia, Germany, Great Britain, Poland, and Russia, research in this science is actively supported by the Government. National, though unofficial, bodies have been formed in Austria, Belgium, Italy, and Netherlands. In Finland efficiency methods have up to the present been confined to the administration of the railways and to agriculture. While research has made rapid strides in France, practical application to industry has lagged, and labor is still opposed to its introduction. Germany holds the leading place in the movement, and even the workers' organizations in that country are interested. A national committee to study scientific management is in process of formation in Spain. The movement is largely in the hands of the employers' organizations in Sweden and Switzerland.

The International Committee for Scientific Organization was formed in 1925.

The report expresses the view that "if scientific management tends to economize and improve the distribution of human effort, if, by thus securing the putting of the right man in the right place, it causes the reduction of fatigue, the improvement of health, and an increased feeling of professional dignity, and if, by establishing new systems of wage payment, it tends to satisfy the claims of justice, its universal social value needs no demonstration."

98796

MINIMUM WAGE

Effect of Minimum Wage Regulations in California

THE California Industrial Welfare Commission's orders regulate the employment of about 160,000 women and children in that State. Pay-roll reports and data secured from inspection and investigation concerning the employment of more than 130,000 women are filed in the department's offices. This immense amount of information, according to the fifth report of the commission, covering the period from July 1, 1922, to June 30, 1926, includes evidence against the claims of opponents of minimum wage legislation. These claim that under such legislation (1) the minimum wage tends to become the maximum wage; (2) apprentices or lower-paid workers will be dropped on reaching their minimum wage and will be replaced by lower-paid workers; (3) infirm or substandard workers who are allowed to receive a lesser wage will be substituted for normal workers; (4) the highest-paid workers will have their wages reduced to equalize the additional wages paid to the lower-paid workers; and (5) industry will be throttled and new industries will not develop in the State.

These claims the report answers in order, to the following effect:

1. A study of recent certified pay-roll reports of woman workers in the laundry, mercantile, and manufacturing industries on file in the office of the commission discloses an increasing per cent of women whose actual weekly earnings are more than the minimum weekly wage of \$16, the percentages for the years listed, based on the pay-roll reports, being as follows:

	Women on pay- roll report	Per cent receiving \$17 or more per week
1920-----	55,922	46.4
1922-----	58,734	54.3
1923-----	68,728	58.6
1924-----	71,664	62.7
1925-----	76,566	63.2

2. The following statement based on pay-roll data, shows a decreasing per cent of learners who receive wage rates under \$16 a week. It will be noted that the year 1925 is an exception, with a slight increase of 0.4 per cent over the preceding year, due to the large addition to the number of women employed. At the same time the number of women employed at \$16 and over increased, indicating that apprentices are not discharged "but absorbed, normally into the great group of higher-paid workers."

	Women on pay- roll report	Per cent re- ceiving less than \$16 a week
1920-----	50,704	14.3
1922-----	52,326	8.3
1923-----	61,007	7.3
1924-----	63,966	5.4
1925-----	68,228	5.8

3. The evidence also indicates that there has been little substitution of infirm and elderly women who are allowed to work for less than the rate fixed for minimum wage workers. Substandard employees must be licensed and licenses are given only after the commission finds that the applicants are unable to earn the minimum rate.

Employers may make application for permits for substandard workers and no legitimate requests are refused. The records show, however, that there were only 327 of these licenses issued in 1923, 1924, and 1925, and 648 renewals. At the close of 1925 there were only 335 licenses in effect in the various industries included under the commission's orders.

4. Referring to the argument of some associations of employers and of a certain group of women that protective labor legislation is a disadvantage to women and that the establishment of a legal minimum wage will be injurious to higher-paid women, the commission states that the pay-roll reports filed with that body for woman workers in the California laundry, mercantile, and manufacturing industries show that in 1919 when the minimum wage was \$10, only 446 women were receiving actual earnings of \$30 or more a week. In 1925, however, with a minimum wage of \$16, 6,084 women in these industries were receiving actual earnings of \$30 or more a week.

5. In the above-mentioned industries the following increases were shown in the number of establishments reporting woman workers:

	Number of establishments
1919	3, 077
1920	3, 244
1922	4, 350
1923	5, 041
1924	5, 174
1925	5, 597

This record of vigorous growth the commission offers as a proof that industry has "not been throttled in California."

INDUSTRIAL ACCIDENTS AND HYGIENE

Health of Working Boys in New York City

A STUDY¹ of the relation of the health and environmental conditions, among a group of 2,000 working boys in New York City, to the development of tuberculosis has been made under the direction of Dr. Iago Galdston, secretary of the New York Tuberculosis and Health Association.

It is well recognized that high morbidity and mortality rates from tuberculosis in any particular group are generally associated with a high general death rate and with a relatively low-grade physical condition, and in studying this particular adolescent group, therefore, the purpose was to find out the number and types of physical and functional deformities of the individuals and evaluate these on their possible causative or contributory relation to tuberculosis. The group of boys selected for study was chosen from the East Side Continuation School in New York City and comprised boys who were past 14 but under 17 years of age and who had not completed the eighth grade in school. These boys were all employed but were required to attend school one morning or afternoon each week. The cooperation of the boys was enlisted through talks explaining the relation of health to industry and the welfare of the worker and by posters, health slogans, and pictures which were placed in the school building.

Each boy was measured and weighed and if the weight in relation to height and age suggested malnutrition a red mark was placed on his record card indicating to the examining physician that the boy should be given additional attention. In the physical examination a definite diagnosis was requested on each given condition and if the diagnosis was not established on the first examination, the boy was reexamined until his condition was defined and agreed upon, conferences being held in doubtful cases by the examining staff. For each boy a summary of the outstanding points was made and of the recommendations of the physician for follow-up work, as in addition to securing the facts relative to the physical condition of the boys it was the aim to correct the defects found so far as possible. Arrangements were made with various hospitals providing for special attention for the boys sent to them for confirmatory diagnosis and treatment. The principal and teachers cooperated in the effort to secure treatment for the boys, and before the completion of the study a report was received from the teachers on the disposition of each boy's case, although for various reasons not all of the boys received treatment.

The examinations covered a period of eleven weeks, five 2-hour sessions being held five days in each week. Four physicians were in

¹"The health of the working boy. A survey of the health of 2,000 working boys in the East Side Continuation School," by Iago Galdston, M. D., New York City. This article is a summary of the original study loaned to the bureau in manuscript form.

attendance, and one assistant was present to take the histories. There was a total of 2,076 boys examined and 433 reexaminations were made, but the statistical data have been calculated on a basis of 2,000 examinations. In addition, industrial histories were taken in 220 cases and 141 of these boys were given vocational guidance. This group of 220 boys was given special consideration both because of the serious physical handicaps among the members and because the examining physician believed, in numerous cases, that the boy's work affected his health.

The boys examined were predominantly foreign in extraction, 27 nationalities being represented. The largest groups were Italians, Russians, Americans, Austrians, and Poles, the Americans, however, representing but 10.05 per cent of the total number.

Of the 2,000 boys, 264 were 15 years of age; 978, 16 years; and 758, 17 years; and the average height ranged from 5 feet 4 inches to 5 feet 7 inches. The fact that a large number of the boys were excessively tall for their age was considered to account for a good many leaving school and entering industry, as such boys frequently feel embarrassed by their size and do not like to remain in school.

Judged by the weight in relation to the height and by inspection of the individuals' mucous membranes, muscle tone, posture, and general appearance, it was found that more than a third of the boys were in the undernourished class, 661 being found from 6 to 18 per cent and over underweight, while 54 were considerably overweight.

Five hundred and forty boys, or 27 per cent, were found to have impaired vision and 60 boys were found to be suffering from various diseases of the eye. There were 67 cases of diseases of the ear, including 4 cases of impaired hearing. About 45 per cent of the boys were found to have decayed teeth which were in need of repair work. Heart defects of various kinds were present in 154 cases. The tonsils were very carefully examined and more than half of the boys were found to have diseased tonsils, the majority of which were considered to require surgical treatment. Nasal obstructions and infections of the upper respiratory tract were present in 187 cases, and there were many cases of skin disease, glandular disease, and orthopedic defects of various kinds.

Special attention was given to the condition of the lungs and suspicious cases were sent to a tuberculosis clinic for X rays and special tests. Six cases of active tuberculosis were discovered, 31 boys were listed as tuberculosis suspects, and 10 had chronic, inactive tuberculosis.

Of the 2,000 boys, only 225 were found to be normal while 620 had one defect, 645 had two, 374 had three, 135 had from four to six defects, and 1 had ten.

Industrial histories were taken of 220 boys who were more or less seriously handicapped by their physical condition. The 220 boys worked at 55 different occupations, most of these being unskilled, and less than half of them were receiving any training for advancement. The hours of work per week varied from 40 to 70 hours and over, but for the majority of the boys the working week was 48 hours or under. The average weekly earnings of the group were \$11.50, but it is not possible on this basis to estimate the yearly income as the average boy does not hold his job very long and between jobs there may be long periods of idleness.

In interpreting the findings of the study, attention is drawn to the fact that, under modern conditions of living, few persons escape invasion by the tubercle bacillus and that by the fourteenth year the percentage of unaffected individuals is very small. The reason, however, that so large a proportion of the population fail to develop the disease is found in the development of an acquired immunity and in the general resistance of the individual. The natural resistance of the body is increased by maintaining the best anatomic and physiologic condition possible, while, conversely, anything that lowers the health and vitality of the individual weakens the resistance. The sickness curve of tuberculosis runs very closely with overstrain, exposure, unhygienic living conditions, and improper food, and it is of the greatest importance to increase the resistance of the individual during the adolescent period, when the physical and psychologic instability are greatest and the reserve margin is probably at its lowest point.

The extent of malnutrition among these boys, the large number of cases of diseased tonsils and of diseases of the nose and upper respiratory tract, all of which are directly concerned in the development of tuberculosis, and the excessive number of other pathological conditions which contribute to lowered vitality and resistance are probably representative of the conditions among similar groups of working boys. The writer of the report believes that such facts show the need for more extensive and detailed instruction of the school child in the elements of personal hygiene and for strict supervision of his physical development and that when the child leaves home and goes to work there should be consideration in the issuance of his work papers not of his age alone but also of his physical condition and of the probable tax upon his strength.

To the objection that the present group is not representative of the general population, Doctor Galdston states that neither are the tuberculosis deaths representative. To lump our 110,000,000 and say that the mortality from tuberculosis is so many per 100,000 does not give a true picture of the situation, as in Manhattan, for example, the Riverside section has a death rate from this disease of 50 per 100,000 and the Battery a rate of 1,117. Tuberculosis takes its most numerous victims from the ranks of the overworked, underpaid, undernourished, and ignorant masses, and the group studied, therefore, is representative of the classes from whom we get the bulk of our tuberculosis deaths.

Malaria Among Mexican Cotton Pickers in Mississippi¹

A STUDY of the extent of malaria among a group of Mexican laborers imported into Mississippi for the cotton-picking season, made by the United States Public Health Service, shows the danger of the spread of this disease through the use of migratory workers who are insufficiently guarded against infection.

The first considerable importation of these laborers into the Mississippi Delta took place in the fall of 1925 when the cotton crop was large and the supply of available labor was scarce. Approximately

¹ United States Public Health Service. Public Health Reports, May 20, 1927, pp. 168-1370: Malaria among Mexican cotton pickers imported into Mississippi, by M. A. Barber and C. P. Coogle.

500 of these laborers were employed in five counties of the delta, usually in groups of 50 or fewer on a plantation. Practically all of them came from a few localities in Texas where many of them had resided for some time. Nearly all were men, but a few brought their families with them. They lived in bunk houses or renters' cabins and were furnished with firewood but supplied their own food and bedding, and the places in which they lived were usually unscreened.

On one plantation where there were many cases of malaria reported in 1925, an examination of the blood of 47 laborers showed that 21.3 per cent had malaria parasites. Eighteen of those examined gave a history of illness after their arrival in Mississippi, in most cases the symptoms being those of malaria, while there had been one death. There had been no evidence of malaria among these workers until two weeks or more after their arrival and most of them stated that they had not suffered from malaria in Texas. Examinations of the members of five groups in other localities failed to show that the disease was present among them, and as many of them had come from the same localities as the group affected it seemed certain that the disease had been contracted after the workers reached Mississippi.

A similar examination in the fall of 1926 confirmed the fact that of those harboring the parasites shortly after arrival, the form was of the benign type while later examinations of the same group showed that they were suffering from the epidemic form of the disease, the type most prevalent in this region during the late summer and autumn.

From the examinations it appeared that on most of the plantations where the Mexicans were employed the amount of transmissible malaria was not great, indicating that generally throughout this region conditions were much improved over former years when immigrants to the Delta had suffered severely.

It was considered, however, that although the survey showed that the number of cases varied greatly with localities and seasons, enough was present to indicate that there was a real danger in the use of these migratory workers, both to them and to the public, unless measures were taken to protect them. Screening of bunk houses would reduce the danger and it should be the duty of employers to furnish this protection and provide medical supervision to guard against possible epidemics. The Mexican laborers remain in Mississippi but a short time, but they are there at the season of the year when the danger of malaria is greatest and it is pointed out that migratory workers are an efficient means of transmitting disease and that a group of such workers infected in one locality may carry the disease into other sections previously exempt and disseminate it there.

Accidents at Metallurgical Works in the United States in 1925

A REPORT indicating increased employment and a better safety record in the metallurgical industry (except the steel industry and blast furnaces) in the United States during the calendar year 1925 has been issued by the United States Bureau of Mines.¹

¹ United States. Department of Commerce. Bureau of Mines. Technical Paper No. 412: Accidents at metallurgical works in the United States during the calendar year 1925. Washington, 1927.

Although the data do not cover the entire industry, the returns from 484 mills, 113 smelters, and 169 auxiliary plants show that 58,935 men were employed during 1925, or 2,739 more than in 1924, an increase of 4.9 per cent. The death rate from accidents at these plants, it is stated, was reduced from 0.87 per thousand 300-day workers in 1924 to 0.66 per thousand in 1925, and the nonfatal injury rate per thousand employees was reduced from 131 to 116. These figures represent reductions of 24.1 per cent in the former instance and of 11.5 per cent in the latter. Reports of nonfatal accidents cover all personal injuries disabling an employee longer than the remainder of the day or shift on which the accident occurred. The following table gives a summary of the accident experience in this industry, classified by groups of plants:

ACCIDENT EXPERIENCE OF METALLURGICAL WORKS IN THE UNITED STATES
IN 1924 AND 1925, BY BRANCH OF INDUSTRY

Branch of industry	Men employed		Man-shifts	Fatal accidents		Nonfatal accidents	
	Actual	Equivalent 300-day workers		Number	Per 1,000 300-day workers	Number	Per 1,000 300-day workers
Ore-dressing plants:							
1924.....	15,735	16,093	4,828,014	20	1.24	2,511	156.03
1925.....	16,945	17,082	5,124,733	17	1.00	2,232	130.66
Smelting plants:							
1924.....	24,941	29,231	8,769,224	16	.55	3,293	112.65
1925.....	25,144	29,658	8,897,434	19	.64	3,376	113.83
Auxiliary works:							
1924.....	15,520	17,624	5,287,225	19	1.08	2,422	137.43
1925.....	16,846	19,480	5,843,923	8	.41	2,103	107.96
Total, 1924.....	56,196	62,948	18,884,463	55	.87	8,226	130.63
Total, 1925.....	58,935	66,220	19,866,090	44	.66	7,711	116.45

The severity rates are not given because figures covering the amount of time lost as a result of accidents and the total hours of exposure are not included in the returns. However, the accidents are classified as to extent of disability, and the average time lost may be computed by applying the scale adopted by the International Association of Industrial Accident Boards and Commissions. This the report does, indicating a total of 569,132 days lost because of accidents in 1925 (1924 figures are not given in the report), giving a frequency rate of 39.04 and a severity rate 2.86 per million hours' exposure.

During the four-year period ending with 1925 accidents at metallurgical plants were less frequent, in proportion to the number of men employed, at large establishments than at small ones. Thus in 1922, the accident rate per thousand 300-day workers at small ore-dressing plants was 198; in 1923, 208; in 1924, 193; and in 1925, 191; while at large plants the figures for these years were, respectively, 172, 143, 135, and 92. A similar showing was made by the smelting plants.

Full-time and part-time employment seemed to affect the safety of employees. Without giving these figures in detail, it may be stated that, taking the extremes of operating time, the injury rates were lower for plants that were active 300 days or more than for

the plants whose periods of operation were less than 100 days. Also, the accident rate for smelters operating 8 hours per day, covering a four-year period, was shown to be generally less than those operating 9 or 10 hours; in the case of ore-dressing plants, the 9-hour plants showed the lowest accident rate per million man-hours during each of the four years noted. The report does not explain this record of the 9-hour plants except to suggest that local conditions, such as variations in type of work, character of personnel, and possible incompleteness of some accident reports, may have had an important influence.

The report includes several tables giving accident records in all branches of the mineral industry in the United States. These show that the fatality rate and the injury rate for all of the industry branches combined was lower in 1925 than in 1924, the fatality rate being 3.63 as compared with 3.85 and the nonfatal injury rate being 197 as compared with 201. The maximum fatality rate of 4.65 in 1925 was for coal mines. The lowest fatality rate, 0.41, in that year was for auxiliary works of the metallurgical industry; and the lowest nonfatal injury rate of 63.34 was for by-product coke ovens. The highest nonfatal injury rate, 468.07; was for lead and zinc mines in the Mississippi Valley.

Accidents in Cement Mills and Quarries in 1926

A REPORT of accidents in 124 cement mills and quarries of the Portland Cement Association in 1926¹ shows a total of 2,221, including 45 fatalities and 2 total disabilities, which is a reduction from 1925² of 388 accidents and 16 fatalities. This indicates a reduction of about 11 per cent in the number of accidents and of 26.2 per cent in the number of fatalities. The 124 plants reporting worked a total of 97,380,785 man-hours, and a severity rate (that is, days lost per 100,000 man hours) of 396.5 is given for 1926 as compared with 502.4 in 1925 and 650.4 in 1922.

The following table summarizes the accident rates for the eight years 1919 to 1926, covering 124 plants in 1926 but a smaller number of plants in the preceding years:

ACCIDENT RATES, PER 100,000 MAN-HOURS, OF CEMENT MILLS AND QUARRIES OF THE PORTLAND CEMENT ASSOCIATION, 1919 TO 1926

Item	1919	1920	1921	1922	1923	1924	1925	1926
Accident frequency.....	4.35	4.38	4.24	4.17	4.16	3.53	2.7	2.2
Permanent disabilities.....	.14	.14	.07	.08	.13	.09	.03	.063
Fatalities.....	.08	.09	.07	.082	.056	.068	.06	.046
Accident severity.....	669.6	727.7	617.6	650.4	541.1	586.9	502.4	396.5

Two plants, reporting a total of 1,503,145 man-hours, had no accidents in 1926.

¹ Portland Cement Association. Accident prevention magazine, May-June, 1927. Cement mill and quarry accidents in 1926. Chicago, 1927.

² An accurate comparison can not be made with 1925 and the six preceding years because many of the plants did not furnish complete reports prior to 1926, and for 1926, 11 plants made no report.

The report contains a table showing that new men suffer the greatest number of accidents. Thus, of 2,048 accidents, 658, or 32.1 per cent, happened to men who had been employed in the plants less than six months, while 901, or 44 per cent, involved men who had been employed less than a year.

In 1926 the greatest number of accidents in any one department occurred in quarries, the number being 465, or 20.9 per cent, involving a loss of 10,846 days, or 24.5 per cent of the total days lost. As to causes, the greatest number of accidents, 309, or 14 per cent, is charged to falls, this cause entailing a time loss of 6,362 days, or 14.4 per cent of the total time lost from all accidents. The greatest time loss, however, was due to machinery accidents, the number of days lost being 7,701, or 17.4 per cent of the total.

A report just received from the Portland Cement Association states that during the first half of June, 1927, 151 out of 164 cement mills had no accidents, 11 mills had 1 accident each, and 2 mills had 2 accidents each. This is a total of 15 lost-time accidents, none of which had a fatal termination. During the same period in 1926 there were 153 lost-time accidents, 5 of which resulted in death, reported by fewer plants employing fewer men than in 1927.

Eye Hazards of Industrial Occupations

INDUSTRIAL accidents resulted in serious injury to the eyes of 719 workmen in New York State during 1926, according to a statement issued recently by the National Committee for the Prevention of Blindness. Seven workmen lost the sight of both eyes, 349 suffered total loss of the sight of one eye, and 363 sustained partial but permanent injury to one eye. The cost to the employers in compensation amounted to \$1,300,000, and it is estimated that there was a loss to these employees of 70,000 weeks of working time. The types of injuries included cuts, punctures and lacerations, and burns to the eyes from the splashing of molten metal and chemicals.

Estimates by officials of the National Safety Council and of insurance companies place the indirect cost of accidents at four times the direct cost, and on this basis the industries of the State are costing the employers, and through them the general public, approximately \$5,000,000 a year for this class of injuries alone. A study of the accident-prevention methods and accomplishments of many industries indicates that the greater part of this loss and the human suffering growing out of these accidents is preventable and therefore wholly unnecessary. Many of the great manufacturing industries have spent hundreds of thousands of dollars for the protection of the eyes of their employees and they would not continue to spend such sums "if they were not convinced by actual experience in their own plants that it is cheaper to prevent eye accidents than to pay for them." Protective devices for machines and men, many of which are not patented and can be made in any workshop, are available and if properly used would prevent the majority of such accidents, and detailed information concerning these methods of prevention is available to employers generally.

It is the belief of the National Committee for the Prevention of Blindness that the greatest possibilities for the elimination of the

eye hazard in industrial occupations lie in the education of the State as to its moral and economic obligations, education of the employer as to the advantage of supplying adequate protection and education of the employee as to the necessity of using this protection when it is provided.

Mortality Experience of International Typographical Union, 1926¹

AN AMPLIFICATION of the health survey of the printing trades, 1922 to 1925, recently published by the Bureau of Labor Statistics (Bul. No. 427), there is given below an analysis of the mortality experience of the International Typographical Union for 1926, compiled in strict conformity with the international classification of causes of death. It will be observed that the experience in the aggregate concerns 913 tabulatable cases. There were in 1926, 87 deaths from tuberculosis of the respiratory system, or precisely the same number as during 1925. There were 64 deaths from cancer of all forms, corresponding to 66 deaths from malignant diseases during 1925. There were 2 deaths from chronic lead poisoning, being the same as in the previous year. There were 83 deaths from pneumonia other than bronchial pneumonia, against 73 during 1925. There were 38 deaths from chronic nephritis during 1926, against 55 classified as Bright's disease during 1925.

The record for the year is, therefore, much like the one for the previous year, suggestive of the value of an annual uniform compilation of the causes of death, which in course of time will be precisely correlated to the membership, which for the present purpose has not been feasible.

MORTALITY EXPERIENCE OF INTERNATIONAL TYPOGRAPHICAL UNION, 1926, BY CAUSE AND AGE GROUP

International list number	Cause of death	Age at death (years)

Cooperation Versus Compulsion in Safety Policy of Large Plant

GETTING the employees to realize the personal benefits of safety rather than compelling them to observe any set rules of safety practice is the policy being pursued in the enterprises founded by George Westinghouse, as described in an article appearing in a recent issue of the *National Safety News*.¹ Referring particularly to one plant of the Westinghouse Air Brake Co. where this principle has been developed, the author states that "one striking feature of safety work in this plant is the absence of compulsion," that "employees work safely because they realize its benefits, not because the management insists upon it," and cites as an example the fact that where the hazards of the occupation require them—grinding wheels, steam hammers, in the foundry, and in the lead mixing department—goggles and respirators are worn without question by employees. The hazards are so well known that they will not take a chance.

Attention has been given to what are termed "good housekeeping" factors which are considered the foundation of safety work in a plant. These include: (1) White aisle lines to avoid congestion; (2) maximum of daylight, and semi-indirect system of lighting which insures illumination without glare when daylight fails; (3) direct ventilation from open windows; and (4) adequately guarded machinery.

In addition there is an active and alert safety committee, each member of which receives from the company, as a mark of appreciation, an additional \$15 per month in wages or salary.

Supplementing this "good housekeeping" program is the attention given to injured employees. Physical examinations are conducted each month to determine incipient cases of lead poisoning, and instruction in personal hygiene has taught employees how to escape the hazards which can be avoided only by habits of cleanliness. Interesting to note is the statement made by the author that the "plant dispensary was the only department not busy on this particular morning," and he adds in explanation "that the accident experience of the plant leaves ample time for medical research and health education of employees." Although figures are not given, a low accident frequency rate is suggested and a severity rate approximating 1.0 during 8 of the past 10 years is noted, for which credit is given to the general safety policy and to the medical department of the plant. Infection cases are few because "first aid has become a habit among the employees."

The plant maintains relief, pension, compensation, and group-insurance departments. All employees are eligible to these benefits upon the payment of fees ranging from 50 cents to \$1.50 per month, depending upon the wages received. Benefits for disability due to sickness or nonindustrial accidents are from \$5 to \$15 per week. Payments are not made during the first seven days of disability but are paid thereafter until the member returns to work. In case of death \$150 is paid to dependents of the deceased member, and if he had been with the company for two years or more an additional \$150 is paid.

¹ *National Safety News*, Chicago, June, 1927, pp. 24-26: "Where cooperation has canceled compulsion," by C. T. Fish.

The pension fund is maintained solely by the company. Seventy years is the retirement age, but an employee may be recommended for retirement at any time after he reaches 60 years.

The service pension is 1 per cent of the average monthly earnings for every year of continuous service, based on the 10 years during which the employee received the largest total income, selected out of the last 20 years, or less, of continuous service. The minimum service pension is \$30 per month and the maximum \$100.

On the death of a service pensioner, his widow is granted 80 per cent of his pension until death or remarriage, with two years' pension after remarriage, plus 10 per cent additional for the support of each child under 16 years of age.

The company liberalizes somewhat the State compensation law by granting a maximum of \$15 a week (State law provides \$12) for disability, with no waiting period (State law requires 10 days). Pension for dependents is provided in addition to this.

Through a contributory group-insurance plan employees may obtain life insurance at \$9 per year per thousand, the difference between this amount and the total premium being paid by the company.

The author states that the plan as outlined has resulted in an exceptionally low labor turnover rate and a large waiting list in the employment department.

Carbon Dioxide a Safe Substitute for Explosives in Mining Coal¹

A NEW method of bringing down coal at the face which avoids the hazards present in the use of the ordinary explosives has been tested in at least six different mines in Indiana and Illinois during the past year. The tests have been carried out on three different types of faces and in coal seams varying from 39 inches to 8½ feet in thickness.

Liquid carbon dioxide compressed within a steel cylinder or bomb 4 inches in diameter and approximately 37 inches long is used in bringing down the coal. A heating element or priming charge composed of certain chemicals which will evolve heat quickly under the action of a powerful electric current is placed in the bomb and the bomb is so constructed that under the action from the force within the gas is liberated against the coal at four points. The detonation of the gas is not in any sense an explosion nor even a chemical process, but its action is entirely physical, exerting a true heave on the coal. In order to be successful the transformation of the liquid to gas must be in an extremely brief interval, about one-twentieth of a second, otherwise it will give inefficient results or will fail to bring down the coal at all.

The amount of carbon dioxide in the bombs ranges from 2 to 5 pounds and the amount of heating element required to exactly gassify the liquid charge can be calculated within close limits. Each day's supply of bombs or cartridges can be taken into the mine at any time as they are comparatively inert. It takes from 150 to 250 amperes of current at 80 volts or more to start the reaction in the heating element and stray currents within the mines are entirely

¹ Coal Age, May 12, 1927, pp. 688, 689. "Carbon dioxide furnishes safe means of bringing down coal at face," by Frank H. Kneclaud.

too small to start this reaction as, so far, the maximum stray current discovered in any American coal mine is approximately 15 amperes at 30 volts. The bombs can also be used in extremely gassy places, as the maximum gas temperature developed is less than one-half the temperature required to ignite the most explosive mixture of air and methane.

The bombs are placed in holes driven in the face in much the same manner as the ordinary explosive and when ready, connection to the lead wires is made, and the bomb is discharged by the momentary closing of a switch. It is not necessary for the workmen to retire to any great distance, but it is desirable that they should not stand in line with the bore hole, as the bomb is occasionally blown out of the hole. In practice, however, the new method has been developed to the point where it is at least 98 per cent reliable and misfires or "duds" are rare. If it does fail to go off there is no danger in approaching the hole at once, as in that event the liquid will gassify so slowly as to have no effect. The effect of the bomb on the coal face resembles the dumping of a carload of coal and there is practically no vitiation of the atmosphere, the increase in carbon dioxide content of the air seldom exceeding 0.5 per cent.

The bombs are strongly constructed and, while they are fairly expensive at first, they can be used indefinitely. There is also no hazard connected with their transportation when loaded, as dropping or crushing, and short circuiting them with electric current has no effect. Although the actual expense involved in the use of this material has so far been slightly greater than when explosives are used, it is believed that this expense will eventually be appreciably decreased; and those using the carbon dioxide agree that the advantages secured, such as greater safety and a better quality of output, far more than offset the comparatively slight increase in expense.

Coal-Mine Accidents in Missouri in 1926

THE report of the State bureau of mines for 1926 shows that with a substantial increase in the production of coal the number of fatal accidents fell from 11 in 1925 to 7 in 1926, while in metal mines the number of fatalities increased from 6 to 11. It perhaps should be considered that in the latter mines nearly 500 more men were employed in 1926 than in the preceding year, and that in both classes of mines about 1,500 more men were working during the last year. Thus there has been an actual improvement in the number of fatalities. The following is a summary indicating the accident experience for 1926:

Coal mines:

Total number of fatal accidents.....	7
Number of tons of coal mined per fatal accident.....	407, 126
Number of men employed per fatal accident.....	815
Number of man-shifts worked per fatal accident.....	163, 000

Lead and zinc mines:

Number of men employed.....	4, 905
Total tons of concentrates produced.....	348, 414
Total number of fatal accidents.....	11
Tons of concentrates produced per fatal accident.....	31, 674

Enactment of Safety and Health Law in Ecuador

THE acting president of the Republic of Ecuador has promulgated a law requiring preventive measures to be adopted against industrial accidents and occupational diseases, the text of which appears in the March 11, 1927, issue of *Registro Oficial* of Guayaquil.

Employers are obliged to observe, in factories, workshops, and in all other establishments, the legal requirements as to sanitation and health and to adopt adequate measures to prevent accidents in the use of machines and other instruments. Labor inspectors shall see that the employers comply with the regulations issued by the sanitary authorities, among which are the following: (1) All workrooms must be kept clean and free from any noxious emanations, (2) proper lighting and sufficient means of ventilation must be provided in all the workrooms, (3) the sanitary authorities are to determine the number of persons who may be employed in any room of a factory, (4) special care must be taken to secure general orderliness in the establishment, (5) smoking is prohibited in all factories.

The law stipulates that if dust or other impurities are generated in quantities tending to injure the health of the employees, proper devices to remove such impurities from the workroom shall be provided.

Women and children under 18 years of age may not be employed in the following industries or occupations: (1) Work involving the danger of industrial poisoning as in the manufacture of white lead, minium, paints, or varnishes which contain lead or arsenic salts; (2) manufacture of explosive, inflammable, or poisonous products; (3) operations in which injurious dust is produced, as in the cutting and polishing of glass or emery polishing; (4) stevedoring; (5) the oiling of machinery while in motion; and (6) work requiring the handling of leather belting, circular saws, and similar mechanical apparatus.

Woman employees must be given a period of four weeks before childbirth, and six weeks thereafter, at one-half of their regular wage. Confinement may not be alleged as a reason for dismissal.

Those who do such work as stonecutting, polishing, photo-engraving, sculpturing, and the like, must wear glasses or some similar protective device. Employers of workers constructing or cleaning conduits and shafts must previously have had such places ventilated. Scaffolding on buildings over a certain height must be equipped with a handrail on each side.

The cleaning of machinery while in motion is prohibited. Block pulleys, fellies, gears, rails, and in general all projecting parts of machines shall be substantially guarded. Proper belted-in garments should be worn by those working on machines. Before the starting of all machines ample warning shall be given by effective signals.

All industrial establishments shall have emergency medicine chests to provide first-aid treatment to the workers in case of accident.

Operators who use electricity shall be taught the dangers to which they are exposed and shall be provided with insulators and other protective devices.

The Ministry of Social Progress and the labor inspectors shall have charge of the enforcement of this law and shall impose a fine on those employers who do not comply with its provisions.

Silicosis in the Pottery Industry in Great Britain

IN CONNECTION with a movement among trade-union members in Great Britain to have "potter's asthma" or silicosis included as an occupational disease under the workmen's compensation act an investigation¹ was carried out by the Home Office regarding the facts as to the incidence of the disease in the pottery industry.

The study included medical examinations of 344 male and 224 female workers, together with radiographic examinations of the lungs of many of these workers.

When the study was undertaken there was already evidence that silicosis was produced among workers exposed to the inhalation of dry flint dust in the manufacture of china, but there was doubt as to the production of silicosis in similar processes in the manufacture of earthenware, in which sand or crushed siliceous material replaces flint.

The occupations which are of the greatest importance from the standpoint of the dust hazards were found to be those in which the raw materials are handled, as in flint milling; the manipulation of the composite body of the ware; the placing of flint or sand used in firing biscuit ware and the removal of the sand adhering to the ware; and occupations involving exposure to other dusts, as in mold and sagger making and glaze dipping.

The frequency with which fibrosis of the lungs was diagnosed in the medical examinations, at a period of employment earlier than that at which silicosis was found by radiological examination in the same occupational groups, was regarded as one of the significant features of the report. Fibrosis of the lungs may be caused by the inhalation of dusts other than silica, but the fibrosis caused by inhalation of silica has certain characteristics which make it easily demonstrable by a skilled observer by means of radiological examination. It is considered that fibrosis of the lungs may take a shorter time to develop or may require a lower concentration of dust than silicosis but there are other factors, such as a number of occupations being followed by the same subjects, which may possibly modify the significance of the sequence.

The cases of silicosis revealed by the examinations numbered 87 and were grouped as follows, according to period of employment:

	Number		Number
Under 5 years.....	1	25 to 30 years.....	15
5 to 10 years.....	2	30 to 35 years.....	15
10 to 15 years.....	8	35 to 40 years.....	8
15 to 20 years.....	7	Over 40 years.....	17
20 to 25 years.....	14		

It will be seen that the great majority of cases occur after 20 years' employment in the industry, although in the occupations where the incidence of silicosis is high the study showed that it appears at an earlier stage in the occupational history of the workers.

Among workers exposed to unmixed flint dust, 112 clinical and 71 radiographic examinations were made and 59 cases were diagnosed as fibrosis and 28 as silicosis, 23 of the cases of silicosis occurring in

¹ Great Britain. Home Office. Report on the incidence of silicosis in the pottery industry, by Dr. C. L. Sutherland and Dr. S. Bryson. London, 1926. 52 pp.

the occupations of biscuit placers, biscuit oddmen, and biscuit warehousemen, 3 in flint milling, and 1 each among glost placers and polishers. Of the workers exposed to dust from composite body, 345 received clinical and 136 radiographic examinations, and there were 125 cases of fibrosis and 53 cases of silicosis found. Twenty-nine of the 53 cases of silicosis occurred in general earthenware manufacturing—from slip house to lookers to ware; 9 among the same classes of workers in china; 5 in the manufacture of tiles, including slip-house workers and pressers; 6 in sanitary earthenware, including casters and pressers; and 4 in electrical earthenware, from slip house to fettlers. In the occupations in which the dust hazard is from placing sand on ground siliceous material, 1 case of silicosis was found out of a total of 37 clinical and 14 radiographic examinations, and in occupations in which the dust hazard is indefinite but is liable to contain flint there were 37 clinical and 14 radiographic examinations made and 5 cases were diagnosed as silicosis.

In summing up the results of the examination it is stated that in the opinion of the investigators it had been demonstrated that silicosis exists among workers in the pottery industry to a very considerable degree and that the evidence tends to emphasize the danger which arises from processes which have been regarded as comparatively safe because of the materials being damp or wet.

The improvements recommended for the protection of the workers are the provision of impervious floors and benches, frequent cleansing of workplaces, including walls, prohibiting the deposit in workrooms or yards of any material not necessary for the purposes of the work which is dry, or liable to become dry and produce dust, and the provision and frequent washing of overalls for all persons employed in handling any clay body which contains over 10 per cent of flint.

COOPERATION

Cooperative Societies as Regulators of Retail Prices

ALTHOUGH it is a general rule with consumers' cooperative societies to make their prices approximate those prevailing in the locality, they "do not hesitate to adopt prices very appreciably lower than those of private trade whenever and wherever it appears to them to be necessary in order to restrain an excessive or too rapid rise." An inquiry made for the International Economic Conference held at Geneva, in May, 1927, the results of which have recently been published,¹ points out that when the cooperative store departs from the current prices the private dealer is usually compelled to do likewise. "Besides the benefit of the dividend and the generally lower prices which the members of cooperative societies enjoy, regard must therefore also be had to the effect of the existence of a cooperative society as a regulator of prices."

The report cites certain instances to illustrate this point. Eight loaves of bread purchased in private bakeries in Cologne (Germany) and an equal number baked by the cooperative society were compared, the price being the same in all cases. Considerable differences were found in the weight of the loaves. When the weight of the loaf was considered in relation to the price it was found that "the price of the loaf was 12.2 per cent higher in the case of the private bakers than in the case of the cooperative society."

In Switzerland a similar comparison was made on a national scale. Since 1912 the Swiss Union of Consumers' Cooperative Societies has published quarterly statistics of retail prices, these figures covering since June, 1919, the prices charged by cooperative societies in 25 towns having a population of over 10,000 each. Until recently the Swiss Government had no index number of food prices of its own, and the cooperative food index was accepted as the official index. The Swiss Grocers' Association has also lately begun to report prices charged by its members. Comparison of the cooperative and private prices of 29 articles which were susceptible of such comparison showed that the cooperative prices were lower for 25, identical for 3, and higher for only 1.

In Erfurt (Germany) it was found that, even after deducting the dividend of 3 per cent from the prices paid to the cooperative society "the cost of the purchases from Retailer A was 25 per cent and from Retailer B 6.5 per cent higher than at the cooperative society. These differences in price would be considerably increased by taking into consideration the difference in weight of certain articles."

In order to measure the influence of the cooperative society on the general level of prices, prices were taken in six localities in France—one in which a regional cooperative union had its headquarters, two in which it had branches, one in which a branch was being established, and two in which there was no cooperative society. The prices charged by the cooperative society were the same in all four

¹ League of Nations. Economic and Financial Section. C. E. I. No. 11: Results of certain of the inquiries for instituting a comparison between the retail prices in private trade and those of distributive cooperative societies. Geneva, 1926.

places in which there was a cooperative store. It was found that "the prices charged by retail traders increase from one locality to another * * * in inverse proportion to the activity of the cooperative societies."

In Hungary, where prices were taken when the local cooperative society first opened its doors and again some months later, the inquiry disclosed that from the first the cooperative prices were lower than those of private dealers. The latter lowered their prices 20 per cent but even then were above the cooperative price level.

The report points out that comparisons such as the above are open to the objection of being possibly due only to coincidence. An experiment was therefore made under conditions designed to eliminate this objection. The prices of 25 or 30 articles were noted at the same day in two localities at small grocery stores, at chain stores, and a large grocery store. This was done on the day the cooperative store opened and twice later, at intervals of two months.

On August 28, 1919, that is to say, before the cooperative society could exercise any influence, the difference between the prices charged by the cooperative society and those charged by the traders in question was 31 per cent. On January 2, 1920, it was 22 per cent and on July 7, 1920, it was only 11 per cent, still in favor of the cooperative society.

At the same date the departmental cooperative society decided to make the crucial experiment. It purchased the same articles in two chief towns of the arrondissement in which it had no branches, and it noted that the difference between its prices and the prices of private traders in these localities was 30 per cent, that is to say, nearly the same as the difference observed 10 months earlier in the localities in which it had just established branches.

As a result of an inquiry made by the Swedish Government the department making the study comments as follows:

It is clear that consumers' cooperation offers a vigorous defense against the tendencies of private trade to combine in order to keep up prices artificially. Many examples could be mentioned where large organizations of shopkeepers have been forced by the cooperative society to pull down their prices—an act which the association between them otherwise would have prevented. The great importance of the cooperative movement in this respect has been proved in a remarkable degree, particularly during the period of depreciation, when the cooperative societies, as a rule, have been the first to cut down prices.

In Great Britain the royal commission on the coal industry, as part of its general study, made an investigation of the prices of cooperative societies dealing in coal and reported as follows:

The general result of this comparison is to suggest that the expenditure of the retail merchants on establishment and clerical salaries is excessive; if all the retail trade in London could in these respects be conducted as economically as that of the cooperative society whose accounts have been examined, a very substantial margin would be available, either for reducing prices to the consumer or for increasing prices to the colliery, and so increasing wages to the miner.

Part Played by Agricultural Cooperative Organizations in International Trade

THAT cooperative organizations play a surprisingly large part in the international trade of agricultural products is shown by a report¹ prepared for the use of the International Economic Conference at Geneva.

¹ League of Nations. Economic and Financial Section. C. E. I. No. 14: The part played by cooperative organizations in the international trade in wheat, dairy produce, and some other agricultural products. Geneva, 1926.

In Denmark more than 85 per cent of the farmers are members of cooperative dairies and slaughterhouses, and so powerful is the cooperative export organization that all butter intended for export must be sold under the cooperative trade-mark. The table below, compiled from data given in the report, shows the per cent of the total output and exports of various commodities which are handled by cooperative organizations, in specified years and countries:

PROPORTION OF CROP AND EXPORTS OF EACH COMMODITY HANDLED BY COOPERATIVE ORGANIZATIONS IN SPECIFIED COUNTRIES

Country	Year	Commodity	Per cent of—	
			Output	Exports

 3 Butter only. 6 Year not specified; presumably 1926.

Development of the Postal Credit Union Movement

THE credit union movement has had a rather remarkable growth among the postal employees of the country. The first postal credit union was formed on January 5, 1923. During the four years since that time the number of societies has risen to 75 and the members now number nearly 14,000. The table below, compiled from Bulletins 1-6 issued by the director of service relations of the Post Office Department, shows how rapidly the movement has spread:

DEVELOPMENT OF POSTAL CREDIT UNIONS

Date	Number of societies	Number of members	Paid-in share capital	Deposits	Total loans granted	Loans outstanding
Jan. 5, 1923	1	8	(1)	(2)	(2)	(2)
End of 1923	7	(2)	(2)	(2)	(2)	(2)
Dec. 26, 1924	25	(2)	(2)	(2)	(2)	(2)
Apr. 1, 1925	36	5,087	\$157,848	\$8,542	\$283,634	\$162,764

1 10 shares of stock; amount not stated. 2 Not reported.

Cooperative Buying of Gasoline and Motor Oils

COOPERATIVE buying of gasoline and automobile oil is a comparatively new development in the cooperative field. The Northern States Cooperator (issue of February, 1927) is authority for the statement that the first cooperative of this type in Minnesota was formed in Cottonwood in July, 1921, by a group of members of the Farm Bureau. Since that time societies have been formed here and there throughout the State, and now there are reported to be more than 50 such companies either already operating or in process of organization.

At the end of 1925 the officers of a number of these companies held several informal meetings, as a result of which was formed in September, 1926, a central company, the Minnesota Cooperative Oil Co. This is a nonstock, nonprofit organization formed for the purpose of assisting in the organization, bookkeeping, and purchasing of supplies for the local societies. About 20 local companies are now reported to be members of the association.

The Bureau of Labor Statistics has knowledge of the existence of at least one cooperative oil company in Iowa, one in Washington, and two in Wisconsin. The movement has also spread to Nebraska, where it is being actively fostered by the Farmers' Union. According to a report in the May 11, 1927, issue of the Nebraska Union Farmer, there are 11 cooperative associations which are in the gasoline and oil business and 7 others in process of organization. Preliminary steps have been taken toward the formation of a federation to do joint buying of the gasoline and oil sold by the local associations and to attempt the solution of their operating problems. It is possible that the buying will be done through the Farmers' Union State Exchange at Omaha.

Savings Effected in One Cooperative Store

AS AN illustration of the savings possible through membership in and patronage of a well-managed cooperative store, the Central States Cooperator (Bloomington, Ill.) of May, 1927, cites the records of six members of the Villa Grove Cooperative Society. These members all moved from Villa Grove to take positions elsewhere, and resigned from the society in consequence. The following table, compiled from the reports, shows the length of time each of these persons was a member of the society, the amount he invested in the society, and his total return in terms of dividends on purchases and through refund of capital:

SAVINGS EFFECTED BY SIX COOPERATORS THROUGH MEMBERSHIP IN AN ILLINOIS COOPERATIVE SOCIETY

	Amount contributed in capital	Period of membership	Amount of purchase dividends and capital refund
Cooperator No. 1.....	\$50	6 years 9 months..	\$659.79
Cooperator No. 2.....	100	5 years 3 months..	416.16
Cooperator No. 3.....	50	7 years 3 months..	275.97
Cooperator No. 4.....	30	do.....	261.11
Cooperator No. 5.....	50	7 years 2 months..	245.42
Cooperator No. 6.....	30	2 years 4 months..	130.43

A Cooperative Community in Czechoslovakia¹

AN EXAMPLE of the possibilities of cooperation in the daily life is given in Prikazy, a village of Czechoslovakia. The beginning was made 60 years ago by a man who was "an enthusiastic cooperater and who succeeded in stirring his neighbors into action."

The village consists of 350 families, each having about 30 acres of land. Due to cooperative effort, the bread for the community is baked in a cooperative bakery, the flour is made in a cooperative flour mill which is stated to be "the last word in up-to-date milling," and there is a cooperative chicory factory and a large cooperative malt kiln. The produce of the community is marketed cooperatively and the livestock is improved by breeding through the cooperative bull and boar society.

Financial matters are handled through the cooperative credit society, which is housed in a beautiful building erected three years ago at a cost of about \$175,000. The credit society is also the local savings bank. In the same building are a cooperative restaurant, a theater seating about 500, a gymnasium, "and, finally, an unlimited number of hot and cold baths for the use of the villagers."

Prikazy shows what high organization can do and how it has carried a community through the throes of the Great War, and through the necessarily difficult period attendant upon the formation of a new State, leaving it rich and prosperous.

New Marketing Law of British Columbia

ON THE authority of advance notices, it was erroneously stated in the May, 1927, issue of the Labor Review that British Columbia had passed a law providing for compulsory cooperative marketing. Study of excerpts from the law, furnished by the Cooperative Marketing Journal (Memphis, Tenn.), discloses that the law provides for a new marketing procedure altogether. It places the marketing of all tree fruits and vegetables grown in the district in the hands of a committee of direction of three persons, two of whom are chosen by a federation composed of the growers' cooperative society and a large majority of the commercial shippers in the district. The third member is appointed by the lieutenant governor of the Province.

The committee is given authority to determine "at what time and in what quantity and from and to what places, and at what price the produce may be marketed." Each shipper shall, however, be permitted "to ship such proportion of his supply of the product as the quantity fixed to be marketed at that time bears to the total estimated available for marketing." The committee is empowered to require the shipper to report to it the quantity he has or will have for marketing, and to inspect his books, accounts, etc.

The Cooperative Marketing Journal states:

This law has been frequently referred to in the press as compelling farmers to cooperate in marketing their products when 75 per cent join a cooperative. But it does no such thing. It does not compel farmers to cooperate at all, and it can be put into operation without the existence of a cooperative. What it

¹ International Labor Office. Cooperation, 49. Geneva, 1927.

does is to compel the shippers of agricultural products to cooperate and sell only in such quantities, in such markets, at such prices and on such terms as may be fixed by a committee of three. Dealers or shippers who will not submit to the control of the committee are not permitted to do business. A farmer can not sell his own products unless he obtains a license and operates under the direction of the committee. Thus it compels the organization not of farmers, but of the agencies of trade (cooperative and commercial) which market the farmer's products.

The purposes of the law are (1) control by law as distinguished from voluntary cooperation, and (2) the requirement that all producers, and not merely the few who join a cooperative, shall bear the cost of stabilizing prices.

The action was made necessary, it is stated, by the condition of the market.

WORKMENS' COMPENSATION AND SOCIAL INSURANCE

Recent Compensation Reports

British Columbia

THE Workmen's Compensation Board of British Columbia in its tenth annual report, for the year ended December 31, 1926, states that during the year final awards were made in the amount of \$2,615,732. There were 30,365 accidents reported. Of these, 198 were fatal, while 12,206 were of a minor nature, being given medical aid only, and 15,697 caused temporary disability but required both medical aid and time loss payments. Seven hundred and eighteen permanent total or permanent partial disability cases were settled.

In 7,218 cases the disability terminated within 14 days, while in 2,620 cases the length of disability was over 2 to 3 weeks, in 1,606 cases over 3 to 4 weeks, and in 1,051 cases over 4 to 5 weeks.

Estimated pay rolls for the year amounted to \$175,000,000 as compared with \$164,216,219 for 1925. Administrative costs amounted to \$2.54 for each \$100 collected, as compared with \$4.94 in 1917, the first year the act was in operation.

There are 19 classes of industries embraced in the schedule. The largest number of accidents occurred in class 1 (lumbering), which had 43 per cent of the total; class 7 (construction) came second with 10 per cent; and coal mining third with 7 per cent. Only 770 out of the total number of employees injured during the year were in receipt of any kind of benefit other than that provided by the compensation act.

On December 31, 1926, 7,613 employing firms were complying with the act as compared with 7,197 at the end of 1925. Tables are given showing injuries by classes, causes, nature, and extent, duration, average daily wage, average age, etc. The average length of disability was 34.69 days and the average age of the employees was 35 years. Fifty-one per cent of all those injured were married.

During the effective period of the act (10 years) 219,670 accidents have been reported, 2,206 of them being fatal, 4,898 left the injured worker either partially or totally incapacitated for further work for life. At the end of 1926, the pension list included 631 widows, 1,063 children under 16, 106 dependent mothers, 42 dependent fathers, 30 other dependents, and 951 permanently disabled workmen.

Ontario

THE Workmen's Compensation Board of Ontario has recently issued its twelfth annual report, which covers in general the calendar year 1926, and also gives final data for 1925.

The number of accidents reported for the year was 65,916. This is the highest number of accidents ever reported to this board in a

single year, the next highest number being 61,109, in 1923, while the number in 1925 was 60,012. Of these, 400 were fatal, as against 345 for the previous year. Medical aid only was required in 24,142 cases in Schedule 1 industries; temporary disability cases numbered 30,019; permanent partial disability cases, 2,384; and permanent total disability cases, 14. Fatal cases numbered 311.

In 1926, benefits were awarded amounting to \$5,821,352, as compared with \$5,565,443 in 1925. There are two principal schedules—Schedule 1 including private industries in general, and Schedule 2, the operation of railroads, steamboat companies, and other public utility companies and public employments. For Schedule 1 industries the awards amounted to \$4,652,527, while for Schedule 2 they amounted to \$1,168,825. Medical aid, amounting to \$988,487, formed a little over 21 per cent of the total for industries in Schedule 1.

In Schedule 2 industries medical aid is paid by employers directly, and the amount so paid does not appear in the figures given for awards.

Estimated pay rolls for the year amounted to \$411,013,000 (24,492 employers), as compared with \$395,619,000 reported in 1925 (25,681 employers). Administrative expenses for the year were \$277,939, as compared with \$269,587 in 1925. There was a decrease in the ratio of administration costs to total benefits awarded, being 4.77 per cent in 1926 as compared with 4.84 per cent in 1925 in Schedule 1, while in Schedule 2 the decrease was from 4.14 per cent in 1925 to 3.44 per cent in 1926. The average assessment rate (provisional) in Schedule 1 for the year was \$1.25 on every \$100 of pay roll; the average for the life of the act (12 years) was \$1.11.

There are 24 classes of industries embraced in Schedule 1, each maintaining its own fund. The largest amount of premiums collected on provisional assessments was from mining and explosives, \$477,782; lumbering coming second with \$438,669; and building third with \$343,049. Compensation, pension reserves, medical aid, and other expenditures and expenses amounted in the case of mining and explosives to \$664,618; lumbering, \$584,224; and building, \$468,517.

Sixteen of the 24 classes of industries show a deficit for the year, the total deficit (provisional) being \$214,821; as there was a balance from prior years of \$185,201, the net result is a deficit (provisional) of \$29,620 over all income and credits.

In Schedule 2 industries each employer is individually liable for accidents to his workmen. Of the \$1,168,825 awarded in compensation during the year in this class, Dominion Crown cases involved the largest amount, \$440,225; steam railroads following with \$368,784; and municipal corporations coming next with \$193,399. Of the total amount awarded \$671,619 was for pensions and \$497,206 for other compensation.

Accident data for the year 1925 show total numbers, frequency, rates, nature, cause, duration, sex, marital conditions, etc. Cuts, lacerations, and punctures were most numerous in temporary disability cases (9,156), followed by bruises and abrasions (6,561), these two representing more than one-half of the total 26,040 cases. Machinery was responsible for 9,868 cases out of a total of 50,905, or 19.39 per cent of all cases.

The average time loss in temporary total disability cases was 20.86 days, in permanent disability cases, 92.92 days. An average of 7.04 days intervened between injury and death in fatal cases. The average age in all cases was 35.24 years, and the average weekly wage, \$22.29.

Bricklayers' Union Relief Fund ¹

THE mortuary benefit of the Bricklayers, Masons, and Plasterers' International Union was inaugurated in 1910 and its relief fund in 1914. During the period from 1910 to July 1, 1926, mortuary and relief benefits paid by the union have aggregated \$10,044,250.

The annual disbursements for such benefits for the fiscal years 1915 to 1926, inclusive, were as follows:

Fiscal year	Relief	Mortuary	Fiscal year	Relief	Mortuary
1915-----	\$217, 610	\$217, 524	1922-----	\$485, 835	\$229, 486
1916-----	277, 564	222, 749	1923-----	608, 698	273, 135
1917-----	371, 170	271, 380	1924-----	783, 296	270, 555
1918-----	295, 935	205, 137	1925-----	858, 287	292, 105
1919-----	414, 495	296, 696	1926-----	955, 008	318, 311
1920-----	426, 940	224, 492			
1921-----	443, 510	233, 431	Total...	6, 138, 348	3, 055, 001

Based on payments made since the close of the fiscal year 1926, it is estimated that the total for relief benefits alone in 1927 will amount to more than \$1,100,000.

LABOR LAWS AND COURT DECISIONS

Basis for Workmen's Compensation Insurance—Individual or Collective

RECENT court and legislative action in the States of Ohio and Wyoming, respectively, renews the question as to the proper basis for the insurance of the liabilities imposed by workmen's compensation laws. The Supreme Court of Ohio had before it the question of the constitutionality of a provision of the compensation law of that State establishing a surplus fund from which payments might be made to the employees of employers who had failed to secure compensation payments. Injured employees or their dependents in such case may sue the employer, or alternatively may file an application for compensation under the terms of the law. Any award made in accordance with such application is obligatory upon the employer, and on failure to pay, the attorney general of the State is to institute a civil action for the collection of the award as a liquidated claim for damages. Payments made from the fund are therefore to be recouped from the responsible employer if possible, but if not, the award is to be paid from the surplus accumulated by a special segregation of moneys from the premiums collected.

In the instant case (*State ex rel. Williams v. Industrial Commission*, 156 N. E. 101), an employee of an employer of five or more workmen, and therefore eligible to come under the law, but who had neither subscribed to the State fund nor arranged for self-insurance, claimed compensation for injuries, for which an award was made. Later the industrial commission reported the employer insolvent, and, on the ground that the fund could not be recouped from him, declined to continue the payments under the award. Action was then brought to force the commission to require a continuance of payments to the injured man. The commission's contention was that, in the absence of contributions by the delinquent employer, solvent and conforming employers would be burdened with the duty of compensating the injured workman of the insolvent and noncontributing employer. The validity of such a provision was sustained by three of the seven judges, four holding that compensation can not be paid out of the surplus fund in such a case, and that the amendment undertaking to impose such a burden was unconstitutional and violative of the due process clause of the Federal Constitution. While, therefore, there was an adverse majority of four to three, the constitution of the State requires the concurrence of six judges before a law can be declared void in a case originating in the Supreme court. The invalidity of the law was therefore not established, under the terms of this constitutional provision.

In support of the constitutionality of the act it was said that, conceding that there was some diversion of the fund for the compensation of insolvent employers, "so far as the record before us discloses the amount that may be taken from the whole body of con-

tributing employers may be comparatively insignificant." In this connection citation was made from the opinion of the United States Supreme Court in *Noble State Bank v. Haskell* (219 U. S. 104, 110, 31 Sup. Ct. 186), where it was declared that "it is established by a series of cases that an ulterior public advantage may justify a comparatively insignificant taking of private property for what, in its immediate purpose, is a private use." The entire structure of the State workmen's compensation act would be in danger, it was said, if only those who contribute to and create a fund may participate in its benefits. "The pole star of our constitutional provisions relating to workmen's compensation is the welfare of its workmen." An employer entering business in 1927 may have employees suffering injury early, but compensation is payable from an established fund, created before the employer started operations. The employer's insolvency or failure to pay premiums does not deprive his employee or the dependents of the latter of the right to compensation. (*Industrial Commission v. Madden*, 115 Ohio St. 130, 152 N. E. 662.) The employee has no authority to sue for the collection of premiums; The State has. The fund does not belong to the employers, and no individual employer's property is taken. "The employer, having paid his premium to the State, has acquired not only insurance, but has also obtained immunity from suit—has obtained his *quid pro quo*—meanwhile the fund is held in trust by the State, solely for the benefit of injured workmen and their dependents."

As already stated, this opinion being concurred in by two judges, becomes the law of the State in sustaining the statute as amended.

On the same day with the foregoing case the court passed upon a different aspect of the question of the right of the employee to payments regardless of the solvency of his employer. However, the originating cause was here an effort to collect an additional award assessed by the industrial commission against an employer who had failed to comply with a specific requirement of the law of the State, such failure being the proximate cause of the injury. Under the law as it stands the commission may assess an additional amount, not less than 15 nor more than 50 per cent of a normal award in such a case. Here the maximum increase was allowed, but an attempt to recoup by extra assessments on the employer failed by reason of his insolvency. The commission's refusal to pay awards unless the fund should be thus recouped led to proceedings in mandamus to compel the payment. The mandamus issued in this case on the concurrence of four judges, three dissenting. It was pointed out that the principle involved here had been conceded by the attorney general of the State in the case *Slatmeyer v. Industrial Commission* (155 N. E. 484), in which he said that "The employee or his dependents have become entitled to and have received the compensation, regardless of the ability to recoup the fund." The court pointed out that to restrict benefits to employees only of careful and cautious employers and withhold it from those who might be careless and subsequently become insolvent "is logically untenable. Its infirmity lies in contrasting the respective rights of solvent and insolvent employers and ignoring the rights of the dependents of killed workmen." While a contributing employer may never have an accident in his establishment, he has yet had the benefits of the insurance.

Some of the employers who have contributed in the past have retired from active operations while others have entered the field. To attempt to allocate individual liabilities and benefits would imperil the whole system of workmen's compensation. "The burdens of the act are placed, not upon the employer, but upon the industry and its hazards; and they are so placed under the exercise of the State's police powers." (State ex rel. Rudd v. Industrial Commission, 156 N. E. 107.)

In contrast with this position is a provision of the law of the State of Wyoming which requires the State treasurer to keep a separate account of each employer contributing to the State fund, the object being to encourage care on the part of the employers, "and to the end that each employer shall compensate all injuries to the workmen of such employer and not those of other employers." The observance of this requirement leads to a large amount of detail, 127 of the 164 pages of the report of the workmen's compensation department of the State for the year 1925 being devoted to statements of individual accounts of employers with the State fund. A measure of feasibility is apparent by reason of the fact that the report named covers the tenth year of the law, though a tremendous contrast exists between the number of persons covered by the Wyoming statute and those under the law of the State of Ohio. However, the question is one of principle at least as much as of practicability.

In line with its individualistic attitude, the legislature of Wyoming at its recent session amended the law so as to require additional payments, other than premiums, by each employer insured in the State fund, such payments being termed a "service and policing charge." The amount in the fund to the employer's credit does not relieve him of the duty of paying this charge; but "no employer who pays for any calendar month 4 per cent of the moneys earned by each of his employees * * * during such calendar month shall be compelled to pay a service and policing charge for such month."

A schedule of charges is established, not on a percentage basis, but arbitrarily, and disclosing a wide range of percentage variation. Where the monthly payment is less than \$10, the charge is \$2 per month. If \$10.01 and not more than \$20, the charge is \$3, etc. Where the payment ranges from \$100.01 to \$250 a service and policing charge of \$50 is assessed, while a premium payment of \$2,500.01 up to \$5,000 is to be accompanied by a service charge of \$175. On the percentage basis these charges range from 3½ per cent where \$5,000 premiums are paid, up to practically 50 per cent where the premium payment is just in excess of \$100. The percentage ranges for the payments, \$20, \$30, \$40, etc., up to \$100 are respectively, 15, 17, 19, 20, 25, 29, 31, 33, 35, while for \$250 the service charge is 20 per cent of the premium payment.

It would seem probable that such variations would be regarded by a court as the result of arbitrary and improper classification rather than of an equitable distribution of the burdens of administration.

The Kansas Legislature likewise incorporated an amendment in the new law of that State, obviously looking toward individual rather than collective responsibility, in its authorization of the assessment of a fee to be collected by the administrative commission for filing agreements and final releases, in the amount of \$1 each;

while in each claim in which testimony is introduced before the commission, it may tax a fee not in excess of \$25, to be apportioned in its discretion. This is an unusual if not unique proceeding, and indicates a purpose to impose the burden of administrative costs on the parties mainly concerned rather than to assume them as a matter of public interest and welfare.

On the side of the collective or general social responsibility idea may be cited those provisions of various State laws which establish second injury funds and/or rehabilitation funds by contributions from employers in cases where an employee is accidentally killed leaving no dependents, or from other sources. Here, clearly, the contributing employer is making provision for the employees of others, and such a provision of law has been declared valid by our highest courts, thus sustaining the collective and social idea as against the distributive and individualistic basis.

Luxemburg Law on Vacations with Pay¹

ACCORDING to an act of December 6, 1926, all workers in Luxemburg except in certain employments and establishments have a right to an annual holiday with pay. Ordinarily this vacation is to fall within the 6 months between April 1 and November 1, unless a formal exemption is granted by the factory inspector in case of necessity. By agreement, however, between the employer and the employee, the annual holiday may be taken at any time.

The duration of the holiday is based on the length of continuous service with the same employer, according to the following schedule: Four days after 1 year, five days after 5 years, seven days after 10 years, and twelve days after 20 years. A holiday of 7 days is provided for workers and apprentices under 18 years of age who have been continuously at work for the same employer for one year.

The provisions of this act, however, do not include agricultural, viticultural and silvicultural workers, home workers, domestic servants, or establishments usually employing 20 workers or less, with the exception of workers under 18 years of age and those employed in slate works and mines.

Hours lost through compulsory vacations may be made up by the employer by recourse to overtime provided it does not exceed 2 hours a day or 30 hours a year per worker.

Any agreement which prejudices the privileges under this law is null and void. An exemption from the provision may be had "in undertakings where the relations between employer and workers are regulated by a collective agreement," and the conditions with which the collective agreement must comply are to be determined by a public administrative regulation. The Luxemburg Chamber of Labor reports that a grand ducal decree on this point is to be issued by the Government, provided such point is not already covered by present legislation.

Law Providing for Compulsory Arbitration of Labor Disputes in Norway¹

A LAW has recently been passed in Norway, over the determined opposition of the labor groups, providing for compulsory arbitration of labor disputes. The measure comes into force immediately but is effective only until August 1, 1929.

Labor disputes had, prior to the passage of the act, been in effect in several industries for some two and one-half months. Protracted negotiations proved fruitless. Matters came to a deadlock, with employers threatening a general lockout and the workers a general strike. The law was passed to deal with this situation.

The measure is to be invoked only in cases where the public interest involved is of sufficient magnitude, and where mediation has failed. Having decided that the case shall be submitted to arbitration, the Government may also require that work be continued, pending settlement of the dispute. Wages and hours are to remain unchanged while the arbitration is proceeding, unless the parties agree otherwise or special provision is made by the arbitration tribunal at the request of the parties.

An arbitration court is provided for, consisting of five members—one member elected by the trade-union involved, one by the Norwegian Employers' Association, two members appointed by the Norwegian Government, and a permanent chairman also selected by the Government. In case of failure by either of the parties to appoint its delegate, such place is to be filled by a person selected by the Government.

Decisions of the court are to be valid for not to exceed two years. In case material changes in conditions affecting wages take place (as, for example, a rise or fall in cost of living, in business conditions, etc.), the case may be reopened upon request of either party after six months from the date of the decision.

¹Consular reports of May 12 and May 20, 1927, from American Consul at Oslo, Norway.

WORKERS' EDUCATION

Workers' Education in Michigan

AS THE result of a discussion at the February, 1926, convention of the Michigan Federation of Labor, a permanent education committee for that State organization was appointed. In the April, 1927, American Federationist, Mr. Edwin E. Linton, third vice president of the Michigan Federation of Labor, traces the development of workers' education in his State.

During 1926 the education committee's principal endeavor was to arouse, through correspondence, an interest in adult workers' education in the different city federations and councils and in planning and discussing questions of the organization, the methods of conducting, the development, and the financing of group study classes. The results of this campaign by correspondence, however, proved so discouraging that the committee had about decided to request the State federation for financial assistance for a personal canvass by the committee. However, after the committee members had attended the conference of the Workers' Education Bureau at the Detroit convention of the American Federation of Labor and after a subsequent discussion at Ann Arbor University, it was decided to start an experimental study class. The Ann Arbor Trades Council agreed to finance a study group on the history of the American labor movement under the guidance of Professor Goodrich, who is lecturing on labor subjects in the university.

During a five-weeks course of one night a week the class attendance averaged 30. After the opening night the discussion became "quite general and lively." This course was followed by a course of 10 weeks under the direction of Professor Bigge on "Wages and their control." Early in 1927 the committee on education was contemplating a personal visit to each city federation or council to supervise an aggressive movement for workers' education throughout Michigan.

At the most recent convention of the State Federation of Labor there was a large amount of literature for distribution on workers' education, and from remarks made at the tables Mr. Linton concludes that the interest in workers' education is widespread "and we can depend on the movement in general to support any program we may plan."

Mr. Linton holds that a few earnest trade-unionists in any community could make arrangements with some teacher or professor of labor subjects in the extension division of any university or college who would be willing to give some attention to the formation of workers' study classes and conduct them ably for a nominal fee.

Prof. John R. Commons of the University of Wisconsin, in an article in the May, 1927, issue of the American Labor World, is in agreement with Mr. Linton in regard to the willingness of higher edu-

cational institutions to further workers' education. The professor says in part:

I believe that State universities and private universities, especially those that have university extension departments, would quite willingly cooperate with State Federations of Labor in arranging these summer short courses. It would not be difficult to work out the details of lectures, conferences, and subjects for discussion. I can think of such subjects as trade-union administration, the best methods of collective bargaining, the best methods of investigation and newspaper publicity, and so on. These could be supplemented during the year by night classes, conducted in cooperation with the university extension department.

I am thinking here only of actual workers who expect to return to the labor movement. There ought also to be a place for a large number of university graduates as employees, not leaders, of State and local unions, partly as teachers, partly as investigators, statisticians, and so on. These would be useful in workers' education, as has already been demonstrated by a few organizations.

LABOR ORGANIZATIONS

Objectives of American Labor Movement¹

THE major objectives of the labor movement in the United States are outlined in a recent address by Matthew Woll, a vice president of the American Federation of Labor and president of the International Photo-Engravers' Union.

The labor movement in this country, he states, seeks to unionize and federate the workers of each trade, not wholly but primarily, to use their economic power, their power to produce, to render service, and to consume "as a means of wresting from industry and those in control of industry, a constantly larger and larger share of the joint results of capital and labor." The method selected for the accomplishment of this is collective bargaining and collective agreement.

When parties fail to agree both parties are free to do as they please, the employer to dismiss workmen, workmen to give up their employment. When that results there follows what is known in general and popular terms as the "strike" or the "lockout," which, after all, is nothing more or less than workmen or employers exercising their freedom of contract to enter or not to enter into the employment of another or to accept or to refuse employment to another.

Collective agreements become "trade laws," providing minimum standards of wages, fixed schedules of working hours, and various other conditions of employment.

In explanation of American labor's concentrating on its economic rather than on its political power, Mr. Woll cites the great difficulty of operating politically in a country where there are so many political divisions of power and where there is such uncertainty in maintaining the validity of remedial measures. At the same time, he states that organized labor has found it necessary to use its political power in the respective States and also in the National Government, not so much as a means for the enacting and enforcing of laws intended for particular trades or organizations, but more for legislation designed for a fairer social order for the people as a whole. In this connection he declares "The record of American labor, in so far as legislative action is concerned, is a splendid one."

Mr. Woll emphasizes the fundamental difference between the American labor movement and those labor movements abroad which have as their final goal the tearing down of the existing social fabric and the substitution of socialism or communism. "Here in America," he says, "we accept the present social order and seek to build upon and within that order, making constant progress * * * and thus by progressive and practical evolution usher in a brighter and happier day. After all, we are more concerned with results than formulas."

According to Mr. Woll, American labor is not seeking to dominate all other classes but is striving for "equal opportunity to work out

¹ The American Photo-Engraver, St. Louis, June, 1927, pp. 656-663.

with all the other classes in society, the common good and the common weal."

In its efforts to advance the general communal life the American labor movement does not condemn capital but undertakes "to learn a lesson from capital and the activities of employers." American labor is beginning to understand what a tremendous factor the workers' purchasing power is in industrial life, and is now endeavoring to organize that power. With the organization of labor's productive and consuming powers the workers "need not worry who owns capital."

Referring to the constant growth of wage earners' savings in this country and to the fact that such savings are to a large extent in the keeping of those who are not so deeply concerned over labor's problems, Mr. Woll calls attention to the trade-union banking and investment institutions which show that labor is now undertaking to gain control of its financial reserves. Special mention is also made of the latest venture of the American labor movement, that into the insurance field.

Toward the close of his address, the speaker expresses himself as strongly in favor of the early renewal of the affiliation of American labor with the International Federation of Trade Unions.

Structural Variety in Union Organization

THE attitude of the American Federation of Labor in regard to the need for different structural plans for union organization is given in an editorial in the May, 1927, *American Federationist*, which reads as follows:

The union is the agency through which workers function in the councils of the industry. The union structure, therefore, must mesh into other organizations and procedure of industry. This makes it impossible to prescribe any single formula for union organization. Where work is organized on the job or unit basis and each worker completes his product, manipulative skill is what establishes the value of the worker. For such industries, the craft becomes the basis of union organization. But when machinery or machine tools replace hand tools and hand work, much or all of the old skill is no longer used and the worker has to develop new skills in the control of his machine and the use of materials. Because machinery has not the adjustability of the human worker, the job is divided into a number of operations. As the operations performed by the workers in the shop together make up the completed product, there comes a new work interdependence among the workers which, expressed through adequate organization, becomes appreciation of the unity of the shop. Under such conditions the shop or plant naturally constitutes the union basis.

The American Federation of Labor is not committed to any single type of union structure. We leave that to the judgment of the workers, who best know the situation they must meet. In those industries where processes and machinery have been standardized as mass production necessitates, craft skill has disappeared from the fabrication and workers are finding new groupings for union organization. The important thing is the continuing necessity for labor organization and finding cohesive ties that will make the union constructive and permanent.

Labor Movement in Mexico

MORONES of Mexico, by J. H. Retinger (London, 1926), is the subject of one of the first histories to be written of the labor movement of Mexico.

The writer points out that from the sixteenth century until late in the nineteenth no organization of any kind existed among Mexican labor, and worker's associations similar to those existing throughout Europe were entirely unknown. The situation of the Mexican worker in the twentieth century is likened to that of the European worker when the disappearing feudalism wiped out the guild and other associations while no new organizations were formed to replace them.

In organizing the labor movement in Mexico the first leaders had not only the practical and material handicaps such as tradition, ignorance, and lack of preparation on the part of the masses, but also the difficulties of choosing among many doctrines the one suitable to Mexico's peculiar conditions. Mexico had no socialistic or even liberal intellectual movement as had practically every other country of the world. The Mexican intellectuals were more absorbed in abstract scientific work or in advancing their own interests. The writer emphasizes the fact that no intellectual during the first 20 years took any real interest in social questions from the worker's viewpoint. The early leaders were required to experiment, study, and learn forms of organization, without any help or encouragement. Furthermore, the number of capable and responsible leaders for the organization work was small.

In 1918 the first National Workmen's Congress was held in Saltillo, at which the leading spirits of the labor movement invited the labor representatives to form one big federation of labor unions, the result of which was the formation of the "Confederacion Regional Obrera Mexicana," popularly known by its initial letters "C. R. O. M."

At this time the official membership of the organization did not exceed 40,000 and the affiliated unions were weak. It was a difficult task to bring the masses together and a still more difficult one to train them to contribute regularly to their local unions and to live up to their obligations.

In June, 1919, the C. R. O. M. congress met in Zacatecas with better results not only from the standpoint of membership, which had increased from 40,000 to 70,000, but also from the increased strength of the inner organizations. Some of the most important industrial unions as, for example, the miners' organization, were persuaded to join the Confederacion.

To-day the Mexican labor movement has amassed both a very large membership, numbering over a million in a population of fifteen million, and very great power, according to the writer. As to Mexico's future problems and needs he states:

For Mexico, one of the richest countries of the world—ruined by civil war—in the clutches of foreign capitalism, the chief problem is to improve the general economic production so as to better both directly and indirectly the standard of living of her workers and to develop the purely national production under the control of national and, if possible, labor capital.

Mexico's need to-day for foreign manufactured machinery and for highways, for irrigation, for railroads, for transport facilities, etc., which can only be developed at the present time by foreign capital, is so enormous that capital from abroad must be brought in immediately. Even more than in Soviet Russia must labor in Mexico to-day compromise with capital in order to live.

INDUSTRIAL DISPUTES

Strikes and Lockouts in the United States, May, 1927

STRIKES and lockouts in the United States beginning in the month of May, 1927, in so far as reports thereof have been received by the bureau are shown in this article. Disputes involving fewer than six workers and those lasting less than one day have been omitted where information on this point is reported.

In presenting these figures, it is important to note that the bureau has no machinery for the prompt and full reporting of strikes and lockouts, but depends largely upon newspapers, trade journals, and labor periodicals for the preliminary reports of disputes. These preliminary reports are then followed up by correspondence, and any necessary revision is made. For the reasons mentioned the data here presented do not pretend to be absolutely complete or fully accurate. It is believed, however, that practically all of the more significant strikes and lockouts are recorded, and that the information presented is sufficiently accurate to give a fair picture of the situation in the United States in the matter of strikes and lockouts.

The Bureau of Labor Statistics solicits the cooperation of employers, labor organizations, and other interested parties in making this compilation of industrial disputes as comprehensive and as accurate as possible.

Strikes and Lockouts Beginning in May, 1927

THE table following shows the number of strikes and lockouts beginning in May, 1927, in comparison with March and April, and also the number of persons involved, to the extent that reports on this point have been received.

STRIKES AND LOCKOUTS BEGINNING IN MARCH, APRIL, AND MAY, 1927

Month	Number of strikes and lockouts ¹	Disputes in which number of employees directly involved is known ¹		
		Number of strikes and lockouts	Number of employees involved	Average number of employees per dispute
March, 1927.....	77	60	11, 837	197
April, 1927.....	93	61	222, 903	3, 654
May, 1927 ²	100	74	20, 535	278

¹ Excluding those involving fewer than six persons.

² Figures subject to revision.

Classification of Strikes and Lockouts by Industries and by Number of Persons Involved

THE statements following show the distribution of the reported strikes and lockouts beginning in May, 1927, by industries or occupations and, in so far as information is available, the disputes classified by number of workers directly involved.

Strikes and lockouts, by industries

	Disputes
Building trades.....	47
Metal trades.....	2
Bakers.....	3
Barbers.....	2
Clothing industry.....	10
Theater and motion-picture employees.....	3
Mining, coal.....	9
Chauffeurs and teamsters.....	3
Textile industry.....	9
Miscellaneous.....	12
Total.....	100

Strikes and lockouts, by number of workers

	Disputes
6 and under 20 workers.....	10
20 and under 100 workers.....	25
100 and under 500 workers.....	26
500 and under 1,000 workers.....	6
1,000 and under 5,000 workers.....	7
Total.....	74

Principal Strikes and Lockouts Beginning in May, 1927

LABORERS, *Connecticut*.—On May 4 about 1,000 laborers in the building trades of Hartford struck for a wage increase from 55 and 60 cents an hour to 65 cents an hour. This strike was abandoned by May 14.

Millwork carpenters, Illinois.—A successful strike of about 1,200 millwork carpenters in Chicago against a wage reduction from \$1.20 an hour to \$1.10 an hour began on May 9 and was over by May 28.

Coal miners, Pennsylvania.—The Maxwell Colliery of the Lehigh & Wilkesbarre Coal Co. was affected by a strike of 1,265 workers beginning May 11 against the discharge of a driver boy. The exact duration of this disturbance has not been reported, but the trouble was referred to a committee and the men had resumed work by May 21.

Coal miners, Pennsylvania.—An unsuccessful strike of 1,408 employees of the Susquehanna Collieries Co. near Glen Lyon occurred on May 10 on account of dissatisfaction with a hired clerk. The grievance was dropped and the men resumed work on May 11.

Coal miners, Pennsylvania.—The miners employed by the Mocanqua Colliery of the West End Coal Co. became involved in a dispute with their employers as to the proper time for the night shift to enter the mines, and quit work during the week ending May 21. The strike was not in conformity with the agreement and the men decided to return to work on May 23, but when they undertook to do so they found that the mines had been closed down indefinitely by the company. About 1,000 men were involved. Operations were resumed on June 14, with the understanding that the workers would comply with all provisions of the agreement between miners and operators.

Principal Strikes and Lockouts Continuing into May, 1927

BITUMINOUS *coal strike*.—No important changes have taken place since our last report in the suspension of organized bituminous coal miners. Conferences have occurred from time to time in the various

districts with a view to reaching an agreement satisfactory to both sides, but these have been without tangible results, except in negotiations between members of the Southwestern Interstate Coal Operators' Association and representatives of districts 14, 21, and 25. At a general conference of these parties a tentative agreement upon working conditions was effected at Kansas City, Mo., on May 11, but this agreement is ineffective until a wage scale has been agreed upon. The report of the subscale committee which was ratified by the general conference read as follows:

We, your subscale committee, to whom was referred on March 17 the operators' proposal and the miners' proposal for a contract, beg leave to report that we have had same under consideration and that being unable to agree upon the adoption of either proposal in its entirety, we beg to report that we have agreed upon and adopted the following resolutions and sections for a contract:

(1) That the operators' substitute resolution offered in subcommittee March 17 be adopted. This resolution is in lieu of the operators' and miners' first resolutions and reads as follows:

"We propose an agreement for districts 14, 21, and 25 for a period of two years from April 1, 1927, embodying all of the written terms of the 1924 contract, including all decisions, agreements, and rulings of the Interstate Joint Commission, commissioners, and district officers, made during the 1924-1927 contract period that are in writing, together with such changes or additions as may be mutually agreed upon, with the exception of the scale of wages as to day and monthly men, tonnage, dead-work, and yardage rates, which shall be made a matter of negotiation, the scale committees representing the miners and operators to continue in session to that end.

(2) That a resolution of March 31, offered in subcommittee, providing for the consideration of interpretations and fundamental principles underlying certain decisions of the Interstate Joint Commission and with reference to rules of procedure, shall be adopted and immediately taken up for final determination and when final conclusions have been determined the same shall be for guidance of the Interstate Joint Commission in the future handling of cases and rendering decisions under the contract. This resolution reads as follows:

Resolved by the subscale committee of miners and operators, That it is agreed that after the adoption of the operators' substitute resolution of March 17 the joint scale committee shall give consideration to the interpretation of the fundamental principles underlying certain past decisions of the Interstate Joint Commission, also to certain rules for the government and procedure of said commission, to the end that certain fundamental principles and rules of procedure may be determined for the guidance of the Interstate Joint Commission in the handling of the future cases and rendering decisions under the contract.

(3) That negotiations on the wage scale be taken up, each side presenting such basis for negotiations for a wage scale as they may elect.

(4) It is understood and agreed that the first and second paragraphs of this recommendation shall not be effective until a wage scale has been agreed upon, at which time the resolutions above referred to will then become in full force and effect.

Plumbers, New York.—The strike of plumbers in Brooklyn which began on April 1 has terminated, but the lockout of plumbers and helpers in Queens and Richmond remains in effect, as the general lockout which was declared in Greater New York on April 27 by the Building Trades Employers' Association against journeyman plumbers and helpers has not been withdrawn except as to Manhattan and the Bronx. In Brooklyn the master plumbers began to employ nonunion workmen on May 31, when work was resumed, according to press reports, on 15 buildings.

On May 26 supreme court Justice May in Brooklyn denied the application of the president of the Queens local for an injunction to restrain the building trades employers' and the master plumbers' associations outside of Brooklyn from continuing the lockout. The

Queens plumbers contended that the lockout in Queens Borough was illegal because they had no part in the Brooklyn strike and were working under "an agreement which does not expire until 1931." The employers held that the Queens plumbers had broken their agreement by refusing to work on jobs in Brooklyn where the local had called a strike. Justice May said:

The lockout on the part of the employers was the inevitable result of the action on the part of the employees. Equity will not assist those who by indirection violate their agreements, or by such means attempt to secure that to which, under ordinary circumstances, they would not be entitled, any more than it would aid them in such an attempt if made by direct action.

It was the intention of the parties (the employers) that the wages of the Queens employees should be no less than the amount paid in any of the other boroughs, but not that the employers should stand idly by while their employees were aiding and assisting in compelling payment of higher wages in Brooklyn, thereby entitling themselves to share in such benefits.

On June 6 a sympathetic strike began of the workers in some other crafts in the building trades of Brooklyn involving 600 men, but it was promptly halted by the Building Trades Council upon the ground that it was a violation of their agreement, which does not expire until January 1 next, and these men were ordered to resume work on June 7. This action had the effect of isolating the striking Brooklyn plumbers, and after a struggle lasting two and one-half months the strike of 1,500 plumbers in Brooklyn was settled on June 14 when the union agreed to arbitrate its demands for higher wages and a reduction of hours. Settlement by arbitration after resumption of work had been proposed by the employers soon after the strike began but was rejected by the men. It is understood that the present settlement provides for a conference between the Brooklyn Master Plumbers' Association and Local 1 of the plumbers' union. If the conference fails in affecting a settlement, resort will be had to arbitration by a committee of three, the union naming one member, the employers one, and these two choosing an impartial umpire. Under this arrangement the plumbers resumed work, it is understood, on June 15.

The plumbers' helpers in Brookland returned to work with the plumbers, according to press reports, and are receiving from \$4.50 to \$6 per day instead of the \$4 wage prevailing before the strike, but their other demands were not granted.

Conciliation Work of the Department of Labor in May, 1927

By HUGH L. KERWIN, DIRECTOR OF CONCILIATION

THE Secretary of Labor, through the conciliation service, exercised his good offices in connection with 57 labor disputes during May, 1927. These disputes affected a known total of 29,706 employees. The table following shows the name and location of the establishment or industry in which the dispute occurred, the nature of the dispute (whether strike or lockout or controversy not having reached the strike or lockout stage), the craft or trade concerned, the cause of the dispute, its present status, the terms of settlement, the date of beginning and ending, and the number of workers directly and indirectly affected.

On June 1, 1927, there were 55 strikes before the department for settlement, and, in addition, 14 controversies which had not reached the strike stage. The total number of cases pending was 69.

LABOR DISPUTES HANDLED BY THE UNITED STATES DEPARTMENT OF LABOR THROUGH ITS CONCILIATION SERVICE, MAY, 1927

WAGES AND HOURS OF LABOR

Hours and Earnings in Bituminous-Coal Mining, 1924 and 1926

THIS article presents average hours and earnings for the various occupations in bituminous-coal mining in the United States as of 1926 in comparison with like figures for 1924.

The averages were computed from data covering hours and earnings of individual employees for a half-month pay period and represent conditions as of October, before certain increases (mostly temporary) were made. The data were taken directly from the pay rolls and other records of 556 representative mines of coal companies in Alabama, Colorado, Illinois, Indiana, Kansas, Kentucky, Ohio, Pennsylvania, Tennessee, Virginia, and West Virginia by agents of the Bureau of Labor Statistics, except for a very few companies which themselves furnished copies of the records.

The three basic occupations in bituminous-coal mining are those of hand or pick miners, machine miners, and hand loaders. They represent approximately 63 per cent of all wage earners in bituminous-coal mining and are usually paid a rate per ton of 2,000 pounds, run of mine—that is, of coal as mined, including “slack.”

Machine miners undercut the coal by machine. Hand loaders shovel the coal into mine cars from the floor of the mine after it has been undercut and blasted from the seam by loaders or shot firers. Hand or pick miners undercut the coal with a pick, blast it from the seam, and shovel it from the floor of the mine into mine cars. Contract loaders, machine loaders, gang miners, and machine miners’ helpers are of much less importance in numbers than other loaders and miners.

As loaders and miners are usually paid tonnage instead of time rates, very few companies keep a daily time record for such employees. It was therefore necessary, in order to get hours worked by employees, to make arrangements with officials of the mines to have a special day-by-day record kept of the hours of each employee for a half-month pay period. Employees in all occupations inside and outside the mines, except loaders and miners, are usually paid time rates—that is, rates per hour, day, or week. The time worked by each time worker and the earnings of each time and each tonnage worker are of regular record.

The 1926 data are for 132,949 underground or “inside” wage earners and for 15,206 surface or “outside” employees—a total of 148,155, or 25 per cent of the 588,493 mine workers reported in bituminous coal mining in 1925 by the United States Bureau of Mines.

Table 1 shows for each State and for all States combined, for 1924 and for 1926, the average number of days in which employees worked in a half-month pay period and the average hours and earnings for the miners and the loaders—that is, for employees who actually do the digging and the loading of coal into mine cars. Average hours and earnings for each of seven specified occupations are presented based on (1) time at the face, including time for lunch, and (2) total time in the mine, including time for lunch and time of travel in mine from its opening to the face and return. The term “face” means the surface of the seam of coal on which the men are working or, broadly, their

place of work in the mine. The time for lunch, as reported, was usually about 30 minutes; and the time of travel in the different mines ranged from 10 minutes per day for the mine with the shortest time of travel to 2 hours for the one with the longest time of travel. The average was about 46 minutes per day or 23 minutes each way.

Reading part of Table 1 in explanation of data therein it is seen that 1926 data are presented for 66,414 hand loaders, 20,594 pick or hand miners, 6,055 machine miners (cutters), 882 machine miners' helpers, 694 contract loaders, 306 machine loaders, and 1,065 gang miners. No 1924 data are shown for machine miners' (cutters) helpers as data for these employees were combined with machine miners (cutters) in that year.

Average hours worked in the half month and per start in these occupations were greater in 1926 than in 1924. Average earnings in the half month were greater in 5 occupations and less in 1 occupation in 1926 than in 1924. Average hours per day or per start based on time in mine were more in 5 occupations and less in 1 occupation in 1926 than in 1924, and average earnings per start were greater in 3 occupations and less in 3 occupations in 1926 than in 1924.

In the half-month pay period in 1926, hand loaders worked an average of 9.4 starts or days. The averages in the different States range from 8.3 in Tennessee to 10.3 in Indiana. Based on time at the face, including time for lunch, loaders worked an average of 73.7 hours in 1926. The averages in different States range from 63.5 in Tennessee to 81.2 in Colorado. They earned an average of 77.9 cents per hour based on time at the face, including time for lunch, and the averages by States range from 43.6 cents in Tennessee to \$1.116 in Indiana. They earned an average of \$6.12 per start or day, the average by States ranging from \$3.35 in Tennessee to \$3.80 in Illinois. The figures for other occupations may be read in like manner.

¹ Data included in total.

Changes in Wage Rates Since October 15, 1926

AS a result of the coal strike in England in 1926 there was an unusual demand for coal from bituminous-coal mining companies in the United States. This demand resulted in temporary increases in wage rates at 289 of the 556 mines covered in 1926. The increases were made in November or December, but in nearly all cases continued in effect for only a short time, after which the rates were reduced to those in effect prior to the increase. In Kentucky 58 of the 86 mines covered made increases ranging from 5 per cent to 40 per cent. In Ohio 3 of the 45 mines made increases ranging from 15 to 25 per cent. In Pennsylvania 86 of the 151 mines made increases ranging from 20 to 50 per cent. In Tennessee 12 of the 14 mines made increases of 20 and 25 per cent. In Virginia 21 of the 22 mines made increases of 10, 20, 25, or 30 per cent. In West Virginia 109 of the 118 mines made increases ranging from 10 to 50 per cent. In Colorado one mine made a permanent increase in wage rates in December.

The figures used in this report are based on the rates which prevailed on October 15, before the temporary increases were made, and are therefore representative of conditions in the industry during the greater part of the year 1926.

Data were obtained from some mines for a period later than October 15, but the earnings of record were adjusted so as to show equivalent earnings as of the October 15 rates. This action was taken so as to put all mines on a comparable base, and show the rates that governed the greater part of 1926.

Table 2 presents for 1924 and 1926 the average number of starts (days) and average hours and earnings for inside and outside occupations in which the employees are usually time workers—that is, paid at rates per hour, day, or week. The averages are based on hours actually worked.

The table shows that engineers and pumpmen worked more starts (days) and hours in the half month than did the employees in any of the other occupations. A large percentage of the employees in these occupations work overtime and on Sundays and holidays. The average earnings per hour in 1926 for inside occupations, exclusive of trappers (boys), range from 62 cents for laborers to 81.1 cents for cagers, and for outside occupations range from 54.6 cents for laborers to 76.2 cents for engineers.

TABLE 2.—AVERAGE NUMBER OF STARTS (DAYS OR PARTS OF DAYS) AND AVERAGE HOURS AND EARNINGS, 1924 AND 1926, BY OCCUPATION

[The data in this table are for employees of all inside and outside occupations, except loaders and miners]

Occupation	Year	Number of mines	Number of employees	Average number of starts (days) made in half-month pay period	Average hours worked—		Average earnings—

¹ Not including 1 female weigher who worked 5 starts, 36 hours, at a rate of \$2.72 per day of 8 hours, and earned \$12.24.

Table 3 shows for 1926 the number and the per cent of the 66,414 hand loaders, 20,594 hand or pick miners, and 6,055 machine miners in each classified earnings group based on (1) the actual hours at the face or seam of coal, including time for lunch, and (2) the actual hours in the mine, including time of travel from the opening of the mine to the face and return, the working hours, and the time for lunch. It will be seen that the difference per day between hours at the face (7.8) and the hours in the mine (8.6), as shown in Table 1 for loaders, is eight-tenths of an hour or 48 minutes, representing the average time of travel inside the mine from the entrance to the place of work and return.

Average earnings per hour computed on the basis of hours at the face (including time for lunch) are greater than when computed on the basis of hours in the mine (including time of travel and time for lunch) because the latter includes 48 minutes per day of nonproductive time spent in travel.

Of the 66,414 hand loaders classified in Table 3, it is seen that, on the basis of hours at the face including time for lunch, 7,088, or 11 per cent, earned 40 and under 50 cents per hour, but on the basis of total hours in the mine (including travel time, working time, and

lunch time) 8,345 of them, or 12 per cent, were in this earnings group; that on the basis of hours at the face, 12,813, or 19 per cent, earned less than 50 cents per hour, while on the basis of total hours in the mine, 16,332, or 25 per cent, earned less than that amount per hour. On the basis of hours at the face, 58 per cent earned less than 80 cents per hour, while on the basis of total hours in the mine, 66 per cent earned less than 80 cents per hour. On the basis of hours at the face, 99 per cent earned less than \$1.50 per hour.

TABLE 3.—NUMBER AND PER CENT OF LOADERS, HAND OR PICK MINERS, AND MACHINE MINERS (CUTTERS) WHOSE HOURLY EARNINGS WERE WITHIN EACH CLASSIFIED AMOUNT, 1926

¹ Less than 1 per cent.

² The actual percentage is between 99.5 and 100.

Table 4 shows the average number of starts (days on which employees worked) and the per cent of employees in each occupation who worked each specified number of days during the pay period covered by the study.

Practically every mine reported some employees as having worked less than the number of days the mine was in operation in the half month for which data were reported because of sickness or other disability, voluntary absence, or whose term of service was less than the full pay period. In a considerable number of the occupations employees, especially engineers and pumpmen, worked on Sundays, and are shown as having worked on more than 11, 12, 13, or 14 days, the number of days (exclusive of Sundays and holidays) in the half month for which data were taken. In such cases employees worked on Sundays and holidays and week days.

Owing to the fact that few companies regularly kept a record of the hours of tonnage workers, it was not possible to obtain data from all companies for an identical half month. It should, therefore, be borne in mind in studying the figures that the week days in the different half months taken were 11, 12, 13, or 14.

TABLE 4.—PER CENT OF EMPLOYEES MAKING EACH SPECIFIED NUMBER OF STARTS (DAYS) IN HALF-MONTH, 1926, BY OCCUPATION

Extras

Extra cooks, Sundays and holidays.....	per day..	7. 00
Extra waiters, waitresses, and miscellaneous help, Sundays.....	per day..	4. 00
Holidays.....	per day..	5. 00

Marine Cooks and Stewards' Association

THE 1927 scale of the Marine Cooks and Stewards' Association contains monthly rates as follows: Stewards, \$140; cooks, first, \$120; cooks, second, \$80; cooks, third, \$60; bakers, \$80; mess men, \$50; mess boys, \$42.50.

Marine Firemen, Oilers, and Water Tenders—Atlantic and Gulf

THE 1927 monthly wages of the Marine Firemen, Oilers and Water Tenders' Union of the Atlantic and Gulf are as follows: Oilers, three-watch system, \$72.50; firemen (oil), \$65; firemen (coal), \$75; coal passers, \$60; and wipers, \$57.50.

Plumbers and Steam Fitters—Lafayette, Ind.

PLUMBERS' Local Union No. 240, of Lafayette, made an agreement effective March 1, 1927, to April 1, 1929. The wage for a 44-hour week is \$1.17½ per hour to April 1, 1928, and \$1.25 thereafter.

Pressmen—Joliet, Ill.

A TWO-YEAR agreement between Web Pressmen's Local Union No. 111 and the Joliet Printing Co. became effective February 1, 1927. Four journeymen were given a scale of \$36 per week of 48 hours and an assistant \$25.72.

¹ And expenses.

Railroad Conductors and Trainmen—Louisville & Nashville Railroad

THE Louisville & Nashville Railroad Co. made agreements with the Brotherhood of Railroad Trainmen and the Order of Railway Conductors, effective February 1, 1927. The rates of pay mentioned in the agreements are per day, as follows: Passenger service—Conductors, \$7.20; baggagemen, \$5.22; baggagemen handling express, dynamo, or United States Mail, \$5.56; baggagemen handling express and dynamo, or express and United States Mail, or dynamo and United States Mail, \$5.90; baggagemen handling express, dynamo, and United States Mail, \$6.24; flagmen and brakemen, \$5.05. Freight service—through freight and mixed service, conductors, \$6.62; flagmen, brakemen, and baggagemen, \$5.20; local freight service, conductors, \$7.18; flagmen and brakemen, \$5.63. Work construction and wrecking service—conductors, \$7.18; flagmen and brakemen, \$5.63. Overtime, per hour—Through freight and mixed train service, conductors, \$1.24; flagmen, baggagemen, and brakemen, \$0.98; local freight, work construction and wrecking service, and mine switching run service, conductors, \$1.35; flagmen and brakemen, \$1.06.

Railroad Maintenance of Way Foremen—Buffalo, Rochester & Pittsburgh Railway

THE Maintenance of Way Foremen's Association made an agreement with the Buffalo, Rochester & Pittsburgh Railway Co., adjusting the rates of pay from May 1, 1927. The old and new monthly rates are as follows:

	Old	New
Carpenter and bridge foremen.....	\$145.00	\$152.00
	150.00	157.00
	155.00	162.00

Railroad Shopmen

ANN Arbor Railroad Co.—By agreement between System Federation No. 77 and the Ann Arbor Railroad Co., April 1, 1927, the rates of pay affecting machinists, boilermakers, blacksmiths, sheet-metal workers, welders, electricians, carmen, stationary engineers, and firemen in the motive and car departments were increased 2½ cents per hour.

NEW Orleans Great Northern Railroad Co.—The New Orleans Great Northern Railroad Co. made an agreement with its employees, members of the machinists', boilermakers', blacksmiths', carmen's, sheet-metal workers', and electrical workers' unions, effective March 1, 1927. Wages per hour are as follows: Machinists, boilermakers, blacksmiths, sheet-metal workers and electricians, 73 cents; electric-hoist operators, 49 cents; coach and engine carpenters, 70 cents; planing-mill men, 68 to 73 cents; air-brake men, 70 cents; passenger-car and locomotive painters, 70 cents; pattern makers, 73 cents; freight-car repairers and freight-car painters, 62 cents; car inspectors, 65 cents; apprentices' starting rate (metal crafts), 29 cents; apprentices' starting rate (car department), 28 cents; helpers (metal crafts), 49 cents; helpers (car department), 45 cents; helpers (train yard) (car inspectors), 46 cents. Apprentices were increased $2\frac{1}{2}$ cents per hour at the expiration of each six months, up to and including the first three years, 5 cents per hour for the first six months of the fourth year, and $7\frac{1}{2}$ cents per hour for the last six months of the fourth year. Helper apprentices receive the minimum helpers' rate for the first six months, with increase of 2 cents per hour for every six months thereafter until they have served three years.

NEW Orleans Public Belt Railroad.—Wages of the crafts on the New Orleans Public Belt Railroad were increased January 25, 1927, the hourly rates being as follows: Machinists (inspectors), 81 cents; machinists, 76 cents; boilermakers (inspectors), 81 cents; boilermakers, 76 cents; blacksmiths (heavy fire), 81 cents; blacksmiths, 76 cents; welders, 81 cents; pipe fitters, 76 cents; painters (locomotive), 74 cents; carpenters (locomotive), 74 cents; apprentices to machinists, boilermakers, blacksmiths, and pipe fitters, 31 cents; helpers (heavy-fire blacksmith), 58 cents; helpers (boilermaker, blacksmith), 53 cents; sheet-metal workers' and machinists' helpers, 53 cents; carmen (interchange inspectors assigned to interchanges), 69 cents; carmen (regular assignment furnishing empties), 69 cents; lead carmen (central station), 79 cents; lead carmen (Pauline yard), 74 cents; lead carmen (cotton warehouse), 74 cents; millman, 74 cents; airman (test-rack operator), 74 cents; carmen, 66 cents; carmen apprentices, 28 cents; carmen helpers, 50 cents. All apprentices receive an increase of 2 cents per hour every six months.

TERMINAL Railroad Association of St. Louis.—The Terminal Railroad Association of St. Louis increased the rates of pay of shopmen 2 cents per hour from February 1, 1927. The new hourly rates are as follows: Machinists, 75 cents; machinists' helpers, 52 cents; boilermakers, 75 cents; boilermakers' helpers, 54 cents; blacksmiths, 75 cents; blacksmiths' helpers, 54 cents; sheet-metal workers, 75 cents; sheet-metal workers' helpers, 52 cents; electricians, first class, 75 cents; electricians, second class, 71 cents; electricians' helpers, 52 cents. Carmen: Passenger-car repairmen and inspectors, cabinet-makers, upholsterers, locomotive carpenters, planing-mill men, air-brake rack men, pattern makers, coach and locomotive painters (performing varnishing, surfacing, lettering, or decorating), 75 cents; carmen helpers, 52 cents. Locomotive tank truckmen, freight-car repairmen and inspectors, air-hose couple-up men, 68 cents. Starting rates for apprentices: All regular apprentices, 32

cents; helper apprentices (boiler maker and blacksmith), 54 cents; helper apprentices (machinist, sheet-metal worker, electrician, and carmen), 52 cents.

Railroad Signalmen

THE Brotherhood of Railroad Signalmen made agreements effective February 1, 1927, with the Los Angeles & Salt Lake Railroad Co. and the St. Joseph & Grand Island Railway Co., the hourly rates for both companies being the same, as follows: Leading signalmen—leading signal maintainers, 85 cents; relay repairmen, 85 cents; signal wiremen, 80 cents; signalmen, 77 cents; signal maintainers, 73 cents; assistant signalmen—assistant signal maintainers, 51 cents for first 145 days with 2 cents additional for each succeeding 145 days up to 65 cents; signalmen helpers, 47 cents for first 145 days, 48 cents for second 145 days, and 49 cents thereafter.

The New York, Chicago & St. Louis Railroad Co. made an agreement with its signal-department employees, effective May 1, 1927. The rates per hour are as follows: Signal maintainers and signalmen, 75 cents; leading signalmen and leading signal maintainers, 80 cents; assistant signal maintainers and assistant signalmen, first six months, 52 cents; second six months, 54 cents; third six months, 56 cents; fourth six months, 58 cents, fifth six months, 60 cents; sixth six months, 62 cents; seventh six months, 64 cents, and eighth six months, 66 cents; helpers, 50 cents.

A board of arbitrators, consisting of W. H. Kirkbride, Daniel W. Helt, and Paul A. Sinsheimer, rendered a decision March 4, 1927, awarding the railroad signalmen on the Southern Pacific Railway an increase in the wage rates that had been in effect since July 1, 1922. The old rates and those awarded by the board are here given in cents per hour.

	Old	New
Leading signalmen and leading signal maintainers.....	77	81½
Signalmen and signal maintainers.....	72	76½

Railroad Station Employees—Boston & Maine Railroad Co.

AN INCREASE in wages of two cents per hour was given by an arbitration board consisting of Victor S. Clark, P. J. Clair, and Benjamin Thomas, by award of April 25, 1927, to the Brotherhood of Railroad Station Employees on the Boston & Maine Railroad. Benjamin Thomas, representing the company, dissented.

Railroad Telegraphers

BUFFALO, Rochester & Pittsburgh Railway Co.—The Order of Railroad Telegraphers made an agreement with the Buffalo, Rochester & Pittsburgh Railway Co., effective as to rates of pay

on February 1, 1927, the rates varying in the different cities and towns. The rates are given in cents per hour, as follows: First trick operators, 59.50 to 72.50, overtime 89.25 to 108.75; second and third trick operators, 57.50 to 70.50, overtime 86.25 to 105.75; trick operators and levermen, 65.25, overtime 98; first trick copiers, 73, overtime 109.50; second and third trick copiers, 71, overtime 106.50; car distributors, 77.50, overtime 116.25; agent operators, 61.50 to 79.50, overtime 92.25 to 119.25; clerk operators, 60.50 to 65.50, overtime 90.75 to 98.25; relief agents, 77.50, overtime 116.25; agents, 63.50 to 74, overtime 95.25 to 111. The monthly rate for agents varies from \$177 to \$222.

NORTHERN Pacific Railway Co.—An award was made by arbitrators, Homer B. Dibell, E. E. Dildine, and B. C. Lewis, April 22, 1927, increasing the rate of the telegraphers on the Northern Pacific Railway by 3 cents per hour. E. E. Dildine, representing the company, dissented.

Railway Clerks

NEW York Central Railroad.—March 26, 1927, an arbitration board consisting of Victor S. Clark, Daniel W. Dinan, and William B. Wilson rendered a decision in a dispute between the New York Central Railroad and the Brotherhood of Railway and Steamship Clerks, adding to the rate of pay in effect March 15, 1927, an increase of 6 per cent of existing rates for certain classes of labor.

SOUTHERN Pacific Co. (Pacific Lines).—A board of arbitrators consisting of J. O. Davis, J. H. Sylvester, and W. B. Kirkland rendered an award in a dispute between the Southern Pacific Co. (Pacific lines) and the Brotherhood of Railway Clerks, effective January 1, 1927. The increases were as follows:

Storekeepers, assistant storekeepers, chief clerks, foremen, subforemen, and other office, station, and store supervisory forces, 3 cents per hour; employees devoting a majority of their time to clerical work or as machine operators, 5 cents per hour; clerical employees and machine operators being paid at a rate less than the full rate of the position to which assigned to be paid the full rate of such position and an increase of 5 cents per hour; train and engine crew callers, 2 cents per hour; assistant station masters, passenger directors, train announcers, gatemen, ticket collectors, station and assistant station baggagemen, and baggage-room employees (other than clerks), 5 cents per hour; baggage and mail handlers and parcel-room employees, 7 cents per hour; auto messengers, baggage and mail truck drivers, 5 cents per hour; operators of small electric baggage and mail tractors, 7 cents per hour; janitors, elevator operators, office, station, store, and warehouse watchmen and employees engaged in assorting waybills and tickets, operating appliances or machines for perforating, addressing envelopes, numbering claims and other papers, gathering and distributing mail, adjusting dictaphone cylinders, and other similar work, 2 cents per hour; station, platform, warehouse, transfer, dock, pier, storeroom, and team track freight handlers or truckers, store helpers, store truck drivers and chauffeurs,

and others similarly employed, 4 cents per hour; store deliverymen, gang leaders, and apron tenders, 3 cents per hour; telephone switchboard operators, 3 cents per hour. Sealers, scalers, and fruit and perishable inspectors to receive 2 cents per hour above the rates for truckers; stowers, stevedores, callers, pickers, loaders, locators, cooperers, and freight platform tractor operators to receive 5 cents per hour above the rates for truckers. Employees without previous clerical experience as a clerical worker, hereafter entering service in the general offices at San Francisco and filling positions of clerk or machine operator to be paid \$2.35 per day for the first three months, \$2.55 per day for the second three months, \$2.75 for the next six months, and thereafter the established full rate of pay for the position occupied.

The board recommended that 1 cent per hour of the increase be used to adjust inequalities. W. B. Kirkland, representing the company, did not concur in the award.

Railways, Electric—Trenton & Mercer County Traction Corp.

THE Trenton & Mercer County Traction Corporation made a three-year agreement with Division No. 540 of the Amalgamated Association of Street and Electric Railway Employees, of Trenton, N. J., April 1, 1927. The basic day's work is nine hours except for men in the power house employed on three-shift forces, whose working time is eight hours. Work on snow plows and sweepers, as well as overtime, is paid for at the rate of time and one quarter. The agreement also includes bus operators. The hourly rates are as follows:

To motormen and conductors, platform time, for the first three months, 52 cents; for the next nine months, 54 cents; and thereafter, 56 cents. Operators of one-man cars get 5 cents additional. Railroad flagmen, 41.7 cents; track greasers, 45.68 cents; and controller repairmen, 56 cents.

Power house: Watch engineers, 71.47 cents; oilers, 56 cents; first fireman, 65.52 cents; second fireman and coal passers, 58.08 cents; utility men, 71.47 cents; and repairmen, 56 cents.

Car shops: Blacksmiths, 59.57 cents; armature winders' helpers, 56 cents; carpenters, 59.57 cents; carpenters' helpers, 56 cents; painters, 59.57 cents; painters' helpers, 56 cents; electricians, 65.05 cents; electricians' helpers, 56 cents; pitmen, 58.38 cents; miscellaneous men, 41.7 to 56 cents.

April 1, 1928, the scale is to be increased 2 cents per hour and April 1, 1929, 2 cents more.

Retail Clerks—Belleville, Ill.

A TWO-YEAR agreement made March 15, 1927, between the Retail Clerks' Local Union No. 219 and the retail merchants of Belleville, Ill., calls for an 8½-hour day except on Saturday, when the hours are increased to 9 hours and 40 minutes for men and 8 hours and 40 minutes for women, to be worked between 8 a. m. and 5.30 p. m., 7 p. m. on Saturday. Clerks are to work until 8 p. m. the four evenings before Christmas eve and until 6 p. m. Saturdays during July and August. The overtime rate is time and a half.

The scale for male clerks is \$11 a week for the first six months, \$12 for the second 6 months, and \$14 thereafter. Women clerks receive \$1 less. Clerks in the employ of a firm for a year are given one week's vacation with pay between May 1 and October 1.

Sailors' Association, Eastern and Gulf

THE Eastern and Gulf Sailors' Association (Inc.), affiliated with the International Seamen's Union of America, has the following monthly scale of wages for 1927: Boatswains, \$75; carpenters, \$80; quartermasters, \$70; able seamen, \$62.50; ordinary seamen, \$47.50. Three-watch system, 8 hours per day.

Typographical Unions

BEARDSTOWN, Ill.—Local Union No. 356, of Jacksonville, Ill., made an agreement with the printing offices of Beardstown and of Jacksonville for the year 1927. The working week in newspaper offices is to be 48 hours, in job offices 44 hours. For overtime time and a half is paid. The wage scale is as follows: Newspapers—Day work, journeymen, \$41 per week; operator machinists, \$43; foremen, \$44; night work, \$3 additional. Job offices—Day work, journeymen, 86½ cents per hour; operator machinists, 90½ cents; foremen, 92½ cents; night work, 6 cents per hour additional. Apprentices receive 45 per cent of the journeymen's wage in the third year, 60 per cent in the fourth year, and 75 per cent in the fifth year.

JOPLIN, Mo.—Local Union No. 350 made an agreement with the newspapers of Joplin, Mo., effective for three years from April 1, 1927, with the following scale for a 48-hour week: Journeymen, \$40; machinist operators and foremen, \$43; night work, \$3 additional; \$1 additional after October 1, 1928. Apprentices receive 50 per cent of journeymen's wages the fifth half year, 55 per cent the sixth, 60 per cent the seventh, 70 per cent the eighth, 80 per cent the ninth, and 90 per cent the tenth half year.

PITTSBURG, Kans.—A two-year agreement, effective February 15, 1927, was made between Typographical Union No. 470 and employers in Pittsburg, Kans., containing the following weekly scale: Daily newspapers—Journeymen, \$37; operators, \$38; night work, \$3 more. Job offices and weekly newspapers—Journeymen, \$33.92; operators, \$34.83; night work, \$2.75 additional. Machinist-operators, \$2 extra. Foremen, \$3 over journeymen. For overtime time and a half is paid. The hours are 48 per week for daily newspapers and 44 for job offices and weekly newspapers.

WASHINGTON, Pa.—Typographical Union No. 456 made an agreement for the year 1927 with the job printers of Washington, Pa., calling for a wage of 93 cents per hour and a 44-hour week; also a 3-year agreement with the newspapers calling for a 48-hour week at \$47 per week for day work, and \$50.50 for night work, foremen \$3 additional, with an increase of \$1 on January 1, 1928. Apprentices receive 50 per cent of the journeymen's scale the third year, 66⅔ per cent the fourth year, and 75 per cent the fifth year. Both sets of workers receive time and one-half for overtime work.

ZANESVILLE, Ohio.—Typographical Union No. 199 made a three-year agreement with the employing printers of Zanesville, Ohio, effective February 1, 1927. By its terms newspaper offices work 48 hours a week and book and job offices 44 hours. For day work on newspapers foremen receive \$47 a week and journeymen \$44; night workers receive \$3 additional. In book and job offices foremen receive \$43 and journeymen \$40; night workers \$3 more. All overtime is at time and a half. February 1, 1929, the scale for every one is to be increased by \$1.

Salaries Paid in Public Schools, 1926-27

THE National Education Association has recently published a report¹ giving detailed data as to the salaries paid to teachers, principals, and other employees of the public schools in cities of various sizes. Table 1 shows these data in summary form:

TABLE 1.—MEDIAN SALARIES PAID IN SCHOOLS OF CITIES OF EACH CLASSIFIED SIZE IN 1926-27

Occupation	Median salaries in cities having population of—				
	2,500 to 5,000 (557 cities)	5,000 to 10,000 (374 cities)	10,000 to 30,000 (298 cities)	30,000 to 100,000 (147 cities)	Over 100,000 (59 cities)
Elementary-school teachers.....	\$1,176	\$1,281	\$1,381	\$1,565	\$2,008
High-school teachers:

Besides the above, the report gives for each occupation, the distribution by salary classes, lowest and highest salaries paid, and illustrates the information by charts of median salaries.

Adequacy of Incomes of Unskilled Laborers in Chicago

A COMPARISON of the earnings of 467 unskilled and semi-skilled laborers in Chicago earning from \$800 to \$2,400 in 1924, or an average of less than \$1,500, with the budget estimates established by the Chicago budget investigation in 1912 and revised from time to time down to 1925, shows that in approximately two-thirds of the families the earnings were insufficient to provide a standard of living equal to that provided in the budget, and that about three-fourths of the families studied had supplemental incomes, thus enabling them to approximate, if not reach or exceed, the budget standard. An analysis of the general living conditions of the whole group of wage earners and of the food consumed by a smaller number of families apparently shows that families living on a lower standard than that provided by the budget estimates "are living under conditions which fail utterly to provide a standard of living that will make possible a high standard of physical, mental, and moral health and efficiency for adults, the full physical and mental growth and development of children, and provision for their moral welfare."

These conclusions are set forth in a summary of an investigation made in Chicago in 1924-1926 by Dr. Leila Houghteling of the faculty of the graduate school of social service administration in cooperation with the local community research committee of the University of Chicago and the Chicago Council of Social Agencies,¹ for the purpose of ascertaining "facts in regard to the standard of living as found in the families of unskilled laborers in Chicago in order to judge whether the budget estimates for dependent families set too high a standard for families who were being supported by relief agencies."

Twelve firms cooperated in the investigation and furnished the names of 2,317 unskilled and semiskilled laborers employed in 1924, and later the earnings of those who furnished the schedules. This classification included "men definitely not of the skilled trades who were engaged in unskilled or semiskilled work earning approximately \$30 a week or less." This wage clause, however, was later modified to meet special conditions reported by the firms. For various reasons the information could not be obtained from many of the families, so that the data in this report are based upon a total of 467 schedules. The report covers facts regarding—

(1) The total income of families of unskilled laborers; how far this income is derived from the chief wage earner; to what extent it is supplemented from other sources; what those sources are; and whether, when all possible sources have been utilized, a "normal standard" of living is maintained; and (2) the relation of this standard to that set up by the Chicago budget in order to ascertain whether the Chicago budget is seeking to create for dependent families an unreasonably high standard of living.

Composition of Families and Households

THE 467 families studied included such as consisted of not less than three persons—father, mother, and one dependent child—where the man had been on the books of a firm for at least a year. Many of the families, however, included more than three persons; 97 families, or 20.8 per cent (the largest group), contained five persons; and 46.1 per cent contain more than five persons. Children in school but contributing in a small way to the family fund were included as dependents. Twenty-four per cent, or 112 families, contained two dependent children, while 59 per cent had three or more. This latter fact is regarded as significant in relation to the adequacy of the father's earnings and the family fund to meet the demands made upon them. Then, many families had other dependents—20 of the 37 families reporting these having also three or more dependent children.

Family Earnings

THE earnings of the men varied from \$800 to \$2,400 a year, about one-half (55.1 per cent) earning less than \$1,400, and about 95 per cent earning less than \$1,800. Four per cent earned less than \$1,000. A reason for this wide variation in earnings was the inexactness of the definition of the words "unskilled" and "semiskilled," some being included who might conceivably have been omitted altogether. Then, wages varied greatly in the firms cooperating; one had a bonus system which materially increased the earnings of

¹ The Social Service Review, Chicago, March, 1927, pp. 1-35: "The budget of the unskilled laborer," by Leila Houghteling.

the 20 men studied who were in its employ, and this served to bring up the average considerably. A point is made of the fact that the record of the earnings in this investigation was obtained from pay rolls and not from estimates made by the people interviewed as has been done in other investigations of this kind. A check-up indicated that in only 3.1 per cent of the cases were the estimated earnings the same as the pay-roll earnings, thus justifying the policy of going to the firms for the record of earnings of each worker scheduled. A tendency to underestimate earnings was found.

In nearly one-fourth of the families (108 or 23.1 per cent), the mothers were gainfully employed, about 50 per cent being in families where the chief wage earner was getting less than \$1,300 a year. Nearly 53 per cent had three or more dependent children. About 64 per cent of these working mothers contributed less than \$500 a year to the family budget, 41.9 per cent contributed less than \$300, and 22.8 per cent contributed less than \$100. Twenty-nine stated that they worked throughout the year. Some relief societies are endeavoring to keep mothers with young children out of industry. This necessarily increases the demands made upon the earnings of the husband, and consequently tends to make a wider difference in the family earnings and the standard budget upon which these same relief organizations base their assistance.

Children contributed quite materially to the family funds. In 33 families their earnings were under \$500, and in 72 families less than \$1,000. In all, 175 working children were found in 108 families, and only 7 of these were under 16 years of age. The supplemental income from other members of the family would appear to be a very important factor, since the report indicates that the father alone was employed in 57.2 per cent of the families, the father and mother in 19.7 per cent, the father and one or more of the children in 19.7 per cent, and both parents and one or more of the children in 3.4 per cent. Thus in 42.8 per cent of the families there were other wage earners than the father.

Income from boarders and roomers and other sources proved to be material factors in meeting the budget needs of many families. Thus in 267 families, or 57.5 per cent, the earnings were augmented by these other sources. Boarders and roomers paid less than \$300 a year in about half the families, while only 17 families received more than \$500 from this source.

In 265 families reporting sources of income, where the man was found to be the only wage earner, 112, or 42.3 per cent, depended entirely upon his earnings. This number, however, represents 24.1 per cent of the entire group of families studied, leaving approximately three-fourths of the families which had opportunity to supplement the father's earnings.

Bearing directly upon the point of the investigation, a table is given showing the number and per cent of families in which the earnings of the chief wage earner, as reported by employers, were above or below the standard budget to which reference has been made. This discloses the fact that in only 98 families (32.5 per cent) of the 302 included in this group (those buying homes were excluded since their expenditures are not entirely for current living expenses but are partly an investment representing the savings of the family) were the

earnings of the chief wage earner in excess of the standard budget, while in the remaining 204 families (67.5 per cent) the earnings fell below the budget standard. However, when all sources of income were considered, a far greater number were able to meet the requirements of the budget. Thus, in 186 families, or 55.4 per cent, the total family funds shows an excess over the budget. The report states at this point that—

In all this discussion there are several facts which stand out clearly and should be emphasized. The first is the fact that in more than two-thirds of the 337 families for whom these comparisons could be made, the wages of the chief wage earner are not sufficient to maintain a standard of living equal to that provided by the Chicago budget for dependent families, and in some of these cases the deficit existing between the earnings and the budget is very great, amounting to one-half the man's earnings. That is, in order to maintain a standard equal to the budget, he would have to increase his earnings by one-half. However, it is equally important to remember that when all sources of income are included, a far larger number are able to meet the requirements of the budget. But it is evident that even with all the sources of income included there are many families still unable to meet or approximate these requirements.

The various items in the family expenditures are taken up in detail to ascertain whether the families under consideration were spending more or less than the items in the budget estimates. The results of this inquiry were found to be rather unsatisfactory, but seemed to indicate generally a lower standard in accordance with the conclusions of the investigation as already noted.

Good Wages as a Factor in Industrial Prosperity

THE value of organization to industry was stressed by Hon. James J. Davis, Secretary of Labor, in an address before the Pittsburgh Chamber of Commerce, May 28, 1927. Formerly industrial combinations were feared, but a gradual change of attitude has taken place, so that to-day "we no longer ask how big is this organization but how useful is it. We know that the bigger the organization the harder it is to hide. Public opinion has become the real and sole regulator of our great industrial combinations. It asks of them only that they supply it at the lowest cost, with a liberal wage and generous treatment for their workers and a good profit to themselves."

The secretary urged that employers also combine for the purpose of admitting to their association only firms paying good wages and providing good working conditions.

The head of one of the nation's greatest industries is on record with the remark that you get nowhere in industry without contented workers—workers well paid, well housed, with no worries and no resentments in their minds. And let me cite right here one of the bitterest resentments a worker can feel.

Men are urged to speed up their production, thereby increasing their earnings, and then are told by the management that this larger pay is "out of line" with standard pay in the same trade. It is only a way of giving him no more money, while getting more work out of him. Keep your worker's production up, but pay him what he earns.

American industry to-day is permeated with a good will between worker and employer such as we have never known before. That good will we must strive to maintain if for no other reason than because it is good business. The nearly forty-two million workers we have are the largest buying element in the country. They constitute a great and important part of our home market. A great metro-

politician paper conceded the other day that the practical, hardheaded men at the head of business now understand that our present prosperity is due in large part to good wages well distributed among our best and biggest customer—the workers. We want that prosperity to continue unbroken and one way to maintain it is the payment of good wages.

Wages in France in October, 1926

THE following were the average hourly wages in different occupations in Paris and other cities in October, 1925, and October, 1926, according to the most recent annual wage study of the General Statistical Bureau of France:¹

Real Wages

IN TABLE 2, also taken from the above-mentioned publication, a comparison is made of the cost of board and lodging in October, 1925, and October, 1926, for an unmarried worker in the same localities in France for which wage data were secured:

TABLE 2.—AVERAGE DAILY WAGES, COST OF BOARD AND LODGING IN FRANCE, OCTOBER, 1925 AND 1926, AND INDEX NUMBERS THEREOF AND OF RETAIL PRICES IN NOVEMBER, 1925 AND 1926

[Average exchange rate of franc=4.43 cents in October, 1925; 2.94 cents in October, 1926]

Item	October, 1925	October, 1926	Index numbers [1911=100]	
			October, 1925	October, 1926
Daily wages:	<i>Francs</i>	<i>Francs</i>		
Men.....	23.25	26.93	504	584
Women.....	12.25	15.29	535	668
Cost of board and lodging per month.....	360.00	422.00	514	603
Retail prices of 13 articles ¹			465	638

¹ For November, 1925, and November, 1926, respectively.

It will be noted that the index numbers of men's and women's wages were, respectively, 16 and 25 per cent higher in October, 1926, than in October, 1925, while the index number of the cost of board and lodging for an unmarried worker was 17 per cent higher in October, 1926, than in the same month of the preceding year. The retail price index (based on 13 articles), however, showed an increase of 37 per cent in November, 1926, as compared with November, 1925. This index, relating as it does to articles of prime necessity alone, represents the influence of price changes upon the cost of a fixed standard of living, while the cost of board and lodging of single workers may represent changes in the standard of living.

Wages and Conditions in the German Textile Industry, First Quarter of 1927¹

RUMORS of general increases in rents effective from April 1, 1927, caused a general agitation on the part of union workers for higher wages during the first two months of 1927. The workmen's associations gave notice that the existing wage agreements would expire in April, 1927. Partial strikes occurred in various textile manufacturing centers that were provisionally settled by arbitration with the consent of both parties to enter immediately into negotiations concerning wages, working hours, holidays, and other factors. These negotiations are still pending. With a few exceptions, they have proved fruitless up to the present. In the Reichenbach (Silesian) cotton industry, the wage rates were increased by 9 per cent on March 3, 1927. Due to a strike embracing about 45,000 workmen in the "Lausitz" (Eastern Saxony)

¹ Report from George P. Waller, American consul in charge at Dresden, dated May 6, 1927.

cotton goods and blanket industry, wages were increased by about 5 per cent (provisional settlement). In general, the wage situation has departed from its stability of last year and become very active and restless. It is generally considered that an increase of textile wages, at least those for skilled workmen, by 10 per cent, will be necessary, due to the increase of rents by 10 per cent on April 1, 1927, and the new increase by another 10 per cent to take effect on October 1, 1927.

The table below shows the tariff wages per hour and per week for adult skilled and unskilled textile workers of the highest tariff class during January and February, 1927, as compared with those in the other principal German industries during the same period:

¹ In the mining, metal, and textile industries, piecework has been abolished.

² Generally 48 hours.

³ Including family allowances for male help for wife and two children up to 14 years of age.

⁴ Time wage, including local additions and family allowances.

Unemployment and Short-time Operation

UNEMPLOYMENT and short-time operation have reached a minimum in the textile industry throughout the German textile centers. In fact, in many special branches, for example in the Chemnitz hosiery and glove industry, and in the tricot goods industry, there exists an acute lack of skilled textile workers which it is hoped may be eliminated by the introduction of special day and night textile lectures and by the establishment of new textile schools. Pressure is also being exerted against the Government with a view of prohibiting the emigration of skilled textile workers to the United States and other foreign countries where important and actively competing textile industries are arising.

The number of totally unemployed textile workers decreased from 54,500 on August 30, 1926, to 24,500 on February 28, 1927. The number of short workers decreased from 139,000 on August 30, 1926, to 26,600 on February 28, 1927. Practically, the normal (pre-war) situation in the employment situation of the textile industry has been reached with these figures, taking into consideration that during the first years after the war many textile workers sought and found work in other more profitable industries, especially in the metal and electrical industries.

Table 2 shows the status of unemployment and short-time operation in the German textile industries, compared with the total unemployment and short-time operation figures in the other principal German industries on February 28, 1927.

STABILIZATION OF EMPLOYMENT

Seasonal Character of the Construction Industry in Ohio

A STUDY of the extent of seasonality of operations in the various building trades in Ohio, covering the years 1914 to 1924, involving the importance of the construction industry in that State, the influence of weather conditions on construction activities, and a suggested remedy for seasonal employment in a branch of industry which in 1923 ranked third among the leading groups of industry measured by total pay roll reported to the Ohio Industrial Commission, was made at the request of the executive committee of the Ohio State Association of Builders' Exchanges; and a report of this investigation has recently been issued.¹

The report aims to show that the building industry, which has been termed the "balance wheel of American business," instead of being regular in its movements and oscillating about a center as a balance wheel is expected to do, is "decidedly off center" and that "this seasonality is not necessary under the circumstances but is the carry-over of the customs and technique of a former period."

This industry in Ohio in 1925 handled construction contracts amounting to \$451,000,000, in 1924 paid 7.83 per cent of the total wages paid by all industry in the State, and in the same year had raised the percentage of those receiving \$35 or more per week to 47.1 as compared with 1.3 in 1914. It is noted that while the building industry is one of the largest in the country, the typical construction firm is a small one and there appears to be no tendency to increase in size. Thus, in Ohio, in 1924 as compared with 1914, there was in all cases an increase in the pay roll of the average firm but a decrease in the average number of wage earners employed. In 1914, a total of \$11,222 was paid to workers the number of whom averaged 19.9 per firm, while in 1924 the pay-roll total had increased to \$17,533, or 56.2 per cent, and the average number of workers had decreased to 11.6 or 41.7 per cent.

The importance of the industry in the State is indicated by the following table, giving a comparison of wage and salary payments in all industries and in the construction industry.

TABLE 1.—COMPARISON OF AVERAGE WAGE AND SALARY PAYMENTS OF THE CONSTRUCTION INDUSTRY AND OF ALL INDUSTRIES IN OHIO, 1914 to 1924 (EXCEPT 1922)

Year	Wage and salary payments		
	All industries	Construction industry	
		Amount	Per cent of total
1914	\$29,844	\$11,222	37.6
1915	29,226	10,342	35.4
1916	37,161	13,112	35.3
1917	43,967	14,983	34.1
1918	52,859	16,647	31.5
1919	57,777	17,847	30.9
1920	66,089	23,808	36.0
1921	47,784	15,607	32.7
1923	61,606	19,254	31.3
1924	52,611	17,533	33.3

¹ Ohio State University. College of Commerce and Journalism. Bureau of Business Research. The construction industry in Ohio, a statistical analysis of a seasonal industry. [Columbus], 1926.

The report gives a rather detailed statistical analysis (including charts) of construction records in the principal cities of the State in order to show the significance of the industry and the extent of its seasonal peaks and recessions, which are shown by the charts to be quite irregular.

Extent of Employment in the Building Industry

THE influence of the weather on the construction industry is of course the chief cause of its seasonal character, and this study attempts to measure the effect of the climatic factor in the State of Ohio. A highly fluctuating seasonal activity is recognized as a great economic waste, and this is found in the construction industry probably more than in any other major industry. It is essentially an outdoor industry and it is entirely natural that it should experience an intense activity during warm months and a dull period during winter months. However, many contractors seem to think that this seasonal factor is the result of custom and may in some measure be avoided. A careful summary of weather conditions in three representative cities of the State (compiled from U. S. Weather Bureau records) during the period 1909 to 1925, covering the daylight hours and including a determination of factors which would in all probability interfere with construction work, such as ice, snow, rain, and temperature, is contained in the report to show just how much climatic conditions in that State may be expected to influence building operations, especially as measured by monthly fluctuations in employment. Thus, during January and February, covering the years 1914 to 1924, inclusive, on the average, only slightly above one-half of the workers in the industry are employed, while less than three-fourths are employed on the average during five months of the year, and during only four months of the year are practically all (more than 95 per cent) of the wage earners employed. In short, the fluctuation of employment in this industry due to climatic conditions is such that during the average year only 81 per cent of all wage earners are employed, and the average man has a chance to work only about nine months in the year. When part-time work is taken into consideration (and an accurate measure of this is not available) it is probable, says the report, that the actual extent of employment during the winter months is less than indicated, thus reducing the percentage of employment to a figure even lower than 81 per cent—probably to 75 per cent or less.

This suggests that if the normal seasonal peaks and troughs could be smoothed out, there would be an oversupply of wage earners. It has been suggested in some quarters that the present restrictive immigration law is resulting in a severe shortage of laborers for the construction industry. In view of the highly seasonal fluctuations of employment in the industry in Ohio, as above outlined, and in further consideration of the fact that experience shows conclusively that winter construction is practical, the evidence points rather to an overmanned industry than to a shortage of wage earners.

Seasonal fluctuations in the different groups of the building industry are considered in detail, with figures showing the average percentage of employment in each.

The following table shows the average percentages of employment and unemployment during the years 1914 to 1924, inclusive, based

on the greatest number of wage earners reported in construction work in 1924, namely 85,301.

TABLE 2.—ESTIMATED AVERAGE PER CENT OF EMPLOYMENT AND UNEMPLOYMENT AND AVERAGE NUMBER UNEMPLOYED IN THE CONSTRUCTION INDUSTRY, 1914 TO 1924, BY MONTHS

Month	Average per cent of employment	Average per cent of unemployment	Average number unemployed
January.....	55.7	44.3	37,778
February.....	53.6	46.4	39,580
March.....	59.6	40.4	34,462
April.....	73.1	26.9	22,946
May.....	81.7	18.3	15,610
June.....	91.4	8.6	7,336
July.....	96.6	3.4	2,900
August.....	99.9	.1	85
September.....	100.0	.0	0
October.....	97.2	2.8	2,388
November.....	89.2	10.8	9,213
December.....	74.2	25.8	22,003
Annual average.....	81.0	19.0	15,207

The economic loss occasioned by seasonal fluctuations in employment can not be accurately determined. The report states in this connection:

It can be pointed out, of course, that the seasonal percentages of employment of wage earners can be applied to building employers also. When so applied, it can be said that these figures indicate percentages of activity of the average construction employer. Not only is the employer subjected to a loss of business in the dull months, but his whole organization suffers because of his inability to keep this organization intact. The result is that he must build up a new organization each spring. The chaotic conditions in the building industry are notorious and this factor of seasonality in activity is probably the greatest contributing cause. There is a further loss in that much work must be crowded into the busy season, resulting in feverish activity and the frequent use of unskilled or semi-skilled workmen for tasks which demand skilled craftsmen for proper performance. The losses occasioned by crowding all building activity into the warm season are, in the last analysis, borne by the public.

The Remedy

THE practicability of winter construction is pointed out, being amply supported by the experience of construction firms throughout the country. The technique of construction has assisted in this respect, for now many processes incident to the work may be carried on within doors and delivered to the job ready to be installed, and protection of workers has been developed so that many operations may be carried on during cold weather. These considerations have led to a great increase in the volume of winter building in most of the larger cities of the country in recent years.

Winter work involves some additional cost, estimated at from 1 to 5 per cent of the total cost of the project, and there are fewer working-days, but these disadvantages are somewhat offset by the facts that labor productivity is greater because men are anxious to hold their jobs during cold weather, that material may often be purchased cheaper and more readily delivered because of less freight congestion, that the best labor is obtainable because the supply

usually exceeds the demand during the winter months, and that workmen are more efficient because not subject to the lassitude prevalent during the heat of summer.

The smoothing out of the seasonal curve in the construction industry may be accomplished, in part at least, if contractors will plan to commence their various projects in accordance with the available labor supply so as to take advantage of seasons of underemployment, with due consideration for the approximate time each craft will be required and the sequence of their operations. In this way labor may be kept employed more or less continuously and a material saving in cost would result. It appears that the building industry itself is convinced of the practicability of winter construction and Government and civic agencies are striving to regulate employment, but the reason why the seasonal curve of employment in this industry continues from year to year to rise during warm weather and to fall during the winter months is because, according to the report, the building public is not convinced of the desirability of winter construction. The immediate responsibility, however, would seem to rest upon those in control of the building industry.

In the last analysis, it is the public which builds and repairs structures; which must decide when such work is to be done. Construction firms operate on a contract basis and the owner's wishes are paramount. While the ultimate responsibility rests with the public, the immediate responsibility rests with the building industry. The executives of the building industry constitute the only managerial group directly affected by this problem. The question as to continuous or seasonally fluctuating activity is a managerial problem and the solution of the problem must be initiated by the executives of the building industry. It is this group which must bring to the notice of the building public the advantages of winter construction to the end that seasonal irregularity may be reduced to a minimum.

TREND OF EMPLOYMENT

Employment in Selected Manufacturing Industries in May, 1927

EMPLOYMENT and pay-roll totals in manufacturing industries decreased 1 per cent each in May, 1927, as compared with April. This decrease in employment was largely seasonal and was smaller than in any year since 1923, when the volume of employment was unchanged from April to May.

The level of employment in each month of 1927 has been below the level of the same month of 1926, but in May, 1927, the difference was less than in any previous month and pay-roll totals had actually reached the level of May, 1926, despite the smaller volume of employment, this condition resulting in an increase in per capita earnings of 2.2 per cent in May, 1927, as compared with per capita earnings in May, 1926.

The bureau's weighted index of employment for May, 1927, is 89.7 as compared with 90.6 for April, 1927, 91.4 for March, 1927, and 91.7 for May, 1926; the weighted index of pay-roll totals for May, 1927, is 95.6 as compared with 96.6 for April, 1927, 97.7 for March, 1927, and 95.6 for May, 1926.

The May, 1927, report is based on returns from 10,768 establishments in 54 of the principal manufacturing industries. These establishments in May had 3,071,266 employees, whose combined earnings in one week were \$83,633,965.

Comparison of Employment and Pay-Roll Totals in April and May, 1927

SEVENTEEN of the 54 separate industries had more employees in May, 1927, than in April, while 26 industries reported increased pay-roll totals. The increases in employment were largely in such seasonal industries as ice cream, sugar refining, cast-iron pipe, structural ironwork, sawmills, cement, brick, carriages, automobiles, and automobile tires. There was a seasonal drop in employment in the fertilizer industry of 36.8 per cent, followed by losses of over 5 per cent each in the women's clothing and the millinery industries and of over 3.5 per cent each in the chemical and the shipbuilding industries. The iron and steel industry reported a decrease of 0.9 per cent in employment and of 5.4 per cent in pay-roll totals.

Notable advances in employment were made in May in four groups of industries—food; lumber; stone, clay, and glass products; and tobacco—and there was a small increase in the vehicle group. The decreases in employment in the remaining seven groups were led by a drop of over 10 per cent in the chemical group. The textile, iron and steel, and leather groups, and the group of miscellaneous industries, each lost about 1½ per cent of their employees.

Improvement in employment in May over April was made in the Pacific, Mountain, and West North Central geographic divisions. The East North Central division shows a very small decrease in employment, but the remaining five divisions each lost about 1½ per cent of their employees.

TABLE 1.—COMPARISON OF EMPLOYMENT AND PAY-ROLL TOTALS IN IDENTICAL ESTABLISHMENTS DURING ONE WEEK EACH IN APRIL AND MAY, 1927

Industry	Estab- lish- ments	Number on pay roll		Per cent of change	Amount of pay roll		Per cent of change

Stone, clay, and glass products.....	+1.1	+2.0			

Comparison of Employment and Pay-roll Totals in May, 1927, with May, 1926

THE volume of employment was 2.2 per cent smaller in May, 1927, than in May, 1926, although pay-roll totals were unchanged.

The textile group of industries as a whole was in a decidedly better condition in May, 1927, than in the same month of the previous year, the notable improvement shown in cotton, silk, and woolen goods and in women's clothing having more than overcome the large losses in employment in the shirt and collar and the millinery industries. There was a slight improvement in the paper and printing group, the gains in the printing industries being somewhat larger than the losses in the paper-making and the paper-box industries. The most conspicuous advance over the year's interval was in the group of miscellaneous industries, caused by the spectacular increases in shipbuilding and in the automobile-tire industry, although the losses in employment in the piano and the agricultural implement industries and in electrical goods establishments had been marked. The food group of industries as a whole shows little change, increases in the flour and the baking industries and in slaughtering being overcome by a large decrease in ice cream, an effect of the cool May of 1927, and a smaller decrease in the confectionery industry.

The iron and steel group made a net loss in employment in this comparison of nearly 5 per cent, each of the eight separate industries having fallen off sharply. Other industries connected with building operations also fell off noticeably, and the chemical industries reported an average loss in employment of 1 per cent.

Employment in the South Atlantic geographic division was nearly 3 per cent greater in May, 1927, than in May, 1926, although both of the South Central divisions reported largely depleted forces, as did the remaining six divisions. Four divisions, including the South Atlantic, reported increased pay-roll totals.

TABLE 3.—COMPARISON OF EMPLOYMENT AND PAY-ROLL TOTALS, MAY, 1927, WITH MAY, 1926

[The per cents of change for each of the 12 groups of industries and for the total of all industries are weighted in the same manner as are the per cents of change in Table 2]

Per Capita Earnings

PER CAPITA earnings in the 54 industries combined in May, 1927, were unchanged from April, 1927, and 2.2 per cent higher than in May, 1926.

Thirty-seven industries showed a gain in per capita earnings in May, 1927, as compared with April, 1927, and 41 showed a gain as compared with May, 1926.

Wage Changes

THIRTY-FOUR establishments in 16 industries reported increases in wage rates during the month ending May 15, 1927. These increases averaged 6.2 per cent and affected 1,245 employees or 14 per cent of the total number in the establishments concerned.

Twenty-one establishments in 11 industries reported decreases in wage rates during the same period. The decreases averaged 6.4 per cent and affected 3,722 employees or 55 per cent of all employees in the establishments concerned.

Indexes of Employment and Pay-Roll Totals in Manufacturing Industries

INDEX numbers for May, 1927, and for March and April, 1927, and May, 1926, showing relatively the variation in number of persons employed and in pay-roll totals in each of the 54 industries surveyed by the Bureau of Labor Statistics, together with general indexes for the combined 12 groups of industries, appear in Table 6.

The general index of employment for May, 1927, is 89.7, this number being 1 per cent lower than the index for April, 1927, 1.9 per cent lower than the index for March, 1927, and 2.2 per cent lower than the index for May, 1927. The general index of pay-roll totals for May, 1927, is 95.6, this number being 1 per cent lower than the index for April, 1927, 2.1 per cent lower than the index for March, 1927, and unchanged from the index for May, 1926.

TABLE 6.—INDEXES OF EMPLOYMENT AND PAY-ROLL TOTALS IN MANUFACTURING INDUSTRIES—MAY, 1926, AND MARCH, APRIL, AND MAY, 1927

[Monthly average, 1923=100]

Industry	Employment				Pay-roll totals			
	May, 1926	March, 1927	April, 1927	May, 1927	May, 1926	March, 1927	April, 1927	May, 1927
General index	91.7	91.4	90.6	89.7	95.6	97.7	96.6	95.6

Table 7 shows the general index of employment in manufacturing industries and the general index of pay-roll totals from January, 1923, to May, 1927.

Following Table 7 is a chart made from index numbers, showing clearly the course of employment in the 54 industries combined, and the course of pay-roll totals as well, for each month of 1926, as compared with the corresponding month of 1927, as far as May.

TABLE 7.—GENERAL INDEX OF EMPLOYMENT AND PAY-ROLL TOTALS IN MANUFACTURING INDUSTRIES, JANUARY, 1923, TO MAY, 1927

EMPLOYMENT.

PAY-ROLL TOTALS.

Proportion of Time Worked and Force Employed in Manufacturing Industries in May, 1927

REPORTS from 8,420 establishments in May, 1927, show 1 per cent idle, 80 per cent operating on a full-time schedule, and 19 per cent on a part-time schedule; 36 per cent of the establishments had a full normal force of employees, and 63 per cent were operating with a force below normal. The establishments in operation were employing an average of 87 per cent of a full normal force of employees who were working an average of 97 per cent of full time. These percentages show no change in average operating time and a decrease of 1 per cent in average per cent of normal force employed since the April report.

Trend of Employment and Pay-Roll Totals in Cotton-Goods Mills, by Districts, 1923 to 1927

THE trend of employment and of pay-roll totals in the three principal cotton manufacturing districts of the United States—New England, Middle Atlantic, and Southern—is shown in the following table and accompanying chart.

The information collected is presented in the form of index numbers which show relatively the movement of employment and pay-roll totals, from month to month, from January, 1923, to May, 1927. In computing these index numbers the monthly average for 1923 is used as the base or 100. The data for 29 months are linked together by means of a chain index, the per cents of change from month to month being obtained by comparing reports from identical establishments for each two consecutive months. The number of establishments reporting has varied from month to month, and the average number in 1927 is considerably greater than in 1923, but even in the earlier year so large a number of employees was represented in each district as to render the information representative of the industry as a whole in the respective districts.

EMPLOYMENT IN MANUFACTURING INDUSTRIES, MAY, 1927 133

¹ Average for 5 months.

In May, 1927, the representation from each district was as follows: New England, 123 establishments, 92,940 employees, and \$1,907,128 pay-roll total; Middle Atlantic, 27 establishments, 13,435 employees, and \$285,074 pay-roll total; Southern, 329 establishments, 130,319 employees, and \$1,723,411 pay-roll total.

The range of employment has been greatest in the Middle Atlantic States, the index having stood at 118.4 in February, 1923, and at 38.6 in August, 1925; the New England States' index ranged from

106.7 in March, 1923, to 66.5 in July, 1926; and the Southern States' index ranged from 103.6 in April, 1927, to 82.1 in July, 1924.

The average monthly indexes of employment for the New England and the Middle Atlantic districts were considerably lower in 1926 than in any year since 1923, while the average monthly index in the Southern district was higher in 1926 than either that for 1924 or 1925 and only 3.4 per cent lower than in 1923.

TREND OF EMPLOYMENT & PAY-ROLL TOTALS IN COTTON-GOODS MILLS.

MONTHLY AVERAGE 1923 = 100.

EMPLOYMENT.

PAY-ROLL TOTALS.

Comparative employment conditions in the three districts are further exemplified by the following tabular statement, which shows the average monthly index for each district for the first five months of each year, 1923 to 1927, inclusive:

District	Average index of employment for first 5 months of—				
	1923	1924	1925	1926	1927
New England.....	105.5	89.6	88.1	82.5	80.3
Middle Atlantic.....	115.7	78.2	73.3	69.3	67.5
Southern.....	100.1	96.4	95.4	97.6	102.8

Employment and Pay-roll Totals on Class I Railroads, April, 1926, and March and April, 1927

THE number of employees on the 15th of April, 1927, and the total earnings of employees in the entire month of April, 1927, on Class I railroads of the United States are shown in the table following, together with similar information for March, 1927, and April, 1926. The data are presented for all occupations combined, excluding executives and officials, and also for the six general groups of occupation; under each group data are shown separately for a few of the more important occupations.

Class I railroads are roads having operating revenues of \$1,000,000 a year and over.

EMPLOYMENT AND TOTAL EARNINGS OF RAILROAD EMPLOYEES—APRIL, 1926, AND MARCH AND APRIL, 1927

[From monthly reports of Interstate Commerce Commission. As data for only the more important occupations are shown separately, the group totals are not the sum of the items under the respective groups]

WHOLESALE AND RETAIL PRICES

Retail Prices of Food in the United States

THE following tables are compiled from monthly reports of actual selling prices¹ received by the Bureau of Labor Statistics from retail dealers.

Table 1 shows for the United States retail prices of food May 15, 1926, and April 15 and May 15, 1927, as well as the percentage changes in the year and in the month. For example, the retail price per pound of potatoes was 6.0 cents on May 15, 1926; 3.7 cents in April, 1927; and 4.5 cents in May, 1927. These figures show a decrease of 25 per cent in the year, and an increase of 22 per cent in the month.

The cost of the various articles of food combined shows a decrease of 3.5 per cent May 15, 1927, as compared with May 15, 1926, and an increase of 1.1 per cent May 15, 1927, as compared with April 15, 1927.

TABLE 1.—AVERAGE RETAIL PRICES OF SPECIFIED FOOD ARTICLES AND PER CENT OF INCREASE OR DECREASE, MAY 15, 1927, COMPARED WITH APRIL 15, 1927, AND MAY 15, 1926

[Percentage changes of five-tenths of 1 per cent and over are given in whole numbers]

Article	Unit	Average retail price on—			Per cent of increase (+) or decrease (-) May 15, 1927, compared with—

Table 2 shows for the United States average retail prices of specified food articles on May 15, 1913, and on May 15 of each year from 1921 to 1927, together with percentage changes in May of each of these specified years, compared with May, 1913. For example, the retail price per pound of round steak was 22.2 cents in May 1913; 35.6 cents in May, 1921; 32.5 cents in May, 1922; 33.0 cents in May, 1923; 34.6 cents in May, 1924; 35.0 cents in May, 1925; 35.8 cents in May, 1926; and 37.0 cents in May, 1927.

As compared with May 15, 1913, these figures show increases of 60 per cent in May, 1921; 46 per cent in May, 1922; 49 per cent in May, 1923; 56 per cent in May, 1924; 58 per cent in May, 1925; 61 per cent in May, 1926; and 67 per cent in May, 1927.

The cost of the various articles of food combined shows an increase of 60.8 per cent in May, 1927, as compared with May, 1913.

³23-ounce package.

⁴No. 2 can.

⁵Beginning with January, 1921, index numbers showing the trend in the retail cost of food have been composed of the articles shown in Tables 1 and 2, weighted according to the consumption of the average family. From January, 1913, to December, 1920, the index numbers included the following articles: Sirloin steak, round steak, chuck roast, chuck roast, plate beef, pork chop, bacon, ham, lard, hens, flour, corn meal, eggs, butter, milk, bread, potatoes, sugar, cheese, rice, coffee, and tea.

Table 3 shows the changes in the retail prices of each of 22 articles of food for which prices have been secured since 1913, as well as the changes in the amounts of these articles that could be purchased for \$1 in specified years, 1913 to 1926, and in April and May, 1927.

TABLE 3.—AVERAGE RETAIL PRICES OF SPECIFIED ARTICLES OF FOOD AND AMOUNT PURCHASABLE FOR \$1 IN EACH YEAR, 1913 TO 1926, AND IN APRIL AND MAY, 1927

Index Numbers of Retail Prices of Food in the United States

IN TABLE 4 index numbers are given which show the changes in the retail prices of specified food articles, by years, for 1913 and 1920 to 1926,² and by months for 1926, and for January through May, 1927. These index numbers, or relative prices, are based on the year 1913 as 100 and are computed by dividing the average price of each commodity for each month and each year by the average price of that commodity for 1913. These figures must be used with caution. For example, the relative price of sirloin steak for the year 1926 was 162.6, which means that the average money price for the year 1926 was 62.6 per cent higher than the average money price for the year 1913. As compared with the relative price, 159.8 in 1925, the figures for 1926 show an increase of nearly three points, but an increase of 1.75 per cent in the year.

In the last column of Table 4 are given index numbers showing changes in the retail cost of all articles of food combined. Since January, 1921, these index numbers have been computed from the average prices of the articles of food shown in Tables 1 and 2, weighted according to the average family consumption in 1918. (See March 1921, issue, p. 25.) Although previous to January, 1921, the number of food articles has varied, these index numbers have been so computed as to be strictly comparable for the entire period. The index numbers based on the average for the year 1913 as 100.0 are 153.6 for April, 1927, and 155.4 for May, 1927.

The curve shown in the chart on page 153 pictures more readily to the eye the changes in the cost of the food budget than do the index numbers given in the table.

TABLE 4.—INDEX NUMBERS OF RETAIL PRICES OF PRINCIPAL ARTICLES OF FOOD, BY YEARS, 1913 AND 1920 TO 1926, AND BY MONTHS FOR 1926, AND JANUARY THROUGH MAY, 1927

Comparison of Retail Food Costs in 51 Cities

TABLE 6 shows for 39 cities the percentage of increase or decrease in the retail cost of food³ in May, 1927, compared with the average cost in the year 1913, in May, 1926, and in April, 1927. For 12 other cities, comparisons are given for the one-year and the one-month periods. These cities have been scheduled by the bureau at different dates since 1913. These percentage changes are based on actual retail prices secured each month from retail dealers and on the average family consumption of these articles in each city.⁴

³ For list of articles see note 5, p. 150.⁴ The consumption figures used from January, 1913, to December, 1920, for each article in each city are given in the Labor Review for November, 1918, pp. 94 and 95. The consumption figures which have been used for each month beginning with January, 1921, are given in the Labor Review for March, 1921, p. 25.

TABLE 6.—PERCENTAGE CHANGE IN THE RETAIL COST OF FOOD IN MAY, 1927, COMPARED WITH THE COST IN APRIL, 1927, MAY, 1926, AND WITH THE AVERAGE COST IN THE YEAR 1913, BY CITIES

City	Percentage increase May, 1927, compared with 1913	Percentage decrease May, 1927, compared with May, 1926	Percentage increase May, 1927, compared with April, 1927	City	Percentage increase May, 1927, compared with 1913	Percentage decrease May, 1927, compared with May, 1926	Percentage increase May, 1927, compared with April, 1927
Atlanta	58.9	4.8	10.1	Minneapolis	54.4	4.4	1.9

Little Rock	47.5	4.5	0.5	Savannah		7.0	10.9
Los Angeles	40.5	4.0	10.3	Scranton	60.5	3.8	1.1
Louisville	51.7	4.7	1.0	Seattle	47.0	1.2	2.7
Manchester	32.3	1.7	1.6	Springfield, Ill.		2.2	1.3
Memphis	45.9	5.5	1.4	Washington, D. C.	62.8	4.1	1.7
Milwaukee	56.6	4.5	2.5				

¹ Decrease.

² Increase.

Effort has been made by the bureau each month to have all schedules for each city included in the average prices. For the month of May 99.4 per cent of all the firms supplying retail prices in the 51 cities sent in a report promptly. The following-named 45 cities had a perfect record; that is, every merchant who is cooperating with the bureau sent in his report in time for his prices to be included in the city averages: Atlanta, Baltimore, Birmingham, Boston, Bridgeport, Buffalo, Butte, Charleston, S. C., Cincinnati, Cleveland, Columbus, Dallas, Fall River, Houston, Indianapolis, Jacksonville, Kansas City, Little Rock, Los Angeles, Louisville, Manchester, Memphis, Milwaukee, Minneapolis, Mobile, Newark, New Haven, New York, Norfolk, Peoria, Philadelphia, Pittsburgh, Portland, Me., Providence, Richmond, Rochester, St. Louis, St. Paul, Salt Lake City, San Francisco, Savannah, Scranton, Seattle, Springfield, Ill., and Washington, D. C.

The following summary shows the promptness with which the merchants responded in May, 1927:

RETAIL PRICE REPORTS RECEIVED FOR MAY, 1927

Item	United States	Geographical division				
		North Atlantic	South Atlantic	North Central	South Central	Western
Percentage of reports received	99.4	100.0	100.0	99.2	99.4	98.0
Number of cities in each section from which every report was received	45	14	8	11	7	5

Retail Prices of Coal in the United States ^a

THE following table shows the average retail prices of coal on January 15 and July 15, 1913, May 15, 1926, and April 15 and May 15, 1927, for the United States and for each of the cities from which retail food prices have been obtained. The prices quoted are for coal delivered to consumers, but do not include charges for storing the coal in cellar or coal bin where an extra handling is necessary.

In addition to the prices for Pennsylvania anthracite, prices are shown for Colorado, Arkansas, and New Mexico anthracite in those cities where these coals form any considerable portion of the sales for household use.

The prices shown for bituminous coal are averages of prices of the several kinds sold for household use.

AVERAGE RETAIL PRICES OF COAL PER TON OF 2,000 POUNDS, FOR HOUSEHOLD USE, ON JANUARY 15 AND JULY 15, 1913, MAY 15, 1926, AND APRIL 15 AND MAY 15, 1927

¹ Per ton of 2,240 pounds.

² Per 25-bushel lot (1,900 pounds).

³ 50 cents per ton additional is charged for "binning." Most customers require binning or basketing the coal into the cellar.

⁴ All coal sold in Savannah is weighed by the city. A charge of 10 cents per ton or half ton is made. This additional charge has been included in the above prices.

Index Numbers of Wholesale Prices in May, 1927

PRACTICALLY no change in the general level of wholesale prices from April to May is shown by information collected in representative markets by the Bureau of Labor Statistics of the United States Department of Labor. The bureau's weighted index number, which includes 404 commodities or price series, registered 144.1 for May compared with 144.2 for April, a decline of less than one-tenth of 1 per cent. Compared with May, 1926, with an index number of 151.7, there was a decrease of 5 per cent.

Slight increases are shown for the groups of farm products, foods, and clothing materials, due to advances in grains, cotton, hides,

TREND OF WHOLESALE PRICES.

(1913 = 100)

onions, potatoes, flour, corn meal, apples, lemons, oranges, sugar, and cotton goods. Certain articles in these groups, as cattle, hogs, sheep, eggs, wool, pork products, and butter, were cheaper than in the month before. Increases were recorded for building materials and miscellaneous commodities, while fuels and metals declined in average price.

Of the 404 commodities or price series for which comparable information for April and May was collected, increases were shown in 108 instances and decreases in 127 instances. In 169 instances no change in price was reported.

INDEX NUMBERS OF WHOLESALE PRICES BY GROUPS OF COMMODITIES

[1913=100.0]

Commodity group	May, 1926	1927	
		April	May
Farm products.....	144.2	136.7	137.4
Foods.....	153.8	147.3	148.0
Clothing materials.....	176.1	169.1	169.6
Fuels.....	178.7	160.6	158.2
Metals and metal products.....	125.2	121.9	120.6
Building materials.....	171.6	165.0	165.6
Chemicals and drugs.....	130.7	121.8	121.9
House-furnishing goods.....	162.2	157.4	157.4
Miscellaneous.....	124.7	118.5	120.2
All commodities.....	151.7	144.2	144.1
Raw materials ¹	153.5	146.9	146.3
Producers' goods ¹	128.5	120.3	120.5
Consumers' goods ¹	163.3	154.9	152.3

¹ Federal Reserve Board grouping.

Comparing prices in May with those of a year ago, as measured by changes in the index numbers, it is seen that appreciable decreases took place in all groups of commodities, ranging from 11½ per cent in the case of fuels to 3 per cent in the case of house-furnishing goods.

Comparison of Retail Price Changes in the United States and in Foreign Countries

THE principal index numbers of retail prices published by foreign countries have been brought together with those of this bureau in the subjoined table after having been reduced in most cases to a common base, namely, prices for July, 1914, equal 100. This base was selected instead of the average for the year 1913, which is used in other tables of index numbers compiled by the bureau, because of the fact that in numerous instances satisfactory information for 1913 was not available. Some of the countries shown in the table now publish index numbers of retail prices on the July, 1914, base. In such cases, therefore, the index numbers are reproduced as published. For other countries the index numbers here shown have been obtained by dividing the index for each month specified in the table by the index for July, 1914, or the nearest period thereto as published in the original sources. As stated in the table, the number of articles included in the index numbers for the different countries differs widely. These results, which are designed merely to show price trends and not actual differences in the several countries, should not, therefore, be considered as closely comparable with one another. In certain instances, also, the figures are not absolutely comparable from month to month over the entire period, owing to slight changes in the list of commodities and the localities included on successive dates.

Retail Prices in Rio de Janeiro, 1922 to 1926

A REPORT from the American consul, Digby A. Willson, at Rio de Janeiro, Brazil, dated April 30, 1927, contains the following table showing the average retail prices of specified food articles in the capital of Brazil for the five-year period from 1922 to 1926:

AVERAGE RETAIL PRICES OF SPECIFIED FOOD ARTICLES IN RIO DE JANEIRO, 1922 TO 1926

[Average exchange rates of the milreis for 1922, 1923, 1924, 1925, and 1926=12.95, 10.23, 10.04, 12.20, and 14.44 cents, respectively; 1 kilogram=2.2 pounds; 1 liter=1.06 quarts; 100 grams=3.5 ounces]

LABOR AGREEMENTS, AWARDS, AND DECISIONS

Labor Agreements

Hotel and Restaurant Employees—Vallejo, Calif.

THE agreement effective January 1, 1927, between the Culinary Workers' Union No. 560 and the restaurant and café proprietors of Vallejo, Calif., contains the following articles relative to duties of members and relief work:

ARTICLE 5. Any member of Culinary Workers' Union, Local No. 560, who fails to appear for work at the appointed time, who has not given at least 8 hours' notice, or has not provided a proper and capable substitute, shall be fined one day's pay.

ART. 9. Cooks, waiters, and waitresses shall not do porter work. (This clause covers the preparation of vegetables, fruits, and berries for service, the cleaning of coffee urns, sweeping, scrubbing, etc.) This work belongs to the dish-washers and miscellaneous help, where there is no regular porter employed.

ART. 10. (a) All relief work shall be paid at the rate of pay of the one relieved except where permanent relief is employed at a fixed salary.

(b) When a relief employee fails to report for duty, and the employer is unable to fill said relief position, the regular employee shall substitute for that day.

(c) There shall be no relief work on Sundays and holidays.

(d) Any employees not taking their day off, when relief can be obtained, will be fined one day's pay.

Awards and Decisions

Stereotypers—Buffalo, N. Y.

ON THE expiration of a three-year agreement between Stereotypers' Local Union No. 25 and the Buffalo newspaper publishers the union demanded an increase in wages of 66 $\frac{2}{3}$ cents per day for journeymen, 75 cents for assistant foremen, \$1 for foremen and for crews who get out seven daily editions of a paper each week. The controversy was laid before Judge Philip Laing as arbitrator, December 6, 1926. After examining the newspaper plants and hearing and reading the briefs presented by each side the arbitrator delivered his written opinion on the 28th of the same month. He considered the various propositions under different heads, discussing and disposing of them separately. The only argument to which he gave much attention was the increase in the cost of living argument. Extracts from his statement on this subject follow:

In a large and growing city like this there is ever something additional to pay out, if one is to keep up with the procession. Things unknown two years ago are necessities to-day, and necessities which cost money. This statement applies to the whole family and to each member of the family. Irrespective of any changes in the cost of food, clothing, rents or heat, I am of opinion that the ordinary man in the city of Buffalo will not be able to get through the year 1927 with the same money that he got through the year of 1923. If that statement

is correct, some provision ought to be made in this controversy, providing to some extent for the cost of better living which the stereotypers must meet as time goes on. I am aware that any allowance made for the reasons now under consideration must be conservative. I am also aware that extravagant people crave every new thing that comes along and call every such thing a necessity. I think, however, it is a fact that the most conservative and economical individuals must, if they keep up with the times, continually incur some additional expense for better living and better living conditions.

What additional allowance should be made to the stereotypers to meet better living conditions? The publishers make answer to this question by saying that the cost of living is not what it was a few years ago, and that that cost is now going back, and for these reasons the stereotypers are in a better position than they were three years ago when the existing scale became effective.

In the monthly bulletin issued by the United States Department of Labor in September, 1926, * * * is a table showing the average retail prices of 42 articles of food in the United States from July 15, 1913, to July 15, 1926, and the percentage each July 15, compared with July 15, 1913, the percentage for July 15, 1913, being arbitrarily fixed at 100, according to this table, the average retail prices for these 42 articles of food * * * on July 15, 1923, [were] 47.8 per cent [more than in 1913]; on July 15, 1924, 43.9 per cent; on July 15, 1925, 60.5 per cent; on July 15, 1926, 57.7 per cent. It thus appears that in 1924 the percentage was less than in 1923, but in 1925 and 1926 the percentage was quite a little more than it was in 1923. The chart contained in the same bulletin at page 153 bears out the foregoing facts.

I am of opinion, however, that during the next two or three years the stereotypers may expect to get some benefit from decreased cost of living, and that that prospect ought to be taken into consideration in connection with the allowance for increased cost of better living.

I come back to the question, "what allowance should be made to the stereotypers for the increased cost of better living?" and I add to that question the other question, "what offset should be made because of the prospect of a decrease in prices of things that make up the necessities of life?" The figures I am about to present are, in a sense, arbitrarily made, but they represent my judgment.

I am of opinion that the stereotypers should be allowed for the increased cost of better living $1\frac{1}{2}$ per cent per year for the last three years, making $4\frac{1}{2}$ per cent, and that there should be deducted from that amount 1 per cent to represent the decreased cost and prospective decreased cost of the things that make up the necessities of life. These figures mean that there should be added to the scale of wages provided for in the existing contract, excepting the foremen, $3\frac{1}{2}$ per cent.

I am of opinion that the foremen should get \$9.50 instead of \$9; the assistant foremen, days, now getting \$7.75, with a $3\frac{1}{2}$ per cent increase would get \$8.02; the assistant foremen, nights, now getting \$8.25, with a $3\frac{1}{2}$ per cent increase, would get \$8.54; the journeymen, days, now getting \$7.50, with a $3\frac{1}{2}$ per cent increase, would get \$7.76; the journeymen, nights, now getting \$8 with a $3\frac{1}{2}$ per cent increase, would get \$8.28.

Railroad Engineers and Firemen—Boston & Maine Railroad

THE Boston & Maine Railroad and its engineers and firemen submitted to a board of arbitrators, consisting of D. S. Brigham, S. H. Huff, and James Jackson, the following question:

Since July, 1900, the engineers and firemen employed on the Fitchburg-Berkshire division have been operating between Boston and Greenfield, Mass., and between Greenfield, Mass. and Troy, N. Y. The management proposes, effective November 29, 1926, to run these engineers and firemen from Boston, Mass., over the Fitchburg-Berkshire division to Troy, N. Y., a distance of 192 miles, which method of operation has been strenuously opposed by the engineers and firemen.

The decision of the board in part was as follows:

The board agreed that this question should be decided on the merits of the testimony offered and that no research of any character would be required.

In the opinion of the majority of the board, the point at issue has resolved itself to one question:

"Do the runs instituted by the management of the Boston & Maine Railroad between Boston, Mass., and Troy, N. Y., cause an excessive strain or unreasonable hardship on the engineers and firemen on those runs?"

The chairman of the board, in order to get some first-hand information, personally took the trip on the slow mail train leaving Boston at 3 a. m. and arriving at Troy at 11.40 a. m. and returned the same day on the Minute Man, the fastest express train on this line, due to leave Troy at 2.35 p. m., arriving Boston at 7.25 p. m.

The board has sat in executive session and weighed the evidence offered on this particular case, and a majority of the board renders its award in favor of the Boston & Maine Railroad, effective this date.

Railroad Station Employees—Boston & Maine Railroad Co.

MANY of the recent wage arbitration awards made between railroad carriers and their employees that have come to the attention of the bureau have provided for increases for the employees and have been accompanied by a dissenting opinion made by the arbitrator appointed by the carriers. The following, signed by Benjamin Thomas on April 26, 1927, is typical of the dissenting opinions:

I regret that I can not concur in the majority decision in this case, believing as I do that notwithstanding the sincerity of the other members, the conclusions they have reached in awarding an increase in wages are not warranted by the evidence presented.

The award involves an increase of about 5½ per cent to approximately \$50 employees; based on 1926 performance, it adds between \$50,000 and \$60,000 a year to an item of nonproductive expense which now aggregates nearly \$1,000,000 a year.

Ninety-five per cent of the employees affected are crossing tenders. Such positions in many cases can be, and in many cases are now, filled by employees not physically able to engage in more active work.

The Boston & Maine average rate for this class before the award was higher by from 6 to 44 cents per day (2.1 to 17.8 per cent) than all but one of its connections, according to reports to Interstate Commerce Commission, and was 37.3 cents a day, or 14.7 per cent, above the average for all the Class I railroads in the United States. Knowing that the duties of such employees are substantially the same all over the country, I could not justify signing an award which would widen the spread, and put the Boston & Maine rate still higher than that of its neighbors and of the country generally.

Four connecting roads have granted increases to crossing tenders and their new average rate is below the old average rate of the Boston & Maine. One other road, having relatively few employees in this group, granted an increase which brought their new rate about ¼ cent per hour, or less than 2 cents per day, above the old Boston & Maine rate.

In addition to these considerations, the evidence conclusively showed that the cost of living has not increased since the last change in wages of this class of employees, which was established by the United States Railroad Labor Board.

I can not escape the conclusion that this award is very largely the result of recent wage increases to other classes of employees awarded by other arbitration boards rather than an exclusive consideration of the evidence presented.

The further conclusion seems inevitable that the application for arbitration under the present railway labor act is being regarded as synonymous with compromise.

IMMIGRATION AND EMIGRATION

Statistics of Immigration for April, 1927

By J. J. KUNNA, CHIEF STATISTICIAN U. S. BUREAU OF IMMIGRATION

DURING the month of April, 1927, there were 50,344 aliens admitted to the United States and 18,576 departed, causing an increase to the alien population of 31,768. Of these alien admissions, 33,034 came here for a permanent stay while 17,310 were transients. Of those departing, 4,185 had been living here a year or more and were leaving permanently, and the remainder, 14,391, were either here on a visit or intend to return after a short absence in a foreign country.

Eight European countries each furnished over half a thousand immigrants during April, ranking in order as follows: Germany, 5,288; Irish Free State, 3,402; Scotland, 1,526; England, 1,147; Poland, 830; Norway, 798; Sweden, 725; and Italy, 697. But the total immigration from Canada (6,225) and Mexico (7,810) was almost as large as the combined immigration from the above eight countries in the Old World.

During the same month 1,530 aliens were denied entrance to the United States for various causes under the immigration laws, principally because they failed to secure visas from American consuls. Most of these were debarred at the international land boundaries, 1,054 at the Canadian and 183 at the Mexican border stations. The other 293 aliens debarred in April were turned back at the seaports. One thousand and thirty-six aliens were deported from the United States during April, 1927. Of this number, nearly half were sent to countries on the Western Hemisphere, 280 going to Canada, 169 to Mexico, and 62 to other Americas. Europe received only 396; 118 went to Asia and 11 to Africa; and Australia.

Of the 50,344 aliens admitted to the United States during April, 17,116 came in as immigrants charged to the quota and 14,741 as natives of nonquota countries principally, of course, Canada and Mexico. Returning United States residents numbered 7,546; aliens coming temporarily on business or pleasure, 5,468; and 2,720 aliens were en route to other countries. The remaining 2,753 belonged to the other admissible classes under the act, including Government officials, wives and children of United States citizens, students, ministers, and professors, aliens to carry on trade under existing treaty, and veterans of the World War.

During the 10 months ended April 30, 1927, a total of 135,808 aliens charged to the quota had been admitted. The countries which exhausted their annual quotas during April were Belgium, Bulgaria, and New Zealand. This makes six countries which have exhausted their allotments during the current fiscal year, Greece, Latvia, and Luxemburg having reached theirs during March.

Grand total admitted.....	50,344	444,924

¹ Wives, and unmarried children under 18 years of age, born in quota countries.

² Does not include aliens born in nonquota countries who were admitted under the act as Government officials, visitors, returning residents, etc.

Immigration to Canada, 1926-27

THE total number of immigrants to Canada in the fiscal year ended March 31, 1927, was 143,991, including 49,784 British, 21,025 from the United States, and 73,182 from other countries. Furthermore, in the same 12 months, 56,957 Canadians returned from the United States, bringing the total to 200,948. These figures and the following two tables are taken from the May, 1927, issue of the Canadian Labor Gazette:

IMMIGRATION TO CANADA DURING FISCAL YEAR ENDED MARCH 31, 1927, BY SEX, OCCUPATION, AND DESTINATION

Sex, occupation, and destination	Number of immigrants		
	Via ocean ports	From United States	Total
Adult males.....	69,763	10,749	80,512

Mennonite Migration to Paraguay

WHILE 2,000 Mennonites have already migrated to Paraguay it is estimated that within the next few years more than a hundred thousand members of this denomination will make their homes in that Republic, according to an article by John W. White, editor and publisher, of Buenos Aires.¹

The Mennonites take their name from Menno Simons, born in 1492, a Catholic priest who left that church and became the chief exponent of the views which later became known as Mennonite, although he was not the originator of this sect. Its original home was in Zurich where Grebel and Manz founded the community in 1525.

The sect's main interest lay in discipline rather than in dogma. They not only abstain from worldly vanities but refuse the civic duties of taking an oath or using the sword. For a period of 400 years the Mennonites have been searching for a place where they may live in peace apart from the rest of the world. In 1783 they migrated in large numbers to southern Russia and from there went to North America where to-day they number 200,000, of whom 175,000 are in the United States and 25,000 are in Canada.

As a result of persecution resulting from the World War and their belief that warfare is un-Christian, they are migrating now to Paraguay where the Government has granted them a charter providing for complete and perpetual immunity from military duty and exemption from participation in warfare, even as noncombatants.

There are 42 sects of noncombatant peoples in all parts of the world. These are watching the Mennonites move to Paraguay and several sects have already made plans to join them.

Five years of preliminary work has been done in preparing, for the Mennonites, the 3,000,000 acres of fertile land in the upper Paraguayan Chaco 1,700 miles above Buenos Aires.

The writer compares their colonization with that of the Puritans and their followers in the United States, in that they will build their first town on the shore and will work westward. On the other hand they will not have to fight Indians, as did the early American settlers, for the Paraguayan Government has sent the national army to build fortifications and to protect the colonists from marauders.

The most important privileges of the charter granted to the Mennonites by the Paraguayan Government are the following: Freedom from military service; exemption from the oath in courts of justice; the privilege of conducting their own churches and schools in their own language, which is German; exemption from all classes of national and municipal taxes; exemption from immigration laws; and the free entry of furniture, machinery, utensils, animals, seeds, implements, etc., in short everything necessary for the development of the colonies.

Although the Paraguayan Government has extended these privileges only to the Mennonites, it is now considering extending the charter to include all the noncombatant peoples of the world.

¹ Pan American Union Bulletin, Washington, May, 1927, pp. 432-442.

A hotel and several substantial community houses have been built at Puerto Casado on the Paraguay River to house temporarily the first colonists. It is expected that within a period of eight months the first arrivals will become self-supporting. In about a year it is planned to send a hundred families about 100 kilometers inland to select the best location and establish another colony. Motor trucks and bullock carts are to furnish the means of communication and carry them supplies as well as to bring back their produce for sale at the port. When the second colony has been firmly established the colonists will go farther inland and set up newer communities.

Authorized representatives of the Mennonites who have explored the territory describe it in the official report as follows:

There are endless opportunities awaiting the skillful and industrious man, and there is not a place on earth except Paraguay that offers such attractions with so few obstacles to overcome. * * * Riches lie dormant awaiting men of energy, thrift, and skill to turn the immense, wild, uncultivated prairies and meadows into a paradise. There, are all resources for the creation of wealth, coupled with the most wonderful climate which can be found anywhere on the globe.

NOTES OF INTEREST TO LABOR

New Labor Party in Brazil

A NEW labor party has been formed at Porto-Alegre, Brazil, according to the May 9 issue of Industrial and Labor Information, issued by the International Labor Office.

The party indorses free and compulsory elementary education and technical occupational training. It holds that work should be compulsory for every fit person regardless of his trade or class, and that wages for both manual and intellectual workers should be high enough to provide for their comfort as well as their subsistence. The party favors the enactment of a law requiring employers of private undertakings to distribute among their permanent employees 60 per cent of the profits. That State lands should be parceled out and divided among individuals under certain conditions is also urged. The construction of workers' settlements and the enforcement of the eight-hour day are approved. The party's program indorses legislation for the protection of the cooperative movement. It indorses infant protection in all its forms.

Mrs. Ethel L. Best conducted the survey and wrote the report.
Other bulletins of the United States Women's Bureau which contain material on time lost by women are: No. 25, Women in the candy industry in Chicago and St. Louis; No. 26, Women in Arkansas industries; No. 29, Women in Kentucky industries; No. 32, Women in South Carolina industries; No. 36, Women in Missouri industries; No. 37, Women in New Jersey industries; No. 44, Women in Ohio industries; No. 55, Women in Mississippi industries.

UNITED STATES. *Public Health Service.*

Reprints from Public Health Reports. Washington, 1916-1926.

The Public Health Service has made studies of sickness among wage earners which have a special bearing on the problems connected with absenteeism. Reprints Nos. 624, 644, 671, 721, 807, 969, and 1020 form one series of studies of sickness frequency among the members of a single group of industrial mutual benefit associations and company relief departments.

335. Statistics of disability. A compilation of some of the data available in the United States, by B. S. Warren and Edgar Sydenstricker. 12 pp. (From Public Health Reports, Apr. 21, 1916.)

492. Disabling sickness among the population of seven cotton-mill villages of South Carolina in relation to family income, by Edgar Sydenstricker, G. A. Wheeler and Joseph Goldberger. 16 pp. (From Public Health Reports, Nov. 22, 1918.)

573. Sickness records for industrial establishments. 14 pp. (From Public Health Reports, Nov. 14, 1919.)

589. Keeping tab on sickness in the plant, by Dean K. Brundage and Bernard J. Newman. 12 pp. (From Public Health Reports, Apr. 9, 1920.)

611. Sickness and absenteeism during 1919 in a large industrial establishment, by Dean K. Brundage. 14 pp. (From Public Health Reports, Sept. 10, 1920.)

624. Sickness frequency among industrial employees. Disease prevalence among wage earners during the first half of the year 1920. 8 pp. (From Public Health Reports, Dec. 3, 1920.)

632. Diseases prevalent among steel workers in a Pennsylvania city, by Dean K. Brundage. 14 pp. (From Public Health Reports, Dec. 31, 1920.)

644. Sickness frequency among industrial employees. Morbidity among a group of wage earners during the first nine months of 1920. 8 pp. (From Public Health Reports, Mar. 4, 1921.)

671. Sickness frequency among industrial employees. Morbidity among a group of wage earners during 1920. 7 pp. (From Public Health Reports, July 1, 1921.)

721. Sickness frequency among industrial employees. Morbidity among a group of wage earners, January, 1920, to June, 1921. 8 pp. (From Public Health Reports, Jan. 6, 1922.)

731. Records of the small sick-benefit association as a source of statistics for the factory medical department, by Dean K. Brundage. 10 pp. (From Public Health Reports, Feb. 24, 1922.)

733. Sickness among office workers; a year's experience of a large manufacturing company, by Dean K. Brundage. 8 pp. (From Public Health Reports, Mar. 10, 1922.)

804. Disabling sickness among employees of a rubber manufacturing establishment in 1918, 1919, and 1920. Some morbidity statistics from the department of health of the B. F. Goodrich Co., Akron, Ohio. 12 pp. (From Public Health Reports, Dec. 15, 1922.)

807. Incidence of serious morbidity among a group of wage earners. 16 pp. (From Public Health Reports, Dec. 29, 1922.)

914. Sickness among 21,000 automobile workers. Morbidity experience of the Flint and Pontiac (Mich.) sick benefit associations in 1921 and 1922, by Dean K. Brundage. 13 pp. (From Public Health Reports, Apr. 19, 1924.)

929. Disabling sickness in cotton-mill communities of South Carolina in 1917. A study of sickness prevalence and absenteeism, as recorded in repeated canvasses, in relation to seasonal variation, duration, sex, age, and family income, by Dorothy Wiehl and Edgar Sydenstricker. 27 pp. (From Public Health Reports, June 13, 1924.)

938. A study of the incidence of disabling sickness in a South Carolina cotton-mill village in 1918, based on records of a continuous canvass of households during the period March 1 to November 30, 1918. 16 pp. (From Public Health Reports, July 18, 1924.)

969. Frequency of disabling illnesses among industrial employees. Incidence of illnesses from important causes lasting longer than one week among 100,000 persons in 1923, and a summary of the experience for 1920-1923. 10 pp. (From Public Health Reports, Oct. 31, 1924.)

1060. Sickness among industrial employees. Incidence and duration of disabilities from important causes lasting longer than one week among 133,000 persons in industry in 1924, and a summary of the experience for 1920-1924. 20 pp. (From Public Health Reports, Jan. 22, 1926.)

1142. A 10-year record of absences from work on account of sickness and accidents. Experience of employees of the Edison Electric Illuminating Co. of Boston, 1915 to 1924, inclusive, by Dean K. Brundage. 22 pp. (From Public Health Reports, Feb. 25, 1927.)

Pedro Santana, jr.

J. Cintron Davila, administrative secretary.

Address of commission: Post-office box 266, San Juan.

Rhode Island

Department of labor:

Edward L. Byers, commissioner, Statehouse, Providence.

Office of factory inspectors:

J. Ellery Hudson, chief inspector, Statehouse, Providence.

Board of labor (for the adjustment of labor disputes):

Edward L. Byers, commissioner of labor, chairman.

Edwin O. Chase (representing employers).

William C. Fisher (representing employers).

Albert E. Hohler (representing employees).

John H. Powers (representing employees).

Christopher M. Dunn, deputy commissioner of labor, secretary.

Address of board: Statehouse, Providence.

United States Employment Service:

Edward L. Byers, Federal director for State, Statehouse, Providence.

South Carolina

Department of agriculture, commerce, and industries:

J. W. Shealy, commissioner.

Address of department: Columbia.

Board of conciliation and arbitration:

B. E. Geer, chairman, Greenville.

W. H. McNairy, Dillon.

H. E. Thompson, secretary, Batesburg.

South Dakota

Office of industrial commissioner: ²
 S. A. Travis, industrial commissioner.
 Address: Pierre.

Tennessee

Department of labor:
 Ed. M. Gillenwaters, commissioner, Nashville.
 Ben Feldman, secretary, Nashville.
 Division of factory inspection—
 M. F. Nicholson, chief inspector, Nashville.
 Division of mines—
 O. P. Pile, chief inspector, Cowan.
 Division of hotel inspection—
 Sam I. Bolton, inspector, Nashville.
 Division of workmen's compensation—
 Harry L. Nelson, superintendent, 2211 Pierce Avenue, Nashville.
 United States Employment Service:
 J. A. Porter, special agent, Knoxville.

Texas

Bureau of labor statistics:
 Chas. McKemy, commissioner.
 Robt. B. Gragg, chief deputy.
 B. C. Westbrook, secretary and statistician.
 Miss Nell Kirkpatrick, assistant secretary.
 Address of bureau: State Capitol, Austin.
 Industrial accident board:
 Jas. W. Swayne, chairman.
 J. M. Pittillo.
 Mrs. Espa Stanford.
 E. B. Barnes, secretary.
 United States Employment Service:
 C. W. Woodman, assistant director, 806 Taylor Street, Fort Worth.

Utah

Industrial commission:
 Wm. M. Knerr, chairman.
 O. F. McShane.
 Henry N. Hayes.
 Carolyn I. Smith, secretary.
 State insurance fund—
 Chas. A. Caine, manager.
 Address of commission: State Capitol, Salt Lake City.

Vermont

Office of commissioner of industries:
 Clarence R. White, commissioner, Montpelier.
 Fred S. Pease, deputy commissioner, Burlington.
 State board of conciliation and arbitration:
 Henry C. Brislin, Rutland.
 Ashley J. Goss, Danville.
 Hugh J. M. Jones, Montpelier.

Virginia

Department of labor and industry:
 John Hopkins Hall, jr., commissioner.
 H. W. Furlow, assistant commissioner.
 Division of mines—
 A. G. Lucas, chief.
 Division of factory inspection—
 John Gribben, chief.

² Administers workmen's compensation act.

Department of labor and industry—Continued.

Division of women and children—

Mrs. Mary L. Scrogam, director.

Division of industrial statistics—

Miss Elizabeth Myers, statistician.

Address of department: State Office Building, Richmond.

Industrial commission:

Bolling H. Handy, chairman.

C. G. Kizer.

Parke P. Deans.

F. P. Evans, statistician.

W. F. Bursey, secretary.

Address of commission: Box 1794, Richmond.

United States Employment Service:

John Hopkins Hall, jr., Federal director for State, State Office Building, Richmond.

Washington

Department of labor and industries:

Claire Bowman, director.

John Shaughnessy, supervisor of industrial insurance and medical aid.

Martin J. Flyzik, supervisor of safety and industrial relations.

Mrs. G. V. Haney, supervisor of women in industry.

Dr. L. L. Goodnow, chief medical adviser.

R. M. Van Dorn, industrial statistician.

Percy Gilbert, secretary.

Industrial welfare committee—

Claire Bowman, chairman, director of labor and industries.

John Shaughnessy, supervisor of industrial insurance and medical aid.

R. M. Van Dorn, industrial statistician.

Martin J. Flyzik, supervisor of safety and industrial relations.

Mrs. G. V. Haney, supervisor of women in industry.

Address of department: Olympia.

United States Employment Service:

William C. Carpenter, Federal director for State, 421 Federal Building, Spokane.

West Virginia

Bureau of labor:

Howard S. Jarrett, commissioner, Charleston.

State compensation commissioner:

C. L. Heaberlin, commissioner.

J. E. Brown, secretary.

J. W. Smiley, actuary.

Lewis J. Frey, chief statistician.

R. H. Walker, chief medical examiner.

Address: Charleston.

Department of mines:

R. M. Lambie, chief, Charleston.

United States Employment Service:

Howard S. Jarrett, Federal director for State, Charleston.

Wisconsin

Industrial commission:

Fred M. Wilcox, chairman.

R. G. Knutson.

Voyta Wrabetz.

A. J. Altmeyer, secretary.

Safety and sanitation department—

R. McA. Keown, engineer.

Workmen's compensation department—

F. T. McCormick, Harry A. Nelson, A. T. Flint, I. M. Kittleston, examiners.

Employment department—

R. G. Knutson, director.

Apprenticeship department—

Walter F. Simon, supervisor.

Industrial commission—Continued.**Women and child labor department—**

Taylor Frye, director.

Miss Maud Swett, field director, room 809, Manufacturers' Home Building, Milwaukee.

Statistical department—

Orrin A. Fried, statistician.

Address of commission: Madison.

United States Employment Service:

R. G. Knutson, Federal director for State, State Capitol, Madison.

Wyoming**Department of labor and statistics:**

Harry C. Hoffman, commissioner.

Child labor board—

Harry C. Hoffman, secretary.

Lewis G. Tidball.

Dr. W. G. Hassed.

Address of department: Capitol Building, Cheyenne.

Workmen's compensation department (under State treasurer's office):

W. H. Edelman, State treasurer.

C. B. Morgan, deputy treasurer.

Arthur Calverley, assistant deputy and department manager.

Address of department: Cheyenne.

Albania

³ Publishes annual reports on labor and industrial statistics.

Canada

Department of Labor:

- Peter Heenan, minister.
 - H. H. Ward, deputy minister.
 - Gerald H. Brown, assistant deputy minister.
 - R. A. Rigg, director of employment service.
 - A. W. Crawford, director of technical education.
 - E. G. Blackadar, acting superintendent of Dominion Government annuities.
 - F. A. McGregor, registrar of combines investigation act.
 - C. W. Bolton, chief of statistical branch.
 - F. J. Plant, chief of labor intelligence branch.
- Address of department: Ottawa, Ontario.

Alberta

Department of public works:

- W. Smitten, commissioner of labor.
 - F. W. Hobson, chief boiler inspector.
 - H. M. Bishop, chief factory inspector.
 - G. P. Barber, chief theater inspector.
 - John T. Stirling, chief mine inspector.
- Addresses of department: Edmonton.

Government employment bureau:

- William Carnill, superintendent, Calgary.
- W. G. Paterson, superintendent, Edmonton.
- A. R. Redshaw, superintendent, Lethbridge.
- J. W. Wright, superintendent, Medicine Hat.
- A. A. Colquhoun, superintendent, Drumheller.

Workmen's compensation board:

- John T. Stirling, chairman.
 - Walter F. McNeill, commissioner.
 - James A. Kinney, commissioner.
 - Frederick D. Noble, secretary.
- Address of board: Qu'Appelle Building, Edmonton.

British Columbia

Department of labor:

- A. M. Manson, minister, Victoria.
- J. D. McNiven, deputy minister, Victoria.
- Robert J. Stewart, chief factories inspector, Vancouver.

Employment service—

- J. H. McVety, general superintendent, Vancouver.

Minimum wage (for females) board—

- J. D. McNiven, deputy minister of labor, chairman.
- Mrs. Helen G. MacGill.
- Thos. Mathews.
- Miss Mabel Agnes Cameron, secretary.

Hours of work and minimum wage (for males) board—

- J. D. McNiven, deputy minister of labor, chairman.
- F. V. Foster.
- T. F. Paterson.

Address of board: Parliament Buildings, Victoria.

Workmen's compensation board:

- E. S. H. Winn, K. C., chairman.
- Parker Williams.
- Hugh B. Gilmour.
- F. W. Hinsdale, secretary.

Address of board: Board of Trade Building, Vancouver.

Manitoba

Bureau of labor:

- W. R. Clubb, minister of public works.
- Edward McGrath, secretary.
- Arthur MacNamara, chief inspector.

Bureau of labor—Continued.

Fair wage board—

D. L. McLean, deputy minister of public works, chairman.
 J. W. Morley.
 E. Claydon.
 Walter Owens.
 C. J. Harding.

Minimum wage board—

Geo. N. Jackson, chairman
 Mrs. Edna M. Nash.
 James Winning.
 Mrs. Jessie McLellan.
 L. J. Rumford.

Address of bureau: 332 Parliament Building, Winnipeg.

Workmen's compensation board:

C. K. Newcombe, commissioner.
 R. S. Ward.
 G. E. Carpenter.
 N. Fletcher, secretary.

Address of board: 166 Portage Avenue East, Winnipeg.

New Brunswick

Department of labor:

H. I. Taylor, minister, St. George.

Workmen's compensation board:

J. A. Sinclair, chairman.
 F. C. Robinson.
 J. L. Sugrue.

Address of board: Post Office Box 1422, St. John.

Inspection of factories:

John Kenney, St. John.

Nova Scotia

Department of public works and mines:

C. S. Harrington, minister.
 Norman McKenzie, deputy minister
 Address of department: Halifax.

Workmen's compensation board:

V. J. Paton, K. C., chairman.
 Fred W. Armstrong, vice chairman.
 John T. Joy, commissioner.

Address of board: Halifax.

Employment service:

C. J. Cotter, superintendent men's division, Halifax.
 Miss Elda E. Caldwell, superintendent women's division, Halifax.

Ontario

Department of labor:

Hon. Forbes Godfrey, minister.
 James H. H. Ballantyne, deputy minister.
 D. M. Medcalf, chief inspector of steam boilers.
 James T. Burke, chief inspector of factories, shops, and office buildings.
 J. M. Brown, chairman stationary and hoisting engineers' board.

Employment service—

H. C. Hudson, general superintendent, Ontario offices.
 Address of department: Parliament Buildings, Toronto.

Minimum wage board:

Dr. J. W. Macmillan, chairman.
 H. G. Fester.
 Mrs. Lydia Parsons.
 Miss Margaret Stephens.
 R. A. Stapells.

Address of board: Parliament Buildings, Toronto.

Workmen's compensation board:

Victor A. Sinclair, K. C., chairman.
 Henry J. Halford, vice chairman.
 George A. Kingston, commissioner.
 N. B. Wormith, secretary.
 T. Norman Dean, statistician.
 F. W. Graham, claims officer.
 W. E. Struthers, medical officer.
 D. E. Bell, medical officer.
 J. M. Bremner, medical officer.

Address of board: Metropolitan Building, 44 Victoria Street, Toronto.

Quebec

Department of labor:

Antonin Galipeault, K. C., minister, Quebec.
 Louis Guyon, deputy minister, and chief inspector of industrial establishments and public buildings, 63 Notre Dame Street East, Montreal.
 Alfred Robert, fair wages officer and deputy chief inspector, 63 Notre Dame Street East, Montreal.
 Felix Marois, registrar of board of conciliation and arbitration, Parliament Buildings, Quebec.

Saskatchewan

Bureau of labor and industries:

Thomas M. Molloy, commissioner.
 T. Withy, chief factory inspector.
 E. Pierce, mine inspector.

Government employment branch—

G. E. Tomsett, general superintendent.

Address of bureau: Regina.

Minimum wage board:

John A. Mather, chairman, Saskatoon.
 Mrs. Wm. Allen, Moose Jaw.
 J. P. Keleher, Moose Jaw.
 Mrs. F. M. Eddie, Regina.
 J. K. R. Williams, Regina.
 T. Withy, chief factory inspector, secretary, Regina.

Ministry of Public Works (address, Caracas).

PUBLICATIONS RELATING TO LABOR

Official—United States

ALASKA.—Mine Inspector. *Annual report, 1923.* [Juneau, 1924.] 109 pp.
— — — *Report upon industrial accidents, compensation and insurance in Alaska for the biennium ending December 31, 1924.* [Juneau, 1927.] 30 pp.

CALIFORNIA.—Industrial Welfare Commission. *Fifth report, for the biennial periods July 1, 1922, to June 30, 1924, and July 1, 1924, to June 30, 1926.* Sacramento, 1926. 143 pp.

Data from this publication are given on page 46 of this issue.

MASSACHUSETTS.—Special Commission on the Necessaries of Life. *Report (under Chapter 273 of the Acts of 1925), January, 1927.* Boston, 1927. 219 pp. [House No. 1106.]

MISSOURI.—Bureau of Mines. Inspection Department. *Thirty-ninth annual report, year ending December 31, 1926.* Jefferson City, [1927]. 92 pp.

Some statistics on mine accidents from this report are given on page 59 of this issue.

NEW JERSEY.—Department of Labor. *The Industrial Bulletin. No. 1, Vol. 1, May, 1927.* Trenton. 66 pp.

A new publication to give more detailed and up-to-date information on the many activities of the New Jersey Department of Labor and to stimulate its personnel.

UNITED STATES.—Department of Commerce. Bureau of Mines. *Technical Paper No. 386: Explosibility of coal dust from four mines in Utah, by H. P. Greenwald.* Washington, 1927. 20 pp.

Describes with tables and a chart and diagram, certain tests made by the Bureau of Mines "to determine the amount of inert dust or water that must be added to the coal dust being examined to make this nonexplosive under various conditions." These tests included the initiation of dust explosions, using the samples supplied by the cooperating mines in Utah, in the bureau's experimental mine at Bruceon, Pa., by two methods, namely, (1) directly by a blown-out shot and (2) by the ignition of an explosive mixture of gas and air.

The conclusion must be drawn from these tests that water can not be relied on as a general preventive of coal-dust explosions. Dust that contained 20 per cent of moisture propagated an explosion in three out of six trials, and when gas was used as a primary source of ignition the explosion was violent and destructive. Wet dust is explosive, and only needs to be raised in the air to become as much of a menace as dry dust.

Although the above tests show that general watering in entries will not prevent the spread of a well-developed explosion, the use of water at the face and on mining machines may readily prevent the initiation of an explosion from sources other than an ignition of gas. Water is effective in preventing the ignition of coal dust from weak sources of ignition.

— — — *Technical Paper No. 412: Accidents at metallurgical works in the United States during the calendar year 1925, by William W. Adams.* Washington, 1927. 40 pp.

A brief summary of this report appears on page 51 of this issue.

UNITED STATES.—Department of Commerce. Bureau of the Census. *Mortality statistics, 1924*. Washington, 1927. 487 pp., map, charts.

— — — — Women's Bureau. *Bulletin No. 59: Short talks about working women*. Washington, 1927. v, 24 pp.

A series of informal discussions of women's progress in industry, recognition by the Federal Government, standards of employment, wages, hours, and working conditions, and of the women to whom these conditions apply.

Official—Foreign Countries

AUSTRALIA (WESTERN AUSTRALIA).—Registrar of Friendly Societies. *Report of proceedings for the year ended June 30, 1926*. Perth, 1927. 27 pp.

The registrar reports a prosperous year for the friendly societies, with a membership at its end of 22,225. The total capital of the societies now amounts to £388,968. During the year sickness benefits amounted to £19,928 and funeral benefits to £4,853.

CANADA (BRITISH COLUMBIA).—Workmen's Compensation Board. *Tenth annual report, for the year ended December 31, 1926*. Victoria, 1927. 32 pp.

Data from this report are given on page 69 of this issue.

— (ONTARIO).—Workmen's Compensation Board. *Report for 1926*. Toronto, 1927. 72 pp.

A brief review of this report is found on page 69 of this issue.

GREAT BRITAIN.—Foreign Office. *Miscellaneous No. 2 (1927): Nationality and naturalization laws of certain foreign countries*. London, 1927. 91 pp. [Cmd. 2852.]

— Home Office. *Report on the incidence of silicosis in the pottery industry, by Dr. C. L. Sutherland and Dr. S. Bryson*. London, 1926. 52 pp.

A summary of this report is given on page 61 of this issue.

— Mines Department. Safety in Mines Research Board. *Paper No. 33: The inflammation of coal dusts—The effect of the chemical composition of the dust, by T. N. Mason and R. V. Wheeler*. London, 1927. 20 pp., charts.

The work described in this paper is concerned with the ignition of coal dust and "is an attempt to correlate the chemical composition of a coal with the 'inflammability' of its dust as determined by large-scale tests" of samples of coal dust from 7 New Zealand seams and from 12 British seams. It was desired to ascertain the amount of incombustible dust that had to be mixed intimately with coal dust "to prevent a violent source of ignition, somewhat arbitrarily chosen, from causing continued propagation of flame along a gallery strewn with the mixture," in this way determining the measure of the degree of inflammability of the coal dust being tested. Fuller's earth was used as the incombustible dust, while the coal dust was prepared from lump coal and all samples were pulverized to the same degree of fineness.

It was found that a very definite direct relationship exists between the content of volatile matter in coal and the inflammability of its dust. The degree of fineness of the coal dust is an important factor in its flammability. The report summarizes its findings as follows:

Experiments with dusts from a number of British bituminous coals have shown that there is a relationship between the content of "volatile matter" (calculated on an ash-free dry basis) and the amount of incombustible matter which must be present in the mixed coal dust and incombustible dust in order that continued propagation of flame shall not take place (under standard conditions of ignition) there being a tendency for the fine dusts from coals containing the higher percentages of volatile matter to be the more readily inflammable.

The report cites similar experiments, leading to practically the same conclusions, made by the United States Bureau of Mines and reported in its Bulletin 167, and by the Experimental Station of Le Comité Central des Houillères de France at Liévin, and reported in *Ann. des Mines*, 1921, 6, 429.

LEAGUE OF NATIONS.—Economic and Financial Section. *C. E. I. No. 11: Results of certain of the inquiries for instituting a comparison between the retail prices in private trade and those of distributive cooperative societies. Geneva, 1926. 31 pp.*

Document prepared for the use of the International Economic Conference of May 4, 1927, at Geneva. Reviewed briefly on page 63 of this issue.

— — — *C. E. I. No. 13: Scientific management in Europe. Geneva, 1926. 15 pp.*

A short review of this document appears on page 44 of this issue.

— — — *C. E. I. No. 14: The part played by cooperative organizations in the international trade in wheat, dairy produce, and some other agricultural products. Geneva, 1926. 46 pp.*

Prepared for the use of the International Economic Conference of May 4, 1927. Data from this report are given on page 64 of this issue.

— — — *C. E. I. No. 16: Electrical industry. Geneva, 1927. 121 pp.*

Contains data on distribution of production costs.

SPAIN.—Ministerio de Trabajo, Comercio e Industria. Jefatura Superior de Estadística. *Anuario estadístico de España, año XI, 1924-25. Madrid, 1926. xxiii, 614 pp.*

In addition to statistical data relating to population, production, agriculture, commerce, etc., this yearbook of Spain contains tables showing index numbers of food prices, wages, strikes, and industrial accidents in Spain. Wage statistics from this report are given on page 115 of this issue.

Unofficial

ALLGEMEINER DEUTSCHER GEWERTSCHAFTSBUND. *Jahrbuch, 1925. Berlin, 1926. 237 pp.*

The 1925 yearbook of the General Federation of German Trade Unions, contains much material on wage movements, employment, and other matters of labor interest.

ASQUITH, CYRIL. *Trade union law for laymen. London, Cassell & Co. (Ltd.), 1927. ix, 102 pp.*

This study, which was prepared before the introduction of the trade-union bill now pending, was intended to make accessible a general knowledge of the legal status of trade-unionism, from which the student of social affairs might draw conclusions as to what changes are desirable, and how a given change might be expected to affect the situation. Of special interest in the light of recent developments is the author's discussion of the lines along which reform in trade-union law might usefully be undertaken.

CARNEGIE ENDOWMENT FOR INTERNATIONAL PEACE. Division of Economics and History. *War and insurance, by Sir Norman Hill and others.* London, Oxford University Press, 1927. xii, 283 pp.

HARDY, CHARLES O., AND COX, GARFIELD, V. *Forecasting business conditions.* New York, The Macmillan Co., 1927. x, 434 pp., charts.

A detailed description of the various methods used in predicting the course of business prosperity.

HOBSON, J. A. *The conditions of industrial peace.* London, George Allen & Unwin (Ltd.), 1927. 123 pp.

Emphasizes the interdependence of all industries, and therefore concludes that the settlement of industrial disputes, to be permanent, must be handled on a national basis. The author specifically recommends for this purpose a national industrial council, representing all the producing and consuming interests as well as the State.

HOFFMAN, FREDERICK L. *The decline in lead poisoning. Address delivered before the Health Congress of the Royal Institute of Public Health, Ghent, Belgium, June, 1927.* [Newark] Prudential Press, 1927. 20 pp.

In this paper various studies of lead poisoning in different industries are reviewed, the writer concluding from the data summarized that there has been a pronounced decline in the death rate from chronic lead poisoning in proportion to the total population during the last decade.

LABOR RESEARCH STUDY GROUP. *The law of social revolution, a cooperative study.* New York, Social Science Publishers, 1926. x, 262 pp.

LACOMBE, ÉDOUARD. *La prévision en matière de crises économiques.* Paris, Librairie des Sciences, Politiques et Sociales, 1926. 166 pp.

The author advocates that the League of Nations interest itself in the problem of the prediction of economic crises, pointing out that the instability of economic life is among the causes which create discord between peoples.

NATIONAL CONFERENCE ON CITY PLANNING. *Planning problems of town, city, and region: Papers and discussions at the eighteenth national conference on city planning, held at St. Petersburg and Palm Beach, Fla., March 29 to April 1, 1926.* Philadelphia, Wm. F. Fell Co., 1926. vi, 213 pp.

NATIONAL EDUCATION ASSOCIATION. Research Division. *Salaries in city school systems, 1926-27.* Washington, D. C., 1201 16th St. N. W., 1927. [Research Bulletin, Vol. V, No. 2, March, 1927, pp. 66-127.]

Data from this report are given on page 105 of this issue.

NEUFANG, OSCAR. *Harmony between labor and capital: An essay on the welfare of nations.* New York, G. P. Putnam's Sons, 1927. viii, 238 pp.

The thesis of this essay is that workers should have a drawing-account or preliminary wage similar to the drawing-account of partners in a copartnership, and that, at the close of the year's business, after a fair dividend has been paid upon capital, the remaining earnings should be allotted to the workers, both managerial and manual, in proportion to salaries or wages.

OHIO STATE UNIVERSITY. College of Commerce and Journalism. Bureau of Business Research. *The construction industry in Ohio, by Ralph J. Watkins.* Columbus, Ohio, 1926. vi, 168 pp., charts.

This report is reviewed on page 117 of this issue.

PAIRAULT, ANDRÉ. *L'immigration organisée et l'emploi de la main-d'oeuvre étrangère en France.* Paris, Les Presses Universitaires de France, [1927?]. vi, 359 pp.

The conclusion is reached in this volume that immigration to France is useful but dangerous to the national economy; that continued attention should be paid to it; and that various steps be taken to insure the assimilation of foreign elements pending the rise of the birth rate of the country to a figure which will permit the reduction of immigrants to the least possible number.

REDFORD, ARTHUR. *Labor migration in England, 1800-1850*. London, Longmans, Green & Co. (Ltd.), 1926. xvi, 174 pp.

A study of the connection between the industrial revolution and the contemporary movement of working-class population in England. The latter was not a simple transference of labor from the south and east of England to the north and west, but an exceedingly complex, wavelike movement. The character and cause of the different migrations are carefully considered, due weight being given to such contributory causes as surplus labor and the settlement question, the "hungry forties," the Irish influx, and the like, including effect of emigration upon the whole movement.

RETINGER, J. H. *Morones of Mexico: A history of the labor movement in that country*. London, Labor Publishing Co. (Ltd.), 1926. xvi, 107 pp.

Reviewed on page 81 of this issue.

RICHARDSON, J. H. *A study on the minimum wage*. London, George Allen & Unwin (Ltd.), 1927. 198 pp.

Among the subjects discussed in this volume are: Purposes of minimum wage legislation, the living wage, industry's capacity to pay, a national minimum, provision for the worker's dependents, machinery for fixing minimum wages, and international action.

One of the most difficult problems in the whole field of industry, the author thinks, is the fixing of a practicable minimum and at the same time retaining a distribution system which will insure specially skilled workers sufficient to provide an adequate labor supply and maintain the requisite "supplies of capital, management, and other agents of production."

SNYDER, CARL. *Business cycles and business measurements: Studies in quantitative economics*. New York, The Macmillan Co., 1927. xv, 326 pp., charts.

The purpose of this study, as set forth in the introduction, was to obtain broader and more detailed measures of trade, production, and business activity in the United States and their fluctuations throughout the last half century or more; to provide a standard for the measurement of business or trade by months from 1919 to date, by means of a new index of the total volume of trade derived from 56 separately computed series; and to make comparison of this with other new indexes of business derived from bank deposits, etc.

STUDENT CHRISTIAN MOVEMENT. *Modern industry: the Christian line of development*, by Malcolm Sparkes. London, 32 Russell Square, W. C. 1, 1927. 63 pp.

TAYLOR, CARL C. *Rural sociology: A study of rural problems*. New York, Harper & Bros., 1926. [v], 509 pp.

A brief review of this book is given on page 27 of this issue.

WALTHER, LÉON. *La technopsychologie du travail industriel*. Paris, Delachaux & Niestlé S. A., 1926. xi, 239 pp.

This is the first book in the French language giving a view of the field of industrial psychology as a whole. The special value of the volume, according to Dr. Ed. Claparede who writes its preface, is that the author has acquired a concrete knowledge of the problems he discusses, through his years of practical experience as a psychological expert in a large industrial establishment.

WEBB, SYDNEY AND BEATRICE. *English local government: English poor law history. Part I: The old poor law*. London, Longmans, Green & Co. (Ltd.), 1927. x, 447 pp.

This volume, one of the series relating to the development of English local government along various lines which Mr. and Mrs. Webb have been issuing since the early part of the present century, deals with the problem of poor relief only up to 1834, when the reform laws came into operation. The subject is given the detailed, accurate, and careful treatment which the public has come to expect from these authors, but it is explained that this volume is only preliminary to a second and more important one, dealing with the poor-law administration from 1834 down to 1927, which is to appear in due time. The serious situation due to the cost of poor relief as at present administered in England gives special timeliness to these studies.
