The Labor Month in Review

During the month, the leaders of organized labor demonstrated growing attention to the political campaigns. Union members were urged to study the issues and to register as voters. Election of a "liberal Congress" was stressed by most union officials in their Labor Day messages. A number of unions endorsed candidates for State or Federal offices.

Steel production was resumed rapidly following the end of the steel stoppage. The last of the "Big 6" contracts, negotiated to confirm the terms of the settlement, was signed a month after the close of the steel strike. Meanwhile, several other unions sought new contract arrangements; wage adjustments and the union shop were prominent among the demands which were advanced.

AFL-ICFTU Relations

Early resumption of active participation in International Confederation of Free Trade Union affairs by the AFL was indicated by two decisions of the AFL Executive Council.

The ICFTU was invited to send a fraternal delegate to address the AFL's convention. AFL officials anticipated that J. H. Oldenbroek, the ICFTU's general secretary, would be the delegate named. A second invitation also was extended to the ICFTU, suggesting that the executive committee of the anti-Communist trade-union federation hold its next meeting in New York City. After further discussions with the ICFTU's American affiliates—the AFL, the CIO, and the United Mine Workers—December 1–5 was the date set for this meeting.

The Unions and Politics

With the conclusion of the Presidential nominating conventions, a large portion of the interest of the leaders of American unions was focused on the 1952 elections. During August the 46-man Executive Board of the CIO recommended that the members of CIO affiliates vote for the Demo-

cratic Party candidates for President and Vice President. A number of international unions, both AFL and CIO, some of which had not taken such a step since 1924, took similar action. The AFL Executive Council arranged to have the standard bearers of both major parties address the seventy-first annual AFL convention.

The importance of the fall elections to organized labor was stressed in Labor Day messages by William Green, Philip Murray, and many international union heads. On Labor Day, both Presidential nominees appealed for the electoral support of labor voters. Governor Stevenson called for replacement of the Taft-Hartley Act by new labor-management legislation in a Detroit speech made under AFL and CIO auspices. General Eisenhower issued a Labor Day pledge and addressed the AFL Letter Carriers' convention in New York City.

Labor-Management Relations

Coal. Following exploratory negotiations between United Mine Workers and anthracite operators' committee representatives, the union announced that it had found the five subjects advanced by the operators to be bargainable. The union asked a reported 20,000 western Pennsylvania bituminous-coal miners to halt their "wildcat" strike which was embarrassing the union in its negotiations. Progress was also reported toward an interim agreement between the union and the Southern Coal Producers Association.

Mr. Lewis had given a 60-day contract-termination notice to the Bituminous Coal Operators Association late in July and similar notices to the Southern Coal Producers Association and the anthracite operators committee 10 days later.

The union observed a 10-day memorial stoppage in tribute to all miners killed and injured in mine accidents since the first of the year and notified the Federal Mediation and Conciliation Service that the negotiations had failed to produce an agreement, leaving the mine workers free to strike late in September.

Rubber. After 7 weeks' negotiations, the CIO Rubber Workers and Goodyear Tire & Rubber Co. agreed to an extension of their contract. The company granted a 10-cent hourly pay increase.

U. S. Rubber, Seiberling, General, and Firestone shortly thereafter followed the example of Goodyear. The B. F. Goodrich Co., after a 12-day work stoppage, agreed to a 10-cent hourly wage

boost and to the full union shop; in return, the union agreed to "take reasonable action" to curb wildcat strikes. Union-shop clauses in the Firestone and Goodrich contracts marked the complete establishment of this form of union security in the large rubber plants.

Non-ops' Union Shop. Agreement for a union shop was reached between the Eastern Carriers' Conference Committee and the 17 nonoperating unions, raising to 400,000 the number of railroad workers under the union-security coverage recommended by a Presidential Emergency Board in February. Since several of the major eastern lines had already established the union shop, the new agreement applied only to the remainder of the lines, the largest of which was the Pennsylvania Railroad.

The agreement provides that present employees must become members of the union of their craft or class within 60 days after the contract was signed. New employees are given 60 days after employment to join. The union's conference committee, headed by AFL Telegraphers president G. E. Leighty, expressed hope that they would soon win agreement to the union shop from western and southeastern conference committees.

ILGWU Anti-Open-Shop Drive. After a month's mass picketing set up by the Cloak Joint Board of the AFL Ladies' Garment Workers in New York City, 19 of the leading nonunion women's apparel shops signed contracts with the union.

Soon after the start of picketing, the open-shop employers formed an association and demanded special contractual relations with the union. Upon refusal by the union to grant them preferential status, the association filed an antitrustaction against the union and the established employer associations.

AFL leaders continued their investigation of alleged racketeering in New York metropolitanarea AFL unions. A preliminary report to the AFL Executive Council cited discrepancies observed in connection with certain dress company truckers, open-shop dress manufacturers, and the holders of certain charters issued by the AFL Jewelry Workers, Auto Workers, and Distillery Workers.

Economic Background

Employment in nonfarm industries declined by

over 400,000 between mid-June and mid-July, to 45.9 million. Seasonal employment gains in construction, food processing, and other industries partly offset the effects of the steel strike on employment. Some 900,000 workers were off industry payrolls in mid-July as a result of the steel strike—split about evenly between steel-workers and iron-ore miners and employees in steel-using industries, coal mines, and railroads.

The average workweek of production workers in manufacturing declined by half an hour from June to July, to 39.9 hours; their average hourly earnings declined nearly 1 cent to \$1.65, indicating decreased overtime in metalworking industries. These declines resulted in a drop in average weekly earnings in manufacturing of \$1.14, to \$65.84.

Housing starts dipped slightly in August when 99,000 new permanent nonfarm dwelling units were put under construction. On a seasonally adjusted basis, housing starts were at an annual rate of 1,035,000 in August, the last of three consecutive months to be taken into account in determining whether residential credit controls will be relaxed. Expenditures for all new construction put in place in August was \$3.152 billion, highest monthly total on record.

Fewer man-days of strike idleness occurred in July than in June. However, the 12.5 million days in July were, except for the 14 million in June, the greatest number in any month since October 1949. About 80 percent of the total July idleness resulted from participants in the steel strike.

An advance of 0.6 percent from June 15 to July 15 raised the CPI to a new record high of 190.8, 12.1 percent above June 15, 1950, and 2.9 percent above a year ago. A sharp rise in food prices was primarily responsible for the increase; only the prices of apparel and of housefurnishings declined during the month. The estimated Retail Food Price Index rose 0.3 percent from July 15 to August 15.

The old series CPI advanced 0.7 percent from June to July, to 192.4, 5.9 percent above January 15, 1951, bringing a quarterly escalated wage increase of 3 cents hourly to over 1 million automobile workers on September 1.

The Wholesale Price Index for July showed an advance over June, the first upward turn of this index since November 1951.

Job Tenure of American Workers

A Fifth of All Workers Have Remained With the Same Employer Continuously For Nine or More Years

SEYMOUR L. WOLFBEIN*

Mobility always has been a major characteristic of the American labor force. Changes from one occupation or industry to another have been accompanied by extensive geographical shifts and appear to form a common pattern in the working lives of substantial numbers of people.

Interest in these movements has been heightened during the past several years by the manpower requirements of a mobilization economy. Many surveys have been conducted to assess the magnitude and nature of job shifts and the characteristics of workers who make them. One of the more important of these, made early in 1951 by the Bureau of the Census, gives added insight into a major facet of the general problem of mobility, i. e., the length of workers' continuous association with the same employer.¹

Job Stability

Job shifting can be gauged effectively by the extent to which workers remain on the same job for long periods of time. The Census survey found that 13 million of the 59 million civilian workers employed in January 1951, had been with the same employer continuously since November 1941 or earlier. In other words, more than a fifth of the workers employed at the time of the survey were still working in the same jobs² they had prior to Pearl Harbor and the beginning of World War II. Thus, a significantly large proportion of workers remained with the same employer or business despite the war and postwar (including

Korea) dislocations, notwithstanding the mass movement of men into and out of the Armed Forces³ and of women into and out of the labor force, and in the face of the extensive variations in industrial demand of the past decade.

The January 1951 total included, of course, many persons who could not possibly have had a continuous job for 9 or more years simply because of their age. It also includes many men who involuntarily interrupted their job holding, by entry into the Armed Forces. The proportion with long-term job tenure, calculated on a base consisting of those with continuous labor-force participation throughout this period, would therefore be considerably higher.

Thus, the Census found that the most significant contributor to the number exhibiting such a large element of stability in job holding was the older worker. As the following tabulation shows, more than two-thirds of the workers on the same job since before World War II were 45 years of age or more, and a little over a tenth were 65 years or older.

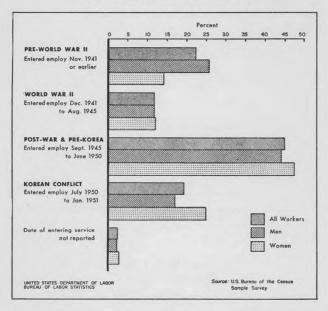

^{*}Of the Bureau's Division of Manpower and Employment Statistics.

¹ All data are from U. S. Department of Commerce, Bureau of the Census, released in Current Population Reports, Labor Force, December 5, 1951 (Series P-50, No. 36): Experience of Workers at their Current Jobs, January 1951, and from special tabulations prepared by the Census Bureau for the Bureau of Labor Statistics.

² For wage and salary workers, a "job" was defined as a "continuous period of employment with a single employer"; and for the self-employed, as a "continuous period of employment in a particular type of business in the same locality."

² The Census considered entry into the Armed Forces as the ending of a particular job, even though a person retained reemployment rights to that job.

Distribution of Workers by Length of Service With the Same Employer, January 1951

	Number (mil- lions)	Percent
All workers employed in jobs acquired prior to World War II	13. 0	100
Under 45 years of age	4. 2	32
45 years of age and over	8. 8	68
45-54 years	4. 2	32
55-64 years		25
65 years and over		11

Occupationally, workers with long-term attachment to their jobs were concentrated in four major areas of work among the men. The most important was the skilled group of craftsmen and foremen—a group in which the majority of workers are older men and the investment in training time and specialized work experience is greatest. Significantly, a large proportion of the men still occupying pre-World War II jobs were also working as semiskilled operatives. Thus, the skilled craftsmen and the semiskilled operatives, the great majority of whom work in factories, accounted for 37 percent of all the men with long-duration attachment to the same employer.

The other two ranking groups represent the selfemployed and managerial personnel, both on and off the farm, and they also include substantial numbers of older men. These groups, together with the craftsmen and operatives, constituted 7 out of every 10 men with a job or business dating back to Pearl Harbor or before.

White-collar work was the predominant field of concentration among women with jobs acquired before World War II. In fact, 25 percent were engaged in a clerical capacity; another 15 percent in professional and technical work. As might be expected, service occupations, including work in private households also accounted for large numbers of women in this group. More significant, however, is the fact that almost a fifth of the women with long-term attachment to their jobs were working as semiskilled operatives. Thus, for both men and women, semiskilled factory work represents one of the most important areas of long job tenure. The occupational distribution of men and women with jobs dating back 9 or more years is shown below.

	Men		Wor	nen

¹ Less than 100,000.				

The Pattern of Job Holding

Four major periods of job acquisition and tenure are discernible as the experience on current jobs of the workers employed in January 1951 is examined. These are shown in chart 1.

The first—already discussed—involves the 13 million workers still at the same job or business acquired prior to the United States entry into World War II. The second—embracing the smallest number of workers—is the period of the war itself. Persons still holding jobs obtained during this period numbered about 7 million or 12 percent of the total. This group was small

because millions of housewives and other wartime "extra" workers returned to nonworker status after the cessation of hostilities. Even those who remained in the labor force changed jobs in large numbers in the shift from war to peacetime production.

Twenty-six and a half million, or 45 percent, acquired their current jobs during the third period—extending from VJ-day to the outbreak of the Korean conflict. The fourth—dating from Korea—accounts for a little over 11 million persons, or about 20 percent of the total. Thus, about two out of every three employed people in January 1951 were working at jobs which they obtained only since the end of World War II.

Importance of Demographic Characteristics

Job tenure varies significantly with the personal characteristics of workers, such as their age, sex, and color. Detailed information on these factors is presented in table 1 which warrants three principal conclusions:

(1) The duration of a worker's continuous association with the same employer or business varies directly with age. The importance of the older worker among those with at least 9 years on the same job has already been shown. For both men and women, the average (median) number of years in continuous employment goes up consistently with the age scale.

(2) The length of job tenure differs considerably between men and women. There is not much difference in the duration of job-holding between boys and girls in their teens or early twenties. Differences begin to get marked as they enter the adult age groups when women drop out of the labor market at the time of marriage or child-bearing. In the older age groups, the median number of years of continuous job-holding among men is double that of women.

The effect of marriage and child-bearing on job tenure among women is clearly indicated in the following summary tabulation. The average number of years on the same job for married women with no children, for example, was more than double that of women with children and more than triple that for married women with children of pre-school age.

Median yeo job in Ja	nuary 1951
All employed women	2. 2
Single	2. 0
Widowed, divorced, or separated	2. 7
Married	2. 1
With no children under 18 years of age	2.8
With children under 18 years of age	1. 3
With children 6 to 17 years of age	2. 1
With children under 6 years of age	. 8

(3) Job tenure was consistently longer among whites than nonwhites, for both men and women and for both farm and nonfarm residents. The major reason for this disparity is, of course, the greater concentration of nonwhite jobs in casual or part-time work and in occupations with characteristically lower job stability. Both result in more frequent periods of unemployment and consequent interruption of job tenure. This appears to be particularly true of nonwhite women in farm employment. Table 1 shows, for example, that the proportion of white women in farm residence with jobs dating from the pre-World War II period was almost 10 times as high as that for nonwhites in the same category.

Occupational Differentials

One of the most important factors affecting the length of job tenure among American workers is the occupation in which they are employed. The proportion of workers with jobs dating back to before World War II and, consequently, the average number of years of continuous association with the same employer or business shows a consistent pattern of variation with occupation for both men and women (table 2).

The group with by far the longest job tenure were the farmers and farm managers—one out of every two in January 1951 having a job acquired at least 9 years ago. The average duration of continuous association with the same employer or business for workers in this category was almost double that of the next highest group. This is the category, of course, which includes a large number of older workers and which is the traditional area of long-term self-employment in the United States. Much of the same can be said of the group with the next largest proportion of long-term job-holding—the managerial and proprietary class off the farm.

In fact, the extent to which any group—age, sex, color, occupation, or any other categorycontains large numbers of workers with longduration job-holding depends in good part on the proportion in that group which is self-employed. The Census tabulations show a very sizable difference in the duration of job tenure between the self-employed and wage and salary workers. In agricultural employment, for example, 50 percent of the self-employed, but only 15 percent of the wage and salary workers, were engaged in the same enterprise for 9 or more years. As a result, there was a marked difference in the average (median) number of years of continuous work in the same job or business for both agricultural groups: 9.4 years for the self-employed and 1.8 years for the wage and salary workers. corresponding averages for persons engaged in nonagricultural industries were 5.0 years for the self-employed and 2.9 years for the wage and salary workers.

Professional and technical workers as a group also show the influence of self-employment on job tenure. The majority of persons employed in this kind of work have made a comparatively heavy investment of time, education, and specialized work experience and might be expected to show a large element of job stability. Table 2 shows that this group ranks high in terms of job stability. Closer examination reveals the additional fact, however, that the biggest contribution to this job stability comes from the self-employed among the professional workers—doctors, lawyers, engineers, architects, etc. The following brief summary tabulation makes this clear.

	Number of curren	years on at job
Professional and technical workers	Men 4. 3	Women 2. 5
Self-employed workersWage and salary workers—	10.0+	4. 1
Private industry	3. 9	2. 3
Government	3. 2	2. 5

¹ Times at which employees began work or persons associated with a business held in January 1951 have been grouped into four consecutive periods of crisis or economic change. Pre-World War II covers time prior to December 1941; World War II extends from December 1941 to August 1945; post-World War II begins September 1945 and ends June 1950; post-Korea covers July 1950 to January 1951, the time of the sample survey.

 $^{^2}$ Figures may not add to 100 because of rounding. 3 Nonwhite includes Negroes, Indians, Chinese, Japanese. All others classified as white.

Private household workers	10.2		10.2	1.2		1.	

The industry in which the occupation is performed also has a significant effect on the length of job tenure among workers. This can be shown with particular force for the skilled craftsmen and foremen group which, with an average duration of 4.3 years on the same job (table 2), ranks very high among the major occupational groups in terms of long duration job-holding.

Industries in which seniority plays a pivotal part (e. g., railroads) or employment conditions in general are much more stable (e. g., utilities) have very high rates of job stability in comparison with such industries as trade or construction in which employment is much more intermittent and seasonal. The following tabulation shows the situation among the male skilled group in January 1951 and accounts for the six industries which employed 80 percent of all the men in that category.

Finally, training time, skill level, and specialized work experience are also important factors in differentiating the various groups in terms of

long-term association with the same employer. This is illustrated by the position of the three skill levels which bulk so large in the Nation's factories—the skilled (craftsmen), semiskilled (operatives), and unskilled (nonfarm laborers)—as well as the position of the service groups, shown in table 2.

Occupational Changes by Age

Job tenure among younger persons, especially boys and girls in their teens, is of course very short. Many of them are holding only part-time or intermittent jobs while attending school, and those who are full-time members of the labor force are concentrated in entry occupations in which job-holding is characteristically short.

Almost 50 percent of the teen-age boys employed in January 1951 were working in unskilled jobs as service employees or laborers, both on and off the farm. (See table 3.) Another substantial pro-

¹ Less than 1 percent.

itized for FRASER s://fraser.stlouisfed.org Ieral Reserve Bank of St. Louis portion (22 percent) were working in semiskilled operative jobs. Among the girls in this age group, concentration within a few occupational groups is also evident. One out of three was working in a clerical capacity; an almost equal proportion were employed as service workers, including private household work.

The interaction of age, sex, and occupational distribution, indicated by table 3, shows very clearly the variation in occupational composition with age. Thus, the age group 20–24 years, with more education, training, and work experience, already shows a marked difference in occupational distribution from the teen-age group. The difference is especially noticeable in the reduction in the proportion of both men and women employed in unskilled jobs. For example, the proportion of men 20 to 24 years of age in laborer (farm and nonfarm) or service jobs was half that of the group 14 to 19 years. Similarly, there was a reduction

of the number of women in service jobs (including private household) from 32 percent in the age group 14 to 19 years to only 12 percent among those 20 to 24 years old. On the other hand, somewhat higher proportions begin to appear in the professional, managerial, and craft groups.

In the groups beginning with age 35 and ending with age 64, the occupational distribution shows little change and is characteristic of the pattern of work among adult members of the labor force. Changes again become marked among men 65 years and older: higher proportions reappear among the unskilled groups and, of course, the proportions in the self-employed and managerial categories, especially on the farm, become significant. Among the older women, too, there is a very noticeable reappearance of a substantial proportion of workers employed in unskilled service jobs and a corresponding decrease in such categories as clerical and semiskilled operative work.

Errata

In the article, "Survey of Consumer Expenditures in 1950," which appeared in the August 1952 Monthly Labor Review, pages 125–133, several clerical errors occurred in the figures.

On page 125, paragraph 2, the figure for the preliminary estimate of total average outlay of urban families of two or more persons was given in error. The figure given was \$4,700; the correct figure should be \$4,550 (rounded from \$4,539). The percentages relating outlay to income on this same page were, however, correct, since they were based on the correct outlay figure of \$4,550.

On page 126, paragraph 2, the percentages of the consumer units drawn in the sample who did not report were given slightly in error. The correct rounded percentages should be: about 4 percent of consumer units did not meet the eligibility requirements defined for the survey; 10 percent furnished incomplete or otherwise unusable information; 6 percent refused to be interviewed; and 4 percent could not be found at home after repeated visits.

It should be emphasized that all the figures presented in the article are preliminary and are subject to later correction, as final results are tabulated and adjusted for the variations among cities, among occupational groups, and among income classes, in the percentage of consumers' units unable or unwilling to provide information on their income and expenditures. The estimates for the average of the 91 cities, presented on page 125, are also the results of preliminary, unadjusted calculations. A technical discussion of the consumer expenditure data from this survey will appear in the October Review and copies of this article can be obtained before publication upon request.

Labor Requirements for Building Air Force Housing

KATHRYN R. MURPHY AND EDWARD M. GORDON*

Housing construction for troop personnel is a limiting factor in the expansion of the Armed Forces in the early stages of mobilization. The military-recruitment program caused by the Korean crisis focused attention on the imperative need for additional troop housing. During 1951 and the first quarter of 1952, over 15 percent of the value of all contracts awarded for military and naval construction was to alleviate this need for troop housing.

To provide information of use in formulating policies aimed at the most effective use of the labor force in periods of defense mobilization, the Bureau of Labor Statistics is developing patterns of labor requirements for selected types of construction projects. The first in this series of labor patterns is for military barracks of the Air Force dormitory type. A related aspect of programming large-scale military mobilization involves deciding whether military service for workers with certain skills—for example, carpenters—should be deferred until their work as civilians expanding the military plant tapers off. Especially important in the recruitment problem is the amassing of labor to build the military plant.

Study of the case histories of three military-building projects for Air Force personnel suggests that while size of project made little difference in the length of time required for construction, it did affect the efficiency with which labor was utilized. The smallest project was 99 percent complete at the end of 34 weeks. But the largest took 7 weeks

less to reach that stage of completion. On the other hand, the number of man-hours (115,000) required for each \$1,000,000 of construction on the largest project was almost 20 percent less than on the smallest, and the value of work put in place per man-hour ² (\$8.69) was 25 percent greater.

The study reveals further that the majority of the site workers engaged in constructing Air Force housing were in the skilled trades and that carpenters were the largest single occupational group. In addition, there was a generally consistent pattern of employment, despite weather conditions and problems of prompt delivery of material and equipment. This pattern was characterized by a rapid expansion of the labor force a few weeks after construction started, with four-fifths or more of the total site employment concentrated in half the entire period of construction.

Development of Labor Patterns

Labor patterns summarize the number of various types of workers employed at the construction site each week from the beginning to the completion of construction. The patterns for federally financed projects are obtained by analyzing the weekly payrolls which contractors and subcontractors submit in compliance with the Prevailing Wage (Davis-Bacon) Act.

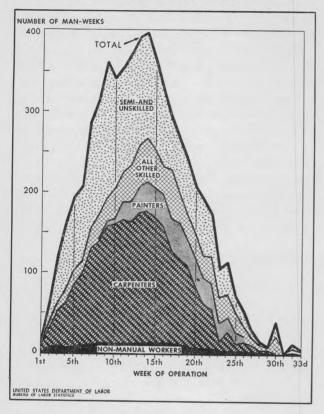

The payrolls cover all site workers employed on a single contract which may include a variety of buildings and facilities. Dormitory-type barracks are the major unit of troop housing included in the three contracts under study. Dormitories represented approximately 80 percent of the value of the contracts for Projects A and C, which included also such related construction as mess and administration buildings, Bachelor Officers Quarters, and some utilities, roads, sidewalks, and parking areas which are listed in table 1. The contract for Project B was for dormitories exclusively.

^{*}Of the Bureau's Division of Construction Statistics.

¹ The 19 troop housing projects being studied by the Bureau of Labor Statistics (completed in 1951 and early 1952) include the Air Force 25-year dormitories and Army 25-year barracks, to form part of the country's permanent standing defense installation, and the more temporary airmen's 10-year dormitories. The labor patterns presented in this article have been developed from payrolls submitted to Army Engineers in charge of 25-year projects at three established Air Force bases in different sections of the United States. These patterns will later be combined with those in preparation for other projects to obtain labor patterns for all types of troop housing.

² Obtained by dividing the v lue of contracts for construction and equipment by the number of man-hours worked on the project site.

Man-Weeks of Labor by Week of Operation, Selected Occupations, Project B

Dormitory Characteristics

The 25-year dormitories studied are two-story buildings with partial basements containing laundry, storage, and utility rooms. Heating equipment may be in the basement or upper floors, depending on the type of heating system used.

The buildings are of frame construction, with concrete and masonry foundations and basements. The outside walls are asbestos shingle siding over wood sheathing. Double-hung wooden frame windows are used on the first and second floors, the basement windows are steel-frame. The roofs, which are almost flat, have a built-up surface of gravel and pitch and are insulated.

Wood is used extensively for the interior finish of the living quarters. Floors are wood covered with asphalt tile. Walls of the bedrooms, lounges, and hallways combine hardwood or plywood wainscoting with a painted wallboard finish on the upper walls and ceilings. Plywood and wood cabinets, drawers, and shelves in the bedrooms provide individual wardrobe and closet space for

each occupant. Toilet rooms contain shower stalls and have tile floors, ceramic tile wainscoting, and plastered upper walls and ceilings.

Labor Requirements and Cost

Although individual contractor's and worker's performance are important factors in cost, experience on the three troop-housing projects suggests that labor was utilized more efficiently as the number of dormitory buildings covered by the contract increased. The value of work put in place per man-hour was \$8.69 on Project A with 25 dormitory units and some mess facilities and utilities, \$7.54 on Project B with 17 dormitories, and \$6.92 on Project C which included 4 dormitories, mess facilities, and BOQ's (table 1). The man-hours required to complete \$1,000,000 of work rose from 115,000 on Project A to 133,000 on Project B and 145,000 on Project C.

Moreover, the ratio of labor cost to total contract value increased from 22.1 percent (Project A) to 27.7 percent (Project B) and 30.7 percent (Project C). The relatively low ratio of Project A compared to the other two projects can be attributed to its lower average hourly earnings. However, when hourly earnings on all projects were assumed to be the same as on Project A—\$1.92—the ratios of payrolls to total contract value would still vary from 22.1 percent on A to 25.6 percent on B and 27.8 percent on C.

Table 1—Summary of contract value, amount of earnings, and employment on selected |contracts for Air Force housing, 1951

Item	Project A	Project B	Project C

Journeymen: TotalApprentices: Total	48. 0 3. 9	58. 8 1. 1	68. 4 2. 9					
Semiskilled and laborers	45.4	1 36. 3	24. 4					
Nonmanual workers	2.7	3.8	4.3					
Total workers	100.0	100.0	100.0					
Total man-weeks of labor 3	9,605	6,095	3, 570					

¹ Nine percent of the workers on this contract were classified as helpers which was higher than the proportion of helpers on the other two contracts. The craft distribution of helpers was as follows: electricians, 2.0 percent; pipefitters, 2.7 percent; plumbers, 3.1 percent; all others, 1.2 percent.

2 Less than 0.05 percent.

3 Number of workers shown on weekly payrolls.

Occupational Distribution

The majority of workers constructing troop housing were in the skilled trades (table 2). Payrolls for the three projects showed considerable variation, however, in the proportion of skilled workers used-52 percent on Project A, 60 percent on Project B, and over 71 percent on Project C. Project A also showed the highest proportion of apprentices among its skilled workers—1 apprentice for every 12 journeymen, as contrasted with 1 for every 57 on Project B, and 1 for every 23 on Project C. The proportion of semiskilled workers and laborers on Project A was almost double that on Project C.

Such differences in the proportions of skilled and unskilled workers employed on the same type of construction may be explained to some extent by local practice in the division of work, which arises often from variation in the extent of unionization in different sections of the country, and in the availability of certain types of skilled workers.

Carpenters were by far the largest group of skilled workers on these projects where woodframe was the basic type of construction.

proportions of carpenters ranged from 27 percent of all workers on Project A to approximately 40 percent on the other two projects. Project A had the highest ratio of laborers, many of whom were probably engaged on carpentry jobs. On all three projects, carpenters outnumbered by approximately 4 to 1 the next largest skilled groupplumbers on Project A, and painters on Projects B and C (table 2). Sizable numbers of pipefitters were employed on the dormitories on the two bases using steam heat. For the third base, using forced air gas heat with a duct system, the payrolls showed few pipefitters but a comparatively high proportion of sheet metal workers.

² Weeks of operation are payroll weeks regardless of the amount of work performed during any 1 week.

³ Each period represents 10 percent of elapsed time from beginning to completion of construction.

Construction Time and Progress

Speed was a prime consideration in the construction of troop housing, undertaken after the outbreak of hostilities in Korea. The contracts required that work was to begin within 10 days after the award date. They further specified that the contractors were to use night shifts and overtime operations if necessary to maintain the approved progress schedules. Some contracts set "Beneficial Occupancy" dates, prior to completion dates, for part of the buildings. Under such arrangements, the Air Force was to be able to use some dormitories for sleeping quarters by a certain date, while the contractor continued work on the exterior painting, basements, grading and

filling, and similar jobs for which a later completion date was set.

Contracts for the three dormitory projects under study were awarded in February, April, and May, 1951. Most of the work was scheduled to be completed within 150 calendar days after the contract-award date. The original completion date for each contract was subsequently extended as delays due to inclement weather and inability to obtain materials and equipment developed.

Actually the elapsed time from the beginning to completion of construction on the three projects ranged from 33 to 44 weeks. By and large, size of project made little difference in the time required for substantial completion. All three

Number of workers shown on weekly payrolls.
 Weeks of operation are payroll weeks, regardless of the amount of work performed during any one week.

³ Includes both manual and nonmanual workers.

projects reached 99 percent of completion between the 27th and 34th week of operation. After this point, a few workers would be on the payroll for 6 weeks or longer before the projects were entirely completed. The final 1 percent of the work on the largest project (A) was spread over 17 weeks while the contractor was waiting delivery of kitchen equipment to be installed in the mess.

Size, however, affected employment levels over the life of the contract. The work was accomplished in approximately the same time regardless of the project size by recruiting labor more heavily on the larger projects during peak construction periods and by the use of extensive overtime. Peak employment on the largest project was about 650 workers, compared with a maximum force of about 180 on the smallest.

The labor patterns for these projects all show a rapid buildup of the work force. The bulk of the employment was concentrated in about half the life of the contract and for the balance of the time a relatively small force was on the payroll. Maximum employment for a single week was 6.8 percent of the total man-weeks worked on Project A and occurred in the sixth week; on Project B, 6.5 percent in the 14th week; on Project C, 5.0 percent in the 12th week. Detailed progress reports obtained for two projects indicated that if distributions of man-hours worked were available they would show an even greater intensity of activity at the height of construction than do the employment figures. Contractors not only increased the number of men on the job but also scheduled workweeks of 60 to 68 hours to get back on schedule after they were held up because of bad weather or lack of material.

To facilitate comparison of progress on the three contracts, the number of weeks that construction was under way on each contract was divided into 10 periods as shown in the lower section of table 3. Employment was relatively low during the initial tenth of the operation on all three projects when materials, equipment, and workers were being assembled for the job. At least 80 percent of the employment on each project was concentrated in the second through the sixth periods. Seven to 14 percent of the employment on the three troop-housing projects was spread over the remaining 40 percent of the construction time.

When the basements were being excavated and

the foundations prepared, all three projects employed small crews consisting almost exclusively of machine operators, carpenters, and laborers. The two larger projects had a few plumbers roughing in plumbing during this initial period (table 4). By the fifth week, as framing got under way, the number of carpenters on the job began increasing rapidly. At the same time, increasing numbers of other types of skilled workers were brought on the job for the wiring, plumbing, insulating, and interior finish. On these large-scale projects of identical dormitories, some buildings were virtually completed when others were in earlier stages of construction.

During the next few weeks when framing, roofing, and siding operations were in full swing, overall employment as well as the employment of carpenters and laborers was at its peak. Between the 10 and 15th weeks, lay-offs started for the two major groups—carpenters and laborers—and total employment began to taper off. Peak employment for painters, plumbers, electricians, and most of the other skilled trades came after employment of carpenters and laborers had begun to decline. This pattern shows up clearly in the accompanying chart, which is based on figures in table 4 for Project B, which consisted entirely of dormitories.

The experience on these three projects illustrates the short period of employment on a particular job and is characteristic of the work history of large numbers of workers in the building construction industry. On the largest project over 200 carpenters were on the payrolls from the 6th through the 10th week after construction started; by the 16th week the number of carpenters had been reduced to less than 100. Concurrently, the number of semiskilled and unskilled workers declined from over 300 to approximately 160. Progress reports available for two projects indicated that contractors experienced little difficulty in expanding employment rapidly when equipment and materials were on hand and weather conditions were favorable.

Approximately three-fifths of the workers employed on the troop-housing projects studied were on the prime contractors' payrolls. This is in line with general experience in many types of building construction. The balance of the labor force was scattered among about a dozen subcontractors on each project (table 5). The prime contractor hired virtually all of the carpenters and

most of the laborers. The largest subcontracts were for painting, plumbing and heating, and electrical work.

Hours and Earnings

Wage rates on troop-housing construction were based on wage determinations of the Secretary of Labor as provided in the Prevailing Wage Act and reflect local labor market conditions. Rates paid for laborers varied considerably on the three projects as follows: \$0.97 (later raised to \$1.06) on Project A; \$1.15 on Project B; and \$1.52 on Project C. The rates for the major groups of skilled workers on these three widely scattered projects varied somewhat less. The modal hourly rates for carpenters were \$2.125 on two projects and \$2.20

on the third. Painters were paid \$2.00 per hour on two projects and \$2.275 on the other. Rates for electricians varied more—from \$2.15 to \$2.50. The range for plumbers was from \$2.25 to \$2.625. In general, the rates paid were higher than those predetermined under the Prevailing Wage Act.

Average hours worked per week on construction varied from 33.6 for Project C to 41.3 for Project B. Forty hours is the regularly scheduled workweek for construction workers. To maintain an average of 40 hours or longer for 30 or more weeks involves overtime on a large scale for considerable periods to offset the inevitable time lost due to bad weather or when materials or equipment do not arrive as scheduled. The prime contractors on Projects A and B averaged 40 hours or more per week. For part of the time, the scheduled week was 68 hours—six 10-hour days with 8 hours on Sunday. Several subcontractors, especially on Project B, averaged 40 hours or more. Project C, the over-all average was lowered by the relatively short workweek (under 30 hours, on the average) during the first 7 weeks and the last 10 weeks of the construction period.

Generally subcontractors' average workweeks tended to be lower than the prime contractors' on these projects, particularly on the smaller subcontracts. For example, it might take the plasterers only 3 or 4 days to finish one group of dormitories, and they would return for another partial week when work on other buildings had progressed to the plastering stage.

Average hourly earnings, including overtime, ranged from \$1.92 on Project A to \$2.12 on Project C. Hourly earnings for employees of the prime contractors were \$1.86 on Project A and \$2.06 on the other two projects. The lower average on Project A resulted from the relatively high proportion of laborers employed. In most instances, the average hourly earnings on subcontractors' pay rolls were below the occupational wage rates for the trade because of the inclusion of helpers and laborers. Occasionally overtime resulted in earnings averaging somewhat higher than the hourly rates.

Highest average weekly earnings were \$86.25 on Project B, where the workweek averaged over 41 hours. On the other two projects average weekly earnings amounted to approximately \$72.

Labor and the Savannah River AEC Project: Part IV

M. MEAD SMITH*

Editor's Note.—This installment brings to a close the article examining the effect on the surrounding community of the construction of the South Carolina atomic energy project. The first three parts explored problems of manpower, and wages, unionization, and housing. All four parts will be reprinted as a single bulletin which, it is hoped, will usefully portray the more serious social and economic problems engendered by such situations and which may help guide appropriate officials to easier solutions.

IV—Community Facilities and Social Changes

Schools were crowded in November 1951, and water, sewage, and other community facilities were heavily loaded in the Savannah River Plant (SRP) communities, ¹ regardless of size: the larger communities, although having more extensive facilities, had absorbed major population increases; the smaller towns had more limited facilities with which to meet the needs of even small population additions. But expected social problems had not been encountered, and piecemeal actions to meet particular needs as they arose had made it possible to absorb, without major dislocations, the more than 10,000 SRP in-migrant workers and those family members accompanying them. The fact that problems had not yet "lived up to expecta-

tions" was attributed by some observers to the SRP hiring delay (see Part I, Monthly Labor Review, June 1952, p. 631). Serious dislocations were expected when the construction force again rose sharply and as the proportion of in-migrant workers increased. Yet local leaders repeatedly commented that "you just can't tell what people will decide to do."

Planning for broad expansion of facilities was considerable throughout 1951, particularly in Barnwell and Augusta, where long-term development and industrialization were being promoted. Most of the plans, however, depended on special Federal aid to defense communities over and above established Federal assistance to the States—and such aid proved disappointingly small when finally authorized in the fall of the year. Programs were being adjusted accordingly, at the time of this study.

Being designed to meet the immediate and future needs of project personnel only, most of the SRP-incurred expansion was not expected to improve existing conditions. Nevertheless, some long-term improvement would inevitably result, local sources pointed out, either because additions were permanent by nature (whether intended to meet temporary or permanent needs) or because they were better than facilities previously in use. In the larger communities, emphasis was placed on construction of permanent rather than temporary facilities, including housing as noted previously. Further, leaders in both Aiken and Augusta anticipated that the newcomers would make important contributions socially and culturally as well as through added business. In contrast, some observers anticipated that the smaller towns would have little but a transitory business expansion to compensate for the "headaches" of a large-scale influx occuring chiefly during the period of temporary housing availability (see Part III, MLR, August 1952, p. 158).

Community Facilities

Individual evaluations varied widely on the current, as well as pre-project, status of community facilities—depending, apparently, on the individ-

^{*}Of the Bureau's Office of Publications.

¹ Conditions in the site towns of Ellenton and Dunbarton or the "newly grown" communities of Jackson and New Ellenton in general are not covered in this survey.

ual's viewpoint on Federal aid, long-term development, the urgency of any existing substandard conditions, and other such factors. Furthermore, since difficulties had not been as severe by November 1951 as had been predicted, some sources concluded that the problem had been altogether exaggerated; they judged the adequancy of existing facilities accordingly, even though the SRP construction force was far from peak size. One Aiken union official, who had been at the Oak Ridge atomic energy project throughout its construction, was highly critical of AEC's decision against providing a Government town, comparing SRP conditions most unfavorably with those at the Tennessee installation.

AEC testimony before a Congressional committee in March 1951 indicated that preliminary review of existing hospitals, schools, sewage disposal systems, and water supply revealed existing facilities "taxed almost to capacity." Most of the communities were, however, slow to act. An Aiken resident, active in civic affairs, pointed out that the SRP had "come as such a shock," and that AEC in the early days had been unable to give them information on what had been done. (Several others criticized AEC sharply for moving in without any advance planning or forewarning.) The "terrible period" immediately after the SRP announcement had provided both Aiken and Augusta with a preview of the possible problems, but the difficulties inherent in planning for future action were enormous.

Planning Problems. Although all community planning for facilities expansion depended on the location of the newcomers, it was impossible to predict with any degree of certainty the size. character, timing, and distribution of total population increases. AEC provided estimates of project manpower totals and the proportion of workers expected to be in-migrants (estimated to be 70 percent at peak); as a basis for planning school and housing expansion, estimates were also made of the probable family breakdown of workers (assuming that 60 percent of construction and a somewhat higher proportion of operations personnel would have families) and the probable total number of persons involved (applying the national average of 3.5 persons per family). The obvious uncertainties inherent in these estimates were augmented by such complications as the in-migrant turn-over rate; the number of in-migrants seeking jobs but not getting them; the question of whether family members other than the head of the household would work; the extent to which workers' needs would be met by expansion of existing businesses rather than by new commercial ventures; and, for Augusta primarily and the others indirectly, the simultaneous expansion of Camp Gordon, the Augusta Arsenal, and Veterans Administration hospital facilities. (Local attitudes toward the SRP in particular and long-term development in general also helped to shape local expectations regarding population inflow as well as community planning.)

Demonstrating the uncertainties of the situation was the fact that estimates of the total influx at peak construction ranged from under 60,000 to over 180,000. (These forecasts were for the entire SRP area, including nearby Georgia and South Carolina counties less immediately affected than the four referred to in this article; total 1950 population of this area was less than 400,000.) The 180,000 was a preliminary estimate prepared by the Federal Security Agency (FSA) in connection with a quick survey of local facilities, existing and needed, made at the request of AEC in February 1951. SRP hiring had barely started; housing plans were not definite; and much of the information on community facilities was of necessity based on material furnished by local officials. Therefore, when the report was submitted to Congress at that time, FSA labeled it preliminary, with estimates subject to revision. It nevertheless received wide publicity in the SRP area and was extensively used in ensuing months by community officials, most of whom were convinced by November 1951 that the estimates were too high.

Lack of comprehensive and accurate information on the capacity of existing facilities was a further complication in planning. Moreover, an extremely limited number of specialists trained in community affairs was available in the area to plan or take action. As one observer pointed out, in a small town the mayor was a businessman accustomed to putting in perhaps a morning a week on city affairs, and city council members were also untrained in these fields; if the council finally reached a decision, there was no one to carry it out. Financing was also a serious problem for all the communities, large and small. The bonded indebtedness of

Richmond County, for example, had already reached its legal limit, according to local sources.

Help in assessing particular facilities and drawing up requests for Federal aid was provided by such FSA agencies as the Office of Education and the Public Health Service. Beginning in March 1951, the National Production Authority (NPA) maintained local offices in the area to review requests for priorities, such as for structural steel for Richmond County schools and steel pipe for water connections in Aiken; in June, NPA sent an experienced construction engineer to the area to study needs for priorities in the community program. The Housing and Home Finance Agency (HHFA) advanced interest-free loans for planning a hospital in Barnwell and additions to North Augusta schools and Aiken water supplies. Several of the communities hired private engineering firms as consultants to survey and recommend action. In addition, Augusta had a planning commissioner. hired before the project announcement. Barnwell employed a planning director early in 1951, who resigned, however, at the end of the year, and had not been replaced by mid-1952.

Coordination of planning was difficult—both within and between communities. Administrative responsibility was divided between municipal, county, and State authorities. In Augusta, for example, city officials were responsible for water and sewerage, roads, police, and recreation; the hospital was owned by the city but run by a separate authority; the county operated the schools. The head of the city's planning commission, in describing it to a reporter in October 1951, attributed its progress to a system he said was unique: the mayor and the chairman of the county commission served on the planning board as voting members, correlating city and county plans and activities. City-county cooperation was good, he said, although at the time of this survey instances of "jockeying for position" between officials at different levels were cited, in some fields, as increasing the difficulties of planning and acting. Further, no single area agency existed to plan for the increased social load, AEC being restricted to supplying information and cooperating in programs of local origin. (On July 1, 1952, the Office of Defense Mobilization designated a local representative to coordinate Federal activities relating to housing and community facilities and services in the area.)

South Carolina leaders had also organized the Western Carolina Council in the early summer of 1951, made up of representatives from cities and towns in eight counties within a 50-mile radius of the project. Established somewhat as a chamber of commerce for the area, the Council planned to work for civic, economic, and social welfare and to provide a forum for combined efforts. At a public meeting held by the Council in Aiken in mid-November, the chairman reported that action taken so far had consisted mainly of several meetings, at which information had been exchanged and a better understanding of mutual problems had been attained. A committee on welfare—first of a number planned on all types of problems—had recently been established, with representatives from each county and city. In addition, the Council secretary had written numerous letters to members of Congress and other authorities on the need for Federal aid.

The possibility of special Federal aid, perhaps the major factor slowing local action, influenced all planning, and much of the initial activity of community leaders was concentrated on estimating needs for such aid. In spite of AEC's repeated statement that provision of facilities for project workers would be left to the communities. the general tendency throughout the area was to assume that extensive Federal aid would be forthcoming. Local and South Carolina State officials pointed out that they had not asked for the project, nor even been consulted about it, and therefore the Government was responsible for providing funds to handle the problems created thereby. Some communities even hoped for sufficient Federal aid to make improvements already needed before the SRP announcement. In one town, for example, construction of a badly needed Negro school was delayed in the hope that it might be financed with Federal funds.

Existing Federal assistance, designed for long-term development, was largely limited to the interest-free loans by the HHFA for planning community facilities and some aid for school and hospital expansion. However, local expectations were buttressed by Congressional consideration of the draft Defense Housing and Community Facilities and Services Act and by the recommendations for extensive aid made by Federal agencies and community leaders at hearings held in Washington and locally during the first several

months of 1951. Aid finally authorized under the Act (see Part III, MLR, August 1952, p. 153) was limited largely to water supply and sewerage and refuse disposal facilities. (Some provision was made for fire and police protection, and streets and roads, but hospitals and health centers, recreation facilities, and day-care centers were excluded.) Total funds appropriated for defense areas throughout the country were "not enough for the project area alone, even if we could get the whole appropriation," according to community leaders.2 One municipal official pointed out that if it had been understood in the very beginning that no Federal aid would be provided, "things would have been a lot better." So far, he said, forecasts by Federal agencies—as to the rate and size of inmigration, needs, and erection of the various temporary structures—had been wide of the mark, and "there has not been one penny of Federal money spent in the area except on salaries and expenses of Federal investigators and surveyors."

As Congressional action was delayed throughout the summer and it became apparent that little aid would be authorized, community leaders began to re-assess their plans in terms of what could be accomplished with local and State resources, supplemented by the limited Federal aid already available. Re-evaluation was also being made in the light of population increases to date. Various comments in November 1951 suggested that the extent of Federal responsibility, particularly for temporary expansion, was still not clear. Some observers continued to predict that action would come for the most part only in response to practical and immediate needs arising in the course of the following few years. But others said that the communities were now alert to the problems and ready to act.

Municipal Services. All of the communities had programs for expanding water and sewage systems in November 1951, to be financed partly by themselves and partly by Federal funds, and most had begun to put these programs into effect. Enactment of the defense housing legislation had given impetus to community action not only because of the new Federal aid but also because adequate basic facilities were required for the HHFA-

programmed housing construction (see Part III, MLR, August 1952, p. 153). Facilities for this housing (which did not depend on the new Federal aid but were to be financed locally) were expected to be ready by the time the first units were completed, sometime in the spring of 1952. Although the Federal funds, available for subsequent expansion, were limited, one Federal authority in the area figured they would be adequate to meet the most urgent needs-primarily water. Application forms and regulations for submitting requests for Federal aid were not available in November. By mid-1952, some \$5 million of Federal assistance was reported to have been approved by the HHFA and the FSA for waterand sewer-facility projects in SRP communities (at an estimated total cost of nearly \$10 million).

The concentration of SRP workers made the water problem most acute in Augusta, North Augusta, Aiken, and Barnwell at the time of this survey. For most SRP communities, the water problem was one of expanding treatment, pumping, storage, and distribution facilities. North Augusta, however, was also without an adequate water supply. Its water came from springs which reportedly did not provide a sufficient volume during the dry periods (at which time water was obtained via a pipe line from Augusta), and development of a new water supply from the Savannah River was needed. A North Augustabusinessman said the town was ready to go ahead with a complete revamping of the waterworks when the project was announced and they had to "scrap" the original plans. In November 1951, town plans were once more complete, and the town was awaiting defense housing funds (to cover the cost above that originally planned) in order to go ahead.

Both Barnwell and Aiken had employed consulting engineering firms early in 1951 to recommend needed improvements in their water and sewage facilities, and a similar survey was under way in Augusta in the fall. Augusta officials indicated that the basic waterworks were sufficiently modern to be adequate and that fortunately an extensive and long-needed program of overhauling the water system had been initiated prior to the project's announcement. Currently, they were adding the necessary extensions to service new sections, and the main problem noted by city officials was the shortage of materials, notably pipe; the NPA office

² Congress initially appropriated \$15,250,000, of which \$4 million was allocated to FSA and the remainder to HHFA. Early in March 1952, FSA announced that about half of the \$4 million would go to the SRP communities.

in Augusta had helped a great deal in meeting such needs, however. Aiken and Barnwell had also laid large amounts of pipe, extending water lines to new housing. Trailer parks and some of the new construction outside city limits were served by wells.

Most of the communities used septic tanks for new construction during 1951. The South Carolina communities, including Aiken and its suburbs, already had a certain number of pit privies and individual septic tank systems in addition to whatever type of city sewage system was in use. Augusta officials early in 1951 described their system as in a deplorable condition, with mains too small, the city inadequately covered, much of the system in bad repair, and no sewage treatment plant (sewage from Augusta being discharged untreated into the river). Barnwell, too, reportedly had inadequate facilities for the existing population at that time, and Williston had no sewer system at all, using pit privies and septic tanks exclusively. The systems in the other towns were regarded as adequate for the preproject population, although an Allendale real estate man said in November 1951 that their sewer system was "just no good" and that the town had therefore applied for Federal aid.

Use of wells and septic tanks in the same areas initially caused some concern, but the wells had to be sunk so deep to get water that contamination was unlikely. While sewage facilities were overtaxed, Williston had the one situation particularly noted as dangerous in November 1951. Not only did the town lack a sewer system but also the houses were crowded together, making the use of septic tanks unsafe, according to one observer. New construction had aggravated a situation already bad, he said, and health officials feared the possibility of a typhus epidemic. He commented incidentally that, if expansion forced the town to do something about its long-standing sewage problem, the SRP would have produced a change of permanent benefit.

Most of the trailers in the area were reported to have their own plumbing facilities, connected to the trailer park sewage systems. The parks were subject to regulation, in Georgia as well as in South Carolina where the bulk of the project workers' trailers were located. SRP officials stated that there had been virtually no complaints on trailer sanitation at the time of this survey.

In their opinion, the assistance given by the Trailer Coach Manufacturers Association representative to local people in setting up the trailer courts had been a major factor in this regard.

Other municipal services requiring expansion included police and fire departments (equipment and personnel), street lights, street paving and repair, garbage collection, and recreation; most of the South Carolina towns lacked such basic regulatory controls as housing or building codes, or zoning ordinances. Scattered additions were made in these fields by the various communities throughout the period under review, as needs became pressing. For example, North Augusta as of August 1951 had a building and fire prevention code, a third policeman and second police car authorized, and a new garbage truck.

Some of the other communities had also expanded their police forces, and, in October 1951, the press announced that the SRP area would be assigned perhaps 300 or more special State constables for 2 years. Crime had not increased particularly, according to local reports, but the number of traffic violations and accidents had soared throughout the area. For instance, the Augusta police chief stated in October 1951 that arrests for drunken driving, speeding, and accidents had passed the 1950 total in only the first 8 months of 1951. Traffic was repeatedly cited as one of the most critical community problems—in terms of roads, parking, and congestion, as well as accidents.

Community-sponsored recreation was extremely limited in the SRP area. A field representative of the National Recreation Association was working with the communities on developing well-rounded recreation programs, and some action had been taken by November. Aiken, for example, had doubled its recreation budget, although this was insufficient for normal needs.

But little had been done to provide recreation for the large number of temporary construction workers. Movies appeared to be the chief amusement available in November 1951, and they were regularly crowded, particularly the outdoor drive-ins, of which several new ones had gone up since the SRP began. Augusta's clubs were also said to be much frequented, and numerous small drinking and eating places had been rapidly constructed to serve the SRP force. Du Pont had some company-sponsored recreational pro-

grams (basketball, softball, and bowling leagues, and dances), it was reported, but in November 1951 the company was not planning anything comprehensive for the construction workers.

In early July 1952, the HHFA reported that the shortage of recreation facilities was "a principal unsolved problem at this time." Indoor and outdoor recreational facilities at the dormitories and trailer camps accordingly were being planned. Du Pont also had received AEC approval for the operation of three recreation areas on the site near the plant boundary lines.

Schools. Increases in school enrollments between January 1951 and January 1952 ranged from 4 percent (80 pupils) in the Allendale school district to 69 percent (622 pupils) in the Williston school district,3 according to information obtained since this survey. (Numerical increases were, of course, greater in some of the other districts.) New enrollments in November 1951 were somewhat smaller in number and, as in other fields, fewer than had been anticipated. Nevertheless, existing classrooms were crowded. and in some Barnwell County schools-reportedly the "hardest hit" in the area-double shifts were necessary. All the counties had employed additional teachers—too many in some counties without additional buildings, according to local observers.

Schools had already been operating with maximum enrollments before major SRP hiring began, according to the FSA survey in early 1951. Several classrooms in each of the four counties referred to in this article were makeshift and, in some instances, hazardous to the welfare of the children. Aiken had more classrooms at that time than any of the other counties; enrollments were also far greater except for Richmond County which, in spite of fewer classrooms, had even more pupils than Aiken. Richmond County had a 2-year school construction program already under way. scheduled to be largely completed in the fall of 1951. Local residents stated, however, that this program had been initiated mainly because of the recent court decisions upholding the States' right to maintain segregated schools but requiring equalization of facilities (SRP in-migration was expected to affect white schools almost exclusively). In any case, local authorities stressed that this construction had been scheduled to provide only for a normal growth. Many of the school districts in the area were heavily pressed as far as teacherpupil ratio was concerned, and, according to some local authorities, many teachers had less than the desirable professional qualifications.

Since SRP hiring did not start until over half the 1950-51 school year had been completed, timing created fewer problems in planning school facilities than in other fields, but again the extent of the increased load was difficult to predict. Added to the basic uncertainties as to size and distribution of population increases were questions concerning the families brought in by workers: number of school-age children; level of schooling required; applicability of the 0.7 national average of school children per family to a large migrant construction force; 6 and the possibility that workers arriving after the the start of the school year would leave their children in school in the communities from which they came. Also children of site residents moving into nearby communities would swell enrollments somewhat, particularly in Negro schools.

Some Federal assistance was available for school construction under legislation enacted before the current emergency period. In June 1951, Congress authorized the Commissioner of Education to set aside from existing appropriations the funds necessary to provide school facilities in areas declared critical by the President,7 and, on the basis of the SRP manning schedule and estimates of anticipated housing (including temporary), the Office of Education and local school authorities worked out a program for the area. Federal aid granted could be used either for permanent or temporary school structures. Richmond County elected to use funds placed at its disposal (because of Camp Gordon as well as the SRP) only for enlargement of permanent school structures, certi-

² Barnwell County's three school districts were Barnwell, Williston, and Blackville; Allendale County's were Allendale and Fairfax; Aiken had nine, of which Aiken, North Augusta, and Ellenton were the main districts affected by the SRP; Richmond County was a consolidated school district.

⁴ Both South Carolina and Georgia were greatly increasing State educational outlays in 1951, which would benefit SRP operations personnel but were not expected to help solve the problems of the SRP construction period.

⁵ According to a community resources survey by an engineering firm engaged by Du Pont, the ratio in the white schools in the six main nonsite South Carolina towns ranged from 1:27.1 in Barnwell to 1:41.2 in Aiken and 1:41.6 in North Augusta.

⁶ Trailer surveys in the summer of 1951 suggested that the average was considerably lower, and the Office of Education permitted use of a figure no higher than 0.5 in applying for Federal aid.

⁷ Amendments providing for more extensive Federal aid to schools were "pocket-vetoed" by the President late in 1951.

fying that such construction would meet temporary as well as permanent needs. Aiken and Barnwell Counties claimed funds for both permanent and temporary school buildings, and Allendale planned only temporary structures.

A total of 187 temporary classrooms accordingly were scheduled to be put up in the three counties for the academic year 1951-52, the largest allocations being made to Aiken and North Augusta. Invitations to bid for the supply and erection of the temporary buildings had not been distributed by November 1951, however. Some observers still expected that the buildings might be available for use early in 1952, but one local authority pointed out that use of demountables did not mean simply setting up a quonset and "running the children into it." Although the metal walls could be put up and taken down readily, he said, wiring, plumbing, toilets, heating, and so on had to be installed and had to meet certain standards. Little information was available as to whether Augusta school construction was on schedule, and none of the federally aided permanent construction had been started in Aiken or Barnwell, although Aiken had obtained some land.

Increased enrollments affected conditions in the various school districts unevenly, reflecting the pre-project size and school capacity of the community as well as the actual size of the increase. Aiken had a numerically greater increase than did Barnwell, but the secretary of the Aiken Chamber of Commerce indicated that in general school facilities had proved adequate so far. In contrast, some Barnwell schools were not only operating on a double shift but classes were being held in churches, the Masonic temple, etc.; at the same time, the number of teachers recruited had been based on the assumption that temporary family housing would be available in the fall. Teachers must be hired for a full school term, and all those newly hired would be needed if, before the end of the current term, an influx of pupils materialized in the numbers originally anticipated. Otherwise, according to a local official, fewer additions would have been adequate, and the added outlay for salaries represented an unnecessary financial drain, for which funds had been diverted from other needed activities. Some Augusta residents pointed to the new schools completed or under construction and, while admitting that existing schools were crowded, were confident that

no serious difficulties would occur. Others maintained that Augusta schools were "overflowing," cited examples of unsafe schools and classes held in buildings other than schools, and doubted whether the new schools, even when completed, would be adequate.

The temporary buildings, once erected, were expected to be sufficient for project-connected children (as well as those of former site residents in these communities), provided employment schedules were not changed (see Part I, MLR, June 1952, p. 631) and Richmond County's permanent school construction program was successfully carried out. By mid-1952, 37 temporary school rooms had been completed in Aiken County (15 classrooms at Jackson; 8 at North Augusta and 12 others in the North Augusta school district; and 2 for Negro pupils at New Ellenton) and 5 in Allendale County (Fairfax); 32 had been completed but not yet accepted by school officials in Barnwell County (15 classrooms for white and 7 for Negro students at Williston and 10 for Negro children at Barnwell).

Queried on the long-run effect of the project, several observers commented that the demountables, while regarded as temporary, would be superior to some local structures which had outside toilets and no central heating or hot water. If the demountables were not taken down after the construction period, they might actually constitute some net improvement of school facilities for the area. School standards, professional qualifications of teachers, and so on continued to occasion some concern, both for the current period and over the long run. An Aiken resident, commenting that a large proportion of the teachers were new, said that many were young people "just out of school" and inexperienced in handling students sometimes little younger than themselves.

Hospitals. Additional beds had been made available in Aiken and Augusta hospitals to meet increased population needs as of November 1951, but it was generally conceded that the main pressure from SRP in-migration was yet to come. Pre-project plans for substantial hospital expansion in Augusta, already the area's medical center, were revised somewhat after the SRP announcement, and plans were drawn for a small hospital in Barnwell County, which had no hospital. When provisions for hospital aid were eliminated from

the defense housing legislation at the last minute, local officials urged AEC financing for planned hospital expansion. Project officials, however, continued to regard this as a local responsibility. Further, various authorities in the area still disagreed in November 1951 on both the extent of the need and the best way of increasing capacity.

The costly and lengthy nature of hospital construction, and the difficulties of obtaining additional physicians and nurses made existing facilities and plans already in progress particularly important in this field. Augusta's University Hospital was the only large hospital in the immediate SRP area,8 and one observer noted that it was virtually the only one with an adequate staff of doctors (nurses, a critical occupation nationally, were in short supply in all of the hospitals). Described as old and in need of remodeling and renovation, it had some 475 beds and a high occupancy rate at the time of the FSA survey; a 200-bed addition to the hospital had been planned before the SRP. A new 100-bed hospital was already under construction at that time, scheduled to be completed in the spring of 1952; it was being constructed with Federal assistance granted under the Hospital Survey and Construction Act (Hill-Burton), designed to assist long-range State plans and requiring substantial local contributions. In addition, the Georgia State Legislature had authorized the sale of bonds for construction of a 750-bed State teaching hospital in Augusta.

The University Hospital had many South Carolina patients because of its proximity and the lack of comparable staff or facilities in the South Carolina counties. So-called "problem cases" in Aiken County, for example, were sent to Augusta. With a recent addition constructed with the aid of Hill-Burton funds, Aiken County General Hospital (that county's only hospital) had approximately 150 beds at the time of the SRP announcement, but a number were not then in use, reportedly because of the shortage of nurses. Allendale General Hospital had 27 beds, generally regarded as adequate to meet SRP-incurred needs.

By converting private rooms to semiprivate, approximately 100 beds had been added to the University Hospital as of November 1951. At a series of fall 1951 meetings, project and Federal and State health officials discussed the desirability as well as the financing of revised plans for expansion of the hospital. Attention was called

to the nonavailability of steel for hospital construction, the possibility that extra beds or additions which would use existing central facilities might be sufficient to meet temporary needs, and the importance of avoiding construction of facilities which might be superfluous after the SRP construction period. According to recent information, a Hill-Burton project for approximately \$1 million for renovating and improving University Hospital was approved early in 1952. No new beds were to be added, however; neither State nor Federal Public Health officials would approve financial aid for expanding the hospital because of the new State Hospital. (A Federal grant also had been urged for the latter—to cover the added costs of accelerating its construction and thereby make it available for part of the SRP construction period; with no such aid authorized, the hospital was not scheduled for completion in less than 3 to 4 years.)

The extra beds in the Aiken hospital had been put in use by mid-1951, and in November consideration was given to opening up an unfinished floor (with a 30-bed capacity) in the pre-project addition. A local leader, interviewed at that time, said that this floor could presumably take care of the added population but that the additional staff required would be very difficult to get. Another Aiken resident, active in hospital work, commented that lack of nurses had already forced them to employ untrained aides.

Apart from hospital capacity, health departments in the counties affected were generally described as understaffed and short of money.¹⁰

Social Problems and Changes

Both short-run social problems and long-range social and cultural changes were still expected at the time of this survey. The former were anticipated largely in connection with the temporary barracks to be put up in the smaller towns, which had been reduced in number and were relatively little occupied by mid-1952, as noted. The long-range changes were predicted mainly in the com-

⁸ Two Veterans Administration hospitals were also located in Augusta.

Or to Orangeburg County (adjacent to Aiken and Barnwell Counties on the east). This county had a 200-bed general hospital which served five counties, including Barnwell and Allendale, and several small specialty hospitals.

 $^{^{10}\,\}mathrm{A}$ brief section on commercial facilities will be included when this article is reprinted as a bulletin.

munities where the permanent workers were expected to settle, and a variety of local sources indicated in November 1951 that, even at that early date, such changes were becoming evident.

Social Problems. Except for isolated instances, few local residents interviewed in November 1951 had observed any increase in crime, juvenile delinquency, prostitution, or other such social problems—in spite of the large number of people who had already arrived in the area and the general lack of recreation facilities. Lack of major social problems was attributed by some people to the dispersal of workers' homes among several established communities. Others suggested that, because of Augusta's relatively greater facilities, the concentration of single workers there had tended to minimize the problems or at least had made them less apparent to local residents. Still others, however, pointed out that recreation was a more important problem for single men, and emphasized once more the change in the migrant force to men accompanied by families.

Augusta was frequently described as having "always been a wide-open town" and local residents said that "entertainment on the light side" had increased substantially since the SRP and Camp Gordon expansion. In September 1951, a Superior Court judge in Augusta, commenting favorably on the newly opened "Teen Town" (a center sponsored by the Junior Women's Club). said that "the increasing trend toward crime and law violation by teen-agers" had been brought forcibly to his attention from first-hand observation. Some local officials described "a lot of drunkenness" in Augusta, but several residents said that if crime and drunkenness had increased it "wasn't obvious to the average citizen." Most people contrasted conditions with those during the war, when Augusta was flooded with unattached servicemen from Camp Gordon, and stressed that even with the "double expansion," of the Camp and the SRP, the problems were not as great.

The smaller numbers of single workers in the South Carolina towns, most of whom reportedly went to Augusta for entertainment, had similarly created few new problems, although organized prostitution was reported to have "hit" Aiken in the early fall of 1951 and some sources described a "rather bad situation" in Ellenton and New Ellenton. Local fears concerning trailers had also

proved unfounded, according to various observers; they were regarded as unlikely to create future special problems for nearby communities. Emphasis was laid on the fact that trailer migrants "regard their trailers as their homes these days," and also that only the better-paid workers could afford to buy trailers.¹¹

Those South Carolina towns scheduled to have temporary barracks located near them, however, continued to be apprehensive over the arrival of such a large body of single workers. Barnwell officials, for example, with the prospect of "1,500 strangers in town," feared trouble even though the men would probably go to Augusta for amusement. They were reported to have under consideration the barring of construction workers from local events, such as the regular square dances, or, if necessary, the elimination of such activities during the period of major influx. Allendale officials were even more concerned; if the site were closed to traffic, Augusta would be nearly 70 miles around the site from Allendale and the nearest city in the other direction was even farther. One observer said that Allendale was not even attempting to plan, but "just throws up its hands in despair."

Welfare authorities, particularly at the State level, were "definitely awake to the problems" which could arise, according to local observers in November 1951. Welfare activities had already increased substantially in the area. In Augusta, an integrated welfare council had been organized, which had established a community chest organization and had helped such private agencies as the Travelers' Aid and the National Recreation Association to establish themselves and the Red Cross to increase its organization. In the fall, the Augusta YWCA announced plans for an expanded program and representatives of the national Y spent a few days in the area, studying the problems and helping formulate plans; by November classes for women had been started, and a day nursery. The American Social Hygiene Association also sent a representative to Aiken in the early fall, and, at local request, again in November, to discuss the possibility of arranging a leadership training institute in the handling of problems which had

¹¹ Trailers were priced in the area at from about \$1,500 for a used 1-bedroom trailer to some \$5,000 for a new 2-bedroom trailer, with a one-third down-payment required. According to a Trailer Coach Manufacturers Association survey, the annual income of the average trailer resident topped the national average, being over \$4,000 on both the East and West Coasts.

developed elsewhere with large groups of migrant workers. The danger of such difficulties arising was also discussed at the Western Carolina Council's November meeting, in connection with the council's new welfare committee.

The churches, numbering over 150 in the Augusta metropolitan area according to the Chamber of Commerce, were also reported to be expanding their activities. A newly appointed area director for the National Council of Churches had arrived in the area just prior to this survey.

Social and Cultural Changes. One Augusta "oldtimer" was voluble on how "the place is full of strangers . . . You have to wait in line for movies . . . The town even looks different.": similar comments were frequently quoted. Most community leaders interviewed, however, indicated that the temporary construction workers had been accommodated without noticeable friction, although they were not "a part of the community" to any great degree. Workers living in trailers outside Aiken, for example, came in to town to market but otherwise were fairly selfsufficient in their trailer communities. In the opinion of some observers, those workers who lived in rooms also regarded themselves as too transient to be interested in local affairs and tended to mix largely with other SRP workers.

Permanent AEC and Du Pont operations staff, on the other hand, residing chiefly in Aiken and Augusta, were repeatedly described as having become remarkably well integrated. Both SRP and local residents remarked that at first the Aiken people resented the newcomers, but gradually they had been accepted and by November were "pretty well assimilated." Many were even active in community affairs.

Aiken and Augusta leaders consistently emphasized that they expected these new permanent residents to make a large social and cultural contribution. The head of the Augusta YWCA pointed out, for example, that some of the newly arrived SRP women had worked in the Community Chest drive, and that benefit thus had been derived from other communities' experience in such activities. The concert organization in Aiken had more members than ever before, making possible a "bigger and better" concert program. Formation of Aiken chapters of the American Association of University Women and League of Women Voters

was also under discussion. A major reason given for the SRP women's desire to form a League chapter quickly was their discovery that they would be ineligible to vote in the 1952 Presidential election; South Carolina required 2 years' residence to establish the right to vote, in contrast to the 1-year requirement in Georgia and elsewhere. The group mentioned wanted to work for a change in the law, according to local sources, and, even though that was impossible before the coming election, to make their opinions heard.

Several persons interviewed also expected the newcomers to have a "healthy" effect on local politics. More than one Augusta resident pointed out that the incoming people had different ideas, were not committed to local parties, and would have the right to vote after a year's residence they were a sizable enough group, these residents suggested, to "worry" the local politicians, who might modify existing policies to gain their support. This was a particularly opportune moment for any such change, it was pointed out, since one of the two major parties in Augusta (both being wings of the Democratic Party) had split in the fall 1951 mayoralty election, and party lines and policies were in process of being reshaped.

All the new ideas and experience which the newcomers brought to the area and the mingling of people from all over the country would also eventually produce a change in local attitudes, most sources agreed. Augusta's new interest in welfare was largely attributed to the new residents, and Augusta officials were being "stirred up" and made aware of inadequate conditions, according to some people. The new arrivals could not vote yet, but they could talk, write letters, and otherwise exert pressure and make the needs clear.

Again it was emphasized that such effects had not yet been fully felt. Less than a year had elapsed since the SRP announcement; many SRP personnel did not bring their wives and families immediately; and the temporary expansion had not reached its peak. Many local residents continued, of course, to view the question of change in terms of a "3-year temporary disruption" and to expect a return to the "status quo" when the construction workers departed. Most local leaders interviewed on this subject, however, seemed to share the opinion of the Barnwell official, who said: "You can't bring several thousand people to a town of under 2,000 and not have change."

Summaries of Studies and Reports

Thirty-fifth Conference of the International Labor Organization

THE ADOPTION of a Recommendation on industrial relations and a Convention on Minimum Standards of Social Security occupied a position of prominence in the deliberations of the Thirty-fifth International Labor Conference held in Geneva, Switzerland, in June 1952. Also considered were questions relating to agricultural labor, health of workers in places of employment, maternity protection, and the employment of young persons underground in coal mines. The Conference also approved a budget of \$6,223,368 for 1953 (\$1,554 less than for 1952), admitted Libya as the sixtysixth member of the Organization, adopted a resolution setting forth six principles designed to insure the independence of trade-unions from government control, and reviewed the growing "operational" program of the Organization.

The 4-week Conference was attended by 218 delegates representing 60 countries; 184 government advisers; 115 employers' advisers; and 137 workers' advisers. Total attendance was 654 including the representatives from the newly admitted United Kingdom of Libya. Although no dissenting votes were cast in connection with Libya's membership application, the Polish and Czech Government delegates took the opportunity to make speeches attacking the Western powers for continuing to dominate that country. The challenge over the seating of Chinese representatives by these two delegations and the rejection of the challenge by the Credentials Committee were repeated this year as in 1951.

In addition to delegates and advisers, the thirty-fifth ILO Conference was attended by many observers from the United Nations as well as specialized agencies and nongovernmental organizations. The following groups were represented: International Confederation of Free Trade Unions; International Cooperative Alliance; International Fed-

eration of Christian Trade Unions; International Federation of Agricultural Producers; International Organization of Employers; and the World Federation of Trade Unions. The Saar was also represented by an observer delegation.

The Conference elected José de Segadas Vianna, Brazilian Minister of Labor, Industry, and Commerce, as its president; George Philip Delaney, United States workers' delegate, as worker vice president; and Julio B. Pons and Vyankatesh V. Dravid as employer and government vice presidents. Frances Perkins, former U. S. Secretary of Labor and currently a U. S. Civil Service Commissioner, was elected chairman of the Committee on Workers' Health. During the sessions of the Conference, three Conventions, three Recommendations, and five substantive resolutions were adopted.

The Convention on Minimum Standards of Social Security was adopted by a vote of 123 for, 32 against, with 22 abstentions. The Convention deals with 9 branches of social security: medical care, sickness, unemployment, old-age, employment injuries, and family, maternity, invalidity, and survivor benefits. It is not binding upon a country unless ratified by it, and ratification may be made on the basis of only 3 of the 9 branches which the ratifying country may select, providing that at least one of these is selected from among the unemployment, old-age, employment injury, invalidity or survivors' benefit branches. The Convention takes into account diverse methods of social security and recognizes not only compulsory social insurance but voluntary private insurance. The employers and the delegates of some Governments, including the United States, favored the form of a Recommendation instead of a Convention. An amendment to this effect, however, was defeated by 43 votes to 111. The employers also believed that its coverage should be limited to employees only, on the grounds that ILO was not competent in fields affecting nonemployees. They proposed separate instruments for dealing with each substantive part or program. Their proposals

on these points were defeated and the Convention, as finally adopted, appears to represent a substantial achievement, although it probably does not satisfy all parties concerned.

The texts of the Convention and the Recommendation on Holidays with Pay in Agriculture were developed with a minimum amount of controversy in committee as workers' and employers' groups were in agreement on most points and opposed amendments to the Office text. Convention deals almost entirely with general principles rather than specific details relating to paid holidays and leaves implementation of the principles up to each participating country. Efforts to specify the allowable minimum holiday and the period of service were defeated. The Convention and Recommendation were adopted by votes of 124 to 16 with 51 abstentions and 136 to 12 with 31 abstentions, respectively. United States Government abstained from voting on the adoption of these two instruments on the grounds that: (1) in the United States, holidays with pay is a matter for collective bargaining and individual arrangements rather than legislation; (2) the vast amount of farm workers are seasonally employed, work on farms less than 3 months a year, and are faced with the basic problem of insufficient employment and too much leisure; and (3) there would be great difficulties in the United States in adopting and implementing the Convention to meet the needs of seasonal workers.

In discussing the revision of the Maternity Protection Convention which was first approved by the ILO in 1919, some speakers expressed the belief that the revised version was too rigid and inflexible and that it would obtain relatively few ratifications. The new Convention extended its scope to include agricultural occupations and women domestic workers. It specified "at least 12 weeks" maternity leave. Joint discussions between the officers of the two committees interested in this Convention (the Committee on Maternity Protection and the Committee on Social Security) prevented the incorporation of provisions contradictory to those in the Minimum Standards of Social Security Convention. The revised Convention was adopted by a vote of 114 to 36 with 25 abstentions and a supplementary Recommendation by a vote of 112 to 31 with 29 abstentions.

The Recommendation on Cooperation at the Level of the Undertaking provided that, at the

plant level, "appropriate steps should be taken to promote consultation between employers and workers on matters of mutual concern not within the scope of collective-bargaining machinery." This Recommendation—the last in a series of international standards that began in 1948 with the adoption of the Convention on Freedom of Association—on industrial relations that is scheduled for consideration by the Conference, was adopted by a vote of 174 to 2 with 13 abstentions. Although this subject was one of the most controversial on the Conference's agenda, the Committee on Industrial Relations achieved remarkable success in developing a text that was supported by the largest majority vote for the adoption of any Convention or Recommendation at this session. A supplementary resolution on this subject was adopted by a vote of 137 to 2 with 16 abstentions.

The Conference adopted a resolution on the Regulation of the Employment of Young Persons. in Underground Work in Coal Mines by a vote of 104 to 13 with 24 abstentions. The resolution outlined desirable standards or practices on minimum age, vocational guidance, vocational training, medical examination, night work, rest periods and holidays, and inspection services. The Governing Body was requested to refer the problems of social security and social welfare to the next session of the Coal Mines Committee for thorough examination with regard to all workers in coal mines, including young persons. The matter of minimum age (for underground work as well as night work in the mines) proved the most controversial. The British Government and employer delegates were particularly concerned over the provision of the resolution prohibiting night work underground for coal miners under 18 years of age because, under their system of rotating shifts, the employment of anyone under 18 years would be precluded. They reserved their right to reopen this question when the Conference in 1953 considers the adoption of a Recommendation on Minimum Age of Admission to Work Underground in Coal Mines.

The Committee on Workers' Health recognized the need for international standards and the Conference decided to put the subject on the agenda of the 1953 Conference for the adoption of either a Recommendation or of a Convention supplemented by a Recommendation. Conclusions concerning the notification of occupational diseases, technical measures for the control of

health hazards, and medical examination, adopted in 1952, will serve as the basis for the second discussion at the 1953 ILO meeting.

Report of the Director-General

ILO operational activities during the past year were described by the Director-General in his report to the Conference. He called special attention to ILO work in Technical Assistance. Most of the more than 100 speakers who commented on the Director-General's report devoted considerable attention to this phase of the Organization's work.

In his response to the report, Philip M. Kaiser, Assistant Secretary of Labor of the United States. stated that the heart and strength of the Technical Assistance Program is cooperation, freely sought and freely given, with an aim to helping those countries who want to help themselves. He said that there was no one solution to all the world's social and economic problems and that "those who insist on a single inclusive formula or panacea for social progress are moving down the road to disillusionment and disaster." He noted that, in the United States, institutions arose from the needs and problems of the people and their willingness to improvise and undertake experimentation to find solutions. "We prefer to place primary reliance on the resourcefulness and voluntary cooperation of our people. . . . We use our Government, as necessary, to buttress and sustain and promote the growth of our voluntary system . . . We do not rely on Government alone." He stated that one of the greatest accomplishments of the ILO is that it has not been lured down the path of doctrinaire inclusiveness and that its Technical Assistance Program is an example of the flexible approach that is indispensable to the cooperative efforts of free nations to solve their problems.

Secretary of Labor Maurice J. Tobin, in an address to the delegates, pointed out that the free nations have contributed generously to the cooperative effort of the United Nations and the specialized agencies under the Technical Assistance Program, but that "neither the Soviet Union nor any of its satellites have contributed to the UN programs to aid the economically underdeveloped countries." With a steadily increasing world population, he said, greater emphasis on efficient production of food, raw materials, and clothing

was needed. "The problem is to increase production and to provide for an equitable sharing of the fruits of production." He added that the free nations of the world, although forced by Communist aggression to devote much of their energies to build military strength, "are not neglecting the well-being of their people. We carry on the struggle for human betterment, even though we must arm, at the same time, to protect human freedom. We look forward to the day when all our efforts can be directed toward improving the welfare of mankind."

Earnings in Synthetic Textiles, March 1952

Production workers in the synthetic textile industry in March 1952 averaged \$1.27 an hour, exclusive of payments for late-shift and overtime work, according to a survey conducted by the Bureau of Labor Statistics.\(^1\) Although individual earnings ranged from 75 cents to more than \$2.10 an hour, the middle 50 percent of the workers earned from \$1.05 to \$1.45 (table 1). Nearly a fifth of the production-worker employment in this industry received hourly earnings of \$1.50 and over.

Average earnings, by type of mill, increased with the proportions of skilled workers required in the processing operations. Considerably more skilled workers are needed in weaving and related departments than in the yarn processing departments. Hourly earnings averaged \$1.34 in weaving mills, \$1.27 in integrated mills, and \$1.16 in yarn mills.²

Women comprised about 45 percent of the production work force in synthetic textiles in March 1952. By type of mill, they constituted about two-thirds of the employment in yarn

¹ This survey included synthetic textile mills employing 21 or more workers. The synthetic textile industry, as defined for the study, includes the spinning and throwing of silk, rayon, acetate, nylon, and other synthetic fibers and the weaving of fabrics from synthetic yarns. It was estimated that the total employment including office, executive, and supervisory employees in the industry, as covered for the study, was approximately 102,000. The data exclude premium pay for overtime and late-shift work. More detailed information on wages and related practices is available on request.

² Yarn mills include establishments primarily engaged in the spinning of staple synthetic fibers and/or the throwing of filament synthetic fibers.

mills, and two-fifths each in weaving and integrated mills.

Women textile workers are generally employed in the lighter and less-skilled tasks; consequently, their earnings are below the levels for men. The \$1.19 average for women was 15 cents lower than the average for men. By type of mill, the differences ranged from 4 to 19 cents an hour (table 2).

Between the summer of 1946, the date of the last Nation-wide study of synthetic textiles,3 and March 1952, average hourly earnings had increased approximately 60 percent, from 79 cents to \$1.27, and the proportions of workers earning \$1 and over an hour advanced from about 15 to 90 percent of the industry's work force.

Nearly a third of the synthetic textile workers were employed in mills which had collectivebargaining agreements. The extent of unionization varied by region. Union contracts covered approximately two-thirds of the industry's workers

3 See Series 2, No. 41-Wage Structure, Rayon and Silk Textiles, 1946.

in New England, two-fifths in the Middle Atlantic States, and a tenth in the Southeast.

Regional Variations

Synthetic textiles are produced primarily in three economic regions.⁴ Of the 96,000 production workers in the industry, 53,000 were employed in the Southeast, 25,000 in the Middle Atlantic States, and 18,000 in New England. Earnings averaged \$1.20, \$1.32, and \$1.39 in these regions, respectively.

Earnings of individual workers in the major regions varied widely. For the middle 50 percent, however, earnings ranged from \$1.20 to \$1.60 in New England, from \$1.10 to \$1.50 in the Middle Atlantic States, and from \$1.05 to \$1.35 in the Southeast (table 1). The proportion of workers with earnings of less than \$1 was greater in the Middle Atlantic States than in the Southeast (12 percent compared with 9 percent). The position was reversed at the upper end of the wage distribution: about 1 out of 4 workers in the Middle Atlantic region and about 1 out of 9 in the Southeast had hourly earnings of at least \$1.50. New England workers showed up best at both ends of the distribution—less than 1 percent under \$1 and a third of the workers at \$1.50 and over.

Workers in Middle Atlantic weaving mills averaged \$1.44, which was 4 and 20 cents an hour higher than the respective earnings in New England and in the Southeast. In the other types

⁴ For purposes of this study the regions include: New England-Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont; Middle Atlantic-New Jersey, New York, and Pennsylvania; Southeast-Georgia, Mississippi, North Carolina, South Carolina, Tennessee, and Virginia.

Excludes premium pay for overtime and night work.
 Includes data for other regions in addition to those shown separately.

of mills, New England averages were highest—\$1.19 in yarn mills and \$1.44 in integrated mills. Only 4 cents an hour separated the low and high regional levels in yarn mills, but in integrated mills, this difference amounted to 24 cents an hour (table 2).

Regional earnings of men and women synthetic textile workers were generally highest in New England. With the exception of the \$1.15 average for women in both Middle Atlantic and Southeast yarn mills, earnings of men and women, by type of mills, were greater in the former than in the latter region (table 2).

The variation between the earnings of men and women was smallest in the Southeast and amounted to 11 cents an hour. Men earned, on the average, 18 cents more than women in New England and 27 cents in the Middle Atlantic States. In Southeast yarn mills, both men and women had the same average—\$1.15 an hour; in weaving mills and integrated mills, the differences were 11 and 12 cents, respectively. By type of mill, men in the other regions had earnings advantages over women, ranging from 8 to 17 cents an hour in New England and from 7 to 36 cents in the Middle Atlantic States. These differences, at least in part, reflect differences in occupational employment among men and women.

Occupational Variations

Nation-wide average hourly earnings for the selected occupations studied in the synthetic textile industry in March 1952 varied from \$1.02 for janitors to \$1.87 for Jacquard loom fixers. The range in the average earnings for women's jobs was much narrower than that for men (56 cents compared with 85 cents); women spinningframe doffers had the lowest level of earnings (\$1.05) and Jacquard loom weavers, the highest (\$1.61). Other men's occupations having wage levels of \$1.50 and over were fixers of other types of looms, maintenance machinists, warper tenders (slow speed), and all weaving categories. Among women workers, plain loom weavers constituted the only other group with average hourly earnings of at least \$1.50.

Women weavers, who comprised slightly more than a third of all weavers, averaged 7 cents an hour less than their men counterparts. In other occupations employing men and women, the differences favored the men and ranged from 6 to 20 cents an hour.

Occupational average earnings, by region, ranged from \$1.15 to \$1.84 in New England, from 99 cents to \$2.08 in the Middle Atlantic States, and from 99 cents to \$1.67 in the Southeast. In all instances, the top averages related to the earnings of loom fixers. The highest averages for men's jobs occurred most frequently in the Middle Atlantic region and for women's jobs, in New England.

Occupational earnings in the Southeast were generally lower than the averages for the Nation as a whole; most frequently, the differences ranged from 1 to 6 cents. In the other two regions, the comparison was reversed, with regional job earnings generally being 5 to 15 cents higher than national earnings. Men weavers on plain looms in New England averaged 4 cents less the national wage levels for workers in this occupation. Several of the women's jobs in the northern regions also recorded earnings below the Nation-wide averages (table 3.).

There was no consistent pattern of regional differences in the earnings of men and women in the same jobs. In the numerically important job of weaving, women in New England had the same average earnings as men; in the other regions, men earned on the average more than women—by 17 cents an hour in the Middle Atlantic States and 6 cents in the Southeast. Men had the higher earnings in other jobs, employing both sexes, by amounts ranging from 1 to 14 cents in New England, from 17 to 23 cents in the Middle Atlantic States, and from 8 to 9 cents in the Southeast.

Wage Practices and Related Benefits

Paid vacations were established practices in synthetic textile mills employing 95 percent of the total work force in the industry in March 1952. The typical policy in the Middle Atlantic and Southeast regions provided for a 1-week paid vacation after a year of service; a second week after 5 years' employment was granted by mills employing about half of the industry's work force in these regions. In New England, the predominant practice was to provide vacation pay of 2

percent of total annual earnings after 1 year's service, 3 percent after 3 years', and 4 percent after 5 years'.

Insurance or pension plans, financed wholly or in part by the employers, were in effect in mills with 88 percent of the total employment in the synthetic textile industry. Hospitalization, health, and life insurance were of almost equal importance in the Southeast and Middle Atlantic regions; each type of coverage affected about seven-eighths of the workers in the former region and three-fourths in the latter. In New England, health insurance plans were applicable to about 95 percent of the synthetic textile workers, life insurance to 7 of every 8 workers, and hospitalization plans to 3 of every 4 workers. Retirement pension plans were in effect in mills with 6 percent of the total industry employment in the Southeast, 4 percent in Middle Atlantic States, and 9 percent in New England.

Paid holidays were granted by mills employing about half of all synthetic textile workers in the country. By region, the proportion of employees receiving paid holidays varied widely. Over ninetenths of the industry's employment in New England, and three-fourths in the Middle Atlantic region were in mills providing such payments. The most common practice in these regions was 6 days a year. Mills employing about a sixth of the synthetic textile workers in the Southeast had provisions for paid holidays varying from 1 to 5 days a year.

Approximately half of the workers in the synthetic textile industry were employed on late shifts in March 1952. The payment of premium rates for second-shift work is not a common practice in this industry; only about a seventh of the secondshift workers, employed primarily in the Middle Atlantic States, received differential payments. In

¹ Excludes premium pay for overtime and night work.
2 Includes data for other regions in addition to those shown separately.

³ Includes data for workers not shown separately.

that region, a majority of the second-shift workers receiving differentials were paid a premium of either 5 cents an hour or 5 percent of earnings. Practically all of the third-shift workers, however, received extra compensation for late shift work. The most prevalent differentials were 7 cents an hour in New England, 5 cents in the Southeast, and 10 cents in the Middle Atlantic States. Differential payments ranging from 5 to 10 percent of earnings were also common in the Middle Atlantic region.

Minimum entrance rates and minimum job rates in the synthetic textile industry relate to the lowest rates paid in an establishment to inexperienced and experienced workers, respectively. Advancement from the entrance rate to the job rate often involves either a formal training period or a progression of rates based on length of service or merit ratings. In many mills, however, no intervening steps between the minimum entrance and job rates were reported, both rates being identical.

No significant pattern of hiring rates existed for

the industry as a whole; there were, however, marked differences regionally. In New England, minimum entrance and job rates of at least \$1.165 were reported by mills employing about half of the synthetic textile workers in this region. In the Middle Atlantic and Southeastern States, there was no concentration of minimum entrance rates, except for the 75-cent rate. This rate was reported to be in effect in synthetic textile mills employing two-fifths of the workers in the Middle Atlantic States and one-third of those in the Southeast. The next greatest concentrations, each affecting a tenth of the workers, were at 85 cents in the Middle Atlantic States and at \$1.01 in the Southeast. Minimum job rates, however, tended to concentrate at \$1.02 in the Southeast and at \$1.14 or more in the Middle Atlantic region, and were found in mills employing over a third of the synthetic textile workers in the respective regions.

—Charles Rubenstein and John F. Laciskey Division of Wages and Industrial Relations

Wages in the Industrial Chemical Industry

PRODUCTION WORKERS employed in the industrial chemical industry generally received higher earnings than the average worker in all manufacturing combined. In its monthly earnings series, the Bureau of Labor Statistics estimated that the average factory worker received \$1.57 an hour exclusive of overtime in November 1951.

The largest occupational group—class A chemical operators—in the selected branches of the industrial chemical industry surveyed by the Bureau in October–November 1951¹ had straight-time earnings of \$1.98 an hour. In only 5 of the 40 production occupations selected for study were a majority of the workers paid less than \$1.60 an hour. At least half the workers in 19 of the jobs earned between \$1.60 and \$1.90 an hour.

The survey covered establishments primarily manufacturing industrial inorganic and organic chemicals (excluding synthetic rubber, synthetic fibers, and explosives) and compressed and lique-

219410-52-3

fied gases. Chemicals produced by the surveyed plants were widely diversified. Sulfuric acid, alkalies and chlorines, cyclic crudes, dyes, and plastics were among the more important products.²

Occupations in which hourly earnings of a majority of the industry's workers were concentrated within a narrow range were cylinder fillers (\$1.50 to \$1.75); class A filterers (\$1.85 to \$1.95); electric-cell men (\$1.85 to \$2.10); and maintenance machinists (\$1.90 to \$2.20). Jobs with at least a fifth of the workers receiving \$2.20 or more an hour were absorberman, class A chemical operator, class A stillman, and the maintenance jobs of carpenter, electrician, lead burner, and pipe fitter.

Workers in the 40 selected production occupations comprised about half of the labor force in the industry. In 28 of the 40 jobs, average earn-

¹ The survey was limited to industrial organic and inorganic chemical establishments employing 21 or more workers. The branches of the industry selected for study were estimated to include about 183,000 employees, of whom 136,000 were classified as production workers. The data exclude premium pay for overtime and late-shift work. More detailed information on wages and related practices is available on request.

² For a discussion of product uses and employment trends, see Employment Trends in the Industrial Chemicals Industry, Monthly Labor Review, May 1952 (p. 522).

ings fell between \$1.55 and \$1.85 an hour. The lowest average (\$1.38) was recorded for women janitors and the highest average (\$2.22), for lead burners. Operators of continuous-process equipment, comprising the largest part of the work force, received average earnings ranging from \$1.61 for class B millers to \$2.03 for absorbermen. The greatest number of workers employed in individual occupations studied were the chemical operators on a combination of various types of equipment. Besides the class A chemical operators, class B chemical operators averaged \$1.80 an hour, and chemical operators' helpers, \$1.63.

Large numbers of workers in the BLS study were involved in duties not directly connected with the processing of chemicals. A large force of maintenance workers were required to maintain the processing equipment; in five selected maintenance jobs, workers averaged \$1.99 or more an hour in October-November 1951. Along with the job of operating absorber units, these were the highest-rated occupations among those surveyed.

Employees in other major types of work had lower earnings levels. The largest numerical groups in filling and packaging departments were drum fillers and cylinder fillers, who earned \$1.68

¹ Excludes premium pay for overtime and night work.

² Includes data for regions not shown separately.

and \$1.55 an hour, respectively. Principal material movement was performed by stock handlers and hand truckers, who averaged \$1.55 an hour. Of the custodial workers, men janitors (\$1.47) and guards (\$1.68) were numerically the most important. Hourly wage levels of the laboratory assistants who performed standard and routine laboratory tests were \$1.77 for the men and \$1.58 for the women.

Earnings Variations

Variations in earnings within the individual production occupations were influenced by such factors as location, type of chemical produced, and size of establishment. Of minor importance in this industry were earnings variations by sex or method of wage payment. Women constituted less than 3 percent of the nonoffice personnel, and less than 5 percent of the workers were paid on an incentive basis. About four-fifths of the production workers were employed in chemical plants which had negotiated collective-bargaining agreements with one of the many unions in the industry.

By region, occupational averages of industrial chemical workers varied considerably. Although industrial chemical plants are located in all the principal economic regions, 85 percent of the industry employment was reported in four regions: Middle Atlantic (35 percent), Great Lakes (23 percent), Border States (16 percent), and Southwest (11 percent); smaller concentrations of workers were employed in the New England and Pacific regions.3 Lowest earnings generally prevailed in New England and the highest in the Southwest. In the 13 production jobs for which comparable earnings data were available in these six principal industrial chemical regions, the differences between the highest and lowest averages, by region, ranged from 15 to 43 percent. In the five lowest-paid jobs, for which average hourly earnings were \$1.80 or less in each of the six regions, the differences were from 15 to 21 percent. The highest regional averages for 7 of the 8 higher-paid jobs ranged from 19 to 43 percent above the lowest. In the two major regions, Middle Atlantic and Great Lakes, job averages approximated the national levels. No consistent wage advantage existed between these two regions, each being higher than the other in about half the occupational averages. Earnings on the Pacific Coast were typically above the national levels; Border State occupational averages were generally less than those for the whole country.

Among selected product branches of the industrial chemical industry in October-November 1951, lowest job earnings were reported primarily in plants employing relatively few workers. Cyclic crude plants had the lowest job averages; almost all these plants employed fewer than 150 workers. In compressed and liquefied gas plants, also employing relatively few workers, occupational averages were generally below the levels for the total industry surveyed. Workers primarily engaged in processing sulfuric acids and alkalies and chlorines tended to earn more than workers in all establishments combined. In these branches of the heavy chemical industry, three-fourths of the workers were employed in plants with over 500 persons.

Grouped by size of establishment, occupational wage averages were higher in the larger industrial chemical establishments. On a national basis, 39 of the 40 production job averages were higher in establishments employing more than 500 workers than in those with 21 to 500 workers. For half of the jobs, the wage advantage in the large plants ranged from 5 to 12 percent. Higher averages in the larger establishments were reported for most jobs in all the major regions except the Pacific Coast, where no consistent pattern existed; in the latter region, averages for almost half the comparable jobs were higher in the smaller-size group.

Chemical plants employing more than 500 persons comprised an eighth of the 600 establishments in the survey; they employed 70 percent of the work force. In five of the six major regions, at least two-thirds of the workers were reported in the larger plants; in the Pacific region, on the other hand, less than 28 percent were in large-size establishments.

Minimum entrance rates ranging from 75 cents to \$1.75 an hour were effective in industrial chemi-

¹ For purposes of this study, the regions for which separate data are presented include: New England—Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont; Middle Allantic—New Jersey, New York, and Pennsylvania; Border States—Delaware, District of Columbia, Kentucky, Maryland, Virginia, and West Virginia; Great Lakes—Illinois, Indiana, Michigan, Minnesota, Ohio, and Wisconsin; Southwest—Arkansas, Louisiana, Oklahoma, and Texas; Pacific—California, Nevada, Oregon, and Washington.

Table 2.—Average straight-time hourly earnings 1 of production workers in selected occupations in the industrial chemical industry by selected branches of the industry, United States, October-November 1951

cal plants in October-November 1951. In a distribution of workers by plant-entrance rate, the middle 50 percent were employed at plants with rates of \$1.20 to \$1.50 an hour. Minimum entrance rates exceeding this concentration were reported principally in the Pacific and Great Lakes regions.

Related Wage Practices

Almost all industrial chemical plants studied had a work schedule of 40 hours a week for first-shift workers. The major variation from this practice was reported in New England, where a seventh of the men regularly worked 48 hours. Because the industry operates mainly on a continuous-process basis, relatively large portions of workers were employed on late shifts; about 16 percent were on the second shift and about 14 percent on the third. Most late-shift workers were paid a shift premium; the typical differen-

tials were 5 cents an hour on the second shift and 10 cents on the third.

All chemical workers surveyed were covered by a formal vacation plan. Plants employing a majority of the workers granted vacations of 1 week after 1 year, 2 weeks after 2 years, and 3 weeks after 15 years. Regionally, there were two major variations from the national pattern: in New England, a majority of the workers received a 2-week vacation after 1 year of service; and in the Great Lakes region, a majority of the production workers were required to serve from 3 to 5 years for a 2-week vacation. The predominant vacation benefit for office workers in each of the major regions was 2 weeks after 1 year and at least 3 weeks after 15 years. Six paid holidays a year were received by most chemical workers; seven holidays were granted to about a seventh.

Formal plans for the immediate payment of sick leave with full-time pay were effective for those with 1 year's service in industrial chemical

plants employing about a ninth of the workers. The principal plans provided for 5, 10, or 15 days of sick leave a year. An additional sixth of the employees received sick leave pay after a specified waiting period or at reduced rates.

Nonproduction bonuses, paid mainly at Christmas or at the end of the year, were reported at plants employing about a fifth of the workers. The Middle Atlantic, Border, and Pacific regions had the highest proportions of workers receiving these bonuses.

Industrial chemical establishments with at least 95 percent of the industry employment in each of the major regions financed insurance or pension plans either partially or totally. Life insurance was the most common; health and hospitalization plans were also prevalent. Employers with about three-fourths of the work force contributed to pension plans for their workers.

Wage Chronology No. 29: San Francisco Printing, 1939-51

Wage rates and related working conditions for printing trades employees in San Francisco, as in many other large cities, have been determined by collective bargaining for several decades. Trade-unions in the San Francisco printing trades predated the formal establishment of national organizations in the industry. A local typographical union is known to have been in existence in the city in 1850, 2 years before the National Typographical Union was formed at Cincinnati, Ohio. The San Francisco local did not formally affiliate with the national union until some years later, and was first represented at the national convention in 1860.

In their early days, both the local and the national typographical unions included not only compositors but also pressmen, press feeders, photoengravers, stereotypers, electrotypers, bookbinders, and mailers. In 1886, the San Francisco pressmen withdrew from the local, organized their own unit, and immediately affiliated with the International Printing Pressmen and Assistants' Union, then in process of formation. Subsequently, the bookbinders withdrew from the national union and organized independently. Early in the 1900's, the stereotypers and electrotypers, and shortly after, the photoengravers, withdrew from the typographical union and organized separate national unions.

This chronology traces the developments and changes in hourly and weekly wage rates and

related conditions of employment from January 1, 1939, through July 1951 for two basic crafts in the San Francisco commercial and newspaper printing industry. Because of the long history of collective bargaining in the industry, the initial entries do not necessarily indicate changes in prior conditions of work.²

In commercial (book and job) printing the two crafts covered are (1) hand compositors and typesetting operators, represented by the San Francisco Typographical Union No. 21, International Typographical Union (AFL), and (2) cylinder pressmen, represented by the San Francisco Printing Pressmen and Assistants' Union No. 24, International Printing Pressmen and Assistants' Union of North America (AFL). Throughout the period covered by this chronology, the commercial printing establishments operating under the terms of union agreements with the compositors were represented by the Employing Printers' Association of San Francisco (formerly known as the Franklin Printing Trades Association). In dealing with the pressmen, they were represented by the Employing Printers' Association until January 1942; subsequently, the Employing Printers' Association and the Printing Trades Conference of San Francisco represented the employers.

¹ The first national convention of journeymen printers was held in New York City in December 1850 and the second was held the following year in Baltimore. At this time a constitution, subject to ratification by the locals in the various States, was adopted. The constitution provided for a convention in May 1852 and the adoption of the official title of the body.

For further information on the history of this union, see The International Typographical Union, Monthly Labor Review, May 1952 (p. 493).

² This is the third wage chronology dealing with the commercial and newspaper printing industry. The two printing chronologies previously published covered negotiations in New York and Chicago since January 1, 1939. See Monthly Labor Review, May 1951 or Serial No. R. 2037, and Monthly Labor Review, July 1951 or Serial No. R. 2043.

Throughout the entire period, The San Francisco Newspaper Publishers Association negotiated for four English-text daily newspapers in dealing with the hand compositors and machine operators, who were represented by San Francisco Typographical Union No. 21, and with the pressmen, represented by the San Francisco Web Pressmen's Union No. 4.

Separate contracts are negotiated for each of the four union groups. Contracts in effect in the spring of 1952 are as follows:

Commercial:

Compositors-negotiated June 20, 1951, to be effective from July 2, 1951, through May 31, 1952. Cylinder pressmen-negotiated June 18, 1951, to be effective for 1 year from June 4, 1951.

Newspapers:

Compositors-negotiated July 17, 1950, to have been in effect from that date through July 28, 1951; the new wage rates were made retroactive to April 16, 1950. However, on January 15, 1951, a supplemental agreement extended the contract to April 26, 1952. New wage rates were made retroactive to December

Web pressmen-negotiated June 28, 1950, to have been in effect from June 26, 1950, through July 28, 1951; the new wage rates were made retroactive to April 16, 1950. By supplemental agreement of January 15, 1951, the contract was extended to April 26, 1952. New wage rates were made retroactive to December 31, 1950.

These contracts cover a total of approximately 2,300 employees: 1,600 compositors; 400 cylinder pressmen; 300 web pressmen.

	13. 3				37. 5				

¹ Hours shown represent net working time, exclusive of lunch periods. In effect, Jan. 1, 1939: 40 hours for commercial crafts; 37.5 hours for newspaper crafts.

² Increases shown for cylinder pressmen reflect changes in basic wage scales for journeymen. In San Francisco, thebasic rate was paid for work on

the following equipment throughout the period covered: cylinder or manifold presses; second position on rotary magazine presses; 2-color presses; coupon or roll ticket presses; wrapper roll presses; job cylinder presses. Special rates were paid for work on other presses. Changes in these rates did not always correspond to changes in the basic scale.

standard workweek for the latter is shorter. In commercial printing, the second night-shift workweek for compositors and cylinder pressmen was 32.5 hours throughout the period covered.

§ Until Dec. 17, 1945, the workweek was 37.5 hours for all shifts. The premium for the second night shift was computed on the basis of the first night-shift rate plus 75 cents for each shift worked between 10 p. m. and 6 a. m.; on Dec. 17, 1945, the workweek for the second night shift was reduced to 35 hours and a second night-shift scale, as such, was established.

Second night (lobster), starting after 8 p. m.
For cylinder pressmen:
Day, between 7:30 a. m. and 5:30 p. m.
First night, until Jan. 1, 1946, call must have been within ½ hour of the termination of the previous shift; after that date, call must have been within 4 hours of the termination of the previous shift.

Second night, until Mar. 8, 1940, starting after 9 p. m.; Mar. 8, 1940, to Jan. 30, 1942, starting after 8:30 p. m. except when the day shift had worked 3 hours or more overtime; since Jan. 30, 1942, starting after 7:30 p. m. except when the day shift had worked 3 hours or more overtime. time

time.

Regular shift hours for compositors, hand and machine:

Day, between 7 a, m, and 6 p, m,

First night, until Dec. 17, 1945, starting between 6 p, m, and 10 p, m.;

Dec. 17, 1945, to Dec. 16, 1946, starting between 6 p, m, and 9 p, m.;

since Dec. 16, 1946, starting between 6 p, m, and 8:30 p, m.

Second night, until Dec. 17, 1945, starting at or after 10 p, m.; Dec. 17, 1945, to Dec. 16, 1946, starting at or after 9 p, m.; since Dec. 16, 1946, starting at or after 8:30 p, m.

For web pressmen, since Jan. 29, 1940:

Day, between 7 a, m, and 7 p, m.

Night, beginning or ending between 7 p, m, and 7 a, m,

covered. Length of second night (lobster) shift: 7½ hours up to Dec. 17, 1945; 7 hours thereafter. \$1 bonus paid to workers called to work more than 2 hours before regular starting time; effective Dec. 16, 1946, changed to: more than ½ hour before starting time; effective January 1949, changed to: "early" starts, 50 cents in addition to scale (every day).

⁸ Length of day or night shift: 8 hours (consecutive) of which ½ hour allowed and paid for as lunch time. Dec. 17, 1945, wording changed to read: 7½ hours within 8 hours constitute day's (or night's) work.

⁷ Effective Jan. 1, 1947, no employee obliged to work Saturday, but anywho did was paid at time and one-half; effective Jan. 3, 1949, if called to work on Saturday day shifts, 4 hours constituted minimum shift.

⁸ Vacation credits nullified when employment ceased before scheduled vacation, whether because of resignation, death, or final discharge.

⁹ A "regular situation" is a full-time job held by a journeyman.

¹⁰ Employee leaving job, voluntarily or otherwise, received vacation credit pay on pro rata basis; if employee died, employer paid to union accrued vacation credit on pro rata basis, such money to be held in escrow until proper beneficiaries had been determined.

¹¹ "Emergency" was defined in the contract as an unusual condition caused by circumstances over which the publisher had no control.

-Marion W. Robbins Division of Wages and Industrial Relations

A National Policy on Youth Employment

To ALERT CITIZENS to the importance of education for the Nation's youth as well as to the need for the provision of good working conditions for young people, a National Policy on Employment of School-Age Youth has been issued by the Secretary of Labor.¹ Suggestions by the Committee on Manpower Policy of the Office of Defense Mobilization were embodied in this policy, which was formulated with the aid and approval of the Advisory Committee on Young Workers to the Bureau of Labor Standards of the U. S. Department of Labor.

The policy is directed to employers, placement workers, schools, parents, unions, Government, and community groups. It recommends the encouragement of young people to obtain the best education they can—at least to complete high school—and encouragement of schools to adjust their curriculums and services to meet students' needs more adequately.

Help should be given to youth who are seeking jobs through vocational guidance, training opportunities, and placement services. Part-time and vacation jobs, the policy points out, should be arranged to provide constructive experience and, at the same time, allow time and energy for education, recreation, and personal development.

All child-labor and school-attendance laws should be continuously observed and enforced, the policy states, and full protection of labor and social-security laws should be provided. Workers employed during school hours or in manufacturing should be at least 16 years of age; those employed outside school hours as part of the regular hired labor force should be at least 14; and those in hazardous occupations should be 18 years of age. Employment or age certificates should be obtained by all workers under 18, as proof of age and assurance that local child-labor standards are being met.

Minor workers should be treated with understanding and respect; their work places should be safe and healthful; they should be given good supervision, training, and a chance to develop on the job; their hours of work should not exceed 8 a day or 40 a week—and when the young worker is attending school, not more than 4 hours daily at the most. The part-time work limit set should take into consideration the age, strength, and obligations of the young worker as well as legal child-labor standards, school hours, and duration of the job. Early morning and night work should be avoided; and at least 1 full day of rest in 7 should be provided.

With regard to young men at or near draft age, it is urged that they be given full opportunity for employment pending their call into military service. Those entering the Armed Forces should be helped to make use of opportunities in military service that will advance their long-range vocational objectives.

Because the country's interests require the development and use of its manpower for defense and essential civilian needs, voluntary cooperation by all groups concerned is needed to develop and apply the practices that will carry out the policy.

In connection with the adoption of this policy, the Bureau of Labor Standards stressed the importance of encouraging those who seek college educations. It stated that "American leadership will depend for the foreseeable future on quality-trained technicians, alert citizens, mature adults." Many more engineers are needed than the number who are graduating in 1952, and the number of young people who are earning degrees in all fields is far below professional needs.

Agencies undertaking to direct the implementation of the National Policy on Employment of School Age Youth should obtain, as background information for the locality covered, data on work permits issued and number of young workers of various ages. The kinds of jobs they fill, their wages, school status, and condition of health should also be ascertained. Careful attention should be given to the counseling and guidance services available and to the degree of moral and financial support which citizens give to the schools in their efforts to furnish the educational facilities needed.

¹ Copies of the policy statement and accompanying leaflets are available upon request to the Bureau of Labor Standards, U. S. Department of Labor, Washington 25, D. C.

Ceiling Price Regulations 154-161; Suspension of Some Price Controls

Adoption of eight new ceiling price regulations and the suspension of controls on certain commod-

ities comprised stabilization activity for July 1952.¹ These are summarized in the following tabulations.

¹ Sources: Federal Registers, vol. 17, No. 131, July 4, 1952, p. 6034; vol. 17, No. 132, July 8, 1952, p. 6036; vol. 17, No. 135, July 11, 1952, pp. 6216 and 6224; vol. 17, No. 136, July 12, 1952, p. 6258; vol. 17, No. 141, July 19, 1952, pp. 6660 and 6667; vol. 17, No. 142, July 22, 1952, p. 6696; and vol. 17, No. 146, July 26, 1952, p. 6842.

Major Provisions of CPR's Adopted in July 1952

CPR No.	Date issued	Effective date	Commodity covered	Distribution level	Scope of provision
154	July 3	July 8	Charcoal	Retail	Establishes dollar-and-cent ceiling prices, on a harvesting and nonharvesting basis, for charcoal sold in the Virgin Islands.
155	July 10	July 15	Western Red Cedar and Inter-Moun- tain poles and pil- ing.	Producers	Fixes ceilings for sales of untreated Western Larch and Inland Douglas Fir poles, piling, anchor logs, reinforcing stubs, and short round material produced in the portion of the U. S. west of the 100th meridian and east of the crest of the Cascade Mountains. Also covers all sales of the same items of Western Red Cedar produced west of 100th meridian. In addition, it establishes ceilings for the sales by treaters of these items after they have been preservatively treated.
156	do	do	Fabricated structural steel, miscellane- ous and ornamen- tal iron, and ves- sel shop products for field assembly or erection.	Fabricators	Provides that a fabricator must determine ceilings for the product involved by estimating costs (on the basis of prices and rates in effect at the time of submission of bid), and adding nine-tenths of the percentage markup for profit received for a comparable product during the base period (July 1, 1950, thru March 31, 1951). In general, products covered are the structural components of buildings, bridges, and other construction projects and large equipment and facilities
157	July 11	July 16	Eastern wood	Producers and treaters.	used in various industrial processes. Establishes ceiling prices for the service of preservatively treating forest products and for sales by treaters by pressure or non-pressure processes, when the treatment is done in the part of the U. S. east of the 100th meridian, except N. Dak., and S. Dak.
158	July 18	July 23	California Redwood lumber.	Manufacturers	Fixes dollars-and-cents ceilings for California Redwood lumber produced in any plant or mill located in Calif., or Oregon.
159	do	do	Milk sold in Juneau, Alaska.	Wholesale and retail.	Establishes ceilings for sales of fresh milk in Juneau, Alaska and a radius of 10 miles from the city limits.
160	July 21	July 26	Used steel drums sold in Alaska.	Various	Establishes ceiling prices at all levels of distribution for empty raw and reconditioned used steel drums of 40- to 58-gallon capacity, inclusive, fabricated of 16- to 20-gage steel, inclusive, sold in Alaska. Also covers the service of reconditioning raw steel drums.
161	July 24	Sept. 24	Consumer durable goods.	Manufacturers	Provides method for establishing ceiling prices for certain new consumer durable commodities, replacing the new-commodity sections of CPR 22 and of the GCPR. Basic technique used in establishing ceilings is comparison pricing.
			Suspension of C	ontrols (Supplementar	ry Regulations)
123	July 7	July 7	Untreated Eastern railroad ties.	Producers	Suspends from the provisions of CPR 123, producers sales for export of untreated Southern Pine cross ties. This action was taken in order to remove any price impediment to an adequate production for export.

Technical Note

The New Daily Index of Spot Market Prices

The daily index of commodities traded on spot markets and organized exchanges has been revised by the Bureau of Labor Statistics, as part of its general program for maintaining its various price indexes. This price index is designed to measure the general trend and movement of those commodity prices which, as a result of daily trading in fairly large volume of standardized qualities, are particularly sensitive to factors affecting spot markets and traders' estimates of current and future economic forces and conditions.

The revised daily index is not a continuation of the former one. It is a separate and distinct index and is based on the prices of 22 commodities; it replaces the former index, based on 28 commodities, which has been published since January 1940. A comparison of the two indexes over the past several years shows that the amplitude of the fluctuations in the revised index is greater than in the former index.

The commodities included in the revised daily index are either raw materials or commodities very close to the initial production stage. Highly fabricated commodities which have relatively large fixed costs built into their prices, and therefore have more stability, are not included. In order to avoid having the index dominated by specific agricultural conditions or seasonal patterns for a few raw commodities, certain commodities are priced at the semi-fabricated stage and some agricultural products are not included. The exclusion of fabricated products and most semi-fabricated commodities, and the careful selection of commodities which are particularly sensitive to the forces acting on open markets and organized

exchanges, contribute to the greater sensitivity of this index compared with the Bureau's wholesale price index. The influence of some international markets upon the economy is also reflected by the inclusion of various commodities which are important in international trade.

The commodities included in the former index were reviewed in light of market developments since World War II, and some have been changed for the revised index. Six commodities (barley, coffee, flaxseed, shellac, silk, and Philadelphia steel scrap) included in the former index were excluded from the revised index. These were excluded because (1) they are no longer traded in large enough volume to get accurate daily prices, (2) their prices tend to be stable over long periods of time, or (3) they react to forces which reflect specialized conditions and not broad economic conditions. For other commodities, the item has been retained, but the specification has been changed.

The most apparent difference between the former and the revised indexes is the change in the base period. The revised index is based on the average of prices for the 3 years—1947, 1948, and 1949; the former index was based on August 1939 prices. This 3-year average is also the base period for the Bureau's revised wholesale price index, and it conforms with the postwar base period for Federal index numbers recommended by the Division of Statistical Standards of the Bureau of the Budget.

The daily index is an unweighted geometric mean of the individual commodity price relatives, i. e., the ratio of the current price to the base period price. This means that price differentials among the commodities have no distorting effect upon the index numbers. A 10-percent change in the price of tallow which is quoted in cents per pound has the same effect as an equal percent

Daily Index of Spot Market Prices

(1) Commodities to be included in index:

Commodity and unit	Specification	Market
Burlap, yd	40", 10-ounce yard	New York
Butter, lb		Chicago
Cocoa beans, lb	Accra	New York
Copper scrap, lb	No. 1 heavy copper and wire, refiners' buying price.	New York
Corn, bu		Chicago
Cotton, lb	15/6" middling staple	10 mkt. avg.
Cottonseed oil, lb	Crude, southeast and valley	Memphis
Hides, lb	Cow, light native packers	Chicago
Hogs, 100 lb	Good to choice, 200-220 pounds	Chicago
Lard, lb	Prime steam, in tierces	Chicago
Lead scrap, lb	Battery plates, flat price, smelters, buying price	New York
Print cloth, yd	39", 80 x 80 count, 4 yds./lb., average of spot and forward	New York
Rosin, lb		New York
Rubber, lb	Plantation ribbed smoked sheets	New York
Steel scrap, ton	No. 1 heavy melting, consumers' buying price	Chicago
Steers, 100 lbs		Chicago
Sugar, 100 lbs		New York
Tallow, lb	Packers, prime, inedible	Chicago
Tin, lb	Grade A, prompt delivery	New York
Wheat, bu	Average of—	
	No. 2 hard winter	Kansas City
	No. 1 dark northern spring	Minneapolis
Wool tops, lb	Spot market	New York
Zinc, lb	Prime western, pig	New York

(2) Commodities for which prices will be published but not included in the index computation:

Barley, bu.—Good malting, Minneapolis

Coffee, lb.—Santos No. 4, New York

Copper, lb.—Electrolytic ingot, New York

Lead, lb.—Desilverized pig, New York

Shellac, lb.—TN grade, New York

- (3) Special groupings and their commodity composition:
 - (a) Foodstuffs—Butter, cocoa beans, corn, cottonseed oil, hogs, lard, steers, sugar, and wheat.
 - (b) Raw Industrials—Burlap, copper scrap, cotton, hides, lead scrap, print cloth, rosin, rubber, steel scrap, tallow, tin, wool tops, and zinc.
 - (c) Livestock and Products—Hides, hogs, lard, steers, and tallow.
 - (d) Metals—Copper scrap, lead scrap, steel scrap, tin, and zinc.
 - (e) Textiles and Fibers—Burlap, cotton, print cloth, and wool tops.
 - (f) Fats and oils—Butter, cottonseed oil, lard, and tallow.

change in the price of steers which is quoted in dollars per 100 pounds. The index is not a simple aggregate of prices in which a change in the price of a commodity with a high-unit price such as steers would have several hundred times the importance of a price change for a commodity such as tallow with a low-unit price. In maintain-

ing the daily index over time, it occasionally becomes necessary to change or modify commodity specifications. These specification changes are handled so that only the actual price movements are reflected in the index; substitution of commodities or specifications of a commodity does not in itself affect the index. All substitutions will be properly indicated in the daily releases of the index.

In addition to the index based upon the prices of all 22 commodities, indexes are calculated and published according to the unique classification of each commodity as either a "raw industrial" commodity or as a "foodstuffs" commodity. Included in the special group indexes are four major product groupings: (1) livestock and products, (2) metals, (3) textiles and fibers, and (4) fats and oils. Not all commodities fall into one of these four product groups; for example, sugar is not included in any of the four groupings. Nor is each grouping unique. For example, lard is included in the group indexes for both "livestock" and "fats and oils." These group indexes are based on the prices for relatively few commodities, all of which are extremely price-sensitive. They are, therefore, in no way comparable to corresponding groups in the comprehensive wholesale price index.

The historical series of the revised daily indexes will be published in three volumes. Volume 1 consists of index numbers for all of the groupings for three dates of special historical significance—August 15, 1939; December 6, 1941; August 17, 1945; and for one day (normally Tuesday) of each

week from June 1946 through December 1951. Volume 2 consists of daily index numbers for all of the groupings from January 1, 1952, to September 1, 1952. (Monthly or annual averages will not be published.) Volume 3 consists of a tabulation of the prices for each commodity in the index from January 1, 1952, to September 1, 1952.

Each Monday release will publish indexes and prices for every trading day of the previous week and for the Friday preceding that week. Daily releases will contain indexes and prices for every trading day from and including the previous Friday.

Because of interest that has developed through the years in the actual prices for commodities in the daily index, prices for five of the commodities (barley, coffee, copper ingot, lead, and shellac) included in the former index but deleted from the revised index will continue to be published daily. However, the prices for these commodities are not used in the computation of either the "all commodities" index or any of the special group indexes.

> —P. A. Don VITO Division of Prices and Cost of Living

¹ Copies of these three volumes are available upon request.

Recent Decisions of Interest to Labor

Wages and Hours²

FLSA Applicable to Flood Control. A United States court of appeals held ³ that employees engaged in removing trees and other obstructions from an area in which a dam was to be constructed were entitled to the minimum-wage and overtime-compensation provisions of the Fair Labor Standards Act. The dam was situated on a non-navigable tributary of a navigable river, and was being constructed as part of a project to control floods and improve navigation on the Arkansas and Mississippi Rivers.

The court of appeals cited Walling v. Patton-Tully Transportation Co., which held that employees engaged in the construction of dikes and revetments on the Missouri and Mississippi Rivers were engaged in the production of goods for commerce. The only difference between that case and the instant case, the court pointed out, was that in the former, the construction was performed on navigable rivers, while in the latter, it was performed on a non-navigable tributary. This was held to be insufficient reason for distinguishing the cases.

Roads and Rivers Instrumentalities of Commerce. A United States court of appeals recently ruled 5 that employees at rock quarries producing crushed rock for maintenance and improvement in the same State of roads and a river over which interstate traffic moves were covered by the Fair Labor Standards Act. In view of a United States Supreme Court ruling (in Overstreet v. North Shore Corp. 6) that roads "used by persons and goods passing between the various States" are "instrumentalities of interstate commerce," and that the persons employed in maintaining such roads are "engaged in commerce," the appeals court reasoned that goods produced for instrumentalities of commerce and applied by persons engaged in commerce have been produced "for commerce." The court emphasized that movement across State lines of the article produced is not a conclusive factor in determining whether the act is ap-

The court also cited *Tobin* v. Alstate Construction Co.,⁷ in which case, off-the-road employees, producing material used to repair and maintain the surface of instrumentalities of commerce, were held to be engaged "in the production of goods for commerce."

However, a State court recently refused to extend the act to off-the-road employees.8

Guaranteed Wage Plans. (1) A United States district court recently held of that section 7 (e) of the amended Fair Labor Standards Act is merely a codification of the law previously established by the Supreme Court. Citing Walling v. Belo Corp. of and Walling v. Haliburton, the court set forth the following requirements of a valid guaranteed weekly income plan: A contract, a regular rate of pay bearing a reasonable relation to the amount guaranteed (as opposed to arbitrary or artifical rates), and a condition of irregularity or instability of work under which the guaranty would yield the employee a stability of income otherwise absent.

(2) A United States district court recently ruled ¹² that a weekly guaranteed-pay plan which did not meet the requirements of section 7 (e) was in violation of the act, and awarded the Secretary of Labor an injunction prohibiting its future use.

Defendant operated an air field and was engaged in the aerial dusting and spraying of agricultural crops with insecticides, fungicides, and herbicides. He paid certain of his employees "the same amounts each week as guaranteed compensation purportedly computed at straight time and time and one-half for the number of hours recorded."

The court noted that there was no showing of irregular hours of work, that there was no contract specifying a regular hourly rate, and that no additional payments had been made when employees worked hours in excess of those for which compensation was guaranteed.

Labor Relations

Secondary Boycott Not Bylaw's Objective. The National Labor Relations Board ruled ¹³ that enforcement by Glaziers' Union Local 27 of a bylaw prohibiting union members from working for construction contractors who did not have all glazing work done at the construction site

¹ Prepared in the U.S. Department of Labor, Office of the Solicitor.

The cases covered in this article represent a selection of the significant decisions believed to be of special interest. No attempt has been made to reflect all recent judicial and administrative developments in the field of labor law or to indicate the effect of particular decisions in jurisdictions in which contrary results may be reached, based upon local statutory provisions, the existence of local precedents, or a different approach by the courts to the issue presented.

² This section is intended merely as a digest of some recent decisions involving the Fair Labor Standards Act and the Portal-to-Portal Act. It is not to be construed and may not be relied upon as interpretation of these acts by the Administrator of the Wage and Hour Division or any agency of the Department of Labor.

^{11 331} U.S. 17.

¹² Tobin v. Wenatchee Air Service, Inc. (E. D. Wash., May 27, 1952).

¹³ In re Galziers' Union Local 27 (AFL), Brotherhood of Painters, Decorators and Paperhangers of America (99 NLRB No. 146, June 30, 1952).

did not constitute an illegal secondary boycott under section 8 (b) (4) (a) of the Labor Management Relations (Taft-Hartley) Act. The Board noted that the bylaw had a legitimate purpose—to provide as much work as possible for glazing employees in that particular area—and that it did not prohibit glaziers from working for a "secondary" employer.

Exclusive Jurisdiction of NLRB. A United States district court enjoined ¹⁴ the New York State Labor Relations Board from proceeding further with unfair labor practice charges over which the National Labor Relations Board claimed exclusive jurisdiction.

Section 2283 of the Judicial Code provides that a Federal court cannot grant an injunction staying proceedings in a State court "except as expressly authorized by act of Congress or where necessary in aid of its jurisdiction or to protect or effectuate its judgments." It was argued by defendant that the Judicial Code prohibited the issuance of the injunction in this case. The court pointed out, however, that the purpose of this statute was to avoid friction between Federal and State courts in litigation over which the two have concurrent jurisdiction, and not to prevent the Federal courts from restraining State-court interference when jurisdiction is vested exclusively in the Federal courts or in a Federal agency.

Union Initiation and Reinstatement Fees. The NLRB found ¹⁵ that a union did not per se violate the LMRA by charging former members a reinstatement fee greater in amount than the initiation fee charged new members.

It was not the intention of Congress, the Board's opinion stated, that labor organizations should be considered in violation of section 8 (b) (5) of the act, when, following a well settled practice, they established a different, but fairly reasonable, classification of former members as distinguished from new applicants.

There was no claim before the Board that the fee was excessive. The sole question considered was whether the respondent union violated the act by setting a reinstatement fee which was higher than the initiation fee.

Employer Interference. The NLRB ordered ¹⁶ an employer to cease his attempts to dominate or support a union, or in any other manner to interfere with the employees' self-organizational rights, in violation of section 8 (a) (1) of the LMRA.

The employer had called 35 employees to a meeting, at which he served refreshments and liquor. At this meeting he advised the employees that he did not want a union in his shop and also that he had applied for permission to grant an increase in wages. Without Government approval of this application, he proceeded to put the wage increase into effect. The meeting was called after 40 employees had signed union authorization cards, and after a union claiming to represent a majority of the employees had requested a bargaining conference.

The Board held that the employer thus engaged in an unlawful interference with the employees' right of self-organization.

Refusal to Bargain. The NLRB recently ordered ¹⁷ an employer to furnish a union with data on wages and changes in productivity. The employer had contended that bargaining on productivity wage increases would be fruitless because of his unwillingness to accept conditions which the Wage Stabilization Board attached to its approval of wage increases.

Citing *NLRB* v. *Hoppes Mfg. Co.*, ¹⁸ the Board pointed out that the employer's attitude did not meet the statutory standard of good-faith bargaining.

Unemployment Compensation

Definition of Unemployment. An Ohio common pleas court held ¹⁹ that a claimant who was engaged in trying to sell real estate was not unemployed even though he earned no commissions for a period of 2 months. The Ohio law states that an individual is totally unemployed "in any week during which he performs no services" and with respect to which "no remuneration is payable to him." The court also held that claimant was liable to repay benefits received during the period when he was trying to sell real estate, because he was at fault, within meaning of the provision on restitution of benefits, in not reporting his real-estate selling efforts to the State Bureau of Unemployment Compensation.

Good Cause. An Ohio court of appeals held ²⁰ that a claimant who was totally deaf and who had been in a mental institution had good cause for quitting his job when the employer made him nervous by constant pressure to hurry in his work, and that he also had good cause for refusing to return to the same job. The decision of the board of review was reversed.

Failure to Receive Offer. The Indiana Appellate Court held ²¹ that a claimant was not disqualified for refusing to accept an offer of suitable work which had been sent to her, but which she had not received. Claimant's former employer had mailed her a recall notice in accordance with the seniority provisions of the employer's contract with claimant's union. This notice had not been delivered because it was mailed to an old address. The claimant had moved without notifying her former employer of her new address. However, her new address was on file with the employer on a notice of her claim for unemployment benefits, and the employer had in fact mailed her bonus check to the new address. The court

²¹ Mouldings Division of Thompson Industries v. Review Board of the Indiana Security Division (App. Ct. Ind., June 13, 1952).

held that, while claimant was at fault, the employer had not mailed the notice to her "last known address" in accordance with the union contract, and claimant was therefore entitled to benefits.

Double Disqualification. The Appellate Division of the New York Supreme Court held ²² that a claimant who had been disqualified for quitting her job without good cause could be disqualified again for refusing to return to the same job.

Claimant had worked in a laundry and was disqualified for benefits for 6 weeks after quitting her job. When she again filed for benefits, at the end of the disqualification period, the laundry offered to take her back at the same kind of work but at a slightly lower wage and without full seniority rights. There was no showing that the job was not one for which claimant was reasonably qualified by training and experience or that claimant had good cause for refusing it.

The court held that, since the voluntary quit and the refusal of suitable work disqualifications are entirely separate provisions of the law, the fact that claimant had been disqualified for voluntarily leaving a job did not prevent her from being disqualified for a refusal of suitable work when she declined to return to the same job. The decision of the New York Unemployment Insurance Appeal Board was thus reversed.

State of Coverage. The Appellate Division of the New York Supreme Court held ²³ that an employee who had worked for the same employer in both New York and New Jersey was covered by the New York law only for the services performed in that State. Claimant was a store clerk in New York, but for 8 or 9 months during 1 year had been assistant manager of a branch store in New Jersey owned by the same employer. The statute provides that where service is performed both within and

without the State of New York, but the service outside the State is incidental to the service in New York, all of the service may be deemed to be performed in New York. The court held that service as an assistant store manager in New Jersey was not incidental to claimant's service as a clerk in New York.

Retroactive Vacation Payment. The New Jersey Superior Court held ²⁴ that an employee who received, retroactively, additional pay for a vacation period during which he worked could not be required to relate such payment to a period when he had been receiving unemployment benefits.

The claimant was laid off in April and was paid unemployment benefits through June. On July 5 he was called back to work by his former employer, during a period which the employer had declared a vacation for most employees. The employer contended that employees who had been laid off during the past year were not entitled to vacation with pay, but in September, after a dispute with the claimant's union, the claimant was given a vacation payment. Thereafter the employer contended that since claimant was working during the July vacation period, he should be considered to have been on vacation during the last 2 weeks of June and should be required to refund the payments he received for that period.

The court held that a vacation payment cannot be related to any period except that specified as such by the employer in accordance with his contract with the union. Even if it could, claimant cannot be required to refund benefits to which he was entitled when paid.

Chronology of Recent Labor Events

July 15, 1952

PRESIDENTS of the 19 AFL building-trades unions unanimously adopted a "Declaration of Policy" which strengthens earlier measures against jurisdictional strikes by providing for revocation of the charter of (1) any local union that places pickets on a job involved in a jurisdictional dispute or (2) any local Building and Construction Trades Council that authorizes picket lines in such a dispute. (Source: AFL News-Reporter, July 18, 1952; and New York Times, July 16, 1952.)

July 16

THE PRESIDENT approved the act amending the Civil Service Retirement Act, effective September 1, 1952, to provide increases in pensions for retired Federal workers. (Sources: Public Law 555, 82d Cong., 2d Session, July 16, 1952.)

THE PRESIDENT approved the Federal Coal Mine Safety Act, which amends an earlier act and authorizes Federal mine inspectors to close unsafe mines in order to prevent disasters from certain causes. (Source: Public Law 552, 82d Cong., 2d Sess., July 16, 1952.)

July 18

THE PRESIDENT approved the Social Security Act Amendments of 1952, which include provisions for: (1) increases, after August 1952, in old-age and survivor insurance benefits (\$5 a month or 12½ percent, whichever is greater); (2) a \$75-a-month limit (formerly \$50) on earnings as a condition of eligibility for benefits; and (3) larger Federal contributions to State public assistance programs. (Source: Public Law 590, 82d Cong., 2d Sess., July 18, 1952.)

July 19

THE PRESIDENT submitted to the Congress his Midyear Economic Report, together with the Midyear 1952 Economic Review of the Council of Economic Advisers, in accordance with the terms of the Employment Act of 1946. (Source: The Midyear Economic Report of the President and the Midyear Economic Review by the CEA, July 1952.)

THE Secretary of Labor informed the President that 80 railroad carriers, under terms of a master agreement with the Brotherhood of Railroad Trainmen (see Chron. item for Jan. 18, 1952, MLR, Mar. 1952), had put into effect a 5-day workweek for yard service employees. (Source: U. S. Dept. of Labor release, July 19, 1952.)

July 24

The Order of Railway Conductors (Ind.) and the Pullman Co. settled their dispute by negotiating an agreement which provides a 12½-cent hourly basic wage increase retroactive to January 1, 1951, a cost-of-living wage escalator clause, and a "wage and rules moratorium to October 1, 1953." (Source: New York Times, July 25, 1952; and Labor, Aug. 2, 1952.)

July 26

The United Steelworkers of America (CIO) ended their strike (see Chron. item for June 2, 1952, MLR, July 1952) after the union's Wage Policy Committee, on the previous day, had ratified an agreement with six major steel companies providing: an average wage increase of 16 cents an hour, retroactive to March 1, 1952; other benefits amounting to 5.4 cents an hour; and a modified union shop. The union postponed the return-to-work order until it had negotiated with mining companies an agreement covering iron-ore miners, who received additional increases to bring thier wage levels up to those in the steel industry by July 1, 1953. (Source: New York Times, July 27, 1952.)

On July 30, the Office of Price Stabilization authorized price increases for steel producers, as ordered by the Acting Director of the Office of Defense Mobilization. (Source: OPS release, July 30, 1952.) (For discussion of preceding items, see p. 309 of this issue.)

July 28

THE WAGE STABILIZATION BOARD announced settlement of its last pending disputes case (see Chron. item for Jan. 26, 1952, MLR, Mar. 1952), with the signing of new contracts by the United Steelworkers of America (CIO) and two major aluminum companies; some workers in one of the companies were covered by an agreement negotiated a few weeks earlier with the International Council of Aluminum Workers (AFL). (Source: New York Times, July 29, 1952; and CIO News, Aug. 4, 1952; for discussion, see p. 309 of this issue.)

The Sailors Union of the Pacific (AFL) voted to approve a new agreement with the Pacific Maritime Association, thus ending their strike (see Chron. item for May 26, 1952, MLR, July 1952). Provisions include a 5-percent wage increase, higher overtime rates and employer contributions to the union welfare fund, and a reduction in the workweek. (Source: AFL News-Reporter, Aug, 1, 1952; and New York Times, July 29, 1952.)

July 30

THE PRESIDENT appointed 14 of 18 members of the new tripartite Wage Stabilization Board, subject to Senate confirmation (see Chron. item for June 30, 1952, MLR, Aug. 1952). The chairman is Archibald Cox, former Chairman of the Construction Industry Stabilization Commission; two industry and two public members are to be appointed; the six labor members were named. (Source: New York Times, July 31, 1952.)

August 7

The Cook County (Illinois) Circuit Court granted the International Harvester Co.'s request for an injunction against mass picketing by Local 141 of the United Electrical Workers (Ind.) in a strike protesting the transfer of the

company's Chicago twine mill to New Orleans. (Source: New York Times, Aug. 8, 1952.)

August 10

The Cloak Joint Board of the International Ladies' Garment Workers Union (AFL) refused to bargain with the Independent Association of Women's Apparel Manufacturers, Inc., a new organization representing nonunion employers. However it indicated that members of the new employers' group could bargain directly with the union or join one of the associations representing unionized employers. The dispute developed after the union began picketing unorganized companies; later, the Association filed suit under the Sherman Anti-Trust Act against union and industry officials. (Source: New York Times, Aug. 11, 1952; and AFL News-Reporter, Aug. 8, 1952.)

Union Conventions Schedule, October 1952

Among union conventions, which are usually held periodically to determine policy and to elect officers, those scheduled for October 1952 are listed below by type—national or international and State—in chronological order.

October	National or International Conventions	Place
2	Air Line Dispatchers Association, AFL	Chicago
3	American Railway Supervisors Association, Ind.	Chicago
6	International Union of Electrical, Radio, and Machine Workers, CIO.	Pittsburgh
6	United National Association of Post Office Clerks, Ind	Los Angeles
6	United Mine Workers of America, Ind	Cincinnati
13	Industrial Union of Marine and Shipbuilding Workers of America, CIO.	Cleveland
13	International Brotherhood of Teamsters, AFL	Los Angeles
13	International Union of Wood, Wire, and Metal Lathers, AFL	Houston
19	Commercial Telegraphers' Union, AFL	Vancouver, B. C.
20	International Air Line Pilots Association, AFL	Chicago
20	International Union of United Cement, Lime, and Gypsum Workers, AFL.	Long Beach, Calif.
21	National Brotherhood of Packinghouse Workers, Ind.	St. Joseph, Mo.
27	International Association of Bridge, Structural and Ornamental Iron Workers, AFL.	St. Louis
27	International Union of Bricklayers, Masons, and Plasterers, AFL.	Minneapolis

October	State Conventions	Place	October	State Conventions	Place
2	West Virginia, AFL	Wheeling	13	Illinois, AFL	Peoria
2	Wyoming, AFL	Casper	13	Nebraska, AFL	Norfolk
3	Georgia, CIO	Atlanta	16	Oklahoma, AFL	Oklahoma
	New Mexico, AFL	Roswell			City
	Wisconsin, CIO	Oshkosh	17	Nebraska, CIO	Lincoln
6	Minnesota, AFL	Minneapolis	18	Kentucky, CIO	Louisville
6	Mississippi, AFL	Meridian	18	Missouri, CIO	Jefferson City
11	Vermont, CIO	Rutland	27	Kentucky, AFL	Lexington

Developments in Industrial Relations¹

More than half a million steel workers started back to work late in July, after a tentative agreement on basic issues was reached with major steel firms. Long-standing disputes with leading aluminum companies were terminated without a work stoppage during the month. The Bituminous Coal Operators Association was served with a 60-day notice of contract termination.

Basic Steel Agreement

The prolonged steel strike ² ended late in July but its imprint was left on the Nation's defense effort, economic controls program, and constitutional law. Steel production for military and civilian requirements was severely curtailed, the Wage Stabilization Board was reconstituted under an amended Defense Production Act without authority to intervene in labor-management disputes,³ and the President's power to act in an emergency without specific legal authority was interpreted by the United States Supreme Court.²

The Steelworkers (CIO) and 6 major steel companies-United States Steel, Bethlehem, Republic, Jones and Laughlin, Youngstown, and Inlandreached a tentative 2-year agreement on basic wage, fringe, and union-security issues on July 24. It was ratified by the union's wage policy committee the following day, but back-to-work orders were withheld until July 26 when a wage agreement was reached in the closely-related dispute involving iron-ore miners.2 Major steel plants reopened, but the signing of formal contracts, pending at the end of the month, awaited the outcome of negotiations on such issues as incentive rates, managerial rights, and seniority. Some smaller steel companies remained closed following failure to agree with the union on certain local working conditions.

As a part of the agreement ending the strike, an increase of \$5.20 a ton in the ceiling price of carbon steel was authorized by Acting Defense Mobilizer John R. Steelman. In addition to increases permitted for special types of steel, the total price adjustment averaged \$5.65, or almost twice the \$2.84 permissible under the Capehart Amendment to the Defense Production Act, prior to the negotiation of the steel settlement.

The wage and fringe benefit "package" of slightly more than 21 cents an hour was substantially similar to the industry offer of June 9.2 Major terms of the settlement which expires June 30, 1954, include (1) a general hourly increase of 12.5 cents in the lowest job rate, retroactive to March 1, 1952, plus a widening of the increments between job classes by half a cent an hour—the combined increases to average 16 cents an hour; (2) liberalized fringe benefits amounting to a little more than 5 cents an hour, including 3 weeks' vacation with pay after 15 years' service (formerly 25 years) retroactive to January 1, straight-time pay for 6 holidays not worked, an increase in pay for holidays worked from time and a half to double time, and increased shift differentials from 4 to 6 cents an hour for the second shift and from 6 to 9 cents for the third shift; and (3) a reduction in the southern differential affecting the United States Steel Co. and the Republic Steel Co. A wage reopening on June 30, 1953, was also provided.

In contrast to the union's original proposal for a union shop, it accepted a compromise security clause which differed only slightly from the maintenance-of-membership provision in the previous contract. The clause requires new employees to apply for union membership at the time of hiring, but permits cancellation of the application between the 15th and 30th day of work by written notification to the employer; present nonunion employees are exempted from this requirement.

Earlier in the month there had been several weeks of intermittent and unsuccessful bargaining meetings arranged under White House auspices. The union filed a complaint of unfair labor

3 Idem (p. 201).

⁴ See June 1952 issue of Monthly Labor Review (p. 696).

practices with the National Labor Relations Board, accusing the "Big Six" steel producers of a conspiracy to prevent other companies from reaching individual agreements. In a parallel action, it requested the United States Department of Justice to institute anti-trust proceedings against these companies.

The negotiations which resulted in the steel agreement followed reports that the President was considering a partial seizure of the industry under the terms of the Selective Service Act and a warning by the Secretary of Defense that the defense program was "grinding to a halt." Mounting steel shortages had led to the closing of the Army's largest shell-producing plant and reportedly had forced sharp lay-offs in the manufacturing and transportation industries.

Aluminum Settlements

Several protracted disputes in the aluminum industry ⁵ which involved issues similar to those in the steel controversy were terminated by agreements between the Steelworkers (CIO) and the Kaiser Aluminum and Chemical Co., ⁶ the Aluminum Co. of America, and the Reynolds Metals Co. ALCOA also settled with the AFL International Council of Aluminum Workers. ⁶ Under the terms of these settlements, about 40,000 workers received a wage "package" approximately the same as that provided in the basic steel agreement.

The Kaiser agreement of July 19 extends for a 2½-year period ending July 1, 1954, and covers about 5,000 workers in five plants. Major wage provisions included general hourly increases of 12 cents retroactive to July 1 and 4 cents retroactive to January 1, and a further 6.3-cent hourly increase in 2 plants, also retroactive to January 1. Increased shift differentials, improved health and welfare benefits, a wage-reopening clause effective July 1, 1953, and renewal of the existing union-shop clause were also agreed upon.

The Steelworkers' 1-year contract with ALCOA, reached on July 28, averted a strike of about 15,000 workers scheduled for the following day. Settlement terms included (1) a 15-cent hourly increase in base pay, retroactive to March 10 and an additional 4 cents an hour retroactive to July 1; (2) a reduction of the 7-cent North-South differential to 4 cents, retroactive to July 1, and then to 2 cents, effective January 1, 1953; and (3) 3 weeks'

vacation with pay after 15 years' service instead of 25 years, hourly increases in second- and third-shift differentials from 4 and 6 cents to 6 and 9 cents, respectively, and increases in hospitalization benefits from \$8.50 a week to \$10 and in nonoccupational sickness and accident benefits from \$26 a week to \$30—all retroactive to July 1. The contract also contained the same union-security provision agreed upon in the steel settlement. A similar wage agreement covering about 10,000 employees of the Reynolds Metals Co. was reached on July 30.

A 5-year contract reached between ALCOA and the Aluminum Workers (AFL) on July 9 preceded the Steelworkers' agreements. It affected about 9,500 workers in 6 plants. Principal wage terms provided (1) a general wage increase of 10 percent (averaging about 15 cents an hour) retroactive to March 10; (2) an "annual improvement factor" wage increase of 4 cents an hour for each year of the contract period, effective July 1; and (3) a cost-of-living escalator clause providing for quarterly wage adjustments based on the Consumers' Price Index. The "annual improvement factor" clause is an unusual arrangement which specifies that if the CPI reaches 200 by July 1, 1953, 1 cent an hour will be added to the second annual increase and this adjustment will be added to the remaining three annual increases depending on the trend in living costs. If the index fails to maintain a specified upward movement, the wage provisions may be reopened on 30 days' notice by either party. Contract terms providing liberalized vacation pay, shift differentials, and health and welfare benefits were the same as those contained in the ALCOA-Steelworkers' settlement. A reopening, limited to fringe issues, is permitted on July 1, 1954. The maintenance-of-membership clause in the previous contract was renewed. The agreement was made contingent on authorization of higher aluminum ceiling prices by the Office of Price Administration and approval by the WSB.6

Other Major Strike Activity and Negotiations

The strike involving major carpet and rug companies continued but stoppages by construction

⁶ See March 1952 issue of Monthly Labor Review (p. 315).

⁶ The contracts were approved by the WSB (industry member dissenting) late in July 1952.

and maritime workers were terminated. The United Mine Workers (Ind.) filed a 60-day notice of contract termination with bituminous-coal producers.

Construction. Construction workers at the Paducah, Ky., project of the Atomic Energy Commission returned to work July 7, ending a strike which began June 5 and idleness affecting about 14,000 employees. The walk-out was allegedly in protest against delay by the prime contractor at the project in paying a wage increase which had been submitted for Wage Stabilization Board approval.

Textiles. Wages of about 17,000 cotton-textile workers in 13 New Bedford-Fall River mills were reduced an average of about 8.5 cents an hour on July 19 by an arbitration decision. The award eliminates the 6.5-percent wage increase approved by the WSB 7 effective March 1951—the date when the adjustment was negotiated with the Textile Workers Union of America (CIO).8 It does not, however, affect the subsequent 4-cent hourly increase which resulted from a cost-ofliving escalator clause in their contract. A wage reduction ranging from 13 to 15 cents an hour had been requested by the employers on the basis that substantially lower textile labor costs in the South jeopardized their competitive position. Company proposals for elimination of the escalator clause and certain fringe benefits provided in the present contract were denied by the arbitrator.

In line with the decision, the TWUA on July 22 agreed to permit the Pepperell and Continental textile mills in Maine to reduce wages of some 3,500 employees by the same amount. The award was also expected to influence pending arbitration cases affecting large numbers of workers in other northern cotton and rayon mills. In June 1952, some 7,700 Bates Manufacturing Co. employees received a wage cut under an arbitration decision.²

Unsettled economic conditions in the textile trades were also reflected in the continuation of the strike involving major carpet and rug firms.² Employees of the Mohawk Carpet Co. rejected two tentative settlements that had been reached with the TWUA. Both provided for an hourly wage increase of 7 cents. A partial settlement of the strike had occurred in June when about

1,000 employees of two smaller companies—Roxbury and A & M Karagheusian—returned to work. The Roxbury employees accepted a 7-cent hourly wage increase contingent upon the final settlement reached between the union and major carpet firms. Karagheusian employees returned to work under the present contract terms pending settlement by the major companies.

Approximately 120,000 tele-Communications. phone workers received wage increases under the terms of 1-year contracts agreed upon by telephone companies and the Communications Workers of America (CIO). The Southwestern Bell Telephone Co. agreed to increases averaging 9.2 cents an hour, effective July 6, for about 50,000 workers. Increases ranging from \$3 to \$6 a week were provided for some 20,000 American Telephone and Telegraph Co. long-lines telephone operators, effective July 5. In addition, the WSB approved wage adjustments ranging from \$2 to \$6 a week, effective June 8, and covering about 50,000 Southern Bell Telephone and Telegraph Co. nonsupervisory employees.

Maritime. Wage negotiations between East and Gulf Coast ship operators and the Masters, Mates and Pilots (AFL) which represents about 8,000 deck officers, collapsed early in the month when the employers rejected the union's requests for a 10-percent hourly wage increase and acceptance of its interpretation of the appropriate scope of discussions under a contractual wage-review clause. The union, in turn, rejected a proposal to arbitrate both issues. The present contract could be terminated August 8 under a clause which provides for such action 60 days after the start of wage discussions.² Further bargaining meetings were scheduled in July.

West Coast shipowners and the union reached an agreement on July 29 providing for a 5-percent wage increase and an increase in employer welfare and pension contributions from 50 to 60 cents a day per worker. The settlement came after the Sailors Union of the Pacific (AFL) and the Pacific Maritime Association (representing 24 major ship operators) agreed upon the same wage rise and a reduction in the present basic workweek at sea from 48 hours (beyond which overtime is paid)

⁷ See October 1951 issue of Monthly Labor Review (p. 471).

⁸ See May 1951 issue of Monthly Labor Review (p. 574).

to 40. The settlement, subject to WSB approval, ended a 2-month old strike that had idled approximately 4,000 workers and tied up Pacific Coast nonmilitary shipping.

Railroads. Seventeen nonoperating railroad unions rejected a union-security offer made by eastern and western carriers employing about 800,000 maintenance and clerical employees. Southern railroads have refused to participate in negotiations on the union-security issue. The unions claimed the railroads' offer was merely the equivalent of a modified maintenance-of-membership clause and insisted on the union-shop provision recommended by an emergency board in February. According to the unions, 40 percent of all railroad mileage is worked by employees covered by union-shop agreements.

The Secretary of Labor reported to the President on July 19 that the 5-day workweek had been made effective for yard-service and related employees of 80 major railroads as a result of agreements reached with the Brotherhood of Railroad Trainmen (Ind.). The union's request for the shorter workweek is still pending with seven other railroads.⁵

Asserting that "annual improvement" wage increases are permissible in the railroad industry, despite the fact that a general policy pronouncement on this issue was still pending at the WSB, representatives of 15 nonoperating and 3 operating railroad unions requested the President to arrange immediate meetings with major railroads in order to discuss such increases. Present agreements with the carriers permit negotiations on this issue on or after July 1, 1952 "if Government wage stabilization policy permits so-called annual improvement wage increases."

Rubber. The United Rubber Workers (CIO) and the U. S. Rubber Co. began wage negotiations affecting about 33,000 employees on July 7.

Bargaining meetings with other major rubber firms started in June. Discussions with U. S. Rubber were limited under the contract to the union's proposals for higher wages but the union requested the company voluntarily to consider liberalization of pension and welfare benefits.

Bituminous Coal. The United Mine Workers (Ind.) on July 22 filed a 60-day notice of contract termination with the Bituminous Coal Operators Association, leading employer bargaining group in the soft-coal industry. The termination notice is specified in the present agreement which was reached late in January 1951.

Aircraft. The United Automobile Workers (CIO) accepted a proposal by the North American Aviation Co. to submit their wage dispute ² to binding arbitration by a fact-finding board to be appointed by the President. The company agreed to include in the corporation-wide bargaining structure about 1,000 employees at its Fresno, Calif., plant for which the union recently won bargaining rights. Acceptance of the arbitration agreement was a departure from the union's normal collective-bargaining practice, but this action was decided upon "as a last measure" in order to avoid curtailment in the supply of Sabre-jet fighter planes to Korea.

Nonferrous Metals. Negotiations during the month between the Mine, Mill and Smelter Workers (Ind.) and major copper mining and other nonferrous mining and processing firms were reported to be largely unsuccessful. Contracts with most of the principal companies expired June 30. The union is requesting an hourly increase of 25 cents, in addition to numerous improvements in fringe benefits. In 1951, a dispute over the union's wage and pension proposals led to a widespread strike.

Special Review

Socialism and American Life. Edited by Donald Drew Egbert and Stow Persons; bibliography by T. D. Seymour Bassett. Princeton, N. J., Princeton University Press, 1952. Two vols.: Vol. 1, xiv, 776 pp., \$10; Vol. 2, xiv, 575 pp., \$10; ordered together, \$17.50.

In addition to providing a worthy and fitting obituary for American socialism as a political force, these two massive volumes bring order and perspective to the history of a political organization whose publishing habits have been chaotic if prolific. To the many living Americans who have at some time during their lives been a part of this movement, the study is a memento of value. Its more general value, however, lies in the 15 essays by 16 authors who joined pens and erudition to produce volume 1 of the history.

Volume 2 of the set is a descriptive and critical bibliography of more than 500 pages keyed to the topical essays. In this impressive compilation may be the enduring value of the entire work.

Though the essays include treatises on left-wing writers, religious influences, the influence of Marxian economics, the social implications of socialist theory, European socialism before and after 1848, and others, there strangely is no single treatise on socialism and the American labor movement. Perhaps this is because the failure here was part and parcel of the general failure on the whole political scene.

Nevertheless, as two of the authors (Daniel Bell, "The Background and Development of Marxian Socialism in the United States," and Will Herberg, "American Marxist Political Theory") point out, socialism did have an important influence on the American trade-union movement. It seeded it but was not seeded by it.

According to Bell, socialism in the United States failed because "by its very statement of goal and in its rejection of the capitalist order as a whole, [it] could not relate itself to the specific problems of social action in the here-and-now, give-and-take political world. It was trapped by the unhappy problem of living 'in but not of the world,'

so it could only act, and then inadequately, as the moral, but not political, man in immoral society. It could never resolve but only straddle the basic issue of either accepting capitalist society, and seeking to transform it from within as the labor movement did, or becoming the sworn enemy of that society, like the Communists. A religious movement can split its allegiances and live *in* but not of the world . . .; a political movement can not." And in conclusion: . . "by 1950 American socialism had become simply a notation in the archives of history."

And as for the labor movement, he finds, in favor of Gompers: "If socialism as an historically organized movement has not achieved a permanency in American life, it is largely due to the role of the American Federation of Labor." The socialists failed to perceive the unique adaptive quality of the AFL in its "day-to-day acceptance of capitalist society." This stemmed in large measure from the very fact that early, formative AFL leaders like Strasser, McGuire, and Gompers had progressed through the anguish of labyrinthian sectarian socialist dogmas and reacted as would be expected. Bell sees two important results: eschewing of the (generally speaking) populist movements and schematic economic nostrums; accepting "concentration of economic power as an inevitable fact of industrial capitalism."

Nevertheless, the Marxist imprint was evident. The Herberg essay, in a section on "Early Gompersism," notes: "The early pronouncements of Samuel Gompers clearly reveal the Marxist inspiration of the ideology of the American Federation of Labor . . ." He terms it a "conservative syndicalism," citing the early stress of Gompers on "direct action and . . . distrust of government and politics" as evidence of a syndicalist tendency. But to Gompers, he contends, without more than a bare hint of explanation, the "movement" was pragmatic American trade-unionism as opposed to "social democracy" for the European, making the latter a gradualist socialist and the former a "conservative" syndicalist. He hopes that a "reinterpretation of old line 'pure and simple' trade-unionism from this point of view" can be made. One might wonder to what purpose even if one can imagine to what end.

There is no general attempt to evaluate the contribution, if any, of latter-day socialist trade-unionists to present-day industrial relations or to the trade-union movement as such.

Authors (in addition to the editors, the bibliographer, and those quoted) include E. Harris Harbison, Harry W. Laidler, Albert T. Mollegen, Sidney Hook, Paul M. Sweezy, Wilbert E. Moore, George W. Hartmann, and Willard Thorp.

Education and Training

Industrial Training: A Guide to Selected Readings. By John M. Brophy, I. Bradford Shaw, Fred T. Golub. Ithaca, Cornell University, New York State School of Industrial and Labor Relations, 1952. 62 pp. (Bull. 20.) Free to New York State residents, 25 cents to others. Labor and Education in 1951. Washington, American Federation of Labor, 1952. 40 pp. 10 cents.

Contains the report of the Workers Education Bureau, resolutions pertaining to education adopted by the AFL convention, and a list of research and education directors of the various AFL national and international unions.

Workers' Education at the University Level. By Irvine L. H. Kerrison. New Brunswick, N. J., Rutgers University Press, 1951. 177 pp., bibliography. \$3.

Problems of Vocational Education—An International Survey.

Edited by Harold Robinson. Stuttgart, Reinhold
A. Mueller, 1952. 149 pp., bibliographies, diagrams, illus. DM 5.80.

Report of International Conference on Vocational Education, Stuttgart, 1950, and facts and figures on vocational education in various countries. Translated from second German edition of "Probleme des beruflichen Bildungswesens," by Walter Drechsler.

Bibliografia de la Literatura Sobre Educación de Adultos en la America Latina. Washington, Pan American Union, Department of Cultural Affairs, Columbus Memorial Library, 1952. 88 pp. (Bibliographic Series, 37.) 25 cents.

Includes references to material on workers' education.

Income

Labor Income in the Postwar Period. By Lawrence Grose. (In Survey of Current Business, U. S. Department of Commerce, Bureau of Foreign and Domestic Commerce, Washington, May 1952, pp. 7-13, 24, charts. 30 cents, Superintendent of Documents, Washington.)

Summary of trends in employees' compensation, by major industry groupings, since end of World War II, and a comparison of prewar and postwar employment patterns. The article is based mainly on the Commerce Department's national income data.

Incomes of Physicians, Dentists, and Lawyers, 1949-51.
(In Survey of Current Business, U. S. Department of Commerce, Bureau of Foreign and Domestic Commerce, Washington, July 1952, pp. 5-7. 30 cents, Superintendent of Documents, Washington.)

Statistics of National Income and Expenditure. New York, United Nations, Department of Economic Affairs, Statistical Office, 1952. 58 pp., bibliographies. (Statistical Papers, Series H, No. 1.) 50 cents.

Gives data by country, in national currencies, for varying periods from 1919 to 1951. Total wage and salary payments are shown by country, for different years, 1938 to 1951.

The National Income, [Canada], 1926–1951. (In Labor Research, Ottawa, April-May-June 1952, pp. 1-10, 12, charts. 10 cents.)

Summarizes some of the more significant data of labor interest in three official Canadian reports. Includes a tabulation showing the percentage of the national income going to wages, salaries, and supplementary labor income.

Industrial Health

- The Health of Welders. By A. T. Doig and L. N. Duguid. London, Ministry of Labor and National Service, Factory Department, 1951. 84 pp., bibliography, illus. 3s. net, H. M. Stationery Office, London.
- Lectures Presented at the Inservice Training Course on the Acoustical Spectrum, Sound—Wanted and Unwanted, February 5-8, 1952. Ann Arbor, University of Michigan, School of Public Health and the Institute of Industrial Health, 1952. 192 pp., bibliographies, charts, diagrams, illus.

Causes, effects, measurement, costs, and control of noise (particularly industrial) are discussed.

Quest for a Suspected Industrial Carcinogen. By Carrol S. Weil, Henry F. Smyth, Jr., Thomas W. Nale, M.D. (In A. M. A. Archives of Industrial Hygiene and Occupational Medicine, Chicago, June 1952, pp. 535-547. \$1.)

Reports of studies and experiments made to identify and control the potential chemical cause of cancer among workers engaged in production of isopropanol.

Recommended Safe Practice for Radium Dial Painting Plants. (In Monthly Review, New York State Department of Labor, Division of Industrial Hygiene and Safety Standards, New York, February-March 1952, pp. 5-10.)

Outlines a program for safe handling of radioactive luminous compounds, to protect workers against radium poisoning and radiation hazards.

Traumatic Vasospastic Disease of the Hand (Raynaud's Phenomenon). By Earl F. Hoerner, M.D. (In Industrial Medicine and Surgery, Chicago, June 1952, pp. 297–302, bibliography. 75 cents.)

Industries in which vibratory tools are employed are on the increase, and vascular disorders have become more pronounced over the last decade, according to the author.

Industrial Relations

- Human Relations in Industry. By E. Daya. (In International Labor Review, Geneva, May 1952, pp. 578–599. 60 cents. Distributed in United States by Washington Branch of ILO.)
- The Employers' Right of Free Speech Under the Taft-Hartley Act. By Walter L. Daykin. (In Iowa Law Review, Vol. 37, No. 2, Iowa City, 1952, pp. 212-241. \$1.)
- Labor-Management Contract Provisions, 1950-51: Prevalence and Characteristics of Selected Collective-Bargaining Clauses. Washington, U. S. Department of Labor, Bureau of Labor Statistics, 1952. 33 pp. (Bull. 1091.) 25 cents, Superintendent of Documents, Washington.
- Labor Views Collective Bargaining. By J. A. Beirne. Washington, Communications Workers of America (CIO), [1952]. 22 pp. Single copies free.

- Railroad Grievance Machinery: A Critical Analysis. By Herbert R. Northrup and Mark L. Kahn. (In Industrial and Labor Relations Review, Ithaca, N. Y., April 1952, pp. 365-382; July 1952, pp. 540-559. \$1.25 each.)
- Work Stoppages: Federal Fact-Finding Boards and Boards of Inquiry, 1945–1951. Washington, U. S. Department of Labor, Bureau of Labor Statistics, [1952]. 30 pp.; processed. Free.
- Work Stoppages in New York State, 1951. New York, State Department of Labor, Division of Research and Statistics, 1952. 25 pp.; processed. (Publication B-59.)
- Industrial Relations in the British Shipping Industry. By L. H. Powell. (In International Labor Review, Geneva, June 1952, pp. 681-702. 60 cents. Distributed in United States by Washington Branch of ILO.)

Interindustry Economics

The Interindustry Relations Study for 1947. By W. Duane Evans and Marvin Hoffenberg. (In Review of Economics and Statistics, Cambridge, Mass., May 1952, pp. 97–142. Reprints available at \$1 each.)

The interindustry relations or input-output method of analysis, originated by Prof. W. W. Leontief of Harvard University, has been the subject of work at the Bureau of Labor Statistics since 1942. The method makes use of empirically established materials and service input patterns for all the separate industries of the economy to determine the detailed production requirements which are implied by any desired or anticipated schedule of finished goods deliveries (purchases by consumers, investors, exporters, and government). An obvious extension is a check of the implied production requirements against manpower, machinery, and materials resource limitations. Because of projected use of the approach for improvement of industrial mobilization and feasibility analyses, a major data compilation project, financed largely by the Department of Defense, was started by the Bureau of Labor Statistics in 1949. The monograph listed is a preliminary report on this study. It includes discussions of the approach itself, of the practical and conceptual problems met in carrying through the study, and of the research areas in which the results may in time be applied. Appended 50-sector tables (aggregated from the 500 sectors distinguished in the basic work) show preliminary results.

Input-Output Analysis as an Aid to Manpower Policy. By James Burtle. (In International Labor Review, Geneva, May 1952, pp. 600-625. 60 cents. Distributed in United States by Washington Branch of ILO.)

Nontechnical discussion of the interindustry relations or input-output method of analysis and its application to problems of labor supply and demand, employment structure and location, policies for alleviating unemployment, and employment balance in inflationary situations. Includes input-output tables for the United States (1947—

identical with those given in report noted in preceding reference), Holland (1948), and Denmark (1946), and a projected (1953) table for Israel.

Marketing Uses of Input-Output Data. By W. Duane Evans. (In Journal of Marketing, Chicago, July 1952, pp. 11-21. \$1.)

Contains analysis of ultimate distribution among finished product and demand categories of iron and steel industry output in 1947. Discusses application of interindustry relations data and methods to national market analysis problems of basic industries.

Labor and Social Legislation

- Time Off for Voting Under State Law. Washington, U. S. Department of Labor, Bureau of Labor Standards, 1952. 12 pp.; processed. (Bull. 138, rev.) Free.
- Asian Labor Laws. New Delhi, International Labor Office, Indian Branch, 1951. 1285 pp. \$7.50. Distributed in United States by Washington Branch of ILO.

The volume deals with Afghanistan, Burma, Ceylon, China, French establishments in India, Hong Kong, India, Indochina, Indonesia, Japan, Federation of Malaya, Pakistan, Philippines, Singapore, and Thailand. It is divided into two parts. In the first part, international regulations and national legislation are summarized by subject; in the second, the more important laws are reproduced chronologically by country.

- Law and Social Change in Contemporary Britain. By W. Friedman. London, Stevens & Sons, Ltd., 1951. xxiv, 322 pp., bibliography. 37s.6d.
- Lois Sociales, Sécurité Sociale. By Perraud-Charmantier and L. de Riedmatten. Paris, Librairie Générale de Droit et de Jurisprudence, 1952. 288 pp. 4th ed.

Handbook of French labor and social legislation. Laws and regulations are listed and briefly described in nonlegal terminology.

Législation Sociale de la Suisse, 1951. Zurich, Office Fédéral de l'Industrie, des Arts et Métiers et du Travail, 1952. 304 pp. In French and German.

Medical Care and Sickness Insurance

Annual Survey [of] Accident and Health Coverage in the United States, as of December 31, 1951. New York, Health Insurance Council, 1952. 31 pp., bibliography, map, charts.

Presents estimates of the number of individuals protected by insurance and other organizations against hospital, surgical, and medical expenses.

Health Education and Preventive Medicine—"New" Horizons in Medical Care. By George Rosen. (In American Journal of Public Health and the Nation's Health, New York, June 1952, pp. 687-693. \$1.)

Describes preventive and educational program carried out by the Health Insurance Plan of Greater New York among its members, in conjunction with provision of prepaid medical care. Medical Services in Industry—A Symposium. (In Industrial Medicine and Surgery, Chicago, June 1952, pp. 282–296. 75 cents.)

Includes discussions of the roles of management, physician, and nurse, and a report on a survey of medical services in industry.

Patient Load and Volume of Medical Services. By Antonio Ciocco, Isidore Altman, T. David Truan. (In Public Health Reports, Federal Security Agency, Public Health Service, Washington, June 1952, pp. 527-534, bibliography, charts. 45 cents, Superintendent of Documents, Washington.)

Findings of a survey among physicians in 27 counties of western Pennsylvania, made in connection with a study of national health manpower requirements.

- Comparison of Temporary Disability Insurance Laws, April 1952. Washington, U. S. Department of Labor, Bureau of Employment Security, 1952. 4 pp.; processed. Free.
- California [Temporary] Disability Insurance Program.
 Washington, U. S. Department of Labor, Bureau of Employment Security, 1952.
 83 pp.; processed.
 Free.
- Off-the-Job Sickness and Disability Benefits in Connecticut.
 [Hartford, Department of Labor], Bureau of Labor
 Statistics, 1952. 22 pp., chart; processed.

Prepared by Governor's committee appointed to draft an off-the-job sickness and disability insurance bill.

Older Workers and Retirement

Company Practices Regarding Older Workers and Retirement. Libertyville, Ill., Edwin Shields Hewitt and Associates, 1952. 34 pp., charts.

Based on information furnished by 657 companies with approximately 2.5 million employees, of whom about 2.3 million were covered by retirement benefit plans.

- Employment and Economic Status of Older Men and Women.
 Washington, U. S. Department of Labor, Bureau of
 Labor Statistics, 1952. 58 pp., map, charts. (Bull.
 1092.) 30 cents, Superintendent of Documents,
 Washington.
- Policies of Recruitment and Retirement of Older Workers Among Denver Employers. By Fred Wilkins. (In Industrial Relations Newsletter, University of Denver, Department of Personnel and Industrial Relations, Denver, Colo., Spring 1952, pp. 4-16.)
- Retirement Plans in Colleges and Universities, and Important Factors Affecting Them. Norman, University of Oklahoma, 1951. 110 pp.; processed.

Report on policies and practices in 37 institutions in 1950–51.

Personnel Management and Policies

Building Employee Morale. Washington, Bureau of National Affairs, Inc., 1952. 15 pp. (Personnel Policies Forum Survey 12.) \$1.

- The Development of Executive Talent: A Handbook of Management Development Techniques and Case Studies. Edited by M. Joseph Dooher and Vivienne Marquis. New York, American Management Association, 1952. 576 pp., bibliography, charts, diagrams, forms. \$5.75 to members of Association, \$6.75 to others.
- Selected Reading List on Personnel Administration Through Supervisors. Pasadena, California Institute of Technology, Industrial Relations Section, June 1952. 8 pp. (Circular 19.)
- Successful Employee Benefit Plans. New York, Prentice-Hall, Inc., 1952. 561 pp., forms. \$8.85.

Analyzes for management the components which make for successful planning of programs.

Social Security (General)

- The Cost of Social Security. (In International Labor Review, Geneva, June 1952, pp. 726-791. 60 cents. Distributed in United States by Washington Branch of ILO.)
- Minimum Standards of Social Security; Objectives and Advanced Standards of Social Security. Geneva, International Labor Office, 1952. 313 and 164 pp. (Reports V (a) (2) and V (b) prepared for 35th session of International Labor Conference.) \$1.75 and \$1, respectively. Distributed in United States by Washington Branch of ILO.

A preliminary draft of a proposed convention on minimum standards of social security was published in report V (a) (1) for the 35th session of the Conference.

- Economic Security of Farm Operators. By Alfred M. Skolnik. (In Social Security Bulletin, Federal Security Agency, Social Security Administration, Washington, May 1952, pp. 3-9, 21. 20 cents, Superintendent of Documents, Washington.)
- Social Security Trends in the Countries of the Near and Middle East. By Ferit H. Saymen. (In Bulletin of the International Social Security Association, Geneva, March 1952, pp. 89-109.)
- Thirty Years of Family Allowances in Belgium. By Leon L. Homès. (In Bulletin of the International Social Security Association, Geneva, April 1952, pp. 144-150.)

Wages, Salaries, and Hours of Labor

- Annual Earnings of Boston Fishermen in 1951. Washington, U. S. Department of Labor, Bureau of Labor Statistics, 1952. 14 pp., chart; processed. Free.
- Wage Movements: Salaries of Firemen and Policemen—A Quarter Century Review. Washington, U. S. Department of Labor, Bureau of Labor Statistics, [1952]. 8 pp.; processed. Free.
- Earnings and Employment of Office Workers in Manufacturing, [New York State], 1951. (In Labor Market Review, State Department of Labor, Bureau of Research and Statistics, Division of Placement and Unemployment Insurance, New York, March 1952, pp. 11-17.)

- Annual Review of Man-Hours and Hourly Earnings, With Average Weekly Wages, [Canada], 1945–1951. Ottawa, Department of Trade and Commerce, Dominion Bureau of Statistics, 1952. 27 pp., charts. 25 cents.
- The Normal Work Week, Canadian Manufacturing (as of October 1, 1951). (In Labor Gazette, Department of Labor, Ottawa, June 1952, pp. 708–722, charts. 10 cents in Canada, 25 cents in other countries.)
- Statistics of Wages and Working Hours in Egypt, January 1951. Cairo, Ministry of National Economy, Statistical Department, 1951. 101 pp.
- Situation des Salariés Agricoles, [France]. Paris, Conseil Économique, 1951. 180 pp. (Études et Travaux, 20.) 320 francs.

A study of the agricultural labor situation in France, giving detailed information on the number of agricultural wage earners, their working conditions, methods of payment, housing, and benefits derived from social-welfare legislation.

Social Incentives and Income Differentiation in the U.S.S.R. By K. Bieda. (In Australian Quarterly, Australian Institute of Political Science, Sydney, March 1952, pp. 31-45. 4s.)

Discusses Government promotion of wage equalization in the early years of the Soviet regime and subsequent change of policy in favor of increasing wage inequality.

Miscellaneous

Charting Statistics. By Mary Eleanor Spear. New York, McGraw-Hill Book Co., Inc., 1952. 253 pp. \$4.50. Describes and illustrates, by means of 176 charts by the author, methods of designing and the proper use of basic charts for the portrayal of economic and statistical data. Includes such subjects of labor interest as employment, earnings, working hours, income, prices, and production.

Human Relations in Administration: The Sociology of Organization, with Readings and Cases. Edited by Robert Dubin. New York, Prentice-Hall, Inc., 1951. 573 pp. \$7.35.

Man, Money, and Goods. By John S. Gambs. New York, Columbia University Press, 1952. 339 pp., bibliography, charts. \$3.75.

Nontechnical evaluation of different schools of economic theory. A chapter on the price of labor, land, and capital includes discussion of wage theories.

Proceedings of the 4th Annual Meeting, Industrial Relations Research Association, Boston, Mass., December 28-29, 1951. Edited by L. Reed Tripp. Madison, Wis. (Secretary-Treasurer of IRRA, Park and University, Temp. 3, Room 5), 1952. 289 pp. (Pub. 8.) \$3.

Topics covered included wages, manpower, recent research on employee attitudes and morale, international labor activities, arbitration in labor relations, union-management cooperation, labor's participation in defense effort, and social security. Some of the papers presented were analyzed in the Monthly Labor Review for February (p. 145) and March (p. 275) 1952.

219410-52-5

- Proceedings of the 15th Annual National Time and Motion Study and Management Clinic Sponsored by the Industrial Management Society, October 31, November 1-2, 1951, Chicago, Ill. Chicago, Industrial Management Society, 1952. 122 pp., charts, illus. \$4.
- The Social History of a War-Boom Community. By Robert J. Havighurst and H. Gerthon Morgan. New York, Longmans, Green and Co., Inc., 1951. xix, 356 pp., charts, maps, illus. \$4.

Willow Run: A Study of Industrialization and Cultural Inadequacy. By Lowell J. Carr and James E. Stermer. New York, Harper and Brothers, 1952. xxii, 406 pp., bibliography, charts, maps, illus. \$5.

The two books listed above are case studies of the social changes brought about by the impact of World War II defense production on small communities. Emphasis is on consequences of unusual population influx in relation to business, local community agencies, social relations, and housing.

A similar book, dealing with the Hampton Roads communities (Norfolk, Va., area) in World War II was noted in the June Monthly Labor Review (p. 705).

British Planning and Nationalization. By Ben W. Lewis. New York, Twentieth Century Fund, 1952. 313 pp., bibliography. \$3.

Explores selected areas in which the Labor Government attempted (1945–1951) positive economic controls, and evaluates results. Includes chapters on formal economic planning machinery, town and country planning, redistribution of industry, national health service, housing, agriculture, and four nationalized industries (coal, transport, electric power, iron and steel), as well as a general chapter on the issue of nationalization.

Industrial Democracy and Nationalization. By H. A. Clegg. Oxford, England, Basil Blackwell, 1951. 147 pp. 9s. 6d. net.

A Fabian Socialist considers how nationalized industries can best be organized in Great Britain so as to provide some measure of worker participation in management, at establishment level; to safeguard independence of unions; and to provide efficient service with a minimum of red tape. Discusses the question of ministerial responsibility and control vis-à-vis the managing board on the one hand, and Parliament on the other. Author's conclusions are of particular interest in view of co-determination issue raised by German trade-unions.

L'Economia Italiana nel 1951. Rome, Confederazione Generale dell'Industria Italiana, 1952. 262 pp.

This annual report on the Italian economy by the General Confederation of Italian Industry includes information on population, production, strikes, wages, etc.

Relazione all'Assemblea dei Delegati delle Associazioni Aderenti (16 Gennaio 1952). Rome, Confederazione Generale dell'Industria Italiana, 1952. 473 pp.

Annual report of the General Confederation of Italian Industry to its member associations for the year 1951. One section deals with labor-management problems and developments and social security and assistance.

Current Labor Statistics

331 Table A-8: Employees in manufacturing industries, by State ¹

worked, and sex

332 Table A-9: Insured unemployment under State unemployment insurance programs, by geographic division and State

B.—Labor Turn-Over

- 333 Table B-1: Monthly labor turn-over rates (per 100 employees) in manufacturing industries, by class of turn-over
- 334 Table B-2: Monthly labor turn-over rates (per 100 employees) in selected groups and industries

C.—Earnings and Hours

- 336 Table C-1: Hours and gross earnings of production workers or nonsupervisory employees
- 351 Table C-2: Gross average weekly earnings of production workers in selected industries, in current and 1939 dollars
- 352 Table C-3: Gross and net spendable average weekly earnings of production workers in manufacturing industries, in current and 1939 dollars
- 352 Table C-4: Average hourly earnings, gross and exclusive of overtime, of production workers in manufacturing industries
- 353 Table C-5: Hours and gross earnings of production workers in manufacturing industries for selected States and areas ¹

¹ This table is included in the March, June, September, and December issues of the Review.

Note.—Beginning with Volume 74, tables in the A section have been renumbered consecutively, to take into account the elimination of two tables.

D.—Prices and Cost of Living

- 359 Table D-1: Consumers' price index for moderate-income families in large cities, by group of commodities
- 360 Table D-2: Consumers' price index for moderate-income families, by city, for selected periods
- 361 Table D-3: Consumers' price index for moderate-income families, by city and group of commodities
- 362 Table D-4: Indexes of retail prices of foods, by group, for selected periods
- 363 Table D-5: Indexes of retail prices of foods, by city
- 364 Table D-6: Average retail prices and indexes of selected foods
- 365 Table D-7: Indexes of wholesale prices, by group of commodities (1947-49=100)
- 365 Table D-7a: Indexes of wholesale prices, by group of commodities, for selected periods (1926=100)
- 366 Table D-8: Indexes of wholesale prices, by group and subgroup of commodities

E.—Work Stoppages

367 Table E-1: Work stoppages resulting from labor-management disputes

F.—Building and Construction

- 368 Table F-1: Expenditures for new construction
- 369 Table F-2: Value of contracts awarded and force-account work started on federally financed new construction, by type of construction
- 370 Table F-3: Urban building authorized, by principal class of construction and by type of building
- 371 Table F-4: New nonresidential building authorized in all urban places, by general type and by geographic division
- 372 Table F-5: Number and construction cost of new permanent nonfarm dwelling units started, by urban or rural location, and by source of funds

Note.—Earlier figures in many of the series appearing in the following tables are shown in the Handbook of Labor Statistics, 1950 Edition (BLS Bulletin 1016). For convenience in referring to the historical statistics, the tables in this issue of the Monthly Labor Review are keyed to the appropriate tables in the Handbook.

¹ Estimates are subject to sampling variation which may be large in cases where the quantities shown are relatively small. Therefore, the smaller estimates should be used with caution. All data exclude persons in institutions. Because of rounding, the individual figures do not necessarily add to group totals.

² Beginning with January 1951, total labor force is not shown because of the security classification of the Armed Forces component.

³ Census survey week contains legal holiday.

⁴ Excludes persons engaged only in incidental unpaid family work (less than 15 hours); these persons are classified as not in the labor force.

⁵ Includes persons who had a job or business, but who did not work during the census week because of illness, bad weather, vacation, labor dispute or because of temporary lay-off with definite instructions to return to work within 30 days of lay-off. Does not include unpaid family workers.

¹ The Bureau of Labor Statistics' series of employment in nonagricultural establishments are based upon reports submitted by cooperating establishments and, therefore, differ from employment information obtained by household interviews, such as the Monthly Report on the Labor Force (table A-1), in several important respects. The Bureau of Labor Statistics' data cover all full- and part-time employees in private nonagricultural establishments who worked during, or received pay for, any part of the pay period ending nearest the 15th of the month; in Federal establishments during the pay period ending just before the first of the month; and in State and local government during the pay period ending on or just before the last of the month, while the Monthly Report on the Labor Force data relate to the calendar week which contains the 8th day of the month. Proprietors, self-employed persons, domestic servants, and personnel of the Armed Forces are excluded from the BLS but not the MRLF series. These employment series have been adjusted to bench-mark levels indicated by social insurance agency data through 1947. Revised data in all except the first four columns will be identified by asterisks the first month they are published.

1 Includes: ordnance and accessories; lumber and wood products (except furniture); furniture and fixtures: stone, clay, and glass products; primary

metal industries; fabricated metal products (except ordnance, machinery, and transportation equipment); machinery (except electrical); electrical machinery; transportation equipment; instruments and related products; and miscellaneous manufacturing industries.

3 Includes: food and kindred products; tobacco manufactures; textile-mill products; apparel and other finished textile products; paper and allied products; printing, publishing, and allied industries; chemicals and allied products; products of petroleum and coal; rubber products; and leather and leather products.

4 Data by region from January 1940, are available upon reguest to the

leather products.

⁴ Data by region, from January 1940, are available upon request to the Bureau of Labor Statistics.

⁵ Fourth class postmasters (who are considered to be nominal employees) are excluded here but are included in table A-5.

⁶ Excludes as nominal employee paid volunteer firemen, employees hired to conduct elections, and elected officials of small local governments.

† Data are not available because of work stoppage.

All series may be obtained upon request to the Bureau of Labor Statistics. Requests should specify which industry series are desired.

¹ Data for earlier years are available upon request to the Bureau of Labor Statistics or the cooperating State agency. State agencies also make available more detailed industry data.

more detailed industry data.

2 Revised series; not comparable with data previously published.

3 Not comparable with preceding data shown.

Cooperating State Agencies:

Alabama—Department of Industrial Relations, Montgomery 5.

Arizona—Unemployment Compensation Division, Employment Security Commission, Phoenix.

Arkansas—Employment Security Division, Department of Labor, Little

Rock.

Colifornia Division of Arba Catalana

Colorado—U.S. Bureau of Labor Statistics and Research, Department of Industrial Relations, San Francisco 1. Colorado—U.S. Bureau of Labor Statistics, Room 24, New Customhouse, Denver 2.

Connecticut-Employment Security Division, Department of Labor, Hartford 15.

Delaware—Federal Reserve Bank of Philadelphia, Philadelphia 1, Pa.

District of Columbia—U. S. Employment Service for D. C., Washington 25.

District of Collindia—U. S. Employment Service for D. C., Washington 25.
Florida—Unemployment Compensation Division, Industrial Commission, Tallahassee.
Georgia—Employment Security Agency, Department of Labor, Atlanta 1.
Idaho—Employment Security Agency, Boise.
Illinois—State Employment Service and Division of Unemployment Compensation, Chicago 54.
Indiana—Employment Security Division, Indianapolis 9.
Iowa—Employment Security Commission, Des Moines 8.
Kanass—Employment Security Division, Department of Labor, Topeka.
Kentucky—Bureau of Employment Security, Department of Economic Security, Frankfort.
Louisiana—Division of Employment Security, Department of Labor, Baton Rouge 4.
Maine—Employment Security Commission, Augusta.
Maryland—Department of Employment Security, Baltimore 1.
Massachusetts—Division of Statistics, Department of Labor and Industries, Boston 10.

tries, Boston 10.

Michigan—Employment Security Commission, Detroit 2.
Minnesota—Division of Employment and Security, St. Paul 1.
Mississippi—Employment Security Commission, Jackson.
Missouri—Division of Employment Security, Jefferson City.
Montana—Unemployment Compensation Commission, Helena.
Nebraska—Division of Employment Security, Department of Labor,
Lincoln J.

Nebraska—Division of Employment Security, Department of Labor, Lincoln 1.

Nevada—Employment Security Department, Carson City.

New Hampshire—Division of Employment Security, Department of Labor, Concord.

New Jersey—Department of Labor and Industry, Trenton 8.

New Mexico—Employment Security Commission, Albuquerque.

New York—Bureau of Research and Statistics, Division of Placement and Unemployment Insurance, New York Department of Labor, New York 18.

North Carolina—Department of Labor, Raleigh

and Unemployment Insurance, New York Department of Labor, New York 18.

North Carolina—Department of Labor, Raleigh.

North Dakota—Unemployment Compensation, Columbus 16.

Oklahoma—Employment Security Commission, Oklahoma City 2.

Oregon—Unemployment Compensation Commission, Salem.

Pennsylvania—Federal Reserve Bank of Philadelphia, Philadelphia 1 (mfg.); Bureau of Research and Information, Department of Labor and Industry, Harrisburg (nonmfg.).

Rhode Island—Department of Labor, Providence 3.

South Carolina—Employment Security Commission, Columbia 1.

South Dakota—Employment Security Commission, Columbia 1.

South Dakota—Employment Security Department, Aberdeen.

Tennessee—Department of Employment Security, Industrial Commission, Salt Lake City 10.

Vermont—Unemployment Compensation Commission, Montpelier.

Virginia—Division of Research and Statistics, Department of Labor and Industry, Richmond 19.

Washington—Employment Security Department, Olympia.

West Virginia—Department of Employment Security, Charleston 5.

Wisconsin—Industrial Commission, Madison 3.

Wyoming—Employment Security Commission, Casper.

¹ Prior to August 1950, monthly data represent averages of weeks ended in specified months; for subsequent months, the averages are based on weekly data adjusted for split weeks in the month and are not strictly comparable with earlier data. For a technical description of this series, see the April 1950 Monthly Labor Review (p. 382).

Figures may not add to exact column totals because of rounding, Source: U. S. Department of Labor, Bureau of Employment Security.

¹ Month-to-month changes in total employment in manufacturing industries as indicated by labor turn-over rates are not comparable with the changes shown by the Bureau's employment and payroll reports, for the following reasons:

reasons:

(1) A coessions and separations are computed for the entire calendar month; the employment and payroll reports, for the most part, refer to a 1-week pay period ending nearest the 15th of the month.

(2) The turn-over sample is not so large as that of the employment and payroll sample and includes proportionately fewer small plants; certain industries are not covered. The major industries excluded are: printing, publishing, and allied industries; canning and preserving fruits, vegetables, and sea foods; women's, misses', and children's outerwear; and fertilizers.

⁽³⁾ Plants are not included in the turn-over computations in months when (3) Plants are not included in the turn-over computations in months when work stoppages are in progress; the influence of such stoppage is reflected, however, in the employment and payroll figures. Prior to 1943, rates relate to production workers only.

† Preliminary figures.

† Prior to 1940, miscellaneous separations were included with quits.

Note: Information on concepts, methodology, and special studies, etc., is given in a "Technical Note on Labor Turn-Over," October 1949, which is available upon request to the Bureau of Labor Statistics.

¹ These figures are based on reports from cooperating establishments covering both full- and part-time employees who worked during, or received pay for any part of the pay period ending nearest the 18th of the month. For the mining, manufacturing, laundries, and cleaning and dyeing plants industries, data relate to production and related workers only. For the remaining industries, unless otherwise noted, data relate to nonsupervisory employees and working supervisors. All series are available upon request to the Bureau of Labor Statistics. Such requests should specify which industry series are desired. Data for the three current months are subject to revision without notation; revised figures for earlier months will be identified by asterisks the first month they are published.

¹ Includes: ordnance and accessories; lumber and wood products (except furniture); furniture and fixtures; stone, clay, and glass products; primary metal industries; fabricated metal products (except ordnance, machinery, and transportation equipment; machinery (except electrical); electrical machinery; transportation equipment; instruments and related products; miscellaneous manufacturing industries.

¹ Includes: food and kindred products; tobacco manufactures; textile-mill products; apparel and other finished textile products; paper and allied products; printing, publishing, and allied industries; chemicals and allied products; products of petroleum and coal; rubber products; leather and leather products.

⁴ Data relate to hourly rated employees reported by individual railroads (exclusive of switching and terminal companies) to the Interstate Commerce Commission. Annual averages include any retroactive payments made, which are excluded from monthly averages.

¹ Data include privately and government operated local railways and bus lines.

⁶ Through May 1949 the averages relate mainly to the hours and earnings o employees subject to the Fair Labor Standards Act. Beginning with June 1949 the averages relate to the hours and earnings of nonsupervisory employees. Data for June comparable with the earlier series are \$51, 47,38,5 hours, and \$1.337. Hours and earnings data for April 1952 affected by work stoppage.

⁷ Data relate to employees in such occupations in the telephone industry as switchboard operators, service assistants, operating room instructors, and pay-station attendants. During 1951 such employees made up 47 percent of the total number of nonsupervisory employees in telephone establishments reporting hours and earnings data.

⁸ Data relate to employees in such occupations in the telephone industry.

⁸ Data relate to employees in such occupations in the telephone industry as central office craftsmen; installation and exchange repair craftsmen; line, cable, and conduit craftsmen; and laborers. During 1951 such employees made up 23 percent of the total number of nonsupervisory employees in telephone establishments reporting hours and earnings data.

New series beginning with January 1952; data relate to domestic employees, except messengers, and those compensated entirely on a commission basis. Comparable data for October 1951 are \$70.52, 43.8 hours, and \$1.610; November—\$70.31, 43.7 hours, and \$1.609; December—\$70.47, 43.8 hours, and \$1.609.

10 Data on average weekly hours and average hourly earnings are not avail-

¹¹ Money payments only; additional value of board, room, uniforms, and tips, not included,

*Preliminary.

†Data are not available because of work stoppage.

¹These series indicate changes in the level of weekly earnings prior to and after adjustment for changes in purchasing power as determined from the Bureau's Consumers' Price Index, the year 1939 having been selected for the base period. Estimates of World War II and postwar understatement by

the Consumers' Price Index were not included. See the Monthly Labor Review, March 1947, p. 498. Data from January 1939 are available upon request to the Bureau of Labor Statistics.

¹ Net spendable average weekly earnings are obtained by deducting from gross average weekly earnings, social security and income taxes for which the specified type of worker is liable. The amount of income tax liability depends, of course, on the number of dependents supported by the worker as well as on the level of his gross income. Net spendable earnings have, therefore, been computed for 2 types of income-receivers: (1) A worker with no dependents; (2) a worker with 3 dependents.

The computation of net spendable earnings for both factory worker with no dependents and the factory worker with 3 dependents are based upon the

gross average weekly earnings for all production workers in manufacturing industries without direct regard to marital status and family composition. The primary value of the spendable series is that of measuring relative changes in disposable earnings for 2 types of income-receivers. That series does not, therefore, reflect actual differences in levels of earnings for workers of varying age, occupation, skill, family composition, etc. Comparable data from January 1939 are available upon request to the Bureau of Labor Statistics.

3 Preliminary.

Overtime is defined as work in excess of 40 hours per week and paid for at time and one-half. The computation of average hourly earnings exclusive of overtime makes no allowance for special rates of pay for work done on holidays. Comparable data from January 1941 are available upon request to the Bureau of Labor Statistics.

² Eleven-month average. August 1945 excluded because of VJ-holiday period.

1 The "Consumers' price index for moderate-income families in large cities" formerly known as the "Cost-of-living index" measures average changes in retail prices of goods, rents, and services purchased by wage earners and lower-salaried workers in large cities.

U. S. Department of Labor Bulletin No. 699, Changes in Cost of Living in Large Cities in the United States, 1913-41, contains a detailed description of methods used in constructing this index. Additional information on the index is given in the following reports: Report of the Joint Committee on the Consumers' Price Index of the U. S. Bureau of Labor Statistics, A Joint Committee Print (1949); September 1949 Monthly Labor Review, Construction of Consumers' Price Index (p. 284); April 1951 Monthly Labor Review, Interim Adjustment of Consumers' Price Index (p. 421), and Correction of New Unit Bias in Rent Component of CPI (p. 437); and Consumers' Price Index, Report of a Special Subcommittee of the House Committee on Education and Labor (1951).

The Consumers' Price Index has been adjusted to incorporate a correction of the new unit bias in the rent index beginning with indexes for 1940 and

adjusted population and commodity weights beginning with indexes for January 1950. These adjustments make a continuous comparable series from 1913 to date. See also General Note below.

Mimeographed tables are available upon request showing indexes for each of the cities regularly surveyed by the Bureau and for each of the major groups of living essentials. Indexes for all large cities combined are available since 1913. The beginning date for series of indexes for individual cities varies from city to city but indexes are available for most of the 34 cities since World War I.

The Miscellaneous group covers transportation (such as automobiles and their upkeep and public transportation fares); medical care (including professional care and medicines); household operation (covering supplies and different kinds of paid services); recreation (that is, newspapers, motion pictures, radio, television, and tobacco products); personal care (barber and beauty-shop service and toilet articles); etc.

Note.—The old series of Indexes for 1951-52 are shown in italics in tables D-1, D-2, D-5 and for reference.

¹ The indexes are based on time-to-time changes in the cost of goods and services purchased by moderate-income families in large cities. They do not indicate whether it costs more to live in one city than in another.

Indexes are computed monthly for 10 cities and once every 3 months for
 additional cities according to a staggered schedule.
 Corrected.

¹ The Bureau of Labor Statistics retail food prices are obtained monthly during the first three days of the week containing the fifteenth of the month, through voluntary reports from chain and independent retail food dealers. Articles included are selected to represent food sales to moderate-income families.

The indexes are computed by the fixed-base-weighted-aggregate method, using weights representing (1) relative importance of chain and independent store sales, in computing city average prices; (2) food purchases by families of wage earners and moderate-income workers, in computing city indexes;

and (3) population weights, in combining city aggregates in order to derive average prices and indexes for all cities combined.

Indexes of retail food prices in 56 large cities combined, by commodity groups, for the years 1923 through 1949 (1935-39=100), may be found in Bulletin No. 1032, Retail Prices of Food, 1949, Bureau of Labor Statistics, U. S. Department of Labor, table 3, p. 7. Mimeographed tables of the same data, by months, January 1935 to date, are available upon request.

1 December 1950=100.

¹ The revised wholesale price index (1947–49=100) is the official index for January 1952 and subsequent months. The official index for December 1951 and previous dates is the former index (1926=100)—see table D-7a. The revised index has been computed back to January 1947 for purposes of comparison and analysis. Beginning with January 1952 the index is based on prices for one day in the month. Prices are collected from manu-

facturers and other producers. In some cases they are secured from trade publications or from other Government agencies which collect price quotations in the course of their regular work. For a more detailed description of the index, see A Description of the Revised Wholesale Price Index, Monthly Labor Review, February 1952 (p. 180).

• Corrected.

¹ This index (1926=100) is the official index for December 1951 and all previous dates. The revised index (1947-49=100) is the official index for January 1952 and subsequent dates—see tables D-7 and D-8. BLS wholesale price data, for the most part, represent prices in primary markets. They are prices charged by manufacturers or producers or are prices prevailing on organized exchanges.

For a detailed description of the method of calculation for this series see November 1949 Monthly Labor Review, Compiling Monthly and Weekly Wholesale Price Indexes (p. 541).

Mimeographed tables are available upon request, giving monthly indexes for major groups of commodities since 1890 and for subgroups and economic groups since 1913.

219410-52-8

¹ All known work stoppages, arising out of labor-management disputes, involving six or more workers and continuing as long as a full day or shift are included in reports of the Bureau of Labor Statistics. Figures on "workers involved" and "man-days idle" cover all workers made idle for one or

more shifts in establishments directly involved in a stoppage. They do not measure the indirect or secondary effects on other establishments or industries whose employees are made idle as a result of material or service shortages.

¹ Joint estimates of the Bureau of Labor Statistics, U. S. Department of Labor, and the Building Materials Division, U. S. Department of Commerce. Estimated construction expenditures represent the monetary value of the volume of work accomplished during the given period of time. These figures should be differentiated from permit valuation data reported in the tabulations for building authorized (tables F-3 and F-4) and the data on value of contract awards reported in table F-2.
² Preliminary.
² Revised.
⁴ Includes major additions and alterations.
⁴ Includes major additions and tourist courts and cabins.
⁵ Expenditures by privately owned public utilities for nonresidential building are included under "Public utilities."

⁷ Includes Federal contributions toward construction of private nonprofit hospital facilities under the National Hospital Program.

⁸ Covers privately owned sewer and water facilities, roads and bridges, and miscellaneous nonbuilding items such as parks and playgrounds.

⁹ Includes nonhousekeeping public residential construction as well as housekeeping units.

¹⁰ Covers all construction, building as well as nonbuilding (except for production facilities, which are included in public industrial building).

¹¹ Covers primarily publicly owned airports, electric light and power systems, and local transit facilities.

¹² Covers public construction not elsewhere classified, such as parks, playgrounds, and memorials.

¹ Excludes classified military projects, but includes projects for the Atomic Energy Commission. Data for Federal-aid programs cover amounts contributed by both owner and the Federal Government. Force-account work is done not through a contractor, but directly by a Government agency, using a separate work force to perform nonmaintenance construction on the agency's own properties.

1 Includes major additions and alterations.
1 Excludes hangars and other buildings, which are included under "Other nonresidential" building construction.
1 Includes projects under the Federal School Construction Program, which provides aid for areas affected by Federal Government activities.

*Includes post offices, armories, offices, and customhouses.

*Includes all buildings on civilian airports and military airfields and air bases with the exception of barracks and other troop housing, which are included under "Troop housing."

*Covers all industrial plants under Federal Government ownership, including those which are privately operated.

*Includes types of buildings not elsewhere classified.

*Includes sewer and water projects, railroad construction, and other types of projects not elsewhere classified.

*During June, the last month in the fiscal year, volume is relatively high because of the large number of contracts customarily awarded.

¹ Building for which building permits were issued and Federal contracts awarded in all urban places, including an estimate of building undertaken in some smaller urban places that do not issue permits.

The data cover federally and nonfederally financed building construction combined. Estimates of non-Federal (private and State and local government) urban building construction are based primarily on building-permit reports received from places containing about 85 percent of the urban population of the country; estimates of federally financed projects are compiled from notifications of construction contracts awarded, which are obtained from other Federal agencies. Data from building permits are not adjusted to allow for lapsed permits or for lag between permit issuance and the start of construction. Thus, the estimates do not represent construction actually started during the month,

Urban is defined according to the 1940 Census, and includes all incorporated places of 2,500 inhabitants or more in 1940 and a small number of places, usually minor civil divisions, classified as urban under special rule. Sums of components do not always equal totals exactly because of rounding. ¹ Covers additions, alterations, and repairs, as well as new residential and nonresidential building. ¹ Includes units in 1-family and 2-family structures with stores. ¹ Includes units in multifamily structures with stores. ¹ Covers hotels, dormitories, tourist cabins, and other nonhousekeeping residential buildings. ⁰ Revised. ¹ Preliminary.

¹ Building for which permits were issued and Federal contracts awarded in all urban places, including an estimate of building undertaken in some smaller urban places that do not issue permits. Sums of components do not always equal totals exactly because of rounding.

¹ For scope and source of urban estimates, see table F-3, footnote 1.

² Preliminary.

³ Preliminary.

⁴ Revised.

Includes factories, navy yards, army ordnance plants, bakeries, ice plants, industrial warehouses, and other buildings at the site of these and similar production plants.

⁶ Includes amusement and recreation buildings, stores and other mercaptile buildings, commercial garages, gasoline and service stations, etc.

⁷ Includes churches, hospitals, and other institutional buildings, schools,

⁷ Includes churenes, nospitals, and other libraries, etc.

⁸ Includes Federal, State, county, and municipal buildings, such as post offices, courthouses, city halls, fire and police stations, jails, prisons, arsenals, armories, army barracks, etc.

⁹ Includes railroad, bus and airport buildings, roundhouses, radio stations, gas and electric plants, public comfort stations, etc.

¹⁰ Includes private garages, sheds, stables and barns, and other buildings not elsewhere classified.

U. S. GOVERNMENT PRINTING OFFICE: 1982

¹ The estimates shown here do not include temporary units, conversions, dormitory accommodations, trailers, or military barracks. They do include prefabricated housing units.

These estimates are based on building-permit records, which, beginning with 1945, have been adjusted for lapsed permits and for lag between permit issuance and start of construction. They are based also on reports of Federal construction contract awards and beginning in 1946 on field surveys in non-permit-issuing places. The data in this table refer to nonfarm dwelling units started, and not to urban dwelling units authorized, as shown in table F-3.

All of these estimates contain some error. For example, if the estimate of nonfarm starts is 50,000, the chances are about 19 out of 20 that an actual enumeration would produce a figure between 48,000 and 52,000.

<sup>Private construction costs are based on permit valuation, adjusted for understatement of costs shown on permit applications. Public construction costs are based on contract values or estimated construction costs for individual projects.
Depression, low year.
Recovery peak year prior to wartime limitations.
Last full year under wartime control.
Housing peak year.
Less than 50 units.
