# MONTHLY LABOR REVIEW 

SEPTEMBER 1983 VOLUME 106, NUMBER 9

Henry Lowenstern, Editor-in-Chief Robert W. Fisher, Executive Editor

Robert W. Bednarzik
R. C. Jensen, and others

James D. York

3 Layoffs and permanent job losses: workers' traits, patterns
Job losers were heavily concentrated among blue-collar workers during 1982 permanent losses, as opposed to layoffs, reached a high in latest recession

13 Motion-related wrist disorders traced to industries, occupations
Jobs that involve repetitive motions of the hand contribute disproportionately to injuries and illnesses; workers in manufacturing, construction, and agriculture are most at risk
17 Productivity growth in plastics lower than all manufacturing
During 1972-81, output per hour increased at an annual 1.4 percent, slowing to a rate of less than 1 percent after 1976; new markets and improved technology expanded output

REPORTS
David Callahan and others Gary Johnston, Philip L. Martin

22 Inflation patterns in the initial stages of recovery
27 Employment and wages reported by California farmers in 1982
DEPARTMENTS
2 Labor month in review
22 Anatomy of price change
27 Research summaries
34 Major agreements expiring next month
36 Developments in industrial relations
42 Book reviews
47 Current labor statistics

# Labor Month In Review 

WORK DISABILITY. The U.S. Census Bureau published a report on persons with work disabilities. The study, based on data for 1982 from the Current Population Survey, shows that the overall rate of work disability among persons age 16 to 64 was 8.9 percent, but the prevalence rate varied among demographic, social, and economic groups. The rate among men was somewhat higher than the rate among women. Other factors strongly associated with the likelihood of having a work disability included age, education, and race. Here are some highlights:

Age. The effect of age on work disability status was relatively minor for persons under 45 but was quite pronounced for persons above that age. The prevalence rate increased from 7.1 percent for persons 35 to 44 years of age to 12.3 percent for persons 45 to 54 years and to 24.1 percent for persons 55 to 64 years. (The study also presents data on persons age 65 to 74 .)

Education. The exact correlation between years of schooling and the likelihood of having a work disability is probably complex, but the association between the two characteristics is very strong. Among persons age 25 to 64 , the work disability prevalence rate varied from 31.0 percent among persons with less than an eighth-grade education to 9.0 percent among those with a high school education and 4.6 percent among college graduates. It could be argued that the correlation between disability and low educational attainment runs in both directions. On the one hand, low levels of schooling may lead to participation in high-risk occupations. On the other hand, certain disabilities may make it more difficult to attend and complete school. A further hypothesis is that a common set of factors (that is, economic deprivation in childhood) may lead both to low educational attainment and to an increased likelihood of becoming disabled.

Part of the observed relationship between education and work disability
may be due to the effect of age because age is positively associated with work disability and has a negative association with education. However, the data indicate that the relationship between education and work disability exists even when age is held constant. For example, among persons 45 to 54 years of age, the work disability rate varied from 28.2 percent among those with less than an eighth-grade education to 9.5 percent among high school graduates and 5.8 percent among college graduates.

Race and Hispanic origin. Blacks were more likely than whites to have a work disability. Persons of Hispanic origin, however, were no more likely than whites and were less likely than blacks to have a work disability. That the Hispanic rate was not higher is somewhat puzzling in view of the strong negative association between years of schooling and disability status. Only about 50 percent of Hispanic persons 25 to 64 years old had completed high school, compared with about 62 percent of blacks and 79 percent of whites in the same group. These differences would lead one to expect a higher work disability rate among Hispanic persons than was actually observed.

Other characteristics. The prevalence of work disability varied by several other characteristics including region and residence, marital status, household relationship, poverty status, and program participation status.

Among the areas of the United States with relatively high prevalence rates for work disability were the central cities of the Northeast ( 11.3 percent) and the nonmetropolitan areas of the South (11.7 percent). Within metropolitan areas, the prevalence rate was generally higher in the central cities than in the areas outside of central cities.

Relationships existed between work disability status and marital status and between work disability status and household relationship. The prevalence rate was higher among widowed, divorced, or separated persons than among
married persons and the rate among unrelated individuals was considerably higher than the rate among family members. The data suggest that the disadvantage of having a work disability is often compounded by the lack of a family support system.

Persons with a work disability were economically disadvantaged. This conclusion is supported by data showing a strong negative relationship between the level of personal income and the likelihood of having a work disability. Of the 13.1 million persons with a work disability, 3.4 million, or about 26 percent, were in poverty. The poverty rate for persons with no work disability was only about 10 percent. Work-disabled persons made up a disproportionate share of the persons participating in some of the major assistance programs. Of the 12.1 million persons in the age universe who received food stamps in 1981, for example, approximately 23 percent were work-disabled. The work disability rate among Medicaid recipients was about 37 percent.

The Bureau of the Census study is based on a redesigned March Income Supplement to the Current Population Survey. The redesign was undertaken after test results suggested that the reporting of income could be improved by the use of a screening technique in which detailed questions about particular income types are asked only of those persons who have been identified as likely to have received the income type. Questions about disability status were added in order to identify those persons who should be asked about their receipt of disability income.

Additional information and tables showing the survey results appear in the publication, Labor Force Status and Other Characteristics of Persons With a Work Disability: 1982, Current Population Reports, Special Studies, Series P-23, No. 127 (Bureau of the Census, 1983). The report is available from the Government Printing Office, Washington, D.C. 20402 at a cost of \$4.50.

# Layoffs and permanent job losses: workers' traits and cyclical patterns 

Job losers were heavily concentrated among blue-collar workers in 1982; permanent losses, as opposed to layoffs, were higher during the latest recession than during any other economic downturn

## Robert W. Bednarzik

Layoffs are probably the most visible and, thus, the most widely recognized form of unemployment in the United States, as recessionary job cutbacks receive broad coverage in the media. It is, therefore, surprising that little empirical analysis, especially prior to the mid-seventies, was done on this group. ${ }^{1}$ This stems, in part, from the fact that traditional theories of unemployment did not consider a distinction between layoffs and other types of unemployment-permanent separations, quits, and labor force entries and reen-tries-to be of significant importance.

This article discusses the "uniqueness" of persons on layoff as distinguished from those who have been permanently separated from their jobs. Data for each group are available back to 1967, when the "reason for unemployment" was first identified in the Current Population Survey (CPS), although they were not tabulated and published separately until 1976. Using these data, demographic and occupational and industry profiles of persons on layoff and those permanently separated are presented. Also, the cyclical variability in the number of workers on layoff relative to the number permanently separated, together with each group's job search and job change behavior and duration of unemployment, is examined to determine its role in short-

Robert W. Bednarzik is an economist formerly with the Division of Employment and Unemployment Analysis. Bureau of Labor Statistics.
run and long-run unemployment patterns. For example, data show that, compared with prior recessions, a greater proportion of the increase in unemployment in the recent recession is attributable to workers who were permanently separated from their jobs. Layoffs, which were concentrated among factory workers, were also severe, but not much different from the deep 1973-75 economic downturn.
On the whole, workers permanently separated were more likely than those on layoff (of whom most were recalled) to change jobs and their duration of unemployment was longer. However, there was still a substantial amount of job search among those on layoff, as many either did not expect to be recalled in the near future or thought their chances were better elsewhere. This raises questions about the CPS layoff classification. Perhaps, the term "layoff" is somewhat ambiguous to respondents and may be interpreted by some to mean job termination.
In the CPS, unemployment status is ascertained primarily from a series of questions that determine, for persons not working, job search activity and availability. ${ }^{2}$ For example, permanently separated workers are those who lost their last job or business (for example, they were fired, plant closed down, company moved, or there was a permanent reduction in staff), do not expect to be recalled, are actively looking for another job, and are currently available for work.

Persons on layoff, however, are determined from a sep-
arate set of questions and are not required to meet the jobseeking test to be counted as unemployed. Respondents who did not work at all during the survey reference week are asked: "Did you have a job (or business) from which you were temporarily absent or on layoff last week?" Those giving affirmative responses are then asked to give the reason for their absence. Anyone who reports being laid off from a regular job is regarded as unemployed. Thus, laid-off workers are those who report layoff as the reason for absence from their regular job. Although the CPS definition of layoff is quite clear, the CPS layoff questions are subject to different respondent interpretations because inherent in the classification (but not specified in any question) is an expectation of recall to the job. ${ }^{3}$ However, since a special-CPS followup survey shows that most of the workers on layoff who reported that they did not expect to be recalled (those who may have been inappropriately classified as on layoff) were also looking for work, they would still have been counted as unemployed-permanently separated.

## Profile of workers who lose jobs

On average, 2.1 million persons were classified as being on layoff in 1982, a little more than one-sixth of total unemployment and two-sixths of all job losers. Exactly who are they, and how do they differ from the 4 million workers who were permanently separated from their jobs? Does the likelihood of being laid off versus permanently separated differ across worker groups? For example, are demographic differences maintained within individual occupational and industry groups?

Age, sex, race. The age-sex composition of persons on layoff was similar to that of workers permanently separated in 1982: for every 100 laid-off workers, roughly 65 were men, 30 were women, and 5 were teenagers. (See table 1). Given that there are more men than women or teenagers in the labor force, one would expect men to predominate among persons who have lost jobs. However, the percentage of men suffering job loss was disproportionately high. Men accounted for only slightly more than half of the civilian labor force in 1982, and even less of total unemployment.

| Characteristics | Layoffs |  |  | Permanent separations |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Number (in thousands) | Percent of total unemployment | Percent of unemployment in each group | Number (in thousands) | Percent of total unemployment | Percent of unemployment in each group |
| Total, 16 years and over. Teenagers Men. Women |  |  |  |  |  |  |
|  |  | 100.0 | 22.4 | 4,141 | 100.0 | 43.6 |
|  | 111 | 5.2 | 5.6 | 348 | 8.4 | 17.6 |
|  | 1,394 | 65.5 | 27.4 | 2,571 | 62.1 | 50.5 |
|  | 622 | 29.2 | 17.2 | 1,222 | 29.5 | 33.8 |
| White Black and other | 1,795 | 84.4 | 21.8 | 3,154 | 76.2 | 38.3 |
|  | 332 | 15.6 | 13.6 | 987 | 23.8 | 40.5 |

Moreover, the trend over the past decade has shown a gradual widening between the proportions of layoffs accounted for by men and by women.

A greater percentage of unemployment among men than among women or teenagers was attributed to layoff. In 1982, for example, 27 percent of all unemployed men were on layoff, compared with 17 percent of women and 6 percent of teenagers. Similarly, a higher proportion of male unemployment was the result of being permanently separated from a job. The main reason was that industries traditionally staffed by men tend to be more cyclically sensitive than those staffed by women. In 1982, for example, 7 of 10 workers in the sensitive goods-producing sector were men 20 years and older. A much larger share of unemployment among women can be attributed to labor force reentry, whereas for youth, it is new entry.

Also, for men, duration of unemployment because of job loss was slightly longer than for women. ${ }^{4}$ By far, teenagers' duration of unemployment was the shortest. Overall, and not surprisingly, the duration of unemployment for workers on layoff in 1982 was several weeks shorter than that for workers whose jobs were permanently terminated. (See table 2.)

Although black and other workers (hereafter referred to as black) are clearly overrepresented among total unemployment, this is not the case among those on layoff. Sixteen percent of persons on layoff in 1982 were black, near their 13 percent share of the labor force. This pattern has prevailed for more than a decade. On the other hand, blacks accounted for 24 percent of workers who were permanently separated-a figure that has worsened over time-comparable to their disproportionate share of unemployment overall.

Blacks were only slightly more likely than whites to suffer a permanent job separation in 1982. Unemployment attributable to layoff made up a smaller share of total black joblessness ( 14 percent) than white ( 22 percent). This is partially explained by the fact that the group most prone to layoff, men age 20 and over, accounts for a smaller share of overall black joblessness than white. Duration of unemployment from layoff as well as from a permanent job separation was longer for black than white workers. (See table 2.)

Industry. The commonly held perception that job loss occurs most often in goods-producing industries was indeed borne out by the data for 1982. However, this was less the case than a decade earlier. Also, there were a number of differences among industrial groups, particularly among factory workers, as to the percentage of their unemployment that resulted from layoff.

In 1982, 51 percent of all layoffs and 28 percent of permanent job separations occurred in manufacturing industries; approximately two-thirds of each were in durable goods. Fifteen percent of those on layoff in 1982 were in the construction industry, 10 percent in trade, and 7 percent in

employed categories: 52 weeks was the assumed midpoint for the 27 weeks or more category.
services. Trade ranked a close second to manufacturing in permanent separations, followed by services, then construction. (See table 3.)

The proportion of layoffs and permanent job separations in the manufacturing industry has declined over the past decade, while services, trade, and government all increased. However, the goods industries-specifically manufacturing and construction-were, relative to their shares of total employment, still overrepresented by layoffs in 1982, while services and trade were underrepresented. The proportion of layoffs that occurred in the public sector was about equal to its share of total employment.

The layoff component of unemployment among service, trade, and government workers was still only around 10 percent each, compared with 40 percent among factory workers. Moreover, the likelihood of layoffs varied considerably among detailed manufacturing groups, perhaps related to the extent of their unionization because studies have shown that employment "adjustments through layoffs are substantially greater in unionized firms than comparable nonunionized firms. ${ }^{15}$ The following tabulation shows the number and percent of unemployed workers on layoff in selected manufacturing industries in 1982, and the percent of each industry's employed wage and salary workers in labor organizations in May 1980: ${ }^{6}$

|  | Layoffs in 1982 |  | Percent |
| :---: | :---: | :---: | :---: |
| Number <br> union workers, |  |  |  |
| (in thousands) |  |  |  | Percent | May 1980 |
| :---: |

Layoffs were relatively most important in automobile manufacturing ( 65 percent) and primary metals ( 60 percent), and accounted for nearly 40 percent or more of joblessness in most manufacturing industries. These industries also had a large segment of workers in labor organizations. For example, autos and primary metals ranked high in both percent of unemployment that stemmed from layoffs and percent of their wage and salary work force that were in labor unions. Union membership was actually the highest in the nonmanufacturing railroad industry, 82 percent in May 1980: two-thirds of this industry's unemployment in 1982 was attributable to layoffs.

Surprisingly, permanent separations among wage and salary workers as a percent of each group's unemployment did not differ much across major industries. The range was from 54 percent in the construction industry to 41 percent in government, although this latter figure was much higher than in previous recessions.

Occupation. As might be expected, the distribution of layoffs is more concentrated across occupations than across industries. Seventy-five percent of the workers on layoff in 1982 were blue-collar, an overwhelmingly disproportionate figure, given that blue-collar employment accounted for only 30 percent of total employment. The heaviest concentrations of blue-collar workers on layoff were among nontransport operatives and craftworkers. (See table 3.) White-collar workers' share of unemployment stemming from layoffs was only 16 percent, half of which was clerical workers. Among workers who were permanently separated from their jobs, blue-collar workers' share was 55 percent, and white-collar workers', 30 percent. There has been very little change in the occupational distribution of either job-loser group over the past 10 years.

Although blue-collar workers were three times as likely as white-collar workers in 1982 to suffer a job layoff, both groups were almost equally likely to be permanently separated from their jobs. The likelihood of job separation vis-a-vis layoff was higher, regardless of occupation.

Table 3. Job losers, by occupation and industry, 1982

| Government | 17 | 3.5 | 9.4 | 324 | 7.8 | 40.5 |

To determine if the observed differences in the likelihood of layoff among the major age-sex and racial groups were due to occupation or industry affiliation, the probability of layoff among each group in the same occupation or industry was examined. (See tables 4 and 5.) Generally, the concentration of worker groups in particular occupations and industries was crucial to the magnitude of their unemployment accounted for by layoffs. Among blue-collar workers in 1982, for example, the percentage of unemployment accounted for by layoff was nearly 35 percent for both men and women. The likelihood of unemployment attributable to layoff was also similar for men and women in other occupations. In other words, when occupations are examined individually, the probability of layoff among men being greater than that among women essentially disappears. Similarly, the layoff rate differentials by sex were much narrower in individual industries than for men and women overall. In the finance, insurance, and real estate industry, moreover, women were more likely than men to be laid off. ${ }^{7}$ The black-white job-loss differential was, for the most part, unaffected by occupational and industry affiliation, although black workers in blue-collar occupations or in the goods sector were now noticeably more likely than white workers to suffer a permanent job separation. (See tables 4 and 5.)

## Cyclical variation in job losses

The rapid shift in recent years within the manufacturing industry towards high technology firms and those making
synthetics may have exacerbated an already high risk among workers in metals-based industries to lose their jobs in a recession. ${ }^{8}$ In other words, in addition to the historical shift from goods to services, the factory shift away from metalsbased industries will make it harder for unemployed workers formerly employed in these industries to reclaim their jobs.
Several factors-peak-to-trough changes, job search and job change propensity, recall rates, and duration of unem-ployment-were explored in an attempt to distinguish the pattern of job losses, both in the current economic downturn and in comparison to other contractions. Specifically, this analysis examines the cyclical variability of layoffs and permanent separations and describes the effect on short- and long-run total jobless rate patterns.

Changes during a recession. As one would expect, job loss accounts for a larger proportion of total unemployment during recessions, when employers are trying to reduce their costs in response to a slumping economy. In two previous studies, job-loser unemployment was found to be more cyclically sensitive than the other types of unemployment. ${ }^{9}$ However, layoffs and permanent separations were not analyzed separately. A 1976 study which isolated the layoff component concluded that because layoffs increased as a proportion of total job losers between the peak and trough of each recessionary cycle, it was "the most cyclically sensitive component of the job-loser group and also more cyclical than any other categories of unemployed., ${ }^{10}$

Chart 1 compares the pattern of layoffs and permanent
separations as a percent of total unemployment over the $1968-82$ period. The percentage of unemployment resulting from permanent separations averaged twice that resulting from layoffs. The gap narrowed considerably during recessions, however. The following tabulation shows the rise in job-loser unemployment as a percent of the increase in total unemployment for selected business cycles peak to trough:

|  | Job losers |  |  |
| :--- | :---: | :---: | :---: |
|  | Permanently |  |  |
|  | Total | Laid off | separated |
| December 1969-November $1970 \ldots$ | 60.0 | 22.9 | 37.1 |
| November 1973-March 1975 ...... | 72.6 | 35.3 | 37.3 |
| January 1980-July 1980......... | 82.3 | 46.3 | 36.0 |
| July 1981-November $1982 \ldots \ldots$. | 84.5 | 31.4 | 53.1 |

Layoffs as a factor in increases in joblessness during recessions have been somewhat more extensive since the mild 1969-70 contraction, the 1980 episode notwithstanding. ${ }^{11}$ It is common practice for employers to lay off workers at the outset of a recession before resorting to more permanent employee cutbacks, hence, the shortness of the 1980 downturn resulted in an abnormally high proportion of layoffs relative to increases in total joblessness. Thus, in determining the long-run pattern of layoffs in recessionary periods, the 1980 episode was not considered. Among the major age-sex groups, men 20 years and over were usually most affected by layoffs: in the 1981-82 downturn, for example, more than a third of their unemployment increase was a result of layoffs. In light of seniority practices, women,
whose job tenure is likely to be shorter than that for men, are laid off first. What eventually happens as recessions lengthen is that the number of layoffs among men catches, then surpasses, the number among women. Also, although joblessness increases stemming from layoffs were higher among white than black workers, the bulk of the layoffs among black workers occurred earlier in the 1981-82 recession.

What really set the most recent recession apart from its predecessors, however, was the larger number of permanent separations. In the three downturns prior to the 1981 episode, the rise in unemployment as a result of permanent separations was about 37 percent. In contrast, more than half the rise in unemployment in the 1981-82 recession was a result of workers being permanently separated from their jobs. Of course, a partial explanation for this phenomenon could be that workers on layoff, after a lengthy wait for recall, perceived that their job was indeed lost and thus began the search for another one, therefore moving into the permanent separation category. Still, in total, job losers accounted for 85 percent of the increase in unemployment in the 1981-82 recession, higher than in any other recession since unemployment data by reason have been collected.

Job search and job change. Although the foregoing statistics clearly indicate the cyclical nature of job-loser unemployment, they do not provide any information about the search activity or likelihood of a job change among job losers. David Lilien noted that the speed at which job search-

Table 4. Job losers, by occupation, age, sex, and race, 1982

| Job losers | Percent of total unemployment |  |  |  |  | Percent of unemployment in each occupation |  |  |  |  |

Note: Excludes agricultural wage and salary workers and self-employed and unpaid family workers.
ers find new jobs and the speed at which firms recall layoffs are major cyclical causes of variations in unemployment. ${ }^{12}$ That is, duration of unemployment is also an important consideration to cyclical variability, and it was usually longer for unemployed workers who were permanently separated than for those who were laid off. Thus, in this regard, the laid-off workers' contribution to the cyclical variability of joblessness is not apt to be as great as that for workers who were permanently separated. However, the fact that recall may be fairly likely for those on layoff does not imply that they fail to engage in job search and, subsequently, may change jobs.

As noted earlier, persons on layoff are not asked in the CPS if they had been looking for work during the prior 4 weeks, a key question in determining whether persons are unemployed. However, such information was collected in the Methods Development Survey ${ }^{13}$-a small experimental survey of the Bureau of the Census that was designed to test alternative questions and refinements that might be introduced into the CPS questionnaire at a future date. The cumulative monthly results over the April 1981 to December 1982 period are shown in the following tabulation of the percent of those on layoff who looked for work:

|  | Total | Men | Women |
| :---: | :---: | :---: | :---: |
| Total, 16 years and over $\ldots \ldots \ldots \ldots$ | 58.0 | 65.2 | 47.3 |
| $16-19$ years $\ldots \ldots \ldots \ldots \ldots \ldots$ | 56.1 | 20.0 | 72.7 |
| 20 years and over $\ldots \ldots \ldots \ldots \ldots \ldots$ | 58.1 | 66.7 | 45.5 |
| $20-24$ years $\ldots \ldots \ldots \ldots \ldots \ldots$ | 70.0 | 72.1 | 64.7 |
| $25-54$ years $\ldots \ldots \ldots \ldots \ldots \ldots$ | 56.9 | 67.7 | 40.5 |
| 55 years and over $\ldots \ldots \ldots \ldots \ldots$ | 38.5 | 47.1 | 20.0 |

Fifty-eight percent of the persons reported as laid off looked for work at some point during the 4 -week period prior to their being surveyed. This was much higher than the 10-percent estimated by Martin Feldstein in his 1975 study of those on layoff who searched for work during the week preceding the survey. ${ }^{14}$ But it was lower than the 83percent from the 1973 Job Finding Survey ${ }^{15}$ who said they looked for work at some time before they either returned to their old job or obtained a new job. Two-thirds of men age 20 and over on layoff looked for work, and they were more likely than women or teenagers to have done so. Among all adults on layoff the likelihood of job search decreased with age (although this was not as visible among men). For example, the proportion of persons age 20-24 on layoff who searched for work was nearly twice the proportion for those 55 years and over. ${ }^{16}$

If, in fact, most workers on layoff are recalled before finding an acceptable job prospect, their search efforts are largely irrelevant in determining duration of unemployment spells. Rather, duration would be determined primarily by the firm's recall policy. ${ }^{17}$ About 75 percent of the respondents in the CPS are common in consecutive months. Therefore, it is possible to gain some perspective on the magnitude of the number of workers on layoff likely to change jobs by comparing their labor force status from one month to the next. ${ }^{18}$ This was done via a matching of the labor force status of persons in June 1976 who were reported as job losers in May. ${ }^{19}$ For this purpose, a change in detailed industry attachment (3-digit level) between the 2 months represented a job change. ${ }^{20}$ The following illustrates the May-to-June flow of job losers.

Laid off Permanently separated
Percent unemployed in May and employed in June
29.8
20.9

Unemployed in May and employed in June, by job change status (percent distribution):
$\begin{array}{rrr}\text { Total. } \ldots \ldots \ldots \ldots \ldots \ldots \ldots & 100.0 & 100.0 \\ \text { Job change } \ldots \ldots \ldots \ldots \ldots & 37.1 & 66.5 \\ \text { No job change } \ldots \ldots \ldots \ldots & 62.8 & 33.5\end{array}$

Thirty percent of those on layoff in May and 21 percent of those permanently separated found employment in June. Two-thirds of those permanently separated changed jobs,
whereas only slightly more than a third of those on layoff actually changed jobs-most returned to their old jobs. ${ }^{21}$

Recall rates. Because a recessionary increase in joblessness usually involves a larger proportion of permanent separations than layoffs, and because separations are twice as likely as layoffs to involve a job change (often a time-consuming process), separations contribute more than layoffs to the short-run variation in unemployment. However, because it is not known if either job-loser group's likelihood of recall or proclivity towards changing jobs has changed over time, it is not possible to say definitively whether their influence on the short-run variation in unemployment has changed.

Chart 1. Laid-off workers and the permanently separated as a percentage of the unemployed, 1968-83

Note: Data are seasonally adjusted. Shaded areas indicate recessionary periods as designated by the National Bureau of Economic Research: $p$ is the peak; $t$ is the trough.

For example, a decrease in the probability of recall could lead to longer duration of layoff employment which, in turn, would heighten the cyclical contribution of layoffs. Data from the Bureau of Labor Statistics Labor Turnover Survey, although not available subsequent to 1981, ${ }^{22}$ are used here to examine the trend in recalls from layoffs, while CPS data are used to examine trends in duration of layoffs.

For manufacturing, communications, and selected mining industries, employers report the number of new hires and other accessions to their payrolls as well as the number of quits, layoffs, and other separations during the month. Each type of turnover action is totaled for the month and expressed as a rate per 100 employees. Layoffs are defined as "suspensions from pay status (lasting or expecting to last more than 7 consecutive calendar days), initiated by the employer without prejudice to the worker. ${ }^{\prime} 23$

To determine how many of those in the manufacturing industry were recalled to their jobs, Feldstein computed a rehire rate-the ratio of other accessions to layoffs. This ratio averaged 85 percent over the 1960-75 period, leading to the conclusion that "the vast majority of those laid off in manufacturing are ultimately rehired by their original employers, although in some cases they take jobs elsewhere in the interim. ${ }^{24}$ But, what is the recent trend in rehires?

Beginning in January 1976, a separate column for recalls was added to the labor turnover questionnaire mailed to establishments. Recalls were defined as "permanent and temporary additions to the employment rolls of persons specifically recalled to a job in the same establishment of the company following a period of layoff lasting more than 7 consecutive days., ${ }^{25}$ A comparison of a recall-to-layoff ratio (recall rate) using these new data with the rehire measure developed by Feldstein is presented in table 6. Interestingly, over the 1976-81 period, the recall rate averaged 72 percent, considerably lower than the rehire rate average of 96 percent

## Table 6. Labor turnover rates in the manufacturing industry, 1968-81

[Per 100 employees]

| Year | (1) | (2) <br> Total accessions | (3) <br> New hires | (4) <br> Rehires ${ }^{1}$ $(2-3)$ | (5) Rehire rate ${ }^{1}$ $(4 \div 1)$ | (6) <br> Recalls | (7) <br> Recall rate $(6 \div 1)$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1968 | 1.2 | 4.6 | 3.5 | 1.1 | 0.92 | - | - |
| 1969 | 1.2 | 4.7 | 3.7 | 1.0 | 0.83 | - | - |
| 1970 | 1.8 | 4.0 | 2.8 | 1.2 | 0.67 | - | - |
| 1971 | 1.6 | 3.9 | 2.6 | 1.3 | 0.81 | - | - |
| 1972 | 1.1 | 4.5 | 3.3 | 1.2 | 1.09 | - | - |
| 1973 | 0.9 | 4.8 | 3.9 | 0.9 | 1.00 | - | - |
| 1974 | 1.5 | 4.2 | 3.2 | 1.0 | 0.67 | - | - |
| 1975 | 2.1 | 3.7 | 2.0 | 1.7 | 0.81 | - | - |
| 1976 | 1.3 | 3.9 | 2.6 | 1.3 | 1.00 | 1.0 | 0.70 |
| 1977 | 1.1 | 4.0 | 2.8 | 1.2 | 1.09 | 0.9 | 0.82 |
| 1978 | 0.9 | 4.1 | 3.1 | 1.0 | 1.11 | 0.7 | 0.78 |
| 1979 | 1.1 | 4.0 | 2.9 | 1.1 | 1.00 | 0.7 | 0.64 |
| 1980 | 1.7 | 3.5 | 2.1 | 1.4 | 0.82 | 1.1 | 0.65 |
| 1981 | 1.6 | 3.2 | 2.0 | 1.2 | 0.75 | 1.0 | 0.63 |

[^0]and the same percentage as those on layoff in one month who had been recalled 2 weeks later as reported in a special CPS followup in July 1982. ${ }^{26}$ Again, although still quite high, not as many workers on layoff return to their original jobs as previously thought.

Both the recall and rehire rates have declined in recent years. However, the rehire rates in the recessionary periods were similar, perhaps an indication that the likelihood of job change among workers on layoff was also similar.

Duration. An increase in the duration of unemployment for those on layoff could be viewed as a decreased likelihood of recall, which could eventualy necessitate a job change. Therefore, an examination of the long-run trend of duration on layoff might also yield some insight into whether the probability of laid-off workers changing jobs has increased or decreased. That is, a trend towards longer duration on layoff might reflect a heightened tendency to change jobs. Also, the longer the unemployment spell of job losers, the greater the probability that a higher overall jobless rate will result in the long run.

Below are estimates of mean duration (in weeks) of unemployment for laid-off and permanently separated workers, 1968-82: ${ }^{27}$

|  | Layoffs | Permanent separations |
| :---: | :---: | :---: |
| 1968 | 7.1 | 11.2 |
| 1969 | 6.8 | 10.4 |
| 1970 | 7.5 | 12.3 |
| 1971 | 10.3 | 16.4 |
| 1972 | 10.8 | 16.9 |
| 1973 | 7.8 | 13.9 |
| 1974 | 7.5 | 13.7 |
| 1975 | 14.1 | 19.5 |
| 1976 | 14.5 | 21.6 |
| 1977 | 11.0 | 19.3 |
| 1978 | 8.9 | 15.8 |
| 1979 | 7.9 | 14.5 |
| 1980 | 11.5 | 12.7 |
| 1981 | 12.4 | 18.0 |
| 1982 | 13.6 | 19.7 |

The mean durations of unemployment among both groups of job losers in the 1981-82 downturn and the later stages of the 1973-75 recession were similar, but were longer than in the mild 1969-70 recession. Actually, the duration of unemployment resulting from layoffs was slightly shorter in the recent downturn than in the mid-1970 episode. Thus, although it is very unlikely that the "job change" behavior of either group changed perceptibly over the past 10 years, their tendency to change jobs may now be higher than 15 years ago.
In summary, layoffs accounted for close to the same percentage of the total increase in unemployment in the current recession as in the 1973-75 episode, while the likelihood of changing jobs remained roughly the same in both periods. Therefore, it is reasonable to assume that the contribution
of layoffs to the short-run variability of unemployment also did not change. Over the longer run, however, the contribution may have grown, especially if allowance is made for the possibility that some workers on layoff, after a time, considered themselves permanently separated. In contrast, job loss from permanent separation made up a much greater share of the overall rise of unemployment in the current recession than in previous downturns. Thus, it is clear that the contribution of workers permanently separated to the short-run variability of unemployment also rose. Moreover, given the greater percentage increase in unemployment accounted for by workers who were permanently separated from their jobs in the recent recession and their longer duration of unemployment, it will probably be more difficult for the overall jobless ratio to fall to prerecession levels.

## Are layoffs overstated?

The fairly substantial amount of job search on the part of persons on layoff reported in the Methods Development Survey and the apparent significant number who do not return to their old jobs raise some questions about the classification of layoff in the regular CPS. If workers who say they are on layoff are searching for work, are they also expecting to be recalled to their jobs, a prerequisite to the layoff classification? If they do not expect to be recalled, is the official classification of layoff overstated?

As discussed earlier, to determine the extent that persons who reported themselves on layoff did not expect to be recalled, a special follow-up survey of the unemployed in July 1982 was conducted 2 weeks subsequent to the CPS interview week. In this survey, respondents who were initially reported as on layoff were asked directly, "Do you eventually expect to be called back to the job from which you were on layoff?' Preliminary results revealed that nearly a fourth of those still on layoff at the time of the follow-up survey did not expect to be recalled, and most of them had looked for work in the prior 4 weeks. That is, whereas they may not actually have been on layoff, they still would have been classified as unemployed. This suggests that the term "layoff"' has different meanings as far as the unemployed are concerned and includes, for some, job termination. It
should be kept in mind that these results are based upon a single month's observation, and a period of testing would have to be done to determine if they would hold up consistently.

The labor force classification of persons on layoff differs among industrial nations because of differences in labor market practices and in degrees of job attachment. For example, many, if not most, workers on layoff in European countries and in Japan, because of work contracts, are virtually certain to be recalled to their jobs and, thus, are classified as employed. ${ }^{28}$ The Eighth International Conference of Labor Statisticians, under the auspices of The International Labor Office, specified in 1954 that only persons on layoff without pay are to be included among the unemployed. Recently, a study of the statistical treatment of layoffs commissioned by the Organization for Economic Cooperation and Development promulgated, for the purposes of international comparison, the following set of "building blocks", relating to persons on layoff: ${ }^{29}$

\[

\]

Date of recall:
Specified
Not specified

Employed
Unemployed

Employed Not in the labor force

According to this line of reasoning, only persons on layoff who had looked for work and did not have a specific recall date would be considered unemployed; all those with a specific recall date would be considered employed. These modifications were discussed at the Thirteenth International Conference of Labor Statisticians held in Geneva in October 1982 but were not adopted (except for a provision that offers some leeway for countries to adopt their own measurement of layoff depending upon national practice). ${ }^{30}$ But in view of recent testing that places some doubt as to the interpretation and measurement of layoff, the United States is contemplating the addition of "job search", and "expected recall date" questions to the CPS at some future date and, thus, may be firming up the measurement and concept.

"An examination of actual trough to peak changes in the number of layoffs relative to changes in the number of unemployed for the same dates yields the following: May 1969 to September 1971, 24.7 percent; October 1973 to June 1975, 40.5 percent; June 1978 to July 1980, 54.0 percent; and July 1981 to September 1982, 39.5 percent. The extent of layoffs relative to total unemployment in the 1973-75 and 1981-82 recessions was similar.
${ }^{12}$ Lilien, "The Cyclical Pattern of Temporary Layoffs," p. 24.
${ }^{13}$ The data on layoffs are from Phase III and IV covering the April 1981 to December 1982 period. The sample size each month was approximately 800 persons ( 200 respondents leave and 200 others enter the sample each month yielding an approximate cumulative sample size of 4,000 over the sample period) drawn from four areas-Chicago, Scranton, San Antonio, and rural Georgia.
${ }^{14}$ Feldstein, "The Importance of Temporary Layoffs," p. 732.
${ }^{15}$ Reported and described in Bradshaw, "The Extent of Job Search," pp. 517-18.
${ }^{16} \mathrm{~A}$ related question in the literature (Feldstein, "The Importance of Temporary Layoffs," pp. 744-45) has to do with whether nonsearchers on layoff are concentrated in high-wage industries. Unfortunately, such information was generally not available from Methods Development Survey data. However, it is possible to gain some insight into this issue from regular monthly CPS data. Individuals on layoff can be classified into two groups: those with a definite date of expected recall within 30 days are classified as on "temporary layoff," while all others are classified as on "indefinite layoff." It is assumed that those on indefinite layoff would be more likely than those on temporary layoff to search for work. Some support for this assumption is available from Methods Development Survey data. Remember, one factor that sets persons on temporary layoff apart from those on indefinite layoff is that the former must have a definite expected recall date. In the Methods Development Survey, persons on layoff were asked if they had a specific date to return to work. Nearly 70 percent of those on layoff without a specific recall date had looked for work, as opposed to 45 percent for those with a specific recall date. The examination of temporary versus indefinite layoff data, or the assumed nonsearchers versus searchers, by detailed industry revealed the following. First, each industry was classified as high- or low-wage based upon whether its average hourly wage was higher or lower than the average for all industries. If the assertion about nonsearchers in high-wage industries was correct, then one would expect that the percentage of those on temporary layoff in highwage industries would be greater than their percentage in all industries. Actually, the percentages were relatively the same, one-fourth. Thus, it does not appear that nonsearching while on layoff is a function of wages.
${ }^{17}$ Lilien, "The Cyclical Pattern of Temporary Layoffs," p. 25.
${ }^{18}$ Using the Current Population Survey as a Longitudinal Data Base. Report 608 (Bureau of Labor Statistics, 1980).
${ }^{19}$ A readily available May-June 1976 CPs match file was the reason this time period was chosen. Eighty-five percent of the job losers in May who also would have been sampled in June were matched: 352 persons on layoff and 929 other job losers.
${ }^{20}$ Under this definition, 14 percent of the workers employed in May were employed in a different job in June. Of course, some of this "job change" could have been the result of reporting errors; that is, the respondent does not actually change jobs but, because of recording or coding error, the detailed industry category is different in successive months. However, in 1982, Wesley Mellow and Hal Sider compared 4,523 CPS respondents' description of their jobs with that provided by the employer and found a fairly high level of agreement ( 84 percent) in worker and employer responses to industry affiliation at the 3 -digit level. (See Wesley Mellow and Hal Sider, "Accuracy of Response in Labor Market Surveys: Evidence and Implications," Journal of Labor Economics, forthcoming.) Assuming that 84 percent of the May-June 1976 job changes were actually job changes and not the result of reporting errors, the job mobility rate would drop a little to 12.5 percent. A study designed specifically to measure job mobility in 1961 found that 10 percent of the number who worked shifted from one employer to another during that year. See Gertrude Bancroft and Stuart Garfinkle, "Job Mobility in 1961," Monthly Labor Review, August 1963, pp. 897-906.
${ }^{21}$ It should be noted that CPS data do not indicate if persons on layoff actually returned to their previous jobs, but only that there was a change in labor force status between measurements. However, a special followup survey of the unemployed in July 1982 that was taken 2 weeks after the reference week found that, of the persons who had been reported on layoff initially but were working in the followup, 72 percent had been called back to their previous job and 22 percent had found another job. The subsequent labor force status for a small percentage could not be identified. The 68 percent recall rate within 6 months for laid-off workers in the manufacturing industry estimated by David Lilien in "The Cyclical Pattern of Temporary Layoffs in U.S. Manufacturing" (Ph.D dissertation, Massachusetts Institute of Technology, 1977) was also in line with the estimate here.
${ }^{22}$ With the publication of data for December and annual averages for 1981, the Bureau discontinued publication of labor turnover survey data. See Carol Utter, "Labor Turnover Survey Discontinued," Employment and Earnings, March 1982, p. 13.
${ }^{23}$ For a description of labor turnover concepts, see the Establishment Data section of "Explanatory Notes" in any issue of Employment and Earnings prior to February 1982.
${ }^{24}$ Feldstein, "The Importance of Temporary Layoff," p. 735.
${ }^{25}$ Carol Utter, "New Series on Recalls from the Labor Turnover Survey," Employment and Earnings, December 1977, pp. 10-11.
${ }^{26}$ See footnote 21 for detailed description of July followup survey.
${ }^{27}$ The mean duration of unemployment was estimated using the midpoints of the available duration of unemployment distribution categories: less than 5 weeks, 5 to 10 weeks, 11 to 14 weeks, 15 to 26 weeks, and 27 weeks and longer; 52 weeks was the assumed midpoint of the last category. Applying this method to 1982 annual average duration of total unemployment categories resulted in a mean of 15.4 weeks, very close to the actual mean of 15.6 weeks.

# Motion-related wrist disorders traced to industries, occupational groups 

> Jobs that involve repetitive motions of the hand contribute disproportionately to a number of injuries and illnesses; analysis of workers' compensation claims data shows workers in manufacturing, construction, and agriculture to be most at risk

Roger C. Jensen, Bruce P. Klein, and Lee M. Sanderson

Tasks which require workers to perform certain repetitive motions have been reported to contribute to the incidence of a variety of occupational diseases. ${ }^{1}$ The Bureau of Labor Statistics 1979 annual survey of occupational injuries and illness found 21,900 cases that were associated with work activities involving repeated motions, vibrations, or pressure. ${ }^{2}$ But while this statistic may help one to appreciate the magnitude of the problem, the annual survey does not obtain data pertaining to body part involved, which would permit the identification of anatomical areas most frequently affected by the stress of repetitive motions; nor does it permit identification of jobs most associated with repetitive motion disorders.
Fortunately, the Bureau has developed an alternate database, the Supplementary Data System (sDS), that does make such analysis possible. The following discussion demonstrates the use of the sDS, which is derived from State records of workers' compensation claims, in investigating the occurrence of one group of motion-related disordersthose involving the soft tissues of the wrist and hand. Such disorders are of interest because many industrial tasks re-

[^1]quire repetitive motions that subject the soft tissues of the wrist and hand to a low level, high frequency form of trauma. ${ }^{3}$ Earlier studies, on a more limited scale, have shown that several disorders of the wrist (including carpal tunnel syndrome, tendinitis, and tenosynovitis) have a larger incidence among workers whose occupations entail frequent, repetitive hand movements. ${ }^{4}$

## The database

The bLs Supplementary Data System was the primary information source for this investigation. The sDS program became functional in 1976 as a Federal-State cooperative

Table 1. Industrial work force by major industrial group, total and for the 26 sDS States combined, 1979
[Numbers in thousands]

| Industrial group | Total U.S. work force | Workers in 26 SDS States | Industry-specific percent of work force represented by 26 SDS States |
| :---: | :---: | :---: | :---: |
| Total | 74,564.6 | 32,070.7 | 43.0 |
| Agriculture | 1,414.0 | 677.0 | 47.9 |
| Construction | 4,528.4 | 1,964.2 | 43.4 |
| Manufacturing | 21,069.0 | 8,871.4 | 42.1 |
| Transportation | 5,110.2 | 2,166.7 | 42.4 |
| Trade. . . . . | 20,308.9 | 8,956.3 | 44.1 |
| Finance | 4,980.5 | 2,063.6 | 41.4 |
| Services | 17,153.6 | 7,371.5 | 43.0 |

system to provide information about occupational injury and illness. ${ }^{5}$ The States participating in the sDS program classify workers' compensation information according to a uniform format ${ }^{6}$ and submit the data to BLS on an annual basis. Data from 26 States which reported current cases for the year 1979 were used for this assessment. ${ }^{7}$ To be included in the analysis, a wrist compensation claim had to relate to inflammation or irritation of joints, tendons, or muscles; or diseases of the nerves and peripheral ganglia. The disorder also had to be attributable to one of the following types of accident or exposure: repetitive pressure; voluntary motions; overexertions; lifting objects; pulling objects; throwing objects; or nonspecific overexertion. ${ }^{8}$ The claims which met these criteria are hereinafter referred to as "nonimpact wrist disorders."
Employment data by industry were obtained from BLS for each of the 50 States. ${ }^{9}$ These data allowed for the calculation of the percentage of industrial work force represented by the 26 States (see table 1, page 13), and provided a means for comparing the number of workers' compensation claims in an industry to the number of workers employed. ${ }^{10}$ The 26 States represented 43 percent of the total U.S. work force employed in the seven major industry groups.
Differences among State workers' compensation coverage and reporting requirements have been cited as limitations of the SDS program. ${ }^{11}$ Furthermore, it must be emphasized that compensation claim data reflect the likelihood of a worker filing a claim for a specific injury or illness and do not directly indicate the incidence of the injury or illness. With these differences acknowledged, it is our view that the SDS program is the most comprehensive data source available for making comparative assessments of serious and moderately serious injuries and illnesses across industries and occupations.

## High-risk groups isolated

Data in table 2 show that there were 3,027 workers' compensation claims reported in 1979 for nonimpact wrist disorders in the 26 States included in this analysis. These account for more than 6 percent of all compensable cases involving the wrist, and are most important in the manufacturing industries, where they account for more than 10

Table 2. Distribution of nonimpact wrist disorder claims and total wrist injury or illness claims in 26 sDS States combined, by industry, 1979

| Industrial group | Number of nonimpact wrist disorder claims | Total wrist injury claims | Nonimpact claims as a percent of total wrist injury claims |
| :---: | :---: | :---: | :---: |
| Total | 3,019 | 48,299 | 6.2 |
| Agriculture | 65 | 1,216 | 5.4 |
| Construction | 198 | 5,769 | 3.4 |
| Manufacturing | 2,107 | 20,013 | 10.5 |
| Transportation | 56 | 2,925 | 1.9 |
| Trade. | 367 | 9,899 | 3.7 |
| Finance | 22 | 674 | 3.3 |
| Services | 204 | 7,803 | 2.6 |

Table 3. Mean indemnity compensation and medical payments for selected types of workers' compensation claims closed in 1979, seven sds States

| Nature of illness or injury ${ }^{1}$ | Indemnity compensation |  |
| :---: | :---: | :---: |
|  | Number of cases reporting cost data | Mean cost per case |
| Fractures | 3,116 | \$2,688 |
| Cuts, lacerations, or punctures | 763 | 1,206 |
| Nonimpact wrist disorders . | 762 | 1,026 |
| Sprains or strains | 2,953 | 985 |
| Contusions, crushing, or bruises | 581 | 910 |
|  | Medical payments |  |
| Nonimpact wrist disorders | 202 | 618 |
| Fractures | 937 | 567 |
| Cuts, lacerations, or punctures | 328 | 312 |
| Sprains or strains | 770 | 190 |
| Contusions, crushing, or bruises | 207 | 186 |

Table lists only those categories with cost data reported for more than 100 cases.

## percent of all wrist injury claims.

Another index of the impact of an occupational injury or illness is the mean compensation cost per case. Data in table 3 indicate that, compared to other common kinds of cases, nonimpact wrist disorders are important with reference to both medical payments and indemnity compensation; on average, they cost $\$ 618$ in medical payments and $\$ 1,026$ in indemnity compensation per case. ${ }^{12}$

With reference to gender differences for nonimpact wrist disorders, the percentages of claims submitted by men ( 50.6 percent) and by women ( 49.4 percent) were similar. However, gender-specific employment figures for 1979 show that the combined work force in the SDS States was 58.6 percent male and 41.4 percent female. ${ }^{13}$ The mean age of claimants in the two groups revealed women ( 33.7 years) to be 3.8 years older than men (29.9 years). (This difference in age between genders was found to be statistically significant at the . 0001 level.)

Industry. The number of nonimpact wrist injury compensation claims across the 26 States used in this analysis reveals that manufacturing produced the largest number of claims $(2,107)$, representing 69.6 percent of the total. Table 4 shows an incidence rating for nonimpact wrist compensation claims for each of the seven industrial groups. This ratio was calculated by dividing the industry-specific number of claims for the 26 SDS States by the respective industryspecific number of workers employed in these States, and multiplying by 100,000 . Again, manufacturing led the seven industries with a ratio of 23.8 claims per 100,000 workers. Construction, which reported the fourth largest number of claims, had the second largest incidence ratio ( 10.1 claims per 100,000 workers), followed by agriculture ( 9.6 claims per 100,000 workers).

In an effort to more accurately identify the specific industries with the most nonimpact wrist disorder claims, the major industrial categories (agriculture, construction, and so forth) were broken down according to four-digit Standard

Industrial Classification (SIC) codes. ${ }^{14}$ As shown in table 5, meatpacking plants accounted for the largest number of claims (245), some 8 percent of all compensation claims filed for nonimpact wrist disorders in the 26 SDS States.

Occupation. Coding of worker job titles by the SDS program allowed for the retrieval of figures on compensation claims according to general occupation (table 6). Meatcutters and butchers (manufacturing) were, by far, at largest risk of filing nonimpact wrist disorder claims, with 498.8 claims per 100,000 workers.

## Interpreting the results

It must be stressed that the number of workers' compensation claims for nonimpact wrist disorders understates the incidence of such cases. The use of workers' compensation claim data restricts the focus of analysis to employees seeking medical attention for the condition or filing for compensation benefits, or both, which is not synonymous with the number of workers experiencing this occupational disorder. For example, in a study of one large manufacturing operation, it was found that, out of 30 workers with a diagnosed case of carpal tunnel syndrome, only 16 became workers' compensation cases. ${ }^{15}$

Several factors may contribute to the discrepancy between the occupational incidence of nonimpact wrist disorders and the incidence of compensation claims reported by State compensation agencies. First, many workers, such as farm owners and their families, railroad employees, maritime workers, and Federal employees, are not covered by State workers' compensation programs. Second, some of the States included in this analysis provide information which is limited to cases in which the worker was unable to work for a specified length of time, depending on State law. Thus, some workers who actually suffer from the disorder but are able to continue working are not identified from compensation data. In addition, such workers may be reassigned to other jobs which reduce their symptoms to the point where it is unnecessary to file a claim. Finally, because repetitive motion disorders occur without an easily recognizable traumatic incident, many workers may not file a claim because they fail to recognize the causative relationship between the repetitive activity and their symptoms.

Table 5. Nonimpact wrist compensation claims by fourdigit sic code, 1979

| $\underset{\text { SIC }}{\substack{\text { SIC }}}$ | Industry | Division |  | Percent of all nonimpact wrist claims |
| :---: | :---: | :---: | :---: | :---: |
| 2011 | Meatpacking plants . . . | Manufacturing | 245 | 8.0 |
| 3714 | Motor vehicle parts and accessories |  | 116 | 3.8 |
| 3711 | Motor vehicle and passenger car bodies. | Manufacturing | 102 | 3.3 |
| 2421 | Sawmills and planing mills . | Manufacturing | 83 | 2.7 |
| 2016 | Poultry dressing plants | Manufacturing | 77 | 2.5 |
| 5812 | Eating places . . . . . | Retail trade | 51 | 1.7 |
| 5411 | Grocery stores | Retail trade | 51 | 1.7 |
| 3519 | Internal combustion engines . . | Manufacturing | 46 | 1.5 |
| 3079 | Miscellaneous plastics products | Manufacturing | 43 | 1.4 |

We are unable to ascribe much significance to our findings on the gender and age of claimants because of inadequate information on the diagnosis of each compensation claim, and lack of data on the gender and age distributions of workers who perform repetitive motion tasks. We acknowledge the multitude of etiological factors which can contribute to the incidence of such conditions as carpal tunnel syndrome, and believe that the effects of age and gender can be better addressed by population-based epidemiological studies.
The manufacturing industries accounted for 69.6 percent of the reported compensation claims secondary to nonimpact wrist disorder, a ratio of 23.8 claims per 100,000 workers. Further breakdown of this information according to specific industrial category revealed the largest number of reported claims to be from the meatpacking and the motor-vehicle manufacturing industries. However, the assessment of specific risk factors is not possible with these data because we lack information on the types of tasks performed and the length of exposure to specific tasks.
The agricultural industries produced the third largest incidence ratio for nonimpact wrist disorders ( 9.6 claims per 100,000 workers), even though employment tends to be

Table 6. Number and incidence ratio of nonimpact wrist disorder claims in 26 sDS States, high-risk occupations, 1979

| Occupation | Number of claims | Estimated employment | Claims per 100,000 workers |
| :---: | :---: | :---: | :---: |
| Meatcutters and butchers |  |  |  |
| Miscellaneous laborers. | 171 | 44,509 102,387 | 498.8 167.0 |
| Bottling, canning operatives. | 33 | 32,416 | 101.8 |
| Filers, polishers, sanders, and buffers | 47 | 60,069 | 78.2 |
| Meat wrappers (retail trade)... | 15 | 21,984 |  |
| Shoemaking machine operators | 19 | 31,631 | 60.1 |
| Nonspecified laborers | 127 | 212,709 | 59.7 |
| Sawyers. . . . . . . | 35 | 58,764 | 59.6 |
| Assemblers | 326 | 550,242 | 59.3 |
| Punch and stamping press operatives | 52 | 91.175 | 57.0 |
| Freight and materials handlers | 136 | 257,299 | 52.9 |
| Packers and wrappers, except meat and produce | 124 | 247,574 | 50.1 |

seasonal and performed, to some extent, by migrant workers who may not file claims as often as other wage workers. Further investigation into the occurrence of nonimpact wrist disorders in agriculture appears warranted.

Finally, with regard to occupation, we found that meatcutters and butchers, miscellaneous laborers, and bottling and canning operators accounted for the largest numbers of nonimpact wrist disorders. Again, however, these observations should be interpreted cautiously, because our analysis is based on data which are available for only very general occupational groups.

RESEARCH PERFORMED IN A VARIETY of industrial settings has supported a positive association between repetitive hand
motions and the incidence of various wrist disorders. ${ }^{16}$ Our analysis of workers' compensation claims provides further evidence of this association by showing large differences in claim ratios (claims per 100,000 employees) for different occupations, with the largest ratios occurring in occupations that entail repeated motions and exertions of the hand. Our study, and similar studies of other job-related disorders, should also be useful in the establishment of priorities for both research and regulatory activities in the field of occupational safety and health. However, the etiological components, including the role of specific hand motions, must be more thoroughly assessed if the factors contributing to the incidence of nonimpact wrist disorders are to be identified and altered.

${ }^{6}$ Supplementary Data System, Microdata Files User's Guide, 19781979 (Bureau of Labor Statistics, 1980).
${ }^{7}$ The 26 States included in this analysis of the 1979 SDS survey are Alaska, Arizona, California, Colorado, Hawaii, Idaho, Indiana, Iowa, Kentucky, Maine, Maryland, Michigan, Minnesota, Missouri, Montana, Nebraska, New Jersey, New Mexico, Oregon, South Dakota, Tennessee, Utah, Vermont, Washington, Wisconsin, and Wyoming. Two States (Massachusetts and Ohio) which also provide current case data were not used
for this analysis because their occupational classification system differs from that for the BLS employment data.
${ }^{8}$ Compensation claims attributed to vibration were excluded from this study.
${ }^{9}$ Employment figures for manufacturing; construction; wholesale and retail trade; finance, insurance, and real estate; transportation; services; and government were obtained from Supplement to Employment and Earnings, States and Areas, Data for 1977-80, Bulletin 1370-15 (Bureau of Labor Statistics, 1981). Agricultural employment is from "Current Population Survey" (Bureau of Labor Statistics, 1979), table A (unpublished), pp. 1547-49.
${ }^{10}$ The SDS data on compensation claims secondary to nonimpact wrist disorders included figures from nine industrial groups (agriculture; mining; construction; manufacturing; wholesale and retail trade; finance, insurance, and real estate; transportation; services; and government). Because of the variance which exists in coverage and reporting procedures for compensation claims among governmental employees, this industrial classification was omitted from tables 1, 2, and 4. The mining industries were also excluded from the analysis because data for the 26 States were not representative of the work force in mining, and because there were only eight cases that met our criteria.
${ }^{11}$ Root and McCaffrey, "Producing more information," p. 17.
${ }^{12}$ Medical and indemnity compensation cost data were submitted on closed workers' compensation claims by seven States (Arkansas, Colorado, Delaware, Montana, North Carolina, Virginia, and Wisconsin).

# Productivity growth in plastics lower than all manufacturing 

During 1972-81, output per hour increased at an annual rate of 1.4 percent, slowing to less than 1 percent after 1976; growth in productivity has been linked to improved technology

## James D. York

Despite rapid output growth during 1972-81, productivity in the miscellaneous plastics products industry increased at a somewhat slower rate than that for all manufacturing. Productivity rose at an average annual rate of 1.4 percent over the period, while the rate for all manufacturing was 1.8 percent. ${ }^{1}$ The rapid rise in output, at an average annual rate of 5.5 percent, was accompanied by an increase in employee hours of 4 percent annually. (See table 1.) Industry productivity benefited from improvements in resins and faster processing equipment, and from the growing use of microprocessor controls for production machinery.
Productivity trends fluctuated during 1972-81, as output and hours responded to cyclical forces in the economy. The output of the plastics industry encompasses a wide range of products consumed in many sectors of the economy. Consequently, industry output tends to be strongly influenced by trends in the overall level of economic activity. A sharp downturn in the economy led to sizable declines in the output of plastics products: 9.0 percent in 1974 and 12.5 percent in 1975. Reductions in employee hours lagged initially, with a decrease of only 1.1 percent in 1974. With output declining much more than hours in that year, productivity posted a 7.9 -percent decrease. In 1975, however, the rate

[^2]of decline in hours accelerated to 12.6 percent, virtually matching the decrease in output. With the changes in output and hours offsetting each other, productivity showed no change for that year.

With an improving economy, output increased very rapidly in 1976 and 1977, rising by 18.9 percent and 24.4 percent. These gains outpaced the corresponding increases in hours of 14.5 and 11.4 percent and productivity consequently rose by 3.8 and 11.7 percent. In 1978, output still showed a sizable increase of 10.7 percent but this was more nearly matched by the rise in hours of 9.8 percent, resulting in a productivity gain of only 0.8 percent. Employee hours continued increasing in 1979, by 4.7 percent, despite a decrease in output of 1.5 percent, yielding a 6 -percent drop in productivity. The economy experienced another downturn in 1980 and industry output decreased by 5.1 percent. Hours were reduced even more, however, by 6.1 percent, and productivity managed to post a gain of 0.9 percent. The economy began to imrove after the sharp downturn in the first half of 1980 and this improvement continued into 1981. Industry output benefited, rising 6.9 percent, which outpaced the 3.9 -percent increase in hours and resulted in a productivity gain of 2.9 percent.

## Employment and plant size

Employment in the industry grew quite rapidly during 1972-81, rising from 342,500 to 477,200 , equivalent to an
average annual rate of increase of 4.0 percent. Employee hours advanced at the same rate during this period. By comparison, the rate of increase for all manufacturing employment was 0.7 percent and the rate for hours was 0.6 percent.

Because the output of plastics products serves such a wide range of markets, trends in the industry's employment are strongly influenced by cyclical swings in the overall economy. Despite rapid employment growth in plastics products during the 1972-81 period as a whole, there were declines of 0.1 percent in 1974 and 12.7 percent in 1975-years in which the economy was in recession. Employment growth was strong in each of the following years until 1980, the next recession year. In that year, employment dropped 5.5 percent. It recovered again in 1981, however, rising by 3.5 percent.

Most of the establishments in the plastics industry are small. Data available for 1977 indicate that about 57 percent of the industry's establishments employ fewer than 20 employees. Most of the employment, however, appears to be concentrated in medium size establishments. Nearly half of total industry employment in 1977 was in establishments with 50 to 249 employees. The establishments with fewer than 20 employees accounted for only about 7.5 percent of industry employment, despite their large share of the total number of establishments. Very large establishments are unusual, with less than 0.2 percent of all establishments employing 1,000 or more workers in 1977. The average number of employees per estabishment hardly changed during 1972-77, declining from 45 employees in 1972 to 44 in 1977.
Data on the skill composition of employment are available for broad occupational groups in the miscellaneous plastics products industry for 1980. These data indicate that operatives are the major occupational group, constituting almost 56 percent of total industry employment, as compared with the all-manufacturing average of just over 43 percent. This job category includes such occupations as assemblers and machine operatives. Craft and related workers, which in-

Table 1. Productivity and related indexes for miscellaneous
plastics products, 1972-81

clude machinists and tool-and-die-makers, were another substantial category with almost 16 percent of total industry employment, slightly less than the all-manufacturing proportion of just under 19 percent. Professional, technical, and related workers constituted a somewhat lower proportion of total employment than for all manufacturing-less than 4 percent in the plastics industry compared with over 9 percent for all manufacturing. By contrast, the share of industry employment composed of managers, officials, and proprietors was nearly the same as that for all manufactur-ing-about 6 percent.

## Major markets

An important reason for the rapid growth of industry output is that new markets for plastics products have been continually opening up. The development over time of new and improved resins has been an important underlying factor in making this possible. Plastics made from these improved resins have been able to meet more stringent performance criteria in areas such as strength and heat resistance. With these improved properties, plastics became suitable for the manufacture of many products from which they had previously been excluded. As a result, plastics began penetrating product markets formerly dominated by other materials. For example, plastic pipe has increasingly been substituted for other types of pipe, such as copper and cast iron, as building codes have been altered to acknowledge its suitability. The greater ease of installation of plastic pipe has also meant that semiskilled workers could be employed to install it. The benefits of plastics in terms of such factors as price, weight, and corrosion resistance have made them a popular alternative to competing materials in many product lines.

Building and construction. The building and construction industry is an important market for plastics products. Plastics products for this market include such items as panels, doors, moldings, pipes, and insulation. By far, pipes are the most popular item: shipments nearly tripled during 197277. The advantages of plastic pipe (such as corrosion resistance) have helped it to penetrate markets previously dominated by other materials.

Agriculture. Agricultural uses are an important market for plastic pipe. The need to increase food production during the 1970's served as a stimulus to the demand for agricultural pipe. Plastic was promoted in drainage and irrigation systems. For example, corrugated polyethylene tubing began to replace more expensive and cumbersome concrete drainage tile. The use of plastic pipe in irrigation has benefited from increased emphasis on agricultural efficiency. ${ }^{2}$

One of the biggest markets for plastics products is in film, sheets, and sheetings. There are a number of types of these items such as cellulosic, polyethylene, polypropylene, polystyrene, and vinyl and vinyl copolymer. Useful for mulching
applications, when spread upon an agricultural bed, film controls moisture evaporation, prevents leaching of fertilizer, accelerates growth, and increases yield.
The value of shipments of film and sheet proucts for all markets, including agriculture, increased considerably from 1972 to 1977. Shipments of polypropylene film and sheet more than quadrupled during this period. Cellulosic and polystyrene also increased rapidly and polyethylene, one of the biggest categories, more than doubled. Sheets are also produced in laminated form. Data for laminated sheets, which are available in combined form with data for laminated rods and tubes, indicate that shipments nearly doubled during 1972-77.
Plastics products have found a growing number of applications in agriculture besides sheeting and pipe. Injection molded plastic parts on many types of agricultural equipment are increasingly substituted for metal parts. Parts for seed drills, combines, planters, and tractors are more frequently being made of plastic. Some of the advantages of plastics include cost and weight reduction and corrosion resistance.

Packaging. Another important market for plastics has been packaging applications. Blow molded milk containers, for example, which are large, break-resistant, and light weight, have achieved a high level of market penetration because of their advantages. Plastic containers for other types of food products have also grown in popularity. Shipments of jars and tubs for food products nearly tripled during 1972 77. Advances in blow molding technology around the beginning of this period helped push plastic drums into competition with steel, offering advantages in reusability and resistance to denting and corrosion as well as lighter weight.

Transportation equipment. Much of the output of the plastics industry is used in the manufacture of transportation products. By far the largest portion of this output goes into the production of motor vehicles. In 1977, nearly 80 percent of plastics output, by value of shipments, going into the transportation market, was used for motor vehicles. The remaining 20 percent went into aircraft, space and missile, and other transportation equipment. About two-thirds of the portion going into motor vehicles was in the form of components, housing, accessories, and parts. The rest was in the form of foam products for such items as seating and dash. Substitution of plastics for metals has contributed to output growth. Light weight has helped make plastics products suitable for a multitude of applications in the automotive area.

Smaller markets. A smaller but still sizable market for plastics is the electrical and electronic products market. One of the biggest segments of this market-household and commercial appliances-showed little change in output during 1972-77 but items in the computing and data processing
category grew rapidly. Furniture components and furnishings also represent a fairly sizable market for industry output.

## Technological advances

The plastics industry produces an extremely wide assortment of products. The resins used as raw material can be formed into a wide variety of shapes using various processes such as molding and extrusion. ${ }^{3}$ The equipment used in these processes has been improving over time, aiding industry productivity gains.
One of the most widely used production processes is injection molding. This process involves heating and working plastics granules or compounds until they are able to flow. This plasticized material is then forced under pressure into a closed mold cavity where it can cool or cure to form the desired part. Productivity in this process has benefited from the adoption of equipment which utilizes a rotating screw to perform the injection operation. Raw material is fed from a hopper onto the screw which is kept rotating by a motor. The material is forced over the flights of the screw and is heated by the barrel and friction from the turning screw. This process heats and plasticizes the material. As the hot material forces its way to the front of the screw, it drives the screw backward. The screw stops turning when the right amount of material reaches the tip. The screw is then forced forward and injects the hot plastic material through the nozzle of the barrel and then through a sprue and runner system into the mold cavities. Use of the screw has resulted in the material being more plasticized when it enters the mold, reducing cycle time. Better resins tailored to injection molding have become available and these have facilitated plasticization and have reduced problems arising when plastic material sets up in the barrel and must be removed.
In recent years, a type of injection molding known as reaction injection molding (RIM) has come into use. ${ }^{4}$ RIM involves the injection of two liquid plastic materials into a mold. This is done at low pressure rather than the usual high pressure. Many improvements in RIM equipment use have contributed to productivity growth. Improved output metering units have resulted in more rapid mold fill, and press speeds have also been increased. The introduction of faster-cure materials has largely eliminated the need for presses with tilt features which extend the cycle time. ${ }^{5}$
Machine controls have continually improved over the years. An important development in this regard has been the increasing adoption of microprocessor controls as they have become more affordable. They provide an integrated system of controls over such production variables as time, temperature, position, and pressure. They offer production monitoring capabilities and can maintain various parameters such as injection velocity and cavity pressure at optimal, preset levels in spite of fluctuations in operating conditions. The ability of microprocessors to detect and adjust for changes in operating conditions enables them to keep production
machinery operating at peak efficiency. Their preprogramming capabilities reduce the needed startup time and their precise control reduces the reject rates.

Reductions in molding cycle time have also aided productivity. Improvements in mold cooling systems have contributed to reduced molding time. More sophisticated mold designs have also reduced the time required for the molding operation. Continual improvements in resins have made important contributions to productivity gains in molding. Improved resins offer such advantages as faster flow, easier ejection, and reduced mold deposit. The advantages of these resins have reduced the cycle time in many molding operations. ${ }^{6}$

A significant development in materials handling has been the adoption of robots for the performance of operations involving such activities as lifting, tilting, twisting, positioning, aligning, or transferring of items. Robots have been used for a number of premolding and postmolding operations, such as loading and unloading presses and the handling and orienting of finished parts for takeaway. Robots offer the advantage of working tirelessly without interruption, improving product quality and shortening cycle time. In addition to their role with molding machines, robots are also being used in such downsteam processes as trimming and deflashing. Robots have also proven beneficial for spray coating plastic parts. The robots offer more uniform and accurate coating weights and fewer rejects, while performing at higher levels of productivity.

The use of lasers has been growing in the plastic processing industry. Lasers have been adopted for cutting and drilling uses and also for their capacity to measure and inspect accurately and quickly. Measuring systems can use interruption of laser scans to determine dimensions while inspection units detect disruptions of the beam when it hits defects, such as bubbles or other flaws, in the surface.

Analysis of the reflected/refracted light, generally by computer control, provides information on the defects. The laser can be connected with process controls, thus permitting adjustment of process parameters in response to detected defects. Lasers can cut thick plastics in a single step, providing clean, smooth edges which do not require abrasive finishing. The speed and precision of lasers and their ability to replace manual operations have enabled them to contribute to industry productivity gains.

## Outlook for technology

More frequent adoption of microprocessor controls for production equipment probably will be an important part of the future automation of the industry. A move toward almost total computer control of many plants appears to be a very real possibility. Microprocessor controls for individual machines could be linked to central computers which coordinate and control the overall manufacturing operation. ${ }^{7}$

Increased adoption of robots also appears likely as part of the push for greater efficiency; not only will there be more robots but the capabilities of those robots almost certainly will expand. Laser systems will probably also continue to be adopted.

Improvements in resins have been an important factor in productivity growth and the industry should continue to benefit from the development and introduction of better resins. Modifications in production machinery to take advantage of new resins may also be beneficial to productivity gains.

Demand for industry output should grow relatively well in coming years, as plastics are substituted for other materials in the manufacture of various products. Any further declines in petroleum prices would also benefit the price competitiveness of plastics products by reducing the cost of raw materials.

## FOOTNOTES-_

#### Abstract

${ }^{1}$ Average annual rates of change are based on the linear least squares trends of the logarithms of the index numbers. The miscellaneous plastics products industry is composed of establishments primarily engaged in molding primary plastics for the trade and fabricating miscellaneous finished plastics products. The industry is designated as SIC 3079 in the Standard Industrial Classification Manual, 1972 Edition, issued by the Office of Management and Budget. Extension of the indexes appears in the annual BLS Bulletin, Productivity Measures for Selected Industries. ${ }^{2}$ For more information on the subject of pipe, see "Agpipe Picks Up," Modern Plastics, March 1975, pp. 54-55; and "Volume Pipe Resin: A Million-Ton 1977 Market Will Grow 30 percent by 1980," Modern Plastics, December 1977, pp. 34-37.

## APPENDIX: Measurement techniques and limitations

Indexes of output per employee hour measure changes in the relation between the output of an industry and employee hours expended on that output. An index of output per employee hour is derived by dividing an index of output by an index of industry employee hours.

The preferred output index for manufacturing industries would be obtained from data on quantities of the various goods produced by the industry, each weighted (multiplied) by the employee hours required to produce one unit of each good in some specified base period. Thus, those goods which require more labor time to produce are given more importance in the index.

In the absence of adequate physical quantity data, the output index for this industry was constructed by a deflated value technique. The value of shipments of the various product classes were adjusted for price changes by appro-
priate Producer Price Indexes to derive real output measures. These, in turn, were combined with employee hour weights to derive the overall output measure. These procedures result in a final output index that is conceptually close to the preferred output measure.

Employment and employee hour indexes were derived from BLS data. Employee and employee hours are each considered homogeneous and additive, and thus do not reflect changes in the qualitative aspects of labor, such as skill and experience.

The indexes of output per employee hour do not measure any specific contributions such as that of labor or capital. Rather, they reflect the joint effect of factors such as changes in technology, capital investment, capacity utilization, plant design and layout, skill and effort of the work force, managerial ability, and labor-management relations.

## Errata

In "Labor market contrasts: United States and Europe" by Janet L. Norwood in the August Monthly Labor Review, two lines were inadvertently dropped from the paragraphs beginning at the bottoms of page 3 and page 4 . The paragraphs are reproduced below with the missing lines in boldface.
Paragraph beginning at the bottom of page 3:
The differences and their effects on attitudes toward policy were discussed at a recent conference in England by experts from Western Europe and North America. The question "Has Full Employment Gone Forever?" was answered far more pessimistically by the Europeans than by the Americans. The attitudes at the conference were shaped by the historical framework and expectations of future developments. The Western European countries had very little job growth during the decade of the 1970's; and in most of the European countries, there was little if any expansion of the labor force.

Paragraph beginning at the bottom of page 4:
Youth unemployment high. Young people also tend to be concentrated in low-paying jobs-when they work. Youth unemployment rates are at very high levels in both Europe and in the United States. More than 1 of 5 teenagers in the U.S. labor force is unemployed, as is 1 of 7 young adults aged 20 to 24. Unemployment rates among British, French, Italian, and Dutch youth now meet or surpass these high U.S. levels, while West Germany manages to maintain much lower rates, especially for teenagers. (See table 3.)

Reprints of the article are available from the Bureau of Labor Statistics, Division of Information Services, Washington, D.C. 20212.

# The Anatomy of Price Change 

#### Abstract

Inflation patterns in the initial stages of recovery

David Callahan, Douglass Robertson, and Lorie Scheibel

The newly-modified Consumer Price Index for All Urban Consumers (CPI-U) advanced at a seasonally adjusted annual rate of 2.9 percent for the first 6 months of 1983, compared with a 3.9 -percent rate during 1982. ${ }^{1}$ Prices in the first quarter continued the general experience of the fourth quarter of 1982 with the overall price level virtually unchanged. This was followed by a moderate upswing, at an annual rate of 5.4 percent, during the second quarter. (See table 1). Energy prices have been a dominant factor in the moderation in the CPI during the economic slowdown, and this continued into the first stages of the recovery. Following a decline in the first quarter, the reversal in energy prices was largely responsible for the second quarter acceleration. The initial surge in energy prices coincided with the imposition of the 5-cent-a-gallon tax on gasoline on April 1.

During the first 6 months of the year, the Producer Price Indexes (PPI) for finished goods and for intermediate materials showed slight decreases, while that for crude materials registered a moderate increase. The difference in the annual rate during the first half of 1983 and during the 12 months ended in December 1982 for producer costs of crude materials was largely attributable to a sharp upturn in the prices of foodstuffs and feedstuffs and in nonfood materials less energy. (See table 2.) The large decrease in intermediate materials and finished goods prices in the first quarter followed a corresponding change for crude materials in the second half of 1982. As in the CPI, energy prices were a major factor in the first quarter deceleration and subsequent second quarter increase.

## Energy prices fall, then spurt

Energy costs declined at a seasonally adjusted annual rate of 4.8 percent during the first half of 1983. An annual rate of decrease of 25.1 percent in the first quarter was nearly

[^3]offset by a second quarter increase at an annual rate of 21 percent. (See table 3.) This large second quarter spurt in energy costs accounted for more than 40 percent of the second quarter rise in the overall CPI. Energy prices had increased 1.3 percent during all of 1982 .

The first quarter drop in energy prices was largely due to a continued abundance of crude oil supplies, as OPEC members failed until March to administer production quotas which would bring oil supply more closely in line with reduced oil demand. The slack domestic oil demand in the first quarter occurred because there was mild winter weather in the oil-consuming Northeast region and low industrial demand for energy resources during the first months of the recovery. Of the major individual components in the energy index, lower prices for fuel oil, electricity, and motor fuels were primarily responsible for the large decline in the first quarter index. These falling prices were followed by partially offsetting second quarter price increases. The only major energy component to vary from this pattern was piped gas, which posted sizable increases in both quarters.

Prices of motor fuels, which account for half of the energy index, demonstrated the most dynamic quarter-to-quarter swing. From a first-quarter plunge at a seasonally adjusted annual rate of 36.3 percent, the index jumped at a rate of 41.4 percent in the second quarter. Abundant oil supplies, which had lowered motor fuel prices 6.5 percent in 1982, continued through the first quarter of 1983. By March, the index for gasoline prices had declined to its January 1980 level.

The second quarter, however, saw the drying up of surplus oil supplies as OPEC production quotas designed to stabilize a $\$ 29$ per barrel price for crude oil took effect. Along with tightening supplies and the approach of the highdemand summer driving season, a Federal excise tax of 5 cents a gallon was imposed in April. Most refineries appear to have taken advantage of consumers' expectations of higher pump prices associated with the tax to pass on additional increases. Several States also increased their own gasoline taxes. The total increase in motor fuel prices following the imposition of the Federal excise tax was substantially larger than the 5 cents. The March to June increase in pump prices was almost 13 cents a gallon.

Household fuel prices account for the other half of the energy index. Compared with the behavior of motor fuels prices, their 8.5 percent rate of decline in the first quarter
and 4.5 percent increase in the second quarter were decidedly less volatile. The decrease in fuel oil prices in the first quarter (43.6 percent) and the moderate drop in charges for electricity ( 4.1 percent) were partially offset by a 14.3 percent increase in the index for piped gas. A second quarter turnaround in the indexes for fuel oil and electricity, which were up at annual rates of 2.1 and 2.6 percent, in part, moderated another sizable increase in piped gas of 17.6 percent.

The continued climb in piped natural gas prices reflects the continuing effects of decontrol and take-or-pay contracts. However, as the result of attempted renegotiations in longterm take-or-pay contracts, the piped gas index fell fourtenths of a percent from May to June. This was the first decline in piped gas prices since August 1982.

An omen of future piped gas price changes, the PPI for natural gas decreased during the second quarter at an annual rate of 14.8 percent. Further piped gas price reductions are possible as suppliers attempt to stabilize prices to discourage users from switching to cheaper fuel oil.

Electricity rates followed the general trend of other energy prices as oil-fired plants took advantage of the lower first-
quarter fuel oil prices. As fuel oil prices increased in the second quarter, electricity rates increased at a 2.6 -percent annual rate.

## Increase in shelter costs

The index for services less energy rose at a 4.2-percent annual rate in the first 6 months of 1983, following a 3.4percent rise in 1982. (See table 4.) Costs of shelter services and other household services accounted for much of the increase. The index for owners' equivalent rent, which represents the cost of shelter services of owner-occupied housing, advanced at a 4.4-percent annual rate, and the residential rent component increased at a 4.5 -percent rate during the first half of the year. Other renters' costs, despite a sharp increase in charges for out-of-town lodging, registered a smaller rate of increase during the first half of 1983 than during 1982.

Among other household services, prices for maintenance and repair services accelerated from the preceding year, as increased activity in construction was accompanied by higher labor charges. Prices for telephone and water and sewage services rose sharply in the first 3 months, then moderated

from March to June, increasing at an annual rate of 6.5 percent during the first 6 months of 1983.

The increase in charges for medical care services slowed to a 7-percent annual rate in the first 6 months of 1983 , compared to 11.2 percent in 1982. The cost of hospital rooms continued to rise substantially, but at a slower rate than in the last 2 years. Charges for professional servicesphysician, dental, and other professional services-accelerated somewhat, increasing at an annual rate of 8.3 percent in the first half of 1983, following a 6.9 -percent increase in 1982.
Among other services, the transportation service index increased at a slower rate this year than in 1982, due to larger declines in auto financing charges and a slower rate of increase in automobile registration fees and most forms of public transportation. Declining fuel costs and compe-tition-induced discount airline fares were largely responsible for the first-quarter decline in public transportation price increases. An increase in airline fares, partially due to fewer discount fares, and a sharp jump in intercity bus fares, were responsible for the second-quarter advance of 7.8 percent. Prices for most other types of services, including entertainment, personal care, apparel, and personal and educational expenses also decelerated in the first half of 1983.

## Food price increases small

For the 6 months ended in June, retail food prices increased at an annual rate of 2.2 percent. (See table 5.) Although larger than the increase during the second half of 1982, the annual rate for food price increases was still smaller

${ }^{1}$ Data are not seasonally adjusted.
than the rate for 1982 as a whole. Adequate to abundant supplies at the wholesale level, lower energy costs, and reduced demand contributed to the slowdown of retail food prices. All major grocery store food groups recorded small increases in the first half. At the farm level, the PPI for crude foodstuffs and feedstuffs advanced at a 9.1 -percent annual rate from December to June with smaller increases reflected in the intermediate and finished consumer foods series. The second-quarter increases at all three stages of processing, however, were markedly less than during the first quarter.

Of all the major food groups, fruits and vegetables, being particularly sensitive to weather conditions, exhibited the greatest month-to-month price fluctations. Nearly offsettng large monthly price swings resulted in a 6 -month annual rate of increase of 2.7 percent. Fresh vegetable prices rose sharply during the first 6 months, at a 14 -percent seasonally adjusted annual rate. Heavy rains during the winter and early spring in Florida, California, and western Mexico (an important U.S. supplier of winter and spring vegetables) disrupted planting and harvesting schedules, delayed growth, reduced yields, and damaged crops. Prices were sharply higher for potatoes and lettuce in the second quarter, while tomato prices shot up during the first quarter and then fell in the second quarter to levels substantially lower than 12 months earlier. By June, prices for most fresh vegetables had declined from their spring levels. Fresh fruit prices were down at a 4.3-percent annual rate in the first half of the year, as a large drop in the first quarter was partially offset by a small increase in the second. Unfavorable weather conditions in Central America pushed up prices for bananas, while a large Florida citrus crop kept price increases in other fresh fruits indexes small. Prices for apples, oranges, and other fresh fruits remain well below those of a year ago.

The index for meats, poultry, fish, and eggs recorded a slight increase during the first half. A sharp jump in egg prices, coupled with moderate price increases in poultry and fish and seafood, were enough to offset the declines in pork and beef prices. Ample supplies and sluggish demand resulted in a sharp drop in pork prices, while less than seasonal
increases yielded a small seasonally adjusted decrease in beef prices. Although registering a small rise during the first 6 months of 1983, poultry prices, like those of beef and pork, have declined over the past 12 months. The U.S. Department of Agriculture (USDA) estimates that red meat and pork supplies will remain well above those of a year earlier. Plentiful supplies also characterized the poultry industry, but increased feed costs and lower profitability are expected to result in monthly supplies that will be the same or slightly less than in the preceding year. Retail egg prices increased sharply in the first half, as production decreased.

Prices for dairy products have increased at a 1.6 -percent annual rate, reflecting continued burdensome milk supplies during the first 6 months. Because of this oversupply, and in order to reduce price support costs to the Government, a 50 -cent-per-hundredweight tax on producers of all commercial milk was implemented in April 1983. The impact of this action, combined with high feed costs and slowing gains in milk production, may increase retail prices for most dairy products later in the year.
Spurred by a stronger economy, overall per-capita food consumption is likely to rise in 1983. Despite increased demand, continuing ample supplies should yield only moderate price increases for most food items. The recently im-

plemented PIK (payment-in-kind) and other acreage reduction programs designed to reduce surplus grains and booster prices at the farm level are expected to have little or no effect through the remainder of this year, and will push up retail food prices only slightly next year, according to USDA. Because idled acres will be those that are least productive, yields per acre are likely to increase although total production is expected to decline. Estimated production declines associated with the 1983 acreage decrease are 10,50, and 45 percent for wheat, rice, and corn. Recent drought conditions may further restrict supplies and eventually drive up grain prices.

## Commodity prices decelerate

Prices for commodities excluding food and energy rose at a 4.3-percent seasonally adjusted annual rate during the first half of 1983, a notable slowdown from the 5.8-percent rate for all of 1982. A 5.7-percent increase in the first quarter slowed to a 2.9 -percent rate from March to June. (See table 6.) Within this category, new cars, tobacco products, and textile housefurnishings experienced the most dramatic shift in prices from quarter to quarter, but most other commodities also slowed down during the recent quarter.

New vehicle prices increased at an annual rate of 1.6 percent during the first 6 months of the year, largely repeating the 1982 experience of 1.4 percent for the year as a whole. From December to March, prices rose 6.8 percent, then they fell 3.5 percent in the second quarter. The price hike associated with the introduction of the 1983 cars was delayed as dealers tried to move large inventories of 1982 cars in the latter part of last year. As a result, the easing of prices, which in the past occurred in February and March, did not happen, causing the large seasonally adjusted increase. On the other hand, manufacturers in the recent past have phased in introductory price increases in a quarterly basis, usually between January and April. To encourage sales, the usual April increase was deferred this year. In addition, several companies continued rebate programs, leading to a significant decrease in the second quarter.

Used car prices, which increased 10.9 percent in 1982 , advanced at about the same rate ( 10.1 percent) during the first half of 1983. Prices had soared from December 1979 to December 1981, increasing at an annual rate of nearly 20 percent, because of the robust secondary market associated with dismal performance of new car sales.

Tobacco products also showed a major deceleration of prices between the first and second quarter. The price increase, at a 3.7-percent annual rate from March to June, was significantly below the 17.2 - and 48.2 -percent rates recorded in the previous two quarters. Last summer, the Federal Government enacted an increase of 8 cents per pack in the Federal excise tax on cigarettes, effective January 1, 1983. Manufacturers steadily increased prices in the latter part of 1982 , ostensibly to avoid a large one-time price hike, thus causing the sharp advance in the fourth quarter of last
year. With the actual imposition of the tax, a large increase was reflected early in the first quarter, with relatively moderate price increases afterwards.

Most other commodities within this grouping showed some price moderation between 1982 and the first half of 1983. The major exception was clothing prices, which rose at an annual rate of 3.9 percent in 1983, following a 0.9 -percent increase in 1982.

## Employment and wages reported by California farmers in 1982

Gary Johnston and Philip L. Martin

In California, the Nation's largest agricultural State, 82,000 farms reported employing an annual average of 66,000 farmers and family workers and 223,000 hired workers to produce crops and livestock worth $\$ 14$ billion in 1982. The vitality of California agriculture obviously has a significant influence on the health of the State's economy.

Most farms in the United States and in California are owned and operated by farmers and their families. Throughout the Nation, farmers do 70 percent of all farm work, but in California hired workers do 70 percent of the State's farm work and farmers, only 30 percent.
Farm labor statistics are confusing and contradictory. The Federal Government collects information on farm labor in the Census of Agriculture. The U.S. Department of Agriculture sends an employment questionnaire to farmers in July and publishes the results in Farm Labor. The department also contracts with the Bureau of the Census to ask the 60,000 households in the Current Population Survey questions about farmwork every other December and publishes the results from about 1,500 farmworker households in biennial The Hired Farm Work Force reports. California's local Job Service offices submit monthly estimates of agricultural employment that are published in 881 reports of the State's Economic Development Department. These information gathering efforts have different purposes and utilize different survey techniques, so each deals with a different part of the heterogeneous farm labor market. A further complication is the presence of the unreported illegal or "undocumented" workers who pour into the market, mostly from Mexico.

The Census of Agriculture reported that more than half

[^6]of California farms hired a total of 800,000 farmworkers in 1978 (a worker employed on two farms would be counted twice). The July 1982 survey of employers reported in Farm Labor that California farms employed 240,000 workers who averaged 43 hours of work each week. Wages averaged $\$ 4.39$ for hourly workers and $\$ 6.63$ per hour for piece-rate workers. The 1981 Hired Farm Work Force survey interviewed a sample of farmworkers and reported that 334,000 persons worked at least 1 hour for wages in California, Arizona, Hawaii, and Nevada. Of this number, about 49 percent were Hispanic. California's monthly estimates show hired farmworker employment ranging from 175,000 in March to 270,000 in September, or an annual average of 223,000 hired farmworkers.
The farm labor data collected regularly by Federal and State agencies are confusing to policymakers and of limited use to farmers and farmworker representatives because each statistical system paints a different but unclear picture of the farm labor market. Much as the blind men describing the elephant, generalizations from a single data series may give a misleading impression of the job market in a particular commodity or region. To generate more detailed information, a farm labor questionnaire was mailed to California farmers by several farm organizations in 1982.' Farmers were asked 13 questions about commodities grown, the number of year-round and seasonal employees, hours of work and wages, and employer satisfaction with the quality and quantity of farmworkers.

## The 1982 survey

More than 800 employers responded to the survey, and they represented the spectrum of crops and livestock produced in California. More than half were growers. Most of the respondents ( 58 percent) produced or worked in the fruit and nut industry. The survey was mailed to employers throughout the State, and 64 percent of the responses came from the San Joaquin Valley, the State's major agricultural area.

The farmers reported that they employed 42,000 yearround workers and 139,000 seasonal workers in 1981. The 619 farms that employed year-round workers averaged 68

Table 1. Year-round farmworkers and hourly wages by region and crop

per farm, with a range of 1 to 1,820 . (See table 1.) Most of the farms employed fewer than 10 year-round workers; 81 percent surveyed had fewer than 50.

A total of 755 farms employed 139,000 seasonal workers sometime in 1981 (seasonal workers are double-counted if they work for two responding employers). (See table 2.) Respondents employed an average of 184 seasonal farmworkers, ranging from a low of 2 to a high of 15,000 seasonal workers (one vegetable farm in Southern California). More than 41 percent of responding farms reported that they hired between 11 and 50 seasonal workers. Farms in Southern California employed most of the seasonal workers: 29 vegetable farms averaged 750 seasonal workers each,
and 13 fruit and nut farms averaged 890 seasonal employees each.
in Southern California employed most of the seasonal workers: 29 vegetable farms averaged 750 seasonal workers each, and 13 fruit and nut farms averaged 890 seasonal employees each.

Some seasonal workers leave the area or the State after the harvest and then migrate back to California the following season. However, only 39 percent of the seasonal workers were reported to have migrated to their farm jobs from other areas. Workers who resided in the area made up 45 percent of all seasonal farmworkers, and an additional 16 percent commuted to their jobs. Generally, livestock and nursery

workers resided locally; seasonal field crop workers tended to commute to their jobs. Seasonal workers on field, fruit and nut, and diversified farms were most likely to migrate. Of the average 186 seasonal workers employed on responding farms, 84 were local residents, 73 , migrants, and 29 , commuters.

## Hourly wages

Average hourly wages were $\$ 5.16$ for year-round workers and $\$ 5.14$ for seasonal farmworkers. These wages, which are higher than State estimates, are gross wages that reflect cash and piece-rate wages paid to workers. The wages do not include mandatory taxes for social security ( 13.4 percent of base wages), unemployment insurance ( 4 to 6 percent),
and workers' compensation insurance ( 6 to 18 percent). Nor do they include the cost of fringe benefits, such as health insurance, vacation, pension contributions, and transportation allowances. Respondents reported one average wage for all their year-round workers and another for seasonal workers, so these sample averages obscure the variation in wages on each farm.

Reported farmworker wages varied widely across California. Hourly wages for year-round workers ranged from $\$ 3.35$ to $\$ 12.80$. Year-round vegetable workers in the Central Coast region that includes the Salinas Valley averaged $\$ 6.68$ hourly, and vegetable wages elsewhere ranged from $\$ 6.77$ hourly on multiregion farms to $\$ 4.71$ on Southern California vegetable farms. Year-round livestock and field
crop workers received the lowest hourly wages, usually $\$ 4.25$ to $\$ 4.75$. The highest wages were reported by a Salinas vegetable fárm that paid its year-round workers an average hourly wage of $\$ 12.80$; the lowest, by Southern California fruit and vegetable farms that paid their yearround workers $\$ 3.35$ hourly.
Seasonal workers averaged $\$ 5.14$ hourly, with a range of $\$ 3$ to $\$ 20$. Seasonal vegetable workers in the Central Coast region averaged $\$ 7.36$ hourly, while field workers in the San Joaquin Valley averaged only $\$ 3.77$ per hour. A Salinas vegetable farm reported the highest wages, an average of $\$ 20$ hourly; a North Coast livestock farm reported the lowest, an average of $\$ 3$. Seasonal fruit and vegetable workers, who often do harvest work for piece rates, had the highest average hourly earnings.

Most respondents offered their year-round and seasonal workers fringe benefits. Health insurance was the most common fringe benefit, offered to 97 percent of all year-round workers and 85 percent of the seasonal workers. More than 87 percent of all year-round workers were eligible for paid vacations, in contrast to 27 percent of the seasonal farm work force. Life insurance was offered to 74 percent of the year-round workers and 41 percent of the seasonal workers. Housing was provided to 26 percent of the seasonal work force and 30 percent of the year-round work force. Generally, seasonal field and livestock workers were less likely to have health insurance (only one-third) but more likely to have housing provided by the employer (two-thirds). Fringe benefits were most common in Southern California, the south coast, and the central coast.

Unions represented 6 percent of the farmworkers employed by responding farms. More than 70 percent of the vegetable employers responding to the survey had unionized work forces. Union contracts were most common in Southern California, the south coast, and the central coast regions. Unionized farmworkers were rare in the north coast and Sacramento Valley regions.

## Recruitment and attitudes

The farm labor market experiences simultaneous labor shortages and surpluses as it matches thousands of seasonal workers with jobs that last from several days to several months. Farmers were asked how they recruited farmworkers and if they were satisfied with the quantity and the quality of employed farmworkers. About two-thirds of the respondents reported that they recruited workers directly or relied on current employees to recruit additional workers. About one-fourth of the respondents relied on farm labor contractors to supply some or all of their farmworkers. Livestock farms were most likely to recruit workers directly, while San Joaquin fruit and nut farmers were most likely to rely on farm labor contractors.

Most employers were satisfied with the quality and quantity of farmworkers. More than 91 percent of seasonal employers were very or moderately successful in obtaining a
sufficient quantity of seasonal workers, and 83 percent were satisfied with the quality of the workers recruited. An overwhelming 95 percent of year-round employers felt that they were very or moderately successful in attracting enough year-round workers, and 94 percent were satisfied with the quality of their year-round employees. Fruit and nut employers, especially in the San Joaquin Valley, reported the most difficulty getting enough seasonal and year-round farmworkers, a difficulty that could be attributed to their heavy reliance on farm labor contractors.
California farmers must pay overtime wages of at least one and one-half times the regular wage after 10 hours of work in any day or 60 hours in any week. Farmers were asked what actions they would take if they were required to pay overtime wages after an 8 -hour work day and after an employee had worked 40 hours in a week. Farmers were asked to distinguish short-run and long-run actions, selecting from a list of responses that included no change in current practices, hire additional workers, mechanize, change crops, share labor with other employers, rely on a custom harvester, or quit farming. The most frequent short-run responses to a change in the overtime wage law were to hire additional workers ( 62 percent), mechanize wherever possible ( 51 percent), and make no changes in present practices ( 24 percent). A significant number of employers, 14 to 17 percent, said they would change production methods, switch to less labor-intensive crops, and rely more on farm labor contractors or custom harvesters, or both.

In the long run, more than 63 percent of the respondents said they would mechanize wherever possible, 33 percent would hire additional workers to reduce overtime wage payments, 32 percent would switch to less labor-intensive crops, and 28 percent would change production methods to use less labor. Field crop and diversified farms were most likely to mechanize immediately, while vegetable farms reported that they would mechanize within 3 to 5 years if the overtime wage law were changed. Only 17 farms said a change in the overtime wage law would cause them to quit farming.

## Conclusions

The 1982 farm labor survey provides another view of California's farm labor market. Responses from more than 800 farm employers indicate that the average farm with yearround employees has 68 -year-round workers who averaged $\$ 5.16$ hourly. Farms with seasonal workers employed an average of 184 workers and paid an average of $\$ 5.14$ hourly. Generally, fruit and vegetable workers in the central coast, southern coast, and Southern California regions had the highest average hourly earnings, while field crop and livestock workers in the north coast and central valley regions had the lowest. Almost all of the responding farms provided health insurance for their year-round and seasonal workers and many offered paid vacations, bonuses, and other fringe benefits.

Employers appeared to be quite satisfied with both the
quantity and quality of farmworkers. If farmers were required to pay overtime wages after 8 hours per day or 40 hours per week, most would try to hire additional workers and mechanize in the short run to reduce overtime wage premiums. In the long run, farmers would mechanize, hire additional workers, and switch to less labor-intensive crops.

The results of the 1982 survey must be interpreted with caution. Questionnaires were distributed to the members of five California farm organizations, and the survey results are based on relatively complete responses from only 12 percent of those who were sent the questionnaire. Respondents appear to include most of the large farm employers who hire the majority of California's farmworkers and have relatively complete records; however, most of the responses were from smaller employers.
The farm labor survey provides benchmark information that will be most useful if future surveys are conducted to chart California's changing farm labor market. Among the questions that need to be clarified in future surveys are those relating to the average weekly and annual earnings of seasonal and year-round farmworkers, the legal status of alien farmworkers, and employer perceptions of how proposed fines for knowingly hiring illegal alien farmworkers and an amnesty for some current farmworkers would affect farm operations.
-_FOOTNOTE-_
${ }^{1}$ Questionnaires were sent by the California Farm Bureau, the California and Tree Fruit League, Western Growers Association, Nisei Farmers League, and the Farm Employers Labor Service.

## Wage rates before and after leaving school

Career data collected from 1972 to 1979 by the National Center for Education Statistics show that the greater the educational attainment of young men and women, the higher their starting wage rates. Young men and women of all educational levels generally receive wage rate increases when they leave school, although some increases are larger than others. After graduating from college, young women had wage rates which quickly overtook those of their female high school classmates who did not attend college. Wage rates of young men who did not attend college were higher than their college-educated classmates for at least 8 years after leaving high school. Young women earned less per hour than comparable young men within every educational level and age group.

These findings are from the "National Longitudinal Study of the High School Class of 1972,'" the Center's first study to follow the progress of young people as they move from high school to adulthood. The sample of 23,451 young adults represents the 12th grade U.S. population in 1972. This study discusses several aspects of the careers of young men and women who make different choices about their education: the reduced earnings capacity of those in college, the crossover point when the wages of the college-educated

catch up to those with no higher education, and the wage increases that come with age and experience after leaving high school or college.

Students who work while attending school generally take part-time jobs paying less per hour than they could earn had they left school and worked full time. After leaving high school or college, wage rates of those with more education catch up to and, after a few years, overtake those with less education. The career patterns of earnings by educational level are similar for young men and women. However, women earn less than men at each age and educational level. Young men and women also differ in the length of time it takes for those with college degrees to catch up to their peers who did not attend college.

For women, the crossover point occurs very soon after college graduation. Those in the 1972 study showed a crossover point in wage rates in 1976 when most of them were 22 years old. In that year, the wage rate of women with no college was $\$ 4.27$ per hour; with less than 2 years of college, $\$ 4.61$; with 2 years or more of college or a 2 -year degree, $\$ 4.54$; and with a bachelor's degree or more, $\$ 4.72$. (See table 1.)

For men, a possible crossover point was in 1979 when most of them were 25 years old. In that year, the median hourly wage rate of men with no college was $\$ 7.06$ per hour; with less than 2 years of college, $\$ 6.94$; with 2 years or more of college or a 2 -year degree, $\$ 6.50$; and with a bachelor's degree or more, $\$ 6.86$.

Men and women who enrolled in higher education programs received higher wage rates when they left school and the greater their educational attainment, the larger their starting wage rate. For men, the starting wage rate of those with no college was $\$ 4.71$ per hour; with less than 2 years of college, $\$ 5.13$; with 2 years or more of college or a 2 -year degree, $\$ 5.56$; with a bachelor's degree, $\$ 5.96$; and with an advanced degree, $\$ 6.98$. For women, the corresponding wage rates were $\$ 3.76, \$ 4.13, \$ 4.54, \$ 5.24$, and $\$ 6.60$, respectively. For both men and women, the financial returns of a college education may repay the actual costs of schooling, as well as the wages lost by not working during the college years. Wage histories from the "National Longitudinal Study of the High School Class of 1972 "' show that up to age 25 , college probably does pay for young women, but it is too early to say the same for young men.

Does College Pay? Wage Rates Before and After Leaving School is available from the Statistical Information Office, National Center for Education Statistics, 400 Maryland Avenue SW, Washington 20202.

## The role of education in lifetime earnings

Lifetime Earnings Estimates for Men and Women in the United States: 1979, the latest in an intermittent series of U.S. Bureau of the Census reports on the subject, presents
estimates of expected lifetime earnings based on data collected in the March Current Population Survey (CPS). The report provides a scientific basis for analyzing the expected future earnings of men and women at specific ages and at five educational attainment levels (less than 12 years, 12 years (high school), 1 to 3 years of college, 4 years of college, and 5 years or more of college). The estimates represent the average amounts that individuals with a specified set of characteristics can expect to earn in their working lifetimes. If it is assumed that a person does not begin to work for pay until age 18, the estimates illustrate earnings potential for men and women between ages 18 and 64 . For example, a man with a high school diploma can expect to earn $\$ 861,000$ constant 1981 dollars between ages 18 and 64 , while a woman with the same level of education can expect to earn only $\$ 381,000$.

The current census report differs from previous census publications on expected lifetime earnings in at least two respects: (1) estimates of annual rates of unemployment by age have been incorporated into the procedures, and (2) estimates of expected lifetime earnings for women have been introduced. Past publications have not included estimates for women because they, on average, experience more breaks in employment (for example, for childbirth and child rearing) than do men.

The lifetime earnings estimates have many uses. First, they permit projecting one's lifetime earnings stream, even though future experiences of an individual are unknown. The author, Dan L. Burkhead, explains that future earnings can depend on many decisions in one's life, such as those concerning marriage, career goals, education, job location, and job availability. These estimates reflect the effect of those possible future decisions. The estimates are also essential to court settlements involving wrongful or negligent death as it is not known what the decedent's earnings would have been.

Finally this information is valuable to show the benefits of continued education. For example, a man with a high school education can expect to earn $\$ 803,000$ between the ages of 25 and 64 and a man with a college degree could earn $\$ 1,165,000$ between the same ages. While the $\$ 365,000$ additional income that a college degree could permit one to earn is quite impressive, the estimates show that a man with a postgraduate degree would earn $\$ 1,273,000$ (only $\$ 108,000$ additional income).

The estimates also indicate, not surprisingly, that women at all comparable age and educational levels will earn less than their male counterparts. (The author reports that if estimates could be derived for persons working continuously, without the intermittent breaks in employment common among women, the estimates for women would be higher.) Comparing female/male estimates, the report indicates that a woman with a high school education can expect to earn, on average, $\$ 330,000$ between 25 and 64 (approximately 59 percent less than her male counterpart),
$\$ 474,000$ with a college degree (also approximately 59 percent less), and $\$ 673,000$ with a post graduate degree (approximately 47 percent less). The data also indicate that a woman with a post graduate degree is estimated to earn $\$ 130,000$ less than a male high school graduate (approximately 16 percent less).

Several important assumptions were necessary to estimate expected lifetime earnings. First, and most important, the lifetime earnings estimates are average amounts based on cross-sectional earnings data by age, sex, and educational attainment for the years 1978-80. Use of this data assumes that current relationship are representative of the future: there is no way, however, to validate this assumption. Sec-
ond, the estimates were based on discount rates and annual productivity rates of zero percent. Any increase in the rate of productivity would result in higher estimates, but no attempt was made to predict future productivity trends. Third, the estimates do not consider values of various fringe benefits received by many employees. Finally, the estimates deal only with one's earnings potential between ages 18 and 64, not one's probability of survival.

Lifetime Earnings Estimates for Men and Women in the United States: 1979 (Current Population Reports, Series $\mathrm{P}-60$, No. 139) is available for $\$ 4.50$ from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

## A note on communications

The Monthly Labor Review welcomes communications that supplement, challenge, or expand on research published in its pages. To be considered for publication, communications should be factual and analytical, not polemical in tone. Communications should be addressed to the Editor-in-Chief, Monthly Labor Review, Bureau of Labor Statistics, U.S. Department of Labor, Washington, D.C. 20212.

## Major Agreements Expiring Next Month

This list of selected collective bargaining agreements expiring in October is based on contracts on file in the Bureau's Office of Wages and Industrial Relations. The list includes agreements covering 1,000 workers or more.

| Employer and location | Industry | Labor organization ${ }^{1}$ | Number of workers |
| :---: | :---: | :---: | :---: |
| ACCO Industries, Inc. (Interstate) | Fabricated metal products | Steelworkers | 1,000 |
| ACF Industries, Inc., Amcar Division (St. Louis, Mo.) | Transportation equipment | Railway Carmen; Machinists; Electrical Workers (IBEW); Firemen and Oilers; and Boilermakers | 1,500 |
| American Can Co. (Naheola, Ala.) | Paper | Paperworkers . . . . . . . . . . . . | 1,250 |
| Bell Telephone Co. of Pennsylvania | Communication | Federation of Telephone Workers of Pennsylvania (Ind.) | 1,300 |
| Bendix Corp., Electrical Components Division (Sidney, N.Y.) | Electrical products | Machinists | 2,350 |
| Boeing Co. (Interstate) | Transportation equipment ..... | Machinists | 3,900 |
| Boeing Co., Boeing Vertol Co. Division (Pennsylvania and Delaware) | Transportation equipment ..... | Auto Workers | 3,000 |
| Commercial Shearing, Inc. (Interstate) | Fabricated metal products | Steelworkers | 1,200 |
| Cyclops Corp., Empire-Detroit Steel Division (Mansfield, Ohio) | Primary metals . . . . . . . . . . . | Steelworkers | 1,200 |
| Dana Corp., Parish Frame Division (Reading, Pa.) | Transportation equipment | Steelworkers | 1,800 |
| Dye and Machine Print Cos. (Interstate) ${ }^{2}$ | Textiles | Clothing and Textile Workers | 4,000 |
| Florida Power and Light Co. (Florida) | Utilities | Electrical Workers (IBEW) | 4,900 |
| General Dynamics Corp., Electric Boat Division (Quincy, Mass.) | Transportation equipment | Marine and Shipbuilding Workers | 2,500 |
| Greyhound Lines, Inc. (Interstate) . . . . . . . . . . . . . . . . . . . . | Transit | Amalgamated Transit Union | 17,000 |
| Hershey Foods Corp. (Hershey, Pa.) | Food products | Bakery, Confectionery and Tobacco Workers | 2,300 |
| Hughes Tool Co. (Houston, Tex.) | Machinery | Steelworkers | 3,250 |
| Ingersoll-Rand Co. (New Jersey) | Machinery | Steelworkers | 1,800 |
| Jersey Central Power and Light Co. (New Jersey) | Utilities | Electrical Workers (IBEW) | 2,150 |
| Kaiser Foundation Hospitals, Permanente Medical Group, Kaiser Foundation Health Plan (San Franscisco, Calif.) | Hospitals | Service Employees | 7,850 |
| Koppers Co., Inc., Metal Products Division (Baltimore, Md.) | Machinery | Machinists | 1,500 |
| Kroger Co., Erie Marketing Area (Interstate) . . . . . . . . | Retail trade | Food and Commercial Workers | 3,550 |
| Leeds and Northrup Co. (Pennsylvania) | Instruments | Auto Workers | 1,200 |
| Libbey-Owens-Ford Co. (Interstate) | Stone, clay, and glass products | Aluminum, Brick and Glass Workers | 4,500 |
| Lincoln Telephone and Telegraph Co. (Nebraska) | Communication | Communications Workers | 1,600 |
| Lockheed Aircraft Corp., LMSC Division (Interstate) | Transportation equipment | Machinists | 6,300 |
| Lockheed Aircraft Corp., Lockheed California Co. Division (Interstate) | Transportation equipment | Machinists | 14,000 |
| Lockheed Aircraft Corp., Lockheed Georgia Co. Division (Interstate) | Transportation equipment | Machinists | 8,500 |
| McDonnell Douglas Corp., Douglas Aircraft Co. (California) | Transportation equipment | Auto Workers | 9,900 |
| McDonnell Douglas Corp. (Interstate) | Transportation equipment | Machinists | 5,700 |
| McLouth Steel Corp. (Trenton, Mich.) | Primary metals | Steelworkers | 3,400 |
| Mechanical Contractors Association of New Orleans (Louisiana) . . . . . . . | Construction | Plumbers | 3,000 |
| National Standard Co. (Interstate) | Primary metals | Steelworkers | 1,200 |
| Newport News Shipbuilding and Dry Dock Co. (Virginia) | Transportation equipment . . . . | Steelworkers | 17,000 |
| Northwest Industries, Inc., Lone Star Steel Co. (Texas) . . . . . . . . . . . . . . | Primary metals ............ | Steelworkers | 4,300 |
| Olin Corp. (Pisgah Forest, N.C.) | Paper | Paperworkers | 1,850 |

Continued-Major Agreements Expiring Next Month

| Employer and location | Industry | Labor organization ${ }^{1}$ | Number of workers |
| :---: | :---: | :---: | :---: |
| Outboard Marine Corp., Johnson Outboards Division (Waukegan, III.) | Machinery | Independent Marine and Machinists Association (Ind.) | 2,500 |
| Owens-Illinois, Inc. (Vineland, N.J.) | Stone, clay, and glass products | Flint Glass Workers . | 1,300 |
| Prudential Insurance Co. of America (Interstate) | Insurance | Insurance Agents | 1,200 |
| Schwinn Bicycle Co. (Chicago, Ill.) | Transportation equipment | Auto Workers | 1,500 |
| Timex Corp. (Connecticut) | Instruments | Waterbury Watch Workers | 1,200 |
| Titanium Metals Corp. of America (Nevada) | Primary Metals | Steelworkers | $1,050$ |
| Titanium Metals Corp. of America, Standard Steel Division (Pennsylvania) | Primary Metals | Steelworkers | 1,500 |
| White Consolidated Industries, Inc., Franklin Manufacturing Co. Division (St. Cloud, Minn.) | Electrical products | Machinists | 1,200 |

## Job loss of long-service workers

The loss of a job after the accumulation of some substantial seniority is likely to be psychologically unsettling and to produce economic hardship under any circumstances. When such an involuntary separation from a long-service job occurs during a man's fifties or sixties it can be calamitous. Although such displacements are not common, they happen often enough to constitute a social problem. Among men who were 55 to 69 years of age in 1976, 1 of 14 had lived through such an experience during the preceding decade. This represents over half a million persons.

This disruption of work career happens indiscriminately to men in all occupational categories and irrespective of educational background. Such displacement is much more likely in the private than in the public sector and is also considerably more common in some major industry divisions, notably trade and manufacturing. Even very long seniority does not provide immunity from such displacement. The overall displacement rate is 7.4 percent, while the rate is as high as 5.9 percent, controlling for other factors, among men with 20 years or more of service.

The incidence of displacement is uneven from other points of view. It is much higher among nonmarried than among married men, and men whose jobs had manifested some lack of stability even before 1966 were more likely to suffer an involuntary separation sometime over the next decade. Displacement was considerably less likely from establishments with pension plans than from those without them. Nevertheless, there is no evidence that the 1966 average hourly earnings of the men who were ultimately displaced differed systematically from those of men who were not. Despite the objective evidence of some qualitative difference in the security and amenities of their 1966 jobs, the men who were later displaced were just as likely as their more fortunate counterparts to have reported that their 1966 jobs were the longest and best of their careers.

Work and Retirement: A Longitudinal Study of Men (Cambridge, Mass., The mit Press,
1981), pp. 82-83.

## Developments in Industrial Relations

## Supreme Court bans sex bias in pensions

The Supreme Court ruled that employer-sponsored retirement plans may no longer pay women smaller benefits than men, despite actuarial studies indicating that women generally live longer than men. The ruling was primarily applicable to "defined contribution" pension plans, in which employers or employees or both make set payments into the plan. Men and women generally pay the same amount into the plan, but the resulting benefits are usually lower for women. According to the Employee Benefit Research Institute, there are 450,000 such pension and profit-sharing plans, with 25 million members. The American Council of Life Insurance put the number of members at 16.5 million, including 5 million women. The Council also estimated that 1 to 3 million of the women are covered by plans that provide smaller benefits for women.

Less likely to be affected by the ruling are "defined benefits" plans which pay set benefits at periodic intervals. The benefits are generally equal for men and women.

The court case, Arizona v. Norris, began in 1975, when Nathalie Norris joined an annuity plan offered by her employer, the State of Arizona, through a commercial insurance company. Her monthly contribution was $\$ 199$, the same as for a male employee, but her monthly benefit beginning at age 65 was scheduled to be $\$ 320.11, \$ 33.96$ less than for a male employee. Norris challenged the inequality under Title VII of the Civil Rights Act of 1964, which prohibits sex, race, and ethnic discrimination in employment. In support of her position, she cited a 1978 Supreme Court ruling in Los Angeles Department of Water and Power v. Manhart, in which the court barred the city agency from requiring female employees to make larger contributions to receive the same monthly benefits as men.

The ruling in the Norris case was delivered in a separate unsigned order summing up conflicting opinions of two groups of justices. Justices Thurgood Marshall, William Brennan, Byron White, and John Stevens held that paying unequal benefits is illegal sex discrimination. Writing for the group, Justice Marshall said, "Actuarial tables could

[^8]unquestionably identify differences in life expectancy based on race or national origin, as well as sex."

However, he continued, "even a true generalization about a class cannot justify class-based treatment. An individual woman may not be paid lower monthly benefits simply because women as a class live longer.,"

Justice Lewis Powell, Chief Justice Warren Burger, and Justices Harry Blackmun and William Rehnquist contended that the discrimination act was not intended to cover either the insurance industry or actuarial tables. Justice Powell wrote, "Sex-based mortality tables reflect objective actuarial experience. Because their use does not entail discrimination in any normal understanding of that term, a court should hestitate to invalidate this long-approved practice on the basis of its own policy judgment." The group also contended that in no event should a remedy be applied retroactively.

Justice Sandra Day O'Connor concurred with the first group only on the illegality of the Arizona plan and concurred with the second group only on the retroactivity aspect. Thus, the court arrived at its finding that the Arizona plan was illegal, but the remedy would be limited to pension contributions accrued after July 31, 1983.

The court did not say that for plans in which women's benefits were less than men's, the women's must be raised to the men's level. Instead, it simply said that unequal benefits must be equalized, which could be accomplished by either raising women's benefits or lowering men's benefits, or a combination of the two approaches.

## GM's plan to combat absenteeism successful

A General Motors Corp.-United Auto Workers plan to reduce unwarranted job absenteeism showed positive results; only 3 percent of the workers represented by the union failed to meet the minimum attendance requirement and were penalized. The overall effort to control unnecessary absences consisted of two parts. The first, counseling of offenders, was the major innovation of a six-member joint committee established under the parties' 1979 collective bargaining agreement and continued under their March 1982 agreement. Under this aspect of the plan, employees who had been absent more than 20 percent of their scheduled work time during the first 6 months of the 1982 agreement
were offered counseling to aid them in improving their attendance. These workers, and all others represented by the Auto Workers, were warned that they faced a temporary reduction in benefits (the second part of the plan) if they exceeded the 20 -percent rate during the second 6 months of the agreement. Both the counseling and the reduction in benefits were to be applied in the same manner during the balance of the 1982 contract, which expires in September 1984.

GM said that the aid by teams of union and management representatives and by professional counselors was so successful that 75 percent of the workers who qualified for the initial round of counseling avoided benefit reductions, while 10,000 workers exceeded the 20 -percent rate during the second 6 months of the agreement. According to the company, the counseling approach was a major factor leading to a decline in "controllable absences" from 11.3 percent in 1981 to 10.3 percent in 1982, and 8.8 percent in the first quarter of 1983.

The company and union indicated that virtually all absences were used in computing the individual rates. Not included in the calculations were absences for "major illnesses or injuries such as heart attacks, strokes, major surgery, etc."

The reduction in benefits for the 10,000 workers was to last for 6 months, beginning in April 1983. The cut in paid holidays, vacation pay, paid absence allowance, bereavement pay, jury duty pay, sickness and accident benefits, and Supplemental Unemployment Benefits, was to equal the individual worker's absence rate. Possible payouts under the company's profit-sharing plan, scheduled to begin in April 1984 (based on 1983 operating results), also would be reduced, but any lost amounts will be distributed to all eligible employees in future years.

Don Davis, an official of the union's General Motors Department, and a member of the committee, said that the plan had been well received by employees, even those who were penalized, because they had been given adequate warning of the consequences of unwarranted time off.

General Motors is the only domestic automobile manufacturer with such an attendance plan, although Chrysler Corp.'s latest settlement with the Auto Workers calls for countering unnecessary absences through tighter disciplinary procedures. (See Monthly Labor Review, February 1983, pp. 46-47, for the Chrysler accord, and May 1982, pp. 5960, for the General Motors accord.)

## California school district files for bankruptcy

The first bankruptcy of a public school system in California occurred when the San Jose Unified School District was unable to persuade its 1,400 teachers to give up a 6.1percent salary increase due in September 1983. Earlier, the school district had refused to put into effect a 6 -percent salary increase that had been scheduled for September 1982 under a 3-year agreement negotiated with the San Jose

Teachers Association in 1981.
The bankruptcy filing, which also affected the pay of 1,400 other school employees, was under Chapter 9 of the Federal Bankruptcy Code which protects a State or municipality against creditors while it restructures its debt. At the time of filing, the San Jose school district had $\$ 3.5$ million in debts and faced an additional $\$ 12$ million deficit for the 1983-84 school year.

Keith McWilliams, the school system's bankruptcy attorney, attributed much of the financial difficulties to Proposition 13, the 1978 California initiative that cut some property taxes and imposed limits on future increases. (In California and most other states, virtually all funds for schools are obtained from property taxes.)

## Ford parts workers accept once-rejected contract

Faced with a threatened cut in production and employment, employees of Ford Electronics and Refrigeration Corp. in Connersville, Ind., voted to accept essentially the same settlement terms they had rejected 10 days earlier. The new contract negotiated by Local 919 of the International Union of Electrical Workers was effective immediately, supplanting the balance of an agreement that had been scheduled to expire in March 1984. Company officials threatened to cut production by a reported 25 percent because they wanted to preclude interruptions in the production of automobile radiators and air conditioning parts at the plant. In 1978, a strike at the plant caused production difficulties at the parent Ford Motor Co.

The new contract provided for 20,50 , and 50 cents an hour wage increases on July 1 of 1983, 1984, and 1985. In a cost reduction move, new production line workers will start at 80 percent of the standard job rate; progress to 90 percent of the rate after 6 months of service, and to the full rate after another 6 months. Previously, new employees attained the standard rate after 90 days of service.

All 1,700 employees will continue to receive automatic quarterly cost-of-living pay adjustments calculated at 1 cent an hour for each 0.4 -point movement in the bls-Consumer Price Index for Urban Wage Earners and Clerical Workers $(1967=100)$. There also is a provision for reopening bargaining on wages and benefits in the fourth year.

Benefit changes included a three-step $\$ 4$ increase in the pension rate to $\$ 17.50$ a month for each year of credited service and a $\$ 50$ increase, to $\$ 80$, in maximum dental insurance coverage.

## Arbitrator to decide steel's benefit-cut issue

A disagreement arose over the application of the temporary wage cut in the March settlement between the United Steelworkers and the Coordinating Committee Steel Companies. (See Monthly Labor Review, May 1983, pp. 4748, for terms of the March settlement.) According to the companies, the $\$ 1.25$ pay cut should also affect pension,
insurance, and other benefits that vary according to pay level.

This was disputed by the union. Vice President Joseph Odorcich, who represented the union during the negotiations that resulted in the March settlement, charged the steel companies with "trying to reduce benefits that were not the subject of the negotiations. . . . ', Odorcich was displeased that the matter would be resolved through arbitration because of the delay involved.

Selected to decide the issue was Benjamin Aaron, professor of law at the University of California at Los Angeles. The case was only the second in the history of the industry involving a number of companies. The first was in 1969, when a ruling resulted in extension of incentive pay to thousands of workers.

Elsewhere in the steel industry, other companies negotiated labor contracts patterned after the March accord. In Coatesville, Pa., Lukens, Inc., and the Steelworkers negotiated a contract that called for a reported $\$ 1.80$ an hour cut in wages and benefits, compared with a reported $\$ 2.25-$ $\$ 2.30$ at the seven larger companies because, "Lukens is in better financial shape than most of the industry," according to a local union official.

In Zanesville, Ohio, Armco, Inc., negotiated a contract with the Steelworkers that called for a smaller wage cut ( 35 cents) than the seven companies but a larger reduction in benefits, resulting in an overall cut in compensation similar to the other companies. About 320 workers were affected. Earlier, Armco negotiated a concessionary contract for 4,500 employees at its Middletown, Ohio, plant. The workers are represented by the Armco Employees Independent Federation.

## Airlines win wage concessions

The Hyatt Corp. made some progress in its efforts to resurrect bankrupt Braniff International, but faced a suit filed by the Machinists union to block implementation of a concessionary labor contract negotiated by one of its local representatives. Four other unions approved concessionary accords-the Air Line Pilots; the Association of Flight Attendants; the Dispatchers; and the Teamsters. According to Braniff, the agreements provided for "significant increases in productivity, wage concessions and the cross-utilization of employees within various classifications." Reportedly, the largest pay cut was about 60 percent for the pilots, bringing their pay to $\$ 43$ an hour or $\$ 3,500$ a month. Under Hyatt's plan, Braniff would resume flying 30 planes by October 15, 1983, rehiring 2,000 of the 10,000 employees affected by its April 1982 shutdown.

Frontier Airlines won a 1-year wage reduction from its 575 pilots. Frontier recorded a $\$ 10.2$ million loss in the first quarter of 1983, following a loss in the last quarter of 1982 that was the first in several years. The 2-year contract permits the airline to increase flying hours to 80 a month, from 75. This change, plus the pay reduction, was expected to
save Frontier $\$ 5$ million. At the time of the settlement, senior captains earned up to $\$ 8,640$ a month flying Douglas DC-9's and up to $\$ 7,874$ flying Boeing 737's.

American Airlines' plan to buy additional airplanes and expand operations received a boost when the Professional Flight Attendants union accepted a contract that made some concessions on pay rates for new employees. American stressed that implementation of its plan was contingent on obtaining concessions from members of the Air Line Pilots Association. American was pressing the Pilots Association for an early renewal of their agreement, which was scheduled to expire in April 1984. Ralph Harkenrider, executive administrator of the union, said, "We see the need for some concessions but we aren't going to give away the store." The settlement for the flight attendants provides that new employees be paid about 30 percent less than current pay scales. American also will be permitted to create some parttime positions, to be filled by current full-time employees. All 6,500 current employees will receive pay increases totaling nearly 15 percent over the 3-year agreement term.

Western Airlines changed leadership and pledged a more cooperative attitude towards the unions representing its employees. This led the Teamsters and the Air Line Pilots to offer assurances that they would cooperate in the airline's efforts to negotiate temporary labor cost cuts.

In a legal matter involving Western Airlines, a Federal appeals court upheld a district court ruling that the company had violated the Age Discrimination in Employment Act by imposing a mandatory retirement age of 60 on flight engineers and by refusing to permit DC-10 pilots nearing the Federal Aviation Administration's required retirement age of 60 for pilots to "down bid" on flight engineer jobs.

The case originated in 1977, when two pilots and a flight engineer contested Western's inauguration of a rule requiring that all three crew members-the captain, copilot, and flight engineer-of a DC-10 must retire at age 60.

In its arguments before the courts, Western contended that a captain's bid for a lower position in the flight crew was not protected by the Age Discrimination in Employment Act. Western also contended that the age 60 policy was a legitimate job qualification, justified by considerations other than age.

In its ruling, the court noted that there have been no accidents resulting from disability of any of the more than 200 flight engineers over age 60 who are still flying.

## Glass Workers end 9-year strike

A strike lasting nearly 9 years against the Bartlett-Collins Co. in Sapulpa, Okla., ended in mid-June when the 75 workers accepted a 30-month contract. American Flint Glass Workers President George Parker termed the settlement a victory "in a long historic labor battle for dignity."

The American Flint Glass Workers had won a representation election at the plant in the 1940 's, but was not able to reach an agreement. The same thing happened to the

Glass and Ceramic Workers in the 1960's. The American Flint Glass Workers won another representation election in 1974, but again was unable to reach agreement, leading to the long strike.
The agreement provided for wage increases, three paid holidays (the first in the plant's history), improvements in health benefits, a dues checkoff, and specified overtime hours and pay rates.

## More copper settlements

Negotiations in the copper mining, smelting, and refining industry moved toward a close as a coalition of unions led by the Steelworkers settled with four companies along the lines of the Kennecott Corp. agreement, which froze wages for 3 years, except for continuation of possible automatic quarterly cost-of-living adjustments. (See Monthly Labor Review, June 1983, p. 45.) The four companies are Magma Copper Co.; Inspiration Consolidated Copper Co.; American Smelting and Refining Co.; and U.S. Metals Refining Co. Most of the facilities are located in Arizona, Utah, New Mexico, and Texas, except for the U.S. Metals plant, which is in Carteret, N.J.
The one bargaining situation that continued the industry's history of frequent work stoppages at agreement terminations was at Phelps Dodge Corp., where a strike began at the end of June. The company contended that it could not afford the cost of following the pattern because it was forced to stand or fall on its own performance, unlike some of the other companies which can sustain losses because they are part of larger firms.
Phelps Dodge's demands included cuts in pay for new workers, a pay freeze for those already on the payroll, elimination of the automatic cost-of-living pay adjustment formula, elimination of 1 of 9 paid holidays, elimination of the fifth week of paid vacation for 25 -year employees, and adoption of larger deductibles under the medical insurance plans.

## Southern paperworkers get new contract

More than 6,000 employees of International Paper Co. mills in four southern States were covered by contracts negotiated by the United Paperworkers and the International Brotherhood of Electrical Workers unions. The 3-year contracts provided for 6,6 , and 5 percent pay increases on June 1 of 1983,1984 , and 1985 , which average 68,72 , and 64 cents an hour. Other wage terms included elimination of the automatic cost-of-living pay adjustment formula, which had resulted in a 43 -cent increase during the 3 -year term of the contracts which expired on May 31, 1983.
The major benefit change was a revision of the pension plan to provide for benefits calculated at $\$ 16$ to $\$ 27$ a month for each year of credited service. Previously, benefit amounts were calculated as a percentage of annual earnings. Other
benefit changes included a fifth paid personal holiday, a $\$ 30$ annual payment for safety shoes, and a $\$ 50$ increase (to $\$ 150$ ) in the annual deductible under the major medical plan.
The mills are located in Mobile, Ala., Moss Point and Natchez, Miss.; Camden and Pine Bluff, Ark.; and Bastrop, La.

## Farm-construction equipment accords

The Auto Workers union concluded its round of bargaining with the major farm and construction equipment companies by settling with J. I. Case Co. for 4,200 active and 2,100 laid-off workers. Some of the terms were similar to those in the Caterpillar Tractor Co. agreement (Monthly Labor Review, July 1983, p. 42) and the Deere and Co. agreement (Monthly Labor Review, August 1983, p. 36).

The 44-month contract provided for a single guaranteed wage increase of 3 percent, effective July 7, but the workers' pay will continue to be subject to automatic quarterly cost-of-living pay adjustments calculated at the existing rate of 1 cent an hour for each 0.26 -point change in the bLS-Consumer Price Index for Urban Wage Earners and Clerical Workers $(1967=100)$.
Another wage provision was establishment of a Guaranteed Sharing Benefits Plan assuring workers of three annual lump-sum payments beginning in 1985 that the union said will total $\$ 1,600$ for a typical worker. All employees on the active payroll on June 27, 1983, also received a $\$ 100$ "settlement bonus."
In a change beneficial to Case, the Attendance Bonus Program was modified so that employees can now accrue only 40 percent of the paid time off that was possible under the previous agreement. Under that agreement, those who worked all scheduled hours in a week earned attendance bonus hours ranging from 1.5 for those with 1 but less than 10 years of service to 3 for those with at least 20 years of service. Those with perfect attendance for 5 consecutive weeks earned additional paid time off, bringing the combined maximum for a 5 -week period to a range of 11.25 hours for those with 1 but less than 10 years of service to 22.5 hours for those with at least 20 years of service.

New protections for employees' jobs and income included advance notice and union input when major outsourcing (subcontracting) is contemplated; advance notice and discussion with the union prior to any company decision on partial or complete plant shutdown; establishment of a "Plant Preferential Seniority Placement List"; formation of a national joint committee on retraining and placement; special early retirement benefits, guaranteed supplemental unemployment benefits, and extended health insurance coverage for workers affected by partial or complete plant shutdowns; and establishment of a rebate program aimed at increasing sales of products made by UAW members.
The new contract covers operations in Racine, Wis.; Terre Haute, Ind.; Rock Island, IIl.; and Burlington and Bettendorf, Iowa.

MONTHLY LABOR REVIEW September 1983 - Developments in Industrial Relations

## Eastman delays merit pay increases

Eastman Kodak Co. announced a 6-month delay in merit pay increases for virtually all of its employees. The only employees who will receive increases on schedule in De-cember-if warranted by their performance-are 3,500 hourly and weekly paid salaried employees in the lowest grades. At the end of 1982, the photographic products manufacturer had 93,300 employees in the United States. Since then, it has laid off 2,700 and shed several thousand through voluntary retirement and separation incentives.

## Problems continue in meat processing industry

The meat processing industry continues to be plagued by plant closings, threats of closings, and wage-and-benefit reductions.
Wilson Food Corp. filed for bankruptcy, then unilaterally cut the wages and benefits of its employees represented by the United Food and Commercial Workers by 40 to 55 percent. The union responded by filing charges with the National Labor Relations Board, contending that Wilson had engaged in unfair labor practices. The union also filed charges with the bankruptcy court, contending that Wilson's action on wages and benefits was an improper use of the Federal bankruptcy code. During this period, the parties began to negotiate on the wage and benefit levels, but the talks became deadlocked, and the union struck seven facilities. The strike ended after 22 days, when the parties agreed on a contract that restored some of the cuts.

The new contract prohibits the company from closing any plants for 12 months. The base hourly pay rate for most employees was set at about $\$ 8$, compared with $\$ 10.69$ before Wilson's unilateral June 25 cut and $\$ 6.50$ afterwards. Workers hired after June 25 , who had been receiving $\$ 5$ an hour, were raised to $\$ 6.50$, with the opportunity to progress to the $\$ 8$ rate over an 18 -month period. The contract, which expires in September 1985, also provided for a continuation of the freeze on automatic cost-of-living pay adjustments; elimination of the fifth and sixth weeks of paid vacation for long-service workers; a reduction in the pension rate to $\$ 10$ a month for each year of credited service, from $\$ 15$; elimination of two annual paid holidays; and establishment of a $\$ 200$ deductible on hospital insurance. (See the Monthly Labor Review, February 1982, p. 48, for terms of the December 1981 contract in which the union had agreed to a freeze on wages and reductions in benefits to aid Wilson and other "old-line" companies that generally signed the "Master Agreement" for the industry.)
Greyhound Corp. announced plans to close 13 facilities of its Armour Food Co. subsidiary in December because of "noncompetitive" labor costs. However, ConAgra Inc. agreed to purchase the operations, contingent on negotiating compensation concessions from Armour's 2,000 employees represented by the Food and Commercial Workers. ConAgra
official Warren McCoy said, "The retention of the present Armour Food Co. labor force will depend on the negotiation of satisfactory terms and conditions of employment at each of the plants.' ConAgra is a diversified basic food company with operations in agricultural chemicals, feed and fertilizer, retailing, grain processing and merchandising, frozen foods, poultry, and seafood. In giving the union the required 6month notice of the plant closings, Greyhound Chairman John W. Teets explained that Armour was unable to compete effectively against " 300 to 400 other packers who are not under the master agreement." He said that Armour paid $\$ 18$ an hour in wages and benefits, compared with less than $\$ 9$ paid by some other packers.

IBP cut the pay of its production workers by $\$ 1.05$ an hour, to about $\$ 8.30$. The cut applies to 600 nonunion beef workers in Luverne, Minn.; Emporia, Kans.; Dennison, Iowa; and West Point, Nebr. A company official said IBP determined that the cut was necessary because "our competitiveness [with other firms] has severely eroded over the past 18 months."

The many plant shutdowns and intensified competition in beef processing are generally attributed to the entry of Iowa Beef Processors (renamed IBP) into the industry in 1960. From the beginning, the company emphasized new technology and methods and located its plants throughout the cattle-producing regions, in contrast with the older firms which used traditional methods and were concentrated in Chicago and Kansas City. The company also strongly resisted the United Food and Commercial Workers' efforts to organize its employees. In instances where the union was successful (at 4 of 13 locations) IBP showed a willingness to bear strikes if necessary to maintain lower labor costs than did the older companies. As a result, IBP became a leading beef processor, along with Excel (a unit of Cargill Inc.) which also has prospered by using IBP's approaches.

Employee compensation was expected to be a major issue in negotiations between Excel and the United Food and Commercial Workers prior to the planned reopening of the company's Schuyler, Nebr., beef-packing plant. Company Vice President Orlan Thorbeck promised to seek "a competitive agreement . . . in terms of wages, benefits-everything." The plant is expected to open with the same employment level- 980 people-as when it was closed in December 1982.

Workers at Monfort of Colorado, Inc., cast 396 votes for "no union" and 301 in favor of the United Food and Commercial Workers, which had represented the workers prior to the plant's shutdown in March 1980 after a lengthy contract dispute. The facility, located in Greeley, has operated on a nonunion basis since its reopening in March 1982. The National Labor Relations Board will hear arguments in September on a union contention that 185 workers employed in the plant prior to the plant shutdown should have been offered jobs when it was reopened. The 185 people were allowed to vote in the 1983 election but only 94 participated.

## Utility seeks rate cut to spur development

Philadelphia Electric Co. asked the Pennsylvania Public Utility Commission for permission to lower the electricity rates of companies that increase employment or make capital improvements. The request amended an earlier rate reduction request, by eliminating the portion of the rate cut that was calculated on consumption, but placed more emphasis on increased employment and investment. To qualify for the reduction, employers would have to add at least six employees or invest at least $\$ 90,000$ in new plants or equipment. Philadelphia Electric said that the proposed plan would not result in rate increases for other customers.

## IUE revises its name

In a move to "fit the times," the International Union of Electrical, Radio and Machine Workers, AFL-CIO, clc, changed its name to the International Union of Electronic, Electrical, Technical, Salaried and Machine Workers, AFLcıo. Union President William H. Bywater said, "This gives IUE a name appropriate to its present makeup, its mission and its future. IUE has strong roots in each of the five segments of industry identified in the new name. We intend to organize in all of those areas, including high tech, professional and salaried workers."
The word "Radio" was dropped from the title because "no IUEer"- or any American worker-produces home
radio receivers for the consumer market; "CLC" was dropped because the IUE is no longer directly affiliated with the Canadian Labour Congress.

## Grain Millers elect new president

Delegates to the Grain Millers biennial convention elected Robert Willis as the union's new president and Larry R. Jackson as the new secretary-treasurer. Willis had been the union's executive vice president, and Jackson had been a vice president.
The new officers succeeded President Frank T. Hoese and secretary-treasurer Joseph T. Smisek who retired after one term of office following long careers in other leadership jobs in the union.

## Buoy retires as head of Boilermakers

Harold J. Buoy retired as president of the Boilermakers, fulfilling a promise he made more than 10 years earlier, following a heart attack, to retire at age 62. Charles W. Jones was selected by the union's executive council to complete Buoy's term of office, which ends in August 1984.
During his career, Buoy held a number of posts, culminating in appointment as president in 1970, followed by election to succeeding terms. Jones joined the union in 1942, was selected as a district representative in 1947, and became a vice president in 1960.

## Book Reviews

## A beginning

## Industrial Relations and Health Services. Edited by Amarjit Singh Sethi and Stuart J. Dimmock. New York, St. Martin's Press, 1982. 370 pp. $\$ 35$.

The papers assembled in this volume achieve the limited goal set by the editors: identifying and examining some of the major elements of the landscape of industrial relations in the health services industry in Canada, the United States, and Great Britain. Relying on contributions by nearly two dozen professionals and academicians to supplement their own papers, the editors relate the development of health services industrial relations from the end of World War II through the early 1980's. Referring to John Dunlop's concept that industrial relations is one of several systems in the wider system of society, the editors trace the development of the health services industrial relations system on several parallels in each of the three countries. The treatment of the system in Canada, however, often unravels into a province-by-province examination so that the three countries at times seem to have quadrupled. While very thorough, the editors might have served the reader better through selected examination of provincial variations. The editors' reliance upon separate papers on similar aspects of the same subject also becomes tedious, as each contributor presents a full treatment of his or her topic. This results in repetition of general history, organizational development, and political aspects.

The editors acknowledge that the reader may feel a lack of analysis, application, and verification of theories, of insight, and of direction. But they note that there is very little literature on this aspect of industrial relations and that one has to start somewhere. Their hope is that this work will serve as a foundation for the evolution of more theory and analysis through future works in this field. While the editors succeed in their modest goal, they might well have been more ambitious in designing their work and in considering the contributions. The sheer speed of events in this field, recognized by the editors, calls into question the limited purpose of this work.

Although not identified as major issues in the text, significant forces receive continuing attention. The relative
imbalance of power between employees and employers, for example, is seen to have shaped the development of bargaining and benefits in the health services industry. Wages in this industry have risen more slowly than have wages for similar work in other industries in all three countries. An outstanding exception, however, is illustrated in the pay of physicians, the least organized (that is, unionized), but most powerful group of health care "workers." Various contributors to the book discuss the physicians' success not only in maintaining high levels of income but in exerting substantial influence on the management and structure of their health care systems and institutions.

The structure of the organizations representing the labor force in the health services industry also receives consideration from several authors. First, they recognize uncertainty in some of the labor organizations as to whether they will emphasize, for example, the dignity of the profession or the dollars in the paychecks. This uncertainty of purpose is seen as inhibiting the growth and success of many labor organizations, but in differing ways and extents in the three countries. Second, the writers depict inherent organizational development problems in the unions. Issues such as centralized or decentralized policymaking and membership service, exclusivity of membership, competition with other unions, and availability of technical competence of union staff are pointed out as needing improvement.

The growth of public financial support of health services in each country is also shown to have exerted decisive influences on the shape and direction of the industrial relations structures. This factor, the papers suggest, likely will become more significant in the future as health care becomes more advanced and more costly. This will raise considerations of different mixes of the work force within the elasticity of the health services labor supply. In turn, this may require management and labor to join together in securing funding and in maintaining viability of their facility.

The editors note that these and other issues generally are referred to as "problems'" in all three countries. The editors trace such nomenclature to the roots of adversarial labor relations systems common to industrial societies. These factors, at once the basis of and the challenge to the system
as seen through the collected papers, foreshadow what underlying potential the work may yield: analysis of the system's future course. The editors arduously avoid such analysis, however, leaving the task to the reader and to future authors. Yet, the book's historical tracking of the political, organizational, and economic influences does afford some tools with which to consider the current juncture. The comparisons among the three countries allow the reader to review evolved actions and consequences in a particular subtopic from one country to another. The latter portions of the work suggest that the outcome could be guided, if not determined, by conscious choices of the industrial relations practitioners, governmental bodies, economic policymakers, and other leaders in the industrial relations system and in the wider societal system. Some contributors briefly suggest that new forms of labor-management adjustment might better serve this industrial relations system. One such approach, cooperative labor-management, is credited with the potential to preserve the give-and-take of collective bargaining while promoting more constructive and productive relationships. Consideration of alternatives for the problems identified in the health services industrial relations system is brief, however, and comes only as an inadvertent postscript in the editors' scheme.

## Management by objectives

The Productivity Prescription: The Manager's Guide to Improving Productivity and Profits. By David Bain. New York, McGraw-Hill Book Co., 1982. 308 pp. \$19.95.
The jacket proclaims that this book is "just what the doctor ordered" for the manager eager to improve his firm's "production, service, quality, and profit." The doctor is obviously a house doctor. An independent colleague asked to render a second opinion could not unreservedly endorse the proffered "prescription." While conceding potential benefits to the manager, he would also want to warn against some doubtful ingredients that threaten harmful side effects.

The book supports many notions that productivity scholars generally have no opportunity to propagate broadly under the aegis of a prestigious commercial publisher. For example, the book soundly insists on the importance of performance measurement for any systematic program to improve individual and organizational accomplishment. It also recognizes that a mental construct such as productivity has attributes that may elude adequate reflection in a single numerical ratio. It emphasizes that, even without significant
new capital investment or technological advance, substantial gains in performance are achievable through the enlistment and proper reward of employee cooperation. It forthrightly assigns to management the responsibility for modification of employee attitudes and behavior in behalf of greater quantity and quality of output and lower unit production cost. Brief chapter summaries tend to neutralize the turgidity of the text and may encourage careful selective rereading. Also included are informative "case histories" (part 6) in which the author apparently played a decisive role.

A reviewer already immersed in the mainstream of professional thought and practice concerning productivity would also find, and could not conscientiously ignore, some misleading statements and other limitations. The guidance given for measurement is sketchy, the bibliography (pp. 299-300) is meager and unrepresentative, and the description of the Bureau of Labor Statistics' procedures of productivity measurement (pp. 53,55) gives no idea of the true scope of the program. More troubling is the book's penchant for fuzzy or incorrect definition. Note, for example, the pseudomathematical statement that "quality" is "what is wanted + when it is needed," or "accuracy + timeliness." If quality is so described, then it merely involves attributes that should be routinely and directly taken into account in the measurement of the output numerator of the productivity ratio.

The book's confusion concerning the meaning of productivity itself is more serious. The first section of the opening chapter is headed "Productivity-What It Is and What It Is Not," but it seems to prefer a definition of what productivity surely is not. That section starts with a ratio of "output" to "input," restates this ratio as "results achieved/ resources consumed," and leaps to an absurd formulation that is supposedly equivalent and good enough to repeat later in the book (for example, on p. 51): "effectiveness/ efficiency."

This flaw in the treatment of productivity is not the only one. The discussion fails to specify that both output and input should preferably be measured in "real" terms-as "quantities" expressed in natural units or as aggregates with stabilized price or other weights. The author incorrectly implies that economists favor confinement of attention to labor productivity as a matter of definition (p. 4) rather than for other reasons. Nowhere does the author note the challenge of defining and measuring the input of capital services. Indeed, he mislabels combinations of labor and materials as indicators of "total input" (pp. 70-74); and he mistakenly says that a financial "rate of return on total assets", corresponds to an organization's "total factor productivity" (p. 56). Another error is to regard measures of unit labor cost (p. 57) and unit production cost (p. 5) as more precise indicators of productivity rather than as distinct measures in their own right. That the author does not conform to his own definitions in citing examples of company "productivity indicators" (chapter 11), is not surprising.

Two concluding remarks are in order. First, the author's success in helping firms improve productivity testifies to the essentiality of managerial commitment rather than to the clarity and accuracy of the concepts and measures that he utilized-or that he cites in the book. The experience of consultants at company and plant levels confirms that crude, even incorrect, and vaguely relevant statistical tools can assist, and need not frustrate, determined drives to upgrade productivity. Second, the author's references to work measurement (to comparisons of "should-take" and "did-take"" times for performing certain tasks) ought to remind productivity scholars of a need to harmonize this common intracompany practice with their own practice of end-product measurement at and above the four-digit industry level. In principle, at least, end products can be described as combinations of "subproducts" of the kind treated in work measurement. Progress made in this direction could lead to (1) better productivity measures for nonmanufacturing industries and (2) better comparisons of plant and company performance against industry averages.

## NOTES ON CURRENT LABOR STATISTICS

This section of the Review presents the principal statistical series collected and calculated by the Bureau of Labor Statistics. A brief introduction to each group of tables provides definitions, notes on the data, sources, and other material usually found in footnotes.

Readers who need additional information are invited to consult the BLS regional offices listed on the inside front cover of this issue of the Review. Some general notes applicable to several series are given below.

Seasonal adjustment. Certain monthly and quarterly data are adjusted to eliminate the effect of such factors as climatic conditions. industry production schedules, opening and closing of schools. holiday buying periods. and vacation practices, which might otherwise mask short-term movements of the statistical series. Tables containing these data are identified as "seasonally adjusted." Seasonal effects are estimated on the basis of past experience. When new seasonal factors are computed each year, revisions may affect seasonally adjusted data for several preceding years.

Seasonally adjusted tabor force data in tables 3-8 were revised in the February 1983 issue of the Revien', to reflect experience through 1982.

Beginning in January 1980, the BLS introduced two major modifications in the seasonal adjustment methodology for labor force data. First, the data are being seasonally adjusted with a new procedure called X-11/ ARIMA, which was developed at Statistics Canada as an extension of the standard X-11 method. A detailed description of the procedure appears in The X-II ARIMA Seasonal Adjustment Method by Estela Bee Dagum (Statistics Canada Catalogue No. 12-564E, February 1980). The second change is that seasonal factors are now being calculated for use during the first 6 months of the year, rather than for the entire year, and then are calculated at mid-year for the July-December period. Revisions of historical data continue to be made only at the end of each calendar year.

Annual revision of the seasonally adjusted payroll data shown in tables 11,13 , and 15 were made in August 1981 using the X-11 ARIMA seasonal adjustment methodology. New seasonal factors for productivity data in tables 29 and 30 are usually introduced in the September issue. Seasonally adjusted indexes and percent changes from month to month and from quarter to quarter are published for numerous Consumer and Producer

Price Index series. However, seasonally adjusted indexes are not published for the U.S. average All Items CPI. Only seasonally adjusted percent changes are available for this series.

Adjustments for price changes. Some data are adjusted to eliminate the effect of changes in price. These adjustments are made by dividing current dollar values by the Consumer Price Index or the appropriate component of the index, then multiplying by 100 . For example, given a current hourly wage rate of $\$ 3$ and a current price index number of 150 . where $1967=100$. the hourly rate expressed in 1967 dollars is $\$ 2(\$ 3 / 150 \times 100=\$ 2)$. The resulting values are described as "real. ${ }^{*}$ "constant." or " 1967 " dollars.

Availability of information. Data that supplement the tables in this section are published by the Bureau of Labor Statistics in a variety of sources. Press releases provide the latest statistical information published by the Bureau; the major recurring releases are published according to the schedule given below. More information from household and establishment surveys is provided in Employment and Earnings, a monthly publication of the Bureau. Comparable household information is published in a two-volume data book-Labor Force Statistics Derived From the Current Population Survey, Bulletin 2096. Comparable establishment information appears in two data books-Employment and Earnings. United States, and Employment and Earnings. States and Areas, and their annual supplements. More detailed information on wages and other aspects of collective bargaining appears in the monthly periodical, Current Wage Developments. More detailed price information is published each month in the periodicals, the CPI Detailed Report and Producer Prices and Price Indexes.

## Symbols

$\mathrm{p}=$ preliminary. To improve the timeliness of some series, preliminary figures are issued based on representative but incomplete returns.
$r=$ revised. Generally, this revision reflects the availability of later data but may also reflect other adjustments.
n.e.c. $=$ not elsewhere classified.

| U.S. Import and Export Price Indexes |  |  |  |  | November 9 | 3rd quarter |  |

## EMPLOYMENT DATA FROM THE HOUSEHOLD SURVEY

Employment data in this section are obtained from the Current Population Survey, a program of personal interviews conducted monthly by the Bureau of the Census for the Bureau of Labor Statistics. The sample consists of about 60,000 households selected to represent the U.S population 16 years of age and older. Households are interviewed on a rotating basis, so that three-fourths of the sample is the same for any 2 consecutive months.

## Definitions

Employed persons include (1) all civilians who worked for pay any time during the week which includes the 12th day of the month or who worked unpaid for 15 hours or more in a family-operated enterprise and (2) those who were temporarily absent from their regular jobs because of illness, vacation, industrial dispute, or similar reasons. Members of the Armed Forces stationed in the United States are also included in the employed total. A person working at more than one job is counted only in the job at which he or she worked the greatest number of hours.

Unemployed persons are those who did not work during the survey week, but were available for work except for temporary illness and had looked for jobs within the preceding 4 weeks. Persons who did not look for work because they were on layoff or waiting to start new jobs within the next 30 days are also counted among the unemployed. The overall unemployment rate represents the number unemployed as a percent of the labor force, including the resident Armed Forces. The unemployment
rate for all civilian workers represents the number unemployed as a percent of the civilian labor force.

The labor force consists of all employed or unemployed civilians plus members of the Armed Forces stationed in the United States. Persons not in the labor force are those not classified as employed or unemployed; this group includes persons who are retired, those engaged in their own housework, those not working while attending school, those unable to work because of long-term illness, those discouraged from seeking work because of personal or job market factors, and those who are voluntarily idle. The noninstitutional population comprises all persons 16 years of age and older who are not inmates of penal or mental institutions, sanitariums, or homes for the aged, infirm, or needy, and members of the Armed Forces stationed in the United States. The labor force participation rate is the proportion of the noninstitutional population that is in the labor force. The employment-population ratio is total employment (including the resident Armed Forces) as a percent of the noninstitutional population.

## Notes on the data

From time to time, and especially after a decennial census, adjustments are made in the Current Population Survey figures to correct for estimating errors during the preceding years. These adjustments affect the comparability of historical data presented in table 1. A description of these adjustments and their effect on the various data series appear in the Explanatory Notes of Employment and Earnings.

Data in tables 2-8 are seasonally adjusted, based on the seasonal experience through December 1982

1. Employment status of the noninstitutional population, 16 years and over, selected years, 1950-82

| Median duration in weeks | 6.9 | 8.7 | 8.3 | 8.3 | 9.4 | 9.6 | 10.0 | 10.1 | 11.5 | 9.6 | 10.3 | 11.3 | 12.3 | 11.8 | 9.9 |

EmpLOYMENT, HOURS, AND EARNINGS DATA in this section are compiled from payroll records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies by 189,000 establishments representing all industries except agriculture. In most industries, the sampling probabilities are based on the size of the establishment; most large establishments are therefore in the sample. (An establishment is not necessarily a firm; it may be a branch plant, for example, or warehouse.) Selfemployed persons and others not on a regular civilian payroll are outside the scope of the survey because they are excluded from establishment records. This largely accounts for the difference in employment figures between the household and establishment surveys.

## Definitions

Employed persons are all persons who received pay (including holiday and sick pay) for any part of the payroll period including the 12 th of the month. Persons holding more than one job (about 5 percent of all persons in the labor force) are counted in each establishment which reports them.

Production workers in manufacturing include blue-collar worker supervisors and all nonsupervisory workers closely associated with production operations. Those workers mentioned in tables 12-17 include production workers in manufacturing and mining; construction workers in construction; and nonsupervisory workers in transportation and public utilities; in wholesale and retail trade; in finance, insurance, and real estate; and in services industries. These groups account for about four-fifths of the total employment on private nonagricultural payrolls.

Earnings are the payments production or nonsupervisory workers receive during the survey period, including premium pay for overtime or late-shift work but excluding irregular bonuses and other special payments. Real earnings are earnings adjusted to reflect the effects of changes in consumer prices. The deflator for this series is derived from the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W). The Hourly Earnings Index is calculated from average hourly earnings data adjusted to exclude the effects of two types of changes that are unrelated
to underlying wage-rate developments: fluctuations in overtime premiums in manufacturing (the only sector for which overtime data are available) and the effects of changes and seasonal factors in the proportion of workers in high-wage and low-wage industries.

Hours represent the average weekly hours of production or nonsupervisory workers for which pay was received and are different from standard or scheduled hours. Overtime hours represent the portion of gross average weekly hours which were in excess of regular hours and for which overtime premiums were paid.

The Diffusion Index, introduced in table 17 of the May issue, represents the percent of 186 nonagricultural industries in which employment was rising over the indicated period. One-half of the industries with unchanged employment are counted as rising. In line with Bureau practice, data for the $3-, 6$-, and 9 -month spans are seasonally adjusted, while that for the 12 -month span is unadjusted. The diffusion index is useful for measuring the dispersion of economic gains or losses and is also an economic indicator.

## Notes on the data

Establishment data collected by the Bureau of Labor Statistics are periodically adjusted to comprehensive counts of employment (called "benchmarks"). The latest complete adjustment was made with the release of May 1983 data, published in the July 1983 issue of the Review. Consequently, data published in the Review prior to that issue are not necessarily comparable to current data. Earlier comparable unadjusted and seasonally adjusted data are published in a Supplement to Employment and Earnings (unadjusted data from April 1977 through February 1983 and seasonally adjusted data from January 1974 through February 1983) and in Employment and Earnings, United States, 1909-78, BLS Bulletin 1312-11 (for prior periods).

A comprehensive discussion of the differences between household and establishment data on employment appears in Gloria P. Green, "Comparing employment estimates from household and payroll surveys," Monthly Labor Review, December 1969, pp. 9-20. See also BLS Handbook of Methods for Surveys and Studies, Bulletin 1910 (Bureau of Labor Statistics, 1976).

NOTE: Figures are the percent of industries with employment rising. (Half of the unchanged components
are counted as rising.) Data are centered within the spans. See the "Definitions" in this section.

## UNEMPLOYMENT INSURANCE DATA

NATIONAL UNEMPLOYMENT INSURANCE DATA are compiled monthly by the Employment and Training Administration of the U.S. Department of Labor from monthly reports of unemployment insurance activity prepared by State agencies. Railroad unemployment insurance data are prepared by the U.S. Railroad Retirement Board.

## Definitions

Data for all programs represent an unduplicated count of insured unemployment under State programs, Unemployment Compensation for ExServicemen, and Unemployment Compensation for Federal Employees, and the Railroad Insurance Act.

Under both State and Federal unemployment insurance programs for civilian employees, insured workers must report the completion of at least I week of unemployment before they are defined as unemployed. Persons not covered by unemployment insurance (about 10 percent of the labor force) and those who have exhausted or not yet earned benefit rights are excluded from the scope of the survey. Initial claims are notices filed by
persons in unemployment insurance programs to indicate they are out of work and wish to begin receiving compensation. A claimant who continued to be unemployed a full week is then counted in the insured unemployment figure. The rate of insured unemployment expresses the number of insured unemployed as a percent of the average insured employment in a 12 -month period.

Average weekly seasonally adjusted insured unemployment data are computed by BLS' Weekly Seasonal Adjustment program. This procedure incorporated the X-11 Variant of the Census Method II Seasonal Adjustment program.

An application for benefits is filed by a railroad worker at the beginning of his first period of unemployment in a benefit year; no application is required for subsequent periods in the same year. Number of payments are payments made in 14-day registration periods. The average amount of benefit payment is an average for all compensable periods, not adjusted for recovery of overpayments or settlement of underpayments. However, total benefits paid have been adjusted.

## PRICE DATA

Price data are gathered by the Bureau of Labor Statistics from retail and primary markets in the United States. Price indexes are given in relation to a base period ( $1967=100$, unless otherwise noted).

## Definitions

The Consumer Price Index is a monthly statistical measure of the average change in prices in a fixed market basket of goods and services. Effective with the January 1978 index, the Bureau of Labor Statistics began publishing CPI's for two groups of the population. It introduced a CPI for All Urban Consumers, covering 80 percent of the total noninstitutional population, and revised the CPI for Urban Wage Earners and Clerical Workers, covering about half the new index population. The All Urban Consumers index covers in addition to wage earners and clerical workers, professional, managerial, and technical workers, the self-employed, short-term workers, the unemployed, retirees, and others not in the labor force.

The CPI is based on prices of food, clothing, shelter, fuel, drugs, transportation fares, doctors' and dentists' fees, and other goods and services that people buy for day-to-day living. The quantity and quality of these items is kept essentially unchanged between major revisions so that only price changes will be measured. Data are collected from more than 24,000 retail establishments and 24,000 tenants in 85 urban areas across the country. All taxes directly associated with the purchase and use of items are included in the index. Because the CPI's are based on the expenditures of two population groups in 1972-73, they may not accurately reflect the experience of individual families and single persons with different buying habits.

Though the CPI is often called the "Cost-of-Living Index," it measures only price change, which is just one of several important factors affecting living costs. Area indexes do not measure differences in the level of prices among cities. They only measure the average change in prices for each area since the base period.

Producer Price Indexes measure average changes in prices received in primary markets of the United States by products of commodities in all stages of processing. The sample used for calculating these indexes contains about 2,800 commodities and about 10,000 quotations per month selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage of processing structure organizes products by degree of fabrication (that is, finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States. from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Most prices are obtained directly from producing companies on a voluntary and confidential basis. Prices generally are reported for the Tuesday of the week containing the 13 th day of the month.

In calculating Producer Price Indexes. price changes for the various commodities are averaged together with implicit quantity weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage of processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings.

Price indexes for the output of selected SIC industries measure average price changes in commodities produced by particular industries, as defined in the Standard Industrial Classification Manual 1972 (Washington, U.S. Office of Management and Budget, 1972). These indexes are derived from several price series, combined to match the economic activity of the specified industry and weighted by the value of shipments in the industry. They use data from comprehensive industrial censuses conducted by the U.S. Bureau of the Census and the U.S. Department of Agriculture.

## Notes on the data

Regional CPI's cross classified by population size were introduced in the May 1978 Review. These indexes enable users in local areas for which an index is not published to get a better approximation of the CPI for their area by using the appropriate population size class measure for their region. The cross-classified indexes are published bimonthly. (See table 20.)

For details concerning the 1978 revision of the CPI, see The Consumer Price Index: Concepts and Content Over the Years, Report 517, revised edition (Bureau of Labor Statistics, May 1978).

As of January 1976, the Producer Price Index incorporated a revised weighting structure reflecting 1972 values of shipments.

Additional data and analyses of price changes are provided in the CPI Detailed Report and Producer Prices and Price Indexes, both monthly publications of the Bureau.

For a discussion of the general method of computing producer, and industry price indexes, see BLS Handbook of Methods, Bulletin 2134-1 (Bureau of Labor Statistics, 1982), chapter 7. For consumer prices, see BLS Handbook of Methods for Surveys and Studies (1976), chapter 13. See also John F. Early, "Improving the measurement of producer price change," Monthly Labor Review, April 1978. For industry prices, see also Bennett R. Moss, "Industry and Sector Price Indexes," Monthly Labor Review, August 1965.

[^19]
## PRODUCTIVITY DATA

Productivity data are compiled by the Bureau of Labor Statistics from establishment data and from estimates of compensation and output supplied by the U.S. Department of Commerce and the Federal Reserve Board.

## Definitions

Output is the constant dollar gross domestic product produced in a given period. Indexes of output per hour of labor input, or labor productivity, measure the value of goods and services produced per hour of labor. Compensation per hour includes wages and salaries of employees plus employers' contributions for social insurance and private benefit plants. The data also include an estimate of wages, salaries, and supplementary payments for the self-employed, except for nonfinancial corporations, in which there are no self-employed. Real compensation per hour is compensation per hour adjusted by the Consumer Price Index for All Urban Consumers.

Unit labor cost measures the labor compensation cost required to produce one unit of output and is derived by dividing compensation by output. Unit nonlabor payments include profits, depreciation, interest, and indirect taxes per unit of output. They are computed by subtracting compensation of all persons from the current dollar gross domestic product and dividing by output. In these tables, unit nonlabor costs contain all
the components of unit nonlabor payments except unit profits. Unit profits include corporate profits and inventory valuation adjustments per unit of output.

The implicit price deflator is derived by dividing the current dollar estimate of gross product by the constant dollar estimate, making the deflator, in effect, a price index for gross product of the sector reported.

Hours of all persons describes the labor input of payroll workers, selfemployed persons, and unpaid family workers. Output per all employee hour describes labor productivity in nonfinancial corporations where there are no self-employed.

## Notes on the data

In the business sector and the nonfarm business sector, the basis for the output measure employed in the computation of output per hour is Gross Domestic Product rather than Gross National Product. Computation of hours includes estimates of nonfarm and farm proprietor hours.

Output data are supplied by the Bureau of Economic Analysis, U.S. Department of Commerce, and the Federal Reserve Board. Quarterly manufacturing output indexes are adjusted by the Bureau of Labor Statistics to annual estimates of output (gross product originating) from the Bureau of Economic Analysis. Compensation and hours data are from the Bureau of Economic Analysis and the Bureau of Labor Statistics.

## WAGE AND COMPENSATION DATA

DATA FOR THE EMPLOYMENT COST Index are reported to the Bureau of Labor Statistics by a sample of 2,000 private nonfarm establishments and 750 State and local government units selected to represent total employment in those sectors. On average, each reporting unit provides wage and compensation information on five well-specified occupations.

Data on negotiated wage and benefit changes are obtained from contracts on file at the Bureau, direct contact with the parties, and secondary sources.

## Definitions

The Employment Cost Index (ECI) is a quarterly measure of the average change in the cost of employing labor. The rate of total compensation, which comprises wages, salaries, and employer costs for employee benefits, is collected for workers performing specified tasks. Employment in each occupation is held constant over time for all series produced in the ECI, except those by region, bargaining status, and area. As a consequence, only changes in compensation are measured. Industry and occupational employment data from the 1970 Census of Population are used in deriving constant weights for the ECI. While holding total industry and occupational employment fixed, in the estimation of indexes by region, bargaining status, and area, the employment in those measures is allowed to vary over time in accord with changes in the sample. The rate of change (in percent) is available for wages and salaries, as well as for total compensation. Data are collected for the pay period including the 12 th day of the survey months of March, June, September, and December. The statistics are neither annualized nor adjusted for seasonal influence.

Wages and salaries consist of earnings before payroll deductions, excluding premium pay for overtime, work on weekends and holidays, and shift differentials. Production bonuses, incentive earnings, commissions, and cost-of-living adjustments are included; nonproduction bonuses are included with other supplemental pay items in the benefits category; and payments-in-kind, free room and board, and tips are excluded. Benefits include supplemental pay, insurance, retirement and savings plans, and hours-related and legally required benefits.

Data on negotiated wage changes apply to private nonfarm industry collective bargaining agreements covering 1,000 workers or more. Data on compensation changes apply only to those agreements covering 5,000 workers or more. First-year wage or compensation changes refer to average negotiated changes for workers covered by settlements reached in the period
and implemented within the first 12 months after the effective date of the agreement. Changes over the life of the agreement refer to all adjustments specified in the contract, expressed as an average annual rate. These measures exclude wage changes that may occur under cost-of-living adjustment clauses, that are triggered by movements in the Consumer Price Index. Wage-rate changes are expressed as a percent of straight-time hourly earnings; compensation changes are expressed as a percent of total wages and benefits.

Effective wage adjustments reflect all negotiated changes implemented in the reference period, regardless of the settlement date. They include changes from settlements reached during the period, changes deferred from contracts negotiated in an earlier period, and cost-of-living adjustments. The data also reflect contracts providing for no wage adjustment in the period. Effective adjustments and each of their components are prorated over all workers in bargaining units with at least 1,000 workers.

## Notes on the data

The Employment Cost Index data series began in the fourth quarter of 1975, with the quarterly percent change in wages and salaries in the private nonfarm sector. Data on employer costs for employee benefits were included in 1980, to produce a measure of the percent change in employers' cost for employees' total compensation. State and local government units were added to the ECI coverage in 1981, providing a measure of total compensation change in the civilian nonfarm economy.

Data for the broad white-collar, blue-collar, and service worker groups, and the manufacturing, nonmanufacturing, and service industry groups are presented in the ECI. Additional occupation and industry detail are provided for the wages and salaries component of total compensation in the private nonfarm sector. For State and local government units, additional industry detail is shown for both total compensation and its wages and salaries component.
Historical indexes (June $1981=100$ ) of the quarterly rates of changes presented in the ECI are also available.

For a more detailed discussion of the ECI, see chapter 11, "The Employment Cost Index," of the BLS Handbook of Methods (Bulletin 21341), and the Monthly Labor Review articles: "Employment Cost Index: a measure of change in the 'price of labor,',' July 1975; "How benefits will be incorporated into the Employment Cost Index," January 1978; and "The Employment Cost Index: recent trends and expansion," May 1982.

Additional data for the ECI and other measures of wage and compensation changes appear in Current Wage Developments, a monthly publication of the Bureau.

| From cost-of-living clauses | 2.4 | 3.1 | 2.8 | 3.2 | 1.4 | 1.2 | . 6 | .3 | 2 | . 6 | . 3 | . 1 | . 1 |
| Total number of workers receiving wage change (in thousands) ${ }^{1}$ | - | - | - | 8.648 | 7.852 | 4.364 | 3.225 | 2.878 | 3,423 | 3,760 | 3,441 | 3.030 | 3,108 |
| From settlements reached in period | - | - | - | 2,270 | 1,907 | 540 | 604 | 204 | 511 | 620 | 825 | 434 | 454 |
| Deferred from settlements reached in earlier period | - | - | - | 6,267 | 4,846 | 3,023 | 882 | 1,001 | 1,594 | 2,400 | 860 | 848 | 1,446 |
| From cost-of-living clauses | - | - | - | 4,593 | 3.830 | 2,934 | 2.179 | 1,920 | 1,568 | 2,251 | 1,970 | 2,075 | 1,395 |
| Number of workers receiving no adjustments (in thousands) | - | - | - | 145 | 483 | 4,428 | 5,568 | 5.457 | 4.912 | 4,575 | 4,895 | 5,085 | 5,007 |

${ }^{1}$ The total number of workers who received adjustments does not equal the sum of workers that received each type of adjustment, because some workers received more than one type of adjustment during the period.

Work stoppages include all known strikes or lockouts involving 1,000 workers or more and lasting a full shift or longer. Data are based largely on newspaper accounts and cover all workers idle one shift or more in establishments directly involved in a stoppage. They do not measure the indirect or secondary effect on other establishments whose employees are idle owing to material or service shortages.

Estimates of days idle as a percent of estimated working time measures only the impact of larger strikes ( 1,000 workers or more). Formerly, these estimates measured the impact of strikes involving 6 workers or more; that is, the impact of virtually all strikes. Due to budget stringencies, collection of data on strikes involving fewer than 1,000 workers was discontinued with the December 1981 data.
37. Work stoppages involving 1,000 workers or more, 1947 to date

[^1]:    Roger C. Jensen, Bruce P. Klein, and Lee M. Sanderson are with the U.S. Public Health Service's National Institute for Occupational Safety and Health, Division of Safety Research, Morgantown, W.Va.

[^2]:    James D. York is an economist in the Division of Industry Productivity Studies, Bureau of Labor Statistics.

[^3]:    David Callahan, Douglass Robertson, and Lorie Scheibel are economists in the Office of Prices and Living Conditions, Bureau of Labor Statistics.

[^4]:    ${ }^{1}$ Data are not seasonally adjusted
    ${ }^{2}$ Data are not available.

[^5]:    ${ }^{1}$ Beginning in January 1983, the CPI-U used an improved method based on rental equivalence to measure homeowners costs. The rental equivalence approach calculates homeowner costs of the shelter based on the implicit rent owners would have to pay to rent the homes they occupy. The CPI-U which used the asset approach to homeownership (old series), showed a 2.5 percent annual rate of increase after seasonal adjustment.

[^6]:    Gary Johnston is a farm adviser for the University of California Cooperative Extension in Fresno, and Philip L. Martin is associate professor of agricultural economics at the University of California. Davis.

[^7]:    1 Employers with locations in several regions.
    ${ }^{2}$ Los Angeles, San Bernardino, Orange, Riverside, Imperial counties
    3 Ventura, Santa Barbara, San Luis Obispo counties.
    ${ }^{4}$ Monterey, San Benito, Santa Cruz, Santa Clara, San Mateo, Alameda, Contra Costa counties.

[^8]:    "Developments in Industrial Relations" is prepared by George Ruben of the Division of Developments in Labor-Management Relations, Bureau of Labor Statistics, and is largely based on information from secondary sources.

[^9]:    ${ }^{1}$ The population and Armed Forces figures are not adjusted for seasonal variation.
    ${ }^{2}$ Includes members of the Armed Forces stationed in the United States.
    ${ }^{3}$ Labor force as a percent of the noninstitutional population.

[^10]:    1 The population figures are not seasonally adjusted.
    ${ }^{2}$ Civilian employment as a percent of the civilian noninstitutional population.

[^11]:    NOTE: Detail for the above race and Hispanic-origin groups will not sum to totals because data for the "other races" groups are not presented and Hispanics are included in both the white and black population groups

[^12]:    ${ }^{1}$ This series is not seasonally adjusted because the seasonal component is small relative to the trendcycle, irregular components, or both, and consequently cannot be separated with sufficient precision.

[^13]:    ${ }^{1}$ Initial claims and State insured unemployment include data under the program for Puerto Rican sugarcane workers.
    ${ }^{2}$ Excludes transition claims under State programs.
    ${ }^{3}$ Excludes data on claims and payments made jointly with other programs.
    ${ }^{4}$ Excludes data or claims and payments made jointly with State programs.

[^14]:    See footnotes at end of table

[^15]:    ${ }^{1}$ Excludes motor oil, coolant, and other products as of January 1983
    ${ }^{2}$ See box with "Price Data.

[^16]:    The areas listed include not only the central city but the entire portion of the Standard Metropolitan
    Statistical Area, as defined for the 1970 Census of Population, except that the Standard Consolidated
    Area is used for New York and Chicago
    ${ }^{2}$ Average of 85 cities

[^17]:    See footnotes at end of table

[^18]:    ${ }^{4}$ Most prices for refined petroleum products are lagged 1 month．
    ${ }^{5}$ Some prices for industrial chemicals are lagged 1 month
    $\mathrm{r}=\mathrm{revised}$ ．

[^19]:    NOTE：Indexes which were deleted in the September issue may now be found in Table 4 of the BLS monthly report，Producer Prices and Price Indexes．

[^20]:    ${ }^{1}$ Not available.

[^21]:    $r=$ revised

[^22]:    ${ }^{1}$ Excludes farm, household, and Federal workers.

[^23]:    Excludes farm, household, and Federal workers.
    ${ }^{2}$ Consists of legislative, judicial, administrative, and regulatory activities.
