### RAIL BONDS.

Many readers know the general fact that electricity refuses to go from one point to another unless it can return; that is, it insists upon a circuit. The substance of which the return path consists may be of poor conductivity, or of insufficient size, or of imperfect continuity; but the current gets through somehow, always choosing the path of least resistance, which, electrically speaking, is always the shortest way. Put sufficient pressure behind the current and it will overleap a gap just as a running jump may carry a man over one which he could not cover from a stand. But if the path is difficult, either by the nature of the material or by the insufficient size of the conductor, or because there are some little gaps like cracks across (thus furnishing miniature chasms), there is a hindrance, and heat is produced. A current with a heavy pressure will quickly burn out a wire which is very much too small. The fact that a spot of imperfect conductivity makes an "arc," is utilized to produce electric light; the same fact that interrupted conductivity is a disturbance, sets up the destructive process called electrolysis where the conditions favor that; the same principle is utilized to great profit in many electro-chemical industries—somewhat as friction, always inevitable and always opposed as an enemy, is really an indispensable aid in other aspects.

In the case of electric railroads, the necessary return path is obtained by using the rails. But the rail, while making up measurably in size what it lacks in conductivity, has joints, and these joints must be bridged by some

connection. The connecting link is called a bond. As copper has seven times the conductivity of a steel rail of the same section, it is the material employed. Copper wires, twisted into the form of rope or cable, and with solid ends or studs which are fastened into holes in the ends of the rails, are used for this purpose. Instead of jumping across the rail joints, as it might do if the pressure (which would then be equivalent to a great waste of power) were sufficient to force it, the current leaves the rail for the copper and goes around the joint, returning to the rail on the other side. There must be ample conductivity in the bond itself. There must be a close contact between bond and rail, without danger of electrolysis or of working loose. There must be enough elasticity to absorb the shocks which might gradually work the bond loose from the rail or even break it in two. There must also be protection for the bond from thieves, who would not hesitate to wrench it off and sell it for junk if it were so placed that they could get at it. These conditions must be met by a good bond.

One form of bond is made by casting into its terminal or knob-like end which enters the hole in the rail two hardened bronze plugs; when in place, a compressor tool forces these two opposite plugs a quarter inch towards each other, thus expanding the terminal within the hole and making it turn over like a rivet-head on the outside. Another pattern founds its especial claim on being a onepiece bond, the copper wire cable being bent over, and its ends being finally forced into the form of a short round knob by pressure in a die; the claim is that as the conductivity of drawn copper is greater than that of cast copper, this form is superior to any in which the terminal is a separate piece and attached, and also that where there is no joint there certainly cannot be an imperfect oue. Another-which claims to produce the needed perfect molecular union by fusing the terminals to the flexible portion—uses the term "protected" as its trade title, making a strong point of so placing its bond under the fish-plate which fastens the rails together that thieves cannot get at it. This pattern of bond is made in a great variety of forms to suit varying conditions, and among these forms is one with flat bands instead of round twisted wires; for this style the claim is made that it yields especially well to the expansion and contraction of the rails lengthwise.

making up measurably in size what it lacks in conductivity, has joints, and these joints must be bridged by some which the owner and non-owner of securities of electric

roads travel with probably no thought about it, is thus an article which involves practical questions. Its perfection or imperfection has much to do with the comparative efficiency of the operation and the conservation or the waste of power, all of which is sure to get into the financial results.

### IMPROVED TRACKLESS TROLLEYS.

of the trackless trolley lines in operation abroad and of the short one lately built in the town of Franklin, N. H. Since absence of the rails deprives the current of its usual return path through them, a second overhead wire and a second pole and trolley are necessary, the current coming in to the motor by one wire and trolley and returning by the other. There is an instance of employing two overhead wires for the complete circuit when tracks are used, but this will probably never become general, for there is some special awkwardness in keeping the trolleys on, as the cars do not maintain a fixed line and must turn out for one another.

Yet this is subject to improvement in mechanical details, and an interesting and practical improvement has already been devised which will soon be put in operation in some New England cities. The small clips or brackets which attach directly to the two parallel overhead wires are bent and face each other, so that the trolley wheels run on the inner and opposite surfaces of the wires instead of on the bottom; the contact is thus on the sides of the wires instead of underneath them, and these two contact sides of the two wires face each other. The trolley wheels are also placed horizontally at the ends of their poles instead of vertically, as usual, and they press outwardly against the inner sides of the pair of wires. This arrangement can be indicated graphically in this manner (o- -o). Here the letter o stands for each wire, seen in cross section, and the hyphen stands for the trolley wheel, placed horizontally, pressing outwardly against the wire and running on the side of it instead of on the bottom.

The result of this ingeniously contrived horizontal contact is that when the car leaves the position directly under the wires and goes to one or the other side the trolley wheels shift around to another portion of the surface of the wires and are not inclined to leave them. This flexibility is limited by the length of the poles. When they are of the usual length a car can go anywhere on a road of 20 to 22 feet in width and can wind its way around and among wagons.

Another device is intended to facilitate getting the trolley on the wire. The small yoke in which the small wheel is carried has an arm extending five or six inches vertically downward below the wheel, and the cord is attached to the end of this extension. By pulling on a third cord the conductor or motorman "pinches" the ends of the trolley poles towards each other and also elevates them until they are between the two wires; on releasing them they spread apart of themselves and come up against the wires about at haphazard. If the cords are against the wires (as they are likely to be) a simple pull downward brings the extensions against them and a further pull slides the grooved wheels into place on the wires. This is done almost automatically.

The device for switching the trolleys from one line to another is equally ingenious. Ordinarily, the track

switch turns the car and the trolley follows because the car pulls it; but the double trolley requires some special arrangement. Where a branch like a Y joins the main track at an angle, one wire at the exact place of junction has a short piece in it which is hinged like a gate and is held closed by a spring, so that the main line is continuous. When a car approaches from the branch to enter the main line, one trolley strikes this switch-gate and pushes it until its end makes contact with the opposite main line wire, while the other trolley rolls around the "corner"; when the trolleys have passed, the spring restores the gate to its former position. Over the main line in either direction, and from the branch into the main line, the arrangement works of itself, for going from the main line into the branch the gate must be opened by hand, although some further arrangement may perhaps make this unnecessary.

Even with the fact before us that the automobile has attained railroad speed and much more than regular railroad speed on broad and exceedingly good highways, it is not reasonable to suppose that high speed can ever be regularly had without tracks; hence the trackless trolley must remain limited to rather low speed and short lines. Yet this does not prohibit it from attaining great usefulness in pioneer and auxiliary service.

### ELECTRIC LOCOMOTIVES IN INDUSTRIAL SERVICE.

While the electric locomotive is awaiting the issue of its rivalry for the larger service, it is doing some subordinate work in freight hauling on small lines for private industrial uses; this is in some respects unlike the quite important business of the trolley as a merchandise carrier. A Berlin concern (Arthur Koppel) has been for six years past engaged in constructing these small machines and installations, which are in use at sugar works, glass works, cement works and many other industrial plants. The most interesting feature of these is their adaptability to circumstances and their semi-portable character. Accumulators have been used, but are not advisable except when the circumstances compel—for instance, in mines, where the emission of sparks at the contact between trolley and wire might be dangerous.

The usual overhead construction is followed, with a light wooden mast which carries a bracket; but there is an ingenious and more portable arrangement which sets up a U-shaped girder, inverted, with its ends fastened to an extra-long tie, which is placed under the rails and is held down by their weight. These little frames having been placed a few hundred feet apart, the feed wire is attached to the arch of the U; it is placed there by being unrolled from a wooden drum mounted on a special wagon, the wire unwinding (and being drawn to tension) as the wagon is pushed along the rails. These small engines are from four to twelve horse-power, and are worked over tracks laid without regard to grading down. On steep grades they are fitted with an electric brake which transforms the momentum into electric energy directed to the task of stoppage.

they are likely to be) a the extensions against locomotive of the mining type to haul coal and ashes for its power plant. The Hawaiian Electric Company (which must be interesting in industrial work) is using one to haul sugar cane from the plantations to the grinder. A larger one is in use on lumber trains at

Georgetown, S. C., by the Atlantic Coast Lumber Company. A still larger one, having eight wheels and two motors, is used by the Carnegie Steel Company to haul freight trains. Thus there seems to be some steady progress in development of electric power in this direction.

### AGGRESSIVENESS IN ELECTRIC ROADS.

The most interesting present process in electric rail-roading is its stretching out after distance—from being merely local street-surface roads becoming urban, then interurban, and so gradually growing in size, importance and aggressiveness. The electric locomotive may displace the steam one—that is a problem of effectiveness and economy, and any prediction of the result would be rash. It is an interesting course to watch, but the extension of electric roads per se is apparently a more advanced one.

From Springfield, Worcester, Providence, and Boston rather more than from New York, and from Indianapolis, Detroit, and Chicago more than in the East, passenger electric roads radiate for moderate distances. One can go (barring a few gaps here and there) between Boston and New York by trolley, and even as far as Chicago, and narratives of such trips have appeared in several periodicals, this appearance showing their pioneer charac-These trips are tourist and experimental, not travel-The fact that a series of little strips of track join each other over quite long distances does not make a through line. At the outset, it is evident that electric roads, mainly single-tracked and loosely laid on or closely along existing highways, following their grades and sharp curves, cannot constitute a railroad in the modern sense. They are interesting, often picturesquely attractive, and very useful locally; they render a valuable service, and are worth much attention in their own class. But the electric roads which count must be of thorough modern construction and must have their own private right of way.

There are already several pieces of such road, of which the most notable are the Union Traction Company's of Indiana and the Aurora Elgin & Chicago. The former is an overhead trolley, mostly single-tracked, operated in connection with an interesting telephone system, and claiming maximum speeds of 40 to 60 miles. The other is even more remarkable. It was opened six months ago, beginning at the moderate speed of 27½ miles, but the aim is to run at 40 on local service with stops three miles apart, and at 65 maximum; the plan looks even to 80 or 100 and thus to contributing towards the workingout of the problem of real high speeds. The road is a third-rail road, and it is proposed to run the cars from a stand to a rate of 50 miles in not more than 30 seconds. Users of the Manhattan Elevated cannot have failed to notice how much greater is the "pick up" or attainment of the regular speed since the electric motor replaced the steam locomotive. Quickness of acceleration is a characteristic of electricity; yet the above rate seems start-

The Elgin road is largely double-tracked and the single-tracked portions have long sidings and were built with the intent of doubling. If it were practicable to reproduce cuts of some of its culverts and masonry bridges, they would show the solidity of the construction; the cars also follow regular types (including specimens of parlor and sleeping) and the extra rail is all which

visibly distinguishes this from what is now understood by the best modern railroad practice. Of course, the intended results could not be attainable otherwise.

This road, perhaps the most highly developed of all as a piece of construction, is only 35 miles long from Chicago to Aurora, but the like process is going on in many places. The Lake Shore Electric, which is a quite close parallel, announced a cut a year ago of a little more than one-third on the steam rate over the 115 miles between Cleveland and Toledo and one of nearly one-half between Cleveland and Norwalk. In most cases the lower rate has an offset in the greater time consumed thus far, but frequency of service and convenience of access modify this offset somewhat. Thus, two steam roads had the travel over the 10 miles between St. Paul and Minneapolis, giving an hourly service, and making the actual interval a half hour; the fare was 30 cents single, 50 cents round trip and 15 cents each way to commuters. The electric road came in, reducing the fare to 10 cents each way. The running time was some 20 minutes more; but the trips were fully three times as frequent, transfers to connecting lines were given, and the cars could be taken at any corner of the principal streets in the business districts instead of only at one or two depots. Time was thus saved in one way while lost in another, and the lower fare and greater convenience gave the electric the business.

What we call trunk lines perform a distinctive service of railroads—quick movement between large and distant centres. A permanent service hardly less in aggregate and certain to have an almost indefinite expansion, is the feeder service, for which electric roads are especially suited. There is some incompatibility between through and local traffic on trunk lines as there is between passenger and freight; and if things were always feasible because they are desirable we should have distinct lines for these several sorts of traffic. In construction, operative methods and grasp for traffic, the electric roads—which have got past the limitation suggested by "broomstick train"—are approaching the steam roads. There has been some overdoing, naturally; but the tendency to unification is clear.

Yet there is no occasion for uneasiness about present or possible competition. The steam roads are observant, and are free to use the new system themselves as well as to dispose of parallels by the old method of absorption. For example, the Boston & Maine recently built and opened an electric line from Concord to Manchester, and the New York & New Haven, which has long been threatened with paralleling, has used both these methods. The rivalry will work itself out peaceably.

### AUTOMATIO BLOCK CLOSING.

The disaster on the Central Railroad of New Jersey, a month ago, recalls the similar one in the Park Avenue tunnel a year ago. Why the signals failed to be seen, or, if seen, why they were not obeyed, may never be certainly known; the ascertained fact is that the human factor somehow failed in both cases.

On single-track roads operation is usually by telegraph and train order; when collision occurs it is by failure of the human factor, either by omitting to send the required order or by sending it erroneously, or by misunderstanding or disobeying it when received. On the most important double-track roads the block system

is used, the line being divided into a series of short sections or blocks. When a train enters one of these it is closed (by signal) against any following one until the first train has passed from the block into the next. As a train approaches a block, the signal shows either "safety" or "danger;" so long as there is no hitch in operation, the danger signal not failing to show when it should, and the engineer not for any reason running by the signal, there is at least the length of a block between trains and collision is plainly impossible.

But sight and hearing, the sense of comprehension and the prompt action in response to both all have their limits. The human factor has its uncertainties. The new rider of a bicycle, seeing a tree or like object ahead, having ample room on each side and earnestly desiring to avoid the obstacle, sometimes runs upon it as if irresistibly drawn. Trolley cars, approaching each other in plain sight on a single track, sometimes collide because each motorman claims the right of way and thinks he can make the other yield and run back to the switch; so each keeps on, unwilling to show irresolution by slowing, until both are frightened; but it is too late to avoid a crash.

A freight train on a trunk line was once standing on a siding at a way station, waiting for an express headed in the same direction to pass ahead; the engineer fell asleep in his cab. The whistle of the coming express startled him, and while only partly awake he mechanically pulled the lever under the impression that this was a call for him to go. Since the switch was set for the main line his forward trucks would soon have dropped off the rail ends, but just as his engine lapped over into the main line the express engine reached the spot and caught it, dragging engines and cars into wreck.

This is only one instance, out of many which may not be so peculiar, of the failure of the human factor at some moment of trial. In the case of block signals, this factor is ordinarily at both ends; one man on the spot is to work the signal, and another one in the cab is to see it, understand it, and obey it. For any of several reasons, the signalman may fail in his part; it is, however, mechanically possible (and sometimes this is done) to nearly or quite eliminate him by some automatic electro or electro-pneumatic device. But the man in the cab remains.

At best the signal is visible in only one instant of time, which is shortened as train speed increases; if he fails to catch it just then the opportunity is gone—he has "run past." Moreover, the circumstances are difficult. Everybody who has seen the moving pictures now

so popular on the projection screen has observed how the swift succession of images fatigues the eyes; so, too, the whirl past tends to drowse or hypnotize the passenger who looks long out of the car window. It must be far worse in the engine cab. The whirl of posts, buildings, switches and other objects, together with the roar of the wheels, must be confusing to the senses; a proof is that the engineers of the fastest trains lie over for alternate trips—human senses and nerves could not endure such tension every day. So it cannot be strange if the retina sometimes fails to catch the signal, or if the brain fails to instantly interpret it and give the proper order to the muscles. Perhaps the surprise should be that this dangerous slip of duty somewhere in the organism does not occur oftener.

Plainly, the desirable thing is to eliminate the human factor as respects signals and to make it impossible for the engine to run past. This can be done under electric propulsion by having the engine cut out the current as to any following one on the same block. Thus each train could close its own block in the signal sense and also physically by making the line "dead" to any following train which approached the block too soon; humanly speaking, such an automatic arrangement could not fail, being as infallible as electricity, which is the surest thing we know, after gravity. The contest between the steam locomotive and the electric is not simple, but includes many practical problems; yet this does seem to be one point on behalf of electricity.

Automatic block closing need not, however, await settlement of this problem. The Boston Elevated, an electric road temporarily using the subway as a part of its line, is now operating a device of the simplest character. Just in front of the leading truck a short arm extends downward, which is connected with the air-brake valve; ordinarily, this rides clear. When the signal is set at "danger," an arm next to one rail rises to a vertical position and remains so until the signal returns to "safety." If a motorman does not obey the signal, this raised arm strikes the lever as soon as the truck reaches the spot, and the brakes go on. The device is not patented and not costly, nor is it new; with the modification of placing it on the roof of the cab, it was suggested for steam locomotives by Mr. Westinghouse some ten years ago.

Nobody is sanguine enough to suppose that disasters can ever be made absolutely impossible. But there seems no room for doubt that an automatic device of this nature could effectually guard against rear-end collisions.

### SECURITIES AND REPORTS.

This is one of our four Supplements. In using the series it is to be remembered that they are inter-dependent publications, complete only as a whole. If utilized together, and with the fresh items of news the Chronicle contains from week to week, the investor will have all the information he needs in seeking a safe and remunerative lodgment for his money. Street Railways forcibly illustrate this inter-dependence. Such roads obviously rely for their income, and therefore in great part for the value of their securities, upon the population and activity of the country they serve. Hence constant reference to our State and City Supplement will be found necessary by those wishing to purchase the stocks and bonds of street roads. Population assessed valuation tax rate total debts of the countries cities and minor municipalities are given at street roads. Population, assessed valuation, tax rate, total debts of the counties, cities and minor municipalities are given at length in that publication, every one of which items is an essential fact contributing more or less to any correct estimate of the amount of suburban travel a given road commands.

The ABBREVIATIONS used in our Street Railway statements will be found explained in a table immediately following the

last statement in this SUPPLEMENT,

A full INDEX which shows where each railway will be found is also given on the closing pages.

Is not a railroad corpora-tion, but was organized under the Business Corporation law of New York to hold the stocks and bonds of railroad companies and to aid in the construction and equipment of railroads.

The Brooklyn Oity RR. Oo. is held under a 999-year lease, dated Feb. 14, 1893, guaranteeing all fixed charges, organization expenses, taxes and 10 per cent dividend on \$12,000,000 of stock. The lease is nominally to the Brooklyn Heights RR. Co. but practically to the Brooklyn Rapid Transit Co., since that company owns the entire capital stock of the Brooklyn Heights Company and guarantees payment of dividends to lessor. In 1898 the Heights Company leased the Brooklyn Queens County & Suburban RR. The lease was renewed year by year, rental being fixed charges, taxes and organization expenses. On July 1, 1901, the B. Q. C. & S. began operating separately again. On April 1, 1899, the Heights Company temporarily leased the Brooklyn Union Elevated RR. Co.—see terms under the latter—and also on the same date the Nassau Electric RR. Later, permanent leases were made. See terms under Nassau Electric.

The Brooklyn Rapid Transit Company in April, 1899, also acquired, through one of its constituent companies, all the franchises and properties of the former Brooklyn & Brighton Beach RR. Co., and has converted it into an electric road. The company also then leased for the period of 999 years the Prospect Park & Coney Island RR. (see terms under the latter), the New York & Coney Island RR. and the Prospect Park & South Brooklyn RR. In November, 1899, acquired all the stock of the Kings County Elevated Railroad, which has since been consolidated with the Brooklyn RR. & Term. Co. V. 74, p. 479. In April, 1900, the Brooklyn Heights Company began suit against the Brooklyn City RR. to recover about \$2,000,000 for failure to fulfill obligations claimed to be imposed by the terms of the lease between the two companies.

On July 1, 1902, the International Ry. Co. acquired by purchase the Niagara Falls Park & River Ry., the Chiton Suspension Bridge Co., the Lewiston Connect. Bridge Co. and Queenston Heights Bridge Co. This leaves the Crosstown St. Ry. Co. and International Ry. On April 14, 1900, President J. H. Witheck filed a bill for the appointment of a receiver, and on the 17th Frank H. Sellers of Chicago was appointed receiver. A reorganization committee consisting of James P. Black, Lyman M. Paine and Glenn E. Plumb, proposed that bondholders surrender one-half or more of their bonds for cancellation, accepting double the amount in stock. They were asked to deposit their bonds with the Real Estate Trust Co. of New York. No definite progress, however, has been made with the reorganization. A stockholders' committee consisting of Chas L. Bonney (General Counsel of the Company) and Wm. A. Goodman and Joseph P. Mahoney, all of Chicago, has been formed, as well as two bondholders' committees, the one for the Chicago General bonds consisting of E. M. Phelps, L. A. Goddard and J. S. Runnells, with the Merchants' L. & T. Co. of Chicago as depository, and the one for the West & South Towns bonds consisting of Granger Farwell, H. B. Davis and Arthur Henrtly, with the Northern Trust Co. of Chicago as depository. V. 74, p. 41, 204.

Interest on the \$1,438,000 of gen. mortgage 5s has been in default since May, 1900, and on the West & South Towns 6s since Aug., 1900.

CHICAGO UNION TRACTION.—Cable and electric.

ORGANIZATION.—Incorporated in Illinois June 3, 1899, by the Elkins-Widener-Whitney syndicate and purchased for \$10,000,000 eash the holdings of stock of Chas. T. Yerkes in the West Chicago and North Chicago roads. These holdings consisted of \$3,200,000 West Chicago stock and \$2,000,000 North Chicago for a yearly rental equal to 6 per cent on the stock and the North Chicago for a yearly rental equal to 6 per cent on the stock and the North Chicago for a rental equal to 12 per cent on the stock, the leases being dated June 1, 1899. By a tripartite agreement entered into on the same date the Union Traction Company's holdings of stock of the two roads are to remain in trust with the Illinois Trust & Savings Bank of Chicago "for all time" as security for the leases.—See V. 68, p. 1131.

On April 14, 1900, negotiations for the acquisition of the Chicago Consolidated Traction were consummated. The Union Traction paid \$45 in bonds of the Chicago Consolidated Traction bearing 4½ p. c. interest and guaranteed by Union Traction and \$150 in cash for each share of the Consolidated company's stock. It is understood that over \$14,500,000 of the total issue of \$15,000,000 stock of the Consolidated Traction has been turned over under this plan.—V.70, p. 791.

Franchises.—There has been much conteution as to the company's franchises, and in June, 1901, company brought suit in the U. S. Circuit Court to restrain the city from interfering with the West Chicago and North Chicago roads. See V. 73, p. 31. Company elaims a 99-year franchise under the act of 1865.—V. 72, p. 1137. In May, 1902, Court sustained on technical grounds the dem urer of the city to the bill. V. 74, p. 1037. Permission granted to appeal to U. 8. Supreme Court. V. 74, p. 1037. In the matter of the taxation of franchises, an important decision bearing adversely on all Chicago corporations was rendered by the llinois Supreme Court in October, 1901. See V. 73, p. 902, 1114: V. 74,

STOCK AND BONDS.—The \$12,000,000 preferred stock was subscribed for at par, a bonus of 50 per ceut, however, being given in common stock.—V. 68, p. 1225. There was thus \$2,000,000 cash left after the payment of \$10,000,000 to Mr. Yerkes, and this \$2,000,000 was spent for improvements and extensions of the lines acquired.

In December, 1899, both issues of stock were listed on the New York Stock Exchange. V. 69, p. 1299.

(1) INTERURBAN STREET RY.

This company was incorporated in New York in 1901, with a capital of \$500,000, and was then understood to have taken a 999-year lease of the People's Traction Co., which had the right to build an extensive system of trolley lines in the Borough of the Bronx and was to build some fifty miles outside the city limits in connection with the New York Westchester & Connecticut Traction (°o. Under the arrange ment for financing the needs of the Metropolitan Street Ry., the stock was in February, 1902, increased to \$20,000,000, all of which was taken by the Metropolitan Securities Co. The latter company paid \$23,000,000 cash into the treasury of the Interurban Co. "receiving in return stock of the Interurban at par and debentures bearing interest at a rate not exceeding 4%." V.74, p.379. The Securities Co. is also to acquire all future issues of stock or securities of the Interurban Co. The \$23,000,000 of cash received by the Interurban was paid over to the Metropolitan Street Ry. Co., which latter in payment turned over \$11,000,000 Metropolitan St. Ry. Refunding 4s (since disposed of) and certain securities "liberated by the payment of the unfunded debt and other assets now almost entirely unproductive." The list of securities is understood to include \$8,000,000 of Third Avenue RR. stock. The Interurban Co. has also leased the Metropolitan Street Ry. for 999 years from Feb. 14, 1902, for 7 per cent per annum on its stock.

Co. and "to defray the expense of extending the electrical system to upwards of 80 miles of Metropolitan lines still operated with horse cars."
