ACKNOWLEDGEMENTS

This study, conducted under the general direction of Daniel H. Garnick, Associate Director for Regional Economics, Bureau of Economic Analysis, was produced by the Regional Economic Measurement Division, Edwin J. Coleman, Chief, and Lowell D. Ashby, Assistant Chief.

The text relating to the methodology was prepared by Edwin J. Coleman and Jeanne S. Goodman. The estimates were monitored and prepared for publication by the Regional Economic Information System Branch under the supervision of Linnea Hazen, Chief; she was assisted by Eunice P. James, Paul M. Levit, and Ronald G. Reel. The secretarial support was provided by Lela S. Lester.

PREFACE

The following summary of the sources of data and methods of estimation provides the user with a basis for judging the accuracy and suitability, for his own purposes, of the local area income measures developed by the Bureau of Economic Analysis' Regional Economic Measurement Division. These income flows include wages and salaries, various types of supplementary earnings termed "other labor income," the net incomes of owners of unincorporated businesses, net rental income, royalties, dividends, interest, government and business transfer payments, and personal contributions for social insurance programs. A comparison for 1970 and 1975 of the importance of each flow relative to total personal income appears at the beginning of the section for each type of payment.

The tables presented in the Statistical Section of this volume are for the States, SMSA's, and Economic Areas only. Detailed county estimates are contained in regional Volumes 2-9: Volume 2 - New England; Volume 3 - Mideastern; Volume 4 - Great Lakes; Volume 5 - Plains; Volume 6 - Southeastern; Volume 7 - Southwestern; Volume 8 - Rocky Mountain; and Volume 9 - Far Western, including Alaska and Hawaii.

The data presented in these volumes differ from the national personal income series to the extent that the conceptual and statistical revisions introduced at the national level in January 1976 are not incorporated in the present State and local area estimates. The newly revised State and local area personal income series for the period 1971-76 will be available in September 1977 and May 1978, respectively. Revised estimates for the earlier years will become available at a somewhat later date.

PERSONAL INCOME DEFINED

Personal income is the current income of residents of an area from all sources. It is measured after deduction of personal contributions to Social Security, government retirement, and other social insurance programs but before deduction of income and other personal taxes. It includes income received from business, Federal, State, and local governments, households, institutions, and foreign governments. It consists of wages and salaries (in cash and in kind); various types of supplementary earnings termed "other labor income" (the largest item being employer contributions to private pension, health, and welfare funds; the net incomes of owners of unincorporated businesses (farm and nonfarm, with the latter including the incomes of independent professionals); net rental income; royalties; dividends; interest; and government and business transfer payments (consisting, in general, of disbursements to persons for which no services are rendered currently, such as unemployment benefits, Social Security payments, Medicare benefits, retirement pay of governmental programs, and welfare and relief payments.)

For the measurement of personal income on a regional basis, BEA assigns the income flows to the State, county, or SMSA in which the individual resides. However, BEA also presents labor and entrepreneurial income in industrial detail by place of work since the bulk of labor 1/ and proprietors' income is reported by industry at the point of disbursement (establishment location) 2/. This income is then adjusted to a place-of-residence basis at an all-industry level.

A more precise residence adjustment may be achieved by computing adjustment factors for each major industry group, thus reflecting industrial differentials in commuting flows. The information needed to effect a detailed industry-by-industry adjustment, however, is not available.

Personal contributions for social insurance, which are included in personal income as explicit deductions, are also subject to residence adjustment. Since employee contributions to most social insurance programs are withheld at the source of payroll disbursement, they are estimated, like wages and salaries, on a place-of-work basis. Accordingly, most personal contributions must be adjusted to reflect place of residence when incorporated into the personal income estimates. Several contribution items obtained by place of residence, the most important of which are contributions of the self-employed and Government Life Insurance contributions, do not require adjustment.

Regional measures of labor and proprietors' income are important on both a place-of-work and place-of-residence basis. The estimates based on place of work (where earned), which include detail by industry, are useful in the analy-

 $[\]underline{1}/$ Labor income is the sum of wages and salaries plus other labor income.

^{2/} In the contract construction industry, point of disbursement may or may not be the actual work site. Therefore, the wage and salary estimates for the construction industry do not necessarily reflect the county of work. This is the only industry where this distinction is of importance.

sis of the industrial structure of a given area. The estimates based on place of residence (where received) are useful for the analysis of consumer markets and purchasing power.

Estimates for the other components of personal income-transfer payments, dividends, personal interest income, and rental income of persons--are made on a where-received basis only. In the case of transfer payments, there is no economic relevance to the where-earned concept. Dividends, interest, and rent are not estimated on a where-earned basis because of the lack of data suitable for assigning such income to the areas in which it is generated. Moreover, there is also a question as to the economic relevance of measuring the investment income components of personal income in this context since they do not represent a complete measure of the contribution of capital to production (dividends being the only part of corporate profits included).

ORIGIN AND USE OF COUNTY INCOME ESTIMATES

BEA's work on regional income estimation began in the midthirties with the construction of a series of "State income payments" to individuals. State income payments were the sums of wages and salaries, proprietors' income, dividends, personal interest income, rental income (the last three components, in aggregate, formerly referred to as "property" income), and "other" income, and were produced as part of a broad effort to explain the processes and structure of the nation's economy in the thirties. The estimation of State income payments was the precursor of the extensive work carried out during the forties and early fifties on the more comprehensive annual State-by-State breakdowns of total personal income, and of work completed in the sixties on the development of quarterly estimates of State personal income.

Currently, a condensed set of State personal income estimates is prepared quarterly. Additional detail on State personal income is prepared annually. The quarterly estimates cover the post-World War II period, and the annual record extends back to 1929.

During the latter half of the fifties, BEA inaugurated its sub-State estimates and projections of personal income and related measures. During this period, the local area measurement effort was limited to the development of estimates of personal income and employment for a relatively small number of counties in the mideastern and plains States. In the midsixties, BEA constructed an historical series of personal income estimates covering selected years 1929 to 1962 for the nation's SMSA's and non-SMSA counties.

BEA is currently producing annual personal and money income estimates for each State, SMSA, and county as well as for the parishes of Louisiana, the independent cities of Virginia, and the census divisions of Alaska. County personal income data are available for the years 1929, 1940, 1950, 1959, 1962, and for 1965-75. Estimates of per capita personal income by State, SMSA, and county have been prepared for the same years as the aggregate personal income measures.

The 1970-75 estimates of personal income by type of payment and of labor and proprietors' income by major industry group (presented in Volumes I-VII) are comparable at all geographic levels: State, economic area, metropolitan area, and county. Similar tables for the earlier years (1929, 1940, 1950, 1959,

1962, and 1965-69) are available upon request. Samples of other local area income tables available upon request are shown as Exhibits A and B in the Appendix.

Regional measures of personal income serve a wide range of uses. Federal, State, and local governments use them to analyze economic conditions in various areas, to serve as a basis for allocating funds, to monitor the effectiveness of government programs, to estimate in advance of adoption the regional effects of alternative development programs, to measure the capacity of local areas to provide tax revenues, and to gauge differences in welfare. The National School Lunch Act and the General Revenue Sharing Act are two examples of programs that use BEA's estimates of personal income to allocate funds. Business uses BEA's estimates as a direct measure of consumer markets by geographic area and as an indirect measure of regional industrial markets. Universities and research organizations use these same estimates to identify and measure the factors responsible for area differences in levels of income and in rates of economic growth.

DERIVATION OF THE ESTIMATES

The local area income estimates prepared by the Regional Economic Measurement Division are tied directly to BEA's official estimates of personal income by States.3/ That is, the State total for each income component, as taken from the official State income series before adjustment for residence, is allocated to the counties of the State in accordance with each county's proportionate share of the same or some related series that is available on a county basis. For some income items, more information is available for SMSA's than for individual counties. In these instances, State totals are first allocated to the individual SMSA's of each State on the basis of a particular allocator and the remainder assigned to all non-SMSA counties by the most appropriate allocator available. Prior to the release of the 1973 estimates, it was not possible to provide county breakdowns of multicounty SMSA's due to a lack of sufficient information. However, the recent availability of Census commuting flows data and IRS county tabulations of selected income items has enabled BEA to make estimates of personal income for all counties.

Because of the availability of State control totals, a different allocator may be used in each State without impairing the interstate comparability of the estimates. This application of individual State totals makes it possible to utilize the best county estimating series in each State. In addition, the insertion of comparatively accurate benchmark "controls" at the State level insures increased accuracy of sub-State estimates.

The allocation procedure also makes for greater accuracy in the county estimates because most components of personal income can be estimated more reliably for

A supplement to the <u>Survey of Current Business</u> entitled <u>Personal Income</u> by <u>States Since 1929</u> contains definitions, sources of data, and methods of estimation used to construct the State personal income series. Although out of print, copies of this volume are available at the libraries and Bureaus of Business Research of most colleges and universities throughout the country.

States than for smaller geographic areas. Allocation permits the utilization of numerous related series of data which, while approximating, may not precisely "match" the basic series to be allocated.

Almost 400 series of separate estimates go into the derivation of the 30 line items shown in the published personal income tables for the SMSA's and counties. This detailed approach provides the information needed to audit both the sources and methods of estimation, and assures that the final estimates will reflect appropriate interindustry and intercomponent differentials at both the State and county levels. While the publication of more detail would enhance the usefulness of the estimates, Federal and State regulations established to safeguard the privacy of individuals or individual establishments prohibit the release of more detailed statistics.

The bulk of the source materials used to prepare the estimates is culled from the administrative records of Federal and State government programs, with the remainder of the data coming from the various censuses and from nongovernment sources. Several of the more important sources of administrative record information include data generated as the by-product of the State unemployment programs of the Bureau of Labor Statistics, the insurance programs of the Social Security Administration, and the Federal tax program of the Treasury Department. Two of the more important censuses utilized are the Censuses of Agriculture and Population. The data obtained from these sources yield more than 90 percent of the data needed for the preparation of State and county income estimates.

BEA supplements these basic statistics, which may be presumed to be "reliable," with data of lesser quality, scope, and relevance. In order to adjust for the gaps and deficiencies in the poorer quality data, indirect procedures and arbitrary assumptions are sometimes required. The use of such indirect procedures varies considerably over the 46-year estimating span. Moreover, the impact of these procedures on the individual State and county estimates varies in accordance with regional differences in industrial structure. It is not possible, therefore, to provide measures of the error introduced into the income estimates by the indirect procedures.

Because the estimates are based on several million administrative records, the data are understandably subject to a wide range of errors as they are encoded and processed by the agencies administering their respective programs. Since it is not possible to verify each individual record or accept the various administrative record files at their face value, BEA has developed several computerized edit routines to locate major errors in the source materials. The routines test the change over time in the industrial composition of employment and wages in each county as well as the change over time in the county distribution of employment and wages in each industry. Without the use of these or similar computerized techniques, the reliability of the many components of BEA's county income series would be greatly reduced.

Although the use of computerized techniques improves the quality of the personal income figures, it is not desirable at the present time to completely automate the county income estimation procedures. Since much of the reported statistical information is not directly or wholly suited for income measurement, close attention must be paid to each input source, not only to identify and correct

errors but to adjust for differences in definition, to close data gaps, and to obtain statistical comparability among geographic units and over time.

The major alternative to BEA's present approach to income measurement would be to collect the necessary information in surveys of income recipients. The survey approach would provide data directly suited for the measurement of personal income, eliminating the necessity of adjusting for definitional and conceptual differences among the various inputs. Unfortunately, the cost associated with this alternative would be prohibitive because a very large sample would be necessary to permit reliable local area estimates. On the other hand, the use of administrative records is both reliable and economical because the data are usually subject to internal review by the agency administering the program, and it costs much less to use data collected by other agencies for other purposes than to conduct regional surveys.

Table 1. - Relative Importance of Wage and Salary Disbursements, by Component, to Total Personal Income, United States, 1970 and 1975*

WAGE AND SALARY DISBURSEMENTS

The definition of wage and salary disbursements is in accord with common usage. It includes executives' compensation, commissions, tips and bonuses, and the value of payments in kind which represent income to the recipient. They are measured before deductions for Social Security contributions, union dues, or other purposes. All disbursements in the current period are covered, including any payments retroactive to past periods; that is, retroactive wages are counted when paid rather than when earned. 4/

The contributions made by employees under the various social insurance programs, although counted in wage and salary disbursements, are not part of the personal income total. They are excluded by means of the deduction made for "personal contributions for social insurance."

Estimates of wage and salary disbursements (which account for about 65 percent of all personal income) are, with perhaps the exception of transfer payments, more complete and reliable than those for any other type of income, and, because of their sizable weight in the total income flows, impart a large measure of reliability to the estimates of aggregate income. For the private sector of each subarea's economy, the payroll component covers employees not only of all nonfarm business establishments, but also of farms, private households, hospitals, and private educational, social service, and nonprofit institutions. Also, all government employees are covered by the measure, including those of the State governments, local governments, and Federal government (both civilian and military).

"Covered" Wages and Salaries

The bulk of the county wage data used to estimate payrolls has been obtained from the administrative records of each State Unemployment Insurance program (ES-202) from tabulations supplied by the State Employment Security Agencies (ESA). (An address list of these agencies appears in the Appendices Section.) Every covered firm is required by State statute to file regular quarterly tax reports with the Employment Security Agency having jurisdiction. These quarterly reports include the wage disbursements by each firm for the reporting quarter as well as the number of full- and part-time workers employed in each of the three months of the quarter.

As part of its data acquisition program, BEA obtains from each State ESA two-digit level tapes and/or tabulations of quarterly wages and monthly employment which, after editing and correcting, form the basis for more than 80 percent of total wage and salary disbursements. Until 1972, more than half of the States excluded from mandatory coverage those establishments with less than four employees (referred to as "small firms"). Beginning with the first quarter of 1972, the UI coverage of payrolls and employment was extended to cover most firms in all but a few industries. The size-of-firm exclusions were eliminated entirely, with firms of all sizes falling under the provisions of the Unemployment Tax Act. The sole exception is nonprofit organizations, for which mandatory coverage extends only to those with four or more employees.

^{4/} While the timing of wages when paid is a clear conceptual feature of personal income measurement, the difference between wages earned and wages paid has been negligible in most years.

Adjustments to "Covered" Wages and Salaries

The UI "industry" data reported by the State Employment Security Agencies have had to be supplemented and modified in several ways for the purpose of deriving a complete measure of covered wages and salaries for the county personal income series. Most obvious and important was the necessity of adjusting for the payrolls of small firms excluded from coverage by the differing size-of-firm provisions of the State laws.

Employees of firms too small for inclusion in the UI program were nonetheless covered under the Old Age and Survivors Insurance (OASI) law, the scope of which is not conditioned or affected by the size-of-firm factor. Under the OASI program, however, employers' quarterly reports are required to show only taxable payroll, not total \underline{and} taxable, as is the case with employers reporting under the UI programs.

Through statistical analysis of the employers' reports for Old Age and Survivors' Insurance, it was possible to derive direct measures from the taxable payroll of firms with too few employees to be covered by the UI laws. Such payroll data were provided BEA, by the Bureau of the Census in cooperation with the Bureau of Old Age and Survivors' Insurance, on a two-digit industry basis for each State and county covering the first quarter of 1965.

For that year, the county distributions indicated by the reported quarterly figures were used to allocate the State estimates of calendar year payrolls (taxable and nontaxable combined) of small firms in each industry. The 1965 distribution was extrapolated by "covered" payrolls from 1966 to 1971 to obtain comparable distributions on an individual industry basis.

In making these extensions of the reported quarterly data to the later years, it was necessary to adjust for any changes in the State laws with respect to the size-of-firm coverage provision.

Both the UI tabulations and the OASI data regularly show minor amounts of payroll which have not been assigned to any industry. Since the individual classification scheme followed in the national, State, and county income estimates permits no "unclassified" category, it is necessary to adopt some convention, necessarily arbitrary, to allocate such unclassified payroll among the industry groups. The procedure for doing this in the State series, so as to achieve conformity with the independent national estimates, is rather complex and need not be detailed here. It should be noted, however, that this particular adjustment of the reported UI industry data is usually quite small--approximately \$800 million, or about one-tenth of l percent 5/, on a national basis in 1975--and that it cannot introduce error into the State payroll totals since only the apportionment by industry of amounts reported for particular States and counties is involved.

Portions of several "covered" industry payrolls still remain outside the scope of the State unemployment insurance laws. These excluded elements consist of wages and salaries of the Federal Reserve Board, national banks, State banks that are members of the Federal Reserve System in New Jersey (prior to 1972), electric railways, carrier affiliates in the transportation industry, insurance

^{5/} The size of the "unclassified payrolls" increased somewhat in 1972 because of the extended coverage to small firms, but has remained relatively constant at the new level.

solicitors working on commission, and employees' tips. In some instances, payrolls of these industrial segments can be estimated quite readily by counties. In others, the task is difficult and the results less satisfactory.

"Noncovered" Wages and Salaries

At one time or another, industries not covered or partially covered by UI data included farms, Federal, State and local governments, railroads, private households, hospitals, nonprofit membership organizations, "museums, art galleries, etc.," private educational services, forestry, fisheries, and "rest of the world."

Hospitals, educational services, nonprofit membership organizations, museums, and forestry and fisheries were covered more extensively by the UI regulations in 1972. This extension of coverage represents an improvement in the estimating data base for these industries, but additional estimation is still required because the new coverage of nonprofit membership organizations does not extend to religious organizations or to other nonprofit organizations with less than four employees and nonprofit schools other than institutions of higher education. The formulation of estimates for each of these industries is covered in the subsequent sections.

Government Wage and Salary Disbursements

In 1975, government wages and salaries accounted for 21 percent of total payrolls and 13 percent of personal income. Thus, the adequacy of the government payroll component has considerable bearing on the quality of the State personal income estimates.

Payments to civilian employees (including employees of government enterprises) comprise 90 percent of total government payrolls in the current period. The statistical basis for estimating civilian government wages has generally been good despite variations in the relative accuracy of the Federal, State, and local segments.

Apart from dependency allotments, for which some direct State and county data have been available, military payroll disbursements have been estimated by allocation of State totals on the basis of the number of personnel stationed in each county. While the lack of payroll data by county is a significant limitation, the basis of allocation in this case is reasonably satisfactory.

Government payroll information available from both the Federal civilian and Federal military establishments, as well as from the units of State and local governments, still lags behind the growing flows of local area wage data available from administrative record files in the private sector. The reliability of the county estimates for government wages may therefore vary in quality from State to State. In most cases, it has been possible to compensate for the deficiencies in the raw materials by using secondary data sources, and BEA has stepped up its efforts to obtain county wage data directly from the respective State governments in an effort to improve the quality of the county wage estimates for State and local government units.

Federal civilian wages and salaries have been covered by the UI program since 1967. However, Federal Government units in many States report on an agency, rather than an establishment, basis. This reporting of Federal civilian wages by agency restricts the usefulness of the UI data as a source for estimating Federal civilian wages at the county level. At the present time, UI data are used directly in preparing the estimates of Federal civilian wages in only 15 States; for the other States, county allocations are based on Civil Service Commission (CSC) employment data. To offset this limitation, the county allocation is made in considerable detail. The county employment totals of the major departments, as reported by the CSC, are weighted by the appropriate UI average wages to derive a more reliable county allocator. Although employment represents a secondary source, its use for Federal civilian wages was acceptable since regional differentials in average wages of Federal agencies outside the Washington, D.C., area tend to be minimal.

<u>State and local government payrolls</u> represent the fastest growing component in the government sector, having increased almost tenfold in the last 25 years.

Benchmark estimates of local government wages and salaries were prepared for each county from the local government payroll data reported in the 1967 and 1972 Censuses of Government. Estimates for the intervening years were the products of straight-line interpolation. The 1973-75 estimates were made in two parts. For the 372 largest counties, the local government payrolls were obtained from the annual Bureau of the Census publication, "Local Government Employment in Selected Metropolitan Areas and Large Counties." These 372 counties accounted for 71 percent of all local government wages and salaries. The estimates for the remaining small counties were made by extrapolating the 1972 benchmark estimates by population and using the extrapolated series to distribute the residual State control totals (derived by summing the large county payrolls for each State and subtracting the aggregates from the State control totals).

State government payrolls were constructed using the 1967 Census of Governments county tabulations of full-time employment of State government units, since the 1972 Census of Governments did not include the information necessary to prepare a new benchmark.

Military disbursements - With one exception, wage and salary disbursements for all industrial components represent gross earnings of employees without deductions of any kind. The exception to this general rule is the military payroll, which differs significantly in concept from a measure of the gross earnings of military personnel stationed in each State or county. Military disbursements by local area are derived as the sum of two separate flows: (1) the gross earnings of military personnel stationed in each State or county less the amounts withheld by the government and sent to their dependents or other individuals in the form of voluntary allotments of pay or benefits under the government's family allowance or dependency assistance programs; and (2) allowances and allotments received by individuals residing in the State or county. The second flow represents amounts withheld from the pay of military personnel wherever stationed. A noteworthy aspect of this item is that it represents an element—the only one—of wage and salary disbursements received by individuals not in an employee status.

In brief, the military payroll component of personal income represents, for each year, that part of the State total military gross pay which is disbursed to residents of the various counties.

Little direct data on military payroll disbursements have been available and, as a result, county estimates of military payrolls had to be constructed from military strength data obtained from the decennial Censuses of Population and from the U.S. Department of Defense. Military payrolls were allocated in two parts--pay to military personnel and allowances and allotments. State totals of cash pay and pay in kind (clothing and food) received directly by military personnel were distributed among counties in proportion to military strength.

State totals of allowances and allotments were allocated to counties by civilian and military population with the latter given twice the weight of the former. Civilian population was included to take account of the substantial volume of pay allotments that military personnel remit to their dependents. The two-to-one weighting system was derived from tabulations of actual disbursements on a State basis.

Private Wage and Salary Disbursements

Farm wages at the county level were measured by allocating the State totals of farm wages, as estimated by the U.S. Department of Agriculture and adjusted to BEA definitions, in proportion to the county distribution of cash farm wages reported in the 1969 Census of Agriculture. Farm pay in kind was estimated by allocating State totals to the counties on the basis of the number of workers on a farm 150 days or more in a year, also reported in the Census of Agriculture.

Forestry, fisheries, private education, and nonprofit membership organizations—With the extension of UI coverage in 1972 and the improvement of OASI coverage under the elective coverage provisions, the methods for estimating wages in these industries have been designed to take advantage of whichever program yields the best coverage for a given industry in a given State.

The 1972-75 county estimates of wages in forestry (accounting for an insignificant fraction of all wages in the U.S.) were based on the UI wage distributions. Estimates for 1970-71 were made in two parts. For those States with the UI laws providing mandatory coverage of firms with one or more employees, estimates were based on the UI county distributions. Estimates for all other States were based on the county distributions of first quarter wages reported by $\frac{\text{County}}{\text{County}}$ $\frac{\text{Business}}{\text{Patterns}}$ (CBP). 6/

The wage estimates for the fishing industry (also accounting for a very small fraction of total wages) were, for the most part, based on UI data. UI wages, adjusted for small firms where necessary, served as allocators for 22 States, including all the States with a major fishing industry except Oregon, Rhode Island, Mississippi, and Maryland. Estimates for these four States were based on modified UI data. For the few remaining States having a fishing industry, CBP data were used to distribute the State totals.

Although UI data were used in estimating wages and salaries in private education at the State level, it was not possible to use them for the county estimates. Since nonprofit schools other than "institutions of higher education" are explicitly excluded from UI coverage, the elementary and secondary schools component of private education should be separated out from the remainder of the industry in order to have a comparable data base for allocation purposes. This is possible at the State level because UI data are available in greater detail (by

 $[\]underline{6}$ / Based on OASI administrative records.

three-digit industry). At the county level, however, BEA receives wage data for two-digit industry groups only. The county estimates were therefore based on the <u>CBP</u> first quarter wage distributions. Although nonprofit schools other than "institutions of higher education" are excluded from mandatory coverage under OASI regulations as well, the degree of coverage is higher because the provisions of elective coverage encourage a high rate of participation.

Nonprofit membership organizations are excluded from the "one or more" mandatory coverage provisions of the 1972 UI extended coverage law. Moreover, employees of religious organizations are explicitly excluded from coverage as well. Therefore, the UI data were considered unsuitable as allocators for the county estimates. CBP coverage, on the other hand, is somewhat better than the UI since employees of religious organizations are not specifically excluded and the elective coverage provisions of OASI have encouraged a high rate of participation. However, under OASI guidelines, the clergy are considered to be self-employed and, therefore, they are excluded from the CBP data. Although this clearly reduces their relevancy as an allocator, in the absence of better data, the CBP first quarter wage distributions were used as the basis for the estimates of wages and salaries in nonprofit membership organizations.

Railroads - County estimates of wages in the railroad industry were based on the biennial employment series for Class I railroads (line-haul and switching and terminal companies) prepared by the Association of American Railroads (AAR). These AAR data are for selected SMSA counties and account for approximately 73 percent of total railroad employment. For the remaining counties, AAR's residual-counties employment estimate in each State was disaggregated in proportion to the railroad employment reported by counties in the 1970 Census of Population. Estimates for the intervening years were derived by averaging the biennial benchmark data. The resulting employment series was used to allocate the State totals of wages and salaries in the railroad industry. The 1975 AAR data were available for distributing the 1975 State totals.

Private households - Due to a complete lack of any other relevant local area statistics, wages and salaries are computed on the basis of Census income and employment data. A 1969 benchmark distribution for allocating the State totals of wages and salaries received by private household workers was computed as the product of the number of private household workers in each county and a mean earnings estimate. The mean earnings of persons employed by private households was derived from Census tabulations of earnings of persons by incomesize class and by industry. Such averages could be prepared only for the State and for each SMSA with a population of 250,000 or more. 7/ An estimate of the combined average earnings for all areas outside the reported SMSA's was computed from the residual resulting from the subtraction of the SMSA data from the State totals. This residual average was used for each county lying outside the reported SMSA's.

The number of private household workers (other than unpaid family workers) in each State and SMSA with a population of 250,000 or more was tabulated directly from the 1970 Census. The SMSA employment numbers were disaggregated into estimates for the constituent counties on the basis of a Census county distribution of employment reflecting the total work force (the difference in concept is not significant in the case of private household workers). The residual employment number for the counties outside the reported SMSA's was also disag-

^{7/} New England SMSA's were excluded for reasons explained in the section entitled "Classification of SMSA's."

gregated into its constituent counties by the Census county employment distribution.

The 1969 distribution was used to allocate the State totals for 1970 and subsequent years.

<u>Hospitals</u> - The county distributions of hospital payrolls for the years 1970-71 were based on data presented in the <u>Journal of the American Hospital Association</u>'s "Hospital Guide Issue" (called "Hospitals" in recent years). The AHA data on payroll expenses were obtained directly from the hospitals in an annual questionnaire survey.

As a result of the 1972 UI coverage extension, UI-based estimates of wages reported for this industry are now considered to be complete; therefore, the use of the AHA data has been discontinued, and the estimates for the years 1972-75 reflect the introduction of the UI data. It was not necessary to revise the estimates prior to 1972 because of the close similarity between the two sets of data.

Private museums, art galleries, etc. - County estimates of wages and salaries were based on first quarter payroll data for this industry as reported in County Business Patterns. UI data were not introduced into the estimates for 1972-75 because substantial differences between the UI and CBP distributions warranted further investigation.

The <u>rest-of-the-world</u> components of wages and salaries represent wage payments to United States residents from international organizations (such as the United Nations) and from foreign governments. The State totals were distributed to the counties in which the United Nations, embassies, and consulates of foreign governments are located.

Wages in Kind

The wage and salary estimates for the various States and counties include allowances for the food, clothing, and lodging paid in kind to employees which represent income to them. The concept of valuation is cost to the employer. Market value to the employee would be a preferable concept for some purposes, although it is more elusive and less subject to quantitative determination.

This area of wage imputation is rather imprecise and involves a number of difficult decisions which can be settled only in a pragmatic fashion. For instance, the imputation is confined to food, clothing, and lodging because other types of perquisites, such as medical and recreational services, are generally less important and cannot be estimated satisfactorily from available data. It is frequently difficult, moreover, to determine whether or not a particular type of payment in kind clearly represents an addition to cash wages and salaries.

Payments in kind are a significant element of military wages. They include the value of the food and clothing provided enlisted personnel as part of their total pay and allowances. The clothing imputation is confined to "standard" issues. It does not include clothing and equipment designed for use on special duties or under unusual conditions.

As to other industrial segments of the State and county estimates, wages in kind (comprising either food or food plus lodging) are of some significance in eating and drinking places, farming, private households (domestic servants), water transportation, hotels, private education, nonprofit organizations, and hospitals. They are quite minor, however, in other areas of private employment and in the government sector apart from the military.

In terms of national income accounting, the imputation of wages depicts the accounts as though the payments in kind had taken the form of cash flows. In the simple case of food furnished restaurant workers, the imputation assumes that the employer, instead of furnishing his employees with free food, pays them corresponding amounts of wages and the employees in turn use these wages to buy items previously purchased by the employer. Employees' wages and business sales to consumers (recorded in personal consumption expenditures) are raised by equivalent amounts. Omission of the imputation would understate the measures of personal income, personal consumption expenditures, and total output. It would also understate the real earnings of employees receiving food relative to those paid wholly on a cash basis.

A breakdown between payments in cash and in kind of private nonfarm wages and salaries in the "covered" industries is not available for States or counties. This is because such a breakdown is not provided in the basic payroll data for industries covered by Social Security legislation. The value of income in kind is covered in the payroll tabulations relating to both the State unemployment insurance systems and Old Age and Survivors Insurance, but is not reported separately by employers. Estimates of pay in kind are made for some of the noncovered industries at the national and State levels. Those estimates are of varying quality. At the county level, except for farms, the State totals of cash pay and pay in kind are distributed by the same allocator.

OTHER LABOR INCOME

Other labor income consists of supplementary types of labor income paid out or accruing in the current period. These include employer contributions to private pension, health and welfare, and group insurance plans; compensation for injuries; pay of military reservists; directors' fees; and several other minor items. The pay of members of the military reserve consists of compensation for inactive duty training under the various reserve programs. The employer contribution component currently accounts for 85 percent of other labor income nationally. The reliability of the county estimates for other labor income thus depends very largely upon the employer contribution item. Data on the other components remain inadequate.

Since employer contributions to private pension funds are made on behalf of employees, they have been distributed to counties on the basis of payrolls. The allocations have been carried out in considerable detail because the ratio of employer contributions to wages and salaries differs widely by industry. The procedure for estimating employer contributions to health and welfare funds followed the same pattern, using employment as the primary county allocator. A similar procedure was utilized for estimating compensation for injuries, employer contributions to supplementary unemployment benefit funds, and directors' fees.

Table 2. - Relative Importance of Other Labor Income, by Component, to Total Personal Income, United States, 1970 and 1975*

welfare funds	14,204 2,286	24,724 3,593	1.76	1.97	

^{*} Detail may not add to higher level totals because of rounding.

Includes pay of military reservists, directors' fees, compensation of prison inmates, marriage fees to Justices of the Peace, jury and witness fees, Federal Government contributions to Government Life Insurance, and employer contributions to supplementary unemployment benefit funds.

The remaining minor items of other labor income include compensation of prison inmates, marriage fees to Justices of the Peace, jury and witness fees, and Federal contributions to group life insurance. Together, these items account for less than 5 percent of total other labor income, and have been apportioned to the counties in terms of payrolls or civilian population as deemed most appropriate.

PROPRIETORS' INCOME

Proprietors' income measures the net business earnings of owners of unincorportated enterprises. Farmers, independent professional practitioners (such as physicians, dentists, and lawyers), entrepreneurs in nonfarm businesses, and others in self-employment status are included in the scope of proprietors' income. Two broad segments of this income component may be distinguished with respect to source material and methods of estimation--nonfarm and farm proprietors' income.

At the national level, prior to the 1976 benchmark revisions, nonfarm proprietors' income consisted of two items--"income of unincorporated enterprises" and "inventory valuation adjustment." The former item represents monetary earnings similar in definition to net business profit (gross receipts less expense of doing business) as reported by individuals and partnerships on their Federal income tax returns. The inventory valuation adjustment (IVA) is made necessary because, under the business accounting practices generally followed for tax reporting purposes, inventories are charged to cost of sales in terms of original cost rather than in terms of current market prices. In periods of changing prices, this practice results in gains or losses reflecting differences between replacement cost of goods taken out of inventory and their recorded acquisition cost, rather than reflecting current production, which is the appropriate measure for national income purposes. The IVA therefore represents the difference between current replacement cost and the "book value" of inventories charged to cost of sales. In general, the adjustment is negative during periods when prices of goods carried in inventory are rising and positive when inventory prices are falling. Lack of relevant information below the national level, however, precludes the development of estimates in similar detail at State and county levels.

No such adjustment is required in the case of farm inventories since farm income estimates are not based on tax return information and are computed directly so as to exclude inventory profit or loss.

A further modification of proprietors' income, the capital consumption adjustment, has been introduced into the newly revised national estimates (first published in the January 1976 Survey of Current Business). This conceptual change, as well as others made at the national level, will be reflected in the major revised State and local area personal income series to be released in August 1977 and April 1978, respectively.

Nonfarm Proprietors' Income

Nonfarm proprietors' income was based essentially on a 1962 county distribution of the all-industry State estimate derived from two sources. About two-thirds

Table 3. - Relative Importance of Proprietors' Income, by Component, to Total Personal Income, United States, 1970 and 1975*

^{*} Detail may not add to higher level total because of rounding.

 $[\]underline{1}/$ Less than .005 percent.

of the aggregate was allocated by reported Internal Revenue Service (IRS) data and the remaining one-third by the product of the number of nonfarm proprietors and average wages. This series was disaggregated by industry and extended to 1973, and intervening years, by OASI data (published in <u>County Business Patterns</u>) on the number of small establishments by industry and by county. In each instance, the preliminary county distributions were adjusted to equal, when summed, relatively more accurate State control totals. The 1973 distributions were used to allocate the 1974 and 1975 State totals since the 1974 <u>CBP</u> small establishment data were not yet available.

Self-employment income data from OASI administrative records for the period 1968-73 have been received from the IRS in cooperation with the Social Security Administration. This IRS/OASI data file contains the self-employment income reported by nonfarm proprietors to IRS when filing Schedule SE of Form 1040, the schedule for computing the Social Security self-employment tax. The records are identified geographically by a city name and zip code. The sole proprietors' records are coded by IRS with the SIC codes. No industrial classification was assigned to the records of partners' income. In order to ensure confidentiality, the industrial records are summed to county and industry and the data suppressed in those instances where there are three or less proprietors or partnerships or where the income of one or two establishments might be revealed.

The acquisition of this data file by BEA has made possible significant improvements in the county estimates of nonfarm proprietors' income at the two-digit industry level. However, because of the lengthy process of editing and evaluating the tabulated materials before incorporating them into the estimates, only the estimates for the trade and service industries (which together account for about 75 percent of total nonfarm proprietors' income) are presently based on the self-employment data. The 1968-70 data were incorporated directly into the estimates. The 1970 distributions were extrapolated to 1973 and intervening years by CBP small establishment data and adjusted to State totals. As in the case of the other industries, the 1973 distributions were used to allocate the 1974 and 1975 State totals.

With the processing of the tabulations having been completed, the IRS/OASI self-employment data for 1968-72 will be incorporated into the estimates for all industries in the forthcoming major revised State and local area personal income series.

Farm Proprietors' Income

Estimates of the net income of farm proprietors at both the State and county levels are equal to (and derived statistically as) the gross income of all farm operators minus production expenses and adjusted to exclude the income of corporate farms (see Exhibit B). Although unpublished, copies of these tables for the various counties are available upon request.

The concepts underlying the BEA county estimates of farm income are the same as those used for the national and State farm income estimates prepared by the

U.S. Department of Agriculture. The major conceptual difference between the two series is that the USDA totals include income of corporate farms while the BEA figures exclude income of corporate farms. It should be noted that total net farm income estimates measure income arising out of the <u>current year's</u> production in the farm sector.

In order to arrive at this level, income is adjusted by the value of the net change during the year in farm inventories of livestock and crops held for sale. If farmers sell crops in the current year that were produced in prior years, cash receipts from marketing will be overstated by the amount of sales from storage, the amount held in inventory will decline, and the net change in value of inventories will be negative. Conversely, if farmers store more of current output than they sell from storage, cash receipts will be understated and the net change in value of inventories will be positive. In either case, the correction yields a measure of farm income reflecting the results of current production.

The methods used to generate farm proprietors' income rely heavily on quinquennial data obtained from the Censuses of Agriculture and on selected intercensal data prepared by the Economic Research Service (ERS) at the State level and by the Statistical Reporting Service (SRS) at the county level. These data are used, where possible, to bridge the intercensal gap. In addition to these basic sources, other statistical sources in the U.S. Department of Agriculture, such as the Agricultural Stabilization and Conservation Service and the Federal Crop Insurance Corporation, are utilized in the preparation of a fairly detailed income and expense statement covering all farms in each State and county.

A substantial amount of farm data is reported to the IRS. However, these data are of limited use for local area farm income estimation due to a lack of standard accounting procedures on the part of the small independent proprietors. The diversity of accounting methods makes it difficult to calculate net income on any uniform basis. IRS tabulations have an additional limitation in that the tax concepts of income and deductions are not comparable with national income accounting concepts. Finally, IRS tabulations do not adequately cover the incomes of many farmers in the lower income brackets.

Gross income covers the following separately estimated items: (1) cash receipts from farm marketing of crops and livestock, (2) payments to farmers under the several government payment programs. (3) the value of food and fuel produced and consumed on farms, (4) the gross rental value of farm dwellings, and (5) the value of the net change in inventories of crops and livestock.

Cash receipts from marketings is the most important component of gross income. The USDA includes some 150 different commodities and generally has production, marketing, and price data available for preparing the estimates on a State basis. However, with the exception of a few States, annual county estimates of cash receipts by component are not available.

To offset this lack of current county data, estimates of cash receipts from marketings have been made by summing the USDA State estimates of cash receipts for individual commodities into the groups for which cash marketing data have been reported by county in the quinquennial Census of Agriculture. These aggregates were then allocated by a 1969 Census county distribution based on value of sales. In order to take account of the specific influence of weather upon

crop production, supplemental county estimates of annual production of selected field crops, available from the SRS, have been used to extrapolate the related Census of Agriculture benchmarks. In addition, SRS county data on production or cash receipts for commodities other than field crops, when available, have also been used as extrapolators. The county estimates for 1971-75 include county data on cash receipts from marketing crops prepared by the State SRS offices in Illinois, Montana, North Carolina, Ohio, Pennsylvania, South Dakota, and Texas. In addition, county data from Arizona and Oregon were incorporated into the 1974 and 1975 estimates.

We had assumed in the past that the relationships among counties with respect to livestock tend to be fairly constant from one census to the next and that marketings in the counties will move up or down together. For some of the important livestock-producing States, however, annual SRS county estimates of livestock on feed or cattle and calves on farms as of January 1 are now used to extrapolate cash receipts from the latest Census benchmark distributions. Moreover, the county estimates of cash receipts from the marketing of livestock prepared by six State SRS offices--Illinois, Montana, North Carolina, Ohio, Pennsylvania, and South Dakota--were first incorporated into the estimates for 1971-73. The 1974 and 1975 estimates include data from Arizona and Oregon, as well. These changes were dictated by intercounty shifts in livestock production.

All State and national estimates prepared by the USDA, with the exception of livestock marketed and purchased and rent paid, are used as control totals in making county allocations. However, because of differences in timing between the farm income and other components of personal income, it is not always possible to incorporate the most current USDA totals. When this situation arises, the national and State farm control totals are estimated in-house, using USDA and BEA data to ensure a consistent series. Because interfarm, intra-State transfers are compensating income and expense items when State accounts are aggregated, the USDA excludes these transactions in its estimates of cash receipts from marketing livestock and expenses of livestock purchased. However, at the county level, such transactions are not necessarily between farmers within a county, and an estimate of both income and expenses (equal at the State level) is made by BEA and distributed among counties by two different allocators--cash receipts for livestock and expenses for livestock purchased. Similarly, for net rent, the allocators for rent received are different from the allocators for rent paid.

Estimates of total government payments to farmers are available by county from the Agricultural Stabilization and Conservation Service (ASCS) on an annual basis.

There is relatively little direct information available for estimating county totals of such nonmoney income items as value of home consumption, gross rental value of farm dwellings and inventory change. The county estimates for these items are, for the most part, based on related data obtained from the Census of Agriculture.

Estimates of the change in farm inventories are weak. Production data were used to allocate inventory change in the same detail that State estimates were available. SRS production data were used when and where available. A serious drawback in using this technique is that it imposes upon each county the change registered at the State level, even though some counties may change in the opposite direction.

Production expenses were estimated by counties for some 45 items using direct and indirect county allocators to distribute the USDA-based State totals. Expenses of farmers by county for items comprising, on the national level, over half of total production expenses were available from the 1969 Census of Agriculture. These items are: feed purchased, seed purchased, expenditures for petroleum fuel and oil, livestock and poultry purchased, fertilizer and lime purchased, expenditures for pesticides, and cash outlays for hired farm workers. Data on the above items were used directly as reported, adjusting to the USDA levels when necessary. (Annual SRS county estimates of cash receipts from livestock and products were used to extrapolate the Census benchmark estimates of feed and livestock purchases in Illinois, Montana, North Carolina, Ohio, Pennsylvania, Arizona, and Oregon.)

The remaining production expenses itemized at the State level were allocated to counties by using indirect, but related, Census data such as crop production, machinery on farms, acres in farms, value of land and buildings, etc.

Because personal income refers to only that part of farm net income accruing to sole proprietors and partnerships, whereas the methodology used (as described above) estimated the net farm income of all farms, a further adjustment was made to exclude corporate farms.

The method introduced in the 1973 estimating cycle (and incorporated into the system for prior years) splits the aggregate net income of all farms in a given county on the basis of the division of acreage between corporate and noncorporate farms in that county, as reported in the 1969 Census of Agriculture. The resulting distributions were then scaled to State levels. Using this procedure, the net incomes of corporate and noncorporate farms were both either positive or negative, depending upon whether the estimate for all farms was a profit or loss.

DIVIDENDS, INTEREST, AND RENTAL AND ROYALTY INCOME

Dividends, personal interest income, and rental and royalty income of persons, both monetary and imputed, have maintained a relatively stable 12 to 14 percent share of the total personal income over the last 26 years.

The quality of the estimates of dividends and monetary interest has improved significantly in recent years with the introduction of comprehensive and direct data at the county level made available by the Internal Revenue Service (IRS). Prior to this, only indirect, incomplete and/or summary data were available for most counties. Monetary rents, royalties, and the imputed items (imputed interest and imputed rent), which together represent the remaining 40 percent of this type of payment, are still based on partial or incomplete data. Because of this, the county estimates of rental income as well as estimates for the imputed items continue to be of a relatively low order of reliability.

The monetary income components include dividends, interest, and rent and royalties received by individuals, fiduciaries, and nonprofit institutions. At the State level, it is possible to make separate estimates for each category of recipient. Because of the lack of detailed sub-State information pertaining to the income receipts of fiduciaries and nonprofit institutions, county estimates of dividends, monetary interest and monetary rent contain no breakdown

Table 4. - Relative Importance of Dividend, Interest, and Rental and Royalty Income, by Component, to Total Personal Income, United States, 1970 and 1975*

^{*} Detail may not add to higher level totals because of rounding.

of income flows by category of recipient. The proportion of monetary property income received by fiduciaries and nonprofit insitutions is estimated at about 10 percent. The method of estimation places most of the income of these quasi-individuals in the more urbanized or higher-income counties.

Dividends, Monetary Interest, and Monetary Rents and Royalties

Dividends and Monetary Interest

Separate special tabulations by county of dividend and interest income as reported on individual income tax returns for 1972 and 1974 were made available to BEA by IRS, enabling the establishment of reliable and more current benchmark estimates. Five-digit zip-coded tabulations of dividend and interest income were also provided by the IRS for 1969. The zip-coded tabulations of dividend and interest income were also provided by the IRS for 1969. The zip-coded data required conversion to a county basis, posing some problems where a zip code overlapped more than one county. The summation of the five-digit zip code to county levels produced a 1969 county distribution that is somewhat less reliable than the 1972 and 1974 estimates which were based on actual county tabulations.

Benchmark estimates of dividends and monetary interest for 1969, 1972, and 1974 were produced by disaggregating State control totals for each income flow by separate IRS-based county tabulations of dividends and interest for each of the corresponding three years. The 1975 estimates were made by using the 1974 county distributions to allocate the 1975 State totals. County distributions for 1970 and 1971, for each income flow, were developed from interpolations between the 1969 and 1972 benchmarks, based on the annual change in a modified county per capita income (i.e., adjusted to exclude dividends, interest, rents and royalties, and farm proprietors' income). The 1973 estimates were developed from straight-line interpolations between the 1972 and 1974 benchmark distributions. The interpolated series for each income flow were used to allocate the relevant State totals to the constituent counties.

Monetary Rents and Royalties

Since there are no five-digit zip-coded or county tabulations of rental and royalty income available from IRS, the 1969-75 estimates of monetary rents and royalties were developed, in part, directly from the IRS sample data for the top 125 SMSA's 8/ as published biennially in the Statistics of Income (SOI) and, in part, on the relationship between monetary rents and royalties and per capita personal income less farm proprietors' and investment income. For the benchmark years, the county distribution of monetary rent was based on the assumption that it paralleled that of monetary interest. The Statistics of Income SMSA data on rents for 1967, 1969, and 1971 were disaggregated to the county level on the basis of the 1969 benchmark for monetary interest. The 1969 distribution of monetary rent was subsequently adjusted for sampling variability by averaging the 1967, 1969, and 1971 distributions. The derived 1969 estimates, adjusted to BEA levels, provided the final estimates for the constituent counties of the selected large SMSA's. The 1970-74 estimates for these counties were produced by extrapolating the 1969 final estimates forward to 1974 by the change in per capita personal income modified to exclude farm proprietors' income, dividends, interest, and rent.

 $[\]underline{8/}$ New England SMSA's were excluded for reasons explained in the section, "Classification of SMSA's."

Estimates of monetary rent and royalty income for the remaining counties for 1969, 1972, and 1974 were prepared by disaggregating the "residual counties" control totals (derived as the difference between the State control total and the sum of the final estimates for the SMSA counties) by the corresponding 1969, 1972, and 1974 benchmark distributions of monetary interest. Estimates of rental income for 1970, 1971, and 1973 were developed by interpolating between the 1969, 1972, and 1974 distributions by the change in the modified per capita personal income. The resulting series were used to allocate the "residual counties" control totals for the relevant years. Because of the lack of current county information on monetary rents and royalties, the 1975 estimates were made by allocating the 1975 State control totals on the basis of the 1974 county distributions.

The foregoing procedure was followed for all States except California. The California Franchise Tax Board in its "Annual Report" publishes county data on income and losses from rents and royalties. County distributions of net income from rents and royalties derived from these data were used as allocators of the California State control totals.

Furthermore, 1972 rental incomes in New York and Pennsylvania were adjusted to include losses due to flood damage incurred from Hurricane Agnes. County estimates of rental loss in these two States were developed by distributing the State totals of rental loss by data on total assistance to counties damaged by flood, which were made available by the Small Business Administration. This distribution of rental loss was subtracted from a recomputed county distribution of monetary rents and royalties (which had been constructed by allocating a State control total, in which the rental loss was added back) proportionate to the original unadjusted county distribution of monetary rents and royalties.

Imputed Interest and Imputed Rent

Imputed Interest

Imputed interest represents the excess of income received by financial intermediaries from funds entrusted to them by persons over income disbursed by these intermediaries to persons. Part of imputed interest reflects the value of financial services rendered persons by financial intermediaries without charge. The remainder is the property income withheld by life insurance companies and mutual financial intermediaries on the account of persons, such as the addition of income to policyholder reserves held by life insurance companies.

In the absence of any information reflecting the amounts of imputed interest accruing to residents of the various counties, State totals of this item for 1969-75 were allocated by the county estimates of monetary interest.

Imputed Rent

Imputed rent measures the gross rental income accruing to nonfarm residents of owner-occupied nonfarm dwelling units less the normal expenses incurred in home ownership. A similar imputation for farm dwellings is implied in the estimates of the net income of farm operators. County estimates of nonfarm imputed net rent were prepared by allocating State totals to the county by the estimated

market value of owner-occupied, single-family nonfarm homes. This estimated market value was prepared for 1970 by multiplying the number of owner-occupied, single-family nonfarm dwellings in each county by their median value. Both numbers of houses and median values were reported in the 1970 Census of Housing. The 1970 amounts were used to allocate State totals for 1970 and subsequent years.

As in the case of monetary rental income, special estimating procedures were used for New York and Pennsylvania in 1972 to take account of the losses incurred due to the flood damage resulting from Hurricane Agnes. County estimates of imputed rental loss were derived by allocating the State totals of imputed rental loss by the data on total assistance to counties damaged by flood (as reported by the Small Business Administration). This distribution of imputed rental loss was subtracted from a county distribution of unadjusted imputed rent (i.e., unadjusted for losses from flood damage) to yield the final estimates of imputed rent for the counties of New York and Pennsylvania. The county distribution of unadjusted imputed rent for each State was constructed by allocating a State total (the sum of imputed rent and the absolute value of the imputed rental loss) by the Census-based county distribution of the market value of owner-occupied, single-family nonfarm homes.

TRANSFER PAYMENTS

Transfer payments, one of the fastest growing components of personal income, are, in general, receipts of persons from government and business (other than government interest) for which no services are rendered currently. The estimates of total transfer payments represent the summation of over 50 separate series. Many of the components are the result of detailed data collection. Others are estimated by means of allocators which vary considerably in quality. Nationally, data from administrative or fiscal records underlie approximately three-fourths of total transfer payments. At the county level, the proportion of total transfer payments based on the fiscal records of government agencies may vary from 50 to 80 percent, depending on the importance of the income flow to individuals from such programs as Old Age and Survivors Insurance, State unemployment insurance, Medicare, and various welfare and relief programs.

Federal Government

Benefits from Social Insurance Funds

Old Age, Survivors and Disability Insurance (OASDI)

County data on benefit payments disbursed by States under the Federal Old Age and Survivors Insurance program were tabulated from information reported by the Social Security Administration (SSA).

The total cash benefits paid during the year include monthly benefits paid to retired workers, dependents and survivors, and special payments to persons 72 years of age and over; lump sum death payments; and disability payments to workers and their dependents.

Table 5. - Relative Importance of Transfer Payments, by Component, to Total Personal Income, United States, 1970 and 1975*

	Dollars	Dollars (000,000)		of TPI
	1970	1975	1970	1975

^{*} Detail may not add to higher level total because of rounding.

^{1/} Includes military retirement, payments to paraplegics, payments to war orphans, payments to children of disabled veterans, payments for automobile and other conveyances for disabled veterans, and educational assistance to wives and widows of veterans.

Includes Federal fellowship payments, Area Redevelopment Act benefits, Manpower Development and Training Act benefits, Job Corps benefits, interest subsidy payments on higher education loans, Education Exchange (1970), and Basic Education Opportunity Grants (1973).

^{3/} Includes Bureau of Indian Affairs' payments and refugee assistance payments.

^{4/} Includes Panama Canal Construction Annuity Act payments, Alaska Native Claims Settlement Act benefits (1974), Federal payments to nonprofit institutions, Federal auto depreciation payments, and trade adjustment assistance.

 $[\]frac{5}{}$ Prior to 1974, estimated in combination with other types of public assistance to derive a single estimate of "Direct relief." (See text, p.35.)

 $[\]frac{6}{2}$ Includes veterans' aid, veterans' bonuses, payments to nonprofit institutions, public foster home care payments, and State and local government auto depreciation payments.

Includes consumer bad debts, corporate gifts to nonprofit institutions, cash prizes, unrecovered thefts of cash and capital assets, and personal injury payments from business to other than employees.

Estimates of total OASDI benefits at the county level were based on SSA tabulations of the amount of monthly benefits paid to those in current payment status as of December 31.

Special procedures were followed for estimating benefits for Alaska's census divisions. An allocator was constructed, based on 1970 Census of Population data, by multiplying the number of families receiving Social Security income in each census division by the mean amount of Social Security income received (in each division).

State Unemployment Insurance Benefits

State totals were allocated to counties by benefit data supplied by the State Employment Security Offices. While most States report benefits directly by county, a few report by local office. In the latter case, local office statistics were distributed among the counties that fall within the jurisdiction of the district office on the basis of Census of Population data on county unemployment. This is a weak procedure, and efforts are being made to obtain the more current county unemployment totals being developed by the Employment and Training Administration as part of the administrative record requirement of the comprehensive Employment Training Act.

Unemployment Compensation for Federal Employees

Employment Security Offices in a number of States now supply county or local office data on unemployment compensation paid to Federal employees. Where county data are available, State totals were allocated directly. Local office data were disaggregated using the procedure outlined for "State Unemployment Insurance Benefits." For the remaining States, estimates of Federal civilian wages and salaries were used as county allocators.

Railroad Benefits

Five types of benefits--retirement, survivors, unemployment, cash sickness, and maternity--are paid out under the Railroad Retirement Act and the Railroad Unemployment Insurance Act.

For the period 1970-75, benefit payments made under the provisions of the Rail-road Retirement Act were based on a 1971 benchmark estimate constructed from 1971 zip code data compiled by the Railroad Retirement Board. The zip code data were summed to county totals and extrapolated forward to 1974 and back to 1970 by county estimates of railroad wages and salaries. The 1974 estimates were used to distribute the 1975 State totals. Benefits paid out under the provisions of the Railroad Unemployment Insurance Act were estimated by allocating State totals by county estimates of railroad wages and salaries.

Government Life Insurance Benefits

This series is composed of (1) death benefits paid under the National Life Insurance Act to survivors of veterans of World War II, the Korean Conflict, and the Vietnam Era, (2) death benefits paid from the Government Life Insurance Fund

to survivors of World War I veterans, and (3) special dividends disbursed to veterans holding National Service Life Insurance policies.

County estimates of Government Life Insurance benefits (including Military and Naval Insurance and Servicemen's Indemnity) for the period 1970-75 were based on a county distribution of total veteran population as reported periodically by the Veterans Administration. (Benchmark data are available for 1969, 1973, and 1974. For the 1969-73 period, annual estimates of veteran population were derived by interpolating between the benchmarks.) The 1974 veteran population was used as the allocator for 1975.

Federal Civilian Pensions

This component includes payments made to, or on behalf of, former employees of the Federal Government covered by the Civil Service Retirement and Disability Fund or by special contributory and noncontributory retirement systems.

Federal civilian pensions for the period 1970-75 were estimated in three segments-employee annuties, survivor annuities, and all other. Zip code distributions of benefit payments for 1971, 1972, and 1975, compiled by the Civil Service Commission, were summed to county totals and used as allocators of State totals for those years. Allocators for 1973 and 1974 were derived by straight-line interpolation between the benchmark distributions. For years prior to 1971, county allocators were prepared by extrapolating the 1971 Civil Service distributions of benefit payments back to earlier years by the change in Federal civilian payrolls.

Medicare Benefits

Included in this category are the benefits received from both the hospital insurance and supplementary medical insurance provisions of Medicare. For all States except Alaska, the county distributions of Medicare benefits were based on the dollar amount reimbursed by Medicare to persons for medical and hospital expenses incurred as reported by the Social Security Administration. Due to the lag in the availability of the data, the 1973 distributions were used to allocate the 1974 and 1975 State totals.

The amount of Medicare benefits paid to persons residing in Alaska's census divisions for the period 1970-75 were based on estimates of income received from Social Security, derived for each division by multiplying the number of families receiving Social Security income by the mean amount of Social Security income received in 1969, reported in the 1970 Census of Population for each division.

Veterans' Benefits

Veterans' Pensions and Compensation

This item consists primarily of compensation to veterans for disability and payments to their survivors, including "survivors' indemnity payments" to survivors of veterans who were in the Armed Forces on or after June 27, 1950. Those eligible for benefits include veterans of all wars since the Spanish-

American War, as well as those who served in peacetime and incurred service-connected disabilities. Veterans with nonservice-connected disabilities who are permanently and totally disabled and meet specified income requirements are also eligible for benefits.

An allocating series was constructed from a 1972 zip code distribution of veterans' pension payments for one month, compiled by the Veterans Administration. The zip code data were summed to the county level and extrapolated back to 1970 by the change in the county distribution of the total veteran population as reported by the Veterans Administration (see "Government Life Insurance benefits"). This series was used to disaggregate the State totals of veterans' pensions and compensation for the years 1970-72. The 1972 distribution was used to disaggregate the 1973-75 State totals.

Military Retirement Benefits

An allocating series was constructed for this component from the June 1972 and June 1974 zip code distributions of military retirement payments compiled by the U.S. Department of Defense. The 1972 zip code data were summed to counties and extrapolated back to 1970 by the change in the county distributions of civilian population. (County estimates of civilian population for 1970 were derived by subtracting Armed Forces population from total population as reported in the decennial Census of Population. For 1971 and 1972, Bureau of the Census postcensal county estimates of population were adjusted to exclude the military, using BEA estimates.) State totals of military retirement benefits for 1970-72 were then disaggregated to constituent counties by this derived allocating series. The 1974 zip code data (summed to county totals) were used to allocate the 1973-75 State totals of benefits paid.

Payments to Paraplegics

This item consists primarily of grants to veterans with service-connected disabilities requiring specially adapted "wheelchair homes." It applies to all veterans since World War II. Due to the lack of more relevant data, county estimates have been based on county distributions of total veteran population obtained from the Veterans Administration.

Payments for Autos and Conveyances for Disabled Veterans

This component covers payment to veterans with specified, service-connected physical handicaps toward the purchase price of an automobile (or other conveyance) and necessary adaptive equipment, as well as for the repair, reinstallation, or replacement of such equipment. As is the case of payments to paraplegics, county estimates have been based on the distribution of total veteran population because of the lack of more direct data.

Veterans' Readjustment Benefits

The benefits included in this component are subsistence payments for schooling and educational allowances made to veterans of the post-Korean Conflict period under the Veterans' Readjustment Benefits Act of 1966.

County estimates of veterans' readjustment benefits were assumed to be in proportion to the county distributions of veterans of the post-Korean Conflict period as reported by the Veterans Administration.

Unemployment Allowances for Veterans (UCX)

This item covers unemployment compensation payments to veterans who, in general, had 90 days or more of continuous active service and are not receiving certain educational assistance or vocational subsistence allowances from the Veterans Administration. Although the amount and duration of payments are governed by State laws, the benefits are paid from Federal funds.

The Employment Security Offices in slightly less than half of the States currently provide county or local office data on unemployment compensation paid to veterans. A varying number of States have been supplying such UCX data since 1965. Where county benefit data were available, State totals were allocated directly. "Local office" data were processed, as described in "State Unemployment Insurance Benefits," in order to develop a comprehensive county allocator. For the "nonreporting States," the State totals were apportioned among the counties in accordance with total veteran population as published by the Veterans Administration.

Other Veterans' Benefits

This category, comprising less than 10 percent of total veterans' benefit payments, includes payments to war orphans, payments to children of disabled veterans, and educational assistance to wives and widows of veterans.

Because of the lack of more relevant data, the county estimates of all three of these components were made by distributing the State totals in proportion to estimates of civilian population for corresponding years. (See "Military Retirement Benefits" for the description of the method used for estimating civilian population.)

Other Federal Government Transfers

While other types of transfer payments are made by the Federal Government in addition to social insurance and veterans' benefits, they currently represent, in aggregate, less than 5 percent of all Federal benefit payments. A description of the methods of estimation at the county level of these "other" Federal transfer payments are detailed below in order to provide a more complete picture.

Federal Fellowship Payments

This component includes only the subsistence portion of the fellowship, which is paid directly to the individual. The far larger portion is given by the government directly to the school and, therefore, is treated in the national accounts as either a transfer payment to a nonprofit institution or a government grant-in-aid. Separate estimates are made for Atomic Energy Commission

(AEC) fellowships, National Science Foundation (NSF) fellowships, payments to State Marine School cadets, and "all other" fellowships.

Since 1970, annual data on the dollar amounts of newly awarded AEC fellowships by institution have been available from NSF. The county in which each institution is located was identified, and the data were then summed to form a county allocating series which was used to distribute the State totals of AEC fellowship subsistence payments for the period 1970-75. (The 1974 distribution was used to allocate 1975 State totals). Civilian population was used for all years for Alaska.

NSF fellowships are granted to outstanding science students to encourage careers in science and engineering. Annual NSF data on the number of students receiving such fellowships, by institution, were summed to counties and used to allocate the State totals of NSF fellowship subsistence payments for the period 1970-75 (The 1974 distribution was used to allocate 1975 State totals.)

The Federal Government makes subsistence payments to cadets attending State Marine Schools as authorized by the Maritime Academy Act of 1958. Since there is only one such school in each of the six States involved, the county estimates were made by assigning the State totals to the county in which each school is located.

County estimates of subsistence payments of "all other" fellowships were derived by apportioning the State totals in accordance with the county distribution of the civilian population for the corresponding years.

Alaska Native Claims Settlement Act Payments

The Alaska Native Claims Settlement Act, enacted in 1971, provides "for the fair and just settlement of all claims by Natives and Native groups in Alaska, based on aboriginal land claims." Settlement is made through the granting of land rights to groups of Natives and through money payments to resident and non-resident Natives. (The claimant, however, must have been a resident of a non-urban village comprising at least 25 Natives at the time of the 1970 Census enumeration.)

Estimates of these payments at the Alaska census division level for 1971-75 were made by allocating the State control totals by the distribution of the number of Natives as reported in the 1970 Census of Population.

NOTE: The transfer payment component, "Alaska Native Service," which appears in the accounts in prior years, and estimated as an insignificant \$1 million annually, refers to a different Federal program. The Alaska Native Service was designed to raise the educational level of the Alaska Natives as well as to assist in improving their economic and social conditions.

Bureau of Indian Affairs (BIA) Payments

Included in this category are a variety of programs for the benefit of Indians on reservations, such as general assistance to needy Indians, adult vocational

training, and direct aid to college students. County estimates were based on 1962-63 data on U.S. Indian population on land administered by the Bureau of Indian Affairs.

More current data on the Indian population on reservations are being made available by BIA and will be incorporated into the estimates at a later date.

Alaska totals were distributed among the census divisions by the 1970 Census of Population data on Indian population.

Federal Auto Depreciation Payments

These are payments for depreciation of privately owned automobiles used in Federal Government service. In making the county estimates, State totals for all years were allocated to counties by REMD estimates of Federal civilian payrolls.

Food Stamp Act Payments

This item reflects the net value of the bonus coupons issued to qualifying household units. Selected fiscal year county data on bonus coupons issued, as reported by the U.S. Department of Agriculture, are available for most States. These data were converted to a calendar year basis and then adjusted to State totals. For those States for which there are only partial or no county data available, allocations were made on the basis of direct relief payments reported on a county-by-county basis (see State and Local Government Transfer Payments).

Refugee Assistance Program

This component represents the financial assistance for resettlement paid mainly to Cuban refugees, as authorized by the Immigration and Refugee Assistance Act of 1962. Similar assistance to Vietnamese refugees, authorized by the Indochina Refugee Assistance Act of 1975, are reflected in the 1975 estimates.

Direct county data have been available from most State Departments of Public Welfare. For those States from which no such data were available, civilian population was used as the county allocator.

Black Lung Benefits

These benefits are the monthly cash payments (beginning in 1970) paid to coal miners who are totally disabled by "black lung" disease. Payments are also made to dependents as well as specified survivors of miners who died due to the disease. Beginning in 1974, regional benefit data for the month of June became available from the Social Security Administration. The 1974 and 1975 data were converted to a county basis for the 15 States in which 95 percent of the benefit payments are made. For the remaining States, State totals were allocated to counties by the number of persons 60 years of age and over receiving OASDHI benefits.

Basic Education Opportunity Grants

This program, inaugurated in 1973, provides grants for the education and training of persons with low incomes.

Estimates of payments made under this program are based on 1974 and 1975 disbursement data supplied by the Department of Health, Education and Welfare. These data, tabulated by instituion, street address, zip code, and State, were subsequently county coded and summed to county totals. The resulting distributions were used to allocate the 1973-75 State totals.

Supplemental Security Income (SSI) Program, Federal Payments

The new Federal program of Supplemental Security Income payments for the aged, blind, and disabled, administered by the Social Security Administration and financed from the general revenue of the Treasury, became operational January 1, 1974. The Federal payments, in combination with supplementary State payments (see State and local government transfers), have replaced payments under the Federal-State welfare system whereby matching Federal grants were made to States for benefit payments to persons eligible for Old Age Assistance, Aid to the Blind, and Aid to the Permanently and Totally Disabled.

For personal income purposes, these Federal transfers are estimated in two parts: "SSI Basic Benefits" and "Hold-Harmless." The latter item refers to the section of the new law which requires those States already paying benefits above the new Federal minimum to maintain the level of payment in effect as of January 1972 for all eligible recipients. However, to minimize the financial burden of this mandatory supplementation, the law also provides that those States concerned need pay only an amount not to exceed their 1972 cash public assistance payments to adult welfare recipients and that the remaining necessary funds be provided by the Federal Government.

Estimates of the "SSI Basic Benefits" and the "Hold-Harmless" payments were made by allocating the State totals among the counties by the distribution of the number of persons on the SSI rolls. This information was made available by the Social Security Administration.

Special Payments to Recipients of OASI, SSI, and Railroad Retirement Benefits

This reflects the \$50 payment made in 1975 to persons receiving Social Security, Supplemental Security Income, and Railroad Retirement benefits. State totals were allocated to counties by the number of persons 60 years and over on the SSI and OASI rolls.

All Other Federal Transfer Payments, n.e.c.

The remaining Federal transfers, with the exception of payments to nonprofit institutions, represent relatively minor dollar amounts. They include Panama Canal Construction Annuity Act payments, Area Redevelopment Act payments, interest subsidy payments on higher education loans, trade adjustment assistance, and benefit payments made under the Manpower Development Training Act, Job Corps,

and the Education Exchange program. Because of the absence of specific geographic data, estimates of these transfers were based on the county distribution of civilian population.

State and Local Government

Benefits from Social Insurance Funds

State and Local Government Retirement Benefits

Representing nearly one-third of all State and local government transfers, these cash payments include not only monthly benefit payments but lump sum payments and withdrawals as well. Since direct data are unavailable, county estimates were made using the REMD county estimates of State and local government payrolls as distributors of the State estimates.

Efforts are being made to develop alternative allocators based on data more closely associated with retirement payments. However, additional testing is needed to determine the extent of their validity.

Cash Sickness or Temporary Disability Payments

These are weekly cash benefits from State-administered programs to insured workers unemployed because of nonoccupational illness or accident. This type of program is in effect in only four States---Rhode Island, California, New York, and New Jersey. County tabulations of actual dollar amounts are not available. County estimates of cash sickness payments were made by apportioning the State totals in accordance with the annual distribution of civilian population.

Veterans' Benefits

Veterans' Aid

The major portion of the benefits included in this category are welfare payments made by State and local governments to indigent veterans. Since there are no direct data available, county estimates of veterans' aid are based on selected population data. State totals for 1970-75 were distributed to counties by the number of veterans of the post-Korean Conflict period, tabulations of which are available from the Veterans Administration.

Veterans' Bonuses

Bonuses were paid to veterans of World War II, Korea and Vietnam. The amount of veterans' bonuses paid out in 1970-75 were based on the county distributions of veterans of the post-Korean Conflict period.

Other State and Local Government Transfer Payments

Direct Relief Payments

This component had, in recent years, comprised slightly more than half of total State and local government transfers. County information on the amount of benefit payments made, separately, for Aid to the Aged, Aid to Families with Dependent Children, Aid to the Blind, Aid to the Disabled, and General Assistance (maintenance payments only) were available annually from the State Departments of Welfare and/or the National Center for Social Statistics of the U.S. Department of Health, Education and Welfare. These data were summed and used to distribute a combined total of programs falling into the category of direct relief payments. The measurement of these components would have been improved by the construction of county distributions for each individual program. However, this was not possible because of frequent changes in the structure and composition of the various programs.

The introduction of the new Supplemental Security Income Program in 1974 (see Federal Government transfer payments) has made this component obsolete. Benefit payments under the various programs are now grouped differently (see below).

Supplemental Security Income (SSI) Program, State Supplementation

This item includes the State mandatory supplementation payments made under the Hold-Harmless provision of the SSI law (discussed under Federal Government Transfer Payments, SSI Program) and State optional supplementation payments. This latter category derives from the provision of the SSI law that allows States to voluntarily make benefit payments above the Federal minimum requirements through their own (State-administered) programs.

The county estimates are based on county distributions of the number of persons enrolled in the SSI program, available from the Social Security Administration, which were used to allocate the State control totals.

Aid to Families with Dependent Children (AFDC)

Prior to 1974, this category of public assistance was estimated in combination with four other programs under the general heading "Direct Relief Payments." Three of these programs are now covered by SSI and are estimated for 1974 and 1975 as such (see Federal Government Transfer Payments, SSI Program). AFDC still operates under the Federal-State welfare system whereby matching Federal funds are provided to the States for money payments to persons in need of public assistance.

Estimates for 1974 and 1975 were based on benefit payments data made available by various State Departments of Welfare and by the National Center for Social Statistics of the U.S. Department of Health, Education and Welfare.

General Assistance

This is the fifth of the five programs that had formerly been estimated in aggregate as "Direct Relief Payments." It is aid furnished by State or local governments to needy individuals or families who do not qualify for help under the Federally aided assistance programs. There is no Federal financial participation in this program.

With the introduction of SSI in January 1974, as described for AFDC, General Assistance is now estimated separately. The county estimates are based on direct data provided by the State Departments of Welfare.

State and Local Medicare Benefits

These transfers represent the premiums for the Supplementary Medical Insurance program of Medicare paid by State and local public assistance agencies for aged persons receiving welfare. County tabulations of persons enrolled in the Supplementary Medical Insurance program, obtained from the Social Security Administration, were used to apportion State and local Medicare benefits to individual counties.

Public Foster Home Care

County estimates of payments for public foster home care for the period 1970-74 were estimated by allocating the total amount expended by the State to individual counties on the basis of the number of children 18 years of age and under as reported in the 1970 Census of Population.

State and Local Government Auto Depreciation Payments

This item is similar to the auto depreciation component in Federal transfers. County estimates for all years are derived by allocating the State estimates of the amount of State and local government auto depreciation payments according to the county disbursements of State and local government payrolls.

State and Local Government Payments to Nonprofit Institutions

The estimates were made in three pieces--private foster home care payments, educational assistance payments, and "other payments." For <u>private</u> foster home care payments, State totals were distributed to counties by the same allocators as were used for estimating <u>public</u> foster home care payments. The amounts paid out by States for educational assistance and for "other payments" were allocated to counties by civilian population.

Business Transfer Payments

Business transfers account for about 4 percent of total transfer payments in the United States. The estimates, of varying quality at the national level, are of

questionable validity at the State and county levels. There are no direct data available except at the national level and little relevant secondary information available to use as allocators.

Consumer Bad Debts

County estimates were derived by apportioning the State totals in accordance with the county distributions of retail sales as published in the quinquennial Census of Business.

Corporate Gifts to Nonprofit Institutions

State totals were allocated to counties by civilian population.

Other Business Transfers

Included in this category are cash prizes, unrecovered thefts from business of cash and capital assets, and personal injury payments from business other than to employees. County estimates were made by distributing State totals in proportion to the civilian population.

PERSONAL CONTRIBUTIONS FOR SOCIAL INSURANCE

Contributions made by individuals under the various social insurance programs are excluded from personal income by handling them as explicit deductions. Payments by both employees and nonfarm self-employed are included in the series.

The employee portion covers contributions for Old Age, Survivors, Disability, and Health Insurance (OASDHI), State unemployment insurance, railroad retirement insurance, cash sickness insurance, and Federal, State, and local public employee retirement systems, as well as premium payments for Government Life Insurance. Contributions of the self-employed relate to OASDHI only. These were first made in 1952 under amendments extending coverage of the OASI system as of January 1, 1951. In most cases, contributions of employees are withheld from payrolls; those made by self-employed individuals are paid annually with their Federal income tax returns.

The personal contributions item in the State and county personal income series is the same as that which enters the national accounts except for an adjustment for contributions to retirement systems made by Federal employees stationed abroad.

In addition to individuals' contributions for social insurance, State and county personal income excludes the contributions made on behalf of employees by their employers. Employee and employer contributions, though viewed as part of the total earnings of employees, are not actually received by them in the current period. In the national income accounts, they are recorded as receipts of social insurance funds in the government sector. The contributions made by

^{*} This table has meaning only in the perspective of giving statistical balance to similar tables, appearing at the beginning of each section, for the various types of payments that make up personal income. The absolute amounts in this table, however, do give an indication of the size of the personal contributions components being estimated.

^{**} Detail may not add to higher level totals because of rounding.

^{1/} After deduction of personal contributions from the sum of all personal income payments.

self-employed persons are treated in the same way--even though paid by them out of current income.

Employee contributions to most programs of social insurance are collected in a manner similar to taxes on wages and salaries in that they are withheld at the source of disbursement under the laws of the Federal Government and of some State and local governments. However, the amounts of such taxes are counted as part of personal income—as though first received by the employee and then paid to government. This is in line with the overall definition of personal income as a before—tax measure. Admittedly, the difference in treatment accorded withheld taxes and social insurance contributions is somewhat arbitrary.

The general procedure used to estimate personal contributions to social insurance was to allocate State totals to the counties on the basis of payrolls or proprietors' income in the relevant category of income. There are several exceptions to this rule. Government Life Insurance (GLI) contributions were estimated by allocating State totals to counties on the basis of veteran population. State UI and cash sickness contributions were generally apportioned in accordance with selected population series from the decennial Censuses of Population. These contributions are made by employees in only a few States.

RESIDENCE ADJUSTMENT

"Residents" Defined

Personal income is defined as the current income received by residents of an area from all sources. The meaning of the term "residents" is therefore of primary importance since it delimits the economies of the various political subdivisions in terms of the summary personal income measure. As defined, residents include not only individuals but quasi-individuals. The latter, a small percentage of the total, are organizations which either function to serve individuals directly or are established in their behalf, e.g., nonprofit institutions and private trust funds. As they are nonprofit in character, they are clearly distinguishable from business enterprises. Nonprofit institutions include religious organizations, social and athletic clubs, labor organizations, nonprofit schools and hospitals, charitable and welfare organizations, and other private nonprofit agencies furnishing services to individuals.

The meaning of the term "resident individual" requires some explanation. Military personnel are considered residents of the State and county in which they are stationed, even though they may consider themselves permanent residents of another area. Similarly, Federal civilian employees are counted as residents of the State and county in which they live and work or from which they commute to work, regardless of the area they consider to be their permanent residence. By the same token, members of the Armed Forces and Federal civilian employees who are located away from their State or county of usual residence are not counted as residents of that State or county in the measurement of personal income. If they are located overseas, they are excluded altogether. Exclusion of income disbursed by the Federal Government to its personnel stationed outside the continental limits of the United States constitutes the major conceptual difference between the State series and the national personal income measures carried regularly in BEA's national income and product accounts. In addition, currently there are other definitional and statistical differences because the national benchmark revisions introduced in the January 1976 Survey have not yet been incorporated.

While the conventions used in defining the residence of Federal Government personnel are the most important, similar conceptual problems occur in defining several groups of residents engaged in activities in the private sector. BEA measures the labor income of seasonal migrant workers in the regions in which the work is performed. No attempt is made to adjust the data to reflect a concept of "permanent" or legal residence. 9/ Rather, the wages of seasonal migrant workers are combined with the wages of nonmigrants and are assigned to the States and counties where the workers live while the work is being performed. However, the wages of a worker on a short temporary assignment away from his home office or usual place of work are measured as if he had worked continuously at his usual place of employment.

^{9/} An exception to this general approach is made for the wages paid to migrant workers in Alaska, most of whom have little connnection with the Alaskan economy. As part of the residence adjustment procedures, these wages are assigned to the States and counties where the workers are assumed to have their "permanent" residences.

In short, individuals actually residing in a State or county, civilian and military personnel alike, are covered by the personal income measures: those living elsewhere, even though normally residents of the State or county, are not counted as residents. This generalization does not mean that the personal income estimates for a particular State or county include the income of tourists or others in temporary stay; these are not counted as residents. The concept of residence is based essentially on physical rather than usual, permanent, or legal residence. It differs from the Census concept mainly in the treatment of seasonal and short-term workers. Whereas Census includes such workers at their usual place of residence (rather than where they were on April 1), BEA assigns the wages of these workers to the area where they resided while performing the work.

In the case of quasi-individuals, the residence of a nonprofit institution is determined according to its geographic location. The residence of a private trust fund or fiduciary, however, is considered to be identical to that of its beneficiary. Since the income received by these entities is received on behalf of individuals, BEA is concerned with the location of the individual rather than the location of the fund.

Residence Adjustment Procedure

In order to estimate the total and per capita income of residents in a local area, all the components of personal income must be put on a "where-received" (i.e., place-of-residence) basis. In the BEA local area income series, dividends, interest, rental income, and transfer payments are estimated on a where-received basis. The proprietors' income series is treated as being on a where-received basis although fragmentary information indicates that for many urban counties the estimates may represent a mixture of the place-of-work and place-of-residence classification.

Wages and salaries, other labor income (OLI) and personal contributions were adjusted to convert them from a where-earned to a where-received basis. Excluded from adjustment were farm wages and OLI, private household wages and OLI, the allowances and allotments portion of military pay, the pay of military reservists (the latter a component of OLI), personal contributions for Government Life Insurance, State unemployment and cash sickness insurance, and contributions by the self-employed for Old Age, Survivors, Disability and Health Insurance, since these are already on a place-of-residence basis. [The term "income subject to adjustment" (ISA), referred to throughout this section, represents the sum of all the personal income components estimated on a place-of-work basis.]

The residence adjustment was based primarily on commuting and income data obtained from the 1960 and 1970 Censuses of Population and on the 1972 and 1974 county wages reported by the Internal Revenue Service. The Census commuting data give the place of residence and place of work of employed persons at the State and county levels. Data on average incomes for selected groups of commuters were also available from the 1970 Census and were incorporated, for the first time, into the 1973 estimating cycle. The Census commuting and average income data were used in the procedures described below to yield the primary residence adjustment. Census county wage data for 1969 and IRS county wage data for 1972 and 1974 were used to identify the areas that needed further adjustment and to determine the size of the correction.

The method used in deriving the primary residence adjustment follows. First, an average "income subject to adjustment for residence" (ISA) was computed for each county for each year. These averages were calculated by dividing the ISA by the corresponding total employment, derived from the 1960 and 1970 Census commuting flow tabulations. The estimates of employment for the intercensal years were derived by a straight-line interpolation between the 1960 and 1970 Census commuting data benchmarks. The 1970 Census commuting data were used for 1971-74 (see Exhibit C).

The average ISA's were weighted for each commuting flow using 1969 special tabulations of Census income data. $\underline{10}$ / These Census data relate the average income of persons working in a given county, classified by county of residence, to the average income for \underline{all} workers in that county of work. Thus, if the Census income data indicated that commuters working in County A and living in County B had an average income 1.5 times as great as all workers employed in County A, then the average ISA for County A was multiplied by 1.5 to obtain a weighted average income for that specific group of commuters.

The weighted income average of each group of commuters (as described in the preceding paragraph) was multiplied by the number of workers in that group (derived from the Census commuting flow tabulations) to yield a preliminary gross income flow. (The gross flows across State lines were adjusted to the controls estimated in the residence adjustment of State data.) All gross flows pertaining to a given county were then used to compute the county net residence adjustment; i.e., the sum of the flows into the county minus the flows out of the county. (NOTE: In the foregoing procedure, the "employment" and "average income" data were derived for computational purposes only and were not intended to serve as measures of actual employment or average income of commuters.)

For the years following 1970, under the foregoing procedure, all the dollar flows out of the county of work grow at the same rate as the ISA of that county. The resulting net flow of income between a given county and its neighbors varies from year to year because of the differences in the rates of growth among the counties. If a county's ISA is growing faster than that of its commuting neighbors, its <u>net residence adjustment</u> as a percent of its ISA becomes more negative. Conversely, if the growth is slower, the relative net adjustment becomes more positive (see Exhibit D).

The estimates of total personal income, adjusted for residence as described above, were subjected to careful editing. The editing centered around the distribution of residence-adjusted wages within BEA economic areas $\underline{11}$ / since there is little commuting across economic area boundaries. This editing provided an indication as to which counties within an economic area required further adjustment as well as the size of the adjustment.

Sharp changes in employment and in commuting patterns can occur in the course of a few years, and such sudden changes can lead to significant errors in the

^{10/} This was done for approximately 40 percent of all the commuting flows for which basic data are available from Census, including all flows of major importance. The remaining commuting flows were given a weight of one.

^{11/} See Appendix, "Classification of Economic Areas," for definition.

estimates of total personal income and per capita personal income. This problem has, however, been handled with reasonable effectiveness by the use of 1969 wage data from Census and 1972 and 1974 wage data from the IRS in a comprehensive editing routine. Ad hoc adjustments were, for the most part, made only in those cases where correlative information supported IRS or Census data. (In counties dominated by military bases, the BEA estimates are consistently higher than those of either Census or IRS. They were left that way.) Where ad hoc commuting adjustments were justified, all available information about the changes in industrial or demographic structure of the county were utilized in determining the size of the additional adjustment. If the income estimates for a given county appeared to be too high, an adjustment would be made only if further analysis indicated that the estimate for an adjacent or nearby county was too low. Increasing the gross flow from the former to the latter then improved the estimates for both counties.

PER CAPITA INCOME

Per capita income is computed by dividing the residence-adjusted total personal income by population estimates. For 1971 forward, the population data are provided by the Bureau of the Census for July 1 of each year. 12/ For earlier noncensal years, Census State population totals, available annually, were distributed among the counties using county population data available from the individual States.

BEA attempts, with varying degrees of success, to make its total personal income series geographically consistent over time. In some cases, this is difficult to do because of the annexation of territory of one jurisdiction by another, leading to discontinuities in the population data. This leads to an understatement or overstatement of the per capita estimates for the years prior to annexation. In those instances where such errors are significant, the per capita income estimates are suppressed.

Per capita income can vary widely from county to county. Those with either extremely high or low per capita incomes are generally the small counties. In many instances, an unusually high (or low) level of per capita income is temporary and results from unusual conditions such as a bumper crop, a major construction project (i.e., a defense facility, a nuclear plant, or a dam), or a catastrophe (i.e., flood, tornado, or drought). In some cases, a high per capita income is illusory (for example, when a construction project brings in a large number of high-paid workers who live near the site and are included in the population count, but who send a substantial portion of their wages to their dependents living at their permanent homes in other counties). Conversely, counties with heavy institutional populations may show unusually low per capita incomes.

In addition, because population is measured as of one date, whereas income is measured as a flow over the calendar year, a significant change in population during the year, particularly after July 1, can cause a distortion in the per capita figure.

^{12/} However, these data reflect the college student population as of April 1.

It should be noted that the considerable differences between BEA's estimates of per capita income and Census' estimates are due to differences in definition of income, collection mode, and method of computation. For example, Census computes 1969 per capita income by dividing $\underline{1969}$ total \underline{money} income by $\underline{1970}$ total population, whereas BEA derives its 1969 per capita income by dividing $\underline{1969}$ total $\underline{personal}$ income by $\underline{1969}$ total population.

Plus: Farm wages and perquisites		1,711	1,688	1,588	1,596	1,756
Plus: Farm other labor income			19	22	26	25
Equals: Total Farm Labor and Proprietors' Income	32,240	19,422	17,646	18,596	38,806	18,110

^{*} Shown only for those States which produce county estimates of cash receipts. For all other States, county estimates of cash receipts are made by BEA at the level of detail shown.

^{**} Conceptually, corporate farm income is excluded--and thus subtracted--from total net income of all farms in deriving the net income of farm proprietors. However, due to the statistical adjustment as well as to the method used in estimating corporate farm income at the State level, positive adjustments to counties with no corporate farms may occur.

^{*} Net residence adjustment as a percent of income subject to adjustment.
** 1970 ratios of \$ outflow to income subject to adjustment are constant through 1973 (see text p.42).
Explanatory Notes to Exhibit D -

^{1.} As is demonstrated in Exhibit C, the residence adjustment procedures for 1970 and later years cause any given outflow of dollars from a county to be a constant percentage of the income subject to adjustment in that county.

^{2.} If the income subject to adjustment (ISA) of a given county grows faster than its commuting partner's ISA, its net residence adjustment as a percent of ISA will become more negative as its outflows grow faster than those of its partner. This is not only dramatically illustrated by county Z in 1971 but also illustrated by County W over the 1970-73 period. Note that the sudden change in County Z in 1971 does not appreciably affect County Y because the flow from County Z to County Y is so small.

^{3.} County Z seems to contradict the rule stated in Note 2. Although its income subject to adjustment (ISA) grows at a slower rate than the ISA of the group as a whole, over the 1970-73 period, its residence adjustment as a percent of ISA becomes more negative. This occurs because its ISA has grown more than that of its major commuting partner, County Y. The growth rate of Counties W and X will have little effect on County Z because of the relatively small amount of commuting of the residents of County Z to Counties W and X.

CLASSIFICATION OF SMSA's

The classification of SMSA's used by BEA in its personal income estimates conforms, with a few exceptions, to the Office of Management and Budget (OMB) definitions as originally issued in 1967 and to each succeeding amendment through February 1977. The exceptions are as follows:

In New England, SMSA's are defined officially in terms of cities and towns instead of counties. For use in summarizing data for New England that are available only for entire counties and to provide a county version of the New England areas for purposes of comparison with areas in other parts of the country, OMB developed a list of New England County Metropolitan Areas (NECMA's). The NECMA's are defined in terms of whole counties, following criteria identical to those used to define SMSA's in other States. The title of each NECMA includes each of the cities within its boundaries that is an SMSA city.

Because adequate data for measuring personal income by cities and towns are not available, BEA uses the NECMA designations instead of the official SMSA's for its personal income estimates for New England.

In Wyoming and Vermont--States without official SMSA's--Cheyenne and Burlington, respectively, are treated as metropolitan areas.

The amendment of February 1971 created a new SMSA in Virginia--the Petersburg-Colonial Heights-Hopewell SMSA. Previously, the independent city of Colonial Heights was included in the Richmond SMSA. In its personal income estimates prior to 1969, BEA includes Colonial Heights in the Richmond metropolitan area; however, in the current estimates for 1969-75, Colonial Heights is part of the Petersburg-Hopewell SMSA.

The geographic definition of each SMSA is held constant over the entire period for which the estimates were made. That is, counties included in an SMSA as of February 1977 are also included in each of the earlier years though they may not have been officially part of the SMSA. This concept is appropriate where the objective is a series that describes the income experience of a given area.

The importance of the metropolitan areas is underscored when one considers that the share of personal income in all SMSA's in 1929 was 72.5 percent when measured on the basis of the boundaries set in terms of the 1940 criteria (as compared with 77.9 percent with the boundaries reflecting 1975 conditions).

An alternative to the fixed-boundary concept would have been to permit the SMSA boundary to vary. In theory, this alternative would be especially useful in studying the economic characteristics of the urbanized portion of the population. However, the variable-boundary concept was eliminated for several reasons. Because SMSA's were first defined in 1949, mainly on the basis of data from the 1940 Census of Population, the fixed-boundary concept was the only choice for the 1929-1950 span, unless a major study were undertaken to delineate SMSA's on the basis of economic conditions in 1929 and to redefine the 1950 SMSA's using the 1950 Census of Population. Moreover, altough variable-boundary SMSA's might serve satisfactorily in measuring the national

trend of urbanization for benchmark years, annual series for individual SMSA's would be quite erratic as boundaries were changed.

The component counties of each of the SMSA's and NECMA's are listed on the following pages.

CLASSIFICATION OF ECONOMIC AREAS

BEA has classified all counties of the country into 173 economic areas. Each economic area consists of a Standard Metropolitan Statistical Area (SMSA), or similar area that serves as a center of trade, and the surrounding counties that are economically related to the center. To the extent possible, each area includes the place of work and the place of residence of its labor force, since an area's major job markets, typically located in a metropolitan area, often attract workers living beyond SMSA boundaries.

For a more complete discussion of the underlying concepts and derivation of BEA's economic areas, see "The BEA Economic Areas: Structural Changes and Growth, 1950-73," <u>Survey of Current Business</u>, November 11, 1975.

The county composition of the 173 economic areas are shown on the following pages.
