ACKNOWLEDGMENTS

The personal income estimates presented in this publication were produced by the Regional Economic Measurement Division of the Bureau of Economic Analysis under the direction of **Edwin J. Coleman**, Chief. These estimates are the result of a divisionwide effort. The names of the Division personnel and selected telephone numbers are included for the reader's convenience for directing questions and requests to the appropriate party.

Estimates of civilian labor income (wages and salaries and other labor income) were prepared by the Regional Wage Branch, under the supervision of Elizabeth H. Queen, Chief. Major responsibilities were assumed by: Sharon C. Carnevale, Carol E. Evans, Michael G. Pilot, Chen Toui Pomsouvan, William E. Reid, Jr., Mary H. Risler, Victor Sahadachny, and James M. Scott.

Estimates of other types of income were prepared by the Regional Income Branch, under the supervision of Kenneth P. Berkman, Chief. Major responsibilities were assumed by Vivian G. Conklin, Gary V. Kennedy, Arthur L. Sensenig, and Andrew E. Weiser.

The residence adjustments, component aggregations, and materials for this publication were prepared by the Regional Economic Information System (REIS) Branch, under the supervision of **David W. Cartwright**, Chief. Major responsibilities for the residence adjustments were assumed by **Wallace K. Bailey**. Major responsibilities for the preparation of personal income tables were assumed by **Paul M. Levit**. **Stuart A. Schwartz** coordinated the production of the publication, **Jeanne S. Goodman** prepared the text, and **Kathy A. Albetski** prepared the charts. **Valeria A. Hamilton** and **Sherry M. Edwards** provided secretarial services. State maps were provided by the Bureau of the Census. Editorial and technical advice and assistance was provided by **Dannelet Teske** and **Patti Trujillo** of the Current Business Analysis Division. Acknowledgment is also made of the services rendered by the staff of the Computer Systems and Services Division of BEA, **Vincent C. Finelli**, Chief.

While the county income measures contained in this report are the result of the effort, experience, and cooperation of the personnel of the Bureau of Economic Analysis, they are founded ultimately on the statistical work of government agencies as well as of private organizations. Particularly noteworthy for their contributions are the State Employment Security Agencies, the various State agencies administering income maintenance programs, the Bureau of Labor Statistics, the Bureau of the Census, the Economic Statistics Cooperative Service of the U.S. Department of Agriculture, the Internal Revenue Service, the Office of Research and Statistics of the Social Security Administration, the Veterans Administration, and the Association of American Railroads.

INTRODUCTION

This volume is part of a nine-volume set published annually by the Regional Economic Measurement Division of the Bureau of Economic Analysis (BEA). The set presents for local areas BEA's estimates of total and per capita personal income as well as additional detail on the sources of personal income by type and major industry. There are six major categories of personal income payments: Wage and salary disbursements; other labor income; proprietors' income; rental income of persons, dividends, and personal interest income; transfer payments; and personal contributions for social insurance. The sum of three of these categories of income payments (wage and salary disbursements, other labor income, and proprietors' income) is termed labor and proprietors' income and is presented for the major industry groups. A description of each of these types of income payments and how they were estimated is contained in Part II of the methodology section. A discussion of the characteristics and applications of these personal income estimates is contained in Part I of the methodology section. Estimates are for the most recent year (the calendar year ending approximately 18 months prior to publication date) and the preceding 5 years.

The estimates presented in these volumes reflect the 1976 national income and product account (NIPA) benchmark revisions of personal income, which were first extended to the local area personal income series in June 1978. (The NIPA revisions are described in Part I of the January 1976 issue of the SURVEY OF CURRENT BUSINESS.) The 1980 NIPA benchmark revisions (described in the December 1980 issue of the SURVEY) of personal income will be incorporated into the local area personal income series scheduled for release in April 1982. The revised local area series

will also reflect distributional revisions made possible by the availability of new or more timely data at the county level. A detailed description of the sources and methods used in making the estimates, including an explanation of the revisions that affect the State and local area estimates, is presented in Volume 1 of the set. Volumes 2-9 contain a summary statement of methodology. These statements of methodology are intended to give the user a basis for evaluating the reliability of the estimates and the necessary information for determining their suitability for various applications.

Volume 1 of the set is a national volume presenting estimates for the United States as a whole and for all the regions, States, Standard Metropolitan Statistical Areas (SMSA's), and BEA economic areas. In addition, it contains the detailed methodology; charts and tables showing the distribution and changes in total personal income for regions; and appendixes with county definitions of SMSA's and BEA economic areas, and samples of tables available through the Regional Economic Information System.

Each of Volumes 2—9 presents estimates for one of the eight BEA regions: New England, Mideast, Great Lakes, Plains, Southeast, Southwest, Rocky Mountain, and Far West. A single regional volume includes estimates for the United States, the region, the States, SMSA's, and counties of the region, and a summary methodology.

This volume presents the personal income estimates, for the period 1974-79, for the United States, for the New England Region, for the six States of the region and for the counties and metropolitan areas of each State. This volume also includes a summary description of the sources and methods used in producing the county estimates.

The BEA Regional Economic Information System

The personal income tables contained in the nine-volume set, as well as other standard tabulations discussed below, are available upon request from the BEA Regional Economic Information System (REIS). REIS is the term applied to the data files, computer programs, and staff established for the maintenance, management, and distribution of the regional data base. This system currently contains approximately 24 million separate estimates covering over 3,500 areas.

Data availability

The REIS includes an active information retrieval service, which provides a variety of standard and specialized analytic tabulations for counties and specified combinations of counties. A sample set of standard tabulations available through this system is included in Volume 1 as Appendix C. All of the tabulations are available in magnetic tape, microfiche, and computer printout form. The REIS data base currently includes the following data sets:

Quarterly State personal income.—These estimates, available approximately 4 months after the close of the subject quarter, are published regularly in the January, April, July, and October issues of the *SURVEY*. As of April 1981, quarterly estimates are available from the first quarter of 1958 through the fourth quarter of 1980. Quarterly estimates for years prior to 1958 have not yet been adjusted to the revised national income series.

Annual State personal income.—Annual estimates for States are published twice each year. Preliminary estimates of total and per capita personal income, derived from the quarterly estimates, are published in the April issue of the SURVEY (4 months after the close of the subject year). A revised set of estimates, based on more complete data and therefore more reliable, is presented in greater detail in the August issue of the SURVEY. Tabulations at the 2-digit Standard Industrial Classification (SIC) code level are available as of August 1981 through REIS for 1958—80. Estimates for years prior to 1958 have not yet been adjusted to the revised national income series.

Annual State disposable personal income.—Annual estimates of total and per capita disposable personal income for States are released as a companion series to the revised annual State estimates of personal income and are published in the August issue of the SURVEY. The State disposable personal income series is consistent with the State personal income series for 1967 and subsequent years.

Annual county personal income.—These estimates, published in this volume, become available approximately 16 months after the close of the subject year. Summary statistics are published in the April issue of the SURVEY. Estimates are available for 1959, 1962, and 1965—79. County estimates for selected years back to 1929 have not yet been adjusted to the revised national income series.

Transfer payments.—The component estimates of transfer payments by county are unpublished. However, tabulations of transfer payments by type of program are available from REIS for the years corresponding to the county personal income series.

Farm income and expenditures.—These estimates of gross receipts and expenditures of farms, which underlie the net farm income estimates in the State and county personal income series, are unpublished. However, tabulations for the years 1969-79 are available upon request from REIS.

Average annual employment for States and counties.—These unpublished estimates are a companion series to the personal income estimates. They are constructed from similar sources using the same concepts and definitions. Tabulations are available from REIS for 1967-79.

Disclosure avoidance

Much of the data underlying the personal income estimates is obtained directly from Federal and State government administrative records, with the condition that BEA observe the Federal and State regulations established to safeguard the privacy of individuals and individual businesses. Therefore, the BEA personal income estimates are subjected to rigorous scrutiny to determine if there are any data cells that might disclose the activities of a single firm or reporting unit. Such cells are suppressed in the final tabulations. Because of the difficulty of adequately protecting against the inadvertent disclosure of confidential information, it is BEA's policy to release estimates for 2-digit SIC code industries for regions, States, and BEA economic areas only and for 1-digit SIC code industries for counties, SMSA's and all other geographic areas aggregated from the county estimates.

BEA user group

In addition to responding to specific data requests addressed to it, REIS distributes estimates through a group of universities and State agencies officially designated as BEA users. This group was created by a congressional directive to provide BEA's personal income and related series to university bureaus and State agencies on a nocost basis. Each of these users, currently 187 in number, receives a full set of standard tabulations for the relevant State, its counties, and its metropolitan areas on the condition that the organization will in turn distribute the data within its State. This congressional directive encourages utilization by universities and State agencies of data that are comparable for all States and counties and consistent with national totals. This enhances the uniformity of analytic approaches taken in economic development plans and programs and improves the ability of the recipient agencies to assess sub-State economic developments and to service their local clientele.

Analytic Aids

In addition to the statistical tables, this volume includes several types of analytic aids.

County outline maps prepared by the Bureau of the Census are presented for each State and for the Washington, D.C., metropolitan area. These maps serve not only to separate the data into State groupings for easy reference, but aid the reader in locating counties and metropolitan areas. The maps for New England States are modified by BEA to show New England County Metropolitan Areas (NECMA's) rather than SMSA's. Similarly, the maps for Vermont and Wyoming, where no SMSA's exist, are modified to show the county containing the principal city in each State. Volume 1 includes maps of the United States that show 1979 per capita income levels for regions and for States.

Pie charts show for each region and State the distribution of 1979 total personal

income within the area. The charts show up to four of the largest SMSA's or State portions of SMSA's in each State; the sum of the remaining SMSA counties, if any; and the sum of the nonmetropolitan counties in the State. It should be noted that the charts show only the portion of each SMSA that lies within that State whereas the tables present data for entire SMSA's.

Bar charts for each region show percent changes in total personal income from 1977—79 for the U.S., and for each State in the region. Similar charts are presented for each State showing percent changes for the U.S., the State, and each portion of the State that is represented in the pie chart.

Two analytic tables are included for each region. The first table shows the 20 counties with the largest and the smallest 1979 per capita income in the region. The second table shows percent changes in total personal income and per capita income for the States of that region.

METHODOLOGY

This methodology is divided into two parts. Part I provides background information (including definitions, characteristics, and applications) pertaining to the State and local area personal income series. Part II provides a summary description of the sources and methods used for estimating each of the personal income components, by county, for the most recent 3 years. The reader's attention is called to the discussion in Part II of the revision in the estimates of wage and salary disbursements for components of civilian government for the years 1977—79.

PART I.—BACKGROUND INFORMATION

Definitions and concepts

Personal income.—Personal income is the income of residents of an area from all sources. It is measured after deduction of personal contributions to old age and survivors insurance, government retirement, and other social insurance programs, but before deduction of income and other personal taxes. It includes income received from business, governments (Federal, State, local, and foreign), households, and institutions. It consists of wages and salaries (in cash and in kind), various types of supplementary earnings termed "other labor income" (the largest item being employer contributions to private pension, welfare, and workmen's compensation funds), proprietors' income (farm and nonfarm, the latter including the income of independent professionals and producer cooperatives), rental income of persons, dividends, personal interest income, and government and business transfer payments (in general consisting of disbursements to persons for services not currently rendered).

Persons.—Persons, in the national and regional accounts, are defined as individuals, nonprofit institutions, private noninsured welfare funds, and private trust funds. The last three are referred to as "quasi-individuals." Further discussion of their treatment in the State and local area personal income series is included in the section on the residence adjustment in Part II of the detailed methodology in Volume 1.

Place of measurement.—For regional economic measurement, income is recorded either by place of work (where earned) or by place of residence (where received). Personal income, by definition, is a measure of income received. Therefore BEA's estimates of total personal income (TPI) reflect the State, county, and SMSA of residence of the income recipients. A detailed description of the SMSA classification as used by BEA is presented in Appendix A in Volume 1.

The measure labor and proprietors' income that BEA presents in industry detail for States, counties, and SMSA's reflects place of work. These individual industry estimates are useful for the analysis of the industrial structure of a given area.

The bulk of the income data basic to preparing the estimates of labor and proprietors' income is reported by industry in the State and county in which the business establishment is located. These data are subsequently adjusted to a place of residence for inclusion in the personal income measure.

Rental income of persons, dividends, personal interest income, and transfer payments are estimated from data that are reported where they are received. There is no relevance to a where-earned classification for transfer payments. However, "dividends, interest, and rent" converted to a where-earned basis (if data were available to make the conversion) could be added to labor and proprietors' income to provide a rough proxy of income originating from current production.

Industry classification.—The industry detail in which the estimates of labor and proprietors' income are presented is in accordance with the Standard Industrial

Classification (SIC) established by the Office of Management and Budget (OMB). However (as footnoted in the tables), the estimates for the years 1975—79 are based on the 1972 SIC and the estimates for the years previous to 1975 are based on the 1967 SIC. It is not possible for BEA to provide 1975 estimates on a 1967 SIC code basis as well as on the 1972 SIC codes because of problems in reconciling differences in the data from the unemployment insurance system. BEA is unable to distinguish between code changes due to OMB's revision of the SIC and code changes due to refiling required periodically of employers by the State Employment Security Agencies. The latter incorporates changes due to errors in classification and/or changes in product activity.

Per capita personal income.—Another measure of income presented by BEA in its tables is per capita income. This is the total personal income of the residents of a given area divided by the resident population of the area. In computing per capita income for the counties, BEA uses Bureau of the Census county population totals as of July 1, which are available for each year beginning with 1971.

Per capita personal income serves as an indicator of the quality of consumer markets and of the economic well-being of the residents of an area. This measure, however, can vary widely from county to county and should be used with caution for several reasons.

In many instances, an unusually high (or low) per capita income is the temporary result of unusual conditions, such as a bumper crop, a major construction project (e.g., a defense facility, nuclear plant, or dam), or a catastrophe (e.g., a tornado or drought). In some cases, a high per capita income is not representative of the standard of living in an area. For example, a construction project may attract a large number of highly paid workers who are included in the population but who send a substantial portion of their wages to dependents living in other areas. Conversely, a county with a large institutional population (e.g., residents of a college, correctional institution, or domiciliary medical facility) may show an unusually low per capita income, which is not necessarily indicative of the economic well-being of the noninstitutional population.

Moreover, population is measured at midyear whereas income is measured as a flow over the year. Therefore, a significant change in population during the year, particularly around midyear, can cause a distortion in the per capita figures.

In counties where farm income predominates, additional considerations should be taken into account. Farm proprietors' income, as measured for personal income, reflects returns from current production; it does not measure current cash flows. Sales out of inventories, though included in current gross farm income, are excluded from net farm income since they represent income from a previous year's production. Additions to inventories are included in net farm income at current market prices. Therefore, farmers' attempts at regulating their cash flows by adjusting inventories are not reflected in BEA's farm proprietors' income estimates. Yet it is this regulation of cash flows by farmers that extends their earnings cycle and allows them to survive losses or lowered income for two or three years.

In counties that are characterized by small population and almost total dependence upon farming, the per capita income will react more sharply to the vagaries in weather, world market demand, and changing government policies related to agriculture than in counties where the sources of income are more diversified.¹

It should be noted that the substantial differences between BEA estimates of per capita income and Census Bureau estimates are due to differences in definition of income, collection mode, and method of computation. For example, the Census Bureau computes 1976 per capita income by dividing 1976 total money income by April 1977 total population, whereas BEA derives its 1976 per capita income by dividing 1976 total personal income by July 1976 total population.

Relationship between the national and regional estimates

The definitions underlying the State and local area estimates for the most part are the same as those underlying the personal income estimates in the national income and product accounts. The major difference is in the treatment of U.S. citizens temporarily working on assignment abroad. The national estimates include not only Federal personnel—civilian and military—stationed abroad but also, since the 1976 benchmark revisions, U.S. residents employed by private U.S. firms on temporary foreign assignment. The State and local area estimates include only persons working and/or residing in the 50 States and the District of Columbia.

Border workers are treated somewhat differently in the State and local area personal income estimates than they are in the national estimates, but the net effect on total personal income is the same. Further information on border workers is included in the section on the residence adjustment in Part II of the detailed methodology in Volume 1.

The national estimate for each individual income component is used as a control total for the State estimates; i.e., the State estimates when summed to an all-State total must equal the national estimate of the same item (modified, where necessary, for differences in definition). Similarly, the county estimates when summed must equal the related State estimate.

Historical development

BEA's work on regional income estimation began in the midthirties with the construction of a series of "State income payments" to individuals. State income payments were defined as the sum of wages and salaries, proprietors' income, dividends, personal interest income, rental income (the last three components, in aggregate, were referred to as "property income"), and "other income." They were produced as part of a broad effort to explain the processes and structure of the Nation's economy in the thirties. During the forties and early fifties, extensive work in locating data sources and implementing methodology resulted in the production of the more comprehensive annual measure, State personal income. State personal income differs from State income payments in several important ways: (1) Personal income includes six categories of "type of payment" in contrast to the four categories of income payments (other labor income and transfer payments replaced "other income" and the component "personal contributions for social insurance" was added as an explicit deduction); (2) personal income includes greater component detail and a broader range of income-in-kind and imputed income items; and (3) the definition of transfer payments is expanded to include transfers by business.

During the sixties, work on the development of quarterly estimates of State personal income was completed. The first set of State quarterly estimates as a continuous series was published in the December 1966 issue of the SURVEY.

BEA began work on sub-State estimates in the midfifties, but the estimates were confined to a relatively small number of counties in the mideastern and plains States. This work on local area measurement was expanded in the midsixties, and resulted in a historical series of personal income for selected years 1929-62 for the SMSA's and for the non-SMSA counties. Estimates for counties within SMSA's were developed in the early seventies and published for the first time in the April $1975\ SURVEY$. BEA now prepares annual estimates of personal income and related (unpublished) estimates of employment for each of the SMSA's and all of the more than 3,100 counties and county equivalents in the United States.

Characteristics

The allocation procedure.—The estimates of State and local area personal income are characterized by the systematic use of the allocation procedure in their preparation. The State estimates are made by allocating the U.S. total for each income item (estimated for the national personal income series) to the States in proportion to each State's share of a related economic series. In a similar manner the State estimates are allocated to the counties in proportion to each county's share of a related economic series. In some cases, national, State, and county estimates are constructed from the same basic source, as for example, wages and salaries reported under the various State UI programs. In other cases, data that are available at the national and State levels are not available at the county level and allocators prepared from related, but indirect, data are used to reflect the geographic distribution of the income item among the counties. An example of this is veterans' payments. At the national and State levels direct information is available on payments to veterans under various government programs, but for many of these programs, such information is not tabulated at the county level. Where the direct data are not available, county veteran population, an indirect allocator, is used to distribute the State total to the counties.

Occasionally, direct information is available for SMSA's as a unit that is not available for counties. In such cases, amounts for single-county SMSA's are assigned to the appropriate county and amounts for multicounty SMSA's are allocated to the constituent counties in proportion to some indirect, but related, series that is available by counties. The SMSA counties are grouped by States (some SMSA's cross State lines) and summed. The difference between the State estimate and the sum of the selected SMSA counties is allocated to the remaining counties within the State in proportion to the indirect, but related, county series. This procedure was used in estimating monetary rent prior to 1973.

The use of the State estimates as control totals in conjunction with the allocation procedure imparts additional reliability to the county estimates because most components of personal income can be estimated more reliably for States than for smaller geographic areas. It also permits, if necessary, the use of a different allocator, in each State, to distribute an income item to the counties without impairing the interstate comparability of the estimates.

Scope of source materials.—The estimates are constructed from nearly 400 individually estimated income items based on data gathered from diverse sources. The bulk of the materials used to prepare the estimates is data generated as the byproduct of Federal and State government programs (administrative records data). The remainder comes from the various censuses and from nongovernment sources. Among the more important sources of the administrative record data used by BEA are the State unemployment programs of the Employment and Training Administration of the U.S. Department of Labor, the insurance programs of the U.S. Social Security Administration, and the Federal tax program of the U.S. Department of the Treasury. The two most important censuses utilized are the Censuses of Agriculture and Population. The information obtained from administrative records and censuses yields more than 90 percent of the data needed for the preparation of the State and local area income estimates.

BEA supplements these basic statistics with data of lesser quality, scope, and relevance. In order to adjust for gaps and deficiencies in the poorer quality data, indirect procedures and value judgments are sometimes employed. The impact of these indirect procedures on the reliability of the individual State and local area estimates has varied over the 51-year estimating span because of regional differences and changes in industrial composition. It is not possible, therefore, to provide measures of the error introduced into the income estimates by the indirect procedures.

Because the estimates are made from existing statistical information, they can be prepared annually and in considerable detail at relatively low cost. However, because the data are generated from programs not primarily designed for income measurement, it is necessary for BEA to adjust the data for definitional differences and for deficiencies in the data. The alternative would be for BEA to collect the necessary information in surveys of income recipients. The surveys would provide data directly suited for the measurement of personal income, eliminating the necessity of adjusting the inputs for definitional and other previously mentioned reasons. The costs associated with this approach, however, would be prohibitive because a very large sample would be necessary to permit reliable local area estimates. The use of administrative record data has the additional advantage that it does not add to the reporting burden of businesses and households.

Electronic edit procedures.—In making the estimates, several million administrative records are put into the system annually. Although these records are usually encoded and processed by the agency administering the program generating these records (thereby reducing the cost to BEA in terms of time and labor), there are still possibilities for error in the data. Because it is not possible to verify each individual re-

¹USDA statistics show an increasing trend among farm operators to supplement their income from nonfarm sources. Since 1974, the national averages indicate that for families operating farms with sales under \$20,000 off-farm income has exceeded income from farming.

cord or accept the various administrative record files at their face value, BEA has developed several computerized edit routines to locate major errors in the source materials. One such routine is the "five quarter exception edit," which is used to identify possible errors in the quarterly tabulations of wages and employment data (compiled for the ES-202 program) received from the various State Employment Security Agencies (ESA's). Data for the current and four preceding quarters are reformatted, by industry, State, and county, into a single record. A quarter-to-quarter comparison of both average quarterly wages and employment and absolute quarterly differences in total wages and employment is made. Where either measure exceeds established parameters, it is flagged for further review. The wage and employment data so identified are then tested against a second set of parameters related to a percent of State and percent of industry. Wage and employment data falling outside the established limits are tabulated and earmarked for specific analysis. Anomalies that the Regional Wage Branch cannot reconcile after its own review are referred back to the originating State ESA.

Computerized edit routines are employed also in the later stages of estimation. Before finalizing the estimates of the separate components of TPI, they are subject to the "relative share test". This edit procedure compares the estimate of a component in a given local area with the previous year's estimate and with TPI. It measures the amount of change the current estimate will introduce into the time series and shows the relationship of the component to TPI, as well as the changes in this relationship that have occurred over time. Where the edit reveals changes, over time or in composition, that exceed the expected norm for the component or for the local area, the data are isolated and earmarked for further review.

Geographic structure.—Estimates are developed independently for States and counties only. Estimates for all other geographic areas below the State level are made by aggregating the county estimates in the appropriate combinations. This building block approach provides BEA with the flexibility necessary for meeting the needs of the wide variety of users of local area data. It also permits estimates for areas whose boundaries change over time—such as SMSA's—to be presented on a consistent geographic definition for all years for analytic purposes. Because estimates are made only for local areas that can be defined in terms of counties, the metropolitan areas for the New England States in BEA's local area personal income series are not the officially designated SMSA's but rather the alternative NECMA's developed by OMB. Whereas New England SMSA's are defined in terms of cities and towns, the NECMA's (New England County Metropolitan Areas) are approximations of SMSA's in terms of counties. (A more detailed description of the NECMA's is included in Appendix A in Volume 1).

Applications

Because of their depth of component detail, geographic flexibility, and annual availability, BEA's estimates of personal income and derivative measures have a broad range of application. They are widely used in both the public and private sectors. In general, they are used to measure and track the levels and types of income flows received or earned by individuals residing or working in a specific political subdivision or microeconomy. They provide a local area data base for economic decision-making

²ES-202 is the Federal report which summarizes the data from the quarterly tax reports filed by employers under the various State unemployment insurance programs. However, it is commonly used to refer to the program of compiling the wage and employment data.

and for the implementation of programs requiring an analysis of the economic activities or the economic well-being of the residents of a particular area.

In recent years there has been an increasing use of personal income (or a derivative) as a variable in formulas for allocating Federal funds to States and local areas and for determining the amount of matching funds for Federal-State programs. The personal income estimates (State and county) are the basic source of the money income series prepared by BEA for the Census Bureau's intercensal per capita money income estimates required for the General Revenue Sharing Program.³ A partial list of other Federal programs using BEA's personal income statistics for the allocation of Federal funds or for determining matching grants includes the National School Lunch program, various U.S. Public Health Service rehabilitation programs (including drug abuse prevention and treatment of alcoholics), U.S. Department of Education grant programs (as, for example, vocational education and libraries), the Medical Assistance program (Medicaid), and the Aid to Families with Dependent Children (AFDC) program.

Personal income is also one of the measures used in the evaluation of the socioeconomic impact of many Federal programs. It is widely used by Federal agencies in the preparation of environmental impact statements required by the National Environmental Policy Act of 1969 and the Federal Land Policy and Management Act of 1976

Federal agencies use estimates of local area personal income as input into econometric models for projecting program needs. For example, the Food and Nutrition Service of the U.S. Department of Agriculture uses them to project the number of persons eligible for domestic food programs; the U.S. Department of Energy uses them to produce indicators in an energy demand forecast model; and the U.S. Water Resources Council uses them to project the future regional requirements from the Nation's water resources.

State and local governments have also increased their use of the personal income estimates. The estimates are being used as input in economic resource profiles and in econometric models developed for planning purposes. They are often used to project tax revenues and future needs for public services. A number of States have passed legislation, and in other States legislation is pending, tying the State's expenditures or tax authority to the level of, or changes in, State personal income.

University Schools of Business and Economics, often working under contract for State and local governments, reproduce BEA personal income data in statistical abstracts or similar reports. These publications are distributed to local government agencies, regional councils, private research groups, businesses, and individuals within the service region.

Businesses also use the estimates of local area personal income. For example, they are used to evaluate additional or alternative market areas for established products, to forecast prospects for marketing new products, to determine areas for relocation or decentralization, and to analyze comparative production costs in relation to consumer ability to pay.

PART II.—SOURCES AND METHODS

Wage and Salary Disbursements

Wage and salary disbursements consists of monetary remuneration of employees including compensation of corporate officers; commissions, tips, and bonuses; and receipts in kind that represent income to the recipients. Retroactive wages are counted when paid rather than when earned.

Private nonfarm.—In a typical State, approximately 95 percent of private, nonfarm payrolls come under the State's UI program. Under the program, every firm covered by unemployment insurance is required to report to the State's ESA the wages and salaries paid its employees in the preceding quarter. These reports are tabulated by county and summed by industry (at the 2-digit SIC level). The quarterly tabulations, in which the individual firm's report is no longer identifiable, are furnished to BEA where they are summed to annual totals, by industry, for each county.

Elements of payroll excluded from coverage—such as tips or small segments of an industry—are estimated independently at the State level and added to the UI-reported data for the appropriate industry. The BEA State estimates of wages and salaries in each industry are then allocated among the constituent counties in direct proportion to the related county distribution of the UI-reported data to yield the final county estimates.

Independent estimates of wages of contract farm laborers, based on the geographic distribution of expenditures for contract labor reported in the 1974 Census of Agriculture, are added to the UI-reported payrolls in agricultural services. Most State UI programs do not cover these workers; a few have partial coverage. Adjustments to avoid double-counting are made to the UI tabulations where appropriate.

³Money income differs from personal income as follows: money income excludes income-in-kind, imputed income, and income of quasi-individuals—which are included in the personal income definition. Furthermore, it includes items that are excluded from the personal income definition—income from private pensions and annuities, cash benefits from private workmen's compensation insurance, regular contributions for support received from individuals not residing in the same living quarters, income received from roomers and boarders residing in households, and employee contributions for social insurance.

⁴The value of pay-in-kind is included in the UI payroll tabulations. However, because it is not reported separately by the employers, it cannot be isolated from cash pay.

Industries presently treated as noncovered at the county level are private households, railroads, and "other." The methodology for making the county estimates for both *private educational services* and *nonprofit membership organizations* was revised for 1978 and extended back to 1973. Estimates for 1978 and subsequent years are now based on the UI county tabulations of payrolls.

State totals of wages and salaries of workers in *private households* are allocated to counties in proportion to the product of the number of persons employed in the industry and their average income; the underlying data are from the 1970 Census of Population. Data from the 1980 Census of Population will be incorporated as soon as they become available.

County estimates of wages and salaries of *railroad workers* are based primarily on the geographic distribution of railroad workers obtained from biennial employment reports of the Association of American Railroads. The use of employment as a county distributor of wages is more acceptable in the case of railroads than for most industries because the regional differences in wage rates are minimized by the tendency to negotiate wages in the railroad industry on a nationwide basis.

Other is the designation used in the State and local area level accounts to reflect U.S. residents employed by international organizations and foreign embassies and consulates located in the United States. It differs from the "rest of the world" designation in the national income and product accounts to the extent that the latter also includes border workers. The treatment of border workers in the local area estimates is included in the description of the residence adjustment at the end of the methodological section.

Farm.—Estimates of cash wages of hired farm labor, pay-in-kind, and the salaries of officers of corporate farms are made separately, based on related county data from the 1974 Census of Agriculture.

Government.—The methodologies for estimating Federal civilian, State, and local government wages and salaries have been revised. The estimates for 1977—79 reflect a shift from periodic and indirectly related data to current wage data from administrative records generated by the unemployment insurance programs. The estimates for the years prior to 1977, based on indirect and periodic data, are unrevised.

The 1979 county estimates of *Federal civilian* wages and salaries for 33 States are based wholly or primarily on the wage data tabulated from the administrative records of the Unemployment Compensation for Federal Employees (UCFE) program. The estimates for counties of the remaining States are based on U.S. Office of Personnel Management (OPM) annual employment data for each major Federal agency, by county, weighted by the agency's average salary in the State (calculated from the UCFE data).

The 1979 county estimates of *State government* wages and salaries for all but 9 States are based on UI wage data. The county estimates for the remaining 9 States are based on the most current distribution of full-time State government employees reported in the Census of Governments.⁷

The disparity in the level of the State government estimates based on UI wage data (1977—79) and those based on data reported in the 1967 Census of Governments (prior to 1977) could not be readily reconciled. Therefore the county estimates of State government wages and salaries for 1977 forward are not comparable with the estimates for earlier years. A fully comparable series will be presented when the 1980 benchmark revisions are extended to the local area personal income series.

The 1979 estimates of *local government* wage and salary disbursements for 34 States and the District of Columbia are based on UI wage tabulations. The estimates for the remaining 16 States are based on the wage data reported in the 1977 Census of Governments.⁸

Wages and salaries of full-time *military personnel* are derived in two parts, cash pay (including allowances and allotments) and pay-in-kind. The county estimates of military

cash pay were made by allocating the State estimates of military cash pay to the counties by the distribution of military strength. The estimates of military strength were developed by BEA primarily from annual Department of Defense (DOD) information, for each service, on the location of military personnel stationed at major installations. For counties in which there are no major installations, the estimates of military strength were made for all services combined based upon the distribution of members of the armed forces reported in the 1970 Census of Population. As part of the 1980 benchmark revisions there are plans to substitute military payroll data, which are to be made available by the DOD. Pay-in-kind is allocated to the counties in proportion to total military strength.

Military reserve pay (including pay-in-kind) is estimated for counties by allocating State estimates (based on limited information pertaining to the National Guard) in proportion to the geographic distribution of civilian resident population.

Other labor income

Other labor income (OLI) consists almost entirely of employer contributions to private pension and welfare funds, employers' payments for privately administered workmen's compensation insurance, and directors' fees. County estimates of contributions to welfare funds are estimated, in industrial detail, by allocating the State estimates in proportion to the geographic distribution of employment in each industry. Directors' fees, contributions to pension funds, and payments for privately administered workmen's compensation insurance are estimated, in industrial detail, in proportion to the geographic distribution of wages and salaries in the related industry.

Proprietors' income

Proprietors' income is the monetary income and income-in-kind of sole proprietorships and partnerships, including the independent professions and producers' cooperatives. It is treated in its entirety as received by individuals. Dividends and interest received by proprietors and income from the rental of real property received by persons who are not primarily engaged in the real estate business are excluded from proprietors' income. (They are included in "dividends, interest, and rent.")

Nonfarm proprietors' income.—The estimates of proprietors' income for many industries are benchmarked on U.S. Internal Revenue Service (IRS) data on the self-employed. These data are tabulated from the Social Security Self-Employment Tax forms filed by proprietors of unincorporated businesses. The self-employment data are presently incorporated into the estimates of nonfarm proprietors' income for all major industries in 19 States. For the remaining 32 States, the IRS self-employment data are only incorporated into the estimates for trade and services (which together account for approximately 75 percent of all nonfarm proprietors' income). The estimates of proprietors' income for the other nonfarm industries, in the 32 States, are based on 1962 IRS-based benchmarks that have been extrapolated to the later years by *County Business Patterns* (CBP) data on the number of small establishments by industry and county.

Nonfarm proprietors' income is estimated for States and counties inclusive of the inventory valuation adjustment (IVA) and the capital consumption adjustment (CCAdj). Unlike the national personal income series, the State and local personal income series provide no separate estimates of either adjustment (because of insufficient related data below the national level). The IVA and CCAdj are necessary because the business accounting conventions used for tax reporting purposes are not appropriate for personal income measurement. The IVA changes the value of inventory charged to cost of sales from original cost to current market value. Somewhat similarly, the CCAdj adjusts the value of capital consumption allowances from original cost to replacement cost and, additionally, adjusts the service lives of fixed capital assets from the tax reporting convention to a consistent economic basis.

Nonfarm proprietors' income also includes the net income of rural electric and telephone cooperatives. Estimates of this income are developed from data contained in annual reports of the Rural Electrification Administration. An adjustment is made for small counties in which large cooperatives are located. In these small counties, the net income of the cooperatives is imputed to the customer-members (usually residing in the surrounding counties, as well as in the county in which the cooperative is located). The imputation is made as part of the residence adjustment. It is intended to offset the impact of the net income of a single large cooperative on a county that would otherwise have a small total personal income. In the labor and proprietors' income (place-ofwork) series, the net income of the cooperatives is included in the counties in which the cooperatives are located. However, in the personal income(place-of-residence) series, the income is distributed among the counties of residence of the customer-members of the cooperatives.

 $^{^5}$ Prior to the 1976 national benchmark revisions other and $rest\ of\ the\ world$ shared the same definition.

⁶The 17 States for which the estimates of Federal civilian wages and salaries are based on the OPM employment weighted by UCFE wage rates are: Alaska, Arizona, Arkansas, Georgia, Hawaii, Maryland, Massachusetts, Michigan, Minnesota, New York, North Carolina, South Dakota, Tennessee, Virginia, Washington, West Virginia, and Wisconsin.

⁷The 9 States for which the estimates of State government wages and salaries are based on 1967 Census of Governments reported full-time employment are: Illinois, Michigan, Minnesota, New Hampshire, New Jersey, Rhode Island, Tennessee, Vermont, and Wisconsin.

^{*}The 16 States for which the estimates of local government wages and salaries are based on 1977 Census of Governments reported payrolls are: Alaska, Arizona, Colorado, Florida, Georgia, Illinois, Maryland, Minnesota, Missouri, New Hampshire, North Carolina, North Dakota, Ohio, South Dakota, Tennessee, and West Virginia.

Farm proprietors' income.—The net income of farm proprietors is computed as the gross income of all farm operators minus total production expenses. It is adjusted to reflect current production through a change-in-inventory adjustment and to exclude the net income of corporate farms and the salaries paid to the corporate officers.

Farm proprietors' income estimates are benchmarked on data collected in the 1974 Census of Agriculture and the revised U.S. Department of Agriculture (USDA) State totals of income and expense items released in July 1974.

County distributions of more than 35 components of gross income and 12 items of production expense are used to allocate annual USDA-based State totals of the corresponding series. County allocators for the postcensal years are prepared by modifying the benchmark county distributions of the various income and expense items by direct information obtained from the States wherever possible. Distributions for which no current direct data are available are either held constant or moved forward by an indirect, but related, series for which county data are available.

The salaries of officers of corporate farms, included in personal income as a subcomponent of farm wages, are deducted from gross farm income in computing total net farm income. Because, by definition, farm proprietors' income includes only the income of sole proprietors and partnerships, an adjustment is made to exclude the net farm income of corporate farms. The adjustment is based on the proportional division of farm acreage between corporate and noncorporate farms reported for each county in the 1974 Census of Agriculture.

Dividends, interest, and rent

Dividends are cash payments by corporations organized for profit to stockholders who are U.S. residents. Interest is the monetary and imputed interest income of persons from all sources. Rent is the monetary income of persons from the rental of real property, except the income of persons primarily engaged in the real estate business (which is classified as nonfarm proprietors' income); the imputed net rental income of owner-occupants of nonfarm dwellings; and the royalties received by persons from patents, copyrights, and rights to natural resources. Rental income from mobile homes is included in both the monetary and imputed measures.

Dividends and monetary interest are allocated to counties by special tabulations provided by IRS. In the absence of direct data, estimates of imputed interest and monetary rental and royalty income of persons are based on the county distributions of monetary interest. Monetary rental income is estimated inclusive of the CCAdj. Unlike the national personal income series, no separate estimates of CCAdj are made for the States or local areas, because of insufficient data.

Imputed rental income accruing to residents of owner-occupied nonfarm dwellings is derived by allocating the State totals to counties by the distribution of the value of owner-occupied homes, constructed from data reported in the 1970 Census of Housing. State totals for postcensal years are disaggregated to counties on the basis of the benchmark distributions. The county estimates of imputed rental income from owner-occupied mobile homes are estimated separately, based on the geographic distribution of the number of mobile homes and trailers reported in the 1970 Census of Housing. Data from the 1980 Census of Housing will be incorporated as soon as they become available.

Transfer payments

Transfer payments to persons is income for which services are not currently rendered. It consists of both government and business transfer payments. Government transfer payments include payments under the following programs: Federal old-age, survivors, disability, and health insurance; railroad retirement and unemployment insurance; government retirement; Federal and State government-insured workmen's compensation; veterans' benefits, including veterans' life insurance; food stamps; black lung; supplemental security income; and AFDC. Government payments to nonprofit institutions, other than for work under research and development contracts, are also included. The principal business transfers are corporate gifts to nonprofit institutions and consumer bad debts.

Total transfer payments is measured as the sum of over 50 separately estimated series. Directly reported data are used to measure about three-fourths of all transfers, although the proportion varies among local areas. Reliable indirect indicators—such as veteran population, which is used to allocate selected components of veterans' benefits—are available for many of the remaining transfers.

Contributions for social insurance

Personal contributions for social insurance includes payments by employees, self-employed, and other individuals who participate in the following programs: Federal old-

age, survivors, disability, and health insurance; supplementary medical insurance; State unemployment insurance; railroad retirement; government retirement; and veterans' life insurance.

In general, the State totals are allocated to counties by the wages and salaries or proprietors' income component. Exceptions to this general procedure are contributions to veterans' life insurance—allocated by veteran population; contributions to State unemployment insurance and temporary disability programs (applicable in only a few States)—allocated by civilian population; and supplementary medical insurance—allocated by the number of persons enrolled in the program.

Residence adjustment

Wage and salary disbursements, OLI, and personal contributions for social insurance, with the exception of several minor subcomponents, are estimated from data that are reported by place of work. The estimates that are initially estimated on a place-of-work basis are residence adjusted for purposes of personal income measurement and are referred to as income subject to adjustment (ISA).

The residence adjustment for each county is measured as the total inflows of commuters' labor income minus the total outflows. Each gross flow is derived as the product of the ISA in the county of work multiplied by a residence adjustment factor. The residence adjustment factor is defined as the ratio of the wages of workers who work in the county but reside in another county (in-commuters) to the total wages of all employees working in the county (resident and non-resident).¹⁰

Benchmark residence adjustment factors were computed separately for civilian workers and for military personnel. Rough industry differentials are introduced into the residence adjustment factors for civilian workers from special tabulations of wages classified by industry for commuting flows of 50 or more workers, prepared by the Bureau of the Census from information collected in the 1970 census. For incommuting flows of less than 50 workers, the residence adjustment factors are computed from 1970 census commuting data at the all-industry level. The residence adjustment factors for the military are computed from a comparative analysis of DOD data on military personnel by major installation and Bureau of Census data from the 1970 census on military personnel by place of residence.

The residence adjustment procedure, for the most part, appropriately reflects the net flow of commuters' labor income in counties that have not experienced either large economic or demographic changes since 1970. There are, however, situations where the results are inadequate, such as, a large construction project in a rural county or rapid growth in an outlying suburban area. To identify such areas and to devise appropriate modifications of the initial residence adjustment, these estimates are subjected to an intensive review and analysis. Census Bureau county wage data for 1969 and IRS county wage data for 1972, 1974, 1975, and 1977 are among the series used to document major shifts in county commuting patterns since 1970. For the most part, adjustments are made only if other economic indicators support the IRS or Census Bureau data. When such adjustments appear to be justified, all available information related to the changes in industrial and demographic structure of the counties are utilized for determining both the size of the additional adjustment and the county to receive the compensating adjustment.

The residence adjustment procedure used for Alaska differs somewhat from the foregoing methodology. Because of the unusually large number of out-of-State workers employed in a variety of industries in Alaska (for example, the construction industry—particularly during the building of the pipeline), special procedures were developed to reflect the unique characteristics.

Border workers are treated as international commuters in the State and local area personal income series; therefore, their earnings are reflected through the residence adjustment. The outflow of earnings of foreign workers (Canadian, Mexican, and Caribbean) is estimated on the basis of data from the U.S. Immigration and Naturalization Service, the U.S. Department of Labor, and the 1974 Census of Agriculture. The small amounts of earnings of U.S. residents commuting to work in Canada (inflows) are assigned to Wayne and Oakland Counties in Michigan.

A more complete description of the residence adjustment procedure and the problems involved is included in the detailed "Sources and Methods" published in Volume 1.

⁹Proprietors' income is treated as being on a place-of-residence basis, although there are indications that for many urban counties proprietors' income reflects a mix of place of work and place of residence.

¹⁰The residence adjustment factor, derived from wage and employment data, is used to adjust OLI and personal contributions for social insurance, as well as wages and salaries, to a place of residence. This procedure is not inconsistent, however, because most of the subcomponents of OLI and personal contributions are closely related to, and estimated from, the geographic distribution of wage and salary disbursements or employment.

FOOTNOTES

D_{Not} shown to avoid disclosure of confidential information, data are included in totals.

Less than \$50,000, data are included in totals.

¹Estimates based on 1967 SIC.

²Estimates based on 1972 SIC.

³Consists of wage and salary disbursements, other labor income, and proprietors' income. Wage and salaries based upon data furnished by individual bureaus of employment security.

Includes the capital consumption adjustment for nonfarm proprietors.

⁵Includes wages and salaries of U.S. residents working for international organizations.

⁶Adjustment for border workers: income of U.S. residents working across U.S. borders less income of foreign residents working in the U.S.

⁷Includes the capital consumption adjustment for rental income of persons.

*Far West Region totals exclude Alaska and Hawaii.

⁹In Wyoming and Vermont—States without official SMSA's—Cheyenne and Burlington, respectively, are treated as metropolitan areas.

 $^{10}\mbox{Estimates}$ for Manassas City, Manassas Park City, and Poquoson City (all in Virginia) are not available for years prior to 1976.

¹¹The estimates for Falls Church City, Virginia, were overstated for years prior to 1979 due to geographic coding errors in source data. The estimates for 1977—79 have been corrected. Estimates for years prior to 1977 will be corrected and published in 1982 as part of the regional benchmark revisions.

¹²Effective January 1, 1979, Jackson and Washabaugh counties, South Dakota are combined into a single county with the title Jackson. The estimates for Jackson County 1974—79 include the data for Washabaugh County.

¹³The estimates for Federal civilian, State, and local governments have been revised for the years 1977 and 1978. The new methodology utilizes a new and improved data source. The estimates for years prior to 1977 will be revised and published in 1982 as part of the regional benchmark revisions. For a more detailed explanation see discussion in Part II of the Methodology section.
