CONSUMER PRICE INDEX FOR APRIL 1968

The Consumer Price Index continued to climb in April, rising 0.3 percent to 119.9 (1957-59=100), an increase of 4.0 percent since April 1967. Prices were higher for nearly all important items except meats, gasoline, and new cars. Nondurable goods and consumer services led the upswing and together were responsible for more than four-fifths of the increase. Apparel prices continued to advance and food prices rose instead of declining as they usually do in April.

The April increase in consumer prices was at approximately the same rate as that which has prevailed over the past year. During the first quarter of 1968, however, prices had risen more than three times the year-earlier rate. Rising food prices this year, in addition to continuing advances for services, apparel, and some other items, have caused the more rapid climb in the index. At the same time, prices for durable goods also began to move up, after several years of relative stability.

## Food

Retail prices of food and beverages at home rose 0.3 percent in April and food away from home was 0.5 percent higher. The advance in grocery store prices was principally the result of higher fruit and vegetable prices. Fresh fruit and vegetable prices were up 2.6 percent to a record high for the month. Fresh vegetable prices were mixed; onions rose 22 percent to their highest index level since April 1948, and lettuce was up nearly 37 percent. Higher prices for these items stemmed from adverse fall and spring growing weather which caused a gap in California lettuce production and a delay in the spring onion crop in Texas. Limited harvests in Florida and declining Mexican imports were responsible for a 14 percent jump in cucumber prices and an 8 percent rise for green peppers. Carrot prices dropped more than 26 percent as supplies from Arizona, California, and Texas came to market, and asparagus prices fell 24 percent, as the California asparagus harvest reached its peak. Most fresh fruits were moderately higher. Oranges were the only exception, declining 3-1/2 percent, as greater supplies of Valencia oranges became available. Overall, fresh fruit and vegetable prices in April averaged about 16 percent higher than those of a year ago. Reduced crop yields, resulting at least in part from adverse weather, were the main cause.

Meat prices declined in April, but the reduction was less than is usual for this time of year. The decline was primarily the result of increased production; strong demand for both beef and pork prevented a larger drop in prices. Seafood prices were slightly higher in April; poultry prices dipped about 2 percent in a reaction to the 11 percent jump in poultry meat production in March. Over the year, beef and veal prices were up 5 percent, pork and poultry nearly $3-1 / 2$ percent. Dairy products rose contraseasonally as the U.S. Department of Agriculture announced an increase in support prices for fluid milk effective April 1.

## Services

Charges for consumer services continued their upward trend, but the increase was one of the smallest in recent months. Medical care services posted an advance of 0.5 percent mainly because of a one percent rise in hospital service costs. Increased dental fees, attributed to higher supply, equipment, and office salary costs, contributed most of the 0.4 percent rise in professional services.

Increases in barber and beauty shop charges were responsible for higher personal care costs; higher wages for domestic help and laundry service helped to push housekeeping services to higher levels. Household moving expenses edged up, coincident with the upswing in moving that usually takes place in late spring, to offset higher wage rates for employees. Home maintenance and repair services, mortgage interest, and real estate taxes were higher, as were rent, hotel and motel charges, most utilities, and local transit fares.

## Nondurable goods other than food

The renewal of gasoline price wars in Los Angeles was the principal cause of a contraseasonal decline of 0.9 percent for this item. Gasoline prices usually go up when the heavy travel season opens. Following their April decline, gasoline and motor oil prices averaged the same as they did a year ago.

Apparel prices continued upward in April to a level nearly five percent higher than a year ago. All apparel categories increased; men's and women's clothing had about equal influence. Men's tropical suits, which were introduced at higher price levels than a year ago, accounted for a major portion of the increase in men's wear. Women's and girls' apparel prices were up, primarily because new spring and summer cotton dresses and blouses were offered at higher price levels. Special sales accounted for minor price reductions for some women's items, such as light weight coats and hose.

Footwear prices also continued their steady rise. Basic reasons for advancing retail apparel prices include higher retail markups, higher wholesale prices, and a booming apparel market reflected in the nearly 19 percent rise in apparel store sales over a year ago. Increases in the price of cotton fabrics are attributable to sharp rises in raw cotton costs in the latter part of 1967 reinforced by strong demand and wage increases at the mills.

## Durable goods

Durable goods, up 0.3 percent, showed a slightly greater than seasonal adyance, principally because of higher used car prices, resulting from solid demand and the decrease in new car production in early April that accrued from labor difficulties and civil disturbances. Since April of last year used car prices have climbed 6.3 percent. New car prices fell 0.3 percent in April, chiefly due to increased concessions offered by dealers.

Appliance prices were slightly higher as increases appeared across the board for all major appliances and home electronics, except tape recorders. Appliance sales have been good in 1968; most items registered gains over the comparable period in 1967.

Furniture prices increased again. Bedroom suits showed the largest increase, but most other types of wood furniture, as well as upholstered furniture, were also higher. Contributing to higher furniture prices were strong demand and higher material, labor, and transportation costs.

Cost-of-living adjustment
Approximately 115,000 workers will receive increases in their cost-of-1iving allowances as a result of the national and city Consumer Price Indexes for April. About 65,000 aerospace employees will receive 3 cents an hour increases based on the change in the national index since January. Most of the remaining increases will range from 1 cent to 6 cents, and will represent monthly, quarterly, and semi-annual adjustments. About 4,200 employees in the home appliance industry will receive an annual increase of 1.75 percent.

$\frac{1}{2}$ Also includes hotel and motel rates not shown separately.
2/ Includes home purchase, mortgage interest, taxes, insurance, and maintenance and repairs.
3/ Also includes telephone, water, and severage service not show separately.
4/ Called "Solid and petroleum fuels" prior to 1964.
5/ Also includes infants' wear, seuing materials, jewelry, and apparel upkeep services not shown separately.
6/ Includes tobacco, alcoholic beverages, and funeral, legal, and bank service charges.
7/ Includes home purchase costs which were classified under services prior to 1964.
(8/ Also includes auto parts, toys, and recreational goods not shom separately.
9/ Excludes home purchase costs which were classified under this hesding prior to 1964.
10) Not available due to insufficient data.

11/ Called "Durables less cars" prior to 1964.
12/ Includes the services components of apparel, personal care, reading and recreation, and other goods and services.

## Reliability of Percent Changes in the CPI

#### Abstract

A system of "replicated" samples introduced into the index structure in the 1964 revision permits an estimate of sampling error for the CPI. 1/ The table below shows standard errors for monthly, quarterly, and annual percent changes in the CPI for all items and for nine comodity groupings based on 1967 averages. The figures may be interpreted as follows: the chances are about 95 out of 100 that the percent change in the CPI as computed differs from the corresponding "complete coverage" change by less than twice the standard error. Data also are shown in terms of the relative error of the standard error of percent changes. The relative errors tend to decrease markedly for successively longer time periods, as expected.

Because the CPI is rounded to one decimal place, some ambiguity may arise in interpreting small index changes. The table below indicates, for example, that a month-tomonth change of 0.1 percent in the all-items CPI is significant. Because of rounding, however, a change of this size in the published index might result from a much smaller change in the unrounded value. Hence, any particular change of 0.1 percent may or may not be significant. On the other hand, a published change of 0.2 percent is almost always significant, regardless of the time period to which it relates.

Standard and Relative Errors of Percent Changes in the CPI Based on 1967 Data

| Component | Standard Error |  |  | Relative Error |  |  |

| Other goods and services | . 10 | . 14 | . 20 | . 25 | . 13 | . 07 |

This replaces the table of average standard errors based on 1965 data which was included in the GPI report through January 1968.

1/ The method of deriving these estimates is described in a paper by Marvin Wilkerson, "Measurement of Sampling Error in the Consumer Price Index," Journal of the American Statistical Association, September 1967.

## Brief Explanation of the CPI

The Consumer Price Index (CPI) measures average changes in prices of goods and services usually bought by urban wage earners and clerical workers, both families and single persons living alone. It is based on prices of about 400 items which were selected to represent the movement of prices of all goods and services purchased by wage earners and clerical workers. Prices for these items are obtained in urban portions of 39 Standard Metropolitan Statistical Areas (SMSA's) and 17 smaller cities, which were chosen to represent all urban places in the United States, including Alaska and Hawail. They are collected from grocery and department stores, hospitals, filling stations, and other types of stores and service establishments which wage earners and clerical workers patronize.

Prices of foods, fuels, and a few other items are obtained every month in all 56 locations. Prices of most other commodities and services are collected every month in the 5 largest SMSA's and every 3 months in other SMSA's and cities. Mail questionnaires are used to obtain local transit fares, public utility rates, newspaper prices, fuel prices, and certain other items which change in price infrequently. Prices of most other goods and services are obtained by personal visits of the Bureau's trained representatives.

In calculating the index, price changes for the various items in each location are averaged together with weights which represent their importance in the spending of all wage earners and clerical workers. SMSA and city data are then combined in the total index with weights based on the 1960 populations of SMSA's and cities they represent. Index numbers are computed on the base 1957-59=100, and are also avaflable on the bases of 1947-49=100 and 1939=100.

The national index (the United States city average) includes prices from the 23 SMSA's for which separate indexes are published in this report, as well as from the following additional locations:

BLS Regional Offices

1371 Peachtree Street, N.E. Atlanta, Georgia 30309
