U.S. CITY AVERAGE AND SELECTED AREAS

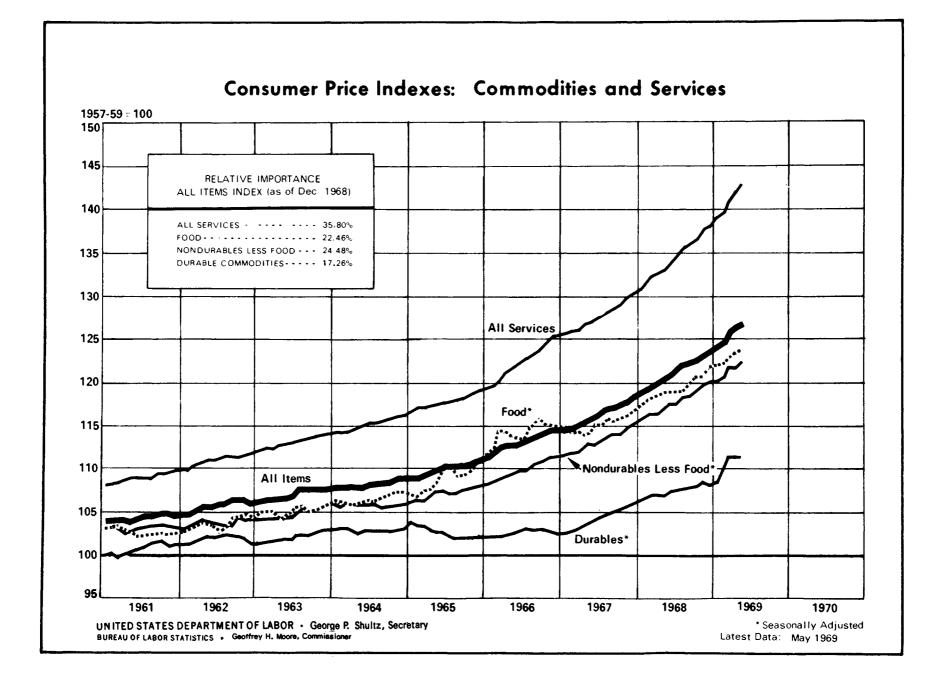

# the consumer price index

**U.S. DEPARTMENT OF LABOR** BUREAU OF LABOR STATISTICS July 1969

## CONSUMER PRICE INDEX FOR MAY 1969

Retail prices rose 0.3 percent in May, considerably less than in the two preceding months. The rise brought the Consumer Price Index to 126.8 (1957-59=100). The May increase, smallest since January, brought the rise in retail prices since the beginning of the year to 2.5 percent; the index has risen 5.4 percent since May 1968. In contrast, during the first five months of last year, retail prices rose less (1.8 percent) to a point 4.1 percent higher than year-earlier levels.

Charges for consumer services, particularly medical care and services associated with homeownership, moved up significantly and accounted for about half of the index advance in May. The remainder of the rise resulted about equally from a contraseasonal increase for food, up 0.4 percent despite a sharp decline for eggs, and higher prices for other nondurable commodities, particularly apparel. Prices of consumer durable goods declined fractionally as a significant decrease for used cars offset the continued uptrend in prices of houses and durable household goods.

Almost half of the 5.4 percent year-to-year increase in the Consumer Price Index was due to the rise of more than 7 percent in costs of services, particularly household services. Higher prices for nondurable commodities, principally food and apparel, were responsible for nearly two-fifths of the index's advance; the 4.1 percent increase for durable goods accounted for the remainder.

## Services

The rate of increase in prices of consumer services slowed appreciably in May from the annual rate of about 10 percent in the previous 2 months. Smaller increases were recorded for all major groups of services; household services, other than rent, registered the most significant slowdown. The May rise left service costs 7.3 percent higher than they were a year ago and 3.3 percent above their December 1968 level.

Mortgage interest charges rose appreciably, but by substantially smaller percentages than in March and April when rate increases on V.A. and F.H.A. loans were reflected in the index. Costs to homeowners for maintenance and repair services increased 1 percent in May and accounted for about one-third of the rise in non-rent household services. Charges for these services, up 4 percent so far this year have played an important role in the continued advance in household services. They have risen nearly 9 percent since May 1968. Higher prices for baby sitting, domestic, and licensed day care services and washing machine repairs were behind the sizeable rise in housekeeping services in May.

Prices of medical care services in May posted their smallest monthly rise so far this year. Their annual rate of increase dropped from more than 10 percent to about 7 percent. The May advance, led by higher prices for professional services, was more in line with the average rate of increase during 1968. Hospital daily service charges increased 0.4 percent in May, their smallest monthly rise in nearly a year.

The increase in transportation services was comparatively moderate and in large part was due to higher automobile insurance premiums and private parking fees. About two-thirds of the 6.7 percent over-the-year increase in transportation services resulted from higher costs for public transportation and automobile liability and physical damage insurance.

Costs of "other" services continued to drift up in May, due largely to higher prices for men's haircuts, legal fees, movie admissions and golfing fees.

Since May last year, the increase in costs of consumer services has stemmed primarily from advances for household and medical care services. Taken together, higher prices for transportation and "other" services accounted for about one-fourth of the 12 month increase.

## Food

Retail food prices rose 0.5 percent on a seasonally adjusted basis in May, primarily on the strength of increases for meats and several fresh vegetables. Since the beginning of the year retail prices of food have advanced 2.3 percent, slightly less than in the similar period of last year. Consumers paid about 4 percent more for food in May this year than they did in May 1968. Prices of food purchased in grocery stores were up 3.6 percent over the 12 months while prices of restaurant meals and other food consumed away from home climbed 5.7 percent.

Prices of meats, poultry, and fish averaged contraseasonally higher in May, primarily because of higher prices for beef, veal, and pork. More than half of the rise in prices of food purchased for home consumption since May of last year was the result of a 6.7 percent increase in meat prices. The strength in meat prices, up 5.4 percent this year, apparently stems from the high level of consumer demand. Poultry prices were lower in May, because of promotional efforts aimed at increasing summer demand, while fish prices rose fractionally, reflecting somewhat smaller supplies of shrimp and several important types of fin fish.

Prices of fresh vegetables contributed significantly to the May rise in food prices. Tomatoes, celery and green peppers rose sharply because of tighter supplies that resulted from declining production and, for tomatoes, smaller imports from Mexico. Higher prices for fresh and evaporated milk and for cheese were largely responsible for the greater-than-seasonal rise in retail prices of dairy products. Declining milk output apparently is the major factor behind the sustained uptrend in dairy product prices, up nearly 3 percent over last year.

Egg prices posted the only significant decline in May; they dropped nearly twice as much as usual for the month in response to reduced consumer demand.

## Nondurable goods other than food

Higher prices for apparel continued to be the key factor behind the rise for nondurable commodities other than food in May. Prices for these commodities accounted for more than four-fifths of the 0.4 percent increase. Prices for nondurables other than food have climbed 1.7 percent this year, virtually the same rate as in the similar period last year.

Apparel prices maintained their strong uptrend as prices for women's clothing, especially skirts, street dresses, and swimming suits, jumped sharply. Men's suits and shirts, and all types of footwear, particularly women's, bore higher price tags. So far this year, apparel prices have advanced about two percent, or approximately two-thirds as much as in the similar 1968 period. The slowdown this year may represent a lessening of cost pressures at the manufacturing or retailing levels since consumer demand apparently is still quite strong.

Gasoline prices at retail averaged fractionally lower in May after several months of increases which reflected boosts in wholesale prices. Strong competitive conditions in several metropolitan areas reportedly were the cause of the slight drop. Prices of magazines and books were up rather sharply and costs of alcoholic beverages continued their trend upward. Higher prices for apparel accounted for about half of the 4.6 percent rise in prices of nondurable commodities other than food over the past year. The remainder of the advance was due to increases for gasoline, alcoholic beverages, cigarettes, reading materials, and toilet goods.

## Durables

Retail prices of consumer durables averaged slightly lower in May, but stood 4.1 percent higher than their level of a year ago. Since the first of the year, prices for durable commodities have advanced 2.4 percent. The increase in the similar 1968 period was only one-third as large.

Used car prices moved down, after very sharp increases earlier in the year, despite indications of sustained strength in demand. New car prices were off fractionally, but by less than usual for the month. Prices of furniture continued to climb strongly in May; the continued increase reflected higher wholesale prices and retailing costs. Since the beginning of the last quarter of 1968, wholesale prices of household furniture have advanced  $3\frac{1}{2}$  percent. At the retail level, over the same period, furniture prices have increased nearly 5 percent.

Purchase prices of houses were up significantly in May as were prices for durable commodities used in home maintenance and repairs. A surge in prices of pine shelving, the reflection of unusually large increases for lumber prices in general, has led the nearly 6 percent advance in maintenance and repair commodities since the first of the year.

Approximately nine-tenths of the over-the-year increase for durable goods in May was due to higher prices for houses and household durables, particularly furniture and durable housefurnishings. Prices of new cars were  $1\frac{1}{2}$  percent higher than last year, while used cars, despite their strength earlier this year, were at the same level as last May.

## Cost-of-Living Adjustments

Approximately 173,000 workers will receive cost-of-living pay increases based on the May Consumer Price Index. About 73,000 workers in the meatpacking industry will receive an 8-cent hourly increase based on the change in the national index between November 1968 and May 1969. Approximately 27,000 aerospace workers will receive increases amounting to 5 cents an hour and 20,000 tobacco workers will get a 2-cent hourly increase based on a quarterly review of the national CPI. About 1500 transit workers in Milwaukee, Wisconsin are due to receive 1-cent hourly increases and 2800 transit employees in Washington, D. C. will receive an increase of 9 cents based on the change in indexes for those areas since February. Also, 3400 employees of the Kellogg Company in Battle Creek, Michigan will get an increase of 8 cents an hour based on a quarterly review of the Detroit index. An additional 35,000 workers who are covered by contract escalator provisions subject to adjustment on the May index will not receive increases this month because they have already reached the maximum adjustments stipulated in their contracts.

9/ Also includes prices for water pump replacement, motor tune-up, automatic transmission repair, exhaust system repair, front end alignment, and chassis lubrication.

11/ Also includes outboard motors, nondurable toys, college tuition fees, paperback books, and college textbooks, not shown separately.

## A NOTE ABOUT CALCULATING INDEX CHANGES

Movements of the indexes from one date to another are usually expressed as percentage changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period while percentages are not. The following example illustrates the computation of index point and percentage changes:

Index Point Change		Percentage Change
May 1969 CPI (1957 <b>-</b> 59 <b>-</b> 100)	126.8	Index point difference divided by the
less April 1969 index	126.4	index for the previous period:
Index point difference =	0.4	$\frac{126.8 - 126.4 \times 100}{126.4} = .3 \text{ percent}$

## Reliability of Percent Changes in the CPI

A system of "replicated" samples introduced into the index structure in the 1964 revision permits an estimate of sampling error for the CPI.  $\underline{1}/$  The table below shows standard errors for monthly, quarterly, and annual <u>percent changes</u> in the CPI for all items and for nine commodity groupings based on 1968 averages. The figures may be interpreted as follows: the chances are about 95 out of 100 that the percent change in the CPI as computed differs from the corresponding "complete coverage" change by less than twice the standard error. Data also are shown in terms of the relative error of the standard error of percent changes. The relative errors tend to decrease markedly for successively longer time periods, as expected.

Because the CPI is rounded to one decimal place, some ambiguity may arise in interpreting small index changes. The table below indicates, for example, that a monthto-month change of 0.1 percent in the all-items CPI is significant. Because of rounding, however, a change of this size in the published index might result from a much smaller change in the unrounded value. Hence, any particular change of 0.1 percent may or may not be significant. On the other hand, a published change of 0.2 percent is almost always significant, regardless of the time period to which it relates.

		Standard Er	ror	Relative Error		
Component	Monthly Change	Quarterly Change	Annual Change	Monthly Change	Quarterly Change	Annual Change
All items	.03	.05	.08	.08	.04	.02

Other goods and services	.08	.17	.36	.29	.19	.08

## Standard and Relative Errors of Percent Changes in the CPI Based on 1968 Data

This replaces the table of average errors based on 1967 data which was included in the CPI report through December 1968.

<u>1</u>/ The method of deriving these estimates is described in a paper by Marvin Wilkerson "Measurement of Sampling Error in the Consumer Price Index," <u>Journal of the American Statis</u> <u>tical Association</u>, September 1967.

### Brief Explanation of the CPI

The Consumer Price Index (CPI) measures average changes in prices of goods and services usually bought by urban wage earners and clerical workers, both families and single persons living alone. It is based on prices of about 400 items which were selected to represent the movement of prices of all goods and services purchased by wage earners and clerical workers. Prices for these items are obtained in urban portions of 39 Standard Metropolitan Statistical Areas (SMSA's) and 17 smaller cities, which were chosen to represent all urban places in the United States, including Alaska and Hawaii. They are collected from grocery and department stores, hospitals, filling stations, and other types of stores and service establishments which wage earners and clerical workers patronize.

Prices of foods, fuels, and a few other items are obtained every month in all 56 locations. Prices of most other commodities and services are collected every month in the 5 largest SMSA's and every 3 months in other SMSA's and cities. Mail questionnaires are used to obtain local transit fares, public utility rates, newspaper prices, fuel prices, and certain other items which change in price infrequently. Prices of most other goods and services are obtained by personal visits of the Bureau's trained representatives.

In calculating the index, price changes for the various items in each location are averaged together with weights which represent their importance in the spending of all wage earners and clerical workers. SMSA and city data are then combined in the total index with weights based on the 1960 populations of SMSA's and cities they represent. Index numbers are computed on the base 1957-59=100, and are also available on the bases of 1947-49=100 and 1939=100.

The national index (the United States city average) includes prices from the 23 SMSA's for which separate indexes are published in this report, as well as from the following additional locations:

Alabama - Florence	Louisiana - Baton Rouge*	Ohio - Findlay
Alaska - Anchorage	Maine - Portland*	Oklahoma - Mangum
California - Bakersfield*	Massachusetts - Southbridge	Oregon - Klamath Falls
Colorado - Denver*	Michigan - Niles	Pennsylvania - Lancaster*
Connecticut - Hartford*	Minnesota - Crookston	South Carolina - Union
Florida - Orlando*	Mississippi - Vicksburg	Tennessee - Nashville*
Indiana - Indianapolis*	New Jersey - Millville	Texas - Austin*
Indiana - Logansport	New York - Kingston	Texas - McAllen
Illinois - Champaign-Urbana*	North Carolina - Durham*	Utah - Orem
Iowa - Cedar Rapids*	North Dakota - Devils Lake	Virginia - Martinsville
Kansas – Wichita*	Ohio - Dayton*	Wisconsin - Green Bay*

### \*Standard Metropolitan Statistical Area

Comparisons of indexes for individual SMSA's show only that prices in one location changed more or less than in another. The SMSA indexes cannot be used to measure differences in price levels or in living costs between areas.

A description of the index and historical tables of index numbers for the United States city average and for 23 large SMSA's are available on request to the Bureau of Labor Statistics, Washington, D. C. 20212 or any of its regional offices (addresses below).
