U.S. DEPARTMENT OF LABOR Bureau of Labor Statistics Washington 25, D. C.

#### CONSUMER PRICE INDEX FOR DECEMBER

Prices of consumer goods and services in U.S. cities rose by 0.1 percent between November and December to 127.5 (1947-49 = 100), according to the United States Department of Labor's Bureau of Labor Statistics. A moderate but generally steady upward movement was a principal characteristic of retail prices in 1960 and by December the index was 1.6 percent above year-ago levels. For the second consecutive month the increase was primarily due to higher food prices although an increase in overall shelter costs also contributed materially to the advance to a new record high. Among nonfood components, services registered a further small increase but commodities excluding food were unchanged as a consequence of divergent price movements between durables and nondurables, largely reflecting higher prices for used cars and lower prices for gasoline and for women's and girls' apparel.

Higher meat prices accounted for a major share of the 0.2 percent rise in the food index; however, four of the five major food subgroups registered price increases. The index for all foods at 121.4 was at a peak for the year and close to the postwar high of 121.7 reached in July 1958.

The 0.5 percent increase in the meats, poultry, and fish subgroup was due almost entirely to higher prices for all beef and veal products priced and for cured pork products. The increases in prices of beef products resulted in part from higher wholesale prices as cattle slaughter decreased over the period. Partially offsetting these increases were lower prices for pork chops, pork roasts and lamb. Lamb prices decreased to the lowest December levels since 1956 reflecting improved supplies over a year ago. Increased production also resulted in lower poultry prices. In comparison with December 1959, meat prices were up by 4.3 percent reflecting primarily a 13.5 percent increase in pork prices. Beef and veal prices, on the other hand, were 2.0 percent below year ago levels.

Higher prices for milk and cheese were largely responsible for the 0.3 percent increase in the index for dairy products. Cheese prices have risen steadily since August mainly as a result of increased demand and higher costs of raw milk, compared to a year ago. An advance in bread prices was mainly responsible for the 0.3 percent rise in average prices of cereals and bakery products; over the year bread prices have increased by 5.4 percent. Lower average prices for candy bars were attributable to continuing reports of increase in size of bar with no change in price.

The fruits and vegetables index registered only a small increase over the period as a small decline in average prices of fresh fruits and vegetables was more than offset by increases for processed fruits and vegetables. Prices of fresh fruits and fresh vegetables moved in opposite directions, with fresh fruits decreasing by nearly 5 percent and fresh vegetables increasing by approximately the same amount. Such divergent trends are not unusual for December when supplies of some fresh fruits, particularly citrus fruits, are increasing while supplies of some fresh vegetables are decreasing. Among fresh fruits, orange and grapefruit prices continued to decline substantially. However, prices were well above a year ago as shipments remained below the previous year. The primary factor for the increase in fresh vegetables was a sharp rise (about 57 percent) in the price of tomatoes. Inclement weather during the early part of December, particularly in Florida, retarded harvesting with resultant light supplies to market.

HOUSING

Most elements of home ownership charges advanced over the period, led by higher residential property taxes. For the past several years tax increases have been widespread as a result of the increasing cost of local government services. Rents continued their upward trend although several cities priced

in December reported decreases. Higher material costs for most items and services accounted for the upward movement in home maintenance and repair costs. Widespread price increases for coal and petroleum fuels accompanied the unusually cold weather.

MEDICAL CARE, APPAREL, AND OTHER GROUPS An increase in fees for professional services was largely responsible for the slight advance in the medical care index. However, average prices for prescriptions and drugs declined for the fourth consecutive month.

Reductions at year-end clearance sales for winter and fall items of women's and girls' apparel mainly accounted for the decline in the apparel index. However, the apparel index is now 1.3 percent above the level of December 1959.

Dealers' selling prices of new cars declined only 0.1 percent. This stability reflected the greater than normal concessions from list prices reported by dealers in the first two months of the 1961 model year. However, new car prices were 3 percent lower than a year ago. Used car prices, on the other hand, advanced by 1.6 percent over the month, reversing the trend of the past 14 months, but are still about 13 percent below levels of a year ago.

The 1960 annual average Consumer Price Index (126.5) was 1.5 percent above the 1959 average, an increase well below that of some postwar years. Continued gains in service charges, especially shelter costs, were again mainly responsible for the 1960 advances. However, higher food prices also contributed significantly to the overall price rise. All food subgroups except the important meats, poultry, and fish component, increased over 1959. The advance was led by higher prices for restaurant meals and fruits and vegetables. Among the nonfood components of the index, significant price declines were registered in dealers' prices of new and used cars and in household durables, particularly major appliances.

COST-OF-LIVING
ADJUSTMENT
150,000 workers will receive automatic cost-of-living wage increases of 1 or 2 cents an hour. About 110,000 workers, mainly employees of various metal working industries, including some aircraft companies, will receive 1 cent an hour raises, practically all on a quarterly basis. The remaining workers, numbering about 42,000, are scheduled to receive increases of 2 cents an hour. Of these, about 20,000 are employed by Western trucking companies whose contracts provide for semiannual adjustments.

Correction of errors since 1958 in the calculation of railroad rates have resulted in adjustments in the Consumer Price Indexes for Public Transportation for the United States and for most of the 20 large cities for which separate city indexes are calculated as shown in the tabulation below. However, these corrections were not sufficiently large to affect the published All Items Consumer Price Indexes or the overall transportation group indexes.

Corrections of the item indexes for railroad coach fares and transportation corvices will be published in the December 1960 quarterly Consumer Price Index report "Price Indexes for Selected Items and Groups."

CORRECTED PUBLIC TRANSPORTATION INDEXES (1947-49 = 100)

### Brief Explanation of the CPI

The Consumer Price Index (CPI) measures average changes in prices of goods and services usually bought by city families of wage earners and clerical workers. It is based on prices of about 300 items which were selected so that their price changes would represent the movement of prices of all goods and services purchased by wage and clerical families; they include all of the important items in family spending. Prices for these items are obtained in 46 cities which were chosen to represent all urban places in the United States; they are collected from grocery and department stores, hospitals, filling stations, and other types of stores and service establishments which wage-earner and clerical-worker families patronize.

Prices of foods, fuels, and a few other items are obtained every month in all 46 cities. Prices of most other commodities and services are collected every month in the 5 largest cities and every 3 months in other cities. Mail questionnaires are used to obtain local transit fares, public utility rates, newspaper prices, fuel prices, and certain other items which change in price infrequently. Prices of most other goods and services are obtained by personal visits of the Bureau's trained representatives.

In calculating the index, price changes for the various items in each city are averaged together with weights which represent their importance in family spending. City data are then combined in the total index with weights based on the 1950 populations of cities they represent. Index numbers are computed on the base 1947-49 = 100.

The national index (the United States city average) includes prices from the 20 large cities for which separate indexes are published in this report, as well as from the following 26 medium-sized and small cities:

Huntington, W. Virginia Pulaski, Virginia Anna, Illinois Camden, Arkansas Laconia, New Hampshire Ravenna, Ohio Canton, Ohio Lodi, California Rawlins, Wyoming Charleston, W. Virginia Lynchburg, Virginia San Jose, California Madill, Oklahoma Evansville, Indiana Sandpoint, Idaho Garrett, Indiana Madison, Wisconsin Shawnee, Oklahoma Glendale, Arizona Middlesboro, Kentucky Shenandoah, Iowa Middletown, Connecticut Grand Forks, N. Dakota Youngstown, Ohio Grand Island, Nebraska Newark, Ohio

Comparisons of city indexes show only that prices in one city changed more or less than in another. The city indexes cannot be used to measure differences in price levels or in living costs between cities.

A description of the index and historical tables of index numbers for the United States city average and for 20 large cities are available on request to the Bureau of Labor Statistics in Washington or any of its regional offices (addresses below). The historical tables include index numbers for All Items, Food, Apparel, and Rent for periods from 1913 to date; and for other groups of goods and services from 1935 to date.
